INTRODUCTION

This publication contains the Public Comment Agenda for consideration at the Public Comment Hearings of the International Code Council on October 23 – 30 at the Rio Hotel and Convention Center, Las Vegas (see page 1). See page xl for the hearing schedule.

This publication contains information necessary for consideration of public comments on the proposed code changes which have been considered at the ICC Committee Action Hearings held on April 28 – May 8, 2019, at the Albuquerque Convention Center in Albuquerque, NM. More specifically, this agenda addresses hearings on public comments on proposed code changes to the Administrative Provisions, *International Building Code (Structural)*, *International Energy Conservation Code (Commercial and Residential)*, *International Existing Building Code*, *International Green Construction Code (Chapter 1)*, and *International Residential Code (Building)*.

ICC GOVERNMENTAL MEMBER REPRESENTATIVES

Council Policy #28, Code Development (page xi) requires that applications for Governmental Membership must have been received by March 29 of this year in order for the representatives of the Governmental Member to be eligible to vote at this Public Comment Hearing and the Online Governmental Consensus Vote, which occurs approximately two weeks after the hearings. Further, *CP#28* requires that ICC Governmental Member Representatives reflect the eligible voters **30 days prior** to the start of the Public Comment Hearings. This includes new, as well as changes, to voting status. Sections 9.1 and 9.2 of *CP#28* (page xxxv) read as follows:

- 9.1 Eligible Final Action Voters:** Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated once each code development cycle. After initial validation, changes to the list of GMVRs for the remainder of the code development cycle shall be made in accordance with Section 9.2. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.
- 9.2 Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

As such, new and updated eligible voter status must be received by ICC's Member Services Department **by September 23, 2019**. This applies to both voting at the Public Comment Hearings as well as the Online Governmental Consensus Vote which occurs approximately two weeks after the hearings. This must be done via the Electronic Voter Designation System. Access the Electronic Voter Designation System directly by logging on to www.iccsafe.org/EVDS and using the email address and password connected to your Primary Representative account. The online form can also be accessed by logging onto "My ICC" and selecting "Designate Voters" or through the Electronic Voter Designation link in the left hand menu on the ICC home page at www.iccsafe.org. These records will be used to verify eligible voter status for the Public Comment Hearing and the Online Governmental Consensus Vote. Voting members are strongly encouraged to review their membership record for accuracy so that any necessary changes are made prior to the September 23 deadline. **Representatives of any Governmental Member that has made application for membership after March 29, 2019 will not be able to vote.**

ICC POLICY ON FINANCIAL ASSISTANCE FOR GOVERNMENTAL MEMBER VOTING REPRESENTATIVES

ICC Council Policy 36 Financial Assistance defines the circumstances under which it is permissible for Governmental Member Voting Representatives to accept funds to enable a Governmental Member Voting Representative to attend ICC code hearings. The policy seeks to prohibit, or appropriately regulate financial assistance which is designed to increase Participation by a Particular interest group or by those supporting a Particular position on a proposed code change.

As part of the registration process (see below), eligible voting members are required to verify their voting status in order to receive a voting device. Improper acceptance of financial assistance, or misrepresentation by a Governmental Member Voting Representative about compliance with CP 36, which are discovered after a code hearing, may result in sanctions regarding voting at future hearings by the Governmental Member Voting Representative or by other Governmental Member Voting Representatives from the same governmental member. CP 36 provides, in pertinent Part:

- 2.0. Contributions.** To allow industry and the public to contribute to the goals of the ICC in transparent and accountable processes, organizations and individuals are permitted to contribute financial assistance to Governmental Members to further ICC Code Development Activities provided that:
 - 2.1** Contributions of financial assistance to Governmental Member Voting Representatives for the purposes of enabling participation in ICC Code Development Activities are prohibited except for reimbursements by the ICC or its subsidiaries, a regional, state, or local chapter of the ICC, or the local, state or federal unit of government such Governmental Member Voting Representative is representing. For the purposes of this policy financial assistance includes the payment of expenses on behalf of the Governmental Member or Governmental Member Voting Representative. Governmental Member Voting Representatives may self-fund for purposes of participating in ICC Activities.
 - 2.2** A Governmental Member accepting contributions of financial assistance from industry or other economic interests shall do so by action of its elected governing body or chief administrative authority. A Governmental Member Voting Representative may not directly accept financial assistance from industry or other economic interests.
 - 2.3** Any contributions to a Governmental Member of the ICC shall comply with applicable law, including but not limited to a Governmental Member's ethics, conflict of interest or other similar rules and regulations.

ADVANCE REGISTRATION

The Public Comment Hearings are only one component of the 2019 ICC Annual Conference and Group B Public Comment Hearings. **All attendees to the Public Comment Hearings are required to register. Registration for the Public Comment Hearings is FREE, and is necessary to verify voting status (see above). You are encouraged to register prior to the Public Comment Hearings. To register for the full Conference, the Education Program, or the Public Comment Hearings, go to http://media.iccsafe.org/2019_ICC_AnCon/register.html.**

NOTICE: If you or your companion require special accommodations to participate fully, please advise ICC of your needs.

ANTITRUST COMPLIANCE

ICC brings together numerous government officials and industry members to participate in the code and standard development process. ICC provides basic guidance on the antitrust laws that may be applicable to these and other activities sponsored by ICC ("ICC Activities"). [Click here](#) to view ICC's policy on Antitrust Compliance.

AGENDA FORMAT

This Public Comment Hearing Agenda includes the Consent Agenda and the Individual Consideration Agenda for the code change proposals that comprise the 2019 Code Development Cycle. This will complete the Public Comment Hearings for the 2019 Code Development Cycle.

The Consent Agenda is comprised of proposed changes to the Administrative Provisions, *International Building Code (Structural)*, *International Energy Conservation Code (Commercial and Residential)*, *International Existing Building Code*, *International Green Construction Code (Chapter 1)*, and *International Residential Code (Building)*, which did not receive a successful assembly action or public comment, and therefore are not listed on the Individual Consideration Agenda.

The Individual Consideration Agenda is comprised of proposed changes, *which* either received a successful assembly action or received a public comment in response to the Code Committee's action at the Committee Action Hearings.

Items on the Individual Consideration Agenda are published with information as originally published for the Committee Action Hearing as well as the published hearing results. Following the hearing results is the reason that the item is on the Individual Consideration Agenda followed by the public comments, which were received.

Public testimony will follow the procedures given in *CP#28-05 Code Development* as published on page x. Refer to the tentative hearing order on page xxxix.

MODIFICATIONS & PUBLIC COMMENTS

In addition to modifications made by a committee at the Committee Action Hearings, *CP#28 Code Development* allows successful modifications, which were voted on during the Online Assembly Vote following the Committee Action Hearings. In addition, modifications can be proposed in form of a Public Comment following the Committee Action Hearings. The Public Comment deadline was July 24, 2019 and all Public Comments received have been incorporated into this document. **Further modifications are not permitted beyond those published in this agenda.**

Proposed changes on the Individual Consideration Agenda at the Public Comment Hearings may have up to five possible motions - Approval as Submitted, Approval as Modified by the Code Committee, Approval as Modified by a successful Assembly Action, Approval as Modified by a Public Comment, or Disapproval. A Public Comment Hearings Discussion Guide will be [posted](#) and copies available at the hearing which includes a list of allowable motions for each code change proposal.

CONSENT AGENDA

The Public Comment Consent Agenda consists of proposals, which received neither a successful assembly action nor a public comment. The Public Comment Consent Agenda for each code will be placed before the assembly at the beginning of each code with a motion and vote to ratify final action in accordance with the results of the Committee Action Hearing.

INDIVIDUAL CONSIDERATION AGENDA

The Public Comment Hearing Individual Consideration Agenda is comprised of proposals, which have a successful assembly action or public comment. For each code, the proposed changes on the Individual Consideration Agenda shall be placed before the assembly for individual consideration of each item. The hearing order is found on page xxlii and the agenda starts on page 1.

ICC PUBLIC COMMENT HEARING PROCESS

The hearing process will follow CP #28. The process is summarized as follows and will occur for each code noted in the hearing order (CP #28 sections noted):

1. At the start of each of the individual hearings for the respective code (see page xxxix):
 - Requests to withdraw code changes
 - Requests to withdraw public comments
 - Requests to revise the hearing order
 - Consent Agenda voted (Section 7.5.5)
2. The first code change on the hearing order brought to the floor with a standing motion to sustain the committee action.
3. If the Committee Action is not Disapproval, a motion to approve a modification by a public comment may be presented (Section 7.5.9.6).
4. Public testimony on either the Committee Action (if Disapproval) or the public comment (Section 5.5.1)
5. ICC Governmental Member Representatives and Honorary Members ("eligible voters") in attendance vote on the motion under consideration. (See page i)
6. Depending on the motion and action determined by the vote, subsequent allowable motions in accordance with Sections 7.5.9.8 can be considered or voting on the main motion in accordance with 7.5.9.7 is taken. (A Public Comment Hearing Discussion Guide will be posted and copies available at the hearing, which includes a listing of allowable motions.)
7. The public comment hearing result on the code change determined by a vote of the eligible voters is announced. In accordance with Section 7.5.7, reconsideration is not permitted. This result will be placed on the Online Governmental Consensus Vote (Section 8.0), which will be open approximately two weeks after the hearings are complete (see page v).
8. Repeat 2 – 7 for subsequent code changes
9. Go the next code indicated on the hearing order and repeat 1 – 8.

ELECTRONIC VOTING

PUBLIC COMMENT HEARING FOLLOWED BY ONLINE GOVERNMENTAL CONSENSUS VOTE

The public comment hearing is the first step in the process to arrive at Final Action on code changes – Public Comment Hearing (PCH) voting followed by the Online Governmental Consensus Vote (OGCV) utilizing cdpACCESS®. Be sure to review the deadlines and eligible voter information on page i. The sections noted below are the applicable sections of CP #28 which is published on page x.

In accordance with Section 7.5.9.7 electronic voting will be used for voting at the PCH. Electronic voting devices will be available for all eligible voters and can be picked up at a designated area at the entrance to the hearing rooms after registration. Voting devices are to be returned to this designated area at the end of each day and picked up each morning. Therefore, you may want to allow extra time in the mornings to pick up your voting device before the hearings begin.

Public Comment Hearing Vote

The first step is the voting that will occur at the Public Comment Hearing. This process is regulated by Section 7.5.9 of CP #28.

The Consent Agenda will be voted with a motion to ratify the action taken at the Committee Action Hearings. This will be the Final Action on those code changes, and they will not be considered in the Online Governmental Consensus Vote (Section 7.5.5).

As part of the Individual Consideration Agenda, individual motions for modifications to the main motion will be dealt with by a hand vote followed by the electronic vote if the moderator cannot determine the outcome of the hand vote. However, in accordance with Section 7.5.9.7, the vote on the main motion to determine the PCH action must be taken electronically with the vote recorded since this is necessary for the second step in the process (see below). As noted in Section 7.5.9.8, if the motion is not successful, motions for Approval as Submitted or Approval as Modified are in order. A motion for Disapproval is not in order. The voting majorities have not changed and are indicated in Section 7.6. As in the past, if the code change proposal does not receive any of the required majorities in accordance with Section 7.6, Section 7.5.9.9 stipulates that the PCH action will be Disapproval. However, the vote recorded will be the vote count on the main motion in accordance with Section 7.5.9.7.

Online Governmental Consensus Vote

The second step in the final action process is the Online Governmental Consensus Vote (OGCV). This process was first used in the 2014 Cycle, and is built into cdpACCESS and is regulated by Section 8.0. It is anticipated that the ballot period will start approximately two weeks after the Public Comment Hearings and will be open for two weeks.

The results of the PCH set the agenda and ballot options for the OGCV. This is stipulated in Section 8.1. For example, if the action taken at the PCH is AMPC 1, 3, 7 (Approved as Modified by Public Comments 1,3 and 7) then the OGCV ballot will be structured to allow eligible voters to vote for either AMPC 1,3, 7 or Disapproval in accordance with the table. The voting majority required for AMPC 1, 3, 7 at the PCH was a 2/3 majority which is the same majority that applies to the OGCV. The vote tally from the PCH will be combined with the vote tally from the OGCV to determine the Final Action. In the example cited, the

combined vote tally would be required to meet the 2/3 majority in order for the final action to be AMPC 1, 3, 7. If the voting majority is less than the 2/3 required, Section 10.3 stipulates the Final Action to be Disapproval.

Be sure to review Section 8.2 which identifies the composition of the ballot. Of note is item 4 where the PCH action is Approved as Modified. The resulting text will be presented in the ballot with the modification(s) incorporated into the original code change in order for the voter to see how the text would appear in the code. A key part of this ballot is also item 10 where the voter will have access to the hearing video from both hearings.

Non-eligible voters will also be able to login and view the OGCV ballot, but will not be permitted to vote.

Eligible voting members who voted at the Public Comment Hearings are not required to vote on the OGCV. The vote entered on the electronic voting device at the PCH will automatically be tabulated on the OGCV.

Final Action on Proposed Code Changes

Section 10.0 regulates the tabulation, certification and posting of the final action results. In accordance with Section 10.4, the Final Action will be published as soon as practicable and will include the action and vote counts from both the PCH and OGCV.

VIEW THE PUBLIC COMMENT HEARINGS ON YOUR PC

The Public Comment Hearings are scheduled to be “webcast”. Streaming video broadcast over the Internet will provide a gateway for all International Code Council members, the construction industry and other interested parties anywhere in the world to view and listen to the hearings. Logging on to the Internet broadcast will be as simple as going to the International Code Council web site, www.iccsafe.org and clicking on a link. [Actual site to be determined - be sure to check the ICC web site for further details].

The hearings can be seen at no cost by anyone with Internet access. Minimum specifications for viewing the hearings are an Internet connection, sound card and Microsoft Windows Media Player. DSL, ISDN, Cable Modems or other leased-line connections are recommended for the best viewing experience. A dial-up modem connection will work, but with reduced video performance.

The 2018 cycle included a new hearing video feature – all hearing videos are now posted following the hearings at <http://hearingvideos.iccsafe.org/>.

PUBLIC COMMENT HEARING CONSIDERATION OF ADM 47-19

As indicated below, Section 4.6 of CP28 notes that updates to referenced standards are accomplished administratively through consideration of a code change proposal. Section 4.6 allows multiple referenced standards updates in a single proposal for ease of processing and placing all the updates together. In this 2019 cycle, the code change proposal for updating referenced standards is ADM47-19.

4.6 Updating Standards Referenced in the Codes: Standards referenced by the Codes that do not require coordination with a code change proposal to the code text shall be updated administratively by the Administrative Code Development Committee in accordance with these full procedures except that

the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.

Multiple standards to be updated may be included in a single proposal. Each referenced standard listed in ADM47-19 is essentially a separate code change proposal or part. Action taken on each referenced standard is independent of action taken on other 2019 ICC PUBLIC COMMENT AGENDA vii standards. All totaled, there are over 950 referenced standards being considered for update and 9 of the referenced standards proposed to be updated have received a public comment requesting either Approval As Submitted (AS), Approval As Modified by Public Comment (AMPC) or Disapproval (D). Therefore, ADM47-19 will be dealt with procedurally by dividing the question as a multiple part code change proposal; with each referenced standard receiving a public comment being dealt with as a separate part in conjunction with the submitted public comment. Updates to the referenced standards listed in ADM47-19 that did not receive a public comment will be processed as part of the Consent Agenda in accordance with Section 7.4.

PROPONENT REVIEW OF PUBLIC COMMENTS

While great care has been exercised in the publication of this document, there may be errata posted for the Public Comment Agenda. **As indicated in the cdpACCESS automated response to public comment proposals, public comment proponents are encouraged to carefully review their comments and email errata to dbroadnax@iccsafe.org by September 18, 2019 to be included in our published errata to the Public Comment Hearing Agenda in order to be included in the agenda for consideration at the Public Comment Hearings.** Errata, if any, identified prior to the Public Comment Hearings will be posted as updates to the Public Comment Hearing Agenda on the ICC website at <https://www.iccsafe.org/products-and-services/i-codes/code-development/current-code-development-cycle/>. Users are encouraged to periodically review the ICC Website for updates to the 2019 Public Comment Hearing Agenda.

EDITORIAL CODE CHANGES - CODE CORRELATION COMMITTEE

In a typical code change cycle, there are code change proposals that are considered strictly editorial. Section 4.4 of CP 28 (see below) establishes a process by which the Code Correlation Committee (CCC) considers such proposals.

4.4 Editorial Code Change Proposals. When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda

shall be published in the next edition of the code with no further consideration.

Since a public comment, by extension, is part of a code change proposal, ICC has applied the purpose and intent of Section 4.4 to public comments. There is one such public comment in the current 2019 Cycle. The comment is located after the last code change in the PCH Agenda and is identified by a code change prefix of CCC. As noted in Section 4.4, anyone may request that this proposals (public comment) be added to the hearing agenda, in this case for individual consideration.

The deadline to make such a request is 11: 59 pm Pacific on Tuesday, October 8, 2019 via email. Be sure to identify the code change number noted above. Such requests must be sent to:
Ed Wirtschoreck Director, Codes ewirtschoreck@iccsafe.org

2018/2019 ICC CODE DEVELOPMENT SCHEDULE

(February 10, 2017)

STEP IN CODE DEVELOPMENT CYCLE	DATE	
	2018 – Group A Codes IBC- E, IBC - FS, IBC -G, IFC, IFGC, IMC, IPC, IPMC, IPSDC, IRC – M, IRC- P, ISPSC, IWUIC, IZC	2019 – Group B Codes Admin, IBC-S, IEBC, IECC-C, IECC- R/IRC-E, IgCC (Ch. 1), IRC – B
2018 EDITION OF I-CODES PUBLISHED	Fall/2017 (except 2018 IgCC, see Group B Codes on next page)	
DEADLINE FOR RECEIPT OF APPLICATIONS FOR ALL CODE COMMITTEES	June 1, 2017 for the 2018/2019 Cycle. Call for committee posted in February /2017.	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF CODE CHANGE PROPOSALS	January 8, 2018	January 7, 2019
WEB POSTING OF “PROPOSED CHANGES TO THE I-CODES”	February 28, 2018*	March 4, 2019*
COMMITTEE ACTION HEARING (CAH)	April 15 – 23, 2018 Greater Columbus Convention Center Columbus, OH	April 28 – May 8, 2019 Albuquerque Convention Center Albuquerque, NM
ONLINE CAH ASSEMBLY FLOOR MOTION VOTE	Starts approx. two weeks after last day of the CAH. Open for 2 weeks.	Starts approx. two weeks after last day of the CAH. Open for 2 weeks.
WEB POSTING OF “REPORT OF THE COMMITTEE ACTION HEARING”	May 30, 2018	June 11, 2019
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF PUBLIC COMMENTS	July 16, 2018	July 24, 2019
WEB POSTING OF “PUBLIC COMMENT AGENDA”	August 31, 2018*	September 4, 2019*
PUBLIC COMMENT HEARING (PCH) ANNUAL CONFERENCE DATES NOTED BY AC	October 24 – 31, 2018 Greater Richmond Convention Center Richmond, VA AC: October 21 – 23	October 23 – 30, 2019 Clark County, NV AC: October 20 - 22
ONLINE GOVERNMENTAL CONSENSUS VOTE (OGCV)	Starts approx. two weeks after last day of the PCH. Open for 2 weeks.	Starts approx. two weeks after last day of the PCH. Open for 2 weeks.
WEB POSTING OF FINAL ACTION	Following Validation Committee certification of OGCV and ICC Board confirmation.	Following Validation Committee certification of OGCV and ICC Board confirmation.

* Web posting of the “Proposed Changes to the I-Codes” and “Public Comment Agenda” will be posted no later than scheduled. ICC will make every effort to post these documents earlier, subject to code change/public comment volume and processing time.

2018 Group A Codes/Code committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11.
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC. See notes.
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33.
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E. See notes.
- IFGC
- IMC
- IPC
- IPMC (code changes heard by the IPM/ZC (IPMC & IZC) code committee)
- IPSDC (code changes heard by the IPC code committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP code committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC - MP code committee)
- ISPSC
- IWUIC (code changes heard by the IFC code committee)
- IZC (code changes heard by the IPM/ZC (IPMC & IZC) code committee)

2019 Group B Codes/Code committees:

- Admin: Chapter 1 of all the I-Codes except the IECC, IgCC and IRC. Also includes the update of currently referenced standards in all of the 2018 Codes, except the IgCC.
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See notes.
- IEBC: IEBC Non-structural provisions. See notes.
- IECC-C: IECC Commercial energy provisions.
- IECC-R/IRC-E: IECC Residential energy provisions and IRC Energy provisions in Chapter 11.
- IgCC: Chapter 1 of the IgCC. Remainder of the code is based on the provisions of ASHRAE Standard 189.1 *Standard for the Design of High-Performance Green Buildings, Except Low-Rise Residential Buildings*. The 2018 IgCC is scheduled to be published in the Summer/2018.
- IRC-B: IRC Building provisions. Chapters 1 – 10.

A 2020 Group C cycle is not scheduled.

Notes:

- Be sure to review the document entitled “2018/2019 Code Committee Responsibilities” which will be posted. This identifies responsibilities, which are different than Group A and B codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 14 of the IBC (IBC – Fire Safety), there are numerous sections which include the designation “[BS]” which indicates that the provisions of the section are maintained by the IBC – Structural code committee. Similarly, there are several sections in Chapter 3 of the IMC, which include the designation “[BS]”. These are structural provisions, which will be heard by the IBC – Structural committee. The designations in the code are identified in the Code Committee Responsibilities document.
- I-Code Chapter 1: Proposed changes to the provisions in Chapter 1 of the majority of the I-Codes are heard in Group B (see Admin above for exceptions). Be sure to review the brackets ([]) of the applicable code.
- Definitions. Be sure to review the brackets ([]) in Chapter 2 of the applicable code and the Code Committee Responsibilities document to determine which code committee will consider proposed changes to the definitions.
- Proposed changes to the ICC Performance Code will be heard by the code committee noted in brackets ([]) in the section of the code and in the Code Committee Responsibilities document

CP #28-05 CODE DEVELOPMENT

Approved: 9/24/05

Revised: 1/22/19

1.0 Introduction

- 1.1 **Purpose of Council Policy:** The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).
- 1.2 **Objectives:** The ICC Code Development Process has the following objectives:
 - 1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.
 - 1.2.2 The open discussion of code change proposals by all parties desiring to participate.
 - 1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare and by honorary members.
 - 1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.
- 1.3 **Code Publication:** The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.
 - 1.3.1 **Code Correlation:** The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Code Scoping Coordination Matrix shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for maintenance of the code text where a given subject matter or code text could appear in more than one Code. The Code Scoping Coordination Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.5.
- 1.4 **Process Maintenance:** The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes

is determined by a majority vote of the governmental and honorary members. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

- 1.5 Secretariat:** The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.
- 1.6 Recording:** Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the recording. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

2.0 Code Development Cycle

- 2.1 Intent:** The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 3.5) and ending with publication of the Final Action on the code change proposals (see Section 10.4).
- 2.2 New Editions:** The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the previous edition.
- 2.3 Supplements:** The results of code development activity between editions may be published.
- 2.4 Interim Code Amendments:** All revisions to the International Codes shall be processed in accordance with other sections of this Council Policy except for Emergency Actions by the ICC Board complying with Section 2.4.1 and Interim Critical Amendments (ICA) complying with Section 2.4.2.
 - 2.4.1 Emergency Actions by the ICC Board:** Emergency actions by the ICC Board are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.
 - 2.4.1.1 Initial Request:** A request for an emergency action shall be based upon perceived immediate threats to health and safety and shall be reviewed by the Codes and Standards Council for referral to the ICC Board for action with their analysis and recommendation.

2.4.1.2 Board and Member Action: In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the Governmental Member Voting Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

2.4.2 Interim Critical Amendments (ICA)

2.4.2.1 Submittal. Anyone may propose an ICA by providing the following information:

- a) Name of submitter
- b) Contact information
- c) Submitters representation
- d) Date
- e) Relevant section(s) and code edition(s) under consideration
- f) Proposed modifications with text changes identified using underlines for new text and strikethroughs for deleted text
- g) A statement that substantiates the need for proposed changes and why the proposed submission is of such a critical nature in accordance with Section 2.4.2.3 that it cannot be left to be addressed during the next code development cycle.
- h) Written endorsement of the proposed ICA by not less than two members of the Code Development Committee(s) responsible for maintaining the affected code section(s)

2.4.2.2 Preliminary Review. An ICA will only be processed if the Codes and Standards Council determines that the proposed ICA appears to be of a critical nature requiring prompt action based on the criteria specified in Section 2.4.2.3. If processed, the question of critical nature shall be further considered by the responsible Code Development Committee(s) and the Codes and Standards Council. The text of a proposed ICA shall be processed as submitted or shall be changed with the approval

of the submitter. The Codes and Standards Council shall process their preliminary “critical nature” determination within 45 days of the ICA submission.

2.4.2.3 Determination of Critical Nature. Qualification for critical nature shall be based on one or more of the following factors:

- a) The proposed ICA corrects an error or an omission that was overlooked during a regular code development process.
- b) The proposed ICA resolves a conflict within an individual code or a conflict involving two or more ICC codes.
- c) The proposed ICA mitigates a previously unknown hazard.

2.4.2.4 Code Development Committee. A proposed ICA that meets the provisions in Sections 2.4.2.2 and 2.4.2.3 shall be submitted to the Code Development Committee(s) responsible for the affected section(s) for a ballot and comment period of 30 calendar days. The committee(s) shall be separately balloted on both the technical merit of the ICA and whether the ICA satisfies the critical nature criteria. Negative votes in the initial ballot, if any, shall require a reason statement and shall be circulated to the full committee(s) to allow initial ballot votes to be changed.

A committee recommendation for approval shall require an affirmative vote of at least three-fourths of members who voted, on both technical merit and critical nature. The following shall be omitted from the three-fourths vote calculation:

- a) Committee members who have abstained.
- b) Committee members whose negative ballots do not include a statement conveying the reason for casting a negative vote.
- c) Committee members who do not return their ballots prior to the announced ballot return deadline.

In addition to the three-fourths majority described above, the number of affirmative votes shall be not less than 50% of all committee members who are eligible to vote. Committee members eligible to vote shall be the total number of individuals who are members of the committee on the date of ballot distribution and shall not be adjusted based on abstentions or ballots that were not returned.

ICAs that achieve the required number of affirmative votes on both technical merit and critical nature are approved for further processing in accordance with Sections 2.4.2.5 through 2.4.2.9. ICAs that do not achieve the required number of affirmative votes on both technical merit and critical nature are rejected.

2.4.2.5 Publication of Proposed ICA for Public Comment. An ICA that is approved in accordance with Section 2.4.2.4 shall be published by ICC in appropriate media with a notice inviting

public comments on the proposed ICA. The public comment period shall be open for at least 30 calendar days from the date of posting of the notice. When a proposed ICA revises text that was changed in the most recent code development cycle, the ICA public comment notice shall also be directly provided to submitters of proposals and public comments to the affected section in the most recent code development cycle.

- 2.4.2.6 Additional Code Development Committee Review.** All public comments shall be circulated to the responsible Code Development Committee(s) for a 30-calendar day ballot and comment period allowing an opportunity for committee members to change votes taken prior to the public comment period. If any votes are changed to negative, negative votes shall be circulated to the full committee, followed by a final ballot following the voting procedures Section 2.4.2.4.

Approved ICAs shall be forwarded to the Codes and Standards Council with a staff report that includes all public comments, ballots, committee member comments on ballots and concurrence by staff on which code editions should be affected by the ICA.

- 2.4.2.7 Action of the Codes and Standards Council.** The Codes and Standards Council shall review the material submitted in accordance with Section 2.4.2.6 at the next Codes and Standards Council meeting. Approval of an ICA shall require an affirmative vote of at least two-thirds of the Codes and Standards Council members who cast a vote at the meeting.

- 2.4.2.8 Effective Date and Publication.** ICAs that are approved by the Codes and Standards Council shall become effective 30 calendar days after approval, or in the case of an appeal in accordance with Section 2.4.2.9, 30 calendar days after a decision by the ICC Board upholding a Codes and Standards Council decision to issue an ICA.

An ICA shall apply to code editions specified by the ICC Codes and Standards Council, and ICC staff shall, by an appropriate method, publish approved ICAs and ensure that approved ICAs are distributed with future sales of affected codes. ICAs shall be distributed as a separate document and shall not be incorporated into the text of a published code until such time that the ICA has been approved by the full code development process, following submittal as a proposal in accordance with Section 2.4.2.11.

- 2.4.2.9 Appeals.** A decision of the Codes and Standards Council to approve an ICA shall be appealable to the ICC Board in accordance with Council Policy 1.

- 2.4.2.10 Applicability.** ICAs shall not be considered retroactive requirements.

2.4.2.11 Subsequent Processing. An approved ICA shall automatically become a code change proposal from the Codes and Standards Council in the following code cycle.

2.5 Code Development Record. The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 4.8)
2. Audio and video recording of the Committee Action Hearing (Section 5.1)
3. The Online Assembly Floor Motion Ballot (Section 5.7.3)
4. Report of the Committee Action Hearing (Section 5.8)
5. Public Comment Agenda (Section 6.6)
6. Public Comment Hearing results (Section 7.5.8.10)
7. Audio and video recording of the Public Comment Hearing (Section 7.1)
8. The Online Governmental Consensus Ballot (Section 8.2)
9. Final Action results (Section 10.4)
10. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

3.0 Submittal of Code Change Proposals

3.1 Intent: Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

3.2 Withdrawal of Proposal: A code change proposal may be withdrawn by the proponent (WP) at any time prior to membership action on the consent agenda at the Public Comment Hearing or prior to testimony on the code change proposal on the individual consideration agenda at the Public Comment Hearing. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

3.3 Form and Content of Code Change Submittals: Each code change proposal shall be submitted separately and shall be complete in itself. Each submittal shall contain the following information:

3.3.1 Proponent: Each code change proposal shall include the name, title, mailing address, telephone number, and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.

3.3.1.1 If a group, organization or committee submits a code change proposal, an individual with prime responsibility shall be indicated.

3.3.1.2 If a proponent submits a code change proposal on behalf of a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated.

3.3.2 Code Reference: Each code change proposal shall relate to the

applicable code sections(s) in the latest edition of the Code.

3.3.2.1 If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.

3.3.2.2 If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.

3.3.3 Multiple Code Change Proposals to a Code Section. A proponent shall not submit multiple code change proposals to the same code section. When a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 4.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.

3.3.4 Text Presentation: The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.

3.3.4.1 A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, a deletion or a revision to existing Code text.

3.3.4.2 Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.

3.3.4.3 Each code change proposal shall be in proper code format and terminology.

3.3.4.4 Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.

3.3.4.5 The proposed text shall be in mandatory terms.

3.3.5 Supporting Information: Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.

3.3.5.1 Purpose: The proponent shall clearly state the purpose of the code change proposal (e.g. clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.)

3.3.5.2 Reasons: The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.

3.3.5.3 Substantiation: The proponent shall substantiate the code change proposal based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 4.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the reason statement. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

3.3.5.4 Bibliography: The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing. Supporting documentation may be provided via a link to a website provided by the proponent and included in the bibliography. The reason statement shall include the date the link was created.

3.3.5.5 Copyright Release: The proponent of code change proposals, floor modifications and public comments shall sign a copyright release developed and posted by ICC.

3.3.5.6 Cost Impact: The proponent shall indicate one of the following regarding the cost impact of the code change proposal:

- 1) The code change proposal will increase the cost of construction;
- 2) The code change proposal will decrease the cost of construction; or
- 3) The code change proposal will not increase or decrease the cost of construction.

The proponent shall submit information which substantiates such assertion. This information will be considered by the code development committee and will be included in the published code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the cost substantiation statement. The cost substantiation statement

shall include the date the link was created.

Any proposal submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

3.4 Online Submittal: Each code change proposal and all substantiating information shall be submitted online at the website designated by ICC. Two copies of each proposed new referenced standard in hard copy or one copy in electronic form shall be submitted. Additional copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the code development committee. Where such additional copies are requested, it shall be the responsibility of the proponent to send such copies to the respective code development committee.

3.5 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the code change deadline. Each code change proposal shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a code change proposal is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

3.6 Referenced Standards: In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

3.6.1 Code References:

3.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.

3.6.1.2 The need for the standard to be referenced shall be established.

3.6.2 Standard Content:

3.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.

3.6.2.2 The standard shall be appropriate for the subject covered.

3.6.2.3 All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.

3.6.2.4 The scope or application of a standard shall be clearly described.

3.6.2.5 The standard shall not have the effect of requiring proprietary materials.

3.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.

3.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.

3.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.

3.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.

- 3.6.2.10** The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.
- 3.6.2.11** The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

3.6.3 Standard Promulgation:

- 3.6.3.1** Code change proposals with corresponding changes to the code text which include a reference to a proposed new standard or a proposed update of an existing referenced standard shall comply with this section.

3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing. If the committee action at the Committee Action Hearing is Disapproval, further consideration on the Public Comment Agenda shall include a recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing.

3.6.3.1.2 Update of Existing Standards. Code change proposals which include technical revisions to the code text to coordinate with a proposed update of an existing referenced standard shall include the submission of the proposed update to the standard in at least a consensus draft form in accordance with Section 3.4. If the proposed update of the existing standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal, including the update of the existing referenced standard, shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the updated standard is not completed, the code change proposal shall automatically be placed on the Public

Comment Agenda with the recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing. If the committee action at the Committee Action Hearing is Disapproval, further consideration on the Public Comment Agenda shall include a recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing.

Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 4.6.

3.6.3.2 The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

4.0 Processing of Code Change Proposals

- 4.1 Intent:** The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published code change proposal accurately reflects that proponent's intent.
- 4.2 Review:** Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, number of copies, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different code committees, the Secretariat shall determine the code committee responsible for determining the committee action in accordance with Section 5.6 and the Code Scoping Coordination Matrix (see Section 1.3.1).
- 4.3 Incomplete Code Change Proposals:** When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected code change proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies addressed by this section, a code change proposal that incorporates a new referenced standard shall be processed with an analysis of the referenced standard's compliance with the criteria set forth in Section 3.6.
- 4.4 Editorial Code Change Proposals.** When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written

request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda shall be published in the next edition of the code with no further consideration.

4.5 Copy Editing Code Text: The Chief Executive Officer shall have the authority at all times to make editorial style and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. Such editorial style or format changes shall not affect the scope or application of the Code requirements.

4.6 Updating Standards Referenced in the Codes: Standards referenced by the Codes that do not require coordination with a code change proposal to the code text shall be updated administratively by the Administrative Code Development Committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.

4.6.1 Updating ICC Standards Referenced in the Codes. All standards developed by ICC and referenced by the Codes which are undergoing an update shall be announced by ICC to allow stakeholders to participate in the update process. Where the updated standard is completed and available by December 1 of the third year of the code cycle, the published version of the new edition of the Code which references the standard shall refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued.

4.7 Preparation: All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned separate, distinct and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 3.3.2 to facilitate the hearing process.

4.8 Code Change Agenda: All code change proposals shall be posted on the ICC website at least 30 days prior to the Committee Action Hearing on those proposals and shall constitute the agenda for the Committee Action Hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

5.0 Committee Action Hearing

5.1 Intent: The intent of the Committee Action Hearing is to permit interested parties to present their views including the cost and benefits on the code

change proposals on the published agenda. The code development committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals. At the conclusion of the code development committee deliberations, the committee action on each code change proposal shall be placed before the hearing assembly for consideration in accordance with Section 5.7.

5.2 Committee: The Codes and Standards Council shall review all applications and make committee appointment recommendations to the ICC Board. The Code Development Committees shall be appointed by the ICC Board.

5.2.1 Chairman/Moderator: The Chairman and Vice-Chairman shall be appointed by the Codes and Standards Council from the appointed members of the committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action_Hearing.

5.2.2 Conflict of Interest: A committee member shall withdraw from and take no part in those matters with which the committee member has an undisclosed financial, business or property interest. The committee member shall not participate in any committee discussion or any committee vote on the matter in which they have an undisclosed interest. A committee member who is a proponent of a code change proposal shall not participate in any committee discussion on the matter or any committee vote. Such committee member shall be permitted to participate in the floor discussion in accordance with Section 5.5 by stepping down from the dais.

5.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the committee.

5.2.4 Committee Composition: The committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the committee members shall be regulators.

5.3 Date and Location: The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.

5.4 General Procedures: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the committee.

5.4.1 Chair Voting: The Chairman of the committee shall vote only when the vote cast will break a tie vote of the committee.

5.4.2 Open Hearing: The Committee Action Hearing is an open hearing. Any interested person may attend and participate in the floor discussion and assembly consideration portions of the hearing. Only code development committee members may participate in the committee action portion of the hearings (see Section 5.6). Participants shall not advocate a position on specific code change proposals with committee members other than through the methods provided in this policy.

5.4.3 Presentation of Material at the Public Hearing: Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 5.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 3.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the code development committee at the public hearing.

5.4.4 Agenda Order: The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.

5.4.4.1 Proponent Approval: A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance in the hearing room and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to change the hearing order is not debatable.

5.4.4.2 Revised Agenda Order Approved: A motion to revise the agenda order is subject to a 2/3 vote of those present.

5.4.5 Tabling: Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Code Change Agenda for the code change proposals under consideration, or
2. To a specific location in the Code Change Agenda for the code change proposals under consideration.

5.4.5.1 Tabling approved: A motion to table is subject to a 2/3 vote

of those present.

5.4.5.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 5.4.5 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

5.4.6 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on by the committee in accordance with Section 5.6.

5.4.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

5.4.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

5.4.7.2 Proponent Testimony: The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

5.4.8 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator or the Chairman. A majority vote of ICC Members in attendance shall determine the decision.

5.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

5.5.1 Discussion Order:

1. Proponents. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opponents. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to

present their views.

3. Rebuttal in support. Proponents shall then have the opportunity to rebut points raised by the opponents.
4. Re-rebuttal in opposition. Opponents shall then have the opportunity to respond to the proponent's rebuttal.

5.5.2 Modifications: Modifications to code change proposals may be suggested from the floor by any person participating in the public hearing. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification.

5.5.2.1 Submission. All modifications shall be submitted electronically to the ICC Secretariat in a format determined by ICC unless determined by the Chairman to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the code development committee during the hearing and will be projected on the screen in the hearing room.

5.5.2.2 Criteria. The Chairman shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. changes the scope of the original code change proposal; or
2. is not readily understood to allow a proper assessment of its impact on the original code change proposal or the Code.

The ruling of the Chairman on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 5.4.8.

5.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairman, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 5.5.1.

5.6 Committee Action: Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the committee:

1. Approve the code change proposal As Submitted (AS) or
2. Approve the code change proposal As Modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to code development committee members. If a committee member proposes a modification which had not been proposed during floor discussion, the Chairman shall rule on the modification in accordance with Section 5.5.2.2. If a committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the committee discussion and shall reopen the floor discussion for

comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume committee discussion.

The code development committee shall vote on each motion with the majority dictating the committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each committee vote shall be supported by a reason.

The code development committee shall maintain a record of its proceedings including the action on each code change proposal.

5.7 Assembly Consideration: At the conclusion of the committee's action on a code change proposal and before the next code change proposal is called to the floor, the Moderator shall ask for a motion from the public hearing attendees who may object to the committee's action. If a motion in accordance with Section 5.7.1 is not brought forward on the committee's action, the results of the Committee Action Hearing shall be established by the committee's action.

5.7.1 Assembly Floor Motion: Any attendee may raise an objection to the committee's action in which case the attendee will be able to make a motion to:

1. Approve the code change proposal As Submitted from the Floor (ASF), or
2. Approve the code change proposal As Modified from the Floor (AMF) with a specific modification that has been previously offered from the floor and ruled in order by the Chairman during floor discussion (see Section 5.5.2) or has been offered by a member of the Committee and ruled in order by the Chairman during committee discussion (see Section 5.6), or
3. Disapprove the code change proposal from the floor (DF).

5.7.2 Assembly Floor Motion Consideration: On receipt of a second to the floor motion, the Moderator shall accept the motion and the second and notify the attendees that the motion will be considered in an online ballot following the hearing in accordance with Section 5.7.3. No additional testimony shall be permitted.

5.7.3 Online Assembly Floor Motion Ballot: Following the Committee Action Hearing, all assembly floor motions which received a second shall be compiled into an online ballot. The ballot will include:

1. The code change proposal as published.
2. The committee action and reason from the Committee Action Hearing.
3. The floor motion, including modifications which are part of the floor motion.
4. Access to the audio and video of the Committee Action Hearing proceedings.
5. Identification of the ballot period for which the online balloting will be open.

5.7.4 Eligible Online Assembly Motion Voters: All members of ICC shall be eligible to vote on online assembly floor motions. Each member is

entitled to one vote, except that each Governmental Member Voting Representative may vote on behalf of its Governmental Member. Individuals who represent more than one Governmental Member shall be limited to a single vote. Application, whether new or updated, for ICC membership must be received by the Code Council 30 days prior to the first day of the Committee Action Hearing. The ballot period will not be extended beyond the published period except as approved by the ICC Board._

5.7.5 Assembly Action: A successful assembly action shall be a majority vote of the votes cast by eligible voters (see Section 5.7.4). A successful assembly action results in an automatic public comment to be considered at the Public Comment Hearing (see Section 7.4).

5.8 Report of the Committee Action Hearing: The results of the Committee Action Hearing, including committee action and reason, online assembly floor motion vote results and the total vote count for each assembly floor motion shall be posted on the ICC website not less than 60 days prior to the Public Comment Hearing, except as approved by the ICC Board.

6.0 Public Comments

6.1 Intent: The public comment process gives attendees at the Public Comment Hearing an opportunity to consider specific objections to the results of the Committee Action Hearing and more thoughtfully prepare for the discussion for public comment consideration. The public comment process expedites the Public Comment Hearing by limiting the items discussed to the following:

1. Consideration of items for which a public comment has been submitted; and
2. Consideration of items which received a successful assembly action.

6.2 Deadline: The deadline for receipt of a public comment to the results of the Committee Action Hearing shall be announced at the Committee Action Hearing but shall not be less than 30 days subsequent to the availability of the Report of the Committee Action Hearing (see Section 5.8).

6.3 Withdrawal of Public Comment: A public comment may be withdrawn by the public commenter at any time prior to public comment consideration of that comment. A withdrawn public comment shall not be subject to public comment consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 7.5.5, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 7.5.5, the proposal shall continue as part of the individual consideration agenda in accordance with Section 7.5.6, however the public comment shall not be subject to public comment consideration.

6.4 Form and Content of Public Comments: Any interested person, persons, or group may submit a public comment to the results of the Committee Action Hearing which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

6.4.1 Public comment: Each public comment shall include the name, title, mailing address, telephone number and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal, committee action or successful assembly action. Public comments which are determined as not within the scope of the code change proposal, committee action or successful assembly action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 3.3.5.5 shall be provided with the public comment.

6.4.2 Code Reference: Each public comment shall include the code change proposal number.

6.4.3 Multiple public comments to a code change proposal. A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 6.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

6.4.4 Desired Final Action: In order for a public comment to be considered, the public comment shall indicate the desired Final Action as one of the following:

1. Approve the code change proposal As Submitted (AS), or
2. Approve the code change proposal As Modified by the committee modification published in the Report of the Committee Action Hearing (AM) or published in a public comment in the Public Comment Agenda (AMPC), or
3. Disapprove the code change proposal (D)

6.4.5 Supporting Information: The public comment shall include a statement containing a reason and justification for the desired Final Action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 6.5 and determined as not germane to the technical issues addressed in the code change proposal or committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in

accordance with the policy of the ICC Board. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Public Comment_Hearing. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the reason statement and bibliography. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

6.4.6 Cost Impact: The proponent of the public comment shall indicate one of the following regarding the cost impact of the public comment to the code change proposal:

- 1) The net effect of the public comment and code change proposal will increase the cost of construction;
- 2) The net effect of the public comment and code change proposal will decrease the cost of construction; or
- 3) The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

The public commenter shall submit information which substantiates such assertion. This information will be considered at the Public Comment Hearing and will be included in the published public comment. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the cost substantiation statement. The cost substantiation statement shall include the date the link was created.

Any public comment submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

6.4.7 Online submittal: Each public comment and substantiating information shall be submitted online at the website designated by ICC. Additional copies may be requested when determined necessary by the Secretariat.

6.4.8 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the public comment deadline. Each public comment shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

6.5 Review: The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 4.2).

6.5.1 Incomplete Public Comment: When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of

the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

6.5.2 Duplications: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for public comment consideration. Each public commenter shall be notified of this action when it occurs.

6.5.3 Deadline: Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the public comment consideration. This deadline shall not apply to public comments submitted by the Code Correlation Committee. In order to correlate submitted public comments with action taken at the Committee Action Hearing on code change proposals that did receive a public comment, the Code Correlation Committee, in conjunction with staff processing of public comments, shall review the submitted public comments and submit the necessary public comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Public Comment Agenda as required in Section 6.6.

6.6 Public Comment Agenda: The Committee Action Hearing results on code change proposals that have not received a public comment and code change proposals which received public comments or successful assembly actions shall constitute the Public Comment Agenda. The Public Comment Agenda shall be posted on the ICC website at least 30 days prior the Public Comment Hearing. Any errata to the Public Comment Agenda shall be posted on the ICC website as soon as possible. Code change proposals and public comments which have not been published in the original posting or subsequent errata shall not be considered.

7.0 Public Comment Hearing_

7.1 Intent: The Public Comment Hearing is the first of two steps to make a final determination on all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 9.0). The second step, which follows the Public Comment Hearing, is the Online Governmental Consensus Vote that is conducted in accordance with Section 8.0.

7.2 Date and Location: The date and location of the Public Comment Hearing shall be announced not less than 60 days prior to the date of the hearing.

7.3 Moderator: The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Public Comment Hearing.

7.4 Public Comment Agenda: The Public Comment Consent Agenda shall be comprised of code change proposals which have neither a successful assembly action nor public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a successful assembly action or public comment (see Section 6.1).

7.5 Procedure: *The Robert's Rules of Order* shall be the formal procedure for the

conduct of the Public Comment Hearing except as these Rules of Procedure may otherwise dictate.

7.5.1 Open Hearing: The Public Comment Hearing is an open hearing. Any interested person may attend and participate in the floor discussion.

7.5.2 Agenda Order: The Secretariat shall publish a Public Comment Agenda for the Public Comment Hearing, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any code change proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.

7.5.2.1 Proponent Approval: A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance at the hearing and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to change the hearing order is not debatable.

7.5.2.2 Revised Agenda Order Approved: A motion to revise the agenda order is subject to a 2/3 vote of those present.

7.5.3 Tabling: Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Public Comment Agenda for the code change proposals under consideration, or
2. To a specific location in the Public Comment Agenda for the code change proposals under consideration.

7.5.3.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

7.5.3.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 7.5.3 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the

process where the tabling occurred.

7.5.4 Presentation of Material at the Public Comment Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 6.4.5 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

7.5.5 Public Comment Consent Agenda: The Public Comment Consent Agenda (see Section 7.4) shall be placed before the assembly with a single motion for Final Action in accordance with the results of the Committee Action Hearing. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion. This action shall not be subject to the Online Governmental Consensus Vote following the Public Comment Hearing (see Section 8.0).

7.5.6 Public Comment Individual Consideration Agenda: Upon completion of the Public Comment Consent Agenda vote, all code change proposals not on the Public Comment Consent Agenda shall be placed before the assembly for individual consideration of each item (see Section 7.4).

7.5.7 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on in accordance with Section 7.5.9.

7.5.8 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

7.5.8.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

7.5.9 Discussion and Voting: Discussion and voting on code change proposals being individually considered shall be in accordance with the following procedures and the voting majorities in Section 7.6:

7.5.9.1 Proponent testimony: The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be

allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

- 7.5.9.2 Points of Order:** Any person participating in the public hearing may challenge a procedural ruling of the Moderator. A majority vote of ICC Members in attendance shall determine the decision.
- 7.5.9.3 Eligible voters:** Voting shall be limited to eligible voters in accordance with Section 9.0.
- 7.5.9.4 Allowable Final Action Motions:** The only allowable motions for Final Action are Approval as Submitted (AS), Approval as Modified by the committee (AM) or by one or more modifications published in the Public Comment Agenda (AMPC), and Disapproval (D).
- 7.5.9.5 Initial Motion:** The code development committee action shall be the initial motion considered.
- 7.5.9.6 Motions for Modifications:** Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Public Comment Agenda may be made (see Section 6.4.4). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.
- 7.5.9.7 Voting:** After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If the motion fails to receive the majority required in Section 7.6, the Moderator shall ask for a new motion.
- 7.5.9.8 Subsequent Motion:** If the initial motion is unsuccessful, a motion for either Approval as Submitted or Approval as Modified by one or more published modifications is in order. A motion for Disapproval is not in order. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If a successful vote is not achieved, Section 7.5.9.9 shall apply.
- 7.5.9.9 Failure to Achieve Majority Vote at the Public Comment Hearing.** In the event that a code change proposal does not receive any of the required majorities in Section 7.6, the

results of the Public Comment Hearing for the code change proposal in question shall be Disapproval. The vote count that will be reported as the Public Comment Hearing result will be the vote count on the main motion in accordance with Section 7.5.9.7.

7.5.9.10 Public Comment Hearing Results: The result and vote count on each code change proposal considered at the Public Comment Hearing shall be announced at the hearing. In the event the electronic voting system is not utilized and a hand/standing count is taken in accordance with Sections 7.5.9.7 and 7.5.9.8, the vote count will not be announced if an individual standing vote count is not taken. The results shall be posted and included in the Online Governmental Consensus Ballot (see Section 8.2).

7.6 Majorities for Final Action: The required voting majority for code change proposals individually considered shall be based on the number of votes cast of eligible voters at the Public Comment Hearing shall be in accordance with the following table:

Committee Action	Desired Final Action		
	AS	AM/AMPC	D
AS	Simple Majority	2/3 Majority	Simple Majority
AM	2/3 Majority	Simple Majority to sustain the Committee Action or; 2/3 Majority on each additional modification and 2/3 Majority on entire code change proposal for AMPC	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

8.0 Online Governmental Consensus Vote

8.1 Public Comment Hearing Results: The results from the Individual Consideration Agenda at the Public Comment Hearing (see Sections 7.5.6 and 7.5.9.10) shall be the basis for the Online Governmental Consensus Vote. The ballot shall include the voting options in accordance with the following table:

Committee Action	Public Comment Hearing result and Voting Majority	Online Governmental Consensus Ballot and Voting Majority	
AS	AS: Simple Majority	AS: Simple Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AS: Simple Majority	D: Simple Majority
AM	AS: 2/3 Majority	AS: 2/3 Majority	D: Simple Majority
	AM: Simple Majority	AM: Simple Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AM: Simple Majority	D: Simple Majority

D	AS: 2/3 Majority	AS: 2/3 Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AS: 2/3 Majority	D: Simple Majority

8.2 Online Governmental Consensus Ballot: The ballot for each code change proposal considered at the Public Comment Hearing will include:

1. The Public Comment Hearing result and vote count.
2. The allowable Online Governmental Consensus Vote actions in accordance with Section 8.1.
3. Where the Public Comment Hearing result is As Submitted (AS) or Disapproval (D), the original code change proposal will be presented.
4. Where the Public Comment Hearing result is As Modified by the committee (AM) or As Modified by one or more Public Comments (AMPC), the original code change and approved modification(s) will be presented.
5. The committee action taken at the Committee Action Hearing.
6. ICC staff identification of correlation issues.
7. For those who voted at the Public Comment Hearing, the ballot will indicate how they voted, unless an electronic vote count is not taken in accordance with Section 7.5.9.10.
8. An optional comment box to provide comments.
9. Access to the Public Comment Agenda which includes: the original code change, the report of the committee action and the submitted public comments.
10. Access to the audio and video of the Committee Action and Public Comment Hearing proceedings.
11. Identification of the ballot period for which the online balloting will be open.

8.3 Voting process: Voting shall be limited to eligible voters in accordance with Section 9.0. Eligible voters are authorized to vote during the Public Comment Hearing and during the Online Governmental Consensus Vote; however, only the last vote cast will be included in the final vote tabulation. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

8.3.1 Participation requirement: A minimum number of participants to conduct the Online Governmental Consensus Vote shall not be required unless the code change proposal(s) were not voted upon utilizing the electronic voting devices at the Public Comment Hearing and the resulting vote was not assigned to each eligible voting member in accordance with Sections 7.5.9.7 and 7.5.9.8 . If this occurs, a minimum number of participants shall be required for those code change proposal(s) based on an assessment of the minimum number of votes cast during the entire Public Comment Hearing and the Online Governmental Consensus Vote shall determine the final on action on the code change proposal(s) in accordance with Section 10.1.

9.0 Eligible Final Action Voters

9.1 Eligible Final Action Voters: Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated once each code development cycle. After initial validation,

changes to the list of GMVRs for the remainder of the code development cycle shall be made in accordance with Section 9.2. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

- 9.2 Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

10.0 Tabulation, certification and posting of results

- 10.1 Tabulation and Validation:** Following the closing of the online ballot period, the votes received will be combined with the vote tally at the Public Comment Hearing to determine the final vote on the code change proposal. If a hand/standing count is utilized per Subsection 7.5.9.7 or 7.5.9.8, those votes of the Public Comment Hearing will not be combined with the online ballot. ICC shall retain a record of the votes cast and the results shall be certified by a validation committee appointed by the ICC Board. The validation committee shall report the results to the ICC Board, either confirming a valid voting process and result or citing irregularities in accordance with Section 10.2.

- 10.2 Voting Irregularities:** Where voting irregularities or other concerns with the Online Governmental Consensus Voting process which are material to the outcome or the disposition of a code change proposal(s) are identified by the validation committee, such irregularities or concerns shall be immediately brought to the attention of the ICC Board. The ICC Board shall take whatever action necessary to ensure a fair and impartial Final Action vote on all code change proposals, including but not limited to:

1. Set aside the results of the Online Governmental Consensus Vote and have the vote taken again.
2. Set aside the results of the Online Governmental Consensus Vote and declare the Final Action on all code change proposals to be in accordance with the results of the Public Comment Hearing.
3. Other actions as determined by the ICC Board.

- 10.3 Failure to Achieve Majority Vote:** In the event a code change proposal does not receive any of the required majorities for Final Action in Section 8.0, Final Action on the code change proposal in question shall be Disapproval.

- 10.4 Final Action Results:** The Final Action on all code change proposals shall be published as soon as practicable after certification of the results. The results shall include the Final Action taken, including the vote tallies from both the Public Comment Hearing and Online Governmental Consensus Vote, as well the required majority in accordance with Section 8.0. ICC shall maintain a

record of individual votes for auditing purposes, however, the record shall not be made public. The exact wording of any resulting text modifications shall be made available to any interested party.

11.0 Code Publication

- 11.1 Next Edition of the Codes:** The Final Action results on code change proposals shall be the basis for the subsequent edition of the respective Code.
- 11.2 Code Correlation:** The Code Correlation Committee is authorized to resolve technical or editorial inconsistencies resulting from actions taken during the code development process by making appropriate changes to the text of the affected code. The process to resolve technical or editorial inconsistencies shall be conducted in accordance with CP#44 Code Correlation Committee.

12.0 Appeals

- 12.1 Right to Appeal:** Any person may appeal an action or inaction in accordance with Council Policy 1 Appeals. Any appeal made regarding voter eligibility, voter fraud, voter misrepresentation or breach of ethical conduct must be supported by credible evidence and must be material to the outcome of the final disposition of a code change proposal(s).

The following actions are not appealable:

1. Variations of the results of the Public Comment Hearing compared to the Final Action result in accordance with Section 10.4.
2. Denied requests to extend the voter balloting period in accordance with Sections 5.7.4 or 8.3.
3. Lack of access to the internet based online collaboration and voting platform to submit a code change proposal, to submit a public comment or to vote.
4. Code Correlation Committee changes made in accordance with Section 11.2.

13.0 Violations

- 13.1 ICC Board Action on Violations:** Violations of the policies and procedures contained in this Council Policy shall be brought to the immediate attention of the ICC Board for response and resolution. Additionally, the ICC Board may take any actions it deems necessary to maintain the integrity of the code development process.

Section revised in January 22, 2019 revision to CP-28:

9.1

WITHDRAWN CODE CHANGE PROPOSALS

The following code change proposal was withdrawn subsequent to the Committee Action Hearings:

FS4-19

Code change proposals withdrawn prior to the end of the committee action hearings are indicated as such in the 2019 Report of Committee Action Hearings.

2019 PUBLIC COMMENT HEARING SCHEDULE

October 23 - 30, 2019
Rio Hotel and Convention Center
Las Vegas, NV

The upcoming 2019 ICC Annual Conference, Group B Public Comment Hearings and Building Safety & Design Expo will be utilizing the same schedule as last year. The Annual Business meeting will be on Monday, October 21st, followed by the Expo and Education Programs. The conference activities will conclude on Tuesday, October 22nd with the Annual Banquet. Global Connections Day will be held on Wednesday. [Click here](#) for the conference schedule.

The Public Comment Hearings will start on Wednesday, October 23rd at **12:00 pm (please note start time)**. The schedule anticipates that the hearings will be completed no later than 7:00 pm on Wednesday, October 30th. This may require adjustments to the daily start/end times based on hearing progress. The hearings will start with the Building related codes, starting with the I-Code Administrative provisions, followed by the Existing building code, Building code and Residential code. The hearings will conclude with the Green (Chapter 1) and Energy codes.

Unless noted by “Start no earlier than 8 am”, the hearing on each code will begin immediately upon completion of the hearing for the prior code. This includes moving the code up or back from the day indicated based on hearing progress. Actual start times for each code cannot be stipulated due to uncertainties in hearing progress. Be sure to review the tentative hearing order in the Public Comment Agenda (to be posted by September 3rd) for code changes that are heard with a code other than that indicated by the code change prefix (see note 4).

Wednesday October 23	Thursday October 24	Friday October 25	Saturday October 26	Sunday October 27	Monday October 28	Tuesday October 29	Wednesday October 30
Start 12 pm ADMIN IEBC IEBC – S End 7 pm	Start 8 am IEBC – S IBC – S End 7 pm	Start 8 am IBC – S IRC – B Start no earlier than 8 am End 7 pm	Start 8 am IRC – B IgCC IECC – R/ IRC – E End 7 pm	Start 10 am IECC – R/ IRC – E End 7 pm	Start 8 am IECC – R IRC – E IECC – C End 7 pm	Start 8 am IECC – C End 7 pm	Start 8 am IECC – C Finish 7 pm

SEE NEXT PAGE FOR SCHEDULE NOTES AND LIST OF CODES

Hearing Schedule Notes:

1. Daily start and end hearing times are subject to change based on progress.
2. Mid-morning, lunch and mid-afternoon breaks to be announced. The hearings are scheduled without a dinner break. A lunch break is not scheduled for Wednesday, October 23rd.
3. Due to the uncertainties in the hearing process, the start time indicated as "Start no earlier than 8 am" is conservatively estimated and is not intended to be a scheduled target.
4. Consult the hearing order for code changes to be heard with a code other than the code under which the code change is designated.

Codes: (be sure to consult the Cross Index of Proposed Code Changes with Public Comments for changes heard with a different code)

ADMIN: Chapter 1 of all the I-Codes except the IECC, IgCC and IRC. Also includes the update of currently referenced standards in all of the 2018 Codes, except the IgCC.

IBC-S: IBC Structural provisions. IBC Chapters 15 – 25.

IEBC: IEBC Non-structural provisions.

IEBC – S: IEBC Structural provisions.

IECC – C: IECC Commercial energy provisions.

IECC – R/IRC – E: IECC Residential energy provisions and IRC Energy provisions in Chapter 11.

IgCC: Administration provisions (Chapter 1) of the IgCC. The technical provisions are based on the provisions of ASHRAE Standard 189.1 *Standard for the Design of High-Performance Green Buildings, Except Low-Rise Residential Buildings*.

IRC – B: IRC Building provisions. Chapters 1 – 10.

TENTATIVE HEARING ORDER FOR EACH INDIVIDUAL CONSIDERATION AGENDA

Note: Code changes to be heard out of numerical order or to be heard with a different code designation are indented. Be sure to review the cross index on page xlii for code change which affect codes other than those under their respective code change number prefix.

2019 GROUP B ICC CODE DEVELOPMENT CYCLE CROSS INDEX OF PROPOSED CODE CHANGES ON THE PUBLIC COMMENT AGENDA FOR INDIVIDUAL CONSIDERATION

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of 2018-2019 Staff Secretaries on page x. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page xlix. For example, IEBC Section 705.3 is proposed for revision in code change S5-19 which is to be heard by the IBC Structural Committee. Chapter 7 of the IEBC is typically the responsibility of the IEBC Code Committee as listed in the table of 2018-2019 Staff Secretaries. It is therefore identified in this cross index. In some instances, there are other subsections that are revised by an identified code change that is not included in the cross index. For example most sections of the IECC – Residential Provisions have revisions to the duplicate section in Chapter 11 of the IRC as noted in each code change proposal. Another example is that all sections of Chapter 1 of every code are designated ADM unless specifically noted in the respective Code listing. This was done to keep the cross index brief enough for easy reference.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 2 of the IBC, locate IBC Chapter 2 in the Cross Index of proposed codes changes, then go proposed code changes in the portion of the monograph for the respective proposed change group. For example, the Cross Index indicates that the definition of STORAGE RACKS is contained within proposed code change S161-19. The IBC-Structural portion of the monograph will contain proposed code change S161-19 for your review. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	PROPOSED CHANGE GROUP (see monograph table of contents for location)
ADM	Administrative
E	International Building Code - Means of Egress
EB	International Existing Building Code

ADM1-19 Part I

IEBC®: [A] 202 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IECC-COMMERCIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Existing Building Code

Revise as follows:

[A] CHANGE OF OCCUPANCY. A change in the use of a building or a portion of a building that results in any of the following:

1. A change of occupancy classification.
2. A change from one group to another group within an occupancy classification.
3. Any change in use within a group for which there is a change in application of the requirements of ~~this code~~, the International Building Code.

Reason: The IBC establishes occupancies, thus the IBC and not “this code” should be referenced for a change in use. The IEBC and IECC do not include occupancy classifications. ADM 9-16 Part 1 was a BCAC revised to this definition for consistency between codes. A floor modification changed “specific occupancy classification” to “change in application of the requirements of this code”. A public comment changed this definition to a list. The question that has been raised is in the IEBC is this should reference IBC or IEBC/IECC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial item.

ADM1-19 Part I

Public Hearing Results

Errata: This proposal includes published errata
Added proponent to the code change.

Committee Action:**As Modified**

Committee Modification: [A] CHANGE OF OCCUPANCY. A change in the use of a building or a portion of a building that results in any of the following:

1. A change of occupancy classification.
2. A change from one group to another group within an occupancy classification.
3. Any change in use within a group for which there is a change in application of ~~the requirements the International Building Code code~~ requirements.

Committee Reason: The committee stated that the proposal as modified cleans up the language and makes the intent of the definition clear to industry. Additionally it was stated that it works better within the code body by capturing all the code provisions. (Vote: 13-0)

Assembly Action:**None**

Staff Analysis: ADM3-19 Part I deletes item 3 from the definition list that is revised in ADM1-19 Part I.

ADM1-19 Part I

Individual Consideration Agenda

Public Comment 1:

IEBC@: [A] 202 (New), [A] 202 (New)

Proponents:

Emma Gonzalez-Laders, RA, LEED AP, New York State Department of State, representing NYS Department of State (emma.gonzalez-laders@dos.ny.gov); Kevin Duerr-Clark, representing NYS Department of State (kevin.duerr-clark@dos.ny.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

[A] CHANGE OF OCCUPANCY. ~~A change in the use of a building or a portion of a building that results in any~~ Any of the following shall be considered a change of occupancy where the code requires a greater degree of safety, accessibility, structural strength, fire protection, means of egress, ventilation, or sanitation than is existing in the current building or structure:

1. A change of occupancy classification.
2. A change from one group to another group within an occupancy classification.
3. ~~Any change in use within a group for which there is a change in application of the code requirements.~~

[A] CHANGE OF USE. A change in the use of a building or a portion of a building, within the same group classification, for which there is a change in application of code requirements.

Commenter's Reason: ADM1-19 should be Approved as Modified by This Public Comment because it does not address all the problems with the definition for a Change of Occupancy. This Public Comment adds a definition for a Change of Use.

Per testimony in opposition to ADM2-19, guidance was needed in the form of one unified proposal that includes all the proposed changes. For the purpose of providing that guidance, this public comment modification also brings into ADM1-19 the changes that were approved in ADM3-19.

Most importantly, this proposal adds a definition for the term Change of Use. The need for clarity in the definition for a Change of Occupancy is evidenced by the number of proposals heard on this topic: ADM1-19, ADM2-19, and ADM 3-19. While ADM1-19 was approved as modified, it does not address the confusion that exists between a "change of use" and a "change of occupancy," which was the chief concern that ADM2-19 sought to address. Sections 1001.2.1 and 1001.2.2 of the Existing Building Code stipulate a distinct set of requirements to be met when a **Change of Use** takes place, and an additional set of requirements for when a **Change of Occupancy** takes place. However, the combined definition for Change of Use and Change of Occupancy does not support that distinction. Providing a separate definition for a Change of Use, which draws from the language of the third bullet in the definition for a Change of Occupancy, would provide clarity and simplify enforcement.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This proposed change is made to provide clarity on an existing code provision and does not increase or decrease the cost of construction.

NOTE: ADM1-19 PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

ADM1-19 Part II

IECC®: 202 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

2018 International Energy Conservation Code

Revise as follows:

CHANGE OF OCCUPANCY. A change in the use of a building or a portion of a building that results in any of the following:

1. A *change of occupancy* classification.
2. A change from one group to another group within an occupancy classification.
3. Any change in use within a group for which there is a change in the application of the requirements of ~~this code~~, the International Building Code.

Reason: The IBC establishes occupancies, thus the IBC and not “this code” should be referenced for a change in use. The IEBC and IECC do not include occupancy classifications. ADM 9-16 Part 1 was a BCAC revised to this definition for consistency between codes. A floor modification changed “specific occupancy classification” to “change in application of the requirements of this code”. A public comment changed this definition to a list. The question that has been raised is in the IEBC is this should reference IBC or IEBC/IECC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial item.

ADM1-19 Part II

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: This change would break the IECC-C. The intent of the IECC-C change of occupancy definition is to address different levels of stringency in the Energy Code. Changing this code to an IBC reference loses the ability to address changes in lighting between an office and a town hall, for example. (Vote: 14-1)

Assembly Action:**None**ADM1-19 Part II

ADM3-19 Part I

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IECC-COMMERCIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Existing Building Code

Revise as follows:

[A] CHANGE OF OCCUPANCY. A change in the use of a building or a portion of a building that results in any of the following Either of the following shall be considered as a change of occupancy where the current IBC requires a greater degree of accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.
1. ~~A change of occupancy classification.~~
2. ~~A change from one group to another group within an occupancy classification.~~
3. ~~Any change in use within a group for which there is a change in application of the requirements of this code.~~

2018 International Building Code

Revise as follows:

[A] CHANGE OF OCCUPANCY. A change in the use of a building or a portion a building which results in one of the following Either of the following shall be considered as a change of occupancy where this code requires a greater degree of accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.
1. ~~A change of occupancy classification.~~
2. ~~A change from one group to another group within an occupancy classification.~~
3. ~~Any change in use within a group for which there is a change in application of the requirements of this code.~~

2018 International Fire Code

Revise as follows:

[A] CHANGE OF OCCUPANCY. A change in the use of a building or a portion of a building that results in any of the following Either of the following shall be considered as a change of occupancy where the International Building Code requires a greater degree of accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.
1. ~~A change of occupancy classification.~~
2. ~~A change from one group to another group within an occupancy classification.~~
3. ~~Any change in use within a group for which there is a change in the application of the requirements of this code.~~

2018 International Residential Code

[RB] CHANGE OF OCCUPANCY. A change in the use of a building or portion of a building that involves a change in the application of the

requirements of this code.

Reason: The proposed change keeps the language add to the 2018 code regarding change of occupancy classification and change of occupancy within the same classification. By adding the "greater degree" it ensures that businesses are not made to "retro-fit" existing tenant spaces that do not present a risk to the welfare or life safety of the tenants. Any renovations would still need to meet the requirements for alterations of the Existing Building Code.

For example, if a nail salon is change to an office space (assuming the same occupant load), why should the office be required to provide additional electrical outlets (section 1007.4) or new lighting (section 1010.1). There was already a tenant in the space with those conditions. Any life safety issues (such as a need for increased exits or sprinklers) are caught by the "greater degree" language.

The purpose of the Existing Building code should be to allow existing buildings to be renovated and occupied while maintaining the level of safety. It should not be to retrofit the tenant space or building to meet today's code.

Cost Impact: The code change proposal will decrease the cost of construction

This should reduce the cost for business owners/tenants by only applying the change of occupancy requirements of the Existing Building Code if the International Building Code requires a greater degree of any one of the six elements listed.

ADM3-19 Part I

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

2018 International Existing Building Code

[A] CHANGE OF OCCUPANCY. Either of the following shall be considered as a change of occupancy where the current *International Building Code* requires a greater degree of safety, accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.

2018 International Building Code

[A] CHANGE OF OCCUPANCY. Either of the following shall be considered as a change of occupancy where this code requires a greater degree of safety, accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.

2018 International Fire Code

[A] CHANGE OF OCCUPANCY. Either of the following shall be considered as a change of occupancy where the *International Building Code* or this Code requires a greater degree of safety, accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.

Committee Reason: The committee stated that the modification addition of "safety" clarifies to a greater extent what the definition includes. The approval of the proposal was based on the revised language clarifying when a change of occupancy occurs based on when the code requirements that are required for the change in the categories listed are greater than the existing conditions. (Vote: 13-0)

Assembly Action:

None

Staff Analysis: ADM3-19 Part I deletes item 3 from the definition list that is revised in ADM1-19 Part I.

Individual Consideration Agenda

Public Comment 1:

IEBC@: [A] 202, [A] 202 (New)

Proponents:

Emma Gonzalez-Laders, RA, LEED AP, New York State Department of State, representing NYS Department of State (emma.gonzalez-laders@dos.ny.gov); Kevin Duerr-Clark, representing NYS Department of State (kevin.duerr-clark@dos.ny.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

[A] CHANGE OF OCCUPANCY. Any of the following shall be considered as a change of occupancy where the current IBC requires a greater degree of safety, accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.
3. A change of use.

[A] CHANGE OF USE. A change in the use of a building or a portion of a building, within the same group classification, for which there is a change in application of code requirements.

Commenter's Reason: ADM3-19 should be Approved as Modified by This Public Comment because it does not address the confusion that exists between a "change of use" and a "change of occupancy."

Sections 1001.2.1 and 1001.2.2 of the Existing Building Code stipulate a distinct set of requirements to be met when a **Change of Use** takes place, and an additional set of requirements for when a **Change of Occupancy** takes place. Removing the third bullet point from the definition, which references a Change of Use, leaves code users without any guidance in the applicability of Section 1001.2.1. Providing a separate definition for a Change of Use, which draws from the language of the third bullet in the current definition for a Change of Occupancy in the Existing Building Code, would provide clarity and simplify enforcement.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is a clarification of existing code provisions.

Public Comment# 1973

ADM3-19 Part II

IECC®: 202

Proposed Change as Submitted

Proponents: Allison Cook, Arlington County, VA, representing VBCOA; Kenney Payne, Moseley Architects, representing AIA Virginia (kpayne@moseleyarchitects.com); Ronald Clements Jr, representing Chesterfield County (clementsro@chesterfield.gov); Bob Orr, representing VBCOA (borr@culpepercounty.gov); Charles Vernon, representing VBCOA (cvernon@arlingtonva.us); Shaina Abney (shaina.abney@fairfaxcounty.gov); David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com); Michael Williams, representing Virginia Building and Code Officials Association (VBCOA) (mike.williams@harrisonburgva.gov); Christina Jackson, representing City of Norfolk / WICED of VA (christina.reynolds@norfolk.gov)

2018 International Energy Conservation Code

Revise as follows:

CHANGE OF OCCUPANCY. ~~A change in the use of a building or a portion of a building that results in any of the following~~ Either of the following shall be considered as a change of occupancy where the International Building Code requires a greater degree of accessibility, structural strength, fire protection, means of egress, ventilation or sanitation than is existing in the current building or structure:

- ~~1. A change of occupancy classification.~~
- ~~2. A change from one group to another group within an occupancy classification.~~
- ~~3. Any change in use within a group for which there is a change in the application of the requirements of this code.~~

1. Any change in the occupancy classification of a building or structure.
2. Any change in the purpose of, or a change in the level of activity within, a building or structure.

Reason: The proposed change keeps the language add to the 2018 code regarding change of occupancy classification and change of occupancy within the same classification. By adding the “greater degree” it ensures that businesses are not made to “retro-fit” existing tenant spaces that do not present a risk to the welfare or life safety of the tenants. Any renovations would still need to meet the requirements for alterations of the Existing Building Code.

For example, if a nail salon is change to an office space (assuming the same occupant load), why should the office be required to provide additional electrical outlets (section 1007.4) or new lighting (section 1010.1). There was already a tenant in the space with those conditions. Any life safety issues (such as a need for increased exits or sprinklers) are caught by the “greater degree” language.

The purpose of the Existing Building code should be to allow existing buildings to be renovated and occupied while maintaining the level of safety. It should not be to retrofit the tenant space or building to meet today’s code.

Cost Impact: The code change proposal will decrease the cost of construction

This should reduce the cost for business owners/tenants by only applying the change of occupancy requirements of the Existing Building Code if the International Building Code requires a greater degree of any one of the six elements listed.

ADM3-19 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal does consider change in energy efficiency requirements to be considered to trigger a change of occupancy.
(Vote: 11-4)

Assembly Action:

None

ADM3-19 Part II

ADM4-19

IBC®: [A] 202; IEBC®: [A] 202

Proposed Change as Submitted

Proponents: David Bonowitz, David Bonowitz, S.E., representing Self (dbonowitz@att.net)

2018 International Building Code

Revise as follows:

[A] REPAIR. The reconstruction, replacement or renewal of any part of an existing building for the purpose of ~~its maintenance or to correct damage~~ correcting damage or restoring the predamage condition.

2018 International Existing Building Code

Revise as follows:

[A] REPAIR. The reconstruction, replacement or renewal of any part of an *existing building* for the purpose of ~~its maintenance or to correct damage~~ correcting damage or restoring the predamage condition.

Reason: This proposal completes an edit from the last cycle to distinguish repair from maintenance. There is already consensus support for this proposal. The 2018 IEBC definition of ROOF REPAIR already has the wording shown here.

In the last cycle, Group A proposal EB26-15 was approved to clarify distinctions in the IEBC between maintenance and repair. Corresponding changes to the definitions of REPAIR and ROOF REPAIR in the IBC and IEBC would be made in Group B with proposal ADM27-16. Here is what happened:

ICC split the proposal, assigning Part I for REPAIR to the Admin Committee and Part II for ROOF REPAIR to the IBC-S Committee.

IBC-S approved its portion, so Part II was done. But because of a snafu in testimony, the Admin Committee became confused and Disapproved Part I. But that was ok, because ...

At the Public Comment Hearing, Part I was easily Approved as Submitted by a show of hands. All good, until ...

OGV voters supported Part I As Submitted, but only with 55% approval. Since the PCH show-of-hands votes could not be added to the OGV votes, the OGV tally did not reach 2/3, so the consensus on Part I could not be approved, leaving the two codes and the two definitions out of coordination. This proposal corrects that snafu.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The change is editorial, for coordination with changes already approved last cycle.

Staff Analysis: There is an errata in the first printing of the 2018 IBC regarding the definition of roof repair. The definition was revised in the run up to the 2018 code. It should read:

ROOF REPAIR. Reconstruction or renewal of any part of an existing roof for the purpose of correcting damage or restoring the predamage condition.

ADM4-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the disapproval was based on the amount of confusion and debate regarding the scope and extent of maintenance and repair and the additional need for clarification about what extent of work is included with the proposed language addition.
(Vote: 13-0)

Assembly Action:

None

ADM4-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

David Bonowitz, representing Self (dbonowitz@att.net)

requests As Submitted

Commenter's Reason: At the hearing, opponents managed to confuse Admin committee members by forgetting work done in the previous cycle (EB26-15), where the substantive issues were already decided. The committee's reason for Disapproval acknowledges this. In the confusion, ADM 4 -- which is nothing but a clean-up that was basically already approved last cycle -- was disapproved.

At the hearing, opponents argued that removing the word "maintenance" from the definition of "repair" would mean that 1) "repair" only applies when there's damage, 2) simple replacement of worn-out items would now have to be called repairs, and 3) the codes would be left without a definition of maintenance.

On point 1, they are correct! That is the point, as was already decided in the last cycle (EB26-15): Maintenance, covered primarily by the IPMC, preserves an acceptable condition, while repair, covered primarily by the IEBC, corrects an UNacceptable condition.

On point 2, the IEBC already provides for that: Sec 105.2 acknowledges that repairs and maintenance are different and explicitly waives any permit requirement for basic repairs that are traditionally thought of as maintenance, including, for mechanical systems, the "replacement of any part that does not alter its approval or make it unsafe."

On point 3, they are obviously INCorrect, as we have an entire code, the IPMC, for maintenance, and it is already referenced from IEBC 302.3.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposal is editorial, completing work that was already done and approved last cycle.

Public Comment# 1982

ADM5-19 Part II

IRC®: [RB] 202, 202 (New), R302.2.1, R302.2.2, R302.2.3, R302.2.4, R302.2.6, R310.1

Proposed Change as Submitted

Proponents: Jeffrey Shapiro, P.E., International Code Consultants, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Residential Code

Revise as follows:

[RB] BUILDING. Any one- or two-family dwelling or townhouse, or portion thereof, including townhouses, used or intended to be used for human habitation, for living, sleeping, cooking or eating purposes, or any combination thereof, or any *accessory structure*. For the definition applicable in Chapter 11, see Section N1101.6.

[RB] TOWNHOUSE. A single-family dwelling unit constructed in a group of building that contains three or more attached townhouse units in which each unit extends from foundation to roof and with a yard or public way on not less than two sides, constructed in a group, and used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.

Add new definition as follows:

TOWNHOUSE UNIT. A single-family dwelling unit in a townhouse that extends from foundation to roof and that has a yard or public way on not less than two sides.

Revise as follows:

R302.2.1 Double walls. Each *townhouse unit* shall be separated from other townhouse units by two 1-hour fire-resistance-rated wall assemblies tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.

R302.2.2 Common walls. Common walls separating ~~townhouses~~ townhouse units shall be assigned a fire-resistance rating in accordance with Item 1 or 2. The common wall shared by two ~~townhouses~~ townhouse units shall be constructed without plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be in accordance with Chapters 34 through 43. Penetrations of the membrane of common walls for electrical outlet boxes shall be in accordance with Section R302.4.

1. Where a fire sprinkler system in accordance with Section P2904 is provided, the common wall shall be not less than a 1-hour fire-resistance-rated wall assembly tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.
2. Where a fire sprinkler system in accordance with Section P2904 is not provided, the common wall shall be not less than a 2-hour fire-resistance-rated wall assembly tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.

R302.2.3 Continuity. The fire-resistance-rated wall or assembly separating ~~townhouses~~ townhouse units shall be continuous from the foundation to the underside of the roof sheathing, deck or slab. The fire-resistance rating shall extend the full length of the wall or assembly, including wall extensions through and separating attached enclosed *accessory structures*.

R302.2.4 Parapets for townhouses. Parapets constructed in accordance with Section R302.2.5 shall be constructed for *townhouses* as an extension of exterior walls or common walls separating townhouse units in accordance with the following:

1. Where roof surfaces adjacent to the wall or walls are at the same elevation, the parapet shall extend not less than 30 inches (762 mm) above the roof surfaces.
2. Where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is not more than 30 inches (762 mm) above the lower roof, the parapet shall extend not less than 30 inches (762 mm) above the lower roof surface.

Exception: A parapet is not required in the preceding two cases where the roof covering complies with a minimum Class C rating as tested in accordance with ASTM E108 or UL 790 and the roof decking or sheathing is of noncombustible materials or fire-retardant-treated wood for a distance of 4 feet (1219 mm) on each side of the wall or walls, or one layer of $\frac{5}{8}$ -inch (15.9 mm) Type X gypsum board is installed directly beneath the roof decking or sheathing, supported by not less than nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members, for a distance of not less than 4 feet (1219 mm) on each side of the wall or walls and any openings or penetrations in the roof are not within 4 feet (1219 mm) of the common walls. Fire-retardant-treated wood shall meet the requirements of Sections R802.1.5 and R803.2.1.2.

3. A parapet is not required where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is more than 30 inches (762 mm) above the lower roof. The common wall construction from the lower roof to the underside of the higher roof deck shall have not less than a 1-hour fire-resistance rating. The wall shall be rated for exposure from both sides.

R302.2.6 Structural independence. Each ~~individual townhouse~~ unit shall be structurally independent.

Exceptions:

1. Foundations supporting *exterior walls* or common walls.
2. Structural roof and wall sheathing from each unit fastened to the common wall framing.
3. Nonstructural wall and roof coverings.
4. Flashing at termination of roof covering over common wall.
5. ~~Townhouses~~ Townhouse units separated by a common wall as provided in Section R302.2.2, Item 1 or 2.

R310.1 Emergency escape and rescue opening required. *Basements, habitable attics* and every sleeping room shall have not less than one operable emergency escape and rescue opening. Where *basements* contain one or more sleeping rooms, an emergency escape and rescue opening shall be required in each sleeping room. Emergency escape and rescue openings shall open directly into a public way, or to a *yard* or court that opens to a public way.

Exceptions:

1. Storm shelters and *basements* used only to house mechanical *equipment* not exceeding a total floor area of 200 square feet (18.58 m²).
2. Where the *dwelling unit* or *townhouse unit* is equipped with an automatic sprinkler system installed in accordance with Section P2904, sleeping rooms in basements shall not be required to have emergency escape and rescue openings provided that the basement has one of the following:
 - 2.1. One means of egress complying with Section R311 and one emergency escape and rescue opening.
 - 2.2. Two means of egress complying with Section R311.

Reason: Correlation with proposed changes to the IRC to clarify use of the term "townhouse" in both codes. In the IBC, there are currently eight uses of the term "townhouse," including three in the preamble. If this change is approved, it will be necessary to editorially revise only one of those current occurrences, the one in Section 2308.1, which will need to be revised as follows to use the term "townhouse unit." *...Detached one- and two-family dwellings and townhouse units not more than three stories above grade plane in height with a separate means of egress and their accessory structures shall comply with the International Residential Code.*

From the IRC proposal reason statement:

The IRC currently contains the terms "townhouse" and "townhouse unit," but only "townhouse" is defined. Here are examples of a few of the locations where the term "townhouse unit" is currently used:

- Preamble "Effective Use of the International Residential Code," which states: The International Residential Code (IRC) was created to serve as a complete, comprehensive code regulating the construction of single-family houses, twofamily houses (duplexes) and buildings consisting of three or more townhouse units."
- Section R302.2 states: Townhouses. Walls separating townhouse units shall be constructed in accordance with Section R302.2.1 or R302.2.2.
- Appendix K uses the term "townhouse units" throughout to describe individual dwelling units within a townhouse. The term "townhouse" is currently used interchangeably as referencing either a single dwelling unit or as a structure with three or more such units, even though the current definition does not accommodate the latter. Literally, the current definition of "townhouse" is a "townhouse unit," yet previously approved code changes that introduced the term "townhouse unit" clearly demonstrate the confusion. I've also experienced this confusion when attempting to teach townhouse requirements to students in code classes.

This proposal will clarify the term "townhouse" as applying to structures that contain three or more dwelling units. This is consistent with how the IRC uses the term "dwelling" to reference a building with one or two dwelling units. Some of the text in the "dwelling" definition has been reproduced in the proposed "townhouse" definition, even though it's arguably poorly written. My objective was consistency, not fixing existing problems with the "dwelling" definition. It should be noted that, while the term "dwelling" currently captures buildings with up to two dwelling units, there is no term that currently defines a structure with more than two dwelling units. The updated definition of "townhouse" fills that hole.

To accommodate the need for a term that applies to individual dwelling units in a townhouse building, the proposal adds a new definition of "townhouse unit." The new definition is correlated with and uses the term "dwelling unit." For reference, the current IRC definitions of "dwelling" and "dwelling unit" are provided below, along with clean versions of the proposed "townhouse" and "townhouse unit" definitions for comparison:

- [RB] DWELLING. Any building that contains one or two dwelling units used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.
- [RB] DWELLING UNIT. A single unit providing complete independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation. For the definition applicable in Chapter 11, see Section N1101.6.
- [RB] TOWNHOUSE. A building that contains three or more attached townhouse units constructed in a group, and used, intended, or designed

to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.

- [RB] TOWNHOUSE UNIT. A single-family dwelling unit in a townhouse that extends from foundation to roof and with a yard or public way on not less than two sides.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Clarifies current code provisions with no intended technical change.

ADM5-19 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Although this is a good start, the committee disapproved this proposal so that the proponent could further develop it. (Vote: 11-0)

Assembly Action:

None

ADM5-19 Part II

Individual Consideration Agenda

Public Comment 1:

IRC@: [RB] 202

Proponents:

Micah Chappell, representing Washington Association of Building Officials (micah.chappell@seattle.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

[RB] TOWNHOUSE. ~~A building that contains three or more attached townhouse units, constructed in a group, and used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.~~

Commenter's Reason: We support the proponent's changes to the townhouse requirements outlined in this proposal. However, the second phrase of the proposed *townhouse* definition can be eliminated because the *townhouse* definition is now a "container" for townhouse units, not the actual units themselves. This information could be relocated to the definition of *townhouse unit*, but it is not necessary. A *townhouse unit* is considered a *dwelling unit* and *dwelling unit* is included in the definition of *dwelling*, which already includes the language in question.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
The public comment change clarifies the relationship between the new definitions created by the proponent. It has no monetary impact.

ADM5-19 Part I

IBC®: [A] 202, 202 (New); IFC®: [A], (New)

Proposed Change as Submitted

Proponents: Jeffrey Shapiro, P.E., representing Self (jeff.shapiro@intlcodeconsultants.com)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. PART III WILL BE HEARD BY THE IECC-RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

[A] TOWNHOUSE. ~~A single-family dwelling unit constructed in a group of building that contains three or more attached townhouse units in which each unit extends from the foundation to roof and with open space on at least two sides, constructed in a group, and used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.~~

Add new definition as follows:

TOWNHOUSE UNIT. A single-family dwelling unit in a townhouse that extends from foundation to roof and with a yard or public way on not less than two sides.

2018 International Fire Code

[A] TOWNHOUSE. ~~A single-family dwelling unit constructed in a group of building that contains three or more attached townhouse units in which each unit extends from the foundation to roof and with open space on not less than two sides, constructed in a group, and used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.~~

Add new definition as follows:

TOWNHOUSE UNIT. A single-family dwelling unit in a townhouse that extends from foundation to roof and with a yard or public way on not less than two sides.

Reason: Correlation with proposed changes to the IRC to clarify use of the term "townhouse" in both codes. In the IBC, there are currently eight uses of the term "townhouse," including three in the preamble. If this change is approved, it will be necessary to editorially revise only one of those current occurrences, the one in Section 2308.1, which will need to be revised as follows to use the term "townhouse unit." *...Detached one- and two-family dwellings and townhouse units not more than three stories above grade plane in height with a separate means of egress and their accessory structures shall comply with the International Residential Code.*

From the IRC proposal reason statement:

The IRC currently contains the terms "townhouse" and "townhouse unit," but only "townhouse" is defined. Here are examples of a few of the locations where the term "townhouse unit" is currently used:

- Preamble "Effective Use of the International Residential Code," which states: The International Residential Code (IRC) was created to serve as a complete, comprehensive code regulating the construction of single-family houses, twofamily houses (duplexes) and buildings consisting of three or more townhouse units."
- Section R302.2 states: Townhouses. Walls separating townhouse units shall be constructed in accordance with Section R302.2.1 or R302.2.2.
- Appendix K uses the term "townhouse units" throughout to describe individual dwelling units within a townhouse. The term "townhouse" is currently used interchangeably as referencing either a single dwelling unit or as a structure with three or more such units, even though the current definition does not accommodate the latter. Literally, the current definition of "townhouse" is a "townhouse unit," yet previously approved code changes that introduced the term "townhouse unit" clearly demonstrate the confusion. I've also experienced this confusion when attempting to teach townhouse requirements to students in code classes.

This proposal will clarify the term "townhouse" as applying to structures that contain three or more dwelling units. This is consistent with how the

IRC uses the term "dwelling" to reference a building with one or two dwelling units. Some of the text in the "dwelling" definition has been reproduced in the proposed "townhouse" definition, even though it's arguably poorly written. My objective was consistency, not fixing existing problems with the "dwelling" definition. It should be noted that, while the term "dwelling" currently captures buildings with up to two dwelling units, there is no term that currently defines a structure with more than two dwelling units. The updated definition of "townhouse" fills that hole.

To accommodate the need for a term that applies to individual dwelling units in a townhouse building, the proposal adds a new definition of "townhouse unit." The new definition is correlated with and uses the term "dwelling unit." For reference, the current IRC definitions of "dwelling" and "dwelling unit" are provided below, along with clean versions of the proposed "townhouse" and "townhouse unit" definitions for comparison:

- [RB] DWELLING. Any building that contains one or two dwelling units used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.
- [RB] DWELLING UNIT. A single unit providing complete independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation. For the definition applicable in Chapter 11, see Section N1101.6.
- [RB] TOWNHOUSE. A building that contains three or more attached townhouse units constructed in a group, and used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.
- [RB] TOWNHOUSE UNIT. A single-family dwelling unit in a townhouse that extends from foundation to roof and with a yard or public way on not less than two sides.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Clarifies current code provisions with no intended technical change.

ADM5-19 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the disapproval was based on the need for more work to improve the language and the issue of the comparison to the existing definition of dwelling unit to the newly proposed definition of townhouse unit. (Vote: 13-0)

ADM5-19 Part III

IECC: R202 (IRC N1101.6), TABLE R405.5.2(1) [IRC N1105.5.2(1)]

Proposed Change as Submitted

Proponents: Jeffrey Shapiro, P.E., International Code Consultants, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Energy Conservation Code

SECTION R202 (IRC N1101.6) GENERAL DEFINITIONS

Add new definition as follows:

TOWNHOUSE UNIT. A single-family dwelling unit in a townhouse that extends from foundation to roof and with a yard or public way on not less than two sides.

Revise as follows:

TABLE R405.5.2(1) [IRC N1105.5.2(1)]
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

Portions of table not shown remain unchanged.

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
--------------------	---------------------------	-----------------

h. For residences with conditioned basements, R-2 and R-4 residences, and for ~~townhouses~~ townhouse units, the following formula shall be used to determine glazing area:

$$AF = A_s \times FA \times F$$

where:

AF = Total glazing area.

A_s = Standard reference design total glazing area.

FA = (Above-grade thermal boundary gross wall area)/(above-grade boundary wall area + 0.5 × below-grade boundary wall area).

F = (above-grade thermal boundary wall area)/(above-grade thermal boundary wall area + common wall area) or 0.56, whichever is greater.

and where:

Thermal boundary wall is any wall that separates conditioned space from unconditioned space or ambient conditions.

Above-grade thermal boundary wall is any thermal boundary wall component not in contact with soil.

Below-grade boundary wall is any thermal boundary wall in soil contact.

Common wall area is the area of walls shared with an adjoining dwelling unit.

L and CFA are in the same units.

Reason: Correlation with proposed changes to the IRC to clarify use of the term "townhouse" in both codes. In the IBC, there are currently eight uses of the term "townhouse," including three in the preamble. If this change is approved, it will be necessary to editorially revise only one of those current occurrences, the one in Section 2308.1, which will need to be revised as follows to use the term "townhouse unit." *...Detached one- and two-family dwellings and townhouse units not more than three stories above grade plane in height with a separate means of egress and their accessory structures shall comply with the International Residential Code.*

From the IRC proposal reason statement:

The IRC currently contains the terms "townhouse" and "townhouse unit," but only "townhouse" is defined. Here are examples of a few of the locations where the term "townhouse unit" is currently used:

- Preamble "Effective Use of the International Residential Code," which states: The International Residential Code (IRC) was created to serve as a complete, comprehensive code regulating the construction of single-family houses, twofamily houses (duplexes) and buildings consisting of three or more townhouse units."
- Section R302.2 states: Townhouses. Walls separating townhouse units shall be constructed in accordance with Section R302.2.1 or R302.2.2.
- Appendix K uses the term "townhouse units" throughout to describe individual dwelling units within a townhouse. The term "townhouse" is currently used interchangeably as referencing either a single dwelling unit or as a structure with three or more such units, even though the current definition does not accommodate the latter. Literally, the current definition of "townhouse" is a "townhouse unit," yet previously approved code changes that introduced the term "townhouse unit" clearly demonstrate the confusion. I've also experienced this confusion when attempting to teach townhouse requirements to students in code classes.

This proposal will clarify the term "townhouse" as applying to structures that contain three or more dwelling units. This is consistent with how the IRC uses the term "dwelling" to reference a building with one or two dwelling units. Some of the text in the "dwelling" definition has been reproduced in the proposed "townhouse" definition, even though it's arguably poorly written. My objective was consistency, not fixing existing problems with the "dwelling" definition. It should be noted that, while the term "dwelling" currently captures buildings with up to two dwelling units, there is no term that currently defines a structure with more than two dwelling units. The updated definition of "townhouse" fills that hole.

To accommodate the need for a term that applies to individual dwelling units in a townhouse building, the proposal adds a new definition of "townhouse unit." The new definition is correlated with and uses the term "dwelling unit." For reference, the current IRC definitions of "dwelling" and "dwelling unit" are provided below, along with clean versions of the proposed "townhouse" and "townhouse unit" definitions for comparison:

- *[RB] DWELLING. Any building that contains one or two dwelling units used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.*
- *[RB] DWELLING UNIT. A single unit providing complete independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation. For the definition applicable in Chapter 11, see Section N1101.6.*
- *[RB] TOWNHOUSE. A building that contains three or more attached townhouse units constructed in a group, and used, intended, or designed to be built, used, rented, leased, let or hired out to be occupied, or that are occupied for living purposes.*
- *[RB] TOWNHOUSE UNIT. A single-family dwelling unit in a townhouse that extends from foundation to roof and with a yard or public way on not less than two sides.*

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Clarifies current code provisions with no intended technical change.

ADM5-19 Part III

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee concluded the definition is in the IRC and should remain there. The proposed definition appears to use the defined term within the definition. (Vote: 11-0)

Assembly Action:

None

ADM5-19 Part III

Proposed Change as Submitted

Proponents: David Bonowitz, representing Self (dbonowitz@att.net)

2018 International Existing Building Code

Revise as follows:

[A] 101.2 Scope. The provisions of the this code shall apply to the *repair, alteration, change of occupancy, addition to and relocation of existing buildings*.

Exception: ~~Detached~~ Subject to the approval of the code official, ~~detached~~ one- and two-family *dwelling*s and multiple single-family *dwelling*s (*townhouses*) not more than three *stories above grade plane* in height with a separate *means of egress*, and their accessory structures not more than three *stories above grade plane* in height, shall comply with this code or the International Residential Code.

Reason: This proposal edits a new exception that was just added in the last cycle (ADM 31-16). It preserves the intent of that proposal, but it explicitly gives discretion to the code official, thus ensuring consistency within a jurisdiction.

ADM 31-16 added the exception to Section 101.2. The intent was given in the Admin committee's reason statement: "Not mixing codes on the same building will make compliance easier." This is true. By the same token, not mixing codes within a jurisdiction with many similar projects will also make compliance easier and avoid a host of problems. Unfortunately, by giving full discretion to the permit applicant, the new exception creates exactly the problems it meant to solve.

Both the IEBC and the IRC contain provisions for existing dwellings and townhouses. For years, neither code has been completely clear about which code applies in a jurisdiction that adopts both. Rather, that decision has been left to the jurisdiction and its code official. The new exception added to the 2018 IEBC overturned that local practice and removed that local discretion. This proposal restores it.

This proposal will allow jurisdictions that have been using the IEBC for existing dwellings and townhouses to continue doing so. This benefits all stakeholders. First, it supports the local code official and policy-makers who have been using the IEBC without incident. Second, it ensures owners and developers that similar projects will be handled consistently, and consistent with past local precedents. Third, it helps FEMA grant applicants (jurisdictions), and FEMA assistance applicants (owners) comply with FEMA policy, which requires consistent use of the IEBC's upgrade triggers (discussed below). Fourth, it helps insurers and their customers understand and anticipate the costs and benefits of upgrade coverage. The new exception to IEBC Section 101.2 re-opened all those questions, but they can all be answered with this proposal, by allowing jurisdictions to maintain their own precedents and practices.

The proposal is consistent with other IEBC provisions that allow code official discretion. The added words are identical to those used in the exception to IEBC Section 301.3.

Is there a significant difference between the IEBC and the IRC's provisions for existing buildings? Yes, especially with regard to townhouses. The IEBC has 18 provisions that jurisdictions rely on to enhance earthquake, wind, and snow safety in existing townhouses, and ten for existing dwellings. All of these would be lost if a permit applicant is allowed to skip them by invoking the exception to Section 101.2. That said, this does not mean the IEBC treats dwellings just like commercial buildings; on the contrary, the IEBC exempts certain existing dwellings and townhouses from ten different triggers.

Whether one likes these IEBC provisions or not, one must acknowledge that any jurisdiction that has been applying them without incident should be allowed to continue that practice, and that it cannot help consistency to allow such different regulations to apply to similar projects. In many cases, the local code official will want to continue using the IEBC; this proposal allows that. In other cases, the local code official might recognize that the IRC approach is acceptable; this proposal allows that too. But the only way to ensure consistent policy is to have that decision rest with the code official.

Finally, even those who prefer the IRC approach must acknowledge that the new exception will lead to unclear application to individual projects as well. The exception allows ANY existing dwelling or townhouse – even one without conventional framing, or one that violates the conventional framing rules, or is highly deficient, or has irregularities that would make it ineligible for the IRC, or is located in a region that would make it ineligible for the IRC, or is highly vulnerable to wind or earthquake – to use the IRC and avoid addressing those conditions. IRC Section R102.7.1 would be the only applicable provision, and it sets a VERY low bar; it prohibits only projects that would *make* the existing building unsafe. If the existing building is already highly deficient, the IRC sets no limits on alterations, additions, or repairs. By giving discretion to the local code official who best knows the local building stock, the proposal resolves these issues as well.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The proposal merely gives discretion to the jurisdiction and code official to maintain precedents and past practices.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the code official needs consistency in the enforcement of the code and it should not depend on the applicant to determine the requirements. Additionally it was stated that the existing code already addresses this in regards to the responsibility of the code official to determine the requirements. (Vote: 13-0)

Assembly Action:

None

ADM7-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

David Bonowitz, representing Self (dbonowitz@att.net)

requests As Submitted

Commenter's Reason: In disapproving ADM7-19, the Admin Committee's reason states, "[T]he code official needs consistency in the enforcement of the code and it should not depend on the applicant to determine the requirements."

With respect, this reasoning, as well as the testimony of opponents at the CAH, appears to completely misunderstand the issue in question. ADM7 would modify an existing exception to IEBC Section 101.2. This exception, added only in 2018 with no review by any technical committee (IRC, IEBC, or IBC-S), now lets the permit applicant for any addition, alteration, or repair to any dwelling or townhouse -- no matter how deficient the existing structure, and no matter how extensive the proposed project -- escape the IEBC and use the far more lenient (and mostly nonexistent) provisions of the IRC instead.

In other words, this exception in the CURRENT code does exactly what the Admin committee's reason says NOT to do: 1. It explicitly allows the permit applicant to pick the requirements, and 2. It guarantees that enforcement of existing building provisions within a jurisdiction will be INconsistent.

The current code removes all discretion from the local code official about whether and how to apply the IEBC and IRC to existing dwellings. This is discretion that jurisdictions across the country have been applying and should be allowed to continue applying, based on local precedent and based on expert knowledge of their existing housing stocks. Instead, the 2018 IEBC says the permit applicant now gets to pick the code, sidestepping the IEBC's prudent provisions for deficient structures in areas subject to severe environmental loads.

In response to this fact about the current code, opponents of ADM7 stated in their testimony that to require code official approval for this option forces the code official to make decisions he or she either cannot or does not want to make. What an insult to ICC members! Have the opponents to ADM7 not read IEBC Section 104.11, or IRC Section R104.11? Those sections explicitly vest in the code official the authority -- and the responsibility -- to review alternatives, confirm their adequacy and equivalence by a number of measures, and state their findings in writing. How can anyone argue that this is not within the code official's authority, or worse, that code officials are not up to the task? Here's something else the Admin committee said: "The existing code already addresses this in regards to the responsibility of the code official to determine the requirements." Well, that used to be true, but not anymore. Prior to the 2018 IEBC, an applicant proposing to use the IRC as an alternative to the IEBC would have been subject to this code official discretion per IEBC Sec 104.11. But now, that discretion is given to the applicant alone -- precisely what the Admin committee says it does not want. ADM7-19, as submitted, would rectify that. Quickly, effectively, with ample precedent, and with respect for local practices and expertise.

Opponents also argued that if jurisdictions are concerned about the IRC's lax existing building provisions, they can adopt IRC Appendix J. Who are they kidding? Appendix J is grossly out of date and so rarely used that hardly anyone has noticed that it now actually defers to the IEBC as a better alternative. If every jurisdiction that adopts Appendix J votes *against* ADM7, and every jurisdiction that doesn't votes *for* ADM7, ADM7 will be approved in a landslide.

Opponents also argued that if ADM7 were approved, code officials would need to make discretionary decisions for every minor project, such as a proposal to add a deck to a house. This is absurd. First, minor projects are not treated differently by the two codes, so the question would never even come up. Second, every building department I know has a set of bulletins that state common interpretations in writing, in advance, for

everyone's benefit. If ADM7 were approved, that is exactly the approach every building official would take. They would merely write down, once, those conditions -- adding a deck, say, and lots of others -- for which the IRC would be allowed, and those -- say, putting a second story on a house with an unbraced cripple wall in seismic design category D -- where the IEBC would be wisely applied instead.

Finally, opponents suggested that if jurisdictions don't like the exception to IEBC Section 101.2, they don't have to adopt it. First, that's just disingenuous given the proliferation of amendment-free adoption policies. But more important, is that really the way the supporters of the current exception want to go? They would rather have the whole thing not adopted than add a few words to rely on the wisdom of the local code official? Well, if that's what they want ..., but ADM7-19 seems like a better idea.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposal merely maintains existing practices.

Public Comment# 2151

ADM10-19 Part II

IRC®: R101.3

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); David Collins (sehpcac@iccsafe.org)

2018 International Residential Code

Revise as follows:

R101.3 Intent. The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and ~~safety to life for~~ providing a reasonable level of life safety and property ~~protection from fire and other hazards attributed the hazards of fire, explosion or dangerous conditions attributed~~ to the built environment, and to provide safety to fire fighters and emergency responders during emergency operations.

Reason: The purpose of this proposal is for consistency in language for the sections on “Intent” or “Purpose” in the family of codes. The title of the section should be revised to be consistent with the text, which is “purpose.”

The IFC was used as the guidance for the phrase to use. Several of the codes included the term “property protection”, but not all. It is the intent of all the codes to provide “a reasonable level of life safety and property protection”. Thus, this phrase is proposed to be used consistently across codes.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals.”

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change that provides consistency between I-codes.

Public Hearing Results

Errata: This proposal includes published errata
Added proponent to the code change.

Committee Action:

Disapproved

Committee Reason: The committee likes the language as approved in ADM9-19 Part IV. The language in this proposal, "or dangers attributed to the built environment," seems to raise the threshold of when the code gets enforced. The IRC does not explain how to design a building for explosions. The laundry list issue is a real one, even in the intent section. It is important to address the concerns raised by this proposal, but it may be better to bring this back in the public comment period using the language "causes of explosions" and "other" dangerous conditions. (Vote: 10-1)

Assembly Action:

None

ADM10-19 Part II

Individual Consideration Agenda

Public Comment 1:

IRC@: R101.3

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

R101.3 Intent. The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation, ~~and for~~ providing a reasonable level of life safety and property protection from the hazards of fire, ~~explosion~~ or dangerous conditions attributed to the built environment, and to provide safety to fire fighters and emergency responders during emergency operations.

Commenter's Reason: Reason: The IRC committee said they preferred ADM9 Part 4, however, the intent of the proposal was for the ADM9 and ADM10 was to work together for all the codes. The floor modification to ADM9 Part 4 was to remove 'explosion'. This public comment is to also remove "explosion" for consistency. Below is what Section R101.3 would look like when ADM9 Part 4 and ADM10 Part 2 were combined. This would be coordinated with the twelve ICC codes revised by ADM10 Part 1 (IBC, IFC, IEBC, IPC, IMC, IPSDC, IFGC, ISPSC, IPMC, IZC, IWUICC and ICCPC)

R101.3. Purpose. The purpose of this code is to establish minimum requirements to provide a reasonable level of safety, health and general welfare through affordability, structural strength, means of egress, stability, sanitation, light and ventilation, energy conservation and for providing a reasonable level of life safety and property protection from the hazards of fire or dangerous conditions, and to provide a reasonable level of safety to fire fighters and emergency responders during emergency operations.

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This is an editorial change that provides consistency between I-codes.

Public Comment# 1203

Public Comment 2:

IRC@: R101.3

Proponents:

Randy Shackelford, representing Simpson Strong-Tie Co. (rshackelford@strongtie.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

R101.3 Intent. The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and for providing a reasonable level of life safety and property protection from ~~the hazards of fire, explosion or dangerous conditions~~ or other hazards attributed to the built environment, and to provide safety to fire fighters and emergency responders during emergency operations.

Commenter's Reason: I support the BCAC's efforts to make the Administrative provisions of all the codes be similar. But they do not have to all be exactly the same since they do not all apply to the same buildings or address the same hazards.

There were objections raised during the Committee Action hearings regarding the addition of the word "explosion" so that is deleted. There was also concern raised that only listing three hazards resulted in a "laundry list" that left out other hazards that are meant to be addressed by the IRC. For example, a good bit of the framing requirements of the IRC are designed to resist the natural hazards of high wind or earthquakes, yet these are left out of the list. So keeping the words "other hazards attributed to the built environment" will include all these other hazards that the IRC is written to resist. The net result of this is that the "hazards" wording is rearranged to more closely resemble the existing 2018 IRC language, with the addition of "dangerous conditions".

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. There should be no cost impact. Just editorial rewrite of the original proposal. This does not contain any technical requirements, it is in the Administrative Chapter.

THIS IS A 4 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. PART III WILL BE HEARD BY THE IECC-COMMERCIAL CODE COMMITTEE. PART IV WILL BE HEARD BY THE IECC-RESIDENTIAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

[A] 101.3 Intent. The purpose of this code is to establish the minimum requirements to provide a reasonable level of safety, public health and general welfare through structural strength, *means of egress* facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life for providing a reasonable level of life safety and property protection from the hazards of fire, explosion and other hazards or dangerous conditions, and to provide a reasonable level of safety to fire fighters and emergency responders during emergency operations.

2018 International Existing Building Code

Revise as follows:

[A] 101.3 Intent. The intent of this code is to provide flexibility to permit the use of alternative approaches to achieve compliance with minimum requirements to safeguard the public health, safety ~~and~~, property protection and welfare insofar as they are affected by the *repair, alteration, change of occupancy, addition and relocation of existing buildings*.

2018 International Swimming Pool and Spa Code

Revise as follows:

[A] 101.3 Intent. The purpose of this code is to establish minimum standards to provide a reasonable level of safety, ~~and protection of health~~, property protection and public welfare by regulating and controlling the design, construction, installation, quality of materials, location and maintenance or use of pools and spas.

2018 International Property Maintenance Code

Revise as follows:

[A] 101.3 Intent. This code shall be construed to secure its expressed intent, which is to ensure public health, safety, property protection and welfare insofar as they are affected by the continued *occupancy* and maintenance of structures and *premises*. Existing structures and *premises* that do not comply with these provisions shall be altered or repaired to provide a minimum level of health and safety as required herein.

2018 International Zoning Code

Revise as follows:

[A] 101.2 Intent. The purpose of this code is to safeguard the health, property protection and public welfare by controlling the design, location, use or occupancy of all buildings and structures through the regulated and orderly development of land and land uses within this jurisdiction.

Reason: The purpose of this proposal is for consistency in language for the sections on "Intent" or "Purpose" in the family of codes. The title of the section should be revised to be consistent with the text, which is "purpose."
The IFC was used as the guidance for the phrase to use. Several of the codes included the term "property protection", but not all. It is the intent of all the codes to provide "a reasonable level of life safety and property protection". Thus, this phrase is proposed to be used consistently across codes.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals.”

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

IMC@: [A] 102.3 (New), ACCA Chapter 15 (New)

Proposed Change as Submitted

Proponents: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Mechanical Code

Revise as follows:

[A] 102.3 Maintenance. Mechanical systems, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe and sanitary condition. Devices or safeguards that are required by this code shall be maintained in compliance with the edition of the code under which they were installed. The owner or the owner's authorized agent shall be responsible for maintenance of mechanical systems. To determine compliance with this provision, the code official shall have the authority to require a mechanical system to be reinspected.

The inspection for maintenance of HVAC systems not within the scope of ACCA 4 QM shall be performed in accordance with ASHRAE/ACCA/ANSI Standard 180.

The inspection for maintenance of HVAC systems in one and two family dwellings and multi family dwellings of three stories or fewer above grade shall be performed in accordance with ACCA 4 QM.

Add new standard(s) as follows:

ACCA

Air Conditioning Contractors of America
2800 Shirlington Road, Suite 300
Arlington VA 22206

ANSI/ACCA 4 QM – 2013: Maintenance of Residential HVAC Systems

Reason: The proposal is to (1) clarify that the current requirement showing Standard 180 specifically covers inspection for maintenance of commercial HVAC systems, and (2) add a reference to ACCA 4 QM which covers inspection for maintenance of residential HVAC systems for one- and two-family dwellings of three stories or less. ACCA 4 QM is a consensus-based ANSI standard. A proposal to add ACCA 4 QM to Chapter 15, Referenced Standards, has also been submitted.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
No cost impacts since this is a clarification of maintenance requirements.

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/ACCA 4 QM – 2013: Maintenance of Residential HVAC Systems, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

ADM12-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the reason for disapproval was that the scope of the IMC does not include IRC dwellings and that the proposed referenced standard addition was unnecessary. (Vote: 13-0)

Assembly Action:

None

ADM12-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

David Bixby, representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

requests As Submitted

Commenter's Reason: ACCA requests approval of the proposal as submitted. The Committee's reason for rejection was that "the scope of the IMC does not include IRC dwellings" and that the proposed addition of ACCA 4 QM was "unnecessary." The existing requirement requires inspection for maintenance to be performed in accordance with ASHRAE/ACCA/ANSI Standard 180. This standard does not cover inspection for maintenance in one and two family dwellings and multi-family dwellings of three stories or fewer above grade. ACCA 4 QM covers such dwellings. The proposal is merely clarifying the current requirement and adding a reference to ACCA 4 QM for dwellings not covered by Standard 180. ACCA 4 QM is a consensus-based ANSI standard. If the Committee approves ACCA's proposal then a reference to ACCA 4 QM needs to be added to Chapter 15, Referenced Standards.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. There will be no cost impacts since this is a clarification of maintenance requirements.

Public Comment# 1981

ADM16-19 Part II

IRC®: SECTION R103, R103.1, R103.2, R103.3

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, representing FCAC (fcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); David Collins (sehpcac@iccsafe.org)

2018 International Residential Code

Revise as follows:

SECTION R103 **DEPARTMENT OF BUILDING SAFETY CODE COMPLIANCE AGENCY**

R103.1 Creation of enforcement agency. The ~~department of building safety~~ [INSERT NAME OF DEPARTMENT] is hereby created and the official in charge thereof shall be known as the building ~~official~~ official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

R103.2 Appointment. The building official shall be appointed by the chief appointing authority of the jurisdiction.

R103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the building official shall have the authority to appoint a deputy building official, ~~the other~~ related technical officers, inspectors, ~~plan examiners~~ and other employees. Such employees shall have powers as delegated by the building official.

Reason: There are many different names for the title of this section, but all include provisions for the creation of the code compliance agency. The department's responsibilities are more than just 'enforcement' of the code. The fill in the blank for the name allows for the agency to develop a name appropriate to their jurisdiction and responsibilities.

In some of the codes there will be a move from this section to *General Authority and responsibilities* section so that requirements for liability and legal defense will be in a consistent location.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

SECTION 103

CODE COMPLIANCE AGENCY

103.1 Creation of agency. The [INSERT NAME OF DEPARTMENT] is hereby created and the official in charge thereof shall be known as the *code official*. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

103.2 Appointment. The *code official* shall be appointed by the chief appointing authority of the jurisdiction.

103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint a deputy *code official*, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the *code official*.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech->

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change with no change to construction requirements.

ADM16-19 Part II

Public Hearing Results

Errata: This proposal includes published errata
Added proponent to the code change.

Committee Action:

Disapproved

Committee Reason: The committee likes the existing language, and doesn't like removing "plans examiner." We're taking a term out of the laundry list that seemed to work. The term "chief appointing authority" is confusing. We don't know who that is. If it is generic the legal authority of the state can resolve that issue. There could be a conflict with state and local laws outlying code enforcement and that could be confusing. Some jurisdictions already give this authority to other departments. (Vote: 9-2)

Assembly Action:

None

ADM16-19 Part II

Individual Consideration Agenda

Public Comment 1:

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Submitted

Commenter's Reason: We are a family of codes. The building department will address residential and commercial, so the administration of these codes should be consistent. This terminology is used in many of the other codes, so it is not clear to us how to revise this proposal to address the items raised by the IRC committee. Addressing the committee comments:

- The phrase "chief appointing authority" proposed to be added in R103.2 is currently used in the IBC, IFC, IPC, IMC, IFGC, IEBC, ISPSC, IPMC, IPSDC, IWUIC (10 of 14 codes).
- The "plans examiner" is an employee, so it does not need to be in a laundry list. It was inconsistently listed in the other I-Codes, so ADM16 has proposed to delete it from the IBC, IRC, IEBC and ISPSC for consistency.
- Building departments have many different names. The intent of this section is to allow for a jurisdiction to insert their chosen name. This will

reduce conflicts and confusion “for state and local laws outlining code enforcement.”

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

2018 International Building Code

Revise as follows:

SECTION 103 DEPARTMENT OF BUILDING SAFETY CODE COMPLIANCE AGENCY

[A] 103.1 Creation of enforcement agency. The Department of Building Safety ~~–[INSERT NAME OF DEPARTMENT]–~~ is hereby created and the official in charge thereof shall be known as the building official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] 103.2 Appointment. The *building official* shall be appointed by the chief appointing authority of the jurisdiction.

[A] 103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the building official shall have the authority to appoint a deputy building official, ~~the other~~ related technical officers, inspectors, ~~plan examiners~~ and other employees. Such employees shall have powers as delegated by the building official. ~~For the maintenance of existing properties, see the International Property Maintenance Code.~~

2018 International Fire Code

Revise as follows:

SECTION 103 DEPARTMENT OF FIRE PREVENTION CODE COMPLIANCE AGENCY

[A] 103.1 General. Creation of agency. The department of fire prevention is established within the jurisdiction under the direction of the *fire code official*. ~~–[INSERT NAME OF DEPARTMENT]–~~ is hereby created and the official in charge thereof shall be known as the fire code official. The function of the department agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] 103.2 Appointment. The *fire code official* shall be appointed by the chief appointing authority of the jurisdiction. ~~and the fire code official shall not be removed from office except for cause and after full opportunity to be heard on specific and relevant charges by and before the appointing authority.~~

[A] 103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the fire code official shall have the authority to appoint a deputy fire code official, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the fire code official.

[A] ~~103.4~~ 104.7 Liability. The *fire code official*, member of the board of appeals, officer or employee charged with the enforcement of this code, while acting for the jurisdiction, in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

[A] ~~103.4.1~~ 104.7.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representatives of the

jurisdiction until the final termination of the proceedings. The *fire code official* or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code; and any officer of the department of fire prevention, acting in good faith and without malice, shall be free from liability for acts performed under any of its provisions or by reason of any act or omission in the performance of official duties in connection therewith.

2018 International Plumbing Code

Revise as follows:

SECTION 103 ~~DEPARTMENT OF PLUMBING INSPECTION CODE COMPLIANCE AGENCY~~

103.1 General. Creation of agency. The ~~department of plumbing inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the ~~executive~~ official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

103.2 Appointment. The code official shall be appointed by the chief appointing authority of the jurisdiction.

103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy code official, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the code official.

~~103.4~~ **104.8 Liability.** The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

~~103.4.1~~ **104.8.1 Legal defense.** Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

2018 International Mechanical Code

Revise as follows:

SECTION 103 ~~DEPARTMENT OF MECHANICAL INSPECTION CODE COMPLIANCE AGENCY~~

[A] 103.1 General. Creation of agency. The ~~department of mechanical inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the ~~executive~~ official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] 103.2 Appointment. The code official shall be appointed by the chief appointing authority of the jurisdiction.

[A] 103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy code official, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the code official.

[A] ~~103.4~~ 104.8 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

[A] ~~103.4.1~~ 104.8.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representatives of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code.

2018 International Fuel Gas Code

Revise as follows:

SECTION 103 (IFGC) ~~DEPARTMENT OF INSPECTION CODE COMPLIANCE AGENCY~~

[A] 103.1 General. Creation of agency. The ~~Department of Inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the ~~executive~~

official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] 103.2 Appointment. The code official shall be appointed by the chief appointing authority of the jurisdiction.

[A] 103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy code official, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the code official.

[A] ~~103.4~~ 104.8 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

[A] ~~103.4.1~~ 104.8.1 Legal defense. Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representatives of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code.

2018 International Existing Building Code

Revise as follows:

SECTION 103 **DEPARTMENT OF BUILDING SAFETY CODE COMPLIANCE AGENCY**

[A] 103.1 Creation of enforcement agency. The Department of Building Safety ~~Department of Building Safety~~ [INSERT NAME OF DEPARTMENT] is hereby created ~~and the official in charge thereof shall be known as the code official.~~ The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] 103.2 Appointment. The *code official* shall be appointed by the chief appointing authority of the jurisdiction.

[A] 103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy code official, ~~the other~~ related technical officers, inspectors ~~, plan examiners,~~ and other employees. Such employees shall have powers as delegated by the code official.

2018 International Swimming Pool and Spa Code

Revise as follows:

SECTION 103 **DEPARTMENT OF BUILDING SAFETY CODE COMPLIANCE AGENCY**

[A] 103.1 Creation of enforcement agency. The ~~department of building safety~~ [INSERT NAME OF DEPARTMENT] is hereby created and the official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] 103.2 Appointment. The code official shall be appointed by the chief appointing authority of the jurisdiction.

[A] 103.3 Deputies. In accordance with the prescribed procedures of ~~the this~~ jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy code official, ~~the other~~ related technical officers, inspectors ~~, plan examiners~~ and other employees. Such employees shall have powers as delegated by the code official.

[A] ~~103.4~~ 104.8 Liability. The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally and is hereby relieved from personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

[A] ~~103.4.1~~ 104.8.1 Legal defenses. Any suit or criminal complaint instituted against an officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by legal representatives of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for cost in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

2018 International Property Maintenance Code

Revise as follows:

SECTION 103
DEPARTMENT OF PROPERTY MAINTENANCE INSPECTION CODE COMPLIANCE AGENCY

[A] **103.1 General: Creation of agency.** The department of property maintenance inspection ~~[INSERT NAME OF DEPARTMENT]~~ is hereby created and the executive official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] **103.2 Appointment.** The code official shall be appointed by the chief appointing authority of the jurisdiction.

[A] **103.3 Deputies.** In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy ~~(s): code official, other related technical officers, inspectors and other employees.~~ Such employees shall have powers as delegated by the code official.

[A] ~~103.4~~ **104.7 Liability.** The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction, in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of an act or by reason of an act or omission in the discharge of official duties.

[A] ~~103.4.1~~ **104.7.1 Legal defense.** Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in an action, suit or proceeding that is instituted in pursuance of the provisions of this code.

2018 International Private Sewage Disposal Code

Revise as follows:

SECTION 103
DEPARTMENT OF PRIVATE SEWAGE DISPOSAL INSPECTION CODE COMPLIANCE AGENCY

[A] **103.1 General: Creation of agency.** The Department of Private Sewage Disposal Inspection ~~[INSERT NAME OF DEPARTMENT]~~ is hereby created and the executive official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] **103.2 Appointment.** The code official shall be appointed by the chief appointing authority of the jurisdiction.

[A] **103.3 Deputies.** In accordance with the prescribed procedures of ~~the this~~ jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy code official, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the code official.

[A] ~~103.4~~ **104.7 Liability.** The code official, member of the board of appeals or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered civilly or criminally liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties.

[A] ~~103.4.1~~ **104.7.1 Legal defense.** Any suit or criminal complaint instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representatives of the jurisdiction until the final termination of the proceedings. The code official or any subordinate shall not be liable for costs in any action, suit or proceeding that is instituted in pursuance of the provisions of this code.

2018 International Wildland-Urban Interface Code

Revise as follows:

SECTION 103
ENFORCEMENT CODE COMPLIANCE AGENCY

[A] **103.1 Creation of enforcement agency.** The department of ~~[INSERT NAME OF DEPARTMENT]~~ is hereby created and the official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] **103.2 Appointment.** The code official shall be appointed by the chief appointing authority of the jurisdiction.

[A] **103.3 Deputies.** In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a ~~deputy(s): deputy code official, other related technical officers, inspectors and other employees.~~ Such employees shall have powers as delegated by the code official.

Reason: There are many different names for the title of this section, but all include provisions for the creation of the code compliance agency. The department's responsibilities are more than just 'enforcement' of the code. The fill in the blank for the name allows for the agency to develop a name appropriate to their jurisdiction and responsibilities.

In some of the codes there will be a move from this section to *General Authority and responsibilities* section so that requirements for liability and legal defense will be in a consistent location.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

SECTION 103

CODE COMPLIANCE AGENCY

103.1 Creation of agency. The [INSERT NAME OF DEPARTMENT] is hereby created and the official in charge thereof shall be known as the *code official*. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

103.2 Appointment. The *code official* shall be appointed by the chief appointing authority of the jurisdiction.

103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint a deputy *code official*, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the *code official*.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac/>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>.

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change with no change to construction requirements.

Public Hearing Results

Errata: This proposal includes unpublished errata
Instead of new text for Section 103.1, it should have been a revise as follows.

2018 International Building Code

Revise as follows:

[A] 103.1 Creation of enforcement agency. The ~~Department of Building Safety~~ [INSERT NAME OF DEPARTMENT] is hereby created and the official in charge thereof shall be known as the *building official*. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Fire Code

Section 103.1 is shown correctly.

2018 International Plumbing Code

Revise as follows:

[A] 103.1 General Creation of agency. The ~~department of plumbing inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the ~~executive~~ official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Mechanical Code

Revise as follows:

[A] 103.1 General Creation of agency. The ~~department of mechanical inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the ~~executive~~ official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Fuel Gas Code

Revise as follows:

[A] 103.1 General Creation of agency. The ~~department of inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the ~~executive~~ official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Existing Building Code

Revise as follows:

[A] 103.1 Creation of enforcement agency. The ~~Department of Building Safety~~ [INSERT NAME OF DEPARTMENT] is hereby created, and the official in charge thereof shall be known as the *code official*. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Swimming Pool and Spa Code

Revise as follows:

[A] 103.1 Creation of enforcement agency. The ~~department of building safety~~ [INSERT NAME OF DEPARTMENT] is hereby created, and the official in charge thereof shall be known as the *code official*. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Property Maintenance Code

Revise as follows:

[A] 103.1 General Creation of agency. ~~The department of property maintenance inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the executive official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Private Sewage Disposal Code

Revise as follows:

[A] 103.1 General Creation of agency. ~~The Department of Private Sewage Disposal Inspection~~ [INSERT NAME OF DEPARTMENT] is hereby created and the executive official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

2018 International Wildland-Urban Interface Code

Revise as follows:

[A] 103.1 Creation of enforcement agency. ~~The department of~~ [INSERT NAME OF DEPARTMENT] is hereby created and the official in charge thereof shall be known as the code official. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

Committee Action:

As Submitted

Committee Reason: The committee stated that the approval was based on the improvement to the consistency and ease of use from the standardization of the code compliance enforcement agency section and naming across the codes. (Vote: 13-0)

Assembly Action:

None

ADM16-19 Part III

IGCC@: 103 (New), 103.1 (New), 103.2 (New), 103.3 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, representing FCAC (fcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

2018 International Green Construction Code

Add new text as follows:

103 **CODE COMPLIANCE AGENCY**

103.1 Creation of agency The **[INSERT NAME OF DEPARTMENT]** is hereby created and the official in charge thereof shall be known as the authority having jurisdiction (AHJ). The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

103.2 Appointment The authority having jurisdiction (AHJ) shall be appointed by the chief appointing authority of the jurisdiction.

103.3 Deputies In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the authority having jurisdiction (AHJ) shall have the authority to appoint a deputy authority having jurisdiction (AHJ), other related technical officers, inspectors and other employees as shall be necessary. Such employees shall have powers as delegated by the authority having jurisdiction (AHJ).

Reason: There are many different names for the title of this section, but all include provisions for the creation of the code compliance agency. The department's responsibilities are more than just 'enforcement' of the code. The fill in the blank for the name allows for the agency to develop a name appropriate to their jurisdiction and responsibilities.

In some of the codes there will be a move from this section to *General Authority and responsibilities* section so that requirements for liability and legal defense will be in a consistent location.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

SECTION 103

CODE COMPLIANCE AGENCY

103.1 Creation of agency. The **[INSERT NAME OF DEPARTMENT]** is hereby created and the official in charge thereof shall be known as the *code official*. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

103.2 Appointment. The *code official* shall be appointed by the chief appointing authority of the jurisdiction.

103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint a deputy *code official*, other related technical officers, inspectors and other employees. Such employees shall have powers as delegated by the *code official*.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change with no change to construction requirements.

ADM16-19 Part III

ADM19-19

IBC®: [A] 104.11 (New)

Proposed Change as Submitted

Proponents: Manny Muniz, Self, representing Self (Mannymuniz.mm@gmail.com)

2018 International Building Code

Delete and substitute as follows:

~~**[A] 104.11 Alternative materials, design and methods of construction and equipment.** The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction is not approved, the building official shall respond in writing, stating the reasons why the alternative was not approved.~~

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design meets all of the following:

1. The alternative material, design or method of construction is satisfactory and complies with the intent of the provisions of this code.
2. The material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code as it pertains to the following:
 - 2.1. quality
 - 2.2. strength
 - 2.3. effectiveness
 - 2.4. fire resistance
 - 2.5. durability
 - 2.6. safety

Where the alternative material, design or method of construction is not approved, the building official shall respond in writing, stating the reasons why the alternative was not approved.

Reason: This section can be written more clearly as to the various criteria that must be met in order to be approved as an alternate material, design or method of construction. This will make it easier for the building official to make the necessary evaluation and decision. Should the alternate not be approved, it will also make it easier for the building official to cite the reasons for disapproval. There are no changes to the various requirements that the building official must consider.

Bibliography: No bibliography.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There are no changes to the existing requirements.

ADM19-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:
2018 International Building Code

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed ~~design~~ alternative meets all of the following:

1. The alternative material, design or method of construction is satisfactory and complies with the intent of the provisions of this code,
2. The material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code as it pertains to the following:

2.1 quality

2.2 strength

2.3 effectiveness

2.4 fire resistance

2.5 durability

2.6 safety

Where the alternative material, design or method of construction is not approved, the building official shall respond in writing, stating the reasons why the alternative was not approved.

Committee Reason: The committee stated that the approval of the modification was based on the improvement to the language that makes it clear that it is the alternative that is subject to the list of requirements. The approval of the proposal was based on the proponent's published reason.

Individual Consideration Agenda

Public Comment 1:

IBC®: [A] 104.11 (New)

Proponents:

Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed alternative meets all of the following:

1. The alternative material, design or method of construction is satisfactory and complies with the intent of the provisions of this code,
2. The material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code as it pertains to the following:
 - 2.1. quality
 - 2.2. strength
 - 2.3. effectiveness
 - 2.4. fire performance ~~resistance~~
 - 2.5. durability
 - 2.6. safety

Where the alternative material, design or method of construction is not approved, the building official shall respond in writing, stating the reasons why

the alternative was not approved.

Commenter's Reason: Fire resistance is defined in the IBC as "That property of materials or their assemblies that prevents or retards the passage of excessive heat, hot gases or flames under conditions of use." Therefore, the term is being misused in this application. In this location the intent is that the alternative material or product or design performs at least as well with respect to fire as the one covered by the code.

Therefore, the appropriate term to use is not fire resistance but fire performance. Fire performance is used in multiple locations in Chapter 8 of the IBC and is also used in other codes, such as the IFC, IRC and IEBC. The concept of fire performance is broader than the concept of fire resistance because it encompasses both reaction to fire (i.e. what the material, product or assembly generates in a fire) and fire resistance (which, as described above, refers to how a product or assembly protects against the passage of heat or flames).

The intent of the section modified by the proposal is to look at the concept of fire performance (however it applies for any individual case) and not simply at the more limited concept of fire resistance. Thus, the only change proposed by this public comment is to use the correct terminology.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This public comment corrects the code to use the proper terminology.

Public Comment# 1403

Public Comment 2:

IBC®: [A] 104.11 (New)

Proponents:

James Smith, American Wood Council, representing American Wood Council (jsmith@awc.org)

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that ~~the proposed alternative meets all of the following:~~

1. ~~The alternative material, the proposed design or method of construction~~ is satisfactory and complies with the intent of the provisions of this code, and
2. ~~The material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code as it pertains to the following in:~~
 - ~~2.1:~~ quality,
 - ~~2.2:~~ strength,
 - ~~2.3:~~ effectiveness,
 - ~~2.4:~~ fire resistance,
 - ~~2.5:~~ durability, and
 - ~~2.6:~~ safety.

Where the alternative material, design or method of construction is not approved, the building official shall respond in writing, stating the reasons why the alternative was not approved.

Commenter's Reason: The Committee approval of the revised language in 104.11 was based upon, in part, the proposal's reason statement that there are no changes to the various requirements that the building official must consider. However, the specific association between "the proposed design" and complying with the intent of the provisions of the code has been changed. Section 104.11 Item 1 of the Committee's recommendation for approval includes the original proponent's wording that the alternative material and method of construction complies with the intent of the provisions of the code. We think this wording change could cause confusion for approval of materials and methods of construction that are fully intended to be

alternatives to those materials and methods of construction that are explicitly prescribed in the code.

The further modifications we are proposing to the Committee's "Approved as Modified" version implement changes that restores original wording of 104.11 while keeping the enumerated list of requirements. These specific additional modifications to restore the original wording while keeping the enumerated list are as follows:

104.11 last sentence before the enumerated list: "the proposed alternative meets all of the following" is deleted because it is not part of the current 104.11.

104.11 item 1: "The alternative material" and "or method of construction" is deleted because it is not part of the current 104.11 sentence associating design with intent of the code. "the proposed" and "and" is added to restore the current text of 104.11.

104.11 Item 2: "as it pertains to the following" is deleted because it is not part of the current 104.11. "in" is added to restore the current text of 104.11.

104.11 Item 2.1 through 2.5: commas and "and" is added to restore the current text of 104.11.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

We feel that the further modifications in this public comment are editorial in nature and will only make the language clearer for the code officials being called upon to approve alternatives.

Public Comment# 1949

ADM20-19

IBC®: [A] 104.11 (New)

Proposed Change as Submitted

Proponents: Manny Muniz, representing Self (Mannymuniz.mm@gmail.com)

2018 International Building Code

Revise as follows:

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material, design or method of construction shall be *approved* where the *building official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, *fire resistance*, durability and safety. Approval of an alternate material, design or method of construction shall be issued in writing demonstrating evaluation of all the criteria stated in this section. Where the alternative material, design or method of construction is not *approved*, the *building official* shall respond in writing, stating the reasons why the alternative was not *approved*.

Reason: Just as written documentation is required for not approving an alternate, written documentation should also be required when the alternate is approved to show that the building official has determined that the alternate meets all of the criteria of 104.11.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This has no impact on the cost of construction.

ADM20-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the reason for disapproval was that when an alternative is approved it is not necessary to document the reasons and that it would put an unnecessary burden on the code official to comply with the requirement. (Vote: 13-0)

Assembly Action:

None

ADM20-19

Individual Consideration Agenda

Public Comment 1:

IBC®: [A] 104.11

Proponents:

Manny Muniz, representing Representing self (mannymuniz.mm@gmail.com)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material, design or method of construction shall be *approved* where the *building official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, *fire resistance*, durability and safety.

Approval of an alternate material, design or method of construction shall be documented. Where the alternative material, design or method of construction is not *approved*, the *building official* shall respond in writing, stating the reasons why the alternative was not *approved*.

Commenter's Reason: Just as written documentation is required for not approving an alternate, approving an alternate should also be documented to explain why specifically prescribed provisions of the code were not followed. This will help should it become necessary to perform a forensic examination of a structure.

Bibliography: None

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Will not increase or decrease cost of construction. This is a clarification of the requirements.

Public Comment# 1864

ADM21-19

IBC®: [A] 104.11

Proposed Change as Submitted

Proponents: Manny Muniz, representing Self (Mannymuniz.mm@gmail.com)

2018 International Building Code

Revise as follows:

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material, design or method of construction shall be *approved* where the *building official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, *fire resistance*, durability and safety. Such approval shall be limited to a specific project. Where the alternative material, design or method of construction is not *approved*, the *building official* shall respond in writing, stating the reasons why the alternative was not *approved*.

Reason: Alternates should be limited to a specific project in order to encourage the use of ICC-ES Acceptance Criteria or a formal code change so an alternate is not used in perpetuity, thus avoiding closer scrutiny. This will not prevent the building official from approving an alternate for future projects but provides a method for limiting them.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The code change does not prevent the building official from approving an alternate for any number of projects.

ADM21-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the disapproval was based on the existing section already having the intent of being about a specific project and it also having the flexibility of allowing the code official to make a blanket approval. (Vote: 13-0)

Assembly Action:

None

Public Comment# 1871

ADM22-19

IBC®: [A] 104.11.2

Proposed Change as Submitted

Proponents: Manny Muniz, representing Self (Mannymuniz.mm@gmail.com)

2018 International Building Code

[A] 104.11.2 Tests. Whenever there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the *building official* shall have the authority to require tests as evidence of compliance to be made without expense to the jurisdiction. Test methods shall be as specified in this code or by other recognized test standards. Test samples shall be randomly selected by an approved agency. In the absence of recognized and accepted test methods, the *building official* shall approve the testing procedures. Tests shall be performed by an *approved agency*. Reports of such tests shall be retained by the *building official* for the period required for retention of public records.

Reason: When the building official requires a test as evidence of compliance, it is important that the test samples be randomly selected by an approved agency so the agency knows what they are testing. This is similar to what test agencies do when testing a product that is to be listed. Unless otherwise instructed, test agencies will perform developmental tests on test samples submitted to them. Such developmental tests are not suitable for listing purposes nor are they suitable for tests required by this section.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The cost of construction will not be affected by the verification of legitimate test samples.

ADM22-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the reasons for disapproval were as follows: the testing agency already has the authority to perform as many test as necessary, the proposal does not specify who is responsible for requiring the random test samples and that the tests would be for only one assembly. (Vote: 13-0)

Assembly Action:

None

ADM22-19

Individual Consideration Agenda

Public Comment MUNIZ-1:

IBC®: [A] 104.11.2

Proponents:

Manny Muniz, representing Representing self (mannymuniz.mm@gmail.com)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

[A] 104.11.2 Tests. Whenever there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the *building official* shall have the authority to require tests as evidence of compliance to be made without expense to the jurisdiction. Test methods shall be as specified in this code or by other recognized test standards. In the absence of recognized and accepted test methods, the *building official* shall approve the testing procedures. Tests shall be performed by an *approved agency that will randomly select test samples*. Reports of such tests shall be retained by the *building official* for the period required for retention of public records.

Commenter's Reason: When the building official requires a test of an alternate material as evidence of compliance, it may be necessary to have the test samples randomly selected by an approved agency to verify what is being testing. This is similar to what test agencies do when testing a product that is to be listed. Approved testing agencies must have some certainty as to what it is they are testing and so they must choose the samples to be tested. The modified language addresses the concerns of the committee.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Will not increase or decrease cost of construction. This is a clarification of the requirements.

Public Comment# 1874

ADM23-19 Part I

IBC®: [A] 104.11, [A] 104.11.1, 104.11.1.1 (New), [A] 104.11.2, 107.3.1.1 (New), 202 (New)

Proposed Change as Submitted

Proponents: Michael Savage, representing Compliance Code Action Committee (CCAC) (ccac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC-STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEES.

2018 International Building Code

[A] 104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*. An alternative material, design or method of construction shall be *approved* where the *building official* finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, *fire resistance*, durability and safety. Where the alternative material, design or method of construction is not *approved*, the *building official* shall respond in writing, stating the reasons why the alternative was not *approved*.

[A] 104.11.1 Research reports. Supporting data, where necessary to assist in the approval of materials or assemblies not specifically provided for in this code, shall consist of valid research reports from *approved* sources.

Add new text as follows:

104.11.1.1 Approved sources. Agencies conducting product certification or product evaluation shall be accredited by an *accreditation body*. For the research report to be accepted for product approval, the scope of accreditation shall include the acceptance criteria referenced in the research report.

[A] 104.11.2 Tests. Whenever there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the *building official* shall have the authority to require tests as evidence of compliance to be made without expense to the jurisdiction. Test methods shall be as specified in this code or by other recognized test standards. In the absence of recognized and accepted test methods, the *building official* shall approve the testing procedures. Tests shall be performed by an *approved agency*. Reports of such tests shall be retained by the *building official* for the period required for retention of public records.

Add new text as follows:

107.3.1.1 Third-party certification. Products and materials required by the code to be in compliance with referenced standards shall be *certified by a third-party certification agency as complying with the referenced standards*. Products and materials shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

Add new definition as follows:

THIRD-PARTY CERTIFICATION AGENCY. An *approved* agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer's quality control system.

Reason: The standard practice in building products conformity assessment involves accreditation of the agencies by an accreditation body such as ISO. Third party testing, manufacturing inspections and product certification or product evaluation provide a higher level of quality assurance on these activities for the building official. Approved sources that issue research reports must be accredited to the specific acceptance criteria referenced in the research report. This ensures that the approved sources have the requisite technical expertise and experience to conduct such activities on behalf of the building official. Harmonized language is proposed for inclusion in a new Section 107.3.1.1 regarding third-party certification, and in Chapter 2 with a definition for third-party certification agency. The language in the new Section 107.3.1.1 is identical to language in the International Plumbing Code Section 303.4. The added definition is the same as that in the International Residential Code, International Plumbing Code and International Mechanical Code. The revised definition for Accreditation Body is necessary as it applies to product certification and inspection activities for building products and materials in general, and not lumber mills specifically. These additions will improve the consistency and intent of the I-codes.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal provides clarification and consistency.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the reason for disapproval was that the provision of the original proposal is far too limiting on code officials and does not give credit to alternative agencies or individuals with expertise on certain products or methods. (Vote: 13-0)

Assembly Action:

None

ADM23-19 Part I

Individual Consideration Agenda

Public Comment 1:

IBC®: 104.11.1.1 (New)

Proponents:

Michael Savage, representing Compliance Code Action Committee (CCAC) (ccac@iccsafe.org)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

104.11.1.1 Approved sources for product certification or product evaluation. Product certification and product evaluations shall be performed by agencies that are accredited by an accreditation body or shall be performed by registered design professionals. The scope of accreditation shall include the standard or acceptance criteria referenced in the research report, for the research report to be accepted for product approval.

Commenter's Reason: Comments were received that the section "Approved Sources" conflicts with the definition of "Approved Source" elsewhere in the code. The section title was revised and clarified to pertain specifically to agencies conducting product certification and product evaluation. Comments were received that in some cases, registered design professionals may already do product certification or product evaluation for certain types of building products. The text was revised to include registered design professionals.

Comments were received that the term "acceptance criteria" was limiting. This is not the case, as the term "acceptance criteria" already appears many times throughout the code, and the meaning is well understood. "Standards" were added alongside "acceptance criteria", as research reports may be based on standards or acceptance criteria.

Comments were received that requiring third-party certification by third-party certification agencies would create an undue burden and was not necessary for all building products in the code. The third- party certification requirement and definition of third-party certification agency are consequently deleted..

For the reasons above, we strongly encourage overturning the committee and approving the code change as modified by this public comment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The public comment removes the requirement for third party certification.

Public Comment# 1467

ADM23-19 Part II

IBC®: [BS] 202

Proposed Change as Submitted

Proponents: Michael Savage, representing Compliance Code Action Committee (CCAC) (ccac@iccsafe.org)

2018 International Building Code

Revise as follows:

[BS] ACCREDITATION BODY. An *approved*, third-party organization that is independent of the grading, product certification and inspection agencies, ~~and the lumber mills,~~ and that initially accredits and subsequently monitors agencies conducting building product certification or evaluation schemes, on a continuing basis, including the competency and performance of a grading or inspection agency related to carrying out specific tasks.

ADM23-19 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee expressed concerns that the definition provided was unclear and the action was consistent with the action on Part I (disapproved).

(Vote: 14-0)

None

ADM23-19 Part II

Individual Consideration Agenda

Public Comment 1:

Proponents:

Michael Savage, representing Compliance Code Action Committee (CCAC) (ccac@iccsafe.org)

requests As Submitted

Commenter's Reason: Comments were received that the proposed modifications to the definition of "Accreditation Body" were unclear. The definition already exists in the code and is well understood. The proposed code change to the definition clarifies the definition and makes it more general pertaining to building product certification or product evaluation.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The public comment requests As Submitted. The cost impact statement on the original proposal notes no increase or decrease in cost of construction. The original proposal provides clarification and consistency.

Public Comment# 1468

ADM24-19 Part I

IBC®: [A] 105.2 (New)

Proposed Change as Submitted

Proponents: Marc Levitan, representing the ICC 500 Development Committee; Pataya Scott, representing Federal Emergency Management Agency (pataya.scott@fema.dhs.gov); Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

[A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction. *Permits* shall not be required for the following:

Building:

1. ~~One-story~~ Other than storm shelters, one-story detached accessory structures used as tool and storage sheds, playhouses and similar uses, provided that the floor area is not greater than 120 square feet (11 m²).
2. Fences not over 7 feet (2134 mm) high.
3. Oil derricks.
4. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge or impounding Class I, II or IIIA liquids.
5. Water tanks supported directly on grade if the capacity is not greater than 5,000 gallons (18 925 L) and the ratio of height to diameter or width is not greater than 2:1.
6. Sidewalks and driveways not more than 30 inches (762 mm) above adjacent grade, and not over any basement or *story* below and are not part of an *accessible route*.
7. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
8. Temporary motion picture, television and theater stage sets and scenery.
9. Prefabricated *swimming pools* accessory to a Group R-3 occupancy that are less than 24 inches (610 mm) deep, are not greater than 5,000 gallons (18 925 L) and are installed entirely above ground.
10. Shade cloth structures constructed for nursery or agricultural purposes, not including service systems.
11. Swings and other playground equipment accessory to detached one- and two-family *dwelling*s.
12. Window awnings in Group R-3 and U occupancies, supported by an exterior wall that do not project more than 54 inches (1372 mm) from the *exterior wall* and do not require additional support.
13. Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height.

Electrical:

1. **Repairs and maintenance:** Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical equipment to *approved* permanently installed receptacles.
2. **Radio and television transmitting stations:** The provisions of this code shall not apply to electrical equipment used for radio and television transmissions, but do apply to equipment and wiring for a power supply and the installations of towers and antennas.
3. **Temporary testing systems:** A *permit* shall not be required for the installation of any temporary system required for the testing or servicing of electrical equipment or apparatus.

Gas:

1. Portable heating appliance.
2. Replacement of any minor part that does not alter approval of equipment or make such equipment unsafe.

Mechanical:

1. Portable heating appliance.
2. Portable ventilation equipment.
3. Portable cooling unit.
4. Steam, hot or chilled water piping within any heating or cooling equipment regulated by this code.
5. Replacement of any part that does not alter its approval or make it unsafe.
6. Portable evaporative cooler.
7. Self-contained refrigeration system containing 10 pounds (4.54 kg) or less of refrigerant and actuated by motors of 1 horsepower (0.75 kW) or less.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe, provided, however, that if any concealed trap, drain pipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures and the removal and reinstallation of water closets, provided that such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Reason: The list of 'Work exempted from permit' in the IBC includes detached accessory structures not greater than 120 square feet; the IRC exempts the same detached accessory structures, but sets the area threshold at 200 square feet. Some detached storm shelters – especially prefabricated units – may be smaller than 120 (or 200) square feet, and classified as accessory structures in accordance with administrative provisions described above. It should also be noted that storm shelters may serve as multi-function buildings such as garden sheds (residential) and light storage (residential and commercial). However, unlike other accessory structures where function is incidental, the storm shelter's primary function is to provide life safety protection from extreme wind events. As such, storm shelter construction and installation should always require a building permit to provide quality assurance for the life safety protection of all potential storm shelter occupants. Non-permitted storm shelter installation is unfortunately common for residential prefabricated models which are frequently installed after the residential building has been occupied. Some Midwestern jurisdictions only permit storm shelters when they are installed under FEMA-sponsored rebate programs, but all storm shelters should provide consumers with the same level of life safety protection and associated security. Unpermitted prefabricated shelters are most vulnerable to inadequate anchorage because in most cases proper installation is not verified through an independent field inspection. For above ground storm shelters, the existing slab must meet manufacturer's minimum requirements to resist uplift and overturning during an extreme wind event. Accordingly, ICC 500 Section 106.3.1 requires special inspection to verify 1) the capacity of anchors that are post-installed in hardened concrete and 2) the adequacy of the existing slab to meet specifications provided by the manufacturer. For in-ground storm shelters, inadequate anchorage can result in shelters being dislodged when groundwater rises around them.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC 500 Storm Shelter Standard Development committee.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The ICC 500 Standards Development committee is responsible for the development of the ICC/NSSA Standard for the Design and Construction of Storm Shelters. The committee is currently working on the development of the 2020 edition. In 2017 the ICC 500 committee held 7 open conference calls. In addition, there were numerous Working Group meetings and conference calls, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/standards-development/is-stm>.

Cost Impact: The code change proposal will increase the cost of construction

Increases the cost for installing storm shelters by the cost of the permit fee, but only in jurisdictions that currently allow installation without permits.

ADM24-19 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the reason for disapproval was that the proposed language was adding an exception to an exception and that storm shelters are not similar to the other structures that are listed in the section. Additionally there was disagreement over the need and use for the definitions to determine if the requirements apply. (Vote: 13-0)

Assembly Action:

None

ADM24-19 Part I

Individual Consideration Agenda

Public Comment 1:

IBC®: [A] 105.2 (New)

Proponents:

Ed Kulik, representing Building Code Action Committee (bcac@iccsafe.org); Pataya Scott, representing FEMA (pataya.scott@fema.dhs.gov); Benchmark Harris, representing National Storm Shelter Association (bharris@huckabee-inc.com); Marc Levitan, representing ICC 500 Standard Development Committee (marc.levitan@nist.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

[A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction. *Permits* shall not be required for the following:

Building:

1. ~~Other than storm shelters, one-story~~ One-story detached accessory structures used as tool and storage sheds, playhouses and similar uses, provided that the floor area is not greater than 120 square feet (11 m²). This exemption does not apply to storm shelters.
2. Fences not over 7 feet (2134 mm) high.
3. Oil derricks.
4. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge or impounding Class I, II or IIIA liquids.
5. Water tanks supported directly on grade if the capacity is not greater than 5,000 gallons (18 925 L) and the ratio of height to diameter or width is not greater than 2:1.
6. Sidewalks and driveways not more than 30 inches (762 mm) above adjacent grade, and not over any basement or *story* below and are not part of an *accessible route*.
7. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
8. Temporary motion picture, television and theater stage sets and scenery.
9. Prefabricated *swimming pools* accessory to a Group R-3 occupancy that are less than 24 inches (610 mm) deep, are not greater than 5,000 gallons (18 925 L) and are installed entirely above ground.
10. Shade cloth structures constructed for nursery or agricultural purposes, not including service systems.
11. Swings and other playground equipment accessory to detached one- and two-family *dwellings*.
12. Window awnings in Group R-3 and U occupancies, supported by an exterior wall that do not project more than 54 inches (1372 mm) from the *exterior wall* and do not require additional support.
13. Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height.

Electrical:

1. **Repairs and maintenance:** Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical equipment to *approved* permanently installed receptacles.
2. **Radio and television transmitting stations:** The provisions of this code shall not apply to electrical equipment used for radio and television transmissions, but do apply to equipment and wiring for a power supply and the installations of towers and antennas.
3. **Temporary testing systems:** A *permit* shall not be required for the installation of any temporary system required for the testing or servicing of electrical equipment or apparatus.

Gas:

1. Portable heating appliance.
2. Replacement of any minor part that does not alter approval of equipment or make such equipment unsafe.

Mechanical:

1. Portable heating appliance.
2. Portable ventilation equipment.
3. Portable cooling unit.
4. Steam, hot or chilled water piping within any heating or cooling equipment regulated by this code.
5. Replacement of any part that does not alter its approval or make it unsafe.
6. Portable evaporative cooler.
7. Self-contained refrigeration system containing 10 pounds (4.54 kg) or less of refrigerant and actuated by motors of 1 horsepower (0.75 kW) or less.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe, provided, however, that if any concealed trap, drain pipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures and the removal and reinstallation of water closets, provided that such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Commenter's Reason: The modification is only editorial and intended to address the committee's concern on grammar. Requiring permits for storm shelters is an important safety consideration.

This requirement for small residential storm shelters to have building permits was successful in the IRC. Residential storm shelter (16 or fewer occupants) can be installed serving Group R-3 and R-4 homes and townhouses that fall in the IBC, so this is applicable to the IBC and the IRC. All storm shelters need to have a building permit to ensure they meet safety requirements and so emergency responders know where they are. Storm shelters can serve other purposes when not needed, so they would be 'accessory' by being under 120 sq.ft., and used as storage sheds, playhouses or similar uses. This is needed to prevent 'home built' storm shelters that do not meet minimum safety requirements to protect a family during a storm.

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Increases the cost for installing storm shelters by the cost of the permit fee, but only in jurisdictions that currently allow installation without permits.

ADM24-19 Part II

IRC®: R105.2 (New)

Proposed Change as Submitted

Proponents: Marc Levitan, representing the ICC 500 Development Committee; Pataya Scott, representing Federal Emergency Management Agency (pataya.scott@fema.dhs.gov); Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Residential Code

Revise as follows:

R105.2 Work exempt from permit. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. ~~One-~~ Other than storm shelters, one-story detached accessory structures, provided that the floor area does not exceed 200 square feet (18.58 m²).
2. Fences not over 7 feet (2134 mm) high.
3. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge.
4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
5. Sidewalks and driveways.
6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
8. Swings and other playground equipment.
9. Window awnings supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
10. Decks not exceeding 200 square feet (18.58 m²) in area, that are not more than 30 inches (762 mm) above *grade* at any point, are not attached to a dwelling and do not serve the exit door required by Section R311.4.

Electrical:

1. *Listed* cord-and-plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Electrical wiring, devices, *appliances*, apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
5. Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical *equipment* to *approved* permanently installed receptacles.

Gas:

1. Portable heating, cooking or clothes drying *appliances*.
2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Mechanical:

1. Portable heating *appliances*.
2. Portable ventilation *appliances*.
3. Portable cooling units.
4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.
5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
6. Portable evaporative coolers.
7. Self-contained refrigeration systems containing 10 pounds (4.54 kg) or less of refrigerant or that are actuated by motors of 1 horsepower (746 W) or less.
8. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Reason: The list of 'Work exempted from permit' in the IBC includes detached accessory structures not greater than 120 square feet; the IRC exempts the same detached accessory structures, but sets the area threshold at 200 square feet. Some detached storm shelters – especially prefabricated units – may be smaller than 120 (or 200) square feet, and classified as accessory structures in accordance with administrative provisions described above. It should also be noted that storm shelters may serve as multi-function buildings such as garden sheds (residential) and light storage (residential and commercial). However, unlike other accessory structures where function is incidental, the storm shelter's primary function is to provide life safety protection from extreme wind events. As such, storm shelter construction and installation should always require a building permit to provide quality assurance for the life safety protection of all potential storm shelter occupants.

Non-permitted storm shelter installation is unfortunately common for residential prefabricated models which are frequently installed after the residential building has been occupied. Some Midwestern jurisdictions only permit storm shelters when they are installed under FEMA-sponsored rebate programs, but all storm shelters should provide consumers with the same level of life safety protection and associated security. Unpermitted prefabricated shelters are most vulnerable to inadequate anchorage because in most cases proper installation is not verified through an independent field inspection. For above ground storm shelters, the existing slab must meet manufacturer's minimum requirements to resist uplift and overturning during an extreme wind event. Accordingly, ICC 500 Section 106.3.1 requires special inspection to verify 1) the capacity of anchors that are post-installed in hardened concrete and 2) the adequacy of the existing slab to meet specifications provided by the manufacturer. For in-ground storm shelters, inadequate anchorage can result in shelters being dislodged when groundwater rises around them.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC 500 Storm Shelter Standard Development committee.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The ICC 500 Standards Development committee is responsible for the development of the ICC/NSSA Standard for the Design and Construction of Storm Shelters. The committee is currently working on the development of the 2020 edition. In 2017 the ICC 500 committee held 7 open conference calls. In addition, there were numerous Working Group meetings and conference calls, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/standards-development/is-stm>.

Cost Impact: The code change proposal will increase the cost of construction

Increases the cost for installing storm shelters by the cost of the permit fee, but only in jurisdictions that currently allow installation without permits.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: It seems reasonable to require a permit for storm shelters, though the embedded exception is awkward. (Vote: 6-4)

Assembly Action:

None

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEES.

2018 International Building Code

Revise as follows:

SECTION 108 TEMPORARY USES, EQUIPMENT AND STRUCTURES ~~AND USES~~

[A] 108.1 General. The *building official* is authorized to issue a permit for temporary ~~structures and temporary uses~~, structures, uses, equipment or systems. Such *permits* shall be limited as to time of service, but shall not be permitted for more than 180 days. The *building official* is authorized to grant extensions for demonstrated cause.

[A] 108.2 Conformance. Temporary ~~structures, uses and uses~~ structures shall comply with the requirements in Section 3103.

[A] 108.3 Temporary power. The *building official* is authorized to give permission to temporarily supply ~~and use power in part of an electric installation before such installation~~ utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final certificate of completion approval has been issued. The part covered by the temporary ~~certificate approval~~ shall comply with the requirements specified for temporary lighting, heat or power in ~~NFPA 70: this code.~~

[A] 108.4 Termination of approval. The *building official* is authorized to terminate such permit for a temporary ~~structure uses equipment, or use system~~ and to order the ~~temporary structure or use same~~ to be discontinued.

2018 International Plumbing Code

Revise as follows:

SECTION 110 TEMPORARY USES, EQUIPMENT, AND SYSTEMS ~~AND USES~~

110.1 General. The code official is authorized to issue a permit for temporary uses, equipment, systems and uses, ~~or systems~~. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

110.2 Conformance. Temporary uses, equipment, and systems ~~and uses~~ shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the ~~public~~ health, safety and general welfare.

110.3 Temporary utilities. The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final ~~certificate of completion approval~~ has been issued. The part covered by the temporary ~~certificate approval~~ shall comply with the requirements specified for temporary lighting, heat or power in ~~the this code.~~

110.4 Termination of approval. The code official is authorized to terminate such permit for temporary uses, equipment, systems or uses ~~system~~ and to order the ~~temporary equipment, systems or uses same~~ to be discontinued.

2018 International Mechanical Code

Revise as follows:

SECTION 110 TEMPORARY USES, EQUIPMENT, AND SYSTEMS ~~AND USES~~

[A] 110.1 General. The code official is authorized to issue a permit for temporary uses, equipment, systems and uses, ~~or systems~~. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

[A] 110.2 Conformance. Temporary uses, equipment, and systems ~~and uses~~ shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the ~~public~~ health, safety and general welfare.

[A] 110.3 Temporary utilities. The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final ~~certificate of completion approval~~ has been issued. The part covered by the temporary ~~certificate approval~~ shall comply with the requirements specified for temporary lighting, heat or power in ~~the~~ this code.

[A] 110.4 Termination of approval. The code official is authorized to terminate such permit for temporary uses, equipment, systems or uses ~~system~~ and to order the ~~temporary equipment, systems or uses same~~ to be discontinued.

2018 International Fuel Gas Code

Revise as follows:

SECTION 110 (IFGC) TEMPORARY USES, EQUIPMENT, AND SYSTEMS ~~AND USES~~

[A] 110.1 General. The code official is authorized to issue a permit for temporary uses, equipment, systems and uses or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

[A] 110.2 Conformance. Temporary uses, equipment, and systems ~~and uses~~ shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the ~~public~~ health, safety and general welfare.

[A] 110.3 Temporary utilities. The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final ~~certificate of completion approval~~ has been issued. The part covered by the temporary ~~certificate approval~~ shall comply with the requirements specified for temporary lighting, heat or power in ~~the~~ this code.

[A] 110.4 Termination of approval. The code official is authorized to terminate such permit for ~~a temporary structure uses equipment, or use system~~ and to order the ~~temporary structure or use same~~ to be discontinued.

2018 International Existing Building Code

Revise as follows:

SECTION 107 TEMPORARY ~~STRUCTURES AND USES~~ USES, EQUIPMENT, AND SYSTEMS

[A] 107.1 General. The code official is authorized to issue a permit for temporary ~~uses, equipment, or systems~~. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

[A] 107.2 Conformance. Temporary uses, equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the ~~public~~ health, safety and general welfare.

[A] 107.3 Temporary power. The code official is authorized to give permission to temporarily supply ~~and use power in part of an electric installation before such installation~~ utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final ~~certificate of completion approval~~ has been issued. The part covered by the temporary ~~certificate approval~~ shall comply with the requirements specified for temporary lighting, heat or power in ~~NFPA 70- this code.~~

[A] 107.4 Termination of approval. The code official is authorized to terminate such permit for ~~a temporary use uses equipment, or system~~ and to order the ~~temporary use same~~ to be discontinued.

2018 International Private Sewage Disposal Code

Revise as follows:

SECTION 110 TEMPORARY USES, EQUIPMENT, AND SYSTEMS ~~AND USES~~

[A] 110.1 General. The code official is authorized to issue a permit for temporary uses, equipment, systems and uses or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

[A] 110.2 Conformance. Temporary uses, equipment, and systems ~~and uses~~ shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the ~~public~~ health, safety and general welfare.

[A] 110.3 Temporary utilities. The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water

~~systems or sewer systems before an installation has been fully completed and the final certificate of completion approval has been issued. The part covered by the temporary certificate approval shall comply with the requirements specified for temporary lighting, heat or power in the this code.~~

[A] 110.4 Termination of approval. The code official is authorized to terminate such permit for ~~a temporary structure uses equipment, or use system~~ and to order the ~~temporary structure or use same~~ to be discontinued.

2018 International Wildland-Urban Interface Code

Revise as follows:

SECTION 112 **TEMPORARY STRUCTURES AND USES ~~USES, EQUIPMENT, AND SYSTEMS~~**

[A] 112.1 General. The code official is authorized to issue a permit for temporary ~~structures and temporary uses~~ uses, equipment, or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

[A] 112.2 Conformance. Temporary ~~structures and uses~~ equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the ~~public~~ health, safety and general welfare.

112.3 Temporary utilities. The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

[A] ~~112.3~~ 112.4 Termination of approval. The code official is authorized to terminate such permit for ~~a temporary structure uses equipment, or use system~~ and to order the ~~temporary structure or use same~~ to be discontinued.

2018 International Swimming Pool and Spa Code

Revise as follows:

SECTION 106 **TEMPORARY USES, EQUIPMENT, AND SYSTEMS**

106.1 General. The code official is authorized to issue a permit for temporary uses, equipment, or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

106.2 Conformance. Temporary uses, equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the health, safety and general welfare.

106.3 Temporary utilities. The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

106.4 Termination of approval. The code official is authorized to terminate such permit for temporary uses equipment, or system and to order the same to be discontinued.

Reason: The purpose of this proposal is coordination between codes for the section on temporary structures. The word use is moved to the front. The allowances for temporary connection under inspection and testing address more than just utilities, so the language in this section should match. The phrase "certificate of completion" is not defined, so "approved" would be a better choice.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

IBC

SECTION 108

TEMPORARY USES, EQUIPMENT, AND SYSTEMS

[A] 108.1 General. The building official is authorized to issue a permit for temporary uses, equipment, or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The building official is authorized to grant extensions for demonstrated cause.

[A] 108.2 Conformance. Temporary uses, equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the health, safety and general welfare.

[A] 108.3 Temporary utilities. The building official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

[A] 108.4 Termination of approval. The building official is authorized to terminate such permit for temporary uses equipment, or system and to order the same to be discontinued.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac/>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change that provides consistency between I-codes.

ADM32-19 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the reason for disapproval was that it is not all inclusive as the intent is and only goes half way. Additionally it was stated that it should include the IFC. (Vote: 10-3)

Assembly Action:

None

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

SECTION 108 TEMPORARY USES, STRUCTURES, EQUIPMENT AND STRUCTURES SYSTEMS

[A] 108.1 **General.** The *building official* is authorized to issue a permit for temporary uses, structures, uses, equipment or systems. Such *permits* shall be limited as to time of service, but shall not be permitted for more than 180 days. The *building official* is authorized to grant extensions for demonstrated cause.

[A] 108.2 **Conformance.** Temporary uses and structures shall comply with the requirements in Section 3103.

[A] 108.3 **Temporary power.** The *building official* is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

[A] 108.4 **Termination of approval.** The *building official* is authorized to terminate such permit for temporary uses, structures, equipment, or system and to order the same to be discontinued.

2018 International Existing Building Code

SECTION 107 TEMPORARY USES, STRUCTURES, EQUIPMENT, AND SYSTEMS

[A] 107.1 **General.** The code official is authorized to issue a permit for temporary uses, structures, equipment, or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

[A] 107.2 **Conformance.** Temporary uses, structures, equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the health, safety and general welfare.

[A] 107.3 **Temporary power.** The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

[A] 107.4 **Termination of approval.** The code official is authorized to terminate such permit for temporary uses, structures, equipment, or system and to order the same to be discontinued.

2018 International Wildland-Urban Interface Code

SECTION 112 TEMPORARY USES, STRUCTURES, EQUIPMENT, AND SYSTEMS

[A] 112.1 **General.** The code official is authorized to issue a permit for temporary uses, structures, equipment, or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

[A] 112.2 **Conformance.** Temporary uses, structures, equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the health, safety and general welfare.

112.3 **Temporary utilities.** The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

[A] 112.4 **Termination of approval.** The code official is authorized to terminate such permit for temporary uses, structures, equipment, or system and to order the same to be discontinued.

2018 International Swimming Pool and Spa Code

SECTION 106 TEMPORARY USES, STRUCTURES, EQUIPMENT, AND SYSTEMS

106.1 General. The code official is authorized to issue a permit for temporary uses, structures, equipment, or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The code official is authorized to grant extensions for demonstrated cause.

106.2 Conformance. Temporary uses, structures, equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the health, safety and general welfare.

106.3 Temporary utilities. The code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

106.4 Termination of approval. The code official is authorized to terminate such permit for temporary uses, structures, equipment, or system and to order the same to be discontinued.

2018 International Fire Code

SECTION 106 TEMPORARY USES, STRUCTURES, EQUIPMENT AND SYSTEMS

106.1 General. The fire code official is authorized to issue a permit for temporary uses, structures, equipment or systems. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The fire code official is authorized to grant extensions for demonstrated cause.

106.2 Conformance Temporary uses, equipment, and systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the health, safety and general welfare.

106.3 Temporary power. The fire code official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

106.4 Termination of approval. The fire code official is authorized to terminate such permit for a temporary uses, structures, equipment, or system and to order the same to be discontinued.

Commenter's Reason: During the code change hearings, no one spoke against this proposal. The original proposal modified the section for temporary facilities where it was already in the code with the exception of ISPSC. The committee felt that it was very important to add these safety options to the IFC as well, so this modification adds this to IFC. As requested by the committee, the BCAC worked with FCAC and PMGCAC to develop this public comment.

When looking for coordination, some of the codes did not include 'structure' and some did. The residential committee felt it was important to keep 'structures', so to be consistent, we are asking for a modification for codes that include structures, which includes, IBC, IEBC, IWUIC, ISPSC and IFC. This is mostly putting it back where it was in current text.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-techsupport/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-techsupport/cs/fire-code-action-committee-fcac/>

The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-techsupport/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

ADM32-19 Part II

IRC®: SECTION R107, R107.1, R107.2, R107.3, R107.4

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgac@iccsafe.org)

2018 International Residential Code

Revise as follows:

SECTION R107 **TEMPORARY STRUCTURES-USES, EQUIPMENT AND USES STRUCTURES**

R107.1 General. The *building official* is authorized to issue a permit for temporary ~~structures and temporary uses, uses, equipment, or systems.~~ Such *permits* shall be limited as to time of service, but shall not be permitted for more than 180 days. The *building official* is authorized to grant extensions for demonstrated cause.

R107.2 Conformance. Temporary ~~structures and uses shall uses, structures, equipment or systems shall~~ conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the public ~~the~~ health, safety and general welfare.

R107.3 Temporary power. The building official is authorized to give permission to temporarily supply ~~and use power in part of an electric installation before such installation utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final certificate of completion approval has been issued.~~ The part covered by the temporary certificate approval shall comply with the requirements specified for temporary lighting, heat or power in ~~NFPA 70: this code.~~

R107.4 Termination of approval. The building official is authorized to terminate such permit for ~~a temporary structure uses equipment, or use system and to order the temporary structure or use same to be discontinued.~~

ADM32-19 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The term "structures" is used in Section R107.2 in the laundry list and this is not consistent. The term is not used in the general scoping provisions of Section R107.1. (Vote: 10-1)

Assembly Action:

None

ADM32-19 Part II

Individual Consideration Agenda

Public Comment 1:

IRC®: SECTION R107, R107.1, R107.2, R107.3, R107.4

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

SECTION R107

TEMPORARY USES, STRUCTURES, EQUIPMENT AND ~~STRUCTURES~~ SYSTEMS

R107.1 General. The *building official* is authorized to issue a permit for temporary uses, structures, equipment, or systems. Such *permits* shall be limited as to time of service, but shall not be permitted for more than 180 days. The *building official* is authorized to grant extensions for demonstrated cause.

R107.2 Conformance. Temporary uses, structures, equipment or systems shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure the health, safety and general welfare.

R107.3 Temporary power. The building official is authorized to give permission to temporarily supply utilities, sources of energy, fuel, power, water systems or sewer systems before an installation has been fully completed and the final approval has been issued. The part covered by the temporary approval shall comply with the requirements specified for temporary lighting, heat or power in this code.

R107.4 Termination of approval. The building official is authorized to terminate such permit for temporary uses, structures, equipment, or system and to order the same to be discontinued.

Commenter's Reason: The IRC committee felt that temporary 'structures' should be included consistently in the sections of this proposal. This modification does that. There is also a public comment to ADM32-19 Part 1 to coordinate this with the other codes that deal with structures. BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-techsupport/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

Public Comment# 1223

ADM33-19 Part II

IECC®: SECTION C104, C104.1, C104.2, C104.3, C104.4, C104.5, C104.6

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, representing FCAC (fcac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

2018 International Energy Conservation Code

Revise as follows:

SECTION C104 FEES

C104.1 Fees. Payment of fees. A permit shall not be ~~issued valid~~ until the fees prescribed in ~~Section C104.2 by law~~ have been paid, nor shall an amendment to a permit be released until the additional fee, if any, has been paid.

C104.2 Schedule of permit fees. ~~A Where a permit is required, a~~ fee for each permit shall be paid as required, in accordance with the schedule as established by the applicable governing authority.

C104.3 Permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued. If, in the opinion of the code official, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can show detailed estimates to meet the approval of the code official. Final building permit valuation shall be set by the code official.

~~C104.3~~ **C104.4 Work commencing before permit issuance.** Any person who commences any work before obtaining the necessary permits shall be subject to ~~an additional a~~ fee established by the *code official* that shall be in addition to the required permit fees.

~~C104.4~~ **C104.5 Related fees.** The payment of the fee for the construction, *alteration*, removal or demolition of work done in connection to or concurrently with the work or activity authorized by a permit shall not relieve the applicant or holder of the permit from the payment of other fees that are prescribed by law.

~~C104.5~~ **C104.6 Refunds.** The *code official* is authorized to establish a refund policy.

Reason: There are two different proposals to address consistency in the Fees section – the end result would be coordination between all codes. The intent is consistency in language for 'Fees' within the codes – IBC, IFC, IEBC, IWUIC, IZC, Energy – Commercial and Residential.

- Payment of fees – consistent title, always two sentences
- Schedule of permit fees – IBC currently also includes “structures”, while IFC and IEBC also includes “alterations”. IWUIC and Energy do not include anything. Eliminate the laundry list and make all codes consistent.
- Permit valuation: added valuation to IWUIC and Energy; permits can be for other than just buildings
- Work commencing before permit issuance – remove redundant language
- Refunds – no change
- The IZC currently has a section on fees that is very limited. It was not clear what should be added other than a section on refunds.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals.”

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as “building/fire/code official”.

IBC

SECTION 109FEES

[A] 109.1 Payment of fees. A *permit* shall not be valid until the fees prescribed by law have been paid. Nor shall an amendment to a *permit* be released until the additional fee, if any, has been paid.

[A] 109.2 Schedule of permit fees. Where a *permit* is required, a fee for each *permit* shall be paid as required, in accordance with the schedule as

established by the applicable governing authority.

[A] 109.3 Permit valuations. The applicant for a *permit* shall provide an estimated *permit* value at time of application. *Permit* valuations shall include total value of work, including materials and labor, for which the *permit* is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. If, in the opinion of the *building official*, the valuation is underestimated on the application, the *permit* shall be denied, unless the applicant can show detailed estimates to meet the approval of the *building official*. Final building *permit* valuation shall be set by the *building official*.

[A] 109.4 Work commencing before permit issuance. Any person who commences any work before obtaining the necessary *permits* shall be subject to a fee established by the *building official* that shall be in addition to the required *permit* fees.

[A] 109.5 Related fees. The payment of the fee for the construction, *alteration*, removal or demolition for work done in connection to or concurrently with the work authorized by a *permit* shall not relieve the applicant or holder of the *permit* from the payment of other fees that are prescribed by law.

[A] 109.6 Refunds. The *building official* is authorized to establish a refund policy.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable and Energy and High Performance Code Action Committee (SEHPCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac/>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change that provides consistency between I-codes.

ADM33-19 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Specificity is not needed in this section. These provisions are commonly modified by adopting jurisdictions to install their own fee structure. (Vote: 14-1)

Assembly Action:

None

ADM33-19 Part II

Individual Consideration Agenda

Public Comment 1:

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

requests As Submitted

Commenter's Reason: We respectively disagree with the Energy committee. The section on fees is existing. This proposal is only adding Section C104.3 for consistency within the family of codes.

Code change proposal ADM27 revised the Fee section where the fees were in the code to allow for the jurisdiction to set the codes and revise when they need to – rather than have it set when the code is adopted with no options for change.

Section 104.3 is current language in the 2018 editions of IRC, IEBC and IBC. ADM33 Part 1 and ADM27 together are to coordinate the fee section in the family of codes. This section does not require a fee for review or compliance with the energy code, but says where a permit is required.

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

2018 International Energy Conservation Code

Revise as follows:

SECTION R104 FEES

R104.1 Fees- Payment of fees. A permit shall not be issued until the fees prescribed in ~~Section R104.2 by law~~ have been paid, ~~nor paid~~. Nor shall an amendment to a permit be released until the additional fee, if any, has been paid.

R104.2 Schedule of permit fees. ~~A Where a permit is required, a~~ fee for each permit shall be paid as required, in accordance with the schedule as established by the applicable governing authority.

R104.3 Permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued. If, in the opinion of the code official, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can show detailed estimates to meet the approval of the code official. Final building permit valuation shall be set by the code official.

~~R104.3~~ **R104.4 Work commencing before permit issuance.** Any person who commences any work before obtaining the necessary permits shall be subject to ~~an additional a~~ fee established by the *code official* that shall be in addition to the required permit fees.

~~R104.4~~ **R104.5 Related fees.** The payment of the fee for the construction, *alteration*, removal or demolition of work done in connection to or concurrently with the work or activity authorized by a permit shall not relieve the applicant or holder of the permit from the payment of other fees that are prescribed by law.

~~R104.5~~ **R104.6 Refunds.** The *code official* is authorized to establish a refund policy.

Reason: There are two different proposals to address consistency in the Fees section – the end result would be coordination between all codes. The intent is consistency in language for 'Fees' within the codes – IBC, IFC, IEBC, IWUIC, IZC, Energy – Commercial and Residential.

- Payment of fees – consistent title, always two sentences
- Schedule of permit fees – IBC currently also includes “structures”, while IFC and IEBC also includes “alterations”. IWUIC and Energy do not include anything. Eliminate the laundry list and make all codes consistent.
- Permit valuation: added valuation to IWUIC and Energy; permits can be for other than just buildings
- Work commencing before permit issuance – remove redundant language
- Refunds – no change
- The IZC currently has a section on fees that is very limited. It was not clear what should be added other than a section on refunds.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals.”

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as “building/fire/code official”.

IBC

SECTION 109FEES

[A] 109.1 Payment of fees. A *permit* shall not be valid until the fees prescribed by law have been paid. Nor shall an amendment to a *permit* be released until the additional fee, if any, has been paid.

[A] 109.2 Schedule of permit fees. Where a *permit* is required, a fee for each *permit* shall be paid as required, in accordance with the schedule as

established by the applicable governing authority.

[A] 109.3 Permit valuations. The applicant for a *permit* shall provide an estimated *permit* value at time of application. *Permit* valuations shall include total value of work, including materials and labor, for which the *permit* is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. If, in the opinion of the *building official*, the valuation is underestimated on the application, the *permit* shall be denied, unless the applicant can show detailed estimates to meet the approval of the *building official*. Final building *permit* valuation shall be set by the *building official*.

[A] 109.4 Work commencing before permit issuance. Any person who commences any work before obtaining the necessary *permits* shall be subject to a fee established by the *building official* that shall be in addition to the required *permit* fees.

[A] 109.5 Related fees. The payment of the fee for the construction, *alteration*, removal or demolition for work done in connection to or concurrently with the work authorized by a *permit* shall not relieve the applicant or holder of the *permit* from the payment of other fees that are prescribed by law.

[A] 109.6 Refunds. The *building official* is authorized to establish a refund policy.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable and Energy and High Performance Code Action Committee (SEHPCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change that provides consistency between I-codes.

ADM33-19 Part III

Public Hearing Results

Committee Action:

Disapproved

Committee Modification: fE

Committee Reason: Fees should not be set by the code official. Fees should not be specified within the code. The proposal gives authority to the code official to set fees, but such can not be appealed as this code has no appeal process. The inclusion of labor cost of inspections in the determination of fees was questioned. (Vote: 10-1)

Assembly Action:

None

ADM33-19 Part III

Individual Consideration Agenda

Public Comment 1:

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

requests As Submitted

Commenter's Reason: We respectively disagrees with the Energy committee. The section on fees is existing. This proposal is only adding Section C104.3 for consistency within the family of codes.

Code change proposal ADM27 revised the Fee section where the fees where in the code to allow for the jurisdiction to set the codes and revise when they need to – rather than have it set when the code is adopted with no options for change.

Section 104.3 is current language in the 2018 editions of IRC, IEBC and IBC. ADM33 Part 1 and ADM27 together are to coordinate the fee section in the family of codes. This section does not require a fee for review or compliance with the energy code, but says where a permit is required.

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

THIS IS A 4 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. PART III WILL BE HEARD BY THE IECC-COMMERCIAL CODE COMMITTEE. PART IV WILL BE HEARD BY THE IgCC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

SECTION 109 FEES

[A] 109.1 Payment of fees. A *permit* shall not be valid until the fees prescribed by law have been paid, nor shall an amendment to a *permit* be released until the additional fee, if any, has been paid.

[A] 109.2 Schedule of permit fees. ~~On buildings, structures, electrical, gas, mechanical, and plumbing systems or alterations requiring~~ Where a permit is required, a fee for each *permit* shall be paid as required, in accordance with the schedule as established by the applicable governing authority.

[A] 109.3 ~~Building permit~~ Permit valuations. The applicant for a *permit* shall provide an estimated *permit* value at time of application. *Permit* valuations shall include total value of work, including materials and labor, for which the *permit* is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. If, in the opinion of the *building official*, the valuation is underestimated on the application, the *permit* shall be denied, unless the applicant can show detailed estimates to meet the approval of the *building official*. Final building *permit* valuation shall be set by the *building official*.

[A] 109.4 Work commencing before permit issuance. Any person who commences any ~~work on a building, structure, electrical, gas, mechanical or plumbing system before work before~~ obtaining the necessary *permits* shall be subject to a fee established by the *building official* that shall be in addition to the required *permit* fees.

[A] 109.5 Related fees. The payment of the fee for the construction, *alteration*, removal or demolition for work done in connection to or concurrently with the work authorized by a building *permit* shall not relieve the applicant or holder of the *permit* from the payment of other fees that are prescribed by law.

[A] 109.6 Refunds. The *building official* is authorized to establish a refund policy.

2018 International Fire Code

Revise as follows:

SECTION 106 FEES

[A] 106.1 Fees. A permit shall not be issued until the fees have been paid, nor shall an amendment to a permit be released until the additional fee, if any, has been paid.

[A] 106.2 Schedule of permit fees. ~~A-Where a permit is required,~~ a fee for each permit shall be paid as required, in accordance with the schedule as established by the applicable governing authority.

Add new text as follows:

106.3 Permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued, such as electrical, gas, mechanical, plumbing equipment and

permanent systems. If, in the opinion of the fire code official, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can show detailed estimates to meet the approval of the fire code official. Final permit valuation shall be set by the fire code official.

Revise as follows:

[A] ~~106.3~~ 106.4 Work commencing before permit issuance. A person who commences any work, activity or operation regulated by this code before obtaining the necessary permits shall be subject to ~~an additional a~~ fee established by the applicable governing authority, which shall be in addition to the required permit fees.

[A] ~~106.4~~ 106.5 Related fees. The payment of the fee for the construction, *alteration*, removal or demolition of work done in connection to or concurrently with the work or activity authorized by a permit shall not relieve the applicant or holder of the permit from the payment of other fees that are prescribed by law.

[A] ~~106.5~~ 106.6 Refunds. The applicable governing authority is authorized to establish a refund policy.

2018 International Existing Building Code

Revise as follows:

SECTION 108 FEES

[A] 108.1 Payment of fees. A permit shall not be valid until the fees prescribed by law have been paid. ~~Not paid nor~~ shall an amendment to a permit be released until the additional fee, if any, has been paid.

[A] 108.2 Schedule of permit fees. ~~On buildings, electrical, gas, mechanical, and plumbing systems or alterations requiring~~ Where a permit is required, a fee for each permit shall be paid as required in accordance with the schedule as established by the applicable governing authority.

[A] 108.3 ~~Building permit~~ Permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work including materials and labor for which the permit is being issued, such as electrical, gas, mechanical, plumbing equipment, and permanent systems. If, in the opinion of the *code official*, the valuation is underestimated on the application, the permit shall be denied unless the applicant can show detailed estimates to meet the approval of the *code official*. Final building permit valuation shall be set by the *code official*.

[A] 108.4 Work commencing before permit issuance. Any person who commences any work before obtaining the necessary permits shall be subject to ~~an additional a~~ fee established by the *code official* that shall be in addition to the required permit fees.

[A] 108.5 Related fees. The payment of the fee for the construction, *alteration*, removal, or demolition of work done in connection to or concurrently with the work authorized by ~~a building a~~ permit shall not relieve the applicant or holder of the permit from the payment of other fees that are prescribed by law.

[A] 108.6 Refunds. The *code official* is authorized to establish a refund policy.

2018 International Wildland-Urban Interface Code

Revise as follows:

SECTION 109 FEES

[A] 109.1 ~~Fees.~~ Payment of fees. A permit shall not be issued until the fees prescribed in ~~Section 109.2 by law~~ have been paid ~~nor~~ shall an amendment to a permit be released until the additional fee, if any, has been paid

[A] 109.2 Schedule of permit fees. ~~A~~ Where a permit is required, a fee for each permit shall be paid as required, in accordance with the schedule as established by the applicable governing authority.

109.3 Permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued. If, in the opinion of the applicable governing authority, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can show detailed estimates to meet the approval of the applicable governing authority. Final building permit valuation shall be set by the applicable governing authority.

[A] ~~109.3~~ 109.4 Work commencing before permit issuance. Any person who commences any work before obtaining the necessary permits shall be subject to ~~an additional a~~ fee established by the applicable governing authority, which shall be in addition to the required permit fees.

[A] ~~109.4~~ 109.5 Related fees. The payment of the fee for the construction, alteration, removal or demolition of work done in connection to or concurrently with the work or activity authorized by a permit shall not relieve the applicant or holder of the permit from the payment of other fees that are prescribed by law.

[A] ~~109.5~~ 109.6 **Refunds.** The applicable governing authority is authorized to establish a refund policy.

2018 International Zoning Code

Revise as follows:

SECTION 111 FEES

[A] **111.1 Fees.** A fee for services shall be charged. Fees shall be set by the jurisdiction and schedules shall be available at the office of the code official.

111.2 Refunds. The code official is authorized to establish a refund policy.

Reason: There are two different proposals to address consistency in the Fees section – the end result would be coordination between all codes. The intent is consistency in language for ‘Fees’ within the codes – IBC, IFC, IEBC, IWUIC, IZC, Energy – Commercial and Residential.

- Payment of fees – consistent title, always two sentences
- Schedule of permit fees – IBC currently also includes “structures”, while IFC and IEBC also includes “alterations”. IWUIC and Energy do not include anything. Eliminate the laundry list and make all codes consistent.
- Permit valuation: added valuation to IWUIC and Energy; permits can be for other than just buildings
- Work commencing before permit issuance – remove redundant language
- Refunds – no change
- The IZC currently has a section on fees that is very limited. It was not clear what should be added other than a section on refunds.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals.”

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as “building/fire/code official”.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change that provides consistency between I-codes.

ADM33-19 Part I

Public Hearing Results

Errata: This proposal includes published errata
Added proponent to the code change. Corrected hearing committee banner.

Committee Action:

As Modified

Committee Modification:
2018 International Fire Code

106.3 Permit valuations. The applicant for a permit shall provide an estimated permit value at time of application. Permit valuations shall include total value of work, including materials and labor, for which the permit is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. If, in the opinion of the building fire code official, the valuation is underestimated on the application, the permit shall be denied, unless the applicant can show detailed estimates to meet the approval of the building fire code official. Final building permit valuation shall be set by the building fire code official.

Committee Reason: The committee stated that the reason for the approval of the modification was the specific improvement to the language for its use in the IFC by using the common title to match the existing language. The reason for approval of the proposal was based on the proponent's reason statement. (Vote: 13-0).

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEES.

2018 International Building Code

Revise as follows:

[A] 110.6 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *building official*. The *building official*, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the *permit* holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *building official*.

2018 International Plumbing Code

Revise as follows:

[A] 107.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Mechanical Code

Revise as follows:

[A] 107.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Fuel Gas Code

[A] 107.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Existing Building Code

:

[A] 109.6 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *code official*. The *code official*, on notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed or shall notify the permit holder or an agent of the permit holder wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *code official*.

2018 International Swimming Pool and Spa Code

:

[A] 106.6 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspection and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this ~~code.~~code. The notification

shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Private Sewage Disposal Code

:

[A] 107.4 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Wildland-Urban Interface Code

Revise as follows:

[A] 110.1.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Fire Code

Revise as follows:

[A] 107.2.2 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *fire code official*. The *fire code official*, on notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing and include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected, and such portion shall not be covered or concealed until authorized by the *fire code official*.

Reason: As written there is no set method of notification. Putting the violation in writing including the chapter and section number(s) would greatly improve the permit holders understanding of the violation. This would reduce the amount of communication and time required to determine the actual violation. Having the chapter and section number(s) would give the permit holder immediate direction as to how to correct the violation.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
While no cost impact was selected an argument could be made that the permit holder may save money by saving time trying to contact the building official.

ADM37-19 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the reasons for disapproval were as follows: making this a mandatory requirement is too much of a burden to have to provide the information for every violation, the information can already be requested and that it should be up to each jurisdiction to determine the need for providing the information. Those that were opposed to the disapproval stated that the applicant is entitled to the information, it acts as an educator and it should be specific in order to avoid unnecessary repeated inspections. (Vote: 9-4)

2018 International Building Code

[A] 110.6 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *building official*. The *building official*, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the *permit* holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing, ~~and When requested, the building official shall~~ include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *building official*.

2018 International Plumbing Code

[A] 107.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing, ~~and When requested, the code official shall~~ include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Mechanical Code

[A] 107.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing, ~~and When requested, the code official shall~~ include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Fuel Gas Code

[A] 107.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing, ~~and When requested, the code official shall~~ include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Existing Building Code

[A] 109.6 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *code official*. The *code official*, on notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed or shall notify the permit holder or an agent of the permit holder wherein the same fails to comply with this code. The notification shall be in writing, ~~and When requested, the code official shall~~ include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *code official*.

2018 International Swimming Pool and Spa Code

[A] 106.6 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspection and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing, ~~and When requested, the code official shall~~ include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Private Sewage Disposal Code

[A] 107.4 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing, ~~and When requested, the code official shall~~ include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Wildland-Urban Interface Code

[A] 110.1.2.3 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing. ~~and~~ When requested, the code official shall include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.

2018 International Fire Code

[A] 107.2.2 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *fire code official*. The *fire code official*, on notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or notify the permit holder or his or her agent wherein the same fails to comply with this code. The notification shall be in writing. ~~and~~ When requested, the fire code official shall include specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected, and such portion shall not be covered or concealed until authorized by the *fire code official*.

Commenter's Reason: The original proposal was too restrictive for many jurisdictions. There is not enough time to include the section numbers for every item found during an inspection. In addition, most inspectors do not memorize specific code references. Therefore, they would need to take the time to look up the reference in the code. Therefore, the committee disapproved this item. We agree with the proponent that some inspectors require things that are not reference in the code. They prefer to have buildings built the way they would build them. Therefore, it is reasonable that if the builder requests a code reference, the inspector should be able to provide that information. If it is not in the code, they should not be requiring it. We have proposed language that would require the inspector to provide the code reference when requested by the builder, owner or architect. This is reasonable request.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an administrative requirement on the inspector and should not affect the cost of construction at all.

Public Comment# 1325

ADM37-19 Part II

IRC®: R109.4

Proposed Change as Submitted

Proponents: Robert DeVries, representing Self (rdevries@nuwool.com)

2018 International Residential Code

Revise as follows:

R109.4 Approval required. Work shall not be done beyond the point indicated in each successive inspection without first obtaining the approval of the *building official*. The *building official*, upon notification, shall make the requested inspections and shall either indicate the portion of the construction that is satisfactory as completed, or shall notify the *permit* holder or an agent of the *permit* holder wherein the same fails to comply with this code. The notification shall include, in writing, specific reference to the code chapter and section number(s) in violation. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the *building official*.

Reason: As written there is no set method of notification. Putting the violation in writing including the chapter and section number(s) would greatly improve the permit holders understanding of the violation. This would reduce the amount of communication and time required to determine the actual violation. Having the chapter and section number(s) would give the permit holder immediate direction as to how to correct the violation.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

While no cost impact was selected an argument could be made that the permit holder may save money by saving time trying to contact the building official.

ADM37-19 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is language that addresses a local process. It is not suited for a national code. These requirements would slow down the inspection process. (Vote: 9-2)

Assembly Action:

None

ADM39-19 Part II

IRC@: SECTION R111, R111.1, R111.2, R111.3

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgac@iccsafe.org); Michael O'Brian, representing FCAC (fcac@iccsafe.org)

2018 International Residential Code

Revise as follows:

SECTION R111 SERVICE UTILITIES

R111.1 Connection of service utilities. A person shall not make connections from a utility, source of energy, fuel, or power, water system or sewer system to any building or system that is regulated by this code for which a permit is required, until approved by the building official.

R111.2 Temporary connection. The building official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel or power, water system or power system for the purpose of testing systems or for use under a temporary approval.

R111.3 Authority to disconnect service utilities. The *building official* shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards ~~set forth in Section R102.4 in~~ in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section R111.1 or R111.2. The *building official* shall notify the serving utility and where possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnection, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing as soon as practical thereafter.

ADM39-19 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This would be in violation of the requirements of many public utilities across the country. (Vote: 6-4)

Assembly Action:

ADM39-19 Part II

Individual Consideration Agenda

Public Comment 1:

IRC@: R111.2

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

R111.2 Temporary connection. The building official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

Commenter's Reason: There was no testimony for or against this proposal. The committee was split in their decision. The ICC is a family of codes – Part 1 was approved with the editorial modification indicated here. Connection (through the local utility) would be permitted for testing of a system (per Section R111.2).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-techsupport/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEES.

2018 International Building Code

Revise as follows:

SECTION 112 SERVICE UTILITIES

[A] 112.1 Connection of service utilities. A person shall not make connections from a utility, source of energy, fuel, ~~or power~~, water system or sewer system to any building or system that is regulated by this code for which a permit is required, until ~~released~~ approved by the building official.

[A] 112.2 Temporary connection. The building official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, ~~or power~~, water system or power system for the purpose of testing systems or for use under a temporary approval.

[A] 112.3 Authority to disconnect service utilities. The building official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards ~~set forth in Section 101.4~~ in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 112.1 or 112.2. The building official shall notify the serving utility, and wherever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

2018 International Plumbing Code

Revise as follows:

SECTION 108 SERVICE UTILITIES

~~107.7~~ **108.1 Connection of service utilities.** A person shall not make connections from a utility, source of energy, fuel, power, water system or sewer system to any building or system that is regulated by this code for which a permit is required until authorized by the code official.

~~107.6~~ **108.2 Temporary connection.** The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or power system for the purpose of testing plumbing systems or for use under a temporary ~~certificate of occupancy~~ approval.

108.3 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 108.1 or 108.2. The code official shall notify the serving utility, and wherever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

2018 International Mechanical Code

Revise as follows:

SECTION 108 SERVICE UTILITIES

[A] ~~107-6~~ 108.1 Connection of service utilities. A person shall not make connections from a utility, source of energy, fuel or power to any building or system that is regulated by this code for which a permit is required, until authorized by the code official.

[A] ~~107-5~~ 108.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of ~~a mechanical~~ the building or system to the ~~sources~~ utility, source of energy, fuel, power, water system or power system for the purpose of testing ~~mechanical~~ systems or for use under a temporary ~~certificate of occupancy~~ approval.

108.3 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 108.1 or 108.2. The code official shall notify the serving utility, and wherever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

2018 International Fuel Gas Code

Revise as follows:

SECTION 108 SERVICE UTILITIES

[A] ~~107-6~~ 108.1 Connection of service utilities. A person shall not make connections from a utility, source of energy, fuel or power to any building or system that is regulated by this code for which a permit is required until authorized by the code official.

[A] ~~107-5~~ 108.2 Temporary connection. The code official shall have the authority to ~~allow~~ authorize the temporary connection of ~~an installation~~ the building or system to the ~~sources~~ utility, source of energy, fuel, power, water system or power system for the purpose of testing ~~the installation~~ systems or for use under a temporary ~~certificate of occupancy~~ approval.

108.3 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 108.1 or 108.2. The code official shall notify the serving utility, and wherever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

2018 International Existing Building Code

Revise as follows:

SECTION 111 SERVICE UTILITIES

[A] 111.1 Connection of service utilities. A person shall not make connections from a utility, source of energy, fuel, ~~or~~ power, water system or sewer system to any building or system that is regulated by this code for which a permit is required, until *approved* by the *code official*.

[A] 111.2 Temporary connection. The *code official* shall shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, ~~or~~ power water system or power system for the purpose of testing systems or for use under a temporary approval.

[A] 111.3 Authority to disconnect service utilities. The *code official* shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 111.1 or 111.2. The *code official* shall notify the serving utility and, wherever possible, the owner or the owner's authorized agent and the occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

2018 International Private Sewage Disposal Code

Revise as follows:

SECTION 108 SERVICE UTILITIES

[A] ~~107.9~~ 108.1 Connection of service utilities. No person shall make connections from a utility, source of energy, fuel or power to any building or system that is regulated by this code for which a permit is required until authorized by the code official.

[A] ~~107.8~~ 108.2 Temporary connection. The code official shall have the authority to ~~allow~~ authorize the temporary connection of ~~an installation the building or system to the sources utility, source of energy, fuel, power, water system or power system~~ for the purpose of testing ~~the installation systems~~ or for use under a temporary ~~certificate of occupancy approval~~.

108.3 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 108.1 or 108.2. The code official shall notify the serving utility, and wherever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

2018 International Wildland-Urban Interface Code

Revise as follows:

SECTION 113 SERVICE UTILITIES

[A] 113.1 Connection of service utilities. Any person shall not make connections from a utility, source of energy, fuel, ~~or power,~~ to water system or sewer system to any building or system that is regulated by this code for which a permit is required until ~~released~~ approved by the code official.

113.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or power system for the purpose of testing systems or for use under a temporary approval.

[A] ~~113.2~~ 113.3 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and ~~standards set forth in Section 102.4 in standards~~ in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the ~~release approval~~ required by Section ~~113.1~~ 113.1 and 113.2. The code official shall notify the serving utility and, where possible, the owner or the owner's authorized agent and the occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnection, the owner, the owner's authorized agent or the occupant of the building, structure or service system shall be notified in writing as soon as practical thereafter.

2018 International Swimming Pool and Spa Code

Revise as follows:

SECTION 107 SERVICE UTILITIES

[A] ~~106.19~~ 107.1 Connection of service utilities. A person shall not make connections from a utility, source of energy, fuel, power, water system or sewer system to any building or system that is regulated by this code for which a permit is required until authorized by the code official.

[A] ~~106.18~~ 107.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or power system for the purpose of testing systems or for use under a temporary approval.

107.3 Authority to disconnect service utilities. The code official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 107.1 or 107.2. The code official shall notify the serving utility, and wherever possible the owner or the owner's authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner, the owner's authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

Reason: The main purpose of this proposal is coordination between codes for the section on connection to services – including those coming from utilities or generated on-site. Revisions for the section on temporary services is addressed in a separate proposal. Some of the codes had service utility requirements as part of the inspection section. For consistency across codes, it is proposed to move this to a separate section. Codes have references to codes and standards throughout the document, so a reference back to the list at the beginning of Chapter 1 is not inclusive (IBC, IRC, IWUIC). The list should include all the systems – not all codes included water and sewer systems – so it is proposed to be added as it is currently in the IPC. The authority to disconnect is an important safety feature that needs to be included in all the codes that deal with service utilities. It is proposed to be added to the codes that do not include that provision.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a

series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals.”

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as “building/fire/code official”.

IBC

SECTION 112

SERVICE UTILITIES

[A] 112.1 Connection of service utilities. A person shall not make connections from a utility, source of energy, fuel, power, water system or sewer system to any building or system that is regulated by this code for which a *permit* is required, until approved by the *building official*.

[A] 112.2 Temporary connection. The *building official* shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or power system for the purpose of testing systems or for use under a temporary approval.

[A] 112.3 Authority to disconnect service utilities. The *building official* shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards in case of emergency where necessary to eliminate an immediate hazard to life or property or where such utility connection has been made without the approval required by Section 112.1 or 112.2. The *building official* shall notify the serving utility, and wherever possible the *owner* or the owner’s authorized agent and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the *owner*, the owner’s authorized agent or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial change that provides consistency between I-codes.

Public Hearing Results

Committee Action:

As Modified

Committee Modification:
2018 International Building Code

[A] 112.2 Temporary connection. The building official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

2018 International Plumbing Code

108.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing plumbing systems or for use under a temporary approval.

2018 International Mechanical Code

[A] 108.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

2018 International Fuel Gas Code

[A] 108.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

2018 International Existing Building Code

[A] 111.2 Temporary connection. The *code official* shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

2018 International Private Sewage Disposal Code

[A] 108.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

2018 International Wildland-Urban Interface Code

113.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

2018 International Swimming Pool and Spa Code

[A] 107.2 Temporary connection. The code official shall have the authority to authorize the temporary connection of the building or system to the utility, source of energy, fuel, power, water system or ~~power~~ sewer system for the purpose of testing systems or for use under a temporary approval.

Committee Reason: The reason for the approval of the modification was to improve the language to include sewer systems within the scope of the temporary connection section. The reason for the approval of the proposal was based on the proponent's reason statement. (Vote: 13-0)

ADM40-19 Part II

IRC®: SECTION R112, R112.1, R112.2, R112.3, R112.4

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, representing FCAC (fcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

2018 International Residential Code

Revise as follows:

SECTION R112 ~~BOARD MEANS OF APPEALS~~

R112.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the building official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The ~~building official shall be an ex officio member of said board but shall not have a vote on any matter before the board.~~ The board of appeals shall be appointed by the applicable governing body authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business ; and shall render all decisions and findings in writing to the appellant with a duplicate copy to the building official.

R112.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an ~~equally good equivalent~~ or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

R112.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training to pass judgement on matters pertaining to building construction and are not employees of the *jurisdiction*.

R112.4 Administration. The *building official* shall take immediate action in accordance with the decision of the board.

Reason: The intent is to establish consistent language for the means of appeal throughout the code. The constitution of the board of appeals will be addressed in another change. There is some slight difference in the fire code in the section on limitations on authority and qualification where some differences given the scope of the code are appropriate to remain. The IPMC includes an additional section for stays of enforcement.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

SECTION 113

MEANS OF APPEALS

[A] 113.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the *code official* relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the *code official*.

[A] 113.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equivalent or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

[A] 113.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

[A] 113.4 Administration. The *code official* shall take immediate action in accordance with the decision of the board.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable,

Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial proposal with no change to construction requirements.

ADM40-19 Part II

Public Hearing Results

Errata: This proposal includes published errata
Added proponent to the code change.

Committee Action:

Disapproved

Committee Reason: The code official needs to be able to give the board guidance and help interpret what is required by the code. We need to be able to appeal the entire code and not leave certain parts out. (Vote: 11-0)

Assembly Action:

None

ADM40-19 Part II

Individual Consideration Agenda

Public Comment 1:

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Submitted

Commenter's Reason: ADM40 Part 1, 4 and 5 were approved for IBC, IEBC, IFC, IWUIC, IPC, IMC, IFGC, ISPSC, IPMC, IPSDC, IPSDC, IECC-Residential, IGCC. The committee had concerns about the make up of the board, and where a local or state jurisdiction made decisions. This section is to address the means for someone to appeal. The requirements for the board is addressed in ADM43.

Section R112.1 had the following sentence deleted (The *building official* shall be an ex officio member of said board but shall not have a vote on any

matter before the board.). This is already addressed in R112.3 with the board not being able to be employees of the jurisdiction. The code official would typically be involved in the process to provide information.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-techsupport/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

Public Comment# 1227

ADM40-19 Part III

IECC®: SECTION C109, C109.1, C109.2, C109.3, C109.4

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, representing FCAC (fcac@iccsafe.org); Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

2018 International Energy Conservation Code

Revise as follows:

SECTION C109 ~~BOARD MEANS OF APPEALS~~

C109.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. ~~The code official shall be an ex officio member of said board but shall not have a vote on any matter before the board.~~ The board of appeals shall be appointed by the applicable governing body authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business ; and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.

C109.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good equivalent or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

C109.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

C109.4 Administration. The code official shall take immediate action in accordance with the decision of the board.

Reason: The intent is to establish consistent language for the means of appeal throughout the code. The constitution of the board of appeals will be addressed in another change. There is some slight difference in the fire code in the section on limitations on authority and qualification where some differences given the scope of the code are appropriate to remain. The IPMC includes an additional section for stays of enforcement.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

SECTION 113

MEANS OF APPEALS

[A] 113.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the *code official* relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the *code official*.

[A] 113.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equivalent or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

[A] 113.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

[A] 113.4 Administration. The *code official* shall take immediate action in accordance with the decision of the board.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable,

Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial proposal with no change to construction requirements.

ADM40-19 Part III

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed revisions place an undue burden on code officials. It is unreasonable to expect 'immediate' action. Perhaps 'timely' may be a better term. (Vote 12-3)

Assembly Action:

None

ADM40-19 Part III

Individual Consideration Agenda

Public Comment 1:

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); David Collins, representing SEHPCAC (sehpcac@iccsafe.org)

requests As Submitted

Commenter's Reason: ADM40 Parts 1, 4 and 5 were approved for coordination between IBC, IEBC, IFC, IWUIC, IPC, IMC, IFGC, ISPSC, IPMC, IPSDC, IECC-Residential, IGCC. The committee was concerned about the word "immediate" in Section 113.4. This is in the current IRC. It is only applicable if a building has gone through a means of appeals and the board has made a decision. This should not be an undue burden on a building official. The intent is only to address the concern in a timely manner – not immediately following the meeting.

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the

International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial change that provides consistency between I-codes.

2018 International Building Code

Revise as follows:

SECTION 113 ~~BOARD MEANS OF APPEALS~~

[A] 113.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the building official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the building official.

[A] 113.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good equivalent or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

[A] 113.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

Add new text as follows:

113.4 Administration. The building official shall take immediate action in accordance with the decision of the board.

2018 International Existing Building Code

Revise as follows:

SECTION 112 ~~BOARD MEANS OF APPEALS~~

[A] 112.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing ~~body~~ authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the building official.

[A] 112.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good equivalent or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

[A] 112.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

Add new text as follows:

113.4 Administration. The code official shall take immediate action in accordance with the decision of the board.

2018 International Fire Code

Revise as follows:

SECTION 109 **BOARD MEANS OF APPEALS**

[A] 109.1 Board of appeals established. In order to hear and decide appeals of orders, decisions or determinations made by the fire code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing body authority and shall hold office at its pleasure. ~~The fire code official shall be an ex officio member of said board but shall not have a vote on any matter before the board.~~ The board shall adopt rules of procedure for conducting its business ; and shall render all decisions and findings in writing to the appellant with a duplicate copy to the fire code official.

[A] 109.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted hereunder thereunder have been incorrectly interpreted, the provisions of this code do not fully apply ; or an equivalent ~~method of protection or safety or better form of construction~~ is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

[A] 109.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training to pass on matters pertaining to hazards of fire, explosions, hazardous conditions or *fire protection systems*, and are not employees of the jurisdiction.

Add new text as follows:

109.4 Administration. The fire code official shall take immediate action in accordance with the decision of the board.

2018 International Wildland-Urban Interface Code

Revise as follows:

SECTION 106 **MEANS OF APPEALS**

[A] 106.1 General. ~~To determine the suitability of alternative materials and methods and to provide for reasonable interpretations of the provisions in order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby is created a board of appeals consisting of five members who are qualified by experience and training to pass judgment on pertinent matters. The code official, building official and fire chief shall be ex officio members, and the code official shall act as secretary of the board. The appeals. The board of appeals shall be appointed by the legislative body applicable governing authority and shall hold office at their discretion its pleasure. The board shall adopt reasonable rules and regulations of procedure for conducting its investigations business and shall render all decisions and findings in writing to the code official, appellant with a duplicate copy to the applicant code official.~~

[A] 106.2 Limitations of authority. ~~The board of appeals shall not have authority relative to interpretation of the administrative provisions of this code and~~ An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equivalent or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

Add new text as follows:

106.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

Revise as follows:

106.4 Administration. The code official shall take immediate action in accordance with the decision of the board.

2018 International Plumbing Code

Revise as follows:

SECTION 109 **MEANS OF APPEAL APPEALS**

Add new text as follows:

109.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and

interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.

Revise as follows:

~~109.1 109.2 Application for appeal. Limitations on authority.~~ Any person shall have the right to appeal a decision of the code official to the board of appeals. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply, or an equally good equivalent or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served. board shall not have authority to waive requirements of this code or interpret the administration of this code.

109.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

109.4 Administration. The code official shall take immediate action in accordance with the decision of the board.

SECTION 110 **BOARD OF APPEALS**

~~109.2 110.1 Membership of board.~~ The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for 5 years, one for 4 years, one for 3 years, one for 2 years and one for 1 year. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.

2018 International Mechanical Code

Revise as follows:

SECTION 109 **MEANS OF APPEAL APPEALS**

Add new text as follows:

109.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.

Revise as follows:

[A] ~~109.1 109.2 Application for appeal. Limitations on authority.~~ A person shall have the right to appeal a decision of the code official to the board of appeals. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply, or an equally good equivalent or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served. board shall not have authority to waive requirements of this code or interpret the administration of this code.

Delete without substitution:

[A] ~~109.1.1 Limitation of authority.~~ The board of appeals shall not have authority relative to interpretation of the administration of this code nor shall such board be empowered to waive requirements of this code.

Add new text as follows:

109.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

Revise as follows:

109.4 Administration The code official shall take immediate action in accordance with the decision of the board.

SECTION 110 **BOARD OF APPEALS**

[A] ~~109.2 110.1 Membership of board.~~ The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for 5 years; one for 4 years; one for 3 years; one for 2 years; and one for 1 year. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.

2018 International Fuel Gas Code

Revise as follows:

SECTION 109 (IFGC) MEANS OF APPEAL

109.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.

[A] ~~109.1~~ 109.2 Application for appeal. Limitations on authority. A person shall have the right to appeal a decision of the code official to the board of appeals. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good equivalent or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served. board shall not have authority to waive requirements of this code or interpret the administration of this code.

109.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

109.4 Administration. The code official shall take immediate action in accordance with the decision of the board.

SECTION 110 BOARD OF APPEALS

[A] ~~109.2~~ 110.1 Membership of board. The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for 5 years; one for 4 years; one for 3 years; one for 2 years and one for 1 year. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.

2018 International Swimming Pool and Spa Code

Revise as follows:

SECTION 108 MEANS OF APPEAL

108.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.

[A] ~~108.1~~ 108.2 Application for appeal. Limitations on authority. Any person shall have the right to appeal a decision of the code official to the board of appeals. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted there under thereunder have been incorrectly interpreted, the provisions of this code do not fully apply ,or an equally good equivalent or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served. board shall not have authority to waive requirements of this code or interpret the administration of this code.

108.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

108.4 Administration. The code official shall take immediate action in accordance with the decision of the board.

SECTION 109 BOARD OF APPEALS

[A] ~~108.2~~ 109.1 Membership of board. The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for 5 years, one for 4 years, one for 3 years, one for 2 years and one for 1 year. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.

2018 International Property Maintenance Code

Revise as follows:

SECTION 111 MEANS OF APPEAL

111.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and

interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.

[A] ~~111.1~~ 111.2 Application for appeal. Limitations on authority. Any person directly affected by a decision of the code official or a notice or order issued under this code shall have the right to appeal to the board of appeals, provided that a written application for appeal is filed within 20 days after the day the decision, notice or order was served. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply, ~~or the or an equivalent or better form of construction is proposed.~~ The board shall not have authority to waive requirements of this code ~~are adequately satisfied by other means, or interpret the administration of this code.~~

111.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

111.4 Administration. The code official shall take immediate action in accordance with the decision of the board.

[A] ~~111.8~~ 111.5 Stays of enforcement. Appeals of notice and orders (other than *Imminent Danger* notices) shall stay the enforcement of the notice and order until the appeal is heard by the appeals board.

SECTION 112 **BOARD OF APPEALS**

[A] ~~111.2~~ 112.1 Membership of board. The board of appeals shall consist of not less than three members who are qualified by experience and training to pass on matters pertaining to property maintenance and who are not employees of the jurisdiction. The *code official* shall be an ex-officio member but shall not vote on any matter before the board. The board shall be appointed by the chief appointing authority, and shall serve staggered and overlapping terms.

2018 International Private Sewage Disposal Code

Revise as follows:

SECTION 109 **MEANS OF APPEAL**

109.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.

[A] ~~109.1~~ 109.2 Application for appeal. Limitations on authority. Any person shall have the right to appeal a decision of the code official to the board of appeals. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder ~~has have~~ been incorrectly interpreted, the provisions of this code do not fully apply or an ~~equally good equivalent~~ or better form of construction is proposed. The ~~application shall be filed on a form obtained from the code official within 20 days after the notice was served.~~ board shall not have authority to waive requirements of this code or interpret the administration of this code.

109.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

109.4 Administration The code official shall take immediate action in accordance with the decision of the board.

SECTION 110 **BOARDS OF APPEALS**

[A] ~~109.2~~ 110.1 Membership of board. The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for 5 years, one for 4 years, one for 3 years, one for 2 years and one for 1 year. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.

Reason: The intent is to establish consistent language for the means of appeal throughout the code. The constitution of the board of appeals will be addressed in another change. There is some slight difference in the fire code in the section on limitations on authority and qualification where some differences given the scope of the code are appropriate to remain. The IPMC includes on additional section for stays of enforcement.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code

change proposals.”

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as “building/fire/code official”.

SECTION 113

MEANS OF APPEALS

[A] 113.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the *code official* relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business and shall render all decisions and findings in writing to the appellant with a duplicate copy to the *code official*.

[A] 113.2 Limitations on authority. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted thereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equivalent or better form of construction is proposed. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

[A] 113.3 Qualifications. The board of appeals shall consist of members who are qualified by experience and training and are not employees of the jurisdiction.

[A] 113.4 Administration. The *code official* shall take immediate action in accordance with the decision of the board.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial proposal with no change to construction requirements.

2018 International Residential Code

Add new text as follows:

APPENDIX A **BOARD OF APPEALS**

SECTION A101 **GENERAL**

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section R112 (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the code official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the building official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the building official within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

A101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The building official shall be an ex officio member of said board but shall not vote on any matter before the board.

A101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority is authorized to appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

A101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

A101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

A101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

A101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

A101.7 Board decision. The board shall only modify or reverse the decision of the building official by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the building official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the building official.

A101.7.2 Administration. The building official shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

Reason: The intent of this proposal is to have a consistent set of requirements for the Board of Appeals. The right for someone to have an appeal is addressed in a separate proposal for Means of Appeals. Currently the IBC and IFC have these requirements in an appendix, while other codes either don't have it at all or have it in the text. It was felt that appendix was a more appropriate place to allow for the jurisdiction to establish their own criteria, or to use this appendix as a template.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

APPENDIX A

BOARD OF APPEALS

SECTION A101

GENERAL

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section XXX (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the *code official* pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the *code official* to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the *code official* within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

A101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The *code official* shall be an ex officio member of said board but shall not vote on any matter before the board.

A101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority may appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

A101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

A101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

A101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

A101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the *code official* and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

A101.7 Board decision. The board shall only modify or reverse the decision of the *code official* by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the *code official* within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the *code official*.

A101.7.2 Administration. The *code official* shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac/>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial correlation and an option for jurisdictions to follow.

ADM43-19 Part II

Individual Consideration Agenda

Public Comment 1:

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Submitted

Commenter's Reason: The main intent of the BCAC Administrative proposals for ICC to be considered a family of codes. ADM40 Part 1 and Part 3 were approved as submitted, therefore, this Appendix for the Board of Appeals will be in multiple codes.

In regards to the IRC provisions, ADM 40 Part 2 and ADM 43 Part 2 were intended to work together. The provisions currently in the IRC Section R112 (ADM 40 Part 2) are specific to customers having a means to appeal. The requirements for an actual Board of Appeals is provided in an appendix (ADM 43 Part 2) to provide guidance for a jurisdiction that might need this. The jurisdiction has the ability to make any modifications they feel are appropriate or use another model.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-techsupport/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an editorial correlation and an option for jurisdictions to follow.

2018 International Energy Conservation Code

Add new text as follows:

APPENDIX RA **BOARD OF APPEALS-RESIDENTIAL**

SECTION RA101 **GENERAL**

RA101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section R109 (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the code official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

RA101.2 Application for appeal. Any person shall have the right to appeal a decision of the code official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served.

RA101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

RA101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

RA101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The code official shall be an ex officio member of said board but shall not vote on any matter before the board.

RA101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

RA101.3.2 Alternate members. The chief appointing authority is authorized to appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

RA101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

RA101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

RA101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

RA101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

RA101.3.7 Compensation of members. Compensation of members shall be determined by law.

RA101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

RA101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

RA101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

RA101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

RA101.5.2 Quorum. Three members of the board shall constitute a quorum.

RA101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

RA101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

RA101.7 Board decision. The board shall only modify or reverse the decision of the code official by a concurring vote of three or more members.

RA101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the code official.

RA101.7.2 Administration. The code official shall take immediate action in accordance with the decision of the board.

RA101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

Reason: The intent of this proposal is to have a consistent set of requirements for the Board of Appeals. The right for someone to have an appeal is addressed in a separate proposal for Means of Appeals. Currently the IBC and IFC have these requirements in an appendix, while other codes either don't have it at all or have it in the text. It was felt that appendix was a more appropriate place to allow for the jurisdiction to establish their own criteria, or to use this appendix as a template.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

APPENDIX A

BOARD OF APPEALS

SECTION A101

GENERAL

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section XXX (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the *code official* pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the *code official* to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the *code official* within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

A101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The *code official* shall be an ex officio member of said board but shall not vote on any matter before the board.

A101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority may appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

A101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

A101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

A101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

A101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the *code official* and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

A101.7 Board decision. The board shall only modify or reverse the decision of the *code official* by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the *code official* within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the *code official*.

A101.7.2 Administration. The *code official* shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

2018 International Building Code

APPENDIX B BOARD OF APPEALS

Revise as follows:

SECTION B101 GENERAL

Delete without substitution:

~~[A] B101.1 Application. Applications for appeal shall be obtained from the building official. Applications shall be filed within 20 days after notice has been served.~~

Add new text as follows:

B101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section 113 (Means of Appeals). The board shall be established and operated in

accordance with this section, and shall be authorized to hear evidence from appellants and the building official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

B101.2 Application for appeal. Any person shall have the right to appeal a decision of the building official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the building official within 20 days after the notice was served.

B101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

B101.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

Revise as follows:

[A] ~~B401.2~~ B101.3 Membership of board. The board of appeals shall consist of ~~persons~~ five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The code official shall be an ex officio member of said board but shall not vote on any matter before the board. ~~as follows:~~

- ~~1. One for 5 years; one for 4 years; one for 3 years; one for 2 years; and one for 1 year.~~
- ~~2. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.~~

~~The building official shall be an ex officio member of said board but shall have no vote on any matter before the board.~~

[A] ~~B401.2.2~~ B101.3.1 Qualifications. The board of appeals shall consist of five individuals, ~~who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction~~ one from each of the following professions or disciplines:

- ~~1. Registered design professional with architectural experience or a builder or superintendent of building construction with not fewer than 10 years of experience, 5 of which shall have been in responsible charge of work.~~
- ~~2. Registered design professional with structural engineering experience.~~
- ~~3. Registered design professional with mechanical and plumbing engineering experience or a mechanical contractor with not fewer than 10 years of experience, 5 of which shall have been in responsible charge of work.~~
- ~~4. Registered design professional with electrical engineering experience or an electrical contractor with not fewer than 10 years of experience, 5 of which shall have been in responsible charge of work.~~
- ~~5. Registered design professional with fire protection engineering experience or a fire protection contractor with not fewer than 10 years of experience, 5 of which shall have been in responsible charge of work.~~

[A] ~~B401.2.1~~ B101.3.2 Alternate members. The chief appointing authority ~~shall be authorized to~~ appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, ~~and shall be appointed for 5 years, the same term~~ or until a successor has been appointed.

Add new text as follows:

B101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

Revise as follows:

[A] ~~B401.2.4~~ B101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

[A] ~~B401.2.6~~ B101.3.5 Secretary. The chief ~~administrative officer~~ appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings ~~in the office of the chief administrative officer, which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.~~

[A] ~~B401.2.5~~ B101.3.6 Disqualification-Conflict of member; interest. A member ~~shall not hear an appeal in which that member has a with~~ any personal, professional or financial ~~interest~~ interest in a matter before the board shall declare such interest and refrain from participating in ~~discussions, deliberations and voting on such matters.~~

[A] ~~B401.2.7~~ B101.3.7 Compensation of members. Compensation of members shall be determined by law.

Add new text as follows:

B101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

Revise as follows:

[A] ~~B401.2.3~~ B101.4 Rules and procedures. The board ~~is authorized to~~ shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

[A] ~~B401.3~~ B101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic meetings.

[A] ~~B401.3.1~~ B101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the building official and any person whose interests are affected shall be given an opportunity to be heard.

Add new text as follows:

B101.5.2 Quorum. Three members of the board shall constitute a quorum.

Delete without substitution:

[A] ~~B401.3.2~~ Procedure. The board shall adopt and make available to the public through the secretary procedures under which a hearing will be conducted. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be received.

Revise as follows:

[A] ~~B401.3.3~~ B101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

Add new text as follows:

B101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

Revise as follows:

[A] ~~B401.4~~ B101.7 Board decision. The board shall modify or reverse the decision of the *building official* by a concurring vote of two-thirds of its members. The board shall only modify or reverse the decision of the code official by a concurring vote of three or more members.

[A] ~~B401.4.1~~ B101.7.1 Resolution. The decision of the board shall be by resolution. Certified copies shall be ~~Every decision shall be promptly filed in writing in the office of the code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the *building code official*.~~

[A] ~~B401.4.2~~ B101.7.2 Administration. The *building official* shall take immediate action in accordance with the decision of the board.

Add new text as follows:

B101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

2018 International Existing Building Code

Add new text as follows:

APPENDIX A **BOARD OF APPEALS**

SECTION A101 **GENERAL**

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section 112. The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the code official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the code official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

A101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each

member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The code official shall be an ex officio member of said board but shall not vote on any matter before the board.

A101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority is authorized to appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

A101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

A101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

A101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

A101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

A101.7 Board decision. The board shall only modify or reverse the decision of the code official by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the code official.

A101.7.2 Administration. The code official shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

2018 International Fire Code

APPENDIX A BOARD OF APPEALS

Revise as follows:

SECTION A101 GENERAL

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the

requirements of the International Fire Code ~~this code~~ pursuant to the provisions of Section ~~108 of the International Fire Code~~ 109. The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the fire code official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

Add new text as follows:

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the fire code official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the fire code official within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A102.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

Delete without substitution:

~~A101.2 Membership.~~ ~~The membership of the board shall consist of five voting members having the qualifications established by this section. Members shall be nominated by the fire code official or the chief administrative officer of the jurisdiction, subject to confirmation by a majority vote of the governing body. Members shall serve without remuneration or compensation, and shall be removed from office prior to the end of their appointed terms only for cause.~~

~~A101.2.1 Design professional.~~ ~~One member shall be a practicing design professional registered in the practice of engineering or architecture in the state in which the board is established.~~

~~A101.2.2 Fire protection engineering professional.~~ ~~One member shall be a qualified engineer, technologist, technician or safety professional trained in fire protection engineering, fire science or fire technology. Qualified representatives in this category shall include fire protection contractors and certified technicians engaged in fire protection system design.~~

~~A101.2.3 Industrial safety professional.~~ ~~One member shall be a registered industrial or chemical engineer, certified hygienist, certified safety professional, certified hazardous materials manager or comparably qualified specialist experienced in chemical process safety or industrial safety.~~

~~A101.2.4 General contractor.~~ ~~One member shall be a contractor regularly engaged in the construction, alteration, maintenance, repair or remodeling of buildings or building services and systems regulated by the code.~~

~~A101.2.5 General industry or business representative.~~ ~~One member shall be a representative of business or industry not represented by a member from one of the other categories of board members described in Sections A101.2.1 through A101.2.4.~~

Revise as follows:

A101.3 Terms-Membership of office: board. Members shall be appointed for terms of 4 years. Members shall not be reappointed to serve more than two consecutive full terms.

The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The fire code official shall be an ex officio member of said board but shall not vote on any matter before the board.

Delete without substitution:

~~A101.3.1 Initial appointments.~~ ~~Of the members first appointed, two shall be appointed for a term of 1 year, two for a term of 2 years, one for a term of 3 years.~~

Add new text as follows:

A101.3.1 Qualifications. The board shall consist of members who are qualified by experience and training to pass on matters pertaining to hazards of fire, explosions, hazardous conditions or fire protection systems, and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority is authorized to appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

Revise as follows:

A101.3.2 A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made. Members appointed to fill a vacancy in an unexpired term shall be eligible for reappointment to two full terms.

Add new text as follows:

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

Revise as follows:

~~A101-5~~ **A101.3.5 Secretary of board.** The ~~fire code official~~ shall act as secretary of the board and shall keep chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all its proceedings ; which shall set forth the reasons for its decisions the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

Delete without substitution:

~~A101-9~~ **Decisions.** Every decision shall be promptly filed in writing in the office of the ~~fire code official~~ and shall be open to public inspection. A certified copy shall be sent by mail or otherwise to the appellant, and a copy shall be kept publicly posted in the office of the ~~fire code official~~ for 2 weeks after filing.

Revise as follows:

~~A101-8~~ **A101.3.6 Conflict of interest.** ~~Members with a material~~ A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

Add new text as follows:

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

Revise as follows:

~~A101-3-3~~ **A101.3.8 Removal from office the board.** ~~Members~~ A member shall be removed from office the board prior to the end of their terms only for cause. ~~Continued absence of any member cause. Any member with continued absence from regular meetings meeting of the board shall, may be removed at the discretion of the applicable governing body, render any such member liable to immediate removal from office.~~ chief appointing authority.

~~A101-10~~ **A101.4 Procedures. Rules and procedures.** The board shall be operated in accordance with the Administrative Procedures Act of the state in which it is established or shall establish rules and regulations for its own procedure not inconsistent establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

~~A101-7~~ **A101.5 Meetings. Notice of meetings.** The board shall meet at regular intervals, to be determined by the chairman. In any event, the board shall meet upon notice from the chairperson, within 10 days ~~after notice of appeal has been received. the filing of an appeal or at stated periodic intervals.~~

Add new text as follows:

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the fire code official and any person whose interests are affected shall be given an opportunity to be heard.

Revise as follows:

~~A101-4~~ **A101.5.2 Quorum.** Three members of the board shall constitute a quorum. ~~In varying the application of any provisions of this code or in modifying an order of the fire code official, affirmative votes of the majority present, but not less than three, shall be required.~~

Add new text as follows:

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

Revise as follows:

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for ~~consideration~~ consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

Add new text as follows:

A101.7 Board decision. The board shall only modify or reverse the decision of the fire code official by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the fire code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the fire code official.

A101.7.2 Administration. The fire code official shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the

2018 International Fuel Gas Code

Add new text as follows:

APPENDIX A **BOARD OF APPEALS**

A101 **GENERAL**

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section 109 (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the code official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the code official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

Revise as follows:

[A] ~~109-2~~ **A101.3 Membership of board.** The board of appeals shall consist of five voting members appointed by the chief appointing authority as follows: one for 5 years; one for 4 years; one for 3 years; one for 2 years and one for 1 year. Thereafter, each new of the jurisdiction. Each member shall serve for 5 [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The code official shall be an ex officio member of said board but shall not vote on any matter before the board.

[A] ~~109-2.1~~ **A101.3.1 Qualifications.** The board of appeals shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction, one from each of the following professions or disciplines:

Add new text as follows:

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

Revise as follows:

~~[A] 111.4.1~~ **A101.4 Procedure Rules and procedures.** The board shall ~~adopt and make available to the public through the secretary procedures under which a hearing will be conducted. establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law.~~ The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be ~~received presented~~.

~~[A] 111.3~~ **A101.5 Notice of meeting.** The board shall meet upon notice from the ~~chairman chairperson~~, within ~~20 10~~ days of the filing of an appeal, or at stated periodic ~~meetings intervals~~.

Add new text as follows:

[A] A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

Revise as follows:

~~[A] 111.5~~ **A101.5.3 Postponed hearing.** When ~~the full board is~~ five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

Add new text as follows:

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

Revise as follows:

[A] ~~411.6~~ A101.7 Board decision. The board shall only modify or reverse the decision of the code official ~~only~~ by a concurring vote of a majority of the total number of appointed board ~~three or more~~ members.

[A] ~~411.6.1~~ A101.7.1 Records and copies. Resolution. The decision of the board shall be ~~recorded~~. Copies shall be ~~by resolution~~. Every decision shall be promptly filed in writing in the office of the code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the code official.

[A] ~~411.6.2~~ A101.7.2 Administration. The code official shall take immediate action in accordance with the decision of the board.

[A] ~~411.7~~ A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

2018 International Swimming Pool and Spa Code

Add new text as follows:

APPENDIX A **BOARD OF APPEALS**

SECTION A101 **GENERAL**

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section 108 (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the code official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the code official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

Revise as follows:

[A] ~~408.2~~ A101.3 Membership of board. The board of appeals shall consist of five voting members appointed by the chief appointing authority as follows: one for 5 years, one for 4 years, one for 3 years, one for 2 years and one for 1 year. Thereafter, each new of the jurisdiction. Each member shall serve for 5 [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The code official shall be an ex officio member of said board but shall not vote on any matter before the board.

[A] ~~408.2.1~~ A101.3.1 Qualifications. The board of appeals shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction, one from each of the following professions or disciplines:

1. Registered design professional who is a registered architect; or a builder or superintendent of building construction with not less than 10 years' experience, 5 years of which shall have been in responsible charge of work.
2. Registered design professional with structural engineering or architectural experience.
3. Registered design professional with mechanical and plumbing engineering experience; or a mechanical and plumbing contractor with not less than 10 years' experience, 5 years of which shall have been in responsible charge of work.
4. Registered design professional with electrical engineering experience; or an electrical contractor with not less than 10 years' experience, 5 years of which shall have been in responsible charge of work.
5. Registered design professional with pool or spa experience; or a contractor with not less than 10 years' experience, 5 years of which shall have been in responsible charge of work.

[A] ~~408.2.2~~ A101.3.2 Alternate members. The chief appointing authority shall be authorized to appoint two alternate members who shall be called by the board chairman-chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for 5 years the same term or until a successor has been appointed.

Add new text as follows:

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

Revise as follows:

[A] ~~408.2.3~~ A101.3.4 Chairman. Chairperson. The board shall annually select one of its members to serve as chairman-chairperson.

[A] ~~108-2.5~~ A101.3.5 Secretary. The chief administrative officer ~~appointing authority~~ shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings in the office of the chief administrative officer, which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

[A] ~~108-2.4~~ A101.3.6 Disqualification-Conflict of member interest. A member ~~shall not hear an appeal in which that member has with~~ any personal, professional or financial ~~interest; interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.~~

[A] ~~108-2.6~~ A101.3.7 Compensation of members. Compensation of members shall be determined by law.

Add new text as follows:

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

Revise as follows:

[A] ~~108-4.1~~ A101.4 Procedure, Rules and procedures. The board shall ~~adopt and make available to the public through the secretary procedures under which a hearing will be conducted; establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law.~~ The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be ~~received; presented.~~

[A] ~~108-3~~ A101.5 Notice of meeting. The board shall meet upon notice from the ~~chairman~~ chairperson, within 10 days of the filing of an appeal or at stated periodic ~~meetings; intervals.~~

[A] ~~108-4~~ A101.5.1 Open hearing. ~~Hearings-~~All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

Add new text as follows:

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

Revise as follows:

[A] ~~108-5~~ A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

Add new text as follows:

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

Revise as follows:

[A] ~~108-6~~ A101.7 Board decision. The board shall only modify or reverse the decision of the code official by a concurring vote of three or more members.

[A] ~~108-6.1~~ A101.7.1 Resolution. The decision of the board shall be by resolution. ~~Certified copies shall be-~~Every decision shall be promptly filed in writing in the office of the code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the code official.

[A] ~~108-6.2~~ A101.7.2 Administration. The code official shall take immediate action in accordance with the decision of the board.

[A] ~~108-7~~ A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

2018 International Wildland-Urban Interface Code

Revise as follows:

SECTION 106 APPEALS

[A] 106.1 General. ~~To determine the suitability of alternative materials and methods and to provide for reasonable interpretations of the provisions of this code, there shall be and hereby is created a board of appeals consisting of five members who are qualified by experience and training to pass judgment on pertinent matters. The code official, building official and fire chief shall be ex officio members, and the code official shall act as secretary of the board. The board of appeals shall be appointed by the legislative body and shall hold office at their discretion. The board shall adopt~~

reasonable rules and regulations for conducting its investigations and shall render decisions and findings in writing to the code official, with a duplicate copy to the applicant.

Add new text as follows:

A **BOARD OF APPEALS**

SECTION A101 **GENERAL**

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section 106 (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the building official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the code official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

A101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The code official shall be an ex officio member of said board but shall not vote on any matter before the board.

A101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority is authorized to appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

A101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

A101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

A101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

A101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

A101.7 Board decision. The board shall only modify or reverse the decision of the code official by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the code official.

A101.7.2 Administration. The code official shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

Reason: The intent of this proposal is to have a consistent set of requirements for the Board of Appeals. The right for someone to have an appeal is addressed in a separate proposal for Means of Appeals. Currently the IBC and IFC have these requirements in an appendix, while other codes either don't have it at all or have it in the text. It was felt that appendix was a more appropriate place to allow for the jurisdiction to establish their own criteria, or to use this appendix as a template.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

APPENDIX A

BOARD OF APPEALS

SECTION A101

GENERAL

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section XXX (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the *code official* pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the *code official* to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the *code official* within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

A101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The *code official* shall be an ex officio member of said board but shall not vote on any matter before the board.

A101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority may appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership,

and shall be appointed for the same term or until a successor has been appointed.

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

A101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

A101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

A101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

A101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the *code official* and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

A101.7 Board decision. The board shall only modify or reverse the decision of the *code official* by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the *code official* within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the *code official*.

A101.7.2 Administration. The *code official* shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and

debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial correlation and an option for jurisdictions to follow.

ADM43-19 Part I

Public Hearing Results

Errata: This proposal includes published errata
Added proponent to the code change.

Committee Action:

As Submitted

Committee Reason: The committee stated that the reasons for the approval of the proposal were that it standardizes the language across the I-Codes, it provides another tool and it gives appropriate guidance as an appendix to establish a board of appeals. (Vote: 13-0)

Assembly Action:

None

APPENDIX CA **BOARD OF APPEALS-COMMERCIAL**

SECTION CA101 **GENERAL**

CA101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section C109 (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the code official pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

CA101.2 Application for appeal. Any person shall have the right to appeal a decision of the code official to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served.

CA101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

CA101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

CA101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The code official shall be an ex officio member of said board but shall not vote on any matter before the board.

CA101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

CA101.3.2 Alternate members. The chief appointing authority is authorized to appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

CA101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

CA101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

CA101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

CA101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

CA101.3.7 Compensation of members. Compensation of members shall be determined by law.

CA101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

CA101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

CA101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

CA101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

CA101.5.2 Quorum. Three members of the board shall constitute a quorum.

CA101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

CA101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

CA101.7 Board decision. The board shall only modify or reverse the decision of the code official by a concurring vote of three or more members.

CA101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the code official within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the code official.

CA101.7.2 Administration. The code official shall take immediate action in accordance with the decision of the board.

CA101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

Reason: The intent of this proposal is to have a consistent set of requirements for the Board of Appeals. The right for someone to have an appeal is addressed in a separate proposal for Means of Appeals. Currently the IBC and IFC have these requirements in an appendix, while other codes either don't have it at all or have it in the text. It was felt that appendix was a more appropriate place to allow for the jurisdiction to establish their own criteria, or to use this appendix as a template.

The BCAC is working from the philosophy that ICC is a family of codes, so administrative requirements should be consistent across books. Most administrative and enforcement matters are the same for any code. Those matters unique for a specific code remain unchanged. This is one of a series of proposals being submitted relating to technical, editorial and organizational changes proposed for the Administrative chapters (Chapter 1) in all of the I-Codes.

While the Administrative Committee will consider each proposal independently, the proposals in this package are a correlated set of companion code change proposals."

The following is the template utilized to create this code change proposal. There may be some differences depending on the unique applications of each code – such as "building/fire/code official".

APPENDIX A

BOARD OF APPEALS

SECTION A101

GENERAL

A101.1 Scope. A board of appeals shall be established within the jurisdiction for the purpose of hearing applications for modification of the requirements of this code pursuant to the provisions of Section XXX (Means of Appeals). The board shall be established and operated in accordance with this section, and shall be authorized to hear evidence from appellants and the *code official* pertaining to the application and intent of this code for the purpose of issuing orders pursuant to these provisions.

A101.2 Application for appeal. Any person shall have the right to appeal a decision of the *code official* to the board. An application for appeal shall be based on a claim that the intent of this code or the rules legally adopted hereunder have been incorrectly interpreted, the provisions of this code

do not fully apply or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the *code official* within 20 days after the notice was served.

A101.2.1 Limitation of authority. The board shall not have authority to waive requirements of this code or interpret the administration of this code.

A101.2.2 Stays of enforcement. Appeals of notice and orders, other than Imminent Danger notices, shall stay the enforcement of the notice and order until the appeal is heard by the board.

A101.3 Membership of board. The board shall consist of five voting members appointed by the chief appointing authority of the jurisdiction. Each member shall serve for [INSERT NUMBER OF YEARS] years or until a successor has been appointed. The board member's terms shall be staggered at intervals, so as to provide continuity. The *code official* shall be an ex officio member of said board but shall not vote on any matter before the board.

A101.3.1 Qualifications. The board shall consist of five individuals, who are qualified by experience and training to pass on matters pertaining to building construction and are not employees of the jurisdiction.

A101.3.2 Alternate members. The chief appointing authority may appoint two alternate members who shall be called by the board chairperson to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership, and shall be appointed for the same term or until a successor has been appointed.

A101.3.3 Vacancies. Vacancies shall be filled for an unexpired term in the same manner in which original appointments are required to be made.

A101.3.4 Chairperson. The board shall annually select one of its members to serve as chairperson.

A101.3.5 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings which shall set forth the reasons for the board's decision, the vote of each member, the absence of a member and any failure of a member to vote.

A101.3.6 Conflict of interest. A member with any personal, professional or financial interest in a matter before the board shall declare such interest and refrain from participating in discussions, deliberations and voting on such matters.

A101.3.7 Compensation of members. Compensation of members shall be determined by law.

A101.3.8 Removal from the board. A member shall be removed from the board prior to the end of their terms only for cause. Any member with continued absence from regular meeting of the board may be removed at the discretion of the chief appointing authority.

A101.4 Rules and procedures. The board shall establish policies and procedures necessary to carry out its duties consistent with the provisions of this code and applicable state law. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be presented.

A101.5 Notice of meeting. The board shall meet upon notice from the chairperson, within 10 days of the filing of an appeal or at stated periodic intervals.

A101.5.1 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the *code official* and any person whose interests are affected shall be given an opportunity to be heard.

A101.5.2 Quorum. Three members of the board shall constitute a quorum.

A101.5.3 Postponed hearing. When five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

A101.6 Legal counsel. The jurisdiction shall furnish legal counsel to the board to provide members with general legal advice concerning matters before them for consideration. Members shall be represented by legal counsel at the jurisdiction's expense in all matters arising from service within the scope of their duties.

A101.7 Board decision. The board shall only modify or reverse the decision of the *code official* by a concurring vote of three or more members.

A101.7.1 Resolution. The decision of the board shall be by resolution. Every decision shall be promptly filed in writing in the office of the *code official* within three days and shall be open to the public for inspection. A certified copy shall be furnished to the appellant or the appellant's representative and to the *code official*.

A101.7.2 Administration. The *code official* shall take immediate action in accordance with the decision of the board.

A101.8 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief administrative officer.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC), the ICC Sustainable, Energy and High Performance Code Action Committee (SEHPCAC) and the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2018 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The SEHPCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance International Codes with regard to sustainability, energy and high performance as it relates to the built environment included, but not limited to, how these criteria relate to the International Green Construction Code (IgCC) and the International Energy Conservation Code (IECC). In 2018-2019, the SEHPCAC has held five two- or three-day open meetings and numerous workgroup calls, to discuss and debate proposed changes and public comments. Attendees at the meetings and calls included members of the SEHPCAC as well as any interested parties. Related documentation and reports are posted on the SEHPCAC website at <http://www.iccsafe.org/cs/SEHPCAC/Pages/default.aspx>.

The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017-2018, the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an editorial correlation and an option for jurisdictions to follow.

ADM43-19 Part III

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The appendix allows a jurisdiction to use this appendix on a Board of Appeals. It is optional, not a requirement. There was concern that not all of the parts of ADM43 have been accepted by the various committees. (Vote 11-3)

Assembly Action:

None

2018 International Building Code

Add new text as follows:

APPENDIX O **PERFORMANCE-BASED APPLICATION**

O101.1 Introduction. The following administrative provisions are excerpted from the ICC Performance Code for Buildings and Facilities. These can be used in conjunction with the Alternate Methods provisions in Chapter 1, or for a review of submittals such as those in Section 909 or elsewhere requiring a rational analysis or performance-based design to provide a recognized framework for the code official in terms of the design expertise needed, the necessary submittals, a review framework and related items. While not every step is required in every instance, these model provisions serve as the starting point for the formulation of an effective submittal and corresponding thorough review.

O101.2 Qualifications. Registered design professionals shall possess the knowledge, skills and abilities necessary to demonstrate compliance with this code.

O101.3 Construction document preparation. Construction documents required by this code shall be prepared in adequate detail and submitted for review and approval in accordance with Section 107.

O101.3.1 Review. Construction documents submitted in accordance with this code shall be reviewed for code compliance with the appropriate code provisions in accordance with Section 107.

O101.4 Construction. Construction shall comply with the approved construction documents submitted in accordance with this code, and shall be verified and approved to demonstrate compliance with this code.

O101.4.1 Facility operating policies and procedures. Policies, operations, training and procedures shall comply with approved documents submitted in accordance with this code, and shall be verified and approved to demonstrate compliance with this code.

O101.4.2 Maintenance. Maintenance of the performance-based design shall be ensured throughout the life of the building or portion thereof.

O101.4.3 Changes. The owner or the owner's authorized agent shall be responsible to ensure that any change to the facility, process, or system does not increase the hazard level beyond that originally designed without approval and that changes shall be documented in accordance with the code.

O101.5 Documentation. The registered design professional shall prepare appropriate documentation for the project that clearly provides the design approach and rationale for design submittal, construction and future use of the building, facility or process.

O101.5.1 Reports and Manuals. The design report shall document the steps taken in the design analysis, clearly identifying the criteria, parameters, inputs, assumptions, sensitivities and limitations involved in the analysis. The design report shall clearly identify bounding conditions, assumptions and sensitivities that clarify the expected uses and limitations of the performance analysis. This report shall verify that the design approach is in compliance with the applicable codes and acceptable methods and shall be submitted for concurrence by the code official prior to the construction documents being completed. The report shall document the design features to be incorporated based on the analysis.

The design report shall address the following:

1. Project scope.
2. Goals and objectives.
3. Performance criteria.
4. Hazard scenarios.
5. Design fire loads and hazards.
6. Final design.
7. Evaluation.
8. Bounding conditions and critical design assumptions.
9. Critical design features.
10. System design and operational requirements.
11. Operational and maintenance requirements.
12. Commissioning testing requirements and acceptance criteria.
13. Frequency of certificate renewal.

14. Supporting documents and references.
15. Preliminary site and floor plans.

O101.5.2 Design Submittal. Applicable construction documents shall be submitted to the code official for review. The documents shall be submitted in accordance with the jurisdiction's procedures and in sufficient detail to obtain appropriate permits.

O101.6 Review. Construction documents submitted in accordance with this code shall be reviewed for code compliance with the appropriate code provisions.

O101.6.1 Peer review. The owner or the owner's authorized agent shall be responsible for retaining and furnishing the services of a registered design professional or recognized expert, who will perform as a peer reviewer, where required and approved by the code official.

O101.6.2 Costs. Costs. The costs of special services, including contract review, where required by the code official, shall be borne by the owner or the owner's authorized agent.

O101.7 Permits. Prior to the start of construction, appropriate permits shall be obtained in accordance with the jurisdiction's procedures and applicable codes.

O101.8 Verification of compliance. Upon completion of the project, documentation shall be prepared that verifies performance and prescriptive code provisions have been met. Where required by the code official, the registered design professional shall file a report that verifies bounding conditions are met.

O101.9 Extent of documentation. Approved construction documents, the operations and maintenance manual, inspection and testing records, and certificates of occupancy with conditions shall be included in the project documentation of the code official's records.

O101.10 Analysis of change. The registered design professional shall evaluate the existing building, facilities, premises, processes, contents and the applicable documentation of the proposed change as it affects portions of the building, facility, premises, processes and contents that were previously designed for compliance under a performance-based code. Prior to any change that was not documented in a previously approved design, the registered design professional shall examine the applicable design documents, bounding conditions, operation and maintenance manuals, and deed restrictions.

Reason: This proposal does not generate any new code requirements, but rather provides an optional design, review and approval framework for use by the code official. Typical uses would include cases of alternate methods in Chapter 1, select areas of the IBC that require a rational analysis such as Section 909 and elsewhere. The proposed Appendix simply extracts the relevant administrative provisions from the ICC Performance Code into a more concise, usable appendix format for a jurisdiction confronted with such a need. Currently there are multiple, varying jurisdictional rules and procedures in many communities regarding procedure and none in even more. The code official is often left alone to reach decisions not just on the merits of a design, but must first also decide on the submittal and review process.

As an Appendix, it is entirely optional to a jurisdiction. It can be adopted, adopted with local modifications, or even used on a case-by-case basis as part of a Memorandum of Understanding or similar legal agreement between the jurisdiction and the owner/design team. It simply represents another tool for the jurisdiction to reach for in cases of need; it neither encourages nor creates any additional opportunity for performance-based design.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

As this provision is an Appendix and, as such, remains optional to the jurisdiction, it imparts no new code requirements and, therefore, no new costs. In fact, by potentially addressing these administrative process issues at the outset, use of the Appendix could realistically result in cost savings.

ADM44-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee stated the reason for the approval of the proposal was that the addition of the appendix provides another option within the code and the previous action taken on ADM11-19. In opposition it was stated that there is a need for a timeline or qualification for the expert and that more work is needed. (Vote: 8-5)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

IBC®: O101.1

Proponents:

Gary Lewis, representing Self (glewis@cityofsummit.org)

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

O101.1 Introduction. The following administrative provisions are excerpted from the ICC Performance Code for Buildings and Facilities. ~~These and can be used in conjunction with the Alternate Methods provisions in Chapter 1, or for a review of submittals such as those in Section 909 or elsewhere requiring a rational analysis or performance-based design. These provisions to provide a recognized an established framework for the code official in terms of the design expertise needed, the necessary submittals, a review framework and related items. While not every step is required in every instance, these model provisions serve as the starting point for the formulation of an effective submittal and corresponding thorough review.~~

Commenter's Reason: This change was recommended for Approval as Submitted by the Admin Committee in Albuquerque. The proponents listened to the comments of the testifiers and the committee and agree that the original introduction paragraph was not exactly written in enforceable language. We now propose a modification to simply streamline the Introduction and make it enforceable, and the remaining points will be suggested for the Code Commentary. This modification does not change the scope, intent or application of the original change as was recommended for approval.

Bibliography: None

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Streamlining the introduction paragraph has no effect on the cost impact of the original proposal.

Public Comment# 1794

IBC®: APPENDIX O (New), O101.1, O102.1, O103.1 (New)

Proposed Change as Submitted

Proponents: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

2018 International Building Code

Add new text as follows:

APPENDIX O **APPROVAL OF PRODUCT EVALUATION AND LISTING AGENCIES**

O101.1 Purpose. The purpose of this appendix is to provide the Building Official criteria to assist in the consideration and approval of products and systems supported by product listings and product evaluation reports. The Building Official is authorized to accept research reports and product listings as proof of compliance with the International Building Code under the authority in Section 104.11 and as defined in Section 1703.4.2.

The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction.

O102.1 Definitions. Approved Agency – See Section 202

Approved Listing Agency - Any agency approved by the Building Official which is in the business of listing and labeling and which makes available at least an annual published report of such listings in which specific information is included that the product has been tested to recognized standards and found to comply.

Approved Testing Agency - An agency which is determined by the Building Official to have adequate personnel and expertise to carry out the testing of systems, materials types of construction, fixtures or appliances.

Approved Source See Section 202

Label - See Section 202

Research report – A report published by an approved source to provide technical evaluation that a new or alternative material, product, design or method of construction complies with the intent of the International Building Code and includes supporting data, and where necessary, to assist in the approval of materials or assemblies not specifically provided for in the code.

O103.1 Qualifications. Listing Agencies issuing a product Listing, and Approved Sources issuing a Research Report, shall be accredited by an approved accreditation body as to competence and capability in compliance with Sections 1703.1.1 through 1703.1.3. Approved Product Listing or Approved Sources issuing product evaluation reports satisfy the following requirements:

1. Approved agencies shall be accredited by Accreditation by a body that is a signatory to the International Accreditation Forum (IAF) Multilateral Recognition Arrangement (MLA) and is itself accredited to ISO/IEC Standard 17011, General Requirements for accreditation bodies accrediting conformity assessment bodies (CABs).
2. The agency shall employ qualified technical personal familiar with the *International Building Code* and the *International Fire Code* and their referenced standards as well as the evaluation criteria and standards used to produce the evaluation report.
3. Evaluation Reports shall be issued under the supervision of a licensed professional engineer.
4. The agencies shall implement a product labeling and identification program consistent with requirements for labeling in the code.
5. The agencies shall publish lists for evaluated or listed materials, assemblies or products.
6. The Agencies shall develop and implement quality control programs that shall be satisfied by the product evaluation and listing report holder and shall require follow up in-plant inspections to determine compliance with the approved quality control program.
7. The agencies shall publish Research Reports or listings based on, in order of importance, the code; or standards recognized in the codes, and when the product is an alternative material or system recognized under IBC Section 104.11, Acceptance Criteria that have been developed with public input and are acceptable to the Building Official.
8. The agencies shall have a process to periodically re-evaluate published product evaluation reports and product listing to address applicable changes in the applicable codes, acceptance criteria or referenced standards used in the evaluation report.
9. The Agencies shall develop and implement quality control programs that shall be satisfied by the product evaluation and listing report holder and shall require regular follow up in-plant inspections to verify compliance with the approved quality control program.

Reason: This code change is necessary to address the significant increase in the number of testing agencies and engineering firms as well as

industry associations developing product certification programs. The proposed Appendix offers an option for the Building Official to adopt the rules and criteria necessary criteria to evaluate the qualifications of the listing or product evaluation agency seeking recognition and approval. The Appendix can be applied to the IBC and IRC so a separate code change is not being proposed for the IRC. All jurisdictions adopt a building code in addition to one or more of the other codes that are members of the ICC family of codes so jurisdictions adopting the IBC have the option to adopt the proposed Appendix .

The code change also seeks to lay the ground work the formation of a body to create acceptance criteria used by all agencies. If one is not created then ICC Evaluation Service or IAPMO's Uniform Evaluation Service will be the only agencies we know that develop and publish evaluation criteria. Uniform acceptance criteria prevent venue shopping and improve the integrity of the process so that outcomes of the evaluations are reasonably similar. When the legacy Uniform Building Code published UBC Standards in volume 3 such standards existed and were regularly referenced. Unfortunately this is no longer true in today's complete market place.

ICC created its subsidiaries ICC ES and IAS to service the needs of the Building Official and manufacturers to create an accreditation process for testing agencies and product evaluation agencies producing research reports amongst others. They also created a service that produces research reports on behalf of the Building Official. The outcome of these evaluations and listings need to be accepted by the Building Official to be implemented. The technical reviews are performed on behalf of the Building Official so as not to require each jurisdiction to develop their own internal process for accepting building products.

A healthy competitive market with firms producing product listings and research reports has resulted in the need to create rules that facilitate approval or disapproval of these agencies and to create uniformity in the industry.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This code change is mainly process related and does not impose new requirements. Most agencies function as proposed in the code change.

ADM45-19

Public Hearing Results

Errata: This proposal includes published errata
Item list 1-9 for the new proposed Section O103.1 Qualifications has been added.

Committee Action:

Disapproved

Committee Reason: The committee stated that the reason for the disapproval was that the new proposed section should be in the appropriate location in the body of the code instead of as an appendix and that it needs further work including the proper framework and information for building departments. (Vote: 13-0)

Assembly Action:

None

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

O101.1 Purpose. The purpose of this appendix is to provide the Building Official criteria to assist in the consideration and approval of products and systems supported by product *listings* and *product evaluation* reports. The Building Official is authorized to accept product evaluation research reports and ~~product listings~~ as proof of compliance with the *International Building Code* and the *International Residential Code* under the authority in

Section 104.11 and as defined in Section 1703.4.2.

~~The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design or method of construction shall be approved where the building official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction:~~

O102.1 Definitions. Approved Agency – See Section 202

Approved Listing Agency - Any agency approved by the Building Official which is in the business of listing and labeling and which makes available at least an annual published report of such listings in which specific information is included that the product has been tested to recognized standards and found to comply.

Approved Testing Agency - An agency which is determined by the Building Official to have adequate personnel and expertise to carry out the testing of systems, materials types of construction, fixtures or appliances.

Approved Source See Section 202

Label - See Section 202

Research report – A report published by an approved source to provide technical evaluation that a new or alternative material, product, design or method of construction complies with the intent of the International Building Code and includes supporting data, and where necessary, to assist in the approval of materials or assemblies not specifically provided for in the code.

O103.1 Qualifications. Listing Agencies issuing a product ~~Listing~~ listing, and ~~Approved Sources~~ approved sources issuing a product evaluation report ~~Research Report~~, shall be accredited by an approved accreditation body as to competence and capability in compliance with Sections 1703.1.1 through 1703.1.3. ~~Approved Product listing agencies or Approved Sources~~ approved sources issuing product evaluation reports shall satisfy the following requirements:

1. Approved agencies shall be accredited by ~~an accreditation~~ Accreditation by a body that is a signatory to the International Accreditation Forum (IAF) Multilateral Recognition Arrangement (MLA) and is itself accredited to ISO/IEC Standard 17011, General Requirements for accreditation bodies accrediting conformity assessment bodies (CABs).
2. ~~The agency shall~~ Shall employ qualified technical personal familiar with the *International Building Code* and the *International Residential International Code* and the *International Fire Code* and their referenced standards as well as the evaluation criteria and standards used to produce the evaluation report.
3. Product evaluation reports ~~Evaluation Reports~~ for structural components shall be issued under the supervision of a licensed professional engineer.
4. ~~The agencies shall implement a product labeling and identification program consistent with requirements for labeling in the code.~~
5. ~~The agencies shall publish lists for evaluated or listed materials, assemblies or products.~~
6. ~~The Agencies shall develop and implement quality control programs that shall be satisfied by the product evaluation and listing report holder and shall require follow up in plant inspections to determine compliance with the approved quality control program.~~
7. ~~The agencies shall publish Research Reports or listings based on, in order of importance, the code; or standards recognized in the codes; and when the product is an alternative material or system recognized under IBC Section 104.11, Acceptance Criteria that have been developed with public input and are acceptable to the Building Official.~~
8. ~~The agencies shall have a process to periodically re-evaluate published product evaluation reports and product listing to address applicable changes in the applicable codes, acceptance criteria or referenced standards used in the evaluation report.~~
9. ~~The Agencies shall develop and implement quality control programs that shall be satisfied by the product evaluation and listing report holder and shall require regular follow up in plant inspections to verify compliance with the approved quality control program.~~

O103.2 Review and Listing Process Listing agencies and approved sources issuing a product evaluation report shall perform their duties in accordance with the limitations of their accreditation as well as the following requirements:

1. The agencies shall implement a product labeling and identification program consistent with requirements for labeling in the code.
2. The agencies shall publish lists for evaluated or listed materials, assemblies or products.
3. The agencies shall develop and implement quality control programs that shall be satisfied by the product evaluation report and listing report holder and shall require regular follow up in-plant inspections to determine compliance with the approved quality control program.
4. The agencies shall publish product evaluation reports or listings based on, in order of importance, the code; or standards recognized in the codes.
5. When the product is an alternative material or system recognized in the Code under Section 104.11 of the International Building Code, acceptance criteria that have been developed with public input and that are acceptable to the Building Official shall be the basis of the review.
6. The agencies shall have a process to periodically re-evaluate published product evaluation reports and product listing to address applicable changes in the applicable codes, acceptance criteria or referenced standards used in the evaluation report.

Commenter's Reason: The public comment for ADM 45-19 was developed in collaboration the joint effort of several listing agencies, agencies that

issue product evaluation reports (also referred to as code compliance reports, research reports, etc), manufacturers and other interested parties. Input was also solicited from interested parties that spoke in support and in opposition to the code change at the Committee Action Hearings in Albuquerque. A working group was formed and met one time. During our meeting it was apparent that three groups exist: one group that believes that rules need to be developed due to the view that "wild west" has developed where anyone can claim to produce a product evaluation report or listing.

During the CAH some speakers stated that ICC should form an ad-hoc group to evaluate the issues beings addressed in the change to include all providers or product evaluation reports and listings. The Compliance Code Action Committee is such a group however the group was not very well publicized and had limited participation as was stated in the CAH and has proposed ADM 23-19.

The ad-hoc group that participated included representation from:

1. Underwriters Laboratories
2. Intertek
3. Uniform Evaluation Service
4. DRJ Engineering
5. City of Los Angeles
6. Hilti
7. Simpson Strong Tie
8. Code Consultants, Thomas Meyers
9. Intech Consulting, Lorraine Ross
10. Preview Group, Steve Winkle.
11. ICC ES was contacted and provided input but did not participate directly.
12. APA was contacted
13. International Code Consultants, Jeff Shapiro was contacted
14. Michael Savage, Compliance Code Action Committee was contacted

During the working group meeting it became clear that there were 4 major encampments on the issue:

1. The do nothing maintain status quo group.
2. The something needs to be done group, but it should be the ICC Board's role and not a code change issue.
3. There is a need to get some consistency and for competition in the market place to be based on the use of uniform evaluation criteria and customer service. In other words cost, speed of service, technical soundness of the review and not the review outcome.
4. Supporters of ADM 45-19 that see it as a middle road that accommodates current practices and raises the bar but does not raise it too high to not be achievable.

The public comment addresses the issues raised by the General committee and the speakers in opposition to the code change.

The appendix is offered as a stand alone option that relies on portions of the chapter 2 definitions to avoid repetition.

The definition of approved source is expanded to directly address accredited product certification agencies to allow test labs or licensed engineers to produce product evaluation reports for specific items.

A listing is defined. It may appear obvious to most code users what it is but a listing really is something in a list but in the context of the code it is proof of compliance with a referenced standard in the code such as a fire resistance rating tested to an ASTM or UL standard.

Research report is changed to a more generic term product evaluation report to reflect the propriety and not a prescriptive nature of the building material.

Product evaluation reports for structural components require supervision by a licensed engineer. The engineer only needs to be licensed by the State in which he/she practices and is reflective of current practice where an ICC ES staff engineer develops acceptance criteria and publishes evaluation reports in Birmingham for use throughout the United States. Licensure is proof of proficiency in the use of codes and standards by a State and thus higher than obtaining a degree by education. This addresses concerns raised by some speakers in opposition or who submitted floor modifications.

The qualifications sections have been split into two sections one for qualifications and one to describe the process envision in IBC Ch. 17.

The word accreditation is used repeatedly to make clear that testing and product certification agencies are accredited as proof of proficiency as and process in compliance with the ISO/IEC standard 17011. The International Accreditation Service (IAS), an ICC subsidiary, as well as ANSI evaluate the competencies of product certification bodies and testing agencies and issue certificates of accreditation to competencies to test or evaluate to specific standards listed in the accreditation. The term was chosen to coincide with the terminology that the industry utilizes.

Clarification has been added that product evaluations demonstrating equivalence to the code should be based on acceptance criteria developed in similar fashion to the prescribed standards in the code. It is important that evaluation criteria used in the product evaluation be developed in as open and transparent process as possible and the proposed code change maintains that requirement. This is generally reflective of current practice for some providers of product evaluation reports who may or may not produce product evaluation reports. As stated in the original code change reason statement it is hoped at some point that criteria development and its costs be separated from publication of product evaluation reports and that product evaluations demonstrate proficiency in the evaluation criteria and the code.

An effort has been made to differentiate a product listing from a product evaluation and to make clear what approved means. A product listing is proof of compliance with a standard actually referenced in the code like fire doors, penetration fire stop assemblies etc. A product evaluation report evaluates a product to be equivalent to that which is prescribed in the code. A steel joist hanger for example or strap is not prescribed in the code and therefore a product evaluation report determines its load carrying capacity based on testing or engineer or both and prescribes conditions of use interior/exterior, the method of fastening, the substrate, etc. Only the Building Official approves the use of the product by approving it on building construction plans.

ADM 45-19 does not conflict with ADM 23-19 and is designed as stand-alone and is non-mandatory in an Appendix to the IBC. As such jurisdictions such as City of Los Angeles, the California State fire Marshal, Miami/Dade, New York City and many others can continue their current practice. Additionally, feedback received has shows that the proposed code change generally reflects current practice.

The proponent has served the ICC membership as chair of the ICC ES Evaluation Committee and as a member for 6 years. Supporters either retired or current Building Officials include past members of the ICC or ICBO ES committees as well. This is not an ICC ES code change and is intended to be as neutral as possible and to look out for the interest of the public and Building Officials.

This code change requires 2/3 of the governmental voting members to support it for the final action to pass. Please support the direction of the Administrative Committee that saw merit in the code change but wanted changes made to reflect the issues raised at the CAH. Please vote for approved as modified by public comment 2.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposal implements current practice. New agencies or approved source will incur additional costs reflected in the cost of service provided to the manufacturer or applicant.

Public Comment# 1332

ADM47-19

This is the referenced standards administrative update code change intended to be heard as a single code change. This code change was set up to include all of the ICC codes in an effort to allow for easier review by code users. ADM47-19 will be heard at the PCH as a single code change. ADM47-19 received 19 public comments that procedurally will be dealt with as separate parts in conjunction with the public comment submitted. Also refer to the Discussion Guide for further information related to the CAH results and the public comments related to each standard that received a public comment.

D3019—08 <u>D3019/D3019M—2017</u>	Specification for Lap Cement Used with Asphalt Roll Roofing, Nonfibered, Asbestos Fibered and Nonasbestos Fibered	IBC®
D3161/D3161M—15 <u>D3161M—2016A</u>	Test Method for Wind Resistance of Steep Slope Roofing Products (Fan Induced Method)	IBC®
D3200—74(2012) <u>D3200—1974(2017)</u>	Standard Specification and Test Method for Establishing Recommended Design Stresses for Round Timber Construction Poles	IBC®
D3462/D3462M—40a <u>D3462M—2016</u>	Specification for Asphalt Shingles Made from Glass Felt and Surfaced with Mineral Granules	IBC®
D3679—13 <u>D3679—2017</u>	Specification for Rigid Poly (Vinyl Chloride) (PVC) Siding	IBC®
D3737—12 <u>D3737—2018E1</u>	Practice for Establishing Allowable Properties for Structural Glued Laminated Timber (Glulam)	IBC®
D3746—85(2008) <u>D3746/D3746M—1985(2015)E1</u>	Test Method for Impact Resistance of Bituminous Roofing Systems	IBC®
D3957—09 <u>D3957—2009(2015)</u>	Standard Practices for Establishing Stress Grades for Structural Members Used in Log Buildings	IBC®
D4318—10e1 <u>D4318—2017E1</u>	Test Methods for Liquid Limit, Plastic Limit and Plasticity Index of Soils	IBC®
D4434/D4434M—12 <u>D4434M—2015</u>	Specification for Poly (Vinyl Chloride) Sheet Roofing	IBC®
D4479/D4479M—07(2012)e1 <u>D4479M—2007(2018)</u>	Specification for Asphalt Roof Coatings—Asbestos-free	IBC®
D4586/D4586M—07(2012)e1 <u>D4586M—2007(2018)</u>	Specification for Asphalt Roof Cement—Asbestos-free	IBC®
D4637/D4637M—44e1 <u>D4637M—2015</u>	Specification for EPDM Sheet Used in Single-ply Roof Membrane	IBC®
D4869/D4869M—15 <u>D4869M—2016A</u>	Specification for Asphalt-saturated (Organic Felt) Underlayment Used in Steep Slope Roofing	IBC®
D4897/D4897M—01(2009) <u>D4897M—2016</u>	Specification for Asphalt-coated Glass Fiber Venting Base Sheet Used in Roofing	IBC®
D4945—12 <u>D4945—2017</u>	Test Method for High-strain Dynamic Testing of Deep Foundations	IBC®
D5055—13e1 <u>D5055—2016</u>	Specification for Establishing and Monitoring Structural Capacities of Prefabricated Wood I-joists	IBC®
D5456—14b <u>D5456—2018</u>	Specification for Evaluation of Structural Composite Lumber Products	IBC®
D5516—09 <u>D5516—2018</u>	Test Method of Evaluating the Flexural Properties of Fire-retardant Treated Softwood Plywood Exposed to Elevated Temperatures	IBC®
D5643/D5643M—06(2012)e1 <u>D5643M—2006(2018)</u>	Specification for Coal Tar Roof Cement, Asbestos-free	IBC®

D5664—10 <u>D5664—2017</u>	Standard Test Method for Evaluating the Effects of Fire-retardant Treatment and Elevated Temperatures on Strength Properties of Fire-retardant Treated Lumber	IBC®
D6083—05e04 <u>D6083/D6083M—2018</u>	Specification for Liquid Applied Acrylic Coating Used in Roofing	IBC®
D6162/D6162M—00a(2015)e4 <u>D6162M—2016</u>	Specification for Styrene-butadiene-styrene (SBS) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	IBC®
D6163/D6163M—00(2015)e4 <u>D6163M—2016</u>	Specification for Styrene-butadiene-styrene (SBS) Modified Bituminous Sheet Materials Using Glass Fiber Reinforcements	IBC®
D6164/D6164M—11 <u>D6164M—2016</u>	Specification for Styrene-butadiene-styrene (SBS) Modified Bituminous Sheet Metal Materials Using Polyester Reinforcements	IBC®
D6222/D6222M—14 <u>D6222M—2016</u>	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using Polyester Reinforcements	IBC®
D6223/D6223M—02(2009)e4 <u>D6223M—2016</u>	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	IBC®
D6298—13 <u>D6298/D6298M—2016</u>	Specification for Fiberglass Reinforced Styrene-butadiene-styrene (SBS) Modified Bituminous Sheets with a Factory Applied Metal Surface	IBC®
D6380/D6380M—03(2013)e4 <u>D6380M—2003(2018)</u>	Standard Specification for Asphalt Roll Roofing (Organic) Felt	IBC®
D6464—03a(2009)e4 <u>D6464—2003A(2017)</u>	Standard Specification for Expandable Foam Adhesives for Fastening Gypsum Wallboard to Wood Framing	IBC®
D6509/D6509M—09(2015) <u>D6509M—2016</u>	Standard Specification for Atactic Polypropylene (APP) Modified Bituminous Base Sheet Materials Using Glass Fiber Reinforcements	IBC®
D6754/D6754M—10 <u>D6754M—2015</u>	Standard Specification for Ketone Ethylene Ester Based Sheet Roofing	IBC®
D6757—2013 <u>D6757/D6757M—2018</u>	Specification for Underlayment Felt Containing Inorganic Fibers Used in Steep Slope Roofing	IBC®
D6841—08 <u>D6841—2016</u>	Standard Practice for Calculating Design Value Treatment Adjustment Factors for Fire-retardant Treated Lumber	IBC®
D6878/D6878M—13 <u>D6878M—2017</u>	Standard Specification for Thermoplastic Polyolefin Based Sheet Roofing	IBC®
D6947/D6947M—07(2013)e4 <u>D6947M—2016</u>	Standard Specification for Liquid Applied Moisture Cured Polyurethane Coating Used in Spray Polyurethane Foam Roofing System	IBC®
D7032—14 <u>D7032—2017</u>	Standard Specification for Establishing Performance Ratings for Wood, Plastic Composite Deck Boards and Guardrail Systems (Guards or Rails)	IBC®
D7147—11 <u>D7147—2011(2018)</u>	Specification for Testing and Establishing Allowable Loads of Joist Hangers	IBC®

D7158/D7158M—16D7158M—2019	Standard Test Method for Wind Resistance of Asphalt Shingles (Uplift Force/Uplift Resistance Method)	IBC®
D7254—15D7254—2017	Standard Specification for Polypropylene (PP) Siding	IBC®
D7655/D7655M—12D7655M—2012(2017)	Standard Classification for Size of Aggregate Used as Ballast for Roof Membrane Systems	IBC®
D7672—14D7672—14E1	Standard Specification for Evaluating Structural Capacities of Rim Board Products and Assemblies	IBC®
E84—16E84—2018B	Standard Test Methods for Surface Burning Characteristics of Building Materials	IBC®
E90—09E90—2009(2016)	Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements	IBC®
E96/E96M—15E96M—2016	Standard Test Methods for Water Vapor Transmission of Materials	IBC®
E108—16E108—2017	Standard Test Methods for Fire Tests of Roof Coverings	IBC®
E119—16E119—2018B	Standard Test Methods for Fire Tests of Building Construction and Materials	IBC®
E136—16E136—2016A	Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C	IBC®
E283—04(2012)E283—2004(2012)	Standard Test Method for Determining Rate of Air Leakage through Exterior Windows, Curtain Walls and Doors Under Specified Pressure Differences across the Specimen	IBC®
E331—00(2009)E331—2000(2016)	Standard Test Method for Water Penetration of Exterior Windows, Skylights, Doors and Curtain Walls by Uniform Static Air Pressure Difference	IBC®
E492—09E492—2009(2016)E1	Test Method for Laboratory Measurement of Impact Sound Transmission Through Floor-ceiling Assemblies Using the Tapping Machine	IBC®
E648—15e1E648—2017A	Standard Test Method for Critical Radiant Flux of Floor-covering Systems Using a Radiant Heat Energy Source	IBC®
E736/E736M—00(2015)e1E736M—2017	Test Method for Cohesion/Adhesion of Sprayed Fire-resistive Materials Applied to Structural Members	IBC®
E814—2013AE814—2013A(2017)	Test Method for Fire Tests of Penetration Firestop Systems	IBC®
E970—14E970—2017	Standard Test Method for Critical Radiant Flux of Exposed Attic Floor Insulation Using a Radiant Heat Energy Source	IBC®
E1300—12ae1E1300—2016	Practice for Determining Load Resistance of Glass in Buildings	IBC®
E1354—16E1354—17	Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter	IBC®
E1592—05(2012)E1592—2005(2017)	Test Method for Structural Performance of Sheet Metal Roof and Siding Systems by Uniform Static Air Pressure Difference	IBC®
E1602—03(2010)e1E1602—2003(2017)	Guide for Construction of Solid Fuel-burning Masonry Heaters	IBC®

E1886—13A <u>E1886—2013A</u>	Standard Test Method for Performance of Exterior Windows, Curtain Walls, Doors and Impact Protective Systems Impacted by Missile(s) and Exposed to Cyclic Pressure Differentials	IBC®
E1996—14a <u>E1996—2017</u>	Specification for Performance of Exterior Windows, Curtain Walls, Doors and Impact Protective Systems Impacted by Windborne Debris in Hurricanes	IBC®
E2174—14b <u>E2174—2018</u>	Standard Practice for On-site Inspection of Installed Fire Stops	IBC®
E2273—03(2011) <u>E2273—2018</u>	Standard Test Method for Determining the Drainage Efficiency of Exterior Insulation and Finish Systems (EIFS) Clad Wall Assemblies	IBC®
E2307—15b <u>E2307—15BE1</u>	Standard Test Method for Determining Fire Resistance of Perimeter Fire Barriers Using the Intermediate-scale, Multistory Test Apparatus	IBC®
E2353—14 <u>E2353—2016</u>	Standard Test Methods for Performance of Glazing in Permanent Railing Systems, Guards and Balustrades	IBC®
E2404—15a <u>E2404—2017</u>	Practice for Specimen Preparation and Mounting of Textile, Paper or Polymeric (Including Vinyl) and Wood Wall or Ceiling Coverings, Facing and Veneers to Assess Surface Burning Characteristics	IBC®
E2556/E2556M—10 <u>E2556M—2010(2016)</u>	Standard Specification for Vapor Permeable Flexible Sheet Water-resistive Barriers Intended for Mechanical Attachment	IBC®
E2568—09e1 <u>E2568—2017A</u>	Standard Specification for PB Exterior Insulation and Finish Systems	IBC®
E2570/E2570M—07(2014) <u>e1</u>	Standard Test Method for Evaluating Water-resistive Barrier (WRB) Coatings Used under Exterior Insulation and Finish Systems (EIFS) for EIFS with Drainage	IBC®
E2573—12 <u>E2573—2017</u>	Standard Practice for Specimen Preparation and Mounting of Site-fabricated Stretch Systems to Assess Surface Burning Characteristics	IBC®
E2579—13 <u>E2579—2015</u>	Standard Practice for Specimen Preparation and Mounting of Wood Products to Assess Surface Burning Characteristics	IBC®
E2599—15 <u>E2599—2018</u>	Standard Practice for Specimen Preparation and Mounting of Reflective Insulation, Radiant Barrier and Vinyl Stretch Ceiling Materials for Building Applications to Assess Surface Burning Characteristics	IBC®
E2634—11(2015) <u>E2634—2018</u>	Standard Specification for Flat Wall Insulating Concrete Form (ICF) Systems	IBC®
E2751/E2751M—13 <u>E2751M—2017A</u>	Practice for Design and Performance of Supported Laminated Glass Walkways	IBC®
F547—06(2012) <u>F547—2017</u>	Terminology of Nails for Use with Wood and Wood-base Materials	IBC®
F1667—15 <u>F1667—2018</u>	Specification for Driven Fasteners: Nails, Spikes and Staples	IBC®
F2200—14 <u>F2200—2017</u>	Standard Specification for Automated Vehicular Gate Construction	IBC®
G154—12a <u>G154—2016A</u>	Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials	IBC®

D1785—15D1785—15E1	Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120	IRC®
D1863/D1863M—05(2011)e1D1863M—2005(2018)	Specification for Mineral Aggregate Used in Built-up Roofs	IRC®
D1970/D1970M—2015AD1970M—2017A	Specification for Self-adhering Polymer Modified Bitumen Sheet Materials Used as Steep Roofing Underlayment for Ice Dam Protection	IRC®
D2178/D2178M—15D2178M—15A	Specification for Asphalt Glass Felt Used in Roofing and Waterproofing	IRC®
D2235—04(2011)D2235—2004(2016)	Specification for Solvent Cement for Acrylonitrile-butadiene-styrene (ABS) Plastic Pipe and Fittings	IRC®
D2412—11D2412—2011(2018)	Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-plate Loading	IRC®
D2466—15D2466—2017	Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40	IRC®
D2513—2014e1D2513—2018A	Specification for Gas Pressure Pipe, Tubing and Fittings	IRC®
D2564—12D2564—2012(2018)	Specification for Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Piping Systems	IRC®
D2657—07D2657—2007(2015)	Standard Practice for Heat Fusion-joining of Polyolefin Pipe Fittings	IRC®

D2661—14 <u>D2661—2014E1</u>	Specification for Acrylonitrile-butadiene-styrene (ABS) Schedule 40 Plastic Drain, Waste, and Vent Pipe and Fittings	IRC®
D2729—11 <u>D2729—2017</u>	Specification for Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings	IRC®
D2822/D2822M—05(2011)e1 <u>D2822M—2005(2011)</u>	Specification for Asphalt Roof Cement, Asbestos Containing	IRC®
D2824/D2824M—2013 <u>D2824M—2018</u>	Specification for Aluminum-pigmented Asphalt Roof Coatings, Nonfibered, Asbestos Fibered and Fibered without Asbestos	IRC®
D2846/D2846M—14 <u>D2846M—2017BE1</u>	Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Hot- and Cold-water Distribution Systems	IRC®
D2855—96(2010) <u>D2855—2015</u>	Standard Practice for Making Solvent-cemented Joints with Poly (Vinyl Chloride) (PVC) Pipe and Fittings	IRC®
D2898—10 <u>D2898—2010(2017)</u>	Test Methods for Accelerated Weathering of Fire-retardant-treated Wood for Fire Testing	IRC®
D3019—08 <u>D3019/D3019—2017</u>	Specification for Lap Cement Used with Asphalt Roll Roofing, Nonfibered, Asbestos Fibered and Nonasbestos Fibered	IRC®
D3034—14a <u>D3034—2016</u>	Specification for Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings	IRC®
D3138—04(2011) <u>D3138—2004(2016)</u>	Standard Specification for Solvent Cements for Transition Joints Between Acrylonitrile-Butadiene-Styrene (ABS) and Poly (Vinyl Chloride) (PVC) Non-Pressure Piping Components	IRC®
D3161/D3161M—15 <u>D3161M—2016A</u>	Test Method for Wind-Resistance of Steep Slope Roofing Products (Fan Induced Method)	IRC®
D3261—12E1 <u>D3261—2016</u>	Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing	IRC®
D3311—11 <u>D3311—2017</u>	Specification for Drain, Waste and Vent (DWV) Plastic Fittings Patterns	IRC®
D3462/D3462M—10A <u>D3462M—2016</u>	Specification for Asphalt Shingles Made From Glass Felt and Surfaced with Mineral Granules	IRC®
D3679—13 <u>D3679—2017</u>	Specification for Rigid Poly (Vinyl Chloride) (PVC) Siding	IRC®
D3737—2012 <u>D3737—2018E1</u>	Practice for Establishing Allowable Properties for Structural Glued Laminated Timber (Glulam)	IRC®
D4068—15 <u>D4068—2017</u>	Specification for Chlorinated Polyethylene (CPE) Sheeting for Concealed Water Containment Membrane	IRC®
D4318—10E1 <u>D4318—2017E1</u>	Test Methods for Liquid Limit, Plastic Limit and Plasticity Index of Soils	IRC®
D4434/D4434M—12 <u>D4434M—2015</u>	Specification for Poly (Vinyl Chloride) Sheet Roofing	IRC®
D4479/D4479M—07(2012)e1 <u>D4479M—2007(2018)</u>	Specification for Asphalt Roof Coatings— asbestos-free	IRC®
D4551—12 <u>D4551—2017</u>	Specification for Poly (Vinyl Chloride) (PVC) Plastic Flexible Concealed Water-containment Membrane	IRC®
D4586/D4586M—07(2012)e1 <u>D4586M—2007(2018)</u>	Specification for Asphalt Roof Cemen— asbestos-free	IRC®

D4637/D4637M—14E1D4637M—2015	Specification for EPDM Sheet Used in Single-ply Roof Membrane	IRC®
D4869/D4869M—15D4869M—2016A	Specification for Asphalt-saturated (Organic Felt) Underlayment Used in Steep Slope Roofing	IRC®
D4897/D4897M—01(2009)D4897M—2016	Specification for Asphalt Coated Glass-fiber Venting Base Sheet Used in Roofing	IRC®
D5055—13E1D5055—2016	Specification for Establishing and Monitoring Structural Capacities of Prefabricated Wood I-joists	IRC®
D5456—14BD5456—2018	Standard Specification for Evaluation of Structural Composite Lumber Products	IRC®
D5516—09D5516—2018	Test Method for Evaluating the Flexural Properties of Fire-retardant-treated Softwood Plywood Exposed to the Elevated Temperatures	IRC®
D5643/D5643M—06(2012)e1D5643M—2006(2018)	Specification for Coal Tar Roof Cement Asbestos-free	IRC®
D5664—10D5664—2017	Test Methods For Evaluating the Effects of Fire-retardant Treatments and Elevated Temperatures on Strength Properties of Fire-retardant-treated Lumber	IRC®
D6083—05e01D6083/D6083M—2018	Specification for Liquid-applied Acrylic Coating Used in Roofing	IRC®
D6162/D6162M—2000a(2015)E1D6162M—2016	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	IRC®
D6163/D6163M—2000(2015)E1D6163M—2016	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Glass Fiber Reinforcements	IRC®
D6164/D6164M—11D6164M—2016	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Polyester Reinforcements	IRC®
D6222/D6222M—11D6222M—2016	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using Polyester Reinforcements	IRC®
D6223/D6223M—02(2009)E1D6223M—2016	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcement	IRC®
D6298—13D6298/D6298M—2016	Specification for Fiberglass-reinforced Styrene Butadiene Styrene (SBS) Modified Bituminous Sheets with a Factory Applied Metal Surface	IRC®
D6380/D6380—03(2013)E1D6380M—2003(2018)	Standard Specification for Asphalt Roll Roofing (Organic Felt)	IRC®
D6464—03a(2009)e1D6464—2003A(2017)	Standard Specification for Expandable Foam Adhesives for Fastening Gypsum Wallboard to Wood Framing	IRC®
D6694/D6694M—08(2013)E1D6694M—2015	Standard Specification for Liquid-applied Silicone Coating Used in Spray Polyurethane Foam Roofing Systems	IRC®
D6754/D6754M—10D6754M—2015	Standard Specification for Ketone-ethylene-ester-based Sheet Roofing	IRC®
D6757—2013D6757/D6757M—2018	Specification for Underlayment Felt Containing Inorganic Fibers Used with Steep Slope Roofing	IRC®

D6841—08 <u>D6841—2016</u>	Standard Practice for Calculating Design Value Treatment Adjustment Factors for Fire-retardant-treated Lumber	IRC®
D6878/D6878M—13 <u>D6878M—2017</u>	Standard Specification for Thermoplastic-polyolefin-based Sheet Roofing	IRC®
D6947/D6947M—07(2013) <u>E1D6947M—2016</u>	Standard Specification for Liquid Applied Moisture Cured Polyurethane Coating Used in Spray Polyurethane Foam Roofing System	IRC®
D7032—14 <u>D7032—2017</u>	Standard Specification for Establishing Performance Ratings for Wood-plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails)	IRC®
D7158—D7158M—2016 <u>D7158/D7158M—2019</u>	Standard Test Method for Wind Resistance of Asphalt Shingles (Uplift Force/Uplift Resistance Method)	IRC®
D7254—15 <u>D7254—2017</u>	Standard Specification for Polypropylene (PP) siding	IRC®
D7672—14 <u>D7672—2014E1</u>	Standard Specification for Evaluating Structural Capacities of Rim Board Products and Assemblies	IRC®
D7793—13 <u>D7793—2017</u>	Standard Specification for Insulated Vinyl Siding	IRC®
E84—2016 <u>E84—2018B</u>	Standard Test Method for Surface Burning Characteristics of Building Materials	IRC®
E96/E96M—2015 <u>E96M—2016</u>	Test Method for Water Vapor Transmission of Materials	IRC®
E108—2016 <u>E108—2017</u>	Test Methods for Fire Tests of Roof Coverings	IRC®
E119—2016 <u>E119—2018B</u>	Test Methods for Fire Tests of Building Construction and Materials	IRC®
E136—2016 <u>E136—2016A</u>	Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C	IRC®
E283—04(2012) <u>E283—2004(2012)</u>	Test Method for Determining the Rate of Air Leakage through Exterior Windows, Curtain Walls and Doors Under Specified Pressure Differences across the Specimen	IRC®
E331—00(2009) <u>E331—2000(2016)</u>	Test Method for Water Penetration of Exterior Windows, Skylights, Doors and Curtain Walls by Uniform Static Air Pressure Difference	IRC®
E779—10 <u>E779—2010(2018)</u>	Standard Test Method for Determining Air Leakage Rate by Fan Pressurization	IRC®
E814—2013A <u>E814—2013A(2017)</u>	Standard Test Method for Fire Tests of Penetration Firestop Systems	IRC®
E970—14 <u>E970—2017</u>	Standard Test Method for Critical Radiant Flux of Exposed Attic Floor Insulation Using a Radiant Heat Energy Source	IRC®
E1509—12 <u>E1509—2012(2017)</u>	Standard Specification for Room Heaters, Pellet Fuel-burning Type	IRC®
E1602—03(2010) <u>e1E1602—2003(2017)</u>	Guide for Construction of Solid Fuel Burning Masonry Heaters	IRC®
E1827—11 <u>E1827—2011(2017)</u>	Standard Test Methods for Determining Airtightness of Building Using an Orifice Blower Door	IRC®
E1886—13A <u>E1886—2013A</u>	Test Method for Performance Impact Protective Systems Impacted by Missile(s) and Exposed to Cyclic Pressure Differentials	IRC®

E1996—2014a <u>E1996—2017</u>	Standard Specification for Performance of Exterior Windows, Curtain Walls, Doors and Impact Protective Systems Impacted by Windborne Debris in Hurricanes	IRC®
E2231—15 <u>E2231—2018</u>	Standard Practice for Specimen Preparation and Mounting of Pipe and Duct Insulation Materials to Assess Surface Burning Characteristics	IRC®
E2273—03(2011) <u>E2273—2018</u>	Standard Test Method for Determining the Drainage Efficiency of Exterior Insulation and Finish Systems (EIFS) Clad Wall Assemblies	IRC®
E2568—09e1 <u>E2568—2017A</u>	Standard Specification for PB Exterior Insulation and Finish Systems	IRC®
E2634—11(2015) <u>E2634—2018</u>	Standard Specification for Flat Wall Insulating Concrete Form (ICF) Systems	IRC®
F409—12 <u>F409—2017</u>	Specification for Thermoplastic Accessible and Replaceable Plastic Tube and Tubular Fittings	IRC®
F438—15 <u>F438—2017</u>	Specification for Socket-type Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 40	IRC®
F628—12E1 <u>F628—2012E2</u>	Specification for Acrylonitrile-butadiene-styrene (ABS) Schedule 40 Plastic Drain, Waste and Vent Pipe with a Cellular Core	IRC®
F656—15 <u>F656—2015</u>	Specification for Primers for Use in Solvent Cement Joints of Poly (Vinyl Chloride)(PVC) Plastic Pipe and Fittings	IRC®
F876—15A <u>F876—2017</u>	Specification for Cross-linked Polyethylene (PEX) Tubing	IRC®
F877—2011A <u>F877—2018A</u>	Specification for Cross-linked Polyethylene (PEX) Plastic Hot- and Cold-water Distribution Systems	IRC®
F891—10 <u>F891—2016</u>	Specification for Coextruded Poly (Vinyl Chloride) (PVC) Plastic Pipe with a Cellular Core	IRC®
F1055—13 <u>F1055—2016A</u>	Specification for Electrofusion Type Polyethylene Fittings for Outside Diameter Controlled Polyethylene and Crosslinked Polyethylene Pipe and Tubing	IRC®
F1281—11 <u>F1281—2017</u>	Specification for Cross-linked Polyethylene/Aluminum/Cross-linked Polyethylene (PEX-AL-PEX) Pressure Pipe	IRC®
F1282—10 <u>F1282—2017</u>	Specification for Polyethylene/Aluminum/Polyethylene (PE-AL-PE) Composite Pressure Pipe	IRC®
F1412—09 <u>F1412—2016</u>	Specification for Polyolefin Pipe and Fittings for Corrosive Waste Drainage	IRC®
F1488—14 <u>F1488—14E1</u>	Specification for Coextruded Composite Pipe	IRC®
F1554—15 <u>F1554—2018</u>	Specification for Anchor Bolts, Steel, 36, 55 and 105-ksi Yield Strength	IRC®
F1667—15 <u>F1667—2018</u>	Specification for Driven Fasteners, Nails, Spikes and Staples	IRC®
F1807—15 <u>F1807—2018</u>	Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing	IRC®

F1866—13 <u>F1866—2018</u>	Specification for Poly (Vinyl Chloride) (PVC) Plastic Schedule 40 Drainage and DWV Fabricated Fittings	IRC®
F1960—15 <u>F1960—2018</u>	Specification for Cold Expansion Fittings with PEX Reinforcing Rings for Use with Cross-linked Polyethylene (PEX) Tubing	IRC®
F1973—13E1 <u>F1973—2013(2018)</u>	Standard Specification for Factory Assembled Anodeless Risers and Transition Fittings in Polyethylene (PE) and Polyamide 11 (PA 11) Fuel Gas Distribution Systems	IRC®
F1986—01(2011) <u>F1986—2001(2011)</u>	Multilayer Pipe Type 2, Compression Joints for Hot and Cold Drinking Water Systems	IRC®
F2080—15 <u>F2080—2016</u>	Specification for Cold-expansion Fittings with Metal Compression-sleeves for Cross-linked Polyethylene (PEX) Pipe	IRC®
F2098—08 <u>F2098—2015</u>	Standard Specification for Stainless Steel Clamps for Securing SDR9 Cross-linked Polyethylene (PEX) Tubing to Metal Insert and Plastic Insert Fittings	IRC®
F2159—14 <u>F2159—2018</u>	Standard Specification for Plastic Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing	IRC®
F2389—15 <u>F2389—2017A</u>	Standard for Pressure-rated Polypropylene (PP) Piping Systems	IRC®
F2735—09 <u>F2735—2009(2016)</u>	Standard Specification for Plastic Insert Fittings for SDR9 Cross-linked Polyethylene (PEX) and Polyethylene of Raised Temperature (PE-RT) Tubing	IRC®
F2769—14 <u>F2769—2018</u>	Polyethylene or Raised Temperature (PE-RT) Plastic Hot and Cold-Water Tubing and Distribution Systems	IRC®
F2945—2015 <u>F2945—2018</u>	Standard Specification for Polyamide 11 Gas Pressure Pipe, Tubing and Fittings	IRC®

Reason:

THIS IS THE ADMIN STANDARDS UPDATE CODE CHANGE.

The CP28 Code Development Policy, Section 4.6 requires the updating of referenced standards to be accomplished administratively, and be processed as a Code Change Proposal for consideration by the Administrative Code Change Committee. In September 2018, a letter was sent to each developer of standards that is referenced in the International Codes, asking them to provide ICC with a list of their standards in order to update to the current edition. Listed are the referenced standards that are to be updated based upon responses received from standards developers.

Cost Impact:

The code change proposal will not increase or decrease the cost of construction
Not applicable.

ADM47-19

Committee Reason: The committee stated that the reason for the approval of the proposal was that updating the reference standards is necessary for the function of the codes. (Vote: 13-0)

Assembly Motion:

None

Individual Consideration Agenda

Public Comment 1:

Proponents: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by Public Comment

Modify as follows:

ASTM

~~E84—2018B-2019b~~: Standard Test Methods for Surface Burning Characteristics of Building Materials

Commenter's Reason: The CP28 Code Development Policy, Section 4.6 requires the updating of referenced standards to the codes.

The latest edition of ASTM E84 approved by the committee ASTM E05, and by the ASTM committee on standards, is dated 2019b, and was approved in July 2019.

This change is intended to apply to all ICC codes that reference ASTM E84 and not just the IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This simply updates the reference to ASTM E84 to the most current edition, as is traditionally done by ICC with consensus standards.

Public Comment 2:

Proponents: Christopher Athari, representing Hoover Treated Wood Products (cathari@frtw.com); Joseph Holland, representing Hoover Treated Wood Products (jholland@frtw.com) requests As Submitted

Commenter's Reason: This public comment is in support of the committee action to update ASTM E84 to the 2018B edition.

Recent changes to ASTM E84 have created conflicts with the codes by mandating a test for more than 10 minutes must use ASTM E2768. ASTM 2768 is not a test for testing FRTW but other products as demonstrated by in the IWUIC code.

Building codes have always required testing for FRTW be accomplished using ASTM E84. E84 is a ten-minute test for determining flame spread and smoke development. After the determination of the flame spread and smoke development the test is continued for an additional 20 minutes. The additional 20 minutes are not a part of the E84 but uses the same apparatus to determine two additional requirements, maximum flame front, and significant progressive combustion.

ASTM E2768 while a test of 30 minute duration is not a test for FRTW. The only reference to E2768 in the ICC codes is for a ignition resistance material in the IWUIC. It clearly does not apply to FRTW as it is listed as a complying material

Because FRTW is a wood product, any test for FRTW should have been developed by ASTM D7 the committee on wood. D7 understands how FRTW products should be tested.

Examples referenced in 703

D2898—10: Test Methods for Accelerated Weathering of Fire-retardant-treated Wood for Fire Testing,

D3201/D3201M—13: Test Method for Hygroscopic Properties of Fire-retardant-treated Wood and Wood-based Products

D5664—10: Standard Test Method for Evaluating the Effects of Fire-retardant Treatment and Elevated Temperatures on Strength Properties of Fire-retardant Treated Lumber

D6305—08(2015)e1: Practice for Calculating Bending Strength Design Adjustment Factors for Fire-retardant-treated Plywood Roof Sheathing

D5516—09: Test Method of Evaluating the Flexural Properties of Fire-retardant Treated Softwood Plywood Exposed to Elevated Temperatures

D6841—08: Standard Practice for Calculating Design Value Treatment Adjustment Factors for Fire-retardant Treated Lumber

Conflicts created by mandating all testing using the E84 apparatus for more than 10 minutes be conducted using E2768.

Section 13.1.2 states the flame front limit is of 10-1/2 feet is "... considered evidence of no significant progressive combustion in this test method." The building code clearly states they are to be considered separately.

Section 13.2 allows the testing and qualification of only one surface, " only surfaces that have been individually tested shall be eligible to be classified and reported as meeting the conditions of classification of this standard. The building code mandates FRTW be pressure impregnated or the fire retardant be incorporated into the product during manufacture. Example: the strands in OSB or the particles in particleboard are treated with the fire retardant prior to assembling as a panel product.

This public comment is for the IBC, IRC, IFC, IMC, IEBC and the IWUIC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Codes and standards discussion

Staff Analysis: This public comment is for the IBC, IRC, IFC, IMC, IEBC and the IWUIC.

Public Comment 3:

Proponents: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by Public Comment

Modify as follows:

ASTM

E136—2016A 2019: Standard Test Method for Assessing Combustibility of Behavior of Materials Using in a Vertical Tube Furnace at 750°C

Commenter's Reason: The CP28 Code Development Policy, Section 4.6 requires the updating of referenced standards to the codes.

The latest edition of ASTM E136, as approved by the committee ASTM E05 and by the ASTM committee on standards, is dated 2019. It changed the title of the standard but the test method was not changed.

This change is intended to apply to all ICC codes that reference ASTM E136 and not just the IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is simply a referenced standard update.

Public Comment 4:

Proponents: Jeffrey Shapiro, Lake Travis Fire Rescue, representing Self (jshapiro@ltfr.org) requests Disapprove

Commenter's Reason: Requesting disapproval of the 2019 update of NFPA 285: Standard Fire Test Method for the Evaluation of Fire Propagation Characteristics of Exterior Nonload-bearing Wall Assemblies Containing Combustible Components

For the past couple years, I have attempted to get the NFPA 285 committee to consider adjustments to the NFPA 285 test procedure before expanding the scope of the standard to allow application of the standard to wall assemblies on any building. My approach was to fight attempts to expand the use of NFPA 285 to include any wall assembly until changes are made to the standard to address concerns regarding sufficiency of the standard with respect to building geometry and possibly wind driven fires. The development process for NFPA 285 has been very contentious on this issue, with the committee completely reversing course from one meeting to the next, and ultimately, the NFPA Standards Council refused to issue one of the updates and returned the entire document to the technical committee. After that, the committee just repeated previous actions, and got the standard approved. I simply gave up in the NFPA process because it was clear that committee members with proprietary interests in the standard were driving the process, and there was no way to stop that train.

The fire service has very little voice in the NFPA 285 process compared to industry interests, and it has been very difficult to get the committee to give these concerns due consideration, and on this issue, I am representing the perspective of the fire service and a code official. Lacking the ability to get appropriate consideration from the NFPA 285 technical committee, I am asking ICC to delay updating the NFPA 285 reference so that the IBC continues to reference a version of NFPA 285 that has a limited scope.

As discussed at numerous code hearings, issues of building geometry, in particular, such as reentrant corners, are not considered by NFPA 285, and they dramatically effect the intensity of the fire exposure to tested assemblies. Either ICC, NFPA or both need to force a discussion about the test sufficiency, recognizing that other international tests and FM tests for the same assembly types are substantially more stringent than what NFPA 285 calls for.

The fire service is well aware of the effects of wind driven fires and of building geometry when it comes to fire behavior, and we can ill afford the risk of catastrophic high-rise fires involving exterior walls. While it has been claimed that there have been no such documented losses involving NFPA 285 compliant panels on buildings, the lack of a bad fire does not equate to a conclusion that everything is fine. Instead, numerous catastrophic exterior fires that have occurred just happened to occur on buildings with non-compliant walls assemblies. What would have happened if NFPA 285 compliant panels were used? Nobody can say for certain.

The previous NFPA 285 test method, that I'm trying to get back to with this public comment, is scoped to ONLY include non-bearing geometrically flat curtain walls attached to buildings, and I have no issue with the current test method continuing for this application. However, the effectiveness of this test method for assemblies with overhangs and inside corners that can intensify the fire exposure needs to be known before these untested geometric variations should be permitted by NFPA 285 or the IBC. UL's mantra is "know by test." We haven't tested, therefore, we don't know.

Building officials and the fire service would be unwise to accept the risk of catastrophic high-rise fires by knowingly standing by while the NFPA 285 test method is exploited. Without knowing the fire performance consequences of stretching the test method to allow assemblies that are not well represented in the test, we cannot reasonably assure public safety or firefighter safety. We must do a better job of making sure we get this issue right because Grenfell Tower was a wake up call with respect to the consequences of inadequate testing. Do we really want to allow buildings to be built with untested wall configurations only to later learn that we screwed up and created a large pool of dangerous existing buildings? The time to address these concerns is now, before NFPA 285's new scoping is permitted by the IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This proposal maintains the current requirements of the 2018 IBC in the 2021 edition. Therefore, no change in the requirement will have no impact on cost.

Public Comment 5:

Proponents: Jeremy Brown, representing NSF International (brown@nsf.org) requests As Modified by Public Comment

Modify as follows:

NSF

Modify as follows:

NSF

~~359--2016~~ 359--2018: Valves for Crosslinked Polyethylene (PEX) Water Distribution Tubing Systems

Commenter's Reason: The code should reference the most recent version of the standard.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This change will not affect cost.

Public Comment 10:

Proponents: David Bixby, representing Air Conditioning Contractors of America (bixster1953@yahoo.com) requests Disapprove

Commenter's Reason: ACCA opposes the Committee's Action to Approve the updated reference to the 2019 edition of ANCE/ CAN-CSA/UL 60335-2-40, and requests the committee to retain the current reference as found in the 2018 IRC. The 2019 edition of the above standard covers residential equipment for direct systems that use A2L flammable refrigerants. Moreover, previous proposals to add coverage for A2L refrigerants for use in all direct systems for air-conditioning applications were **all rejected** by the membership and technical committees during the 2018 "Group A" code change cycle for the IMC and the IFC. Therefore, allowing the 2019 edition of this standard to appear in the Admin section for the IRC would create confusion in the field since no approval requirements will exist in the 2021 IRC. It would also be in direct conflict with the IMC and IFC. Currently the IRC has no additional restrictions or code provisions to safely install these new flammable refrigerant systems in homes, schools and offices. Until training is created and provided for installers, inspectors and firefighters, the current research at AHRI is completed and analyzed, and ASHRAE completes the residential air-conditioning standard (15.2), it is very premature to allow these systems in the residential marketplace. ACCA requests disapproval of this proposal and an overturn of the committee recommendation.

Cost Impact:

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No change to code.

Public Comment 11:

Proponents: James Narva, representing National Assoc. of State Fire Marshals (jnarva@narvaassociates.com) requests Disapprove

Commenter's Reason: The National Association of State Fire Marshals is opposed to updating the standard for air conditioners to accommodate flammable refrigerants – UL/CSA/ANCE 60335-2-40 – 2019. We ask that the ICC membership overturn the Administrative Committee and maintain the protections afforded in the current IRC. This is consistent with actions taken by the IMC committee and the membership during the 2021 Group A cycle.

In addition, when A2L refrigerants are introduced to flame, they will ignite, burn completely and produce significant quantities of hydrofluoric acid. This highly corrosive contact poison can penetrate tissue, readily poisoning firefighters and citizens through exposure of skin or eyes, or when inhaled or swallowed.

We believe that while a lot of work has been accomplished to identify and mitigate the risks associated with these products, much work remains before there is solid scientific justification to support this change.

For instance, we have learned that flammable refrigerant detectors aren't durable enough to serve their intended purpose in these systems; they may only last a few months to a few years at best. These systems, many times, are in service for decades. It's likely, as we have learned with battery powered smoke alarms, that homeowners will find ways to circumvent the detection system if they don't perform as intended for the life of the equipment.

Training for the fire service will also take some time. Without this training, which is vitally necessary to inform responding fire fighters of these new risks, which include flammability, combustion byproduct issues, including the previously mentioned HF poisoning, we place first responders in harm's way needlessly.

We believe introducing a product safety standard as a stand-alone document in the code is an ill-conceived idea. Product safety standards of this type need installation criteria, either in the form of code provisions or an installation standard, to complete the regulatory loop. The code requires many products to be listed, then goes on to say how they should be installed and maintained. We understand that such an installation standard is under development, but perilously, it is not yet available. The update of this standard absent the accompanying installation standard further only further escalates the risks imposed on fire fighters.

Industry decided to risk developing the regulations for the use of flammable refrigerants without input from the public safety community. We have offered our expertise to industry and remain committed to working toward a safe solution for the implementation of more environmentally palatable refrigerants. Yet, we are disappointed that the industry has resisted our overtures while attempting to use an administrative update procedure to achieve their goal after being turned down during the normal code development process.

Overturning the committee action will provide the time to develop reasonable installation criteria, identify and repair any flaws in the current standard, and implement training programs for fire fighters.

Cost Impact:

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Since the public comment maintains the current code language, there is no increase or decrease in cost.

Public Comment 12:

Proponents: Paul Armstrong, representing JCI (paul.armstrong@pacodeservices.com) requests Disapprove

Commenter's Reason: This Public Comment is submitted specifically to ask for the disapproval of the update of UL60335-2-40 to the 2019 edition. The code change update proposal would allow flammable refrigerants to be used in direct HVAC systems installed in residential construction covered by only the International Residential Code. Please note that in all model mechanical codes there is currently a prohibition against the use of such flammable refrigerants in residential construction in direct HVAC systems, so this is a major change. This revision was previously heard during the Group A Code Development Cycle last year in a more comprehensive manner and was disapproved by the code committee and the ICC membership. Also, the 2019 edition of this UL Standard is supposed to have completed its review and ANSI approval process but no ICC technical committee has been given the opportunity to review it in its final form to date. Also, note that this is only proposed for the IRC, a more complete proposal is needed to completely cover all types of projects covered by both the IRC and IMC to eliminate confusion between the two model codes.

While the move to more climate friendly refrigerants is ideal, we also need a complete review considering all aspects of the installation of flammable refrigerants in the IRC. Other Public Comments will address the, to date, known issues in the 2019 edition of the UL standard, other concerns need to be addressed as follows:

1. There is an assumption that highly trained contractors will be installing HVAC systems but the IRC is intended for use by all levels of construction experience. As such, there are no safety measures addressed for people to attempt to do this installation themselves. There isn't even a limitation proposed that would require certified installers.

2. Significant training would be required for both professional and volunteer fire department personnel, building inspectors or even home inspectors in dealing with these systems in both emergency and non-emergency situations. Again, nothing has been proposed either through this code development process or heard of outside of it. Home owners would also need much more than just an owner's guide to be safe.
3. Lastly, no evaluation has been provided on the impacts to both new and existing construction under the IRC for the effects of fires involving HVAC systems using flammable refrigerants. The IRC was developed with the current code limitations in mind and further protection may be required of the structure and/or for safety of the occupants as a result.

Please understand that while this seems as if it is a minor change, it really is a big shift in IRC related construction and should be completely evaluated by all facets of industry, especially emergency responders, to understand its impacts on the bulk of the projects that occur in jurisdictions across the United States. Please disapprove the update to the 2019 edition of UL 60335-2-40 so a more thorough review can be completed next code development cycle.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. However the effect of the original proposal will increase the cost of construction based on the use of the 2019 edition of UL 60335-2-40.

Public Comment 13:

Proponents: James Dominik, representing UL Fire Advisory Board on behalf of Public Safety and Emergency Responders requests Disapprove

Commenter's Reason: Requesting disapproval of the update of UL/CSA/ANCE standard 60335-2-40 to the 2019 edition.

UL created a Fire Services Advisory group to evaluate flammable refrigerants and the standards being created. This group is comprised of:

International Association of Firefighters
International Association of Fire Chiefs
National Association of State Fire Marshals
Fire Department New York City
Chicago Fire Department
Boston Fire Department
Plano Fire Department

This group feels that inclusion of flammable refrigerants in the IRC update is premature and should not be included in the proposed IRC update. This recently was not approved in the update to the UMC code.

Since the public safety/emergency responder community has been involved it is apparent there still is much research that is not complete. Until the planned research can be completed and the code creation process can have involvement from all stakeholders this is premature and potentially putting the public and its emergency responders at increased risk. Industry agrees there has been a failure to involve the public safety/emergency responder community in the creation of these standards at this time.

<https://img1.wsimg.com/blobby/go/253af947-bd2c-4f8b-9959-e817c041d781/downloads/UL%20Fire%20Service%20Position%20Statement%20-%20Flammable.pdf?ver=1566757294047>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. No change to code.

Public Comment 14:

Proponents: Chris Forth, Johnson Controls, representing Johnson Controls (chris.m.forth@jci.com) requests Disapprove

Commenter's Reason: JCI requests that the committee disapprove the update of UL 60335-2-40 to the 2019 version to allow for the completion of all testing, training and standards updates and for a thorough review to be completed during the code development cycle.

- **Proposed change has a substantive impact.** Although characterized as an administrative update to the UL60335-2-40 2019 edition, this is a substantive change that would allow flammable refrigerants in residential and commercial air conditioning and heat pump systems.
- **Proposed change has been rejected by the membership in the Group A cycle (IMC and IFC hearings).** Both the technical committee and the voting ICC membership rejected the proposed change during the IMC and IFC Group A code development hearings in Richmond, Virginia.
- **Training Not In Place to Support Proposed Change.** The proposed change to allow flammable refrigerants in residential and commercial air conditioning and heat pump systems, where such provisions have never been allowed and where licensing requirements and training does not presently exist, should not be rushed. OEM's such as JCI depend on independent contractors to properly and safely install our equipment. These independent contractors need a uniform, nationwide training curriculum fully developed and executed prior to any new flammable equipment being released to the

market. Given that the training materials for the safe handling, transportation and storage of flammable refrigerants are not complete, as well as the absence of a nationwide licensing system to ensure compliance, dictates that the industry is not ready for such provisions. Given adequate time we feel such issues can be addressed but it will require further stakeholder input and study.

- **Uniform Model Codes Not In Place to Support Proposed Change.** The HVAC industry needs both universal models codes (IMC and UMC) to be in alignment in regards to the allowance of flammable refrigerants to ensure consistent safety standards across the country and avoid interstate border compliance gaps. At this time, the UMC has rejected any proposal to allow flammable refrigerants in residential and commercial air conditioning and heat pump systems.
- **Research Designed to Inform Decision Making Not Complete.** In addition to the training and licensing risk, there are critical safety standards (ASHRAE 15.2) and research testing (AHRI, ASHRAE, etc.) which remain incomplete or have yet to even be started as follows:

AHRI/AHRTI Research Projects

1. 9012: Refrigerant Leak Characterization: Evaluates the impact of A2L flammable refrigerant leaks on concentrations in the spaces to which they are connected. Project currently delayed and not expected to be complete until 2020.
2. 9014: Assess Refrigeration Detector Characteristics for Use in HVACR Equipment. Work underway. Not expected to be completed until early 2020.
3. 9015: Assessment of Refrigerant Leakage Mitigation Effectiveness for Air Conditioning and Refrigeration Equipment. Work not started. Uncertain as to when the project will be completed.

ASHRAE Research Projects

4. RP-1806: Post-Ignition Risk Assessment of Flammable Refrigerants. Work has started but has been suspended. Results not expected until the end of 2020.
5. RP-1808: Evaluation of Mechanical Field Joints. Testing is complete but results have not been reviewed for incorporation into standards.
6. WS-1855: Evaluation of Combustion By-Products for HFO Refrigerants. Testing has not started and is not expected to be complete until ~2020

Standards

7. ASHRAE Standard 15.2P: Safety Standard for Air-conditioning and Heat Pump Systems in Residential Applications. In the proposal stage. Not likely to be complete until ~2021 or later. This standard is critical for contractors and inspectors to understand the specific installation, sizing and safety requirements for residential applications.

The results of this new research testing needs to be evaluated and if deemed appropriate incorporated into the multiple standards (ASHRAE 15 / 15.2 – UL 60335-2-40) as well as into future contractor training materials which presently do not exist. Due to the complexity of the multiple standards which have overlapping and in some cases conflicting requirements, inspectors will also need sufficient time to study and digest the standard in order to provide proper enforcement.

For these reasons, JCI reiterates its request that the committee disapprove the update of UL 60335-2-40 to the 2019 version.

Bibliography: Johnson Controls

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. However the effect of the original proposal would increase the cost of compliance based on the use of the 2019 edition of UL 60335-2-40 which would require the addition of special refrigerant sensors, dedicated control schemes and dedicated piping requirements for specific applications.

Public Comment 15:

Proponents: Joe Holomy, Illinois Fire Advisory Commission, representing Illinois Fire Advisory Commission requests Disapprove

Commenter's Reason: Requesting disapproval of the update of UL/CSA/ANCE standard 60335-2-40 to the 2019 edition.

The Illinois Fire Advisory Commission (FAC) has determined the vast majority of the mainstream refrigerant replacements being proposed by industry are odorless and colorless and have a higher heat ignition resulting in the introduction of a new risk to the general public. The FAC has formally voted on and adopted Resolution 01-19 which is attached.

Resolution 01-19

ILLINOIS FIRE ADVISORY COMMISSION RELATING TO INDUSTRY FLAMMABLE REFRIGERANTS

1. Whereas the Illinois Fire Advisory Commission (FAC) is a statutorily created organization that is charged with advising the Office of the State Fire Marshal in the exercise of its duties which includes fire prevention and life safety subject matter (20 ILCS 2905/3);
2. Whereas the FAC is a fire service member organization that promotes progress of all major fire service organizations as it relates to the life, health, and safety of the citizens of the State of Illinois while also being the common voice on behalf of the fire service members in communicating with the Illinois General Assembly Fire Caucus, with membership including the Associated Firefighters of Illinois, the City of Chicago Fire Department, Illinois Chapter of the International Association of Arson Investigators, Illinois Association of Fire Protection Districts, Illinois Fire Chiefs Association, Illinois Fire Inspectors Association, Illinois Fire Safety Alliance, Illinois Fire Service Institute, Illinois Firefighters Association, Illinois Professional Firefighters Association, Illinois Society of Fire Service Instructors, Mutual Aid Box Alarm System, and the Northern Illinois Alliance of Fire Protection Districts and;
3. Whereas it has come to the attention of the FAC that the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) representing manufacturers of the Heating, Ventilation, Air Condition, Refrigeration and Water Heating equipment (HVAC&R) within the global industry is proposing a change to the International Residential Building Code allowing for a new refrigerant that has been determined to be highly flammable and;
4. Whereas the FAC has further determined the vast majority of the mainstream refrigerant replacements being proposed by industry are odorless and colorless and have a higher heat ignition resulting in the introduction of a new risk to the general public and;
5. Whereas the FAC has discovered until now, the public safety community has not been involved in the testing of these products and policy discussions as to the long-term impacts;

It is hereby Resolved that the FAC:

1. Formally objects to the proposed industry action relating to flammable refrigerants as it is currently being introduced;

2. Urges industry representatives to withdraw any current proposals to National Codes and Standards that would result in the widespread installation of equipment using flammable refrigerants;

3. Urges industry representatives to fully research the actual and potential consequences of their proposed action relative to public and firefighter safety prior to implementing such action; and

4. Urges industry representatives to formally meet with the FAC prior to the implementation of any such proposed action for the specific purpose of discussing the proposed industry action and any alternative actions that could be implemented which address public and firefighter safety.

We further certify that the FAC is duly organized and existing, and that the members have voted, authorized, and called for the foregoing resolution.

Chief Joseph Holomy
Chairman
Illinois Fire Advisory Commission

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Public Comment 16:

Proponents: Michael O'Brian, Fire and Life Safety Section of the International Association of Fire Chiefs, representing Fire and Life Safety Section of the International Association of Fire Chiefs (mobrian@brightonareafire.com) requests Disapprove

Commenter's Reason: Requesting disapproval of the update of UL/CSA/ANCE standard 60335-2-40 to the 2019 edition.

During the Group A code development process, several proposals to allow air conditioning equipment using increased quantities of flammable refrigerants were discussed at length, and the committee voted against those proposals. Public comments were filed, and the membership considered those same proposals. Those proposals failed again, so the 2021 IMC will not change its current restrictions on flammable refrigerants.

The proposal to administratively update the standard for air conditioning equipment is a "back door" for the industry to achieve what they couldn't during the IMC debates.

Regardless of the process, the flaws in the proposal remain, including:

- Wildland fire potential has not been considered during the development of this standard
- This is a product safety standard; we also need installation criteria for this new risk
- Training for fire fighters so that they are aware of the risks associated with flammable refrigerants is imperative. This would include ignition/fire risks as well as the risks associated with the combustion byproducts of these gases.
- Serious consideration should be given to finding a way to odorize this material.
- The risk mitigation scheme proposed (detection/ventilation) should be validated through a comprehensive study before the standard is used.

As one person said "So, someone wants to run flammable, unodorized gas through your home at high pressure through copper tubing . . . what could go wrong?"

We urge the ICC membership to overturn the committee and keep the current standard until the concerns over flammable refrigerants are addressed.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Public Comment 17:

Proponents: Matthew Perez, Illinois State Fire Marshal, representing Illinois State Fire Marshal requests Disapprove

Commenter's Reason: UL should curtail development of Standard 60335-2-40 until all pertinent research is available to assure the current level of safety is maintained and resist any proposals to national codes and standards that would result in the widespread installation of equipment using flammable refrigerants. UL should take into consideration the input and expertise of the fire service as well as acquire complete scientific justification in order to fully address risk management..

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Public Comment 18:

Proponents: Richard Swan, representing IAFF requests Disapprove

Commenter's Reason: Requesting disapproval of the update of UL/CSA/ANCE standard 60335-2-40 to the 2019 edition.

The International Association of Fire Fighters represents over 317,000 fire fighters and paramedics in the United States and Canada and these are the bulk of the responders that will be facing this issue. There are many issues of concern with the proposal; no definition of the word "mildly flammable", the marketing department came up with this because it is quickly tied to "when compared to hydrocarbons", A2L must only be used in A2L equipment- we all know this won't happen, what are the combustion byproducts of these new refrigerants, questions related to the detection systems and detectors, using non-standard DOA and NFPA symbols, complete lack of knowledge, analysis and consideration as to: Mitigation of incidents involving now flammable appliances - Tactical considerations for homes containing flammable appliances - Identification of this hazard prior to determining the risk vs. reward of committing personnel to an interior attack.

Based upon the amount of research pending, and the apparent lack of knowledge around some of these issues, the development of regulations enabling the use of flammable refrigerants is premature. If done now without careful thought and consideration the consequences could be catastrophic.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Public Comment 19:

Proponents: Jim Tidwell, representing Honeywell (jimtiddwell@tccfire.com) requests Disapprove

Commenter's Reason: This public comment is for disapproval of the proposed update of UL 60335-2-40. This is a product safety standard that covers air conditioning equipment.

The proposal to update the standard for air conditioning systems to allow for the use of flammable refrigerants is premature and in direct conflict with actions taken by the membership in the Group A cycle (IMC and IFC hearings). This is especially relevant for direct systems where a flammable refrigerant can leak in the occupied space. Whether it's a small commercial system or a residential system, the safety issues are the same. The IMC committee rejected each and every proposal to allow increased quantities of flammable refrigerants and their rejections were upheld by the membership. Now, the proponents would have the membership negate that process through an administrative update of the standard. We don't believe it was ever the intent of the ICC Board of Directors to allow an administrative standard update to circumvent the normal code development process, which will be the result if the standard is allowed to be updated.

In addition to the philosophical issues, we believe the update of this product safety standard is premature for the following reasons:

- A product safety standard such as UL-60335-2-40, even if it is appropriate, is only part of the regulatory solution. In addition to the product safety standard, installation criteria are necessary for the safe installation and use of any equipment - and that criteria doesn't currently exist. At this time, ASHRAE is in the process of developing the installation standard for this equipment in residential occupancies (ASHRAE 15.2). In the current ASHRAE draft, there are requirements for outdoor equipment to be located a minimum distance from a structure; requirements for protection of piping containing flammable refrigerants and other requirements to attempt to address the additional risks involved with the use of flammable refrigerants. These are not included in the UL standard, as it's only addresses product safety, not installation.
- There are several studies (ASHRAE, AHRI, DOE, etc.) in various stages to validate the requirements set by these standards. These studies will likely uncover deficiencies in the standards that will need to be addressed before equipment is actually installed. Note that approximately 8 million air conditioning units are installed in the U.S. each year; getting this right is of paramount importance.
- The UL Standard has not received a review from any ICC technical committee; the Administrative Committee did not debate the technical issues related to the standard, although several members of the ICC attempted to address them. The Administrative Committee chose to move the standard forward based on the fact that the procedural issues were all satisfied.

In addition to these facts, the membership should be aware that the standard has a number of gaps/issues that many believe are critical and need to be corrected including:

- The standard doesn't require risk mitigation unless the equipment exceeds a certain amount of refrigerant; a formula is used to calculate the maximum amount allowed without mitigation rather than a fixed weight or volume of refrigerant. A research project is currently underway by the Oak Ridge National Laboratory to investigate the proper basis for setting charge limits of all flammable refrigerants; when that study is complete, the results should be used to determine the appropriate amount of flammable refrigerant allowed in the equipment.
- Once triggered, the risk mitigation scheme is to detect any leaking refrigerant and activate mechanical air movement (either circulation or ventilation). There is a study proposed by AHRI to evaluate the detection and mitigation strategies in this standard. It hasn't begun as of this writing, and may identify gaps in the standard in need of attention.
- The standard does not require listed detectors; rather, it requires sensors to be "evaluated" with the air conditioning equipment being listed. This is a significant difference. UL staff testified in the Group A hearings that there is a UL listing standard for these devices, so there should be no reason to allow anything other than listed detectors. The requirements in the latest draft of the standard for evaluation of detectors doesn't address calibration drift, which is a known problem with existing detectors that could render them useless.
- In determining the maximum charge size, the standard assumes that any leak will diffuse completely and immediately throughout the room into which it leaks – this is a false assumption; no gas or liquid diffuses immediately and completely in the atmosphere. If the leak is in liquid form, the situation worsens. In tests at UL, leaks of this fluid actually pooled on the floor and off-gassed for some period of time. We don't believe this is addressed in the standard.
- The standard allows unlimited quantities of refrigerant where the system is installed with shutoff valves activated by refrigerant detectors to limit the amount of refrigerant released. Neither the valves nor the detectors are required to be listed. This may be a substantial safety risk, but more research is needed to make that determination.
- Many of the requirements of the standard are based upon complex computer modeling. During actual tests, it was found that turbulence had a significant and dangerous effect on the ignitability and burning characteristics of these refrigerants. Turbulence isn't a condition that can be adequately predicted using computer models.
- The standard only requires detection inside equipment. Any failure of piping that results in leaked refrigerant outside the equipment will not result in detection and mitigation.
- In the current draft of the standard, notification of occupants is by a "series of flashing lights", which will not produce adequate information for occupants to react to a leak.

Overturning the committee for this single standard will allow the industry and public safety officials the opportunity to address these important issues; updating to the new standard presents unnecessary and inordinate risks to our communities. Please vote to overturn the committee.

Here is the link to the AHRI report:

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Proposed Change as Submitted

Proponents: Michael Fillion, representing National Council of Structural Engineers Association (mrf.structure@verizon.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Revise as follows:

[BS] SUBSTANTIAL STRUCTURAL ALTERATION. An alteration in which the gravity load-carrying structural elements altered within a 5-year period support more than 30 percent of the total floor and roof area of the building or structure. The areas to be counted toward the 30 percent shall include mezzanines, penthouses, and in-filled courts and shafts tributary to the altered structural elements. For the purpose of this definition, a structural element shall be considered altered if its demand is increased by more than 5% or its capacity is reduced by any amount.

Reason: The National Council of Structural Engineers Existing Buildings Sub-committee has received inquiries from practicing structural engineers regarding the interpretation of this definition. In Massachusetts, a structural engineering firm requested an interpretation from the Chief of Building Inspectors and the Structural Advisory Committee to the Massachusetts State Building Code. From our feedback, practicing structural engineers have various opinions regarding the interpretation of the definition. A common question is "What is considered an alteration." The intent of the proposed added language is to make it clear what an alteration is in the context of the definition.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The intent of this code change proposal is for clarification

EB2-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Item is not required in the code - commentary material (Vote: 12-2)

Assembly Action:

Individual Consideration Agenda

Public Comment 1:

IEBC®: [BS]

Proponents:

Michael Fillion, representing National Council of Structural Engineers Association (mrf.structure@verizon.net)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

[BS] SUBSTANTIAL STRUCTURAL ALTERATION. An alteration in which the gravity load-carrying structural elements required to be replaced or altered within a 5-year period support more than 30 percent of the total floor and roof area of the building or structure. The areas to be counted toward the 30 percent shall include mezzanines, penthouses, and in-filled courts and shafts tributary to the altered structural elements. ~~For~~

~~the purpose of this definition, a structural element shall be considered altered if its demand is increased by more than 5% or its capacity is reduced by any amount~~

Commenter's Reason: NCSEA's basis for this code change proposal is based on feedback from practicing structural engineers and code officials who have expressed confusion with the definition. Our feedback has indicated that the definition is being interpreted in more than one way. Depending on which way the definition is interpreted can result in weather or not the lateral load resisting system of an altered building is required to meet the wind and seismic requirements of the IBC.

The word 'altered' is not defined in Definitions in Chapter-2 of the IEBC or IBC. The Webster dictionary defines altered as: 'made different in some way'.

Sections 503.3, 706.2 & 806.2 of the IEBC refer to existing structural elements carrying gravity loads. In those sections, the word altered is used. It states that when an alteration causes an increase in gravity loads of more than 5% or any decrease in capacity to a gravity load-carrying structural element, the element shall be replaced or altered as needed to comply with IBC gravity loads for new structures. In the context of these sections, the replaced or altered elements for IBC compliance count toward the 30% of the total floor and roof area threshold.

Our proposal makes it clear which gravity load-carrying structural elements contribute to the 30% threshold which determines weather or not the lateral load resisting system of a building is required to be IBC compliant for wind and seismic loads.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. If the 2018 definition of Substantial Structural Alteration is misinterpreted, it may result in an increase of construction cost.

Public Comment# 1844

Proposed Change as Submitted

Proponents: Allison Cook, Arlington County, VA, representing VBCOA; Kenney Payne, Moseley Architects, representing AIA Virginia (kpayne@moseleyarchitects.com); Ronald Clements Jr, representing Chesterfield County (clementsro@chesterfield.gov); Shaina Abney (shaina.abney@fairfaxcounty.gov); Bob Orr, representing VBCOA (borr@culpepercounty.gov); Charles Vernon, representing VBCOA (cvernon@arlingtonva.us); Michael Williams, representing Virginia Building and Code Officials Association (VBCOA) (mike.williams@harrisonburgva.gov); Debra McMahon (debra.mcmahon@fairfaxcounty.gov); David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com); Christina Jackson, City of Norfolk, representing City of Norfolk / WICED of VA (christina.reynolds@norfolk.gov)

2018 International Existing Building Code

Revise as follows:

WORK AREA. ~~That portion or portions of a building consisting of all reconfigured spaces as indicated on the construction documents. Work area excludes other portions of the building where incidental work entailed by the intended work must be performed and portions of the building where work not initially intended by the owner is specifically required by this code.~~ intended room, space, or portion of a building or structure where a wall or walls are added, relocated, or removed. Work area excludes the following:

1. The addition or elimination of any door or window.
2. The reconfiguration or extension of any system
3. The installation of any additional equipment
4. the removal of finished flooring or ceiling materials
5. adjacent rooms or other rooms, spaces, or portions of the building or structure where incidental work entailed by the intended work must be performed
6. portions of the building or structure where work not initially intended is specifically required by this code.

Reason: The current definition of work area is too vague and creates the potential for significantly different interpretations of what constitutes a work area. In Virginia, we have experienced inconsistency between jurisdictions and adopted this definition to address that issue. The proposed change provides more details on what is and is not part of a work area. This should help both building officials and design professionals.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal is only to add clarification, it should not impact cost.

EB3-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The revised definition better reflects work area and is presented in a better format. There was some concern that the revised wording of the main portion of the definition reduces the scope of the term too much. (Vote: 8-5)

Assembly Action:

None

EB3-19

Individual Consideration Agenda

Public Comment 1:

IEBC®: 202

Proponents:

Jeff Inks, representing Window and Door Manufacturers Association (jinks@wdma.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

WORK AREA. That intended room, space, or portion of a building or structure where a wall or walls are added, relocated, or removed. Work area excludes the following:

1. The addition or elimination of any door, ~~or~~ window or skylight.
2. The reconfiguration or extension of any system
3. The installation of any additional equipment
4. the removal of finished flooring or ceiling materials
5. adjacent rooms or other rooms, spaces, or portions of the building or structure where incidental work entailed by the intended work must be performed
6. portions of the building or structure where work not initially intended is specifically required by this code.

Commenter's Reason: The modification proposed by this PC to include skylights in exclusion 1., adds further clarification to what is considered a "work area" and is consistent with the intent of the proposal on the whole. Skylights should be included with doors and windows in exclusion item 1., for the same reasons windows and doors are.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This PC will reduce the cost of construction by ensuring skylight replacement or elimination is not considered part of a work area and exempt from requirements that are not intended for such activity.

2018 International Existing Building Code

Revise as follows:

SECTION ~~305~~ 508 ACCESSIBILITY FOR EXISTING BUILDINGS

~~305.1~~ 508.1 Scope. The provisions of Sections ~~305.1-508.1~~ through ~~305.9-508.9~~ apply to maintenance, *change of occupancy*, *additions* and *alterations* to *existing buildings*, including those identified as *historic buildings*.

~~305.2~~ 508.2 Maintenance of facilities. A *facility* that is constructed or altered to be *accessible* shall be maintained *accessible* during occupancy.

~~305.3~~ 508.3 Extent of application. An *alteration* of an existing *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction. *Alterations* shall not reduce or have the effect of reducing accessibility of a *facility* or portion of a *facility*.

~~305.4~~ 508.4 Change of occupancy. *Existing buildings* that undergo a change of group or occupancy shall comply with this section.

Exception: Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

~~305.4.1~~ 508.4.1 Partial change of occupancy. Where a portion of the building is changed to a new occupancy classification, any *alterations* shall comply with Sections ~~305.6-508.6~~, ~~305.7-508.7~~ and ~~305.8-508.8~~.

~~305.4.2~~ 508.4.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy*, it shall comply with Section ~~305.4.1~~ 508.4.1 and shall have all of the following accessible features:

1. Not fewer than one accessible building entrance.
2. Not fewer than one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the International Building Code.
4. Accessible parking, where parking is being provided.
5. Not fewer than one accessible passenger loading zone, where loading zones are provided.
6. Not fewer than one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, Items 1 through 6 shall conform to the requirements to the maximum extent technically feasible.

Exception: The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

~~305.5~~ 508.5 Additions. Provisions for new construction shall apply to *additions*. An *addition* that affects the accessibility to, or contains an area of, a *primary function* shall comply with the requirements in Section ~~305.7-508.7~~.

~~305.6~~ 508.6 Alterations. A *facility* that is altered shall comply with the applicable provisions in Chapter 11 of the International Building Code, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section ~~305.7-508.7~~.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing facilities.

3. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.
4. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in *existing buildings* and facilities undergoing *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

~~305.7~~ 508.7 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to, or contains an area of *primary function*, the route to the *primary function* area shall be *accessible*. The accessible route to the *primary function* area shall include toilet facilities and drinking fountains serving the area of *primary function*.

Exceptions:

1. The costs of providing the *accessible* route are not required to exceed 20 percent of the costs of the *alterations* affecting the area of *primary function*.
2. This provision does not apply to *alterations* limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration* of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.
5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

~~305.8~~ 508.8 Scoping for alterations. The provisions of Sections ~~305.8.1~~ 508.8.1 through ~~305.8.15~~ 508.8.15 shall apply to *alterations* to *existing buildings* and *facilities*.

~~305.8.1~~ 508.8.1 Entrances. Where an *alteration* includes alterations to an entrance that is not accessible, and the *facility* has an *accessible* entrance, the altered entrance is not required to be *accessible* unless required by ~~Section 305.7.~~ Section 508.7. Signs complying with Section 1111 of the International Building Code shall be provided.

~~305.8.2~~ 508.8.2 Elevators. Altered elements of existing elevators shall comply with ASME A17.1 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

~~305.8.3~~ 508.8.3 Platform lifts. Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

~~305.8.4~~ 508.8.4 Stairways and escalators in existing buildings. Where an escalator or stairway is added where none existed previously and major structural modifications are necessary for installation, an accessible route shall be provided between the levels served by the escalator or stairways in accordance with Section 1104.4 of the International Building Code.

~~305.8.5~~ 508.8.5 Ramps. Where slopes steeper than allowed by Section 1012.2 of the International Building Code are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table ~~305.8.5.~~ 805.8.5.

**TABLE ~~305-8.5~~ 508.8.5
RAMPS**

SLOPE	MAXIMUM RISE
Steeper than 1:10 but not steeper than 1:8	3 inches
Steeper than 1:12 but not steeper than 1:10	6 inches

For SI: 1 inch = 25.4 mm.

~~305-8.6~~ 508.8.6 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the International Building Code for Accessible units apply only to the quantity of spaces being altered or added.

~~305-8.7~~ 508.8.7 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the International Building Code for Type A units apply only to the quantity of the spaces being altered or added.

~~305-8.8~~ 508.8.8 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being added. Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the *work area* is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

~~305-8.9~~ 508.8.9 Jury boxes and witness stands. In *alterations*, accessible wheelchair spaces are not required to be located within the defined area of raised jury boxes or witness stands and shall be permitted to be located outside these spaces where the ramp or lift access restricts or projects into the required means of egress.

~~305-8.10~~ 508.8.10 Toilet rooms. Where it is *technically infeasible* to alter existing toilet and bathing rooms to be *accessible*, an *accessible* family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the International Building Code is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

~~305-8.11~~ 508.8.11 Additional toilet and bathing facilities. In assembly and mercantile occupancies, where additional toilet fixtures are added, not fewer than one accessible family or assisted-use toilet room shall be provided where required by Section 1109.2.1 of the International Building Code. In recreational facilities, where additional bathing rooms are being added, not fewer than one family or assisted-use bathing room shall be provided where required by Section 1109.2.1 of the International Building Code.

~~305-8.12~~ 508.8.12 Dressing, fitting and locker rooms. Where it is *technically infeasible* to provide accessible dressing, fitting or locker rooms at the same location as similar types of rooms, one accessible room on the same level shall be provided. Where separate-sex facilities are provided, accessible rooms for each sex shall be provided. Separate-sex facilities are not required where only unisex rooms are provided.

~~305-8.13~~ 508.8.13 Fuel dispensers. Operable parts of replacement fuel dispensers shall be permitted to be 54 inches (1370 mm) maximum, measuring from the surface of the vehicular way where fuel dispensers are installed on existing curbs.

~~305-8.14~~ 508.8.14 Thresholds. The maximum height of thresholds at doorways shall be $\frac{3}{4}$ inch (19.1 mm). Such thresholds shall have beveled edges on each side.

~~305-8.15~~ 508.8.15 Amusement rides. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.4.8 of the International Building Code.

~~305-9~~ 508.9 Historic buildings. These provisions shall apply to *facilities* designated as historic structures that undergo *alterations* or a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the *facility*, as determined by the authority having jurisdiction, the alternative requirements of Sections ~~305-9.1~~ 508.9.1 through ~~305-9.4~~ 508.9.4 for that element shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in historic buildings.

~~305-9.1~~ 508.9.1 Site arrival points. Not fewer than one accessible route from a site arrival point to an accessible entrance shall be provided.

~~305-9.2~~ 508.9.2 Multiple-level buildings and facilities. An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.

~~305-9.3~~ 508.9.3 Entrances. Not fewer than one main entrance shall be accessible.

Exception: If a public entrance cannot be made accessible, an accessible entrance that is unlocked while the building is occupied shall be provided; or, a locked accessible entrance with a notification system or remote monitoring shall be provided.

Signs complying with Section 1111 of the International Building Code shall be provided at the public entrance and the accessible entrance.

305.9.4 508.9.4 Toilet and bathing facilities. Where toilet rooms are provided, not fewer than one accessible family or assisted-use toilet room complying with Section 1109.2.1 of the International Building Code shall be provided.

Add new text as follows:

SECTION 405 **Accessibility**

405.1 General. Repairs shall be done in a manner that maintains the level of accessibility provided.

SECTION 705 **Accessibility**

705.1 General. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible. A facility that is constructed or altered to be accessible shall be maintained accessible during construction.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing facilities undergoing less than a Level 3 alteration.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

705.2 Extent of application. An alteration of an existing element, space or area of a facility shall not impose a requirement for greater accessibility than that which would be required for new construction. Alterations shall not reduce or have the effect of reducing accessibility of a facility or portion of a facility.

705.3 Scoping. A facility that is altered shall comply with the applicable provisions of Sections 705.3.1 through 705.3.15, and Chapter 11 of the International Building Code unless it is technically infeasible.

705.3.1 Entrances. Where an alteration includes alterations to an entrance that is not accessible, and the facility has an accessible entrance, the altered entrance is not required to be accessible unless required by Section 705.4. Signs complying with Section 1111 of the International Building Code shall be provided.

705.3.2 Elevators. Altered elements of existing elevators shall comply with ASME A17.1 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

705.3.3 Platform lifts. Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

705.3.4 Ramps. Where slopes steeper than allowed by Section 1012.2 of the International Building Code are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table 705.3.4.

TABLE 705.3.4
RAMPS

SLOPE	MAXIMUM RISE
Steeper than 1:10 but not steeper than 1:8	3 inches
Steeper than 1:12 but not steeper than 1:10	6 inches

For SI: inch = 25.4 mm

705.3.5 Dining areas An accessible route shall be provided throughout the dining area.

Exception: An accessible route to raised or sunken areas or to outdoor seating areas is not required provided the same services and decor are provided in an accessible space.

705.3.6 Accessible dwelling and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the International Building Code for Accessible units apply only to the quantity of spaces being altered or added.

705.3.7 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the International Building Code for Type A units apply only to the quantity of the spaces being altered or added.

705.3.8 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being added. Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

705.3.9 Jury boxes and witness stands. In alterations, accessible wheelchair spaces are not required to be located within the defined area of raised jury boxes or witness stands and shall be permitted to be located outside these spaces where the ramp or lift access restricts or projects into the required means of egress.

705.3.10 Toilet rooms. Where it is technically infeasible to alter existing toilet and bathing rooms to be accessible, an accessible family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the International Building Code is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

705.3.11 Additional toilet and bathing facilities. In assembly and mercantile occupancies, where additional toilet fixtures are added, not fewer than one accessible family or assisted-use toilet room shall be provided where required by Section 1109.2.1 of the International Building Code. In recreational facilities, where additional bathing rooms are being added, not fewer than one family or assisted-use bathing room shall be provided where required by Section 1109.2.1 of the International Building Code.

705.3.12 Dressing, fitting and locker rooms. Where it is technically infeasible to provide accessible dressing, fitting or locker rooms at the same location as similar types of rooms, one accessible room on the same level shall be provided. Where separate-sex facilities are provided, accessible rooms for each sex shall be provided. Separate-sex facilities are not required where only unisex rooms are provided.

705.3.13 Fuel dispensers. Operable parts of replacement fuel dispensers shall be permitted to be 54 inches (1370 mm) maximum, measuring from the surface of the vehicular way where fuel dispensers are installed on existing curbs.

705.3.14 Thresholds The maximum height of thresholds at doorways shall be 3/4 inch (19.1 mm). Such thresholds shall have beveled edges on each side.

705.3.15 Amusement rides. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.4.8 of the International Building Code.

705.4 Alterations affecting an area containing a primary function. Where an alteration affects the accessibility to, or contains an area of primary function, the route to the primary function area shall be accessible. The accessible route to the primary function area shall include toilet facilities and drinking fountains serving the area of primary function.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of primary function.
2. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.

4. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of a facility.
5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

SECTION 806

Accessibility

806.1 General. A building, facility, or element that is altered shall comply with this section and Section 705.

806.2 Stairways and escalators in existing buildings. In alterations where an escalator or stairway is added where none existed previously, an accessible route shall be provided in accordance with Sections 1104.4 and 1104.5 of the International Building Code.

SECTION 906

Accessibility

906.1 General. A building, facility, or element that is altered shall comply with this section and Sections 705 and 806.

906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being altered.

Exception: Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

SECTION 1006

Accessibility

1006.1 General. Accessibility in portions of buildings undergoing a change of occupancy classification shall comply with Section 1011.

SECTION 1105

Accessibility

1105.1 Minimum requirements. Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of primary function, shall comply with the requirements of Sections 705, 806 and 906 as applicable.

1105.2 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for accessible units apply only to the quantity of spaces being added.

1105.3 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type A units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being added.

1105.4 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of spaces being added.

SECTION 1204

Accessibility

1204.1 Accessibility requirements The provisions of Sections 705, 806 and 906, as applicable, shall apply to facilities designated as historic structures that undergo alterations or a change of occupancy, unless technically infeasible. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the facility, as determined by the authority having jurisdiction, the alternative requirements of Sections 1204.1.1 through 1204.4.4 for that element shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in historical buildings.

Revise as follows:

~~305.9.1~~ **1204.1.1 Site arrival points.** Not fewer than one accessible route from a site arrival point to an accessible entrance shall be provided.

~~305.9.2~~ **1204.1.2 Multiple-level buildings and facilities.** An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.

~~305.9.3~~ **1204.1.3 Entrances.** Not fewer than one main entrance shall be accessible.

Exception: If a public entrance cannot be made accessible, an accessible entrance that is unlocked while the building is occupied shall be provided; or, a locked accessible entrance with a notification system or remote monitoring shall be provided.

Signs complying with Section 1111 of the International Building Code shall be provided at the public entrance and the accessible entrance.

305.9.4 1204.1.4 Toilet and bathing facilities. Where toilet rooms are provided, not fewer than one accessible family or assisted-use toilet room complying with Section 1109.2.1 of the International Building Code shall be provided.

Add new text as follows:

1301.2.6 Accessibility requirements. Accessibility shall be provided in accordance with Section 410 or 605.

Reason: The IEBC was set up many code cycles ago to offer three distinct options for compliance of existing buildings. By lumping all of the accessibility requirements into one chapter, there is no distinction for accessibility under any of the compliance methods. Previous editions of the IEBC offered code requirements for accessibility under each distinct compliance method. Those requirements should remain with each distinct compliance method as each method is designed to stand on its own merits.

This proposal is relocating the contents of Section 305 to the various chapters, depending on the compliance method. For the prescriptive method, the language in 305 has been moved to a new Section 508. For the work area compliance method, the language in 305 has been moved to Section 705. In addition to the language in Section 705, language has been added to cover the other work area options including repairs, Level 2 alterations, Level 3 alterations, change of occupancy, additions and historic buildings. For the performance compliance method, a section has been added to direct the user to comply with either the prescriptive method or the language for repairs.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is just reformatting current language so there is no impact to the construction cost.

EB5-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The movement of the accessibility provisions back to where they were in the 2015 was seen as unnecessary. It was noted that a review of Chapters 1, 2 and 3 would occur in every project and it simplifies compliance having the requirements in Chapter 3. It was noted that dining areas were intentionally deleted in the 2018 IEBC. (Vote: 13-0)

Assembly Action:

None

EB5-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

requests As Submitted

Commenter's Reason: The IEBC was set up many code cycles ago to offer three distinct options for compliance of existing buildings. By lumping all of the accessibility requirements into one chapter, there is no distinction for accessibility under any of the compliance methods. Previous editions of the IEBC offered code requirements for accessibility under each distinct compliance method. Those requirements should remain with each distinct compliance method as each method is designed to stand on its own merits.

The committee said this code change was unnecessary as that every project would be reviewed using Chapter 1, 2 and 3. Rather than make assumptions that every project would be reviewed using those chapter, it would be easier to provide for all of the individual provisions to have the accessibility provisions contained within the parameters for that provision. This code change allows for that to happen.

As far as the dining provision, EB 35 of this cycle is an attempt to add it back into the 2021 IEBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is just reformatting current language so there is no impact to the construction cost.

Proposed Change as Submitted

Proponents: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Existing Building Code

Revise as follows:

4 306 REPAIRS

Delete without substitution:

~~SECTION 401 GENERAL~~

Revise as follows:

~~401-1 306.1~~ **Scope.** *Repairs* shall comply with the requirements of this chapter. ~~Section 306.~~ *Repairs to historic buildings* need only comply with Chapter 12.

~~401-2 306.2~~ **Compliance.** The work shall not make the building less complying than it was before the *repair* was undertaken.

[BS] ~~401-3 306.3~~ **Flood hazard areas.** In flood hazard areas, *repairs* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the International Building Code, or Section R322 of the International Residential Code, as applicable.

Delete without substitution:

~~SECTION 402 BUILDING ELEMENTS AND MATERIALS~~

Revise as follows:

~~402-1 306.4~~ **Glazing in hazardous locations.** Replacement glazing in hazardous locations shall comply with the safety glazing requirements of the International Building Code or International Residential Code as applicable.

Exception: Glass block walls, louvered windows and jalousies repaired with like materials.

Delete without substitution:

~~SECTION 403 FIRE PROTECTION~~

Revise as follows:

~~403-1 306.5~~ **General Fire Protection.** *Repairs* shall be done in a manner that maintains the level of fire protection provided.

Delete without substitution:

~~SECTION 404 MEANS OF EGRESS~~

Revise as follows:

~~404-1 306.6~~ **General Means of Egress.** *Repairs* shall be done in a manner that maintains the level of protection provided for the means of egress.

Delete without substitution:

~~SECTION 405 STRUCTURAL~~

Revise as follows:

[BS] ~~405.1~~ **306.7 General-Structural.** Structural *repairs* shall be in compliance with this section and Section ~~401.2~~ **306.2**

[BS] ~~405.2~~ **306.7.1 Repairs to damaged buildings.** *Repairs* to damaged buildings shall comply with this section.

[BS] ~~405.2.1~~ **306.7.1.1 Repairs for less than substantial structural damage.** Unless otherwise required by this section, for damage less than *substantial structural damage*, the damaged elements shall be permitted to be restored to their predamage condition.

[BS] ~~405.2.1.1~~ **306.7.1.1.1 Snow damage.** Structural components whose damage was caused by or related to snow load effects shall be repaired, replaced or altered to satisfy the requirements of Section 1608 of the International Building Code.

[BS] ~~405.2.2~~ **306.7.1.2 Disproportionate earthquake damage.** A building assigned to Seismic Design Category D, E or F that has sustained *disproportionate earthquake damage* shall be subject to the requirements for buildings with substantial structural damage to vertical elements of the lateral force-resisting system.

[BS] ~~405.2.3~~ **306.7.1.3 Substantial structural damage to vertical elements of the lateral force-resisting system.** A building that has sustained *substantial structural damage* to the vertical elements of its lateral force-resisting system shall be evaluated in accordance with Section ~~405.2.3.1~~ **306.7.1.3.1**, and either repaired in accordance with Section ~~405.2.3.2~~ **306.7.1.3.2** or repaired and retrofitted in accordance with Section ~~405.2.3.3~~ **306.7.1.3.3**, depending on the results of the evaluation.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B or C whose *substantial structural damage* was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

[BS] ~~405.2.3.1~~ **306.7.1.3.1 Evaluation.** The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the *code official*. The evaluation shall establish whether the damaged building, if repaired to its predamage state, would comply with the provisions of the International Building Code for load combinations that include wind or earthquake effects, except that the seismic forces shall be the reduced seismic forces.

[BS] ~~405.2.3.2~~ **306.7.1.3.2 Extent of repair for compliant buildings.** If the evaluation establishes that the building in its predamage condition complies with the provisions of Section ~~405.2.3.1~~ **306.7.1.3.1**, then the damaged elements shall be permitted to be restored to their predamage condition.

[BS] ~~405.2.3.3~~ **306.7.1.3.3 Extent of repair for noncompliant buildings.** If the evaluation does not establish that the building in its predamage condition complies with the provisions of Section ~~405.2.3.1~~ **306.7.1.3.1**, then the building shall be retrofitted to comply with the provisions of this section. The wind loads for the *repair* and *retrofit* shall be those required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be in accordance with the International Building Code. The seismic loads for this *retrofit* design shall be those required by the building code in effect at the time of original construction, but not less than the reduced seismic forces.

[BS] ~~405.2.4~~ **306.7.1.4 Substantial structural damage to gravity load-carrying components.** Gravity load-carrying components that have sustained *substantial structural damage* shall be rehabilitated to comply with the applicable provisions for dead and live loads in the International Building Code. Snow loads shall be considered if the *substantial structural damage* was caused by or related to snow load effects. Undamaged gravity load-carrying components that receive dead, live or snow loads from rehabilitated components shall also be rehabilitated if required to comply with the design loads of the *rehabilitation* design.

[BS] ~~405.2.4.1~~ **306.7.1.4.1 Lateral force-resisting elements.** Regardless of the level of damage to vertical elements of the lateral force-resisting system, if *substantial structural damage* to gravity load-carrying components was caused primarily by wind or seismic effects, then the building shall be evaluated in accordance with Section ~~405.2.3.1~~ **306.7.1.3.1** and, if noncompliant, retrofitted in accordance with Section ~~405.2.3.3~~ **306.7.1.3.3**.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B, or C whose substantial structural damage was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

[BS] ~~405.2.5~~ **306.7.1.5 Flood hazard areas.** In *flood hazard* areas, buildings that have sustained *substantial damage* shall be brought into compliance with Section 1612 of the International Building Code, or Section R322 of the International Residential Code, as applicable.

Delete without substitution:

SECTION 406 ELECTRICAL

Revise as follows:

~~406-1 306.8~~ **Material- Electrical.** Existing electrical wiring and equipment undergoing *repair* shall be allowed to be repaired or replaced with like material.

~~406-1-1 306.8.1~~ **Receptacles.** Replacement of electrical receptacles shall comply with the applicable requirements of Section 406.4(D) of NFPA 70.

~~406-1-2 306.8.2~~ **Plug fuses.** Plug fuses of the Edison-base type shall be used for replacements only where there is no evidence of over fusing or tampering per applicable requirements of Section 240.51(B) of NFPA 70.

~~406-1-3 306.8.3~~ **Nongrounding-type receptacles.** For replacement of nongrounding-type receptacles with grounding-type receptacles and for branch circuits that do not have an equipment grounding conductor in the branch circuitry, the grounding conductor of a grounding-type receptacle outlet shall be permitted to be grounded to any accessible point on the grounding electrode system or to any accessible point on the grounding electrode conductor in accordance with Section 250.130(C) of NFPA 70.

~~406-1-4 306.8.4~~ **Group I-2 receptacles.** Receptacles in patient bed locations of Group I-2 that are not "hospital grade" shall be replaced with "hospital grade" receptacles, as required by NFPA 99 and Article 517 of NFPA 70.

~~406-1-5 306.8.5~~ **Grounding of appliances.** Frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers and outlet or junction boxes that are part of the existing branch circuit for these appliances shall be permitted to be grounded to the grounded circuit conductor in accordance with Section 250.140 of NFPA 70.

Delete without substitution:

SECTION 407 MECHANICAL

Revise as follows:

~~407-1 306.9~~ **General- Mechanical.** Existing mechanical systems undergoing *repair* shall not make the building less complying than it was before the damaged occurred.

~~407-2 306.9.1~~ **Mechanical draft systems for manually fired appliances and fireplaces.** A mechanical draft system shall be permitted to be used with manually fired appliances and fireplaces where such a system complies with all of the following requirements:

1. The mechanical draft device shall be listed and installed in accordance with the manufacturer's installation instructions.
2. A device shall be installed that produces visible and audible warning upon failure of the mechanical draft device or loss of electrical power at any time that the mechanical draft device is turned on. This device shall be equipped with a battery backup if it receives power from the building wiring.
3. A smoke detector shall be installed in the room with the appliance or fireplace. This device shall be equipped with a battery backup if it receives power from the building wiring.

Delete without substitution:

SECTION 408 PLUMBING

Revise as follows:

~~408-1 306.10~~ **Materials- Plumbing.** Plumbing materials and supplies shall not be used for *repairs* that are prohibited in the International Plumbing Code .

~~408-2 306.10.1~~ **Water closet replacement.** The maximum water consumption flow rates and quantities for all replaced water closets shall be 1.6 gallons (6 L) per flushing cycle.

Exception: Blowout-design water closets [3.5 gallons (13 L) per flushing cycle].

Reason: The purpose of this code change is to pull the provisions for repairs from Chapter 4 and put them in Chapter 3 which covers general provisions as repairs can occur using any of the compliance methods with the requirements being the same for each method.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
There is no cost impact as this is just moving current language to another location within the body of the code.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the repairs section should remain in an independent chapter as revised for the 2018 code. Placement in Chapter 3 seemed unnecessary as the provisions can stand on their own in Chapter 4. (Vote: 13-0)

Assembly Action:

None

EB6-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

requests As Submitted

Commenter's Reason: The purpose of this code change is to pull the provisions for repairs from Chapter 4 and put them in Chapter 3 which covers general provisions as repairs can occur using any of the compliance methods with the requirements being the same for each method.

The committee felt that the repairs should stand on their own merit. However, Chapter 3 also includes accessibility provisions which could also be deemed a separate stand alone item. Generally the I Codes are set up so that common elements are located in one chapter. If repairs can apply to any of the three methods why would not all of the provisions that apply to all three methods be provided for in one chapter, thus providing the designer all of the requirements they need to meet in one location?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is just moving current language to another location within the body of the code so there is no cost associated with this change.

Staff Analysis: Note that Code Change Proposals and associated public comments to EB6-19, EB7-19 and EB50-19 take differing approaches as to how repairs should be addressed in the IEBC. The voting membership should consider the differences and make their intentions clear.

2018 International Existing Building Code

CHAPTER 5 4 PRESCRIPTIVE COMPLIANCE METHOD

SECTION 501 401 GENERAL

Revise as follows:

~~501.1~~ **401.1 Scope.** The provisions of this chapter shall control the *alteration, repair, addition and change of occupancy of existing buildings and structures, including historic buildings and structures as referenced in Section 301.3.2.*

Exception: Existing bleachers, grandstands and folding and telescopic seating shall comply with ICC 300.

~~501.1.1~~ **401.1.1 Compliance with other methods.** *Alterations, repairs, additions and changes of occupancy to existing buildings and structures shall comply with the provisions of this chapter or with one of the methods provided in Section 301.3.*

SECTION 502 402 ADDITIONS

SECTION 503 403 ALTERATIONS

Add new text as follows:

SECTION 404 REPAIRS

404.1 General. Buildings and structures, and parts thereof, shall be repaired in compliance with Section 404.

404.2 Repairs to damaged buildings. Repairs to damaged buildings shall comply with this section.

404.2.1 Repairs for less than substantial structural damage. Unless otherwise required by this section, for damage less than substantial structural damage, the damaged elements shall be permitted to be restored to their predamaged condition.

404.2.1.1 Snow damage. Structural components whose damage was caused by or related to snow load effects shall be repaired, replaced or altered to satisfy the requirements of Section 1608 of the International Building Code.

404.2.2 Disproportionate earthquake damage. A building assigned to Seismic Design Category D, E or F that has sustained disproportionate earthquake damage shall be subject to the requirements for buildings with substantial structural damage to vertical elements of the lateral force-resisting system.

404.2.3 Substantial structural damage to vertical elements of the lateral force-resisting system. A building that has sustained substantial structural damage to the vertical elements of its lateral force resisting system shall be evaluated in accordance with Section 404.2.3.1, and either repaired in accordance with Section 404.2.3.2 or repaired and retrofitted in accordance with Section 404.2.3.3, depending on the results of the evaluation.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B or C whose substantial structural damage was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.

2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

404.2.3.1 Evaluation. The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the code official. The evaluation shall establish whether the damaged building, if repaired to its predamage state, would comply with the provisions of the International Building Code for load combinations that include wind or earthquake effects, except that the seismic forces shall be the reduced seismic forces.

404.2.3.2 Extent of repair for compliant buildings. If the evaluation establishes that the building in its predamage condition complies with the provisions of Section 404.2.3.1, then the damaged elements shall be permitted to be restored to their predamage condition.

404.2.3.3 Extent of repair for noncompliant buildings. If the evaluation does not establish that the building in its predamage condition complies with the provisions of Section 404.2.3.1, then the building shall be retrofitted to comply with the provisions of this section. The wind loads for the repair and retrofit shall be those required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be in accordance with the International Building Code. The seismic loads for this retrofit design shall be those required by the building code in effect at the time of original construction, but not less than the reduced seismic forces.

404.2.4 Substantial structural damage to gravity load-carrying components. Gravity load-carrying components that have sustained substantial structural damage shall be rehabilitated to comply with the applicable provisions for dead and live loads in the International Building Code. Snow loads shall be considered if the substantial structural damages was caused by or related to snow load effects. Undamaged gravity load-carrying components that receive dead, live or snow loads from rehabilitated components shall also be rehabilitated if required to comply with the design loads of the rehabilitation design.

404.2.4.1 Lateral force-resisting elements. Regardless of the level of damage to vertical elements of the lateral force-resisting system, if substantial structural damage to gravity load-carrying components was caused primarily by wind or seismic effects, then the building shall be evaluated in accordance with Section 404.2.3.1 and, if noncompliant, retrofitted in accordance with Section 404.2.3.3.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B or C whose substantial structural damage was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

404.2.5 Flood hazard areas. In flood hazard areas, buildings that have sustained substantial damage shall be brought into compliance with Section 1612 of the International Building Code, or Section R322 of the International Residential Code, as applicable.

**SECTION 504 405
FIRE ESCAPES**

**SECTION 505 406
WINDOWS AND EMERGENCY ESCAPE OPENINGS**

**SECTION 506 407
CHANGE OF OCCUPANCY**

**SECTION 507 408
HISTORIC BUILDINGS**

**CHAPTER 6 5
CLASSIFICATION OF WORK**

**SECTION 601 501
GENERAL**

Add new text as follows:

**SECTION 502
REPAIRS**

502.1 Scope. Repairs, as defined in Chapter 2, include the patching or restoration or replacement of damaged materials, elements, equipment or fixtures for the purpose of maintaining such components in good or sound condition with respect to existing loads or performance requirements.

502.2 Application. Repairs shall comply with the provisions of Chapter 6.

502.3 Related Work. Work on nondamaged components that is necessary for the required repair of damaged components shall be considered part of the repair and shall not be subject to the provisions of Chapter 7, 8, 9, 10 or 11.

SECTION ~~602~~ 503
ALTERATION—LEVEL 1

SECTION ~~603~~ 504
ALTERATION—LEVEL 2

SECTION ~~604~~ 505
ALTERATION—LEVEL 3

SECTION ~~605~~ 506
CHANGE OF OCCUPANCY

SECTION ~~606~~ 507
ADDITIONS

SECTION ~~607~~ 508
HISTORIC BUILDINGS

SECTION ~~608~~ 509
RELOCATED BUILDINGS

CHAPTER 4 ~~6~~
REPAIRS

SECTION ~~401~~ 601
GENERAL

Revise as follows:

~~401-1~~ 601.1 Scope. *Repairs as described in Section 502* shall comply with the requirements of this chapter. *Repairs to historic buildings* need only comply with Chapter 12.

~~401-2~~ 601.2 Compliance. The work shall not make the building less complying than it was before the *repair* was undertaken.

[BS] **~~401-3~~ 601.3 Flood hazard areas.** In flood hazard areas, *repairs* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the International Building Code, or Section R322 of the International Residential Code, as applicable.

SECTION ~~402~~ 602
BUILDING ELEMENTS AND MATERIALS

~~402-1~~ 602.1 Glazing in hazardous locations. Replacement glazing in hazardous locations shall comply with the safety glazing requirements of the International Building Code or International Residential Code as applicable.

Exception: Glass block walls, louvered windows and jalousies repaired with like materials.

SECTION ~~403~~ 603
FIRE PROTECTION

~~403-1~~ 603.1 General. *Repairs* shall be done in a manner that maintains the level of fire protection provided.

SECTION ~~404~~ 604
MEANS OF EGRESS

~~404-1~~ 604.1 General. *Repairs* shall be done in a manner that maintains the level of protection provided for the means of egress.

SECTION ~~405~~ 605
STRUCTURAL

[BS] **~~405-1~~ 605.1 General.** Structural *repairs* shall be in compliance with this section and Section ~~401-2~~-601.2.

[BS] **~~405-2~~ 605.2 Repairs to damaged buildings.** *Repairs* to damaged buildings shall comply with this section.

[BS] **~~405-2-1~~ 605.2.1 Repairs for less than substantial structural damage.** Unless otherwise required by this section, for damage less than *substantial structural damage*, the damaged elements shall be permitted to be restored to their predamage condition.

[BS] ~~405.2.1.1~~ 605.2.1.1 Snow damage. Structural components whose damage was caused by or related to snow load effects shall be repaired, replaced or altered to satisfy the requirements of Section 1608 of the International Building Code.

[BS] ~~405.2.2~~ 605.2.2 Disproportionate earthquake damage. A building assigned to Seismic Design Category D, E or F that has sustained *disproportionate earthquake damage* shall be subject to the requirements for buildings with substantial structural damage to vertical elements of the lateral force-resisting system.

[BS] ~~405.2.3~~ 605.2.3 Substantial structural damage to vertical elements of the lateral force-resisting system. A building that has sustained *substantial structural damage* to the vertical elements of its lateral force-resisting system shall be evaluated in accordance with Section ~~405.2.3.1~~ 605.2.3.1, and either repaired in accordance with Section ~~405.2.3.2~~ 605.2.3.2 or repaired and retrofitted in accordance with Section ~~405.2.3.3~~ 605.2.3.3, depending on the results of the evaluation.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B or C whose *substantial structural damage* was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

[BS] ~~405.2.3.1~~ 605.2.3.1 Evaluation. The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the *code official*. The evaluation shall establish whether the damaged building, if repaired to its predamage state, would comply with the provisions of the International Building Code for load combinations that include wind or earthquake effects, except that the seismic forces shall be the reduced seismic forces.

[BS] ~~405.2.3.2~~ 605.2.3.2 Extent of repair for compliant buildings. If the evaluation establishes that the building in its predamage condition complies with the provisions of Section ~~405.2.3.1~~ 605.2.3.1, then the damaged elements shall be permitted to be restored to their predamage condition.

[BS] ~~405.2.3.3~~ 605.2.3.3 Extent of repair for noncompliant buildings. If the evaluation does not establish that the building in its predamage condition complies with the provisions of Section ~~405.2.3.1~~ 605.2.3.1, then the building shall be retrofitted to comply with the provisions of this section. The wind loads for the *repair* and *retrofit* shall be those required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be in accordance with the International Building Code. The seismic loads for this *retrofit* design shall be those required by the building code in effect at the time of original construction, but not less than the reduced seismic forces.

[BS] ~~405.2.4~~ 605.2.4 Substantial structural damage to gravity load-carrying components. Gravity load-carrying components that have sustained *substantial structural damage* shall be rehabilitated to comply with the applicable provisions for dead and live loads in the International Building Code. Snow loads shall be considered if the *substantial structural damage* was caused by or related to snow load effects. Undamaged gravity load-carrying components that receive dead, live or snow loads from rehabilitated components shall also be rehabilitated if required to comply with the design loads of the *rehabilitation* design.

[BS] ~~405.2.4.1~~ 605.2.4.1 Lateral force-resisting elements. Regardless of the level of damage to vertical elements of the lateral force-resisting system, if *substantial structural damage* to gravity load-carrying components was caused primarily by wind or seismic effects, then the building shall be evaluated in accordance with Section ~~405.2.3.1~~ 605.2.3.1 and, if noncompliant, retrofitted in accordance with Section ~~405.2.3.3~~ 605.2.3.3.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B, or C whose substantial structural damage was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

[BS] ~~405.2.5~~ 605.2.5 Flood hazard areas. In *flood hazard* areas, buildings that have sustained *substantial damage* shall be brought into compliance with Section 1612 of the International Building Code, or Section R322 of the International Residential Code, as applicable.

SECTION 406 606 ELECTRICAL

~~406.1~~ 606.1 Material. Existing electrical wiring and equipment undergoing *repair* shall be allowed to be repaired or replaced with like material.

~~406.1.1~~ 606.1.1 Receptacles. Replacement of electrical receptacles shall comply with the applicable requirements of Section 406.4(D) of NFPA 70.

~~406.1.2~~ 606.1.2 Plug fuses. Plug fuses of the Edison-base type shall be used for replacements only where there is no evidence of over fusing or tampering per applicable requirements of Section 240.51(B) of NFPA 70.

~~406.1.3~~ 606.1.3 Nongrounding-type receptacles. For replacement of nongrounding-type receptacles with grounding-type receptacles and for branch circuits that do not have an equipment grounding conductor in the branch circuitry, the grounding conductor of a grounding-type receptacle outlet shall be permitted to be grounded to any accessible point on the grounding electrode system or to any accessible point on the grounding

electrode conductor in accordance with Section 250.130(C) of NFPA 70.

~~406.1.4~~ **606.1.4 Group I-2 receptacles.** Receptacles in patient bed locations of Group I-2 that are not “hospital grade” shall be replaced with “hospital grade” receptacles, as required by NFPA 99 and Article 517 of NFPA 70.

~~406.1.5~~ **606.1.5 Grounding of appliances.** Frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers and outlet or junction boxes that are part of the existing branch circuit for these appliances shall be permitted to be grounded to the grounded circuit conductor in accordance with Section 250.140 of NFPA 70.

SECTION ~~407~~ 607 MECHANICAL

~~407.1~~ **607.1 General.** Existing mechanical systems undergoing *repair* shall not make the building less complying than it was before the damaged occurred.

~~407.2~~ **607.2 Mechanical draft systems for manually fired appliances and fireplaces.** A mechanical draft system shall be permitted to be used with manually fired appliances and fireplaces where such a system complies with all of the following requirements:

1. The mechanical draft device shall be listed and installed in accordance with the manufacturer’s installation instructions.
2. A device shall be installed that produces visible and audible warning upon failure of the mechanical draft device or loss of electrical power at any time that the mechanical draft device is turned on. This device shall be equipped with a battery backup if it receives power from the building wiring.
3. A smoke detector shall be installed in the room with the appliance or fireplace. This device shall be equipped with a battery backup if it receives power from the building wiring.

SECTION ~~408~~ 608 PLUMBING

~~408.1~~ **608.1 Materials.** Plumbing materials and supplies shall not be used for *repairs* that are prohibited in the International Plumbing Code .

~~408.2~~ **608.2 Water closet replacement.** The maximum water consumption flow rates and quantities for all replaced water closets shall be 1.6 gallons (6 L) per flushing cycle.

Exception: Blowout-design water closets [3.5 gallons (13 L) per flushing cycle].

~~1301.2.4 Alterations.~~ **Alterations and repairs.** An *existing building* or portion thereof shall not be altered or repaired in such a manner that results in the building being less safe or sanitary than such building is currently. Exception: Where the current level of safety or sanitation is proposed to be reduced, the portion altered or repaired shall conform to the requirements of the International Building Code.

Reason: The IEBC was set up many code cycles ago to offer three distinct options for compliance of existing buildings. By lumping all of the repair requirements into one chapter, there is no distinction for repairs under any of the compliance methods. Previous editions of the IEBC offered code requirements for repairs under each distinct compliance method. Those requirements should remain with each distinct compliance method as each method is designed to stand on its own merits.

This proposed code change is moving the language from Chapter 4, Repairs, to become its own Chapter under the Work Area Compliance Method as well as providing language in the Prescriptive Method and the Compliance Method. The intention is that this relocation puts the repair language in the appropriate compliance method, depending on which method is utilized by the designer.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
There is no cost impact with this code change as it is only relocating language.

EB7-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was seen as inconsistent with previous actions as to where the repair provisions should be located. The current code structure for repairs was preferred. (Vote: 13-0)

Assembly Action:

None

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Add new text as follows:

303.4 Concrete evaluation and design procedures. Evaluation and design of repairs of structural concrete in compliance with ACI 562 and this code shall be permitted. ACI 562 shall not be used to comply with provisions of this code that involve the classification of earthquake damage or the evaluation or retrofit of structures using load combinations that include earthquake load effects. The following Sections of ACI 562 are not applicable:

1. Section 1.3.8 for seismic resistance
2. Section 4.1.4 for determining the rehabilitation category of work

3. Section 4.7 for additions
4. Section 4.8 for alterations
5. Section 4.9 for change in occupancy

2018 International Building Code

Add new standard(s) as follows:

ACI

American Concrete Institute

562-19: Code Requirements for Assessment, Repair, and Rehabilitation of Existing Concrete Structures

Reason: Concept – This code change proposal adds ACI 562: *Code Requirements for Assessment, Repair, and Rehabilitation of Existing Concrete Structures*, to establish minimum requirements for the design, construction, repair, and rehabilitation of concrete structural elements in buildings for various levels of desired performance as deemed appropriate for the project. In addition to improved life safety, the requirements clearly define objectives and anticipated performance for the code official, owners, designers, contractors and installers. The proposed language is permissive, allowing other methods to be used to comply with the intent of the building code. Further Section 104.11 of the IEBC allows for alternative design methods:

"104.11 Alternative materials, design and methods of construction, and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material, design, or method of construction shall be approved where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method, or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Where the alternative material, design or method of construction is not approved, the code official shall respond in writing, stating the reasons why the alternative was not approved."

The public discussion version of this standards is available at: www.concrete.org/publications/standards/upcomingstandards.aspx

Background – In 2006, the repair industry approached ACI asking for a concrete repair and rehabilitation code that would improve the overall quality of concrete repairs by establishing common requirements and establishing clear responsibilities between owners, designers, and contractors. This code would also provide building code officials with a reference by which to evaluate rehabilitated concrete structures. ACI, following its rigorous American National Standards Institute accredited standards development process assembled a code committee with balanced representation and produced the first official code in 2012. The committee members reviewed and considered numerous reports and publications related to concrete repair and rehabilitation to identify and develop requirements consistent with current industry practice. The committee has received feedback from users of the code and are now completing their third version of this code, ACI 562-19.

Scope – ACI 562-19 complements the IEBC by providing specific direction on how to design concrete repairs and how to handle the unique construction problems associated with repair. This standard helps the designer assess the existing structure in accordance with the IEBC. The standard then provides the requirements that bridge the inconsistencies and gaps in acceptable criteria that occur from the two following situations that a designer must solve: one, repairing a structure according to the original building code used at the time it was built using today's construction methods and materials; or, repairing a structure built according to an older building code but repaired according to the latest building code. Note that ACI 562 does not directly address the evaluation of lateral-force resisting systems in high seismic areas. ASCE 41 is the appropriate standard for this situation as stated in the IEBC and ACI 562.

Benefits – There are many benefits that ACI 562 provides for the designer, owner, contractor, materials providers, building code official and the public. A few of these benefits are:

- Provides a level of expectation of life safety to the public in buildings where repairs or rehabilitation is performed on concrete structural elements.
- Provides clearly defined, uniform requirements aimed at extending the service life of existing structures.
- Provides minimum requirements for safety and quality of concrete repair.
- Establishes clear responsibilities between owners, designers, and contractors.
- Provides building code officials with a means to evaluate rehabilitation designs.
- Provides specific repair requirements that often result in less costly repairs compared to repairs required to meet only new construction requirements.

Flexibility – ACI 562 permits flexibility in evaluation, design, construction and repair materials to provide economies while establishing expected performance for the service-life of the rehabilitation or repairs.

Resources – Also, there many resources that complement ACI 562. Among these are:

- *Concrete Repair Manual: Fourth Edition 2013*
- ACI 563-18, *Specifications for Repair of Structural Concrete in Buildings*
- MNL-3(16) *Guide to the Code for Assessment, Repair, and Rehabilitation of Existing Concrete Structures*

These resources are readily available to provide greater understanding of assessment, repair and rehabilitation of concrete structural elements. ACI MNL-3 provides case studies demonstrating the ease of use of ACI 562. Numerous technical notes, reports, guides, and specifications that provide background information and technical support are available through other organizations, such as American Society of Civil Engineers, British Research Establishment, Concrete Society, International Concrete Repair Institute, National Association of Corrosion Engineers, Post-Tensioning Institute, Society for Protective Coatings, and US Army Corps of Engineers. Many of these organizations publications related to concrete repair can be found in the Concrete Repair Manual.

Sustainability - Reference of ACI 562 in the IEBC will help improve the confidence of owners, builders, and developers regarding effective repairs, upgrades, and reuse of existing buildings in lieu of demolition and replacement. Typically, extending the life of existing buildings is substantially more sustainable than demolition and new construction. Adoption of ACI 562 by reference is needed to help facilitate efforts that conserve energy and resources while maintaining a minimum level of requirements to ensure reasonable levels of life safety, and welfare are afforded to the public.

State and Local Adoptions – Jurisdictions see the need for these requirements. As the model for state and local adoptions, the IEBC should include this reference with appropriate charging language. ACI 562 is already being used in several jurisdictions:

Hawaii: Hawaii was the first state to adopt ACI 562 by reference. The following provisions are included in the State Building Code Council HAWAII STATE BUILDING CODE, which became effective on November 13, 2018:

“3401.6 Alternative compliance.

- 1) Work performed in accordance with the International Existing Building Code shall be deemed to comply with the provisions of this chapter.
- 2) Work performed in accordance with the 2016 version of the American Concrete Institute Committee 562, “Code Requirements for Assessment, Repair, and Rehabilitation of Existing Concrete Structures” shall be deemed to comply with this chapter when used as a supplement to the requirements of this chapter or the International Existing Building Code. Wherever the term International Existing Building Code (IEBC) is used in ACI 562-16, it shall mean International Existing Building Code or Chapter 34 of the International Building Code.”

Ohio: The Ohio Board of Building Standards Ohio adopted rule changes identified as Amendments Group 95. Included in this group is:

3401.6 Concrete evaluation and design procedures. Evaluation and design of structural concrete repairs and rehabilitation shall be in compliance with Chapter 34 and ACI 562.

ACI, a professional technical society, has developed this standard in response to industry needs and to help assure minimum levels of life safety results where repairs and rehabilitation are associated with concrete structural elements. For this reason and the other benefits identified in this reason statement, ACI recommends this code change proposal for committee approval as submitted.

New York City: The New York City Buildings Department issued *BUILDINGS BULLETIN 2015-017* in December 2017 Conditions of Acceptance for Fiber Reinforced Cementitious Matrix strengthening systems.

FRCM shall comply with the NYC Construction Codes and the following applicable provisions:

A. Design

1. FRCM system shall be designed in accordance with the ACI 549.4R-132 Guide for the Design and Construction of Externally Bonded Fabric-Reinforced Cementitious Matrix (FRCM) Systems for Repair and Strengthening Concrete and Masonry Structures with properties used for design obtained from tests performed in accordance with AC 434. Fire-resistance-rating and interior finish requirements shall be in accordance with the NYC Construction Codes, manufacturer’s recommendations and the conditions of the required listing.
2. For repairs and upgrade achieved with unprotected external FRCM, the increase in flexural or shear strength provided by the external reinforcing system shall not exceed 50% of the existing structural capacity of the member prior to strengthening. This increase should be checked before applying the strength reduction factor.
3. Careful consideration should be given to determine reasonable strengthening limits. These limits are imposed to guard against collapse of the structure should bond or other failure of the FRCM system occur due to damage, vandalism, or other causes. The required strength of a structure without repair should be as specified in in accordance with ACI 562 *Code Requirements for Assessment, Repair, and Rehabilitation of Existing Concrete Structures* Section 5.5.

Recommendation – ACI, a professional technical society, has developed this ACI 562 in response to industry needs and to help assure minimum

levels of life safety, health, and welfare for the public. For this reason and the other benefits identified in this reason statement, ACI recommends this code change proposal for committee approval as submitted.

Guide to the Code for Assessment, Repair, and Rehabilitation of Existing Concrete Buildings, ACI and ICRI, 2016, 176 pp.

<https://www.concrete.org/store/productdetail.aspx?ItemID=MNL316&Language=English>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The use of this referenced standard should in many cases reduce the cost of repair. Too often in the process of repair, there is insufficient information to determine acceptance criteria that is amicable to both the owner and the building code official. The result is the determination that the repair must meet the latest building code requirements for new construction. This standard increases the options available for repair and provides the acceptance criteria necessary to permit these options. A case study that illustrates this point: "ACI 562 has been referenced in expert reports for litigation cases, resulting in significantly reduced financial settlements. Denver-based J. R. Harris & Company recently used the code as a standard in several litigation reports assessing damages in existing concrete structures. As an approved consensus standard, according to American National Standards Institute (ANSI) procedures, ACI 562-13 has been accepted as the source standard to use for damage assessment and repair on individual projects by Greenwood Village and Pikes Peak Regional Building Departments in Colorado. Based on this acceptance, the consulting engineer was able to cite the code in their recommendation for structural remediation and determination of damages. In one case involving rehabilitation work on four buildings with faulty construction, J.R. Harris was able to reduce the repair costs from \$12 million to \$3 million, with a repair plan based on the lesser of the demand-capacity ratio based on either the original or current building code per ACI 562."

Staff Analysis: A review of the standard proposed for inclusion in the code, ACI 562-19, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

EB16-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Proposed reference standards, ACI Standard 562, is currently provided in draft format with additional changes anticipated, which are not currently available for review. Proposed language could create inconsistencies. Proposed change would be hard to enforce and uses language such as 'shall be permitted'. (Vote: 9-4)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

IEBC®: 303.4 (New); IBC®: ACI Chapter 35 (New)

Proponents:

Kerry Sutton, American Concrete Institute, representing American Concrete Institute (kerry.sutton@concrete.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

303.4 Concrete evaluation and design procedures. Evaluation and design of repairs of structural concrete shall be in compliance with ACI 562 and this code ~~shall be permitted~~. ACI 562 shall not be used to comply with provisions of this code that involve the classification of earthquake damage or the evaluation or retrofit of structures using load combinations that include earthquake load effects. ~~The following Sections of ACI 562 are not applicable:~~

1. ~~Section 1.3.8 for seismic resistance~~
2. ~~Section 4.1.4 for determining the rehabilitation category of work~~
3. ~~Section 4.7 for additions~~
4. ~~Section 4.8 for alterations~~
5. ~~Section 4.9 for change in occupancy~~

562-19: Code Requirements for Assessment, Repair, and Rehabilitation of Existing Concrete Structures

Commenter's Reason:

The Committee recommendation at the committee hearing was for disapproval because:

1) *Proposed reference standards, ACI Standard 562, is currently provided in draft format with additional changes anticipated, which are not currently available for review.* ACI 562-19 has been published and is an appropriate reference for the IEBC and compliant with Council Policy 28.

2) *Proposed language could create inconsistencies.* The language in the proposal identifying sections 1.3.8, 4.1.4, 4.7, 4.8 and 4.9 of ACI 562-19 are removed with this modification. ACI Committee 562 intentionally included the references back to the IEBC to ensure that determination of category of work be compliant with the IEBC.

3) *Proposed change would be hard to enforce and uses language such as 'shall be permitted'.* The revised language in this modification eliminates "shall be permitted". Section [A] 104.11 of the IEBC allows for alternative means and methods. Thus this proposal does not limit compliance to ACI 562.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The use of this referenced standard should in many cases reduce the cost of repair. Too often in the process of repair, there is insufficient information to determine acceptable criteria. In some conditions, the resulting determination is that the requirements for new construction are used in lieu of acceptable requirements for existing buildings. In other instances, repairs may be deficient with regards to structural performance or longevity.

Public Comment# 2009

Public Comment 2:

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Submitted

Commenter's Reason: At the Committee Action Hearings, there were three reasons given for recommending disapproval. The first is: "*Proposed reference standards, ACI Standard 562, is currently provided in draft format with additional changes anticipated, which are not currently available for review.*" ACI 562 *Code Requirements for Assessment, Repair, and Rehabilitation of Existing Concrete Structures* was provided to committee member in a public discussion draft as required by ICC Council Policy 28. This was verified by staff during the hearings. Earlier editions have been published, are available, and have been used for the repair of structural concrete. The final published edition of ACI 562-19 is now available. The second reason was that "*Proposed language could create inconsistencies.*" The code change proposal was specifically written with guidance from the Applied Technology Council to provide exceptions that could be construed as circular references.

The third reason was: "*Proposed change would be hard to enforce and uses language such as 'shall be permitted.'*" The phrase is common language in the model codes and is thus not an appropriate reason to reject the adoption of ACI 562 as a permissible reference standard. The phrase is used 71 times in the 2018 edition of the IEBC and 532 times in the 2018 edition of the IBC in various Chapters as follows:

IEBC		IBC			
Chapter	Occurrences	Chapter	Occurrences	Chapter	Occurrences
1	2	1	2	18	153

2	0	2	0	19	2
3	7	3	1	20	0
4	5	4	56	21	4
5	16	5	16	22	6
6	0	6	12	23	31
7	5	7	113	24	6
8	14	8	14	25	2
9	5	9	25	26	19
10	11	10	71	27	0
11	0	11	16	28	0
12	4	12	7	29	2
13	1	13	0	30	8
14	0	14	14	31	6
15	1	15	29	32	0
16	0	16	16	33	2
17	0	17	1		

Testimony against focused on the standard development process. The process used is compliant with ICC Council Policy 28 as it is an American National Standards Institute accredited standards development process. Mention was made as to the number of comments submitted during the public review period. All comments submitted during this period were reviewed and acted upon in a manner consistent with the ANSI accredited process. ACI 562 is in its third edition, and like the model building codes being developed through this process, revisions are made in subsequent editions. New information must be properly vetted to assure a quality document. Further, there was mention of the volume of comments submitted in the public review period. Please consider that all consensus standards development processes a public comment period and from time to time individuals in opposition to the concept of standardization flood the committee during public comment periods with the intent of derailing or delaying development.

This document was developed by a committee of the American Concrete Institute which is a professional society dedicated to the development and adoption of documents that advance concrete technology and serve the public good. ACI, not being a trade or product association, does not campaign to promote the use of concrete in lieu of other building materials. ACI committees develop a variety of documents in the form of guides, reports, specifications, and code requirements. Over the past five decades, ACI Committee 562 and other related committees have generated numerous documents for use as guides and resources for the repair of structural concrete. Recognizing that even with the availability of these guides and resources nearly 50% of all repairs fail in less than 20 years, the committee determined that guidance and resources are not sufficient for the purposes of providing for the public good. The result has been committee work that produced building code requirements specifically addressing the evaluation, repair and rehabilitation of structural concrete.

Rationale for referencing ACI 562 in the IEBC was provided in testimony from design professionals, materials suppliers, building owners and managers, code officials, and contractors. The compelling testimony which may be viewed on the ICC website emphasized that: ACI 562 serves the public by providing the designer, owner, contractor, materials providers, and building code officials:

- A level of expectation of life safety to the public in buildings where repairs or rehabilitation is Performed on concrete structural elements;
- Clearly defined, uniform requirements aimed at extending the service life of existing structures;
- Minimum requirements for efficiency, safety, and quality of concrete repair;
- Clear communication of responsibilities between owners, designers, and contractors;
- Means for building code officials to evaluate rehabilitation designs;
- Specific repair requirements that often result in less costly repairs compared to requiring compliance with provisions for new construction requirements; and
- Increased confidence in performance of repairs that support the more sustainable approach compared to demolish and rebuild.

ACI recommends approval as submitted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

For reasons stated in the cost impact provided with the original proposal, the proposal will not increase, but may often decrease the cost of construction.

Public Comment# 1342

EB17-19

IEBC®: CHAPTER 3, SECTION 301, 301.1, SECTION 302, 302.1, SECTION 503, 503.1

Proposed Change as Submitted

Proponents: Gina Hilberry, Scoping Task Group of ICC/A117.1 Standard Development Committee, representing United Cerebral Palsy (gina@cohenhilberry.com); Rick Lupton, representing Self (sparkylupton@msn.com); Marsha Mazz, representing United Spinal Association (m.mazz@verizon.net); Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Existing Building Code

CHAPTER 3 PROVISIONS FOR ALL COMPLIANCE METHODS

Revise as follows:

SECTION 301 ADMINISTRATION SCOPE

301.1 General. Applicability The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with Section 301.2, 301.3, or 301.4. The provisions of Sections 302 through 305 shall apply to all alterations, repairs, additions, relocation of structures and changes of occupancy regardless of compliance method.

SECTION 302 GENERAL PROVISIONS

Delete without substitution:

~~**302.1 Applicability.** The provisions of Section 302 apply to all *alterations, repairs, additions, relocations of structures and changes of occupancy* regardless of compliance method.~~

SECTION 503 ALTERATIONS

Revise as follows:

503.1 General. ~~Except as provided by Section 302.4, 302.5 or this section, alterations~~ Alterations to any building or structure shall comply with the requirements of the International Building Code for new construction. *Alterations* shall be such that the *existing building* or structure is not less complying with the provisions of the International Building Code than the *existing building* or structure was prior to the *alteration*.

Exceptions:

1. An existing stairway shall not be required to comply with the requirements of Section 1011 of the International Building Code where the existing space and construction does not allow a reduction in pitch or slope.
2. Handrails otherwise required to comply with Section 1011.11 of the International Building Code shall not be required to comply with the requirements of Section 1014.6 of the International Building Code regarding full extension of the handrails where such extensions would be hazardous because of plan configuration.
3. Where provided in below-grade transportation stations, existing and new escalators shall have a clear width of less than 32 inches (815 mm).

Reason: An intent of the IEBC changes creating the 2018 edition was to make the provisions of Chapter 3 applicable to all existing building work regardless of the compliance method chosen. Our group's concern was that the route a code user must follow to get to requirements of Section 305 was unclear. Section 305 contains provisions which are 'exceptions' from compliance with the IBC and the ICC A117.1 standard; thus the text of 503.1 is incomplete because it doesn't like you to exceptions in Section 305. Section 305 is similar to 302.4 and 302.5 in that something less than full compliance with IBC is allowed. We noticed that the other compliance methods had no link within them to Chapter 3. The real problem, and the solution, is in the beginning of Chapter 3 where it fails to clearly state its purpose except in the title to the chapter. Titles are not code. It is essential that Section 301.1 state that Chapter 3 applies to all compliance methods as the title states.

We further noticed that 302.1 had such language covering Section 302 – but the rest of the chapter has no such statement. This proposal fixes it. Once stated in Section 301.1, it isn't needed in 302. Once stated in 301, exceptions aren't needed in 503 or in any of the other compliance methods. We also recommend the title of 301 be changed to either Scope or Applicability. Administration is something for Chapter 1 and not appropriate here.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The change provides an editorial correction to make sure the user understands that Section 305 also allows construction of alterations to a different and lesser technical requirement. And to make sure that the text of the Chapter is corrected to reflect the title – provisions for All Compliance Methods.

EB17-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The current language will get the code user to the correct sections but these revisions makes the links to the appropriate sections much cleaner. The provisions in Chapter 3 are intended to address all compliance methods. (Vote: 10-3)

Assembly Action:

None

EB17-19

Individual Consideration Agenda

Public Comment 1:

IEBC@: 301.1

Proponents:

Kelly Cobeen, Wiss Janney Elstner Associates, representing Federal Emergency Management Agency and Applied Technology Council Seismic Code Support Committee (FEMA/ATC SCSC) (kcobeen@wje.com); Michael Mahoney, Federal Emergency Management Agency, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

301.1 Applicability The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with Section 301.2, 301.3, or 301.4. The provisions of Sections 302, ~~304 and through~~ 305 shall apply to all alterations, repairs, additions, relocation of structures and changes of occupancy regardless of compliance method. The provisions of Section 303 shall apply where specifically required by other provisions of this code.

Commenter's Reason: The submitted code change proposal implies that the provisions of Section 303 are applicable to any alteration, addition or repair. That is not correct. Section 303 is only applicable when specifically triggered by other sections of the IEBC. The proposed language clarifies the intended use.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Both the original code change proposal and the public comment are clarifying already existing code language, and as a result do not have an impact on cost of construction.

Public Comment# 1463

(geneb@codeconsultants.com)

2018 International Existing Building Code

SECTION 305 ACCESSIBILITY FOR EXISTING BUILDINGS

Revise as follows:

305.6 Alterations. A facility that is altered shall comply with the applicable provisions in Chapter 11 of the International Building Code, ICC A117.1 and the provisions of Sections 305.6.1 through 305.6.19, unless technically infeasible. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent technically feasible.

~~Exceptions:~~

- ~~1. The altered element or space is not required to be on an accessible route, unless required by Section 305.7.~~
- ~~2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing facilities.~~
- ~~3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.~~
- ~~4. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities undergoing alterations where the work area is 50 percent or less of the aggregate area of the building.~~

~~305.7~~ 305.6.1 Alterations affecting an area containing a primary function. Where an alteration affects the accessibility to, or contains an area of primary function, the route to the primary function area shall be accessible. The accessible route to the primary function area shall include toilet facilities and drinking fountains serving the area of primary function.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of primary function.
2. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of a facility.
5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

Add new text as follows:

305.6.2 Accessible route. The altered element or space is not required to be on an accessible route, unless required by Section 305.6.1.

305.6.3 Accessible means of egress Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing facilities.

305.6.4 Alteration of Type A units The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.

305.6.5 Type B units Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities undergoing alterations where the work area is 50 percent or less of the aggregate area of the building.

Delete without substitution:

~~305.8 Scoping for alterations.~~ ~~The provisions of Sections 305.8.1 through 305.8.15 shall apply to alterations to existing buildings and facilities.~~

Revise as follows:

~~305.8.1~~ 305.6.6 Entrances. Where an alteration includes alterations to an entrance that is not accessible, and the facility has an accessible

entrance, the altered entrance is not required to be *accessible* unless required by Section ~~305.7~~-305.6.1. Signs complying with Section 1111 of the International Building Code shall be provided.

~~305.8.2~~ **305.6.7 Elevators.** Altered elements of existing elevators shall comply with ASME A17.1 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

~~305.8.3~~ **305.6.8 Platform lifts.** Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

~~305.8.4~~ **305.6.9 Stairways and escalators in existing buildings.** Where an escalator or stairway is added where none existed previously and major structural modifications are necessary for installation, an accessible route shall be provided between the levels served by the escalator or stairways in accordance with Section 1104.4 of the International Building Code.

~~305.8.5~~ **305.6.10 Ramps.** Where slopes steeper than allowed by Section 1012.2 of the International Building Code are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table ~~305.8.5~~-305.6.10.

**TABLE 305.8-5 305.6.10
RAMPS**

SLOPE	MAXIMUM RISE
Steeper than 1:10 but not steeper than 1:8	3 inches
Steeper than 1:12 but not steeper than 1:10	6 inches

For SI: 1 inch = 25.4 mm.

Add new text as follows:

305.6.11 Determination of number of units Where Chapter 11 of the International Building Code requires Accessible, Type A or Type B units, where units are being altered or added, the number of Accessible, Type A and Type B units shall be determined in accordance with Sections 305.6.11.1 through 305.6.11.3.

Revise as follows:

305.8-6 305.6.11.1 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the International Building Code for Accessible units apply only to the quantity of spaces being altered or added.

305.8-7 305.6.11.2 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the International Building Code for Type A units apply only to the quantity of the spaces being altered or added.

305.8-8 305.6.11.3 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being added. Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the *work area* is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

305.8-9 305.6.12 Jury boxes and witness stands. In *alterations*, accessible wheelchair spaces are not required to be located within the defined area of raised jury boxes or witness stands and shall be permitted to be located outside these spaces where the ramp or lift access restricts or projects into the required means of egress.

305.8-10 305.6.13 Toilet rooms. Where it is *technically infeasible* to alter existing toilet and bathing rooms to be *accessible*, an *accessible* family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the International Building Code is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

305.8-11 305.6.14 Additional toilet and bathing facilities. In assembly and mercantile occupancies, where additional toilet fixtures are added, not fewer than one accessible family or assisted-use toilet room shall be provided where required by Section 1109.2.1 of the International Building Code. In recreational facilities, where additional bathing rooms are being added, not fewer than one family or assisted-use bathing room shall be provided where required by Section 1109.2.1 of the International Building Code.

305.8-12 305.6.15 Dressing, fitting and locker rooms. Where it is *technically infeasible* to provide accessible dressing, fitting or locker rooms at the same location as similar types of rooms, one accessible room on the same level shall be provided. Where separate-sex facilities are provided, accessible rooms for each sex shall be provided. Separate-sex facilities are not required where only unisex rooms are provided.

305.8-13 305.6.16 Fuel dispensers. Operable parts of replacement fuel dispensers shall be permitted to be 54 inches (1370 mm) maximum, measuring from the surface of the vehicular way where fuel dispensers are installed on existing curbs.

305.8-14 305.6.17 Thresholds. The maximum height of thresholds at doorways shall be $\frac{3}{4}$ inch (19.1 mm). Such thresholds shall have beveled edges on each side.

305.8-15 305.6.18 Amusement rides. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1110.4.8 of the International Building Code.

305.9 305.6.19 Historic buildings. These provisions shall apply to *facilities* designated as historic structures that undergo *alterations* or a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the *facility*, as determined by the authority having jurisdiction, the alternative requirements of Sections 305.9-1 305.6.19.1 through 305.9-4 305.6.19.4 for that element shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in

historic buildings.

~~305.9.1~~ **305.6.19.1 Site arrival points.** Not fewer than one accessible route from a site arrival point to an accessible entrance shall be provided.

~~305.9.2~~ **305.6.19.2 Multiple-level buildings and facilities.** An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.

~~305.9.3~~ **305.6.19.3 Entrances.** Not fewer than one main entrance shall be accessible.

Exception: If a public entrance cannot be made accessible, an accessible entrance that is unlocked while the building is occupied shall be provided; or, a locked accessible entrance with a notification system or remote monitoring shall be provided.

Signs complying with Section 1111 of the International Building Code shall be provided at the public entrance and the accessible entrance.

~~305.9.4~~ **305.6.19.4 Toilet and bathing facilities.** Where toilet rooms are provided, not fewer than one accessible family or assisted-use toilet room complying with Section 1109.2.1 of the International Building Code shall be provided.

Reason: Sections 305.6 through 305.9 all address alterations but there is no connection between the sections. This is a problem when trying to determine the purpose of 305.8. Section 305.8 is titled 'Scoping for alterations', however many of the 15 provisions which follow are technical exceptions. Some of them are additional technical requirements. Eleven of the 15 are only found in the IEBC and four of them duplicate exceptions contained in the ICC A117.1 standard. Three of the 15 are telling the user how to calculate a requirement where not all units need to be accessible. The intent of this proposal is editorial. It is simply to provide connections between all of the Sections of 305 specifically addressing alterations. Substantive changes to these sections are found in companion proposals. This proposal does the following.

- It renumbers Section 305.7 to 305.6.1 to indicate that it is a subset set of the alterations section. There is a companion proposal to revise the language of 305.6.1 to be more consistent with the corresponding ADA requirement.
- It changes the 4 exceptions now found in Section 305.6 into the next four subsections – 305.6.2 through 305.6.5. Having titled subsections allow for quicker access for code users than sorting through numbered exceptions.
- It deletes the confusing lead in provisions of 305.8 and relocates its various provisions as the next subsections – 305.6.6 through 305.6.18. We have submitted a companion proposal which would delete four of these 9 because they are redundant with exceptions in the ICC A117.1 standard.
- It renumbers Section 305.9 and its subsections to be 305.6.19 because it contains a set of provisions and exceptions unique to historic buildings.
- Finally, it groups 3 provisions into a new subsection 305.6.11 All 3 of these sections provide a calculation methodology for determining the number of required dwelling and/or sleeping units

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The intent of this proposal is to be 100% editorial by reorganizing existing provisions into a more logical format.

EB20-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal provides a better structure and format of the provisions by pulling requirements out of an exception and providing better lead in language to the allowances or requirements as applicable. (Vote: 13-0)

Assembly Action:

None

EB20-19

Individual Consideration Agenda

Public Comment 1:

IEBC®: 305.6

Proponents:

Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

Further modify as follows:

2018 International Existing Building Code

305.6 Alterations. A *facility* that is altered shall comply with the applicable provisions in Chapter 11 of the International Building Code, ICC A117.1 and where specifically permitted by the provisions of Sections 305.6.1 through 305.6.19, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

Commenter's Reason: I was the proponent for EB 19, which was a similar attempt to clean up the accessibility provisions. I like how the proponents of this code change cleaned up these provisions but there's still a small tweak needed. By adding this additional code language, I think this change overall clearly identifies how accessibility provisions are to be applied within the IEBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. There is no cost associated with this code change as it's cleaning up current code language for clarification.

Public Comment# 1599

EB25-19

IEBC@: 305.4 (New), 305.4.1 (New), 305.4.2 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Existing Building Code

Revise as follows:

305.4 Change of occupancy. *Existing buildings* that undergo a change of group or occupancy shall comply with this ~~section~~, Sections 305.6, 305.7 and 305.8.

Exception: Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

Delete without substitution:

305.4.1 Partial change of occupancy. ~~Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 305.6, 305.7 and 305.8.~~

305.4.2 Complete change of occupancy. ~~Where an entire building undergoes a change of occupancy, it shall comply with Section 305.4.1 and shall have all of the following accessible features:~~

- ~~1. Not fewer than one accessible building entrance.~~
- ~~2. Not fewer than one accessible route from an accessible building entrance to primary function areas.~~
- ~~3. Signage complying with Section 1111 of the International Building Code.~~
- ~~4. Accessible parking, where parking is being provided.~~
- ~~5. Not fewer than one accessible passenger loading zone, where loading zones are provided.~~
- ~~6. Not fewer than one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

~~Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, Items 1 through 6 shall conform to the requirements to the maximum extent technically feasible.~~

Exception: ~~The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.~~

Reason: There are several arguments to simplify this section.

What this does administratively is take a change of occupancy and make it consistent with requirements for an alteration. This allows flexibility for small properties.

- The federal requirements in the 2010 ADA Standard do not address a change of occupancy – they treat all alterations the same. There is no justification for ICC to require a business in stand alone building to provide additional requirements past what is expected for a business in a multi-tenant building.
- The list in Section 305.4.2 basically lists all the elements in accessible routes, which is addressed in Section 305.7, but does not include bathrooms and drinking fountains. Therefore, it is unclear as to if renovations to those items are required in a complete change of occupancy, where they would be on the list for an alteration and a partial change of occupancy. This list does not add any clarification of improvements to the code.
- This could also be read that a complete change of occupancy would never have to fix the toilet rooms or drinking fountains since it is not in the list. If the alterations are small, allowing someone to spend money to fix the toilet rooms is addressed the needs of many individuals with mobility issue.
- If the part of the route missing is an elevator or extensive front ramp, the cost could make the existing building remain vacant since this section could be viewed as not tied to the 20% maximum cost allowance.
- The arguments against revising this section in past code cycles have all been around the issue of a change of occupancy with no alterations. Many building departments are not involved in changes of occupancy that do not include alterations. Even in jurisdictions that look at this, they do not require alterations for occupancies with lesser hazards. How much should you ask someone to spend if there are no construction costs? If it is a higher hazard, there will mostly likely be alterations – so just use those requirements.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will decrease the cost of construction

Requiring the six route requirements in Section 305.4.2 for small buildings that undergo a change of occupancy can be a large cost. It is more appropriate to limit the cost of the route to 20% of the alteration - which this change will allow. In large buildings, this change will have minimal impact since they are more likely to already have the accessible route - or the cost will be a much smaller portion of their budget.

EB25-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal was approved as change of occupancy is not addressed by the federal regulations. It was felt that the 20% requirement will address accessibility needs. The references to Section 305.6, 305.7 and 305.8 will address the needs for accessibility in existing buildings. (Vote: 13-0)

Assembly Action:

None

EB25-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Gregory Nicholls, representing American Institute of Architects (gnicholls@preview-group.com)

requests Disapprove

Commenter's Reason: The reason statement from the proponent is correct in stating that a change of occupancy is not addressed in the ADA Standard. That is because the DOJ regulations don't contain anything parallel to the building code's concept of change of occupancy, and don't have any occupancy classifications to start with. The only basis for working with existing buildings in the ADA Standard is when physical changes are proposed, as that is their only defined threshold.

One issue is consistency. The building codes of the ICC have always taken change of occupancy into account for egress, energy, fire safety and existing buildings. It would unfair for a new small office building to have to provide an accessible entrance while changing from a building with no requirements for accessibility, a single family dwelling, to an office without alterations would require absolutely nothing. The proponent says the current code may be onerous, but has not attempted a compromise. Instead, accessibility for the mobility impaired to at least enter the building has been proposed to be eliminated. This is unfair to the disabled.

Another issue with this code change is that the ICC codes have been leaders and not followers on scoping for accessibility. The IBC and IEBC include private clubs, churches and multi-family dwellings that ADA and FHAG have not. Why retreat to a position of no inclusion?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction No change to code.

Public Comment# 2042

Proposed Change as Submitted

Proponents: Gina Hilberry, Scoping Task Group of ICC/A117.1 Standard Development Committee, representing United Cerebral Palsy (gina@cohenhilberry.com); Rick Lupton, representing Self (sparkylupton@msn.com); Marsha Mazz, representing United Spinal Association (m.mazz@verizon.net); Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Existing Building Code

Revise as follows:

305.7 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to, or contains an area of *primary function*, ~~the route~~ an accessible path of travel to the *primary function* area shall be ~~accessible~~ provided. The accessible ~~route~~ path of travel to the *primary function* area shall include the accessible route, toilet facilities and drinking fountains serving the area of *primary function*.

Exceptions:

1. The costs of providing the ~~accessible route~~ path of travel are not required to exceed 20 percent of the costs of the *alterations* affecting the area of *primary function*.
2. ~~This provision~~ The requirement to provide an accessible path of travel does not apply ~~to alterations~~ where alterations within the primary function area are limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. ~~This provision does not apply to alterations limited solely to , signs,~~ mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.
5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

Reason: The IEBC code is unclear with respect to this requirement which derives from the ADA. The term used in the ADA is 'path of travel'. In the ADA it includes the accessible route to the primary function area as well as the telephones, toilet facilities and drinking fountains which serve the area of primary function. Saying 'accessible route' as it does in exception 1 is misleading. Path of travel could be defined in Chapter 2, but the last sentence of 305.7 is essentially the definition. As the term is not used elsewhere in the code, a chapter 2 definition seems unnecessary. Telephones are not included in the IEBC text because they are not typically part of the building regulated by the local building official. Telephone requirements for new construction are in Appendix E of the IBC.

Exception 3 is merged into exception 2 as they are both simply lists of elements exempt from the path of travel requirements.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is primarily an editorial clarification of an existing requirement.

EB29-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There was support for the concept provided in this proposal to correlate language however the revisions as presented need more clarification as the terms may cause confusion with other terms used for means of egress in the I-Codes. (Vote: 10-3)

Assembly Action:

None

EB29-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Gene Boecker, representing Code Consultants, Inc.; Gina Hilberry, representing Scoping Task Group of ICC/A117.1 Standard Development Committee, representing United Cerebral Palsy (gina@cohenhilberry.com); Rick Lupton, representing Self (sparkylupton@msn.com); Marsha

requests As Submitted

Commenter's Reason: Although there were a few on the committee who agreed with the proposal, the committee did not understand and voted wrong.

There are several reasons why the committee's vote should be overturned in favor of As Submitted.

1. The code has always tended to use the terminology that is used by the industry which it is addressing in the code text. The accessibility industry (the users, consultants, and enforcers; including the U.S. Department of Justice) uses the term "Path of Travel" when describing the mandated renovation work that includes the area outside the initial area of alteration. To be consistent with the industry usage, the code language should be changed.

2. The committee expressed concern that the change would lead to confusion in the use of the three words. A search of the expression yielded the following ten results. All are within the IBC. The term does not exist within the IEBC except in the proposed code change. The chances of getting the text confused based on the number of occurrences is extremely low.

- DIRECT ACCESS. A path of travel from a space to an immediately adjacent space through an opening in the common wall between the two spaces.
- 410.5.3.3 Two means of egress. Where two means of egress are required, the common path of travel shall be not greater than 100 feet (30 480 mm).
- 1008.2.3 Exit discharge. Illumination shall be provided along the path of travel for the exit discharge from each exit to the public way.
- 1028.1, exceptions 1.1. Discharge of interior exit stairways and ramps shall be provided with a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable from the point of termination of the enclosure.
- 1028.5, exception 4. The area shall be provided with a safe and unobstructed path of travel from the building.
- 1029.4 Foyers and lobbies. In Group A-1 occupancies, where persons are admitted to the building at times when seats are not available, such persons shall be allowed to wait in a lobby or similar space, provided that such lobby or similar space shall not encroach on the minimum width or required capacity of the means of egress. Such foyer, if not directly connected to a public street by all the main entrances or exits, shall have a straight and unobstructed corridor or path of travel to every such main entrance or exit.
- 2902.3.23 Location of toilet facilities in occupancies other than malls. In occupancies other than covered and open mall buildings, the required public and employee toilet facilities shall be located not more than one story above or below the space required to be provided with toilet facilities, and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m).
- 2902.3.34 Location of toilet facilities in malls. In covered and open mall buildings, the required public and employee toilet facilities shall be located not more than one story above or below the space required to be provided with toilet facilities, and the path of travel to such facilities shall not exceed a distance of 300 feet....
- 3007.6.1 Access to interior exit stairway or ramp. The enclosed fire service access elevator lobby shall have direct access from the enclosed elevator lobby to an enclosure for an interior exit stairway or ramp.
 - Exception: Access to an interior exit stairway or ramp shall be permitted to be through a protected path of travel that has a level of fire protection not less than the elevator lobby enclosure. The protected path shall be separated from the enclosed elevator lobby through an opening protected by a smoke and draft control assembly in accordance Section 716.5.32.2.1.
- 3008.6.1 Access to interior exit stairway or ramp. The occupant evacuation elevator lobby shall have direct access from the enclosed elevator lobby to an interior exit stairway or ramp.
 - Exceptions: 1. Access to an interior exit stairway or ramp shall be permitted to be through a protected path of travel that has a level of fire protection not less than the elevator lobby enclosure.

3. Additionally, the term as intended within the IEBC is prefaced with the word "accessible" in all occurrences, further identifying this as a unique situation.

4. The accessible path of travel includes other elements. It is the overarching "thing" that addresses what is included in the renovation work. The current text uses the term "accessible route" which is only a part of the accessible path of travel. It then has to add in the other items. The proposed text makes it much simpler and is consistent with its use in the federal ADA standards.

This proposal is brought to you by experts in the accessibility industry - people who use the IBC, the IEBC and the ADA Standards. Please overturn the committee and make the IEBC consistent with the terminology used throughout the country for this concept.

Bibliography: U.S. 2010 ADA Standards for Accessible Design; Section 202.4 and the Advisory to Section 202.4.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. As stated in the original proposal, there is no change in the cost of construction.

EB35-19

IEBC®: 305.8.6 (New)

Proposed Change as Submitted

Proponents: Ronald Clements Jr, representing VBCOA (clementsro@chesterfield.gov)

2018 International Existing Building Code

Add new text as follows:

305.8.6 Dining areas. An accessible route is not required to raised or sunken dining areas or outdoor dining areas where accessible dining areas with the same services are provided on the same floor level.

Reason: This provision for dining areas was in the work area method going back to the first edition. It was not in the prescriptive method when that method was introduced in the 2006 edition. When the accessibility provisions were consolidated in chapter 3 the dining area provision was lost; it was section 705.1.5 in the 2015 edition. It appears the loss was not intentional.

Cost Impact: The code change proposal will decrease the cost of construction
This provides another option that could decrease construction cost.

EB35-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This exception for dining areas was not seen as reasonable and can be addressed as a technical feasibility issue. It was noted that this section was purposely removed for the 2018 IEBC. (Vote: 13-0)

Assembly Action:

None

EB35-19

Individual Consideration Agenda

Public Comment 1:

IEBC®: 305.8.6 (New)

Proponents:

Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

305.8.6 Dining areas. An accessible route shall be provided throughout the dining area.

Exception: An accessible route is not required to raised or sunken dining areas or outdoor dining areas where accessible dining areas with the same services are provided on the same floor level.

Commenter's Reason: As written, the original code change is writing an exception as code language. That's not how any of the I Codes are intended to be formatted. This public comment corrects the code language so that the exception is now in the correct location.

The committee noted that the removal of this language from the 2018 IEBC was intentional and that this can be addressed as a technical feasibility

issue. Some jurisdictions that adopt the IEBC may not see this issue as such and would require this, thus the language should be provided for in the IEBC to clearly define the intention.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

Per the original proponent, this provides another option that could decrease construction cost. The overall change may not affect construction costs at all.

Public Comment# 1596

EB38-19

IEBC@: SECTION 306 (New), 306.1 (New)

Proposed Change as Submitted

Proponents: Stephen Thomas, representing Himself (stthomas@coloradocode.net)

2018 International Existing Building Code

Add new text as follows:

SECTION 306 **MEANS OF EGRESS FOR EXISTING BUILDINGS**

306.1 Occupant Load based on Capacity Where approved by the code official, the occupant load of any room, areas, space or story shall be permitted to be established as the number of occupant for which the existing means of egress capacity is adequate. Measures shall be established to prevent occupancy greater than the number and capacity of the means of egress components. Such measures can include, but are not limited to the posting of the occupant load for the room, area, space or story.

Reason: Many shell and core buildings are constructed with the minimum means of egress capacity for the anticipated use. However, when the space is finished, the new use may have spaces with occupant loads higher than originally anticipated. Therefore, the existing egress capacity is not adequate enough for the new space. This proposal provides an option to base the occupant load on the existing capacity of the space. It requires the building official's approval to use this option to reduce possible abuse of the requirement.

For example, if a space has two 36-inch wide doors that provide 34-inches of egress capacity, the maximum occupant load permitted in that space would be 340. In some cases, it is either very expensive or impossible to add an additional means of egress or capacity. If the calculated occupant load was greater than the 340, the building official could approve the reduction of the occupant load to a maximum of 340. They would then determine how that occupant load would be maintained which could include the posting of the occupant load in the space. This happens in office tenant improvements quite often. The original building was designed with an occupant load calculation for business use, but the new tenant space has some assembly functions that increase the occupant load.

This proposal was submitted to the Means of Egress Committee in the Group A Cycle. They felt that the requirement would be better located in the IEBC. Their other concerns were addressed by some revisions to the original language submitted to them.

Cost Impact: The code change proposal will decrease the cost of construction

By allowing the occupant load to be based on the egress capacity, the cost of additional exits or capacity will be eliminated.

EB38-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved. Although the challenge to address these situations exists the language needs further revision. It was generally felt that the language is unnecessary as the building official already has the authority to address these situations based upon the intent and purpose of the code. There was some opinion that this is a necessary tool and would provide necessary guidance. (Vote: 8-5)

Assembly Action:

None

EB38-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter (stthomas@coloradocode.net)

requests As Submitted

Commenter's Reason: There are many times where shell buildings are designed using the minimum occupant load for a building. Then, the tenant comes in and has different occupant loads than were originally used. If the means of egress was designed to the original occupant load, the new tenant has a problem with complying with Chapter 10 of the IBC. This proposal gives the building official the authority to use the actual capacity and number of exits to determine the total occupant load for a space or story. This is similar to the exception to IBC Section 1004.5, but is more specific to address the actual capacity of the means of egress to determine the occupant load. We feel that this provides the building official with additional tools to address alterations to a building in dealing with the means of egress. The building official does not have to approve the design if they are not comfortable with it. It is an option, not a requirement.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. By reducing the occupant load based on the capacity, additional exits or plumbing fixtures will not be required.

Public Comment# 1561

EB39-19

IEBC®: SECTION 306 (New), 306.1 (New), 306.1.1 (New), 306.1.2 (New)

Proposed Change as Submitted

Proponents: John Williams, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Existing Building Code

Add new text as follows:

SECTION 306 **HEALTHCARE**

306.1 General. Healthcare facilities including Group I-2, ambulatory care facilities and outpatient clinics undergoing repair, alterations, additions and change of occupancy shall be in accordance with Sections 306.1.1 and 306.1.2, as applicable.

306.1.1 Existing construction requirements. Existing Group I-2 facilities shall meet the minimum construction requirements in Chapter 11 of the International Fire Code.

306.1.2 Projections in Nursing Home Corridors. In Group I-2, Condition 1 occupancies, where the corridor is at least 96 inches wide, projections into the corridor width are permitted in accordance with Section 407.4.3 of the International Building Code.

Reason: This proposal creates a section in chapter 3 for special requirements for healthcare facilities. Due to federal reimbursement requirements, there are specific existing building issues that must be mitigated before receiving federal funds. These are reflected in Chapter 13 of the IFC, however, not all jurisdictions adopt this chapter. By referencing those requirements in the IEBC, we provide facilities with a greater chance at maintaining federal certification and at the same time ensure basic safety provisions for facilities that house fragile populations.

A companion proposal directly references chapter 11 of the IFC in all of the compliance methods. If it is more effective to have the actual technical requirements in this document, this change creates a place for those requirements to live..

The intent of Section 306.2 is to correlate with the federal regulations and the allowances in the IBC for fixed furniture in corridors where special considerations are met.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 and 2018 the CHC held 4 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a pointer to the IEBC that indicates the allowances permitted for fixed furniture.

EB39-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This new section was approved as it was felt to provide the necessary correlation with federal healthcare occupancy requirements. It was suggested that potentially Chapter 3 may need a section dealing with occupancy based provisions. (Vote: 13-0)

Assembly Action:

None

EB39-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Jeffrey Shapiro, International Code Consultants, representing Self (jeff.shapiro@intlcodeconsultants.com)

requests Disapprove

Commenter's Reason: ADM8-19 added the following text to IEBC Chapter 1:

"101.2.1 Application of fire code. Where work regulated by this code is also regulated by the construction requirements for existing buildings in Chapter 11 of the International Fire Code, such work shall comply with applicable requirements in both codes."

With this text providing a broad reference to IFC Chapter 11, individual pointed references spread throughout the IEBC are unnecessary, and there is an implication of ..."well, if only these sections are being referenced in a specific section of the code, is compliance with the rest of IFC Chapter 11 not necessary to these applications?" It is better to let the general reference in Chapter 1 prevail and not include partial/incomplete references on specific topics elsewhere in the code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Public Comment# 2027

EB40-19

IEBC®: SECTION 306 (New), 306.1 (New), SECTION 307 (New), 307.1 (New), 502.6, 502.7, 503.14, 503.15, 803.4.3, SECTION 804, 804.1, SECTION 1104, 1104.1, SECTION 1105, 1105.1

Proposed Change as Submitted

Proponents: Stephen Thomas, representing Himself (sthomas@coloradocode.net)

2018 International Existing Building Code

Add new text as follows:

SECTION 306 **SMOKE ALARMS**

306.1 Smoke Alarms Where an alteration, addition, change of occupancy or relocation of a building is made to an existing building or structure of a Group R and I-1 occupancies, the existing building shall be provided with smoke alarms in accordance with Section 1103.8 of the International Fire Code or Section R314 of the International Residential Code.

SECTION 307 **CARBON MONOXIDE DETECTION**

307.1 Carbon monoxide alarms. Where an addition, alteration, change of occupancy or relocation of a building is made to Group I-1, I-2, I-4 and R occupancies, the existing building shall be provided with carbon monoxide alarms in accordance with Section 1103.9 of the International Fire Code or Section R315 of the International Residential Code.

Exceptions:

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.
2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances.

Delete without substitution:

~~**502.6 Smoke alarms in existing portions of a building.** Where an addition is made to a building or structure of a Group R or I-1 occupancy, the existing building shall be provided with smoke alarms in accordance with Section 1103.8 of the International Fire Code.~~

~~**502.7 Carbon monoxide alarms in existing portions of a building.** Where an addition is made to a building or structure of Group I-1, I-2, I-4 or R occupancy, the existing building shall be provided with carbon monoxide alarms in accordance with Section 1103.9 of the International Fire Code or Section R315 of the International Residential Code, as applicable.~~

Exceptions:

- ~~1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.~~
- ~~2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances.~~

~~**503.14 Smoke alarms.** Individual sleeping units and individual dwelling units in Group R and I-1 occupancies shall be provided with smoke alarms in accordance with Section 1103.8 of the International Fire Code.~~

~~**503.15 Carbon monoxide alarms.** Carbon monoxide alarms shall be provided to protect sleeping units and dwelling units in Group I-1, I-2, I-4 and R occupancies in accordance with Section 1103.9 of the International Fire Code.~~

Exceptions:

- ~~1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.~~
- ~~2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances.~~

~~**803.4.3 Smoke alarms.** Individual sleeping units and individual dwelling units in any work area in Group R and I-1 occupancies shall be provided with smoke alarms in accordance with the International Fire Code.~~

~~**Exception:** Interconnection of smoke alarms outside of the work area shall not be required.~~

SECTION 804 **CARBON MONOXIDE DETECTION**

~~**804.1 Carbon monoxide alarms.** Any work area in Group I-1, I-2, I-4 and R occupancies shall be equipped with carbon monoxide alarms in accordance with Section 1103.9 of the International Fire Code.~~

Exceptions:

- ~~1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.~~
- ~~2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances.~~

**SECTION 1104
SMOKE ALARMS IN OCCUPANCY
GROUPS R AND I-1**

~~**1104.1 Smoke alarms in existing portions of a building.** Where an addition is made to a building or structure of a Group R or I-1 occupancy, the existing building shall be provided with smoke alarms as required by Section 1103.8 of the International Fire Code or Section R314 of the International Residential Code as applicable.~~

**SECTION 1105
CARBON MONOXIDE ALARMS IN
GROUPS I-1, I-2, I-4 AND R**

~~**1105.1 Carbon monoxide alarms in existing portions of a building.** Where an addition is made to a building or structure of a Group I-1, I-2, I-4 or R occupancy, the existing building shall be equipped with carbon monoxide alarms in accordance with Section 1103.9 of the International Fire Code or Section R315 of the International Residential Code, as applicable.~~

Reason: Smoke alarms and carbon monoxide alarms are required for all the different options in the IEBC. It does not make sense to have the same requirements duplicated in the different options. Chapter 3 was created to address requirements that were applicable to all of the options. Therefore, this proposal places the requirement for smoke alarms and carbon monoxide alarms in Chapter 3 and deletes the specific requirements elsewhere in the code. This change also maintains the pointer to the fire code for these requirements.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is just a relocation of the requirements into a single location.

EB40-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

~~**307.1 Carbon monoxide alarms-detection.** Where an addition, alteration, change of occupancy or relocation of a building is made to Group I-1, I-2, I-4 and R occupancies and classrooms of Group E occupancies, the existing building shall be provided with carbon monoxide ~~alarms-~~detection in accordance with Section 1103.9 of the International Fire Code or Section R315 of the the International Residential Code.~~

Exceptions:

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.
2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances.

Committee Reason: The committee agreed with moving the smoke alarms and carbon monoxide detection to Chapter 3 in an effort to simplify the application of requirements. There was a concern raised that we need to have an exception added during public comment for Alteration level 1 as these sections currently only apply to level 2 alterations. The modification aligns the language with what is proposed in EB52-19. These revisions align with actions taken on the IBC and IFC. (Vote:13-0)

Assembly Action:

None

EB40-19

Individual Consideration Agenda

Public Comment 1:

IEBC@: SECTION 306 (New), 306.1 (New), SECTION 307 (New), 307.1 (New)

Proponents:

Ed Kulik, representing ICC (bcac@iccsafe.org)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

SECTION 306 SMOKE ALARMS

306.1 Smoke Alarms Where an alteration, addition, change of occupancy or relocation of a building is made to an existing building or structure of a Group R and I-1 occupancies, the existing building shall be provided with smoke alarms in accordance with Section ~~1103.8~~ 1103.9 ~~1103.8.2.10~~ of the International Fire Code or Section R314 of the International Residential Code.

Exception: Alterations and changes of occupancy shall be permitted to comply with the following:

1. Section 1103.8.2 of the International Fire Code for interconnection.
2. Section 1103.8.3 of the International Fire Code for power source

SECTION 307 CARBON MONOXIDE DETECTION

307.1 Carbon monoxide detection. Where an addition, alteration, change of occupancy or relocation of a building is made to Group I-1, I-2, I-4 and R occupancies and classrooms of Group E occupancies, the existing building shall be provided with carbon monoxide detection in accordance with Section ~~1103.9~~ 1103.9 ~~1103.9.15~~ of the International Fire Code or Section R315 of the the International Residential Code.

Exceptions:

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.
2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances.
3. For alterations and changes of occupancy the following shall apply:
 - 3.1. Carbon monoxide alarms are permitted to be solely battery operated where the code that was in effect at the time of construction did not require carbon monoxide detectors to be provided.
 - 3.2. Carbon monoxide alarms are permitted to be solely battery operated in dwelling units that are not served from a commercial power source.

Commenter's Reason: Code change proposal EB106-19 made a revision for additions related to smoke alarms and carbon monoxide detection that reference the new construction requirements in Chapter 9 of the IBC. EB40-19 moved all the requirements to one section in Chapter 3 for additions, alterations and change of occupancy. This public comment is combining those code change concepts to better understand how the revisions work together. This PC is necessary as additions are treated as new construction. Alterations and change of occupancy are afforded more flexibility therefore the exceptions allowed in Chapter 11 of the IFC are added for alterations and change of occupancy.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The intent of the codes is that additions are treated as new construction and alterations and change of occupancy are considered existing and typically have more flexibility. This public comments is trying to make this intent clear therefore the application should be the same.

Public Comment 2:**IEBC@: 306.1 (New), 307.1 (New)****Proponents:**

Steve Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter (stthomas@coloradocode.net)

requests As Modified by Public Comment

Further modify as follows:**2018 International Existing Building Code**

306.1 Smoke Alarms Where an alteration, addition, change of occupancy or relocation of a building is made to an existing building or structure of a Group R and I-1 occupancies, the existing building shall be provided with smoke alarms in accordance with Section 1103.8 of the International Fire Code or Section R314 of the International Residential Code.

Exception: Work classified as Level 1 Alterations in accordance with Chapter 7.

307.1 Carbon monoxide detection. Where an addition, alteration, change of occupancy or relocation of a building is made to Group I-1, I-2, I-4 and R occupancies and classrooms of Group E occupancies, the existing building shall be provided with carbon monoxide detection in accordance with Section 1103.9 of the International Fire Code or Section R315 of the the International Residential Code.

Exceptions:

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.
2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances.
3. Work classified as Level 1 Alterations in accordance with Chapter 7.

Commenter's Reason: The committee pointed out that Level 1 Alterations did not require that smoke alarms or carbon monoxide detectors were required. We agree with the committee and requested that the committee approve the proposal as modified and promised to add the exceptions show in this proposed modification. This is intended to just clarify that the upgrades are not required when doing a Level 1 Alteration.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction
This public comment is only meant as a clarification as to what the code currently requires so the cost of construction will not change.

EB41-19

IEBC: 401.1.1 (New), 401.1.2 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Existing Building Code

Revise as follows:

SECTION 401 GENERAL

401.1 Scope. *Repairs* shall comply with the requirements of this chapter. *Repairs to historic buildings* need only comply with Chapter 12.

Add new text as follows:

401.1.1 Partial reconstruction. Where damage from fire, earthquake, storm or a similar event has rendered one or more stories of a building, structure or portion thereof as unsafe, reconstruction of such areas shall meet the requirements for a Level 2 or 3 alteration, as applicable.

401.1.2 Complete reconstruction. Where damage from fire, earthquake, storm or similar event has demolished the building structure, or a portion of a building or structure from the foundation to the roof, reconstruction of such areas shall be in accordance with the International Building Code.

Reason: There is a question as to when damage from a fire or other disaster destroying all or a good chunk of a building. Do you have to go back to IBC or can you build back the way it was? This concept is to try and separate repair from new construction requirements at a logical point. Note that this also helps people get the true value for reconstruction as the insurance industry may sometimes classify a new building (or a replacement of the large portion or an entire story) as a repair and funding is limited.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is intended as a clarification of requirements.

EB41-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The intent of what this is addressing is valid but some felt that the code already provides the necessary provisions to address these issues. Others felt that the concern was valid however the language needs to be cleaned up in particular when addressing partial reconstruction. There was a concern that without this proposal the definition of repair would allow buildings to be constructed as a repair when only the foundation remains. (Vote: 8-5)

Assembly Action:

None

EB41-19

Individual Consideration Agenda

Public Comment 1:

IEBC@: SECTION 401 (New), 401.1 (New), 401.1.1 (New), 401.1.2 (New)

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

Modify as follows:

2018 International Existing Building Code

SECTION 401 GENERAL

401.1 Scope. *Repairs* shall comply with the requirements of this chapter. *Repairs to historic buildings* need only comply with Chapter 12.

401.1.1 Partial reconstruction. Where ~~a structure sustains substantial structural damage from fire, earthquake, storm or a similar event has rendered one or more stories of a building, structure or portion thereof as unsafe~~, reconstruction of such areas shall meet the requirements for a Level 2 or 3 alteration, as applicable.

401.1.2 Complete reconstruction. Where ~~damage from fire, earthquake, storm or similar event disaster has demolished the building~~ a structure is destroyed, or a portion of a building or structure from the foundation to the roof, reconstruction of such areas shall be in accordance with the International Building Code or the International Residential Code.

Commenter's Reason: The purpose of this public comment is to address the committee's concerns that more clarification was needed. New Section 401.1.1 requires that partial reconstruction also meet the requirements of a Level 2 alteration when substantial structural damage has occurred and the scope of reconstruction is consistent with the Section 603 description of Alteration – Level 2. Likewise, new Section 401.1.1 requires that partial reconstruction also meet the requirements of a Level 3 alteration when substantial structural damage has occurred and the scope of reconstruction is consistent with the Section 604 description of Alteration - Level 3. New Section 401.1.2 requires that complete reconstruction from the foundation up meet the requirements of the International Building Code or International Residential code when substantial structural damage has occurred

While Chapter 4 of the IEBC does has triggers for upgrading a building's structural system to current code based on the source and degree of damage, it is still possible under Chapter 4 for significant reconstruction to occur without upgrades to egress, fire protection, or MEP systems. By requiring that partial reconstruction also meet the requirements of a Level 2 alteration per Section 603 or Level 3 alteration per Section 604 based on the total scope and area of reconstruction, a more clear line can be drawn between when the reconstruction need only maintain the level of fire protection, egress, etc. that existed in the building at the time the damage occurred, versus when a sufficient portion of the building has been damaged that those portions should be reconstructed as a new building. Note based on the requirements of Level 2 and 3 alterations this may require upgrading building systems outside of the damaged area. The BCAC did revise the language of Section 401.1.1 to refer specifically to "significant structural damage", which is a defined term in the IEBC.

Section 401.1.2 has been revised to clarify the language and better draw the dividing line between a repair that need only maintain the existing level of protection and structural performance and a reconstruction that needs to meet the requirements of a new building. The BCAC determined the word "destroyed" was better than "demolished". A reference to the IRC is added for code users who opt to (or are required to by the jurisdiction) use the IEBC to direct existing work in an otherwise IRC-scope dwelling rather than deferring entirely to the IRC.

The BCAC also removed the laundry list of events that could cause damage to a building. This is consistent with a variety of IEBC definitions related to repair or to types of damage (e.g. substantial damage) that imply damage can be from any type of event that is no fault of the owner (i.e. not poor maintenance).

The defined terms are as follows:

[A] REPAIR. The reconstruction, replacement or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.

[BS] SUBSTANTIAL STRUCTURAL DAMAGE. A condition where any of the following apply:

1. The vertical elements of the lateral force-resisting system have suffered damage such that the lateral load carrying capacity of any story in any horizontal direction has been reduced by more than 33 percent from its predamage condition.
2. The capacity of any vertical component carrying gravity load, or any group of such components, that has a tributary area more than 30 percent of the total area of the structure's floor(s) and roof(s) has been reduced more than 20 percent from its predamage condition, and the remaining capacity of such affected elements, with respect to all dead and live loads, is less than 75 percent of that required by the International Building Code for new buildings of similar structure, purpose and location.
3. The capacity of any structural component carrying snow load, or any group of such components, that supports more than 30 percent of the roof area of similar construction has been reduced more than 20 percent from its predamage condition, and the remaining capacity with respect to dead, live and snow loads is less than 75 percent of that required by the International Building Code for new buildings of similar structure, purpose and location.

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open

meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

By drawing a brighter line between when one can reconstruct to a pre-damage condition versus reconstructing as a new building, some buildings that may have been allowed to treat extensive reconstruction as a repair will now need to have egress, fire protection, or MEP systems upgraded as well as any triggered structural upgrades. The cost of the reconstruction would increase where the cost of compliance with new code provisions has increased. The benefit is an increase in safety and gain in community resilience as more of the existing building stock is upgrade.

Public Comment# 1176

EB47-19

IEBC®: 406.1.4 (New), 802.3 (New), 805.4.1.2 (New), 1301.6.4 (New), 1301.6.21 (New), 1301.6.21.1 (New), TABLE 1301.6.21.1 (New), 1301.6.21.1.1 (New), 1301.6.21.2 (New), TABLE 1301.6.21.2 (New), 1301.6.21.2.1 (New), 1301.6.21.3 (New), TABLE 1301.6.21.3 (New), 1301.6.21.3.1 (New), 1301.7 (New), TABLE 1301.7

Proposed Change as Submitted

Proponents: John Williams, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Existing Building Code

Revise as follows:

406.1.4 Group I-2 receptacles. Receptacles in ~~patient-care recipient~~ bed locations of Group I-2 that are not “hospital grade” shall be replaced with “hospital grade” receptacles, as required by NFPA 99 and Article 517 of NFPA 70.

802.3 Smoke compartments. In Group I-2 occupancies where the *work area* is on a story used for sleeping rooms for more than 30 ~~patients-care recipients~~, the story shall be divided into not less than two compartments by smoke barrier walls in accordance with Section 407.5 of the International Building Code as required for new construction.

805.4.1.2 Group I-2. In buildings of Group I-2 occupancy, any ~~patient-care recipient~~ sleeping room or suite of ~~patient-care recipient~~ rooms greater than 1,000 square feet (93 m²) within the *work area* shall have not fewer than two egress doorways.

1301.6.4 Tenant and dwelling unit separations. Evaluate the fire-resistance rating of floors and walls separating tenants, including dwelling units, and not evaluated under Sections 1301.6.3 and 1301.6.5. Group I-2 occupancies shall evaluate the rating of the separations between ~~patient-care recipient~~ sleeping rooms.

Under the categories and occupancies in Table 1301.6.4, determine the appropriate value and enter that value in Table 1301.7 under Safety Parameter 1301.6.4, Tenant and Dwelling Unit Separation, for fire safety, means of egress, and general safety.

1301.6.21 ~~Patient-Care recipient~~ ability, concentration, smoke compartment location and ratio to attendant. In I-2 occupancies, the ability of ~~patients-care recipients~~, their concentration and ratio to attendants shall be evaluated and applied in accordance with this section. Evaluate each smoke compartment using the categories in Sections 1301.6.21.1, 1301.6.21.2 and 1301.6.21.3 and enter the value in Table 1301.7. To determine the safety factor, multiply the three values together; if the sum is 9 or greater, compliance has failed.

1301.6.21.1 ~~Patient-Care recipient~~ ability for self-preservation. Evaluate the ability of the ~~patients-care recipients~~ for self-preservation in each smoke compartment in an emergency. Under the categories and occupancies in Table 1301.6.21.1, determine the appropriate value and enter that value in Table 1301.7 under Safety Parameter 1301.6.21.1, ~~Patient-Care recipient~~ Ability for Self-preservation, for means of egress and general safety.

TABLE 1301.6.21.1
PATIENT-CARE RECIPIENT ABILITY VALUES

OCCUPANCY	CATEGORIES		
	a	b	c

1301.6.21.1.1 Categories. The categories for patient-care recipient ability for self-preservation are:

1. Category a—(mobile) Patients-Care recipients are capable of self-preservation without assistance.
2. Category b—(not mobile) Patients-Care recipients rely on assistance for evacuation or relocation.
3. Category c—(not movable) Patients-Care recipients cannot be evacuated or relocated.

1301.6.21.2 Patient-Care recipient concentration. Evaluate the concentration of patients in each smoke compartment under Section 1301.6.21.2. Under the categories and occupancies in Table 1301.6.21.2 determine the appropriate value and enter that value in Table 1301.7 under Safety Parameter 1301.6.21.2, Patient-Care Recipient Concentration, for means of egress and general safety.

TABLE 1301.6.21.2
PATIENT-CARE RECIPIENT CONCENTRATION VALUES

OCCUPANCY	CATEGORIES		
	a	b	c
I-2	1	2	3

1301.6.21.2.1 Categories: The categories for ~~patient-care recipient~~ concentration are:

1. Category a—smoke compartment has 1 to 10 ~~patients-care recipients~~.
2. Category b—smoke compartment has more than 10 to 40 ~~patients-care recipients~~.
3. Category c—smoke compartment has more than 40 ~~patients-care recipients~~.

1301.6.21.3 ~~Attendant-to-patient~~ Attendant-to-care recipient ratio. Evaluate the ~~attendant-to-patient~~ attendant-to-care recipient ratio for each compartment under Section 1301.6.21.3. Under the categories and occupancies in Table 1301.6.21.3 determine the appropriate value and enter that value in Table 1301.7 under Safety Parameter 1301.6.21.3, ~~Attendant-to-patient~~ Attendant-to-care recipient Ratio, for means of egress and general safety.

TABLE 1301.6.21.3
~~ATTENDANT-TO-PATIENT~~ ATTENDANT-TO-CARE RECIPIENT RATIO VALUES

OCCUPANCY	CATEGORIES		
	a	b	c
I-2	1	2	3

1301.6.21.3.1 Categories. The categories for attendant-to-patient concentrations are:

1. Category ~~a—attendant-to-patient~~ a—attendant-to-care recipient concentration is 1:5.
2. Category ~~b—attendant-to-patient~~ b—attendant-to-care recipient concentration is 1:6 to 1:10.
3. Category ~~c—attendant-to-patient~~ c—attendant-to-care recipient concentration is greater than 1:10 or no patients.

1301.7 Building score. After determining the appropriate data from Section 1301.6, enter those data in Table 1301.7 and total the building score.

Building score—total value			

***No applicable value to be inserted.

a. Only applicable to Group I-2 occupancies.

Reason:

The purpose of this proposal is to coordinate the terminology for healthcare in the IBC and IFC with the IEBC. Care recipient is more appropriate when speaking about the persons receiving care in nursing homes and hospitals.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 and 2018 the CHC held 4 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes*. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is editorial.

EB47-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

1301.6.21.2 Care recipient concentration. Evaluate the concentration of ~~patients—care recipients~~ in each smoke compartment under Section 1301.6.21.2. Under the categories and occupancies in Table 1301.6.21.2 determine the appropriate value and enter that value in Table 1301.7 under Safety Parameter 1301.6.21.2, Care Recipient Concentration, for means of egress and general safety.

1301.6.21.3.1 Categories. The categories for attendant-to-~~patient—care recipient~~ concentrations are:

1. Category a—attendant-to-care recipient concentration is 1:5.
2. Category b—attendant-to-care recipient concentration is 1:6 to 1:10.
3. Category c—attendant-to-care recipient concentration is greater than 1:10 or no ~~patients—care recipients~~.

Committee Reason: This proposal simply updates to the correct term “care recipients” from “patient.” The modification simply addresses a couple locations in Chapter 13 where this revision was missed. (Vote: 13-0)

Assembly Action:

None

EB47-19

Individual Consideration Agenda

Public Comment 1:

IEBC®: 1301.6.21.3, TABLE 1301.6.21.3, 1301.6.21.3.1 (New)

Proponents:

John Williams, representing Healthcare Committee (ahc@iccsafe.org)

requests As Modified by Public Comment

Further modify as follows:**2018 International Existing Building Code**

1301.6.21.3 Attendant-to-patient ratio. Evaluate the attendant-to-patient ratio for each compartment under Section 1301.6.21.3. Under the categories and occupancies in Table 1301.6.21.3 determine the appropriate value and enter that value in Table 1301.7 under Safety Parameter 1301.6.21.3, Attendant-to-patient Ratio, for means of egress and general safety.

**TABLE 1301.6.21.3
ATTENDANT-TO-PATIENT RATIO VALUES**

OCCUPANCY	CATEGORIES		
	a	b	c
I-2	1	2	3

1301.6.21.3.1 Categories. The categories for attendant-to-care recipient concentrations are:

1. Category a - attendant-to-care recipient concentration is 1:5 or no care recipients.
2. Category b - attendant-to-care recipient concentration is 1:6 to 1:10.
3. Category c - attendant-to-care recipient concentration is greater than 1:10 ~~or no care recipients~~.

Commenter's Reason: This is not attended as a technical change. This is intended as a clarification for the categories for attendant-to-care recipient concentrations area. There is no circumstance where a patient will be left unattended in an area of care at any facility.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is a rating system, not a construction requirement.

Public Comment# 1211

EB50-19

IEBC®: SECTION 502 (New), 502.1 (New), 502.2 (New), SECTION 602 (New), 602.1 (New), 602.2 (New), 1301.2.5 (New)

Proposed Change as Submitted

Proponents: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Existing Building Code

Add new text as follows:

SECTION 502 **Repairs**

502.1 Scope. Repairs, as defined by Chapter 2, include the patching or restoration or replacement of damaged materials, elements, equipment or fixtures for the purpose of maintaining such components in good or sound condition with respect to existing loads or performance requirements.

502.2 Application. Repairs shall comply with the provisions of Chapter 4.

SECTION 602 **Repairs**

602.1 Scope. Repairs, as defined by Chapter 2, include the patching or restoration or replacement of damaged materials, elements, equipment or fixtures for the purpose of maintaining such components in good or sound condition with respect to existing loads or performance requirements.

602.2 Application. Repairs shall comply with the provisions of Chapter 4.

1301.2.5 Repairs. Repairs shall comply with the provisions of Chapter 4.

Reason: With the 2018 IEBC providing a stand alone chapter specific to repairs, some of the pointers that previously existed appear to have been lost. This code change is providing pointers for all three compliance methods to Chapter 4 for how repairs are to be provided.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
There is no cost impact with this code change as it is only adding text for clarification purposes.

EB50-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved as the language in chapters 3 and 4 was clear as to how repairs are addressed. Pointers were not felt to be necessary within the prescriptive and work area method. (Vote: 13-0)

Assembly Action:

None

EB50-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

requests As Submitted

Commenter's Reason: With the 2018 IEBC providing a stand alone chapter specific to repairs, some of the pointers that previously existed appear to have been lost. This code change is providing pointers for all three compliance methods to Chapter 4 for how repairs are to be provided.

The committee felt the pointers were not necessary as the language in Chapters 3 and 4 was clear on how to address repairs. I disagree, I believe the pointers are necessary to remind the user that repairs do stand on their own merit and have provisions associated with them. Each method should have a pointer indicating how repairs are to be addressed.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. There is no cost impact with this code change as it is only adding text for clarification purposes.

Staff Analysis: Note that Code Change Proposals and associated public comments to EB6-19, EB7-19 and EB50-19 take differing approaches as to how repairs should be addressed in the IEBC. The voting membership should consider the differences and make their intentions clear..

Public Comment# 1600

Proposed Change as Submitted

Proponents: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Revise as follows:

[BS] 503.4 Existing structural elements carrying lateral load. Except as permitted by Section 503.13, where the *alteration* increases design lateral loads, results in a prohibited structural irregularity as defined in ASCE 7, or decreases the capacity of any existing lateral load-carrying structural element, the structure of the altered building or structure shall meet the requirements of Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted.

Exception:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *alteration* considered is not more than 10 percent greater than its demand-capacity ratio with the *alteration* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of *additions* and *alterations* since original construction.
2. Buildings in which the increase in the demand capacity ratio is due entirely to the addition of roof top supported mechanical equipment individually having an operating weight less than 400 lb and when the total additional weight of all roof top equipment placed after initial construction of the building is less than 10% of the roof design dead load. For purposes of this exception roof shall mean the roof level above a particular story.
3. Replacement of rooftop mechanical equipment where the new equipment has an operating weight equal to or less than the existing equipment to be replaced.

Reason: Building owners and tenants frequently add or replace roof top mechanical equipment as a part of interior tenant improvement work. Most projects only consider the gravity load effects and ignore contributions to roof dead load and as a result increases to the seismic weight that needs to be resisted by the seismic force resisting system. Additionally, engineers performing the structural design for new buildings determine the total accumulated operating weight of roof top equipment and divide the load by the area of the roof and add the weight in psf to the seismic dead weight. As a consequence, new building designs do not account for localized impacts of roof top equipment. This code change merely codifies current practice. ASCE 7 does not require that anchorage and bracing be determined for supported equipment having a weight of 400 lb or less. Most building departments I polled and review staff indicated that the vast majority of engineers focus merely on support and anchorage and typically do so after the first review cycle since only mechanical plans are provided.

Cost Impact: The code change proposal will decrease the cost of construction

The proposal seeks to limit the need for structural analysis of the lateral force resisting system, and to limit the need for a structural upgrade due to the possible increase in seismic forces and thus the demand capacity ratio, to cases where there is a need to add significantly heavy equipment such as a building maintenance equipment (BMU) to wash and replace windows on a high rise or heavy cooling towers. Currently there is not consistency of enforcement where engineers make a judgement call to not verify compliance and often times the building official only reviews support and anchorage for example on a wood retail building or a concrete tilt-up building.

EB54-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

[BS] 503.4 Existing structural elements carrying lateral load. Except as permitted by Section 503.13, where the *alteration* increases design lateral loads, results in a prohibited structural irregularity as defined in ASCE 7, or decreases the capacity of any existing lateral load-carrying structural element, the structure of the altered building or structure shall meet the requirements of Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted.

Exceptions:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *alteration* considered is not more than 10 percent greater than its demand-capacity ratio with the *alteration* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of *additions* and *alterations* since original construction.
2. Buildings in which the increase in the demand capacity ratio is due entirely to the addition of roof top supported mechanical equipment individually having an operating weight less than 400 lb and when the total additional weight of all roof top equipment placed after initial construction of the building is less than 10% of the roof design dead load. For purposes of this exception roof shall mean the roof level above a particular story.
- ~~3. Replacement of rooftop mechanical equipment where the new equipment has an operating weight equal to or less than the existing equipment to be replaced.~~

Committee Reason: This proposal limits the need to hire a structural engineer for small modifications. The floor modification simplifies the proposal and provides clarity. (Vote 13-1)

Assembly Action:**None**

EB54-19

Individual Consideration Agenda

Public Comment 1:**IEBC®: [BS] 806.3****Proponents:**

David Bonowitz, representing Self (dbonowitz@att.net)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

[BS] 806.3 Existing structural elements resisting lateral loads. Except as permitted by Section 806.4, where the *alteration* increases design lateral loads, or where the alteration results in prohibited structural irregularity as defined in ASCE 7, or where the *alteration* decreases the capacity of any existing lateral load-carrying structural element, the structure of the altered building or structure shall meet the requirements of Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted.

Exception-Exceptions:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *alteration* considered is not more than 10 percent greater than its demand-capacity ratio with the *alteration* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of *additions* and *alterations* since original construction.
2. Buildings in which the increase in the demand capacity ratio is due entirely to the addition of roof top supported mechanical equipment individually having an operating weight less than 400 lb and when the total additional weight of all roof top equipment placed after initial construction of the building is less than 10% of the roof dead load. For purposes of this exception roof shall mean the roof level above a particular story.

Commenter's Reason: This PC merely coordinates the IEBC's Prescriptive and Work Area methods, just as changes over the last two cycles have done. EB54 is already approved as modified, but it only included the Prescriptive method (Sec 503.4). For consistency, the same change should be made in the Work Area method (Sec 806.3).

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction
For the same reason as stated with proposal EB54-19, already approved as modified.

Public Comment# 1997

EB56-19

IEBC®: (New), [BS] 503.4

Proposed Change as Submitted

Proponents: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Add new definition as follows:

[BS] PHOTOVOLTAIC PANEL SYSTEM. A system that incorporates discrete photovoltaic panels, that converts solar radiation into electricity, including rack support systems.

Revise as follows:

[BS] 503.4 Existing structural elements carrying lateral load. Except as permitted by Section 503.13, where the *alteration* increases design lateral loads, results in a prohibited structural irregularity as defined in ASCE 7, or decreases the capacity of any existing lateral load-carrying structural element, the structure of the altered building or structure shall meet the requirements of Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted.

Exception:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *alteration* considered is not more than 10 percent greater than its demand-capacity ratio with the *alteration* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Sections 1609 and 1613 of the International Building Code. Reduced seismic forces shall be permitted. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of *additions* and *alterations* since original construction.
2. The installation of rooftop photovoltaic panel systems where the additional roof dead load due to the system, including ballast where applicable, does not exceed 5 psf and 10% of the dead load of the existing roof. For purposes of this exception roof shall mean the common roof above a common story.

Reason: The IEBC includes a needed exception to exempt existing buildings undergoing alterations from compliance with more current seismic requirements in IBC chapter 16. The existing exception uses demand/capacity ratios (DCR) to identify a threshold below which the alteration is not deemed to be significant enough to require an evaluation and possible upgrade of the existing lateral force resisting system. Demand equates to the load applied to the lateral force resisting system and capacity equates the strength of the lateral force resisting system to resist the lateral load. Demand can be impacted by an increase in gravity load, an alternation that redirects load to existing elements in addition to the loads they resist prior to the alteration (such as for example force transfer around and due to a large floor/roof opening). The capacity of existing lateral force resisting elements can be impacted by alterations that cut into the elements such as for example reducing the length of a shearwall. Roof top solar photovoltaic systems, and especially those with ballast, may increase the demand capacity ratio of lateral force resisting systems due to the location of the installation relative to the existing lines of resistance below the roof. For example a building that includes lateral force resisting systems at the interior of the building in addition to those at the exterior may cause an increased DCR at the interior shearwalls due additional tributary loads. As a consequence and without the proposed code change the installation of a rooftop solar system would require that a qualified engineer identify the existing lateral force resisting system (possibly without plans), determine its capacity and determine the demand and thus demonstrate that the DCR increase is not increased by more than 10%.

This requirement imposes a significant burden on buildings constructed with light framed wood construction since unlike other buildings they do not incorporate heavier concrete or steel floors and roofs or heavier concrete or masonry exterior walls. Heavier walls and roofs will allow the roof top installations to easily satisfy the DCR limit.

While unlike Section 503.3 exception 2 where 3 psf is used this code change uses 5 psf as a load threshold to allow for small-ballasted systems to benefit from proposed exception 2. There is no published data demonstrating that alterations involving the installation of rooftop solar photovoltaic caused a life-safety hazard due to a seismic event. It would be difficult to explain to a building owner that the installation of a rooftop solar system necessitates \$2,000 or more in engineering costs and possible upgrades to the lateral force resisting system. ASCE 7 as well as the IBC recognizes that solar voltaic systems are unique and allow seismic force resistance through friction and allow discounting of the roof live load under the rack-mounted assemblies. This proposed code change offers a similar and reasonable accommodation to light weight components that are hand carried on to a roof and which occupy a portion of the roof.

Cost Impact: The code change proposal will decrease the cost of construction

The proposed code change may eliminate the need to develop detailed structural plans to demonstrate the capacity of the existing lateral force resisting system as well as lateral force resisting system upgrades.

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: The committee felt no need for this proposal as the proposed second exception did not provide sufficient information above and beyond the current code first exception. The wording was confusing such as 'whole' or 'partial' roof area to be considered. (Vote: 14-0)

Assembly Action:**None**

EB56-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Ali Fattah, representing City of San Diego (alifattah@sbcglobal.net)

requests As Submitted

Commenter's Reason: This code change is being resubmitted for consistency with the committee recommendation for approval made in EB54 which addressed roof top mechanical equipment. Some have argued that EB56 is not necessary since solar PV is a form of roof top equipment. EB56 simply intends to not require establishing capacity to compare to demand for a demand capacity check. Demand, or the lateral load due to seismic forces can be relatively easy to determine. However capacity requires structural plans that show the lateral force resisting system. Plans may not be available or the building may be constructed of conventionally framed light frame construction with prescriptively designed wall bracing that has no capacity.

The committee was confused by testimony in EB 55 that addressed gravity load and included a 3 pdf exemption. Prior to the 2018 the IEBC did not limit the weight of roof covering replacement so my jurisdiction used 5 psf since that would be the weight of one additional layer including underlayment.

The proposed code change addresses impacts to the lateral force resisting system of the building and not the gravity loads. The anchorage and support requirements still apply and based on the limits within the proposal a structural engineer will have to verify the adequacy of the roof for gravity loads but will not have the owner incur additional design expense to establish the design/capacity ratio.

Some have argued that since the alteration is simply adding dead load then the demand capacity determination will be simple and that the Building Official should ignore the capacity portion of the requirement simply focus on the load. Actually reading the code does not lead to this conclusion.

Demand capacity ratios are an elegant way to capture the effects of alterations to the lateral force resisting system such as reducing capacity, redirecting more load to existing lateral force resisting systems or adding mass.

We request that the voting members support reconsideration of the committee's determination during the CAH and vote yes in support of the code change.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This will reduce the need to develop structural plans beyond a roof framing plan.

Proponents: John Williams, representing Healthcare Committee (AHC@iccsafe.org); Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Existing Building Code

SECTION 503 ALTERATIONS

Add new text as follows:

503.17 Group I-2. In Group I-2 occupancies, existing elements within the area undergoing alterations shall comply with Chapter 11 of the International Fire Code.

SECTION 701 GENERAL

Add new text as follows:

701.3 Group I-2. In Group I-2 occupancies, existing elements within the work area shall comply with Chapter 11 of the International Fire Code.

SECTION 702 BUILDING ELEMENTS AND MATERIALS

Add new text as follows:

702.7 Group I-2, Condition 2 location. Existing Group I-2, Condition 2 shall not be located on a floor level higher than the floor level limitation in Table 1105.3 of the International Fire Code based on the type of construction.

SECTION 703 FIRE PROTECTION

Add new text as follows:

703.2 Incidental uses in Group I-2. In Group I-2 occupancies, existing incidental use areas within the work area shall comply with Section 1105.4 of the International Fire Code.

703.3 Corridor construction in Group I-2. In Group I-2 occupancies, existing corridors, including openings, within the work area shall comply with Section 1105.5 of the International Fire Code.

703.4 Waste and linen chutes. In Group I-2 occupancies, existing waste and linen chutes shall comply with Sections 1103.4.9 of the International Fire Code.

SECTION 704 MEANS OF EGRESS

Add new text as follows:

704.2 Means of egress in Group I-2. In Group I-2 occupancies, existing means of egress within the work area shall comply with Sections 1105.1 and 1105.6 of the International Fire Code.

704.3 Group I-2 care suites. Care suites in existing Group I-2, Condition 2 occupancies shall comply with Sections 407.4.4 through 407.4.4.6.2 of the International Building Code.

Revise as follows:

SECTION 802 BUILDING ELEMENTS AND MATERIALS

Add new text as follows:

802.2.2 Group I-2 and I-3 occupancies. In Group I-2 and I-3 occupancies, interior vertical openings connecting two or more stories shall comply with Section 1103.4.1 of the International Fire Code.

Revise as follows:

802.3 Smoke compartments. In Group I-2 occupancies where the *work area* is on a story used for sleeping rooms for more than 30 patients, the story shall be divided into not less than two compartments by smoke barrier walls in accordance with Section 407.5 of the International Building Code as required for new construction. Existing smoke barriers shall comply with Section 1105.7.2 through 1105.7.6 of the International Fire Code.

Reason: The Healthcare committee worked over the last several cycles to match the federal requirements for Medicare reimbursement (K-tags) with the IFC requirements for existing buildings. While this is required for most existing hospitals, not everything is caught during survey. A cross check of these basic requirements during the review of alteration projects would be a useful mechanism to increase compliance. Where there are alterations, there is the opportunity to make sure existing elements within the work area comply. Therefore, the requirements for hospitals in IFC Chapter 11 should be referenced in the IEBC.

The scope of this committee is limited to healthcare, so this proposal does not bring in requirements for uses other than that that are addressed in the IFC Chapter 11.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 and 2018 the CHC held 4 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. These requirements are bare minimum standards for all existing buildings and would be a requirement whether a facility is performing renovations or not.

EB61-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

~~**703.4 Waste and linen chutes.** In Group I-2 occupancies, existing waste and linen chutes shall comply with Sections 1103.4.9 of the International Fire Code.~~

Committee Reason: This proposal was approved as it further aligns with federal requirements for existing healthcare facilities by referencing the specific Group I-2 requirements in Chapter 11 of the IFC. The modification removes the waste and linen chute requirements as such requirements would create confusion with the work area concept. (Vote: 13-0)

Assembly Action:

None

EB61-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Jeffrey Shapiro, International Code Consultants, representing Self (jeff.shapiro@intlcodeconsultants.com)

requests Disapprove

Commenter's Reason: ADM8-19 added the following text to IEBC Chapter 1:

"101.2.1 Application of fire code. Where work regulated by this code is also regulated by the construction requirements for existing buildings in Chapter 11 of the International Fire Code, such work shall comply with applicable requirements in both codes."

With this text providing a broad reference to IFC Chapter 11, individual pointed references spread throughout the IEBC are unnecessary, and there is an implication of "...well, if only these sections are being referenced in a specific section of the code, is compliance with the rest of IFC Chapter 11

not necessary to these applications?" It is better to let the general reference in Chapter 1 prevail and not include partial/incomplete references on specific topics elsewhere in the code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction No change to code.

Public Comment# 2031

Proposed Change as Submitted**Proponents:** Thomas Daly, HSCG, representing HSCG (Thomas.Daly@myhscg.com)**2018 International Existing Building Code****Add new text as follows:****803.4.4 Smoke Alarms replacement.** Where existing smoke alarms in sleeping units of Group I and R occupancies, requiring only a single smoke alarm without interconnection, are to be replaced, ten-year listed sealed battery powered smoke alarms shall be permitted, as an option.**Reason:**

1. The 2018 IFC requires smoke alarms in occupancies other than one and two-family dwellings to be replaced if non-functional or when they have reached 10 years of age. ICC Interpretation 01-18 issued 5.15.18 and re-affirmed 8.15.18 expanded that mandate to impact existing smoke alarms in existing buildings. That Interpretation also indicated that such replacement was deemed 'maintenance' not 'construction'.

As such, the IEBC and, in the next cycle the IPMC, are the requisite codes in which to make this change since the IFC specifies construction requirements for smoke alarms. As the IPMC was included in Group A codes, only the IEBC remains available now to amend.

1. History – 10-yr smoke alarms were first allowed in the 2002 edition of NFPA 72, see Sec. 11.6.1(3) and continue to be allowed, see the 2019 edition of NFPA 72 Sec. 29.9.1(3) and 29.9.2.

This technology gained favor among both fire officials and the public as it precluded the removal of the battery (a known factor in residential fire deaths) and avoided the periodic replacement of such batteries, typically annually, for battery only powered smoke alarms or the back-up battery in 120vac powered smoke alarms (often ignored by property owners).

Since being introduced most major smoke alarm manufacturers have provided this optional 10-yr smoke alarm technology, see for example, Kidde Model i9010, <https://www.kidde.com/home-safety/en/us/products/fire-safety/smoke-alarms/i9010/>

and First Alert Model SA340CN, <https://www.firstalertstore.com/store/products/sa340cn-tamperproof-10-year-smoke-alarm.htm>.

There have been no reported recalls of 10-yr smoke alarms based on a review of the Consumer Product Safety Commission (CPSC) website, see https://cpsc.gov/search?site=cpsc_site&output=xml_no_dtd&getfields=*&tlen=120&client=ek_drupal_01&proxystylesheet=ek_drupal_01&filter=p&query=smoke+alarm+re

As such, 10-yr smoke alarms have a proven track record of reliability.

Further, NFPA studies, see for example <https://www.nfpa.org/News-and-Research/Data-research-and-tools/Detection-and-Signaling/Smoke-Alarms-in-US-Home-Fires>,

indicate the reason for smoke alarm failures and subsequent injuries and deaths in fires are most related to the failure to replace a battery for battery only smoke alarms, the failure of the replacement back-up battery for 120vac models when power failures occur and the removal of batteries for other purposes.

The 10yr battery powered smoke alarm removes these failure mode potentials, so is more reliable and is likely to save lives.

NFPA 72 has permitted 10-yr battery only smoke alarms for more than a decade and our Work Group has been directed by the FCAC to align the I-Codes with NFPA 72 to the extent possible.

2. Cost impact - The retail price differential between a traditional smoke alarm (120vac powered with a 9vac battery backup) and 10-yr smoke alarms is about \$13 (\$35 for the former and \$22 for the latter based on retail prices at Home Depot October 2018).

Given the number of commercial occupancies involved (hotels, apartments, condominiums, dormitories, board and care facilities, assistive living facilities and time-shares) the number of smoke alarms to be replaced in the near-term (2019-2022), as the 2018 IFC is adopted state-by-state, is estimated at more than 200 million based on the ten-year age replacement obligation and in such occupancies' sleeping accommodations where only one smoke alarm is required. The cost savings to those owner/operators is thus estimated at \$2.6 billion, if 10-yr smoke alarms technology could replace traditional 120vac/9vac powered smoke alarms.

Bibliography: NFPA 72 -2019 and manufacturerers literature noted.

Cost Impact: The code change proposal will decrease the cost of construction

The proposed code change would decrease the cost of operations for occupancies utilizing single station smoke alarms.

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: The proposal was disapproved as it was felt to result in the reduction in fire safety as it allows battery only smoke alarm replacement where the current smoke alarms are already hardwired into the building. Additionally, this appears to be a subject better addressed in the IFC versus IEBC. (Vote: 13-0)

Assembly Action:**None**

EB80-19

Individual Consideration Agenda

Public Comment 1:**IEBC®: 803.4.3, 803.4.4 (New)****Proponents:**

Thomas Daly, representing HSCG (thomas.daly@myhscg.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

803.4.3 Smoke alarms. Individual sleeping units and individual dwelling units in any *work area* in Group R and I-1 occupancies shall be provided with smoke alarms in accordance with the International Fire Code .

Exception Exceptions:

1. Interconnection of smoke alarms outside of the *work area* shall not be required.
2. Where existing smoke alarms in sleeping units of Group I-1 and R occupancies requiring only a single smoke alarm without interconnection are to be replaced, ten-year listed sealed battery powered smoke alarms shall be permitted.

~~**803.4.4 Smoke Alarms replacement.** Where existing smoke alarms in sleeping units of Group I and R occupancies, requiring only a single smoke alarm without interconnection, are to be replaced, ten-year listed sealed battery powered smoke alarms shall be permitted, as an option.~~

Commenter's Reason: As stated in the floor modification (DALY 3) to place the option in an exception rather than in a sub-section.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The change would decrease the cost of operations as further explained in the original proposal.

Public Comment# 1956

Proposed Change as Submitted

Proponents: Kevin Duerr-Clark, New York State Department of State, representing New York State Department of State (kevin.duerr-clark@dos.ny.gov); John Addario, New York State Department of State - Building Standards & Codes, representing New York State Department of State (john.addario@dos.ny.gov)

2018 International Existing Building Code

Revise as follows:

803.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2. In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, *work areas* that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where both of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the International Building Code as applicable to new construction.
2. The *work area* exceeds 50 percent of the floor area.

Exception: If the building does not ~~have sufficient municipal water supply for~~ have an existing municipal water supply present at the floor of the proposed work area, with sufficient pressure and flow for the design of a fire-sprinkler system available to the floor without, and without installation of a new fire pump, ~~work-service piping, or vertical piping,~~ the *work areas* shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the International Building Code.

Reason: There is some confusion surrounding the language of the exception to this section. Some interpret that "sufficient municipal supply available to the floor" means a water main is in the ROW with adequate pressures and flow, and available to tap into with new piping to the building and work area. As supported by the ICC IEBC Interpretation No. 12-04 (see attached), it was never intended for a new water service pipe or vertical/riser pipes to be installed as a requirement for "sufficient municipal supply" to satisfy this code section. The newly proposed language makes it clear that the existing sufficient municipal supply is to exist and be available to the floor where the work area is located without the installation of new service piping, fire pump, or vertical piping.

Commentary to this code section states *"One exception to these requirements states that if the building does not have a sufficient municipal water supply for a sprinkler system at the floor where the work area is located, then sprinklers are not required; however, that same exception does require an automatic smoke detection system throughout the work area. The smoke detection coverage is required throughout all occupiable spaces other than areas already required to install smoke alarms."* While useful in understanding this code section, in many cases the Commentary is not available or enforceable. This proposal brings the stated intent of in the Commentary into the actual Code language.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This is simply a clarification of the language as already interpreted by ICC and the commentary, so no change in the construction cost is anticipated.

EB82-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved with concern that the terminology "service piping" and "vertical piping" is not consistent with NFPA 13. Note there were some on the committee of the opinion that the language proposed would provide more guidance for a common scenario to determine if sprinklers are feasible. (Vote: 8-5)

Assembly Action:

None

EB82-19

Individual Consideration Agenda

Public Comment 1:

IEBC@: 803.2.2

Proponents:

Kevin Duerr-Clark, representing NYS Department of State (kevin.duerr-clark@dos.ny.gov); Felix Zemel, representing ICC Region 6 -- North East Regional Coalition (felix@pracademicsolutions.com); Peter Zvingilas, Town of Groton and Voluntown, CT, representing Region VI (pzvingilas@voluntown.gov); Emma Gonzalez-Laders, representing New York State Department of State (emma.gonzalez-laders@dos.ny.gov); John Addario, representing New York State Department of State (john.addario@dos.ny.gov)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

803.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2. In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, *work areas* that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where both of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the International Building Code as applicable to new construction.
2. The *work area* exceeds 50 percent of the floor area.

Exception: If the building does not have an existing ~~municipal~~ water supply present at the floor of the proposed work area, with sufficient pressure and flow for the design of a sprinkler system, and without installation of a new fire pump, private fire service main, or fire sprinkler riser, ~~service piping, or vertical piping~~, the *work areas* shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the International Building Code.

Commenter's Reason: The proposal should be Approved as Modified by This Public Comment

The original proposal was based on ICC code interpretation 12-04 issued on 04-07-2005. In response to the committee's concerns, this public comment does two things:

1. It replaces the undefined terms "service piping" and "vertical piping" with terms defined in NFPA 13 ("private fire service main" and "fire sprinkler riser").
2. It removes the term "municipal" as the committee felt that the term did not accurately represent the intent of the provision, which is for the water supply to be available at the floor.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is a clarification of an existing provision

Public Comment# 1942

EB94-19

IEBC: 905.4 (New), 503.17 (New)

Proposed Change as Submitted

Proponents: Dawn Anderson, representing self (gonedawning@yahoo.com); Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing United Spinal Association (m.mazz@verizon.net)

2018 International Existing Building Code

SECTION 905 MEANS OF EGRESS

905.1 General. The means of egress shall comply with the requirements of Section 805 except as specifically required in Sections 905.2 and 905.3.

905.2 Means-of-egress lighting. Means of egress from the highest *work area* floor to the floor of exit discharge shall be provided with artificial lighting within the exit enclosure in accordance with the requirements of the International Building Code .

905.3 Exit signs. Means of egress from the highest *work area* floor to the floor of exit discharge shall be provided with exit signs in accordance with the requirements of the International Building Code .

Add new text as follows:

905.4 Two-way communications systems. In buildings with elevator service, a two way communication system shall be provided in accordance with Section 1009.8 of the International Building Code.

SECTION 503 ALTERATIONS

Add new text as follows:

503.17 Two-way communications systems. Where the work area for alterations exceeds 50 percent of the building area and the building has elevator service, a two way communication systems shall be provided in accordance with Section 1009.8 of the International Building Code.

Reason: The addition of Sections 503.7 and 905.4 would allow for a person who could not use the stairways for evacuation to at least have a way to contact emergency responders. Since this is only alteration of Level 3 or exceeds 50% of the building area, this would have minimal impact on the construction and would be a big boost for persons who needed assistance in evacuation and the fire department.

Cost Impact: The code change proposal will increase the cost of construction
A two way communication system may need to be added in older multi-story buildings that were undergoing Level 3 alterations.

EB94-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The addition of 2-way communication in existing buildings are necessary for those that are unable to take the stairways. In addition placing in larger alterations (over 50% area of the building) was a seen as a reasonable trigger for these requirements. (Vote: 13-0)

Assembly Action:

None

EB94-19

Individual Consideration Agenda

Public Comment 1:

IEBC@: SECTION 905, 905.1, 905.2, 905.3, 905.4 (New), SECTION 503, 503.17 (New)

Proponents:

John Williams, representing Healthcare Committee (ahc@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

SECTION 905 MEANS OF EGRESS

905.1 General. The means of egress shall comply with the requirements of Section 805 except as specifically required in Sections 905.2 and 905.3.

905.2 Means-of-egress lighting. Means of egress from the highest *work area* floor to the floor of exit discharge shall be provided with artificial lighting within the exit enclosure in accordance with the requirements of the International Building Code .

905.3 Exit signs. Means of egress from the highest *work area* floor to the floor of exit discharge shall be provided with exit signs in accordance with the requirements of the International Building Code .

905.4 Two-way communications systems. In buildings with elevator service, a two way communication systems shall be provided where required by ~~in accordance with~~ Section 1009.8 of the International Building Code.

SECTION 503 ALTERATIONS

503.17 Two-way communications systems. Where the work area for alterations exceeds 50 percent of the building area and the building has elevator service, a two way communication systems shall be provided where required by ~~in accordance with~~ Section 1009.8 of the International Building Code.

Commenter's Reason: There is a concern that this requirement could be read to require two way communication systems where it was not required in new construction. Currently Section 1009.8 has six exceptions for two way communication systems. This is intended to be a clarification only and does not change the intent of the original proposal.

This proposal is submitted by the ICC Ad Hoc Committee on Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April, 2011, the AHC has held 6 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx> .

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. While the original proposal would be an increase where adding two-way communication systems, the modification would clarify where adding such systems would not be required. This would be a savings both initially and from a long term operational standpoint.

Public Comment# 1207

EB95-19

IEBC: SECTION 908 (New), 908.1 (New), 1010.2 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Existing Building Code

Add new text as follows:

SECTION 908 **EMERGENCY RESPONDER RADIO COVERAGE**

908.1 Emergency responder radio coverage in existing buildings. Where existing buildings do not have an approved emergency responder radio coverage in the building based on existing coverage levels of the public safety communication systems, an approved emergency responder radio coverage system shall be installed within the building in compliance with Section 510 of the International Fire Code.

SECTION 1010 **OTHER REQUIREMENTS**

1010.1 Light and ventilation. Light and ventilation shall comply with the requirements of the International Building Code for the new occupancy.

Add new text as follows:

1010.2 Emergency responder radio coverage in existing buildings. Where an existing building undergoes a complete change of occupancy, and the building does not have an approved emergency responder radio coverage based on existing coverage levels of the public safety communication systems, an approved emergency responder radio coverage system shall be installed within the building in compliance with Section 510 of the International Fire Code. The system shall be installed within the time frame established by the code official.

Reason: For jurisdictions that do not adopt the Chapter 11 (retroactive) requirements of the IFC for Emergency Responder Radio Coverage, this proposal would add triggers to the IEBC that would require all existing buildings that undergo a Level 3 alteration or Change of Occupancy to have approved radio coverage. Providing these two triggers for Emergency Responder Radio Coverage provides a reasonable opportunity to install equipment and systems that ensure the safety of emergency responders that depend on reliable communication for their safety. We are not asking for this in a building undergoing a partial change of occupancy with a Level 1 or 2 alteration because that could be only one tenant in a very large multi-tenant building. IFC Section 510 includes all the requirements for the design and installation. Allowing for a time frame for installation in a COO is consistent with IFC Section 1103.2.

This proposal will correlate consistency between the IFC and the IEBC as it relates to the requirements for emergency responder radio coverage in existing buildings.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will increase the cost of construction
For the safety of emergency responders, a system may need to be added in some of the larger buildings.

EB95-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The provisions for emergency responder radio coverage is appropriate for existing buildings undergoing level 3 alterations or a change of occupancy classification. The requirements are also consistent with the IFC that contains retroactive provisions for radio coverage.
(Vote: 12-0)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

IEBC@: SECTION 908 (New), 908.1 (New), 1010.2 (New)

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

SECTION 908

EMERGENCY RESPONDER ~~RADIO~~ COMMUNICATION COVERAGE

908.1 Emergency responder ~~radio~~ communication coverage in existing buildings. Where existing buildings do not have an approved in building 2-way emergency responder ~~radio~~ communication coverage in the building based on existing coverage levels of the public safety communication systems, an approved in building 2-way emergency responder ~~radio~~ communication coverage system shall be installed within the building in compliance with Section 510 of the International Fire Code.

1010.2 Emergency responder ~~radio~~ communication coverage in existing buildings. Where an existing building undergoes a complete change of occupancy, and the building does not have an approved in building 2-way emergency responder ~~radio~~ communication coverage based on existing coverage levels of the public safety communication systems, an approved in building 2-way emergency responder ~~radio~~ communication coverage system shall be installed within the building in compliance with Section 510 of the International Fire Code. The system shall be installed within the time frame established by the code official.

Commenter's Reason: This revision is a coordination item with F45-18 so that there is consist terminology in the IFC and IEBC for these requirements.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-techsupport/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

The modification will not change the cost of the proposal, however, for the entire proposal, for the safety of emergency responders, a system may need to be added in some of the larger buildings.

Public Comment# 1221

Public Comment 2:

Proponents:

Jeffrey Shapiro, International Code Consultants, representing Self (jeff.shapiro@intlcodeconsultants.com)

requests Disapprove

Commenter's Reason: ADM8-19 added the following text to IEBC Chapter 1:

"101.2.1 Application of fire code. Where work regulated by this code is also regulated by the construction requirements for existing buildings in Chapter 11 of the International Fire Code, such work shall comply with applicable requirements in both codes."

With this text providing a broad reference to IFC Chapter 11, individual pointed references spread throughout the IEBC are unnecessary, and there is an implication of ..."well, if only these sections are being referenced in a specific section of the code, is compliance with the rest of IFC Chapter 11 not necessary to these applications?" It is better to let the general reference in Chapter 1 prevail and not include partial/incomplete references on specific topics elsewhere in the code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction No change to code.

Public Comment# 2034

EB103-19

IEBC@: 1011.2.1.1 (New), 1011.2.1.1.1 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Existing Building Code

Add new text as follows:

1011.2.1.1 Nonrequired automatic sprinkler systems. The code official is authorized to permit the removal of existing automatic sprinkler system where all of the following conditions exist:

1. The system is not required for new construction.
2. The system is removed in its entirety throughout the building.
3. The system was not installed as part of any special construction features, including fire-resistance-rated assemblies and smoke-resistive assemblies, conditions of occupancy, means of egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building.

1011.2.1.1.1 Approval. Plans, investigation and evaluation reports, and other data shall be submitted documenting compliance with Items 1 and 2 of Section 1011.2.1.1 for review and approval in support of a determination authorizing the removal of the automatic sprinkler system by the code official.

Reason: A change of occupancy could be to an occupancy that did not require a sprinkler system. If the system was old, outdated or needed extensive reconfiguration, costs could be high. The new Section 1011.2.1.1 allows for non required systems to be removed. To be removed the designer/building owner would have to demonstrate to the code official that the building did not need the sprinklers for occupancy, fire areas or type of construction limitations, and that none of the trade off's for items such as travel distance or corridor rating were in effect in the building. The system would have to be removed totally – including the system in the ceiling, standpipes and the connections for the fire department outside of the building.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There will be the cost of removal, but this may be less than the cost of repairing or replacing an older system.

EB103-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

1011.2.1.1 Nonrequired automatic sprinkler systems. The code official is authorized to permit the removal of existing automatic sprinkler system where all of the following conditions exist:

1. The system is not required for new construction.
2. ~~Portions of the system that are obvious to the public are removed.~~ The system is removed in its entirety throughout the building.
3. The system was not installed as part of any special construction features, including fire-resistance-rated assemblies and smoke-resistive assemblies, conditions of occupancy, means of egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building.

Committee Reason: This proposal provides a reasonable approach for the removal of non-required systems based upon a series of criteria such systems are not required by the IBC. One of the criteria was that it be removed in its entirety which was seen as excessive and the true concern is to not provide a false sense of security of such systems to occupants. Therefore, the modification clarifies that such systems only need to be removed from areas where they are visible to occupants. This addresses the intent and reduces the costs. It should be noted that there was some concern with the concept of the removal of working systems even though they are not required. It was suggested that feedback should be obtained from the fire service on this issue. (Vote: 9-4)

Individual Consideration Agenda

Public Comment 1:

Proponents:

Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

requests Disapprove

Commenter's Reason: The proposed 1011.2.1.1.1 only requires an evaluation report or an investigation to remove the non-required sprinkler system if sprinklers are not required for new construction and if the public portions of the systems are removed. It doesnt include #3 of 1011.2.1.1. The committee did not contemplate many buildings are sprinklered because of fire flow, setback, grade, appeals, wildland urban interface, etc and are done without being specific to the occupancy of the building.

Removing the sprinkler system solely on a change to another occupancy could negate an agreement made long ago between the owner and another enforcing agency of the jurisdiction, i.e. fire department, water department, etc.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Public Comment# 2037

EB104-19

IEBC®: 1011.7.2 (New), 1011.7.4 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Existing Building Code

Revise as follows:

1011.7.2 Stairways. Where a change of occupancy classification is made to a higher-hazard category as shown in Table 1011.4, interior stairways shall be enclosed as required by the International Building Code .

Exceptions:

1. In other than Group I occupancies, an enclosure shall not be required for openings serving only one adjacent floor and that are not connected with corridors or stairways serving other floors.
2. Unenclosed existing stairways need not be enclosed in a continuous vertical shaft if each story is separated from other stories by 1-hour fire-resistance-rated construction or *approved* wired glass set in steel frames and all exit corridors are sprinklered. The openings between the corridor and the occupant space shall have not fewer than one sprinkler head above the openings on the tenant side. The sprinkler system shall be permitted to be supplied from the domestic water-supply systems, provided that the system is of adequate pressure, capacity, and sizing for the combined domestic and sprinkler requirements.
3. ~~Existing penetrations of stairway enclosures shall be accepted if they are protected in accordance with the International Building Code~~
Stairways enclosed in compliance with the applicable provisions of Section 903.1.

1011.7.4 Openings. Openings into existing vertical shaft enclosures shall be protected by fire assemblies having a fire protection rating of not less than 1 hour and shall be maintained self-closing or shall be automatic-closing by actuation of a smoke detector. Other openings shall be fire protected in an *approved* manner. Existing fusible linktype automatic door-closing devices shall be permitted in all shafts except stairways if the fusible link rating does not exceed 135° F (57° C).

Exception: Existing penetrations of stairway enclosures shall be accepted if they are protected in accordance with the International Building Code.

Reason: This is an editorial correction. Without this exception, the means of egress allowance to use the provisions of Section 903.1 (and 802.2) would not be applicable in change of occupancy classification with alterations projects. This will make the requirements consistent and provide a pointer to 903.1. The exception related to openings (1011.7.2 Exception 3) is moved to Section 1011.7.4 since that deals with openings into exiting vertical shafts.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The proposal is an editorial correction and may reduce potential costs by providing design options.

EB104-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved with concern that it will remove a necessary exception. The proposal makes inadvertent technical changes. The intent is understood but further work is necessary to provide the clarity intended by the revisions. (Vote: 13-0)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

1011.7.2 Stairways. Where a change of occupancy classification is made to a higher-hazard category as shown in Table 1011.4, interior stairways shall be enclosed as required by ~~the International Building Code~~ Section 903.1.

Exceptions:

1. In other than Group I occupancies, an enclosure shall not be required for openings serving only one adjacent floor and that are not connected with corridors or stairways serving other floors.
2. Unenclosed existing stairways need not be enclosed in a continuous vertical shaft if each story is separated from other stories by 1-hour fire-resistance-rated construction or *approved* wired glass set in steel frames and all exit corridors are sprinklered. The openings between the corridor and the occupant space shall have not fewer than one sprinkler head above the openings on the tenant side. The sprinkler system shall be permitted to be supplied from the domestic water-supply systems, provided that the system is of adequate pressure, capacity, and sizing for the combined domestic and sprinkler requirements.
3. Existing penetrations of stairway enclosures shall be accepted if they are protected in accordance with the International Building Code.
~~Stairways enclosed in compliance with the applicable provisions of Section 903.1.~~

1011.7.4 Openings. Openings into existing vertical shaft enclosures shall be protected by fire assemblies having a fire protection rating of not less than 1 hour and shall be maintained self-closing or shall be automatic-closing by actuation of a smoke detector. Other openings shall be fire protected in an *approved* manner. Existing fusible linktype automatic door-closing devices shall be permitted in all shafts except stairways if the fusible link rating does not exceed 135° F (57° C).

~~**Exception:** Existing penetrations of stairway enclosures shall be accepted if they are protected in accordance with the International Building Code.~~

Commenter's Reason: This public comment addressed issues brought up during the testimony and the reason for the committee disapproval. The modification would allow for the stairways to comply with the provisions in the IEBC instead of requiring compliance with the IBC. Leaving Exception 3 as it was before would allow for items such as standpipes in stairways to meet IBC penetration requirements. The ultimate goal was to allow for existing stairways to meet the same requirements for new tenants if that new tenant is the same use or not. This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Stairways in a COO would be allowed to use the exit stairway requirements currently allowed for Level 2 and 3 alterations, which can be less than new IBC requirements.

Public Comment# 1177

EB111-19

IEBC®: 1203.3 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Existing Building Code

Revise as follows:

1203.3 Means of egress. ~~Existing door openings and corridor and stairway widths less than those specified elsewhere in this code may be approved, provided that, Where, in the opinion of the code official, there is sufficient width and height for a person to pass through the opening or traverse the means of egress, existing door openings and corridor and stairway widths not required to meet the widths required by the International Building Code or this code. Where approved by the code official, the front or main exit doors need not swing in the direction of the path of exit travel, provided that other approved means of egress having sufficient capacity to serve the total occupant load are provided.~~

Reason: This addresses non mandatory language and also addresses the fact that this is likely intending to refer also to the IBC. This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is editorial.

EB111-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was intended to be editorial but there appeared to be some incomplete language in the proposal that needs to be addressed during public comment. (Vote: 12-1)

Assembly Action:

None

EB111-19

Individual Consideration Agenda

Public Comment 1:

IEBC®: 1203.3 (New)

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

1203.3 Means of egress. Where, in the opinion of the code official, there is sufficient width and height for a person to pass through the opening or traverse the means of egress, existing door openings and corridor and stairway widths are not required to meet the widths required by the International Building Code or this code. Where *approved* by the *code official*, the front or main exit doors need not swing in the direction of the path of exit travel, provided that other *approved* means of egress having sufficient capacity to serve the total occupant load are provided.

Commenter's Reason: There was a small modification needed to correct the grammar in the proposal. The intent remains the same as stated in the original reason.

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This modification is an editorial correction.

Public Comment# 1178

EB133-19

IEBC®: (New), 1402.8 (New)

Proposed Change as Submitted

Proponents: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

2018 International Existing Building Code

Add new definition as follows:

WILDLAND-URBAN INTERFACE AREA. That geographical area where structures and other human development meets or intermingles with wildland or vegetative fuels.

Add new text as follows:

1402.8 Wildland-Urban Interface Areas. If moved into a *wildland-urban interface area*, buildings shall comply with the *International Wildland-Urban Interface Code* as applicable.

Exception: Buildings previously located in a *wildland-urban interface area* or moved within a *wildland-urban interface area*.

Reason: The wildland-urban interface code provides additional building standards for buildings subjected to fire hazards within a *wildland-urban interface area* and as a result are subject the increased fire risk when relocated into such an area. The Scope of Section 101.2 of the IWUIC includes moved buildings. This code change merely correlates the two codes. The alterations Sections are not proposed to be amended nor is an exception being added for historical buildings to allow local jurisdictions to determine whether to exempt their historical resources or exterior building alterations from compliance. It makes no sense that if a building is moved to a vacant lot that a site built adjacent building is required to satisfy WUI regulations but not the relocated building.

Cost Impact: The code change proposal will increase the cost of construction

By moving a building into a wui area the exterior roof, walls and openings may require upgrading. However the cost of the enhanced protection will provide a community benefit since in the WUI it is not unusual for conflagration hazards to occur when non compliant buildings burn and expose compliant buildings to hazards that they were not quite designed for since exterior fire fighting suppression may not be available to control the non-compliant building.

EB133-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved with concern that it may not be the correct location for such provisions. Another concern was how the exception would be applied as the IWUIC not only includes construction requirements but also addresses the need for clear space. (Vote: 13-0)

Assembly Action:

None

EB133-19

Individual Consideration Agenda

Public Comment 1:

IEBC®: (New), 1402.8 (New)

Proponents:

Ali Fattah, representing City of San Diego (alifattah@sbcglobal.net)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

WILDLAND-URBAN INTERFACE AREA. That geographical area where structures and other human development meets or intermingles with wildland or vegetative fuels.

1402.8 Wildland-Urban Interface Areas. If moved into a *wildland-urban interface area*, buildings shall comply with the *International Wildland-Urban Interface Code* as applicable.

~~**Exception:** Buildings previously located in a *wildland-urban interface area* or moved within a *wildland-urban interface area*.~~

Commenter's Reason: The proposed code change is intended to correlate the IEBC with the IUWIC. During the CAH there was support for the proposal from some commenters and some members of the committee however they found that the exception to be confusing. It was intended to recognize that the moved building when moved within the WUI Area is not experiencing more fire risk since when it was first constructed. However, the building may have been constructed prior to WUI building standards. As such the exception is proposed to be deleted as a part of this public comment.

Commenter at the CAH confused a moved building with a relocatable building. A moved building is an existing site-built building that is raised in whole and in part and put on a truck and moved. It's original design and construction did not envision moving it. A relocated building is a building that is designed be transported and factory-built homes are a form of a relocated building and not a moved building. The proposal only applies to moved buildings and not relocated buildings such as mobile homes or manufactured homes.

Interestingly both the IEBC and the IRC address within their scope moved buildings so this code change will not require jurisdictions to adopt the International Wildland Urban Interface Code. The committee reason statement states that this requirement is added in an incorrect location, however IEBC Chapter 14 is for moved buildings and i the IRC includes in the scope Section R101.2 movement of a building. Moved buildings are required to comply with new conditions at the site to which they are to be moved to such as flood, wind, soil and wildfire hazards are another environmental hazard that are not addressed. The proposal merely points back to the WUI code that does regulate the hazard when a building is moved if the WUI code is adopted. We request the voting members support for approval as modified with public comment. We require 2/3 of the governmental voting members for this proposal to pass final action.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction
The increased cost of construction may be due to the need to replace windows or to change/modify exterior cladding and vent openings.

Public Comment# 1314

EB145-19

IEBC®: [BS] A205.4, A205.5 (New), A205.6 (New)

Proposed Change as Submitted

Proponents: David Bonowitz, representing Self (dbonowitz@att.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Revise as follows:

[BS] A205.4 Structural ~~observation, testing and inspection~~, observation. Structural observation ~~in accordance with Section 1709-1704.6 of the International Building Code, shall be required for all structures in which seismic retrofit is being performed in accordance with this chapter. is required, regardless of seismic design category, height, or other conditions.~~ Structural observation shall include visual observation of work for conformance to the *approved* construction documents and confirmation of existing conditions assumed during design.

~~Structural testing and inspection for new construction materials shall be in accordance with the building code, except as modified by this chapter.~~

Add new text as follows:

A205.5 Contractor responsibility. Contractor responsibility shall be in accordance with Section 1704.4 of the International Building Code.

A205.6 Testing and Inspection. Structural testing and inspection for new construction materials, submittals, reports, and certificates of compliance, shall be in accordance with Sections 1704 and 1705 of the International Building Code. Work done to comply with this chapter shall not be eligible for Exception 1 to International Building Code Section 1704.2, Exception 2 to International Building Code Section 1705.12, or the Exception to International Building Code Section 1705.12.2.

Reason: This proposal corrects a code reference and clarifies that typical quality assurance provisions from IBC Chapter 17 apply to Chapter A2 projects.

A205.4: For clarity, the current provision is broken into three subsections. Regarding structural observation, the proposal corrects a mistaken IBC section number and clarifies that the requirement applies despite IBC waivers for buildings of certain heights or assigned to certain seismic design categories.

A205.5: Regarding the contractor statement of responsibility, the proposed new section confirms that IBC section 1704.4 applies.

A205.6: Regarding testing and inspection, proposed Section A205.6 clarifies the existing reference to “the building code” and disallows certain exemptions in IBC Chapter 17 that apply to new construction of a minor nature but should not apply to Chapter A2 retrofits.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The proposal merely clarifies existing requirements. In rare cases, the cost of testing and inspection might increase slightly.

EB145-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal corrects section numbering, clarifies testing and inspection requirements and special inspections regardless of project size. (Vote: 12-2)

Assembly Action:

None

EB145-19

Individual Consideration Agenda

Public Comment 1:

IEBC®: [BS] A205.4, 205.5 (New), A205.5 (New)

Proponents:

Jonathan Siu, representing City of Seattle Department of Construction and Inspections (jon.siu@seattle.gov)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

[BS] A205.4 Structural observation. Structural observation in accordance with Section 1704.6 of the International Building Code is required, regardless of seismic design category, height, or other conditions. Structural observation shall include visual observation of work for conformance to the *approved* construction documents and confirmation of existing conditions assumed during design.

~~**A205.5 Contractor responsibility.** Contractor responsibility shall be in accordance with Section 1704.4 of the International Building Code.~~

A205.6 A205.5 Testing and Inspection Structural testing and inspection for new construction materials, submittals, reports, and certificates of compliance, shall be in accordance with Sections 1704 and 1705 of the International Building Code. Work done to comply with this chapter shall not be eligible for Exception 1 to International Building Code Section 1704.2, Exception 2 to International Building Code Section 1705.12, or the Exception to International Building Code Section 1705.12.2.

Commenter's Reason: This public comment does not change any technical requirements of the code or the proposal--it merely removes unnecessary language contained in the original proposal. The proponent's reason statement says, "...the proposed section confirms that IBC section 1704.4 applies." Taken to its logical conclusion, the reason statement implies if a required section is not cross-referenced, it does not apply--a concept with which we disagree. The proponent has argued in other code change proposals that the rest of the code still applies, so redundant language or cross references aren't necessary--we heartily agree with this concept.

It is unclear to us why this particular reminder is necessary, versus the many other important requirements in IBC Chapter 17. Why not confirm special inspections are required in addition to the normal inspections in Section 110 (IBC 1704.2)? Or confirm that the special inspectors have to be competent and have relevant training and experience (IBC 1704.2.1)? Or confirm any of the reporting requirements that are the responsibility of the design professional or the special inspector (IBC 1704.2.3, 1704.3 and 1704.5)? The proponent did not indicate in either the reason statement or in testimony that this is something that is commonly missed, which would be a reasonable rationale for having cross references.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This public comment does not change technical requirements of the code or the proposal. Given the original proposal had a neutral or minimal cost impact, this public comment will not change that.

Public Comment# 1433

Public Comment 2:

IEBC®: A205.6 (New)

Proponents:

Jonathan Siu, representing City of Seattle Department of Construction and Inspections (jon.siu@seattle.gov)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

A205.6 Testing and Inspection Structural testing and inspection for new construction materials, submittals, reports, and certificates of compliance, shall be in accordance with Sections 1704 and 1705 of the International Building Code. Work done to comply with this chapter shall not be eligible for Exception 1 to International Building Code Section 1704.2, or Exception 2 to International Building Code Section 1705.12, ~~or the Exception to International Building Code Section 1705.12.2.~~

Commenter's Reason: This public comment restores an exception to special inspections for lightly-loaded wood diaphragms that was removed in the original proposal.

The proposal requires special inspections be provided as required in IBC Chapter 17, but then says three exceptions contained in Chapter 17 cannot be used--they aren't available as an option for this type of retrofit. We do not take issue with the two of the exceptions to the Chapter 17 exceptions relating to minor work (IBC 1704.2, Exception 1) or shorter concrete or masonry buildings (IBC 1704.12, Exception 2). However, we do not agree with the need for special inspections of wood shear walls and diaphragms with nail spacing greater than 4 inches (IBC 1705.12.2, Exception).

The concept behind the exception in IBC 1704.12.2 is where the element isn't heavily loaded, special inspection is not required--the hazard or risk is less. If required nail spacing for shear walls and diaphragms is greater than 4 inches, the capacities are lower than the capacities if the nail spacing is 4 inches or less. This is true whether the building is of new construction or is existing. It has been generally accepted this is an indication the wall or diaphragm is not heavily loaded. See 2015 AWC Special Design Provisions for Wind and Seismic Tables 4.2A and 4.2C for comparative nominal diaphragm values, and Tables 4.3A and 4.3B for nominal shear wall values. Because these tables have columns for 6-inch and 4-inch spacing, we're generally talking about diaphragms and shear walls nailed at 6 inches at the panel edges.

Given these diaphragms and shear walls are lightly loaded, we do not see the need to impose more stringent special inspections requirements for existing buildings than is required for new buildings of the same type of construction.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The original proposal's statement essentially says the cost impact is neutral or marginally more. This public comment will marginally decrease the cost of the proposal, but has no effect on the cost of what the code currently requires, since it doesn't change the current requirements.

Public Comment# 1436

EB147-19

IEBC®: A205.4.1 (New), [BS] A206.2

Proposed Change as Submitted

Proponents: David Bonowitz, representing Self (dbonowitz@att.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Add new text as follows:

A205.4.1 Additional special inspection. In addition to the requirements of International Building Code Section 1705.12, special inspection shall be required for:

1. Installation of continuity connectors along the length of crossties, to ensure properly sized fastener holes and adequate crosstie stiffness.

[BS] A206.2 Special requirements for wall anchorage systems. The steel elements of the wall anchorage system shall be designed in accordance with the International Building Code without the use of the 1.33 short duration allowable stress increase where using allowable stress design.

The wall anchorage system, excluding subdiaphragms and existing roof or floor framing members, shall be stiff enough to limit the relative movement between the wall and the diaphragm to no more than 1/8" before engagement of the anchors, when subject to the wall anchorage design forces.

Wall anchors shall be provided to resist out-of-plane forces, independent of existing shear anchors.

Expansion anchors are only allowed with special inspection and *approved* testing for seismic loading.

Attaching the edge of plywood sheathing to steel ledgers is not considered compliant with the positive anchoring requirements of this chapter. Attaching the edge of steel decks to steel ledgers is not considered as providing the positive anchorage of this chapter unless testing or analysis is performed to establish shear values for the attachment perpendicular to the edge of the deck. Where steel decking is used as a wall anchor system, the existing connections shall be subject to field verification and the new connections shall be subject to special inspection.

Exception: Existing cast-in-place shear anchors are allowed to be used as wall anchors if the tie element can be readily attached to the anchors, and if the engineer or architect can establish tension values for the existing anchors through the use of *approved* as-built plans or testing and through analysis showing that the bolts are capable of resisting the total shear load (including dead load) while being acted on by the maximum tension force caused by an earthquake. Criteria for analysis and testing shall be determined by the building official.

Reason: This proposal adds a stiffness requirement for the wall anchorage system. The proposed requirement is consistent with ASCE 41-17 Table 17-34. It has the same intent as a stiffness requirement discussed in the SEAOC commentary to IEBC Chapter A2 and implemented by the City of Los Angeles Department of Building and Safety. The SEAOC and Los Angeles approach limits the elongation under load. The ASCE 41 approach, which is the approach adopted here, limits the slack in the system (including continuity connectors along the length of the cross-ties) provided by the detailing and construction.

In addition to the proposed design criteria in Section A206.2, the proposal adds a special inspection requirement to Section A205.4 to ensure that additional slack is not introduced as continuity connectors are added to crossties.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Typical applications are expected to already satisfy the new stiffness requirement.

EB147-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

A205.4.1 Additional special inspection. In addition to the requirements of International Building Code Section 1705.12, special inspection shall be required for:

1. Installation of continuity connectors along the length of crossties, to ensure ~~properly sized fastener holes and adequate crosstie stiffness~~ compliance with Section A206.2. This inspection may be periodic special inspection.

[BS] A206.2 Special requirements for wall anchorage systems. The steel elements of the wall anchorage system shall be designed in accordance with the International Building Code without the use of the 1.33 short duration allowable stress increase where using allowable stress design.

The wall anchorage system, excluding subdiaphragms and existing roof or floor framing members, shall be ~~stiff enough~~ designed and installed to limit the relative movement between the wall and the diaphragm to no more than 1/8" before engagement of the anchors, ~~when subject to the wall anchorage design forces.~~

Wall anchors shall be provided to resist out-of-plane forces, independent of existing shear anchors.

Expansion anchors are only allowed with special inspection and *approved* testing for seismic loading.

Attaching the edge of plywood sheathing to steel ledgers is not considered compliant with the positive anchoring requirements of this chapter. Attaching the edge of steel decks to steel ledgers is not considered as providing the positive anchorage of this chapter unless testing or analysis is performed to establish shear values for the attachment perpendicular to the edge of the deck. Where steel decking is used as a wall anchor system, the existing connections shall be subject to field verification and the new connections shall be subject to special inspection.

Exception: Existing cast-in-place shear anchors are allowed to be used as wall anchors if the tie element can be readily attached to the anchors, and if the engineer or architect can establish tension values for the existing anchors through the use of *approved* as-built plans or testing and through analysis showing that the bolts are capable of resisting the total shear load (including dead load) while being acted on by the maximum tension force caused by an earthquake. Criteria for analysis and testing shall be determined by the building official.

Committee Reason: The proposal adds a necessary stiffness criteria to Chapter A2. The modifications remove redundant terms and commentary type language. (Vote: 14-0)

Individual Consideration Agenda

Public Comment 1:

IEBC®: A205.4.1 (New)

Proponents:

Jenifer Gilliland, representing Seattle Department of Construction and Inspections (jenifer.gilliland@seattle.gov); Jonathan Siu, representing City of Seattle Department of Construction and Inspections (jon.siu@seattle.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

A205.4.1 Additional special inspection. In addition to the requirements of International Building Code Section 1705.12, special inspection shall be required for:

Installation of continuity connectors along the length of crossties, to ensure compliance with Section A206.2. This inspection ~~may be~~ shall be permitted to be periodic special inspection.

Commenter's Reason: This is an editorial modification. "May" is not mandatory code language. Adding "shall be permitted to" will align this section with the rest of the code where this phrase is used to describe circumstances not normally allowed by the code official.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The elimination of ambiguous code language in lieu of mandatory code language will not impact the cost of construction.

EB149-19

IEBC®: [BS] A206.2, [BS] A206.3

Proposed Change as Submitted

Proponents: David Bonowitz, representing Self (dbonowitz@att.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Revise as follows:

[BS] A206.2 Special requirements for wall anchorage systems. The steel elements of the wall anchorage system shall be designed in accordance with the International Building Code without the use of the 1.33 short duration allowable stress increase where using allowable stress design.

Where new members are added as crossties, they shall be spaced no more than 24 feet (7315 mm) apart. Where existing girders are used as crossties, their actual spacing shall be deemed adequate even where the spacing exceeds 24 feet (7315 mm), as long as the girders are provided with adequate continuity connectors.

Wall anchors shall be provided to resist out-of-plane forces, independent of existing shear anchors.

Expansion anchors are only allowed with special inspection and *approved* testing for seismic loading.

Attaching the edge of plywood sheathing to steel ledgers is not considered compliant with the positive anchoring requirements of this chapter. Attaching the edge of steel decks to steel ledgers is not considered as providing the positive anchorage of this chapter unless testing or analysis is performed to establish shear values for the attachment perpendicular to the edge of the deck. Where steel decking is used as a wall anchor system, the existing connections shall be subject to field verification and the new connections shall be subject to special inspection.

Exception: Existing cast-in-place shear anchors are allowed to be used as wall anchors if the tie element can be readily attached to the anchors, and if the engineer or architect can establish tension values for the existing anchors through the use of *approved* as-built plans or testing and through analysis showing that the bolts are capable of resisting the total shear load (including dead load) while being acted on by the maximum tension force caused by an earthquake. Criteria for analysis and testing shall be determined by the building official.

[BS] A206.3 Development of anchor loads into the diaphragm. Development of anchor loads into roof and floor diaphragms shall comply with Section 1613 of the International Building Code using horizontal forces that are 75 percent of those used for new construction.

In wood diaphragms, anchorage shall not be accomplished by use of toenails or nails subject to withdrawal. Wood ledgers, top plates or framing shall not be used in cross-grain bending or cross-grain tension. The continuous ties required in Section 1613 of the International Building Code shall be in addition to the diaphragm sheathing.

Lengths of development of anchor loads in wood diaphragms shall be based on existing field nailing of the sheathing unless existing edge nailing is positively identified on the original construction plans or at the site.

~~**Exception:** If continuously tied girders are present, the maximum spacing of the continuity ties is the greater of the girder spacing or 24 feet (7315 mm).~~

Reason: This editorial proposal corrects a misplaced provision and clarifies its intent. The current exception to Section A206.3 is out of place for two reasons. First, it is unrelated to the issue of load development into the diaphragm (crossties must be continuous across the full diaphragm width), so it really belongs in Section A206.2. Second, since ASCE 7 sets no limit on the maximum spacing of crossties, the provision is not really an exception at all. Therefore, as the existing text is relocated to Section A206.2, it has been edited to clarify the intended spacing limit and the allowance where existing members act as adequate crossties.

Cost Impact: The code change proposal will not increase or decrease the cost of construction Editorial therefore will have no impact on cost.

EB149-19

Public Hearing Results

Committee Action:**As Submitted**

Committee Reason: This proposal is editorial in nature whereas it relocates, from section A206.3 to A206.2, the special requirements for wall anchorages systems where new members are added as crossties. The committee urged that during the public comment phase 'girders' be changed to 'members'.

(Vote: 14-0)

Assembly Action:**None**

EB149-19

Individual Consideration Agenda

Public Comment 1:**IEBC®: [BS] A206.2****Proponents:**

David Bonowitz, representing Self (dbonowitz@att.net)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

[BS] A206.2 Special requirements for wall anchorage systems. The steel elements of the wall anchorage system shall be designed in accordance with the International Building Code without the use of the 1.33 short duration allowable stress increase where using allowable stress design.

Where new members are added as crossties, they shall be spaced no more than 24 feet (7315 mm) apart. Where existing girders are used as crossties, their actual spacing shall be deemed adequate even where the spacing exceeds 24 feet (7315 mm), as long as the girders are provided with ~~adequate~~ continuity connectors as required.

Wall anchors shall be provided to resist out-of-plane forces, independent of existing shear anchors.

Expansion anchors are only allowed with special inspection and *approved* testing for seismic loading.

Attaching the edge of plywood sheathing to steel ledgers is not considered compliant with the positive anchoring requirements of this chapter. Attaching the edge of steel decks to steel ledgers is not considered as providing the positive anchorage of this chapter unless testing or analysis is performed to establish shear values for the attachment perpendicular to the edge of the deck. Where steel decking is used as a wall anchor system, the existing connections shall be subject to field verification and the new connections shall be subject to special inspection.

Exception: Existing cast-in-place shear anchors are allowed to be used as wall anchors if the tie element can be readily attached to the anchors, and if the engineer or architect can establish tension values for the existing anchors through the use of *approved* as-built plans or testing and through analysis showing that the bolts are capable of resisting the total shear load (including dead load) while being acted on by the maximum tension force caused by an earthquake. Criteria for analysis and testing shall be determined by the building official.

Commenter's Reason: The IBC-S committee approved EB149-19 as submitted. During testimony, however, committee members suggested that "adequate continuity connectors" could be changed to "continuity connectors as required," to make the provision more enforceable. This PC responds to that committee suggestion. (Note, the term continuity connector is now defined by proposal EB141, also approved by the committee.)

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposal and the PC are editorial.

Public Comment# 2137

Proposed Change as Submitted

Proponents: David Bonowitz, representing Self (dbonowitz@att.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Delete and substitute as follows:

~~**[BS] A403.8 Horizontal diaphragms.** The strength of an existing horizontal diaphragm sheathed with wood structural panels or diagonal sheathing need not be investigated unless the diaphragm is required to transfer lateral forces from vertical elements of the seismic force-resisting system above the diaphragm to elements below the diaphragm because of an offset in placement of the elements.~~

~~Rotational effects shall be accounted for where asymmetric wall stiffness increases shear demands.~~

[BS] A403.8 Floor diaphragms. Floor diaphragms within the scope of Section A403.2 shall be shown to have adequate strength at the following locations:

1. For straight lumber sheathed diaphragms without integral hardwood flooring: Throughout the diaphragm. The code official is authorized to waive the requirement where the condition occurs only in relatively small portions of each residential unit.
2. For other diaphragms: At locations where forces are transferred between the diaphragm and a new or strengthened vertical element of the seismic force-resisting system. Collector elements may be provided to distribute the transferred force over a greater length of diaphragm.

Exception: Where the existing vertical elements of the seismic force-resisting system are shown to comply with this chapter, diaphragms need not be evaluated.

Reason: This proposal clarifies the chapter's intent regarding the need for diaphragm strengthening. The current provision focuses on locations where the walls above and below the diaphragm are offset from each other, but this can be read improperly to mean the entire diaphragm since a lack of stacked walls in the lower story is typically what makes a building a candidate for Chapter A4. Instead, the focus should be on proper force transfer between the critical diaphragm and the new or existing wall lines below.

The proposal implements a recommendation by the Structural Engineers Association of Northern California Existing Buildings Committee that has already been adopted by retrofit programs affecting thousands of buildings in San Francisco, Berkeley, and Oakland, California.

The proposal recognizes that diaphragms are rarely the critical elements in these buildings. In many cases, the proposed requirement will require less work than the current provision. This is appropriate for the limited objective of Chapter A4.

The proposal also adds clarity by stating requirements for vulnerable diaphragm types that the current provision only implies.

Straight lumber sheathed diaphragms without integral hardwood flooring are weaker and more flexible than other diaphragm systems. Though there are no known collapses due to this condition, expected poor performance could compromise the building's ability to meet even the limited objective of Chapter A4. Integral hardwood flooring – but not newer “floating” wood flooring – provides significant added strength and stiffness. Even in buildings with original hardwood flooring, some remodeled, carpeted, or tiled areas might have had the original wood flooring removed. Areas of the diaphragm that form a roof for the critical story (such as the portion of a garage that extends beyond the wall line above, or at a lightwell or building setback) are also unlikely to have hardwood flooring to supplement the straight sheathing. Small isolated areas without hardwood flooring are not expected to affect overall building performance, so the provision grants a waiver for these cases.

For less vulnerable diaphragm types, the provision requires a local check for each new or strengthened SFRS element but does not require an overall analysis of the full diaphragm. Diaphragm capacity need not be checked at existing vertical elements that are not strengthened because (except for straight lumber sheathed diaphragms) it is assumed that the unit capacities of the existing vertical elements and the diaphragm are comparable.

The exception waives any retrofit of the diaphragms if the existing walls and frames are already found adequate.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. In some cases, it could decrease the cost of construction as it may require less work than the current provisions.

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

[BS] A403.8 Floor diaphragms. Floor diaphragms within the scope of Section A403.2 shall be shown to have adequate strength at the following locations:

1. For straight lumber sheathed diaphragms without integral hardwood flooring: Throughout the diaphragm. The code official is authorized to waive the requirement where the condition occurs only in relatively small portions of each residential unit.
2. For all other diaphragms: At locations where forces are transferred between the diaphragm and ~~a~~ each new or strengthened vertical element of the seismic force-resisting system. Collector elements ~~may~~ shall be provided where needed to distribute the transferred force over a greater length of diaphragm.

Exception: Where the existing vertical elements of the seismic force-resisting system are shown to comply with this chapter, diaphragms need not be evaluated.

Committee Reason: This proposal clarifies the chapter's intent regarding the need for diaphragm strengthening. The current provision focuses on locations where the walls above and below the diaphragm are offset from each other, but this can be read improperly to mean the entire diaphragm since a lack of stacked walls in the lower story is typically what makes a building a candidate for Chapter A4. Instead, the focus should be on proper force transfer between the critical diaphragm and the new or existing wall lines below. The proposal implements a recommendation by the Structural Engineers Association of Northern California Existing Buildings Committee that has already been adopted by retrofit programs affecting thousands of buildings in San Francisco, Berkeley, and Oakland, California. The modifications makes editorial revisions to clarify the application of the section. The committee requests a public comment to address unenforceable language such as "in relatively small portions." (Vote: 14-0)

Assembly Action:

None

EB161-19

Individual Consideration Agenda

Public Comment 1:

IEBC@: [BS] A403.8

Proponents:

David Bonowitz, representing Self (dbonowitz@att.net)

requests As Modified by Public Comment

Further modify as follows:

2018 International Existing Building Code

[BS] A403.8 Floor diaphragms. Floor diaphragms within the scope of Section A403.2 shall be shown to have adequate strength at the following locations:

1. For straight lumber sheathed diaphragms without integral hardwood flooring Throughout the diaphragm. The code official is authorized to waive the requirement where it is shown that the condition occurs in areas small enough not to affect overall building performance ~~only in relatively small portions of each residential unit.~~
2. For all other diaphragms: At locations where forces are transferred between the diaphragm and each new or strengthened vertical element of the seismic force-resisting system. Collector elements shall be provided where needed to distribute the transferred force over a greater length of diaphragm.

Exception: Where the existing vertical elements of the seismic force-resisting system are shown to comply with this chapter, diaphragms need not be evaluated.

Commenter's Reason: The IBC-S committee approved this proposal as a valuable improvement already adopted in several jurisdictions. As noted

in the committee's reason, however, members suggested revising some of the wording to make the provision more enforceable. This proposal accepts that suggestion and uses wording offered by a committee member consistent with the proposal's reason statement. By saying "where it is shown," the provision now provides a mechanism for justifying the waiver, requiring the engineer of record to provide reasoning.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. As with the original proposal, the proposal modified by public comment is intended only to clarify the current requirements but could, in some cases, actually reduce the cost of design and construction.

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Add new text as follows:

A403.10 Steel retrofit systems. Steel retrofit systems shall have strength and stiffness sufficient to resist the seismic loads and shall conform to the requirements of this section.

A403.10.1 Special moment frames. Steel special moment frames shall comply with all applicable provisions of AISC 341, except that the “strong-column/weak-beam” provision of AISC 341-10, Section E3.4a is waived for columns that carry no gravity load. Proprietary frame systems that qualify as special moment frames shall be permitted.

A403.10.2 Intermediate or ordinary moment frames. Steel intermediate or ordinary moment frames shall comply with all applicable provisions of AISC 341.

A403.10.3 Cantilevered column systems. Steel special or ordinary cantilevered column systems shall comply with all applicable provisions of AISC 341.

A403.10.4 Inverted moment frame systems. Cantilevered column systems shall be permitted to be designed as inverted special, intermediate, or ordinary moment frames, with corresponding moment frame seismic design coefficients, where the system satisfies the following conditions:

1. The columns carry no gravity load.
2. The columns are configured in pairs or larger groups connected by a continuous reinforced concrete foundation or grade beam.
3. The foundation or grade beam shall be designed to resist the expected plastic moment at the base of each column, computed as $R_y F_y Z$ in accordance with AISC 341.
4. The flexibility of the foundation or grade beam, considering cracked section properties of the reinforced concrete, shall be included in computing the deformation of the steel frame system.
5. The column height shall be taken as twice the actual height when checking lateral torsional buckling.

Add new standard(s) as follows:

341-16: Seismic Provisions for Structural Steel Buildings

Reason: This proposal adds details for structural systems commonly used in Chapter A4 retrofits. The proposal implements a recommendation by the Structural Engineers Association of Northern California Existing Buildings Committee that has already been adopted by retrofit programs affecting thousands of buildings in San Francisco, Berkeley, and Oakland, California.

The inverted moment frame (proposed Section A403.10.4) is a modification of traditional cantilevered column systems. Cantilevered column systems for new construction are normally assigned seismic design coefficients that severely limit their use. When used for retrofit of wood frame structures, however, the columns are less vulnerable to buckling failure because they carry no gravity load. SEAONC EBC has therefore recommended that these cantilever column systems, configured as upside-down moment frame bents (with concrete cross beams), should be allowed to be designed as moment frame systems.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposal merely codifies typical practices already in use and shown to be feasible.

Staff Analysis: Note that AISC 341 is new to the IEBC but is currently referenced in the IBC.

EB163-19

Public Hearing Results

Committee Modification:

A403.10.1 Special moment frames. Steel special moment frames shall comply with all applicable provisions of AISC 341, except that the "strong-column/weak-beam" provision of AISC 341-10, Section E3.4a is waived for columns that carry no gravity load. Proprietary frame systems that qualify as special moment frames shall be permitted.

Committee Reason: The committee agreed with the proponents reason statement. The editorial modification removes the year from the AISC 341 reference as the year is included in Chapter 35 listing the reference standards. (Vote: 14-0)

341-16: Seismic Provisions for Structural Steel Buildings

Commenter's Reason: We support the technical content in the original proposal. This public comment removes unnecessary code language referenced elsewhere in the code as well as addresses the concern of creating incomplete lists.

ASCE 7 and AISC 341 are adopted reference standards in the IBC with clearly defined and acceptable steel lateral force-resisting systems. There is no need to add code language to point to what are already allowable steel lateral force-resisting systems. We understand the proponent's desire to clarify that proprietary special moment frames, intermediate or ordinary moment frames, and cantilevered column systems can be used with no further requirements or exceptions. However, these systems are already allowed by code. In addition, by listing a limited number of code allowed steel lateral force-resisting systems engineers or building officials may misinterpret as only those systems listed may be used. What about steel concentrically braced frames or steel buckling-restrained braced frames? Incomplete lists can unintentionally be limiting and should be avoided.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The public comment removes language contained in other code sections and eliminates language that could be mistakenly used as an incomplete list. Neither of these changes result in a cost impact.

Public Comment# 1865

EB164-19

IEBC@: SECTION A406, [BS] A406.1

Proposed Change as Submitted

Proponents: David Bonowitz, representing Self (dbonowitz@att.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Existing Building Code

Revise as follows:

SECTION A406

INFORMATION REQUIRED TO BE ON THE PLANS CONSTRUCTION DOCUMENTS

[BS] A406.1 General. The plans shall show all information necessary for plan review and for construction ~~and~~ shall accurately reflect the results of the ~~engineering investigation and design~~ design, and shall otherwise comply with all requirements established by the code official. The plans shall contain a note that states that this retrofit was designed in compliance with the criteria of this chapter.

Reason: This proposal revises the Chapter A4 administrative requirements to better align with IEBC Section 106 and with practices already adopted by the local building department.

The reference to "engineering investigation" is removed to avoid confusion (Chapter A4 does not explicitly require any such investigation) and because the "design" should already account for existing conditions, which are required to be documented per Section A406.2.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal is consistent with Section 106 and is also consistent with local building department practices and therefore will not have an effect on cost.

EB164-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The proposal was approved based upon the proponents reason statement. Additionally, the revisions delete unnecessary requirements for field investigation notes on the drawings.

(Vote: 11-3)

Individual Consideration Agenda

Public Comment 1:

IEBC@: [BS] A406.1

Proponents:

David Bonowitz, representing Self (dbonowitz@att.net)

requests As Modified by Public Comment

Modify as follows:

2018 International Existing Building Code

[BS] A406.1 General. The plans shall show all information necessary for plan review and for construction; and shall accurately reflect the results of

the design, ~~and shall otherwise comply with all requirements established by the code official.~~ The plans shall contain a note that states that this retrofit was designed in compliance with the criteria of this chapter.

Commenter's Reason: The IBC-S committee approved EB164 as submitted. During testimony, however, some committee members questioned the referent of the proposed word "otherwise," some suggested that the phrase involving that word is unnecessary, and some suggested that the "otherwise" phrase is actually an important part of the proposal.

Everyone, however, agreed (as the committee's reason statement says) that the proposal is valuable for removing an improper and confusing requirement regarding whether to put engineering investigation findings on the plans (especially since IEBC Chapter A4 does not require an engineering investigation). Therefore, this comment is meant to focus on the portion that everyone agreed on, and give the ICC members a choice between the proposal as submitted and the proposal as modified by this comment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Same as the original proposal.

Public Comment# 2141

G2-19

THIS CODE CHANGE WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows:

[BS] DANGEROUS. Any building, structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation or lacks the necessary support of the ground.
2. There exists a significant risk of collapse, detachment or dislodgment of any portion, member, appurtenance or ornamentation of the building or structure under ~~service loads~~; permanent, routine, or frequent loads; under actual loads already in effect; or under snow, wind, rain, flood, earthquake, or other environmental loads when such loads are imminent.

2018 International Existing Building Code

Revise as follows:

[BS] DANGEROUS. Any building, structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation, or lacks the necessary support of the ground.
2. There exists a significant risk of collapse, detachment or dislodgment of any portion, member, appurtenance or ornamentation of the building or structure under ~~service loads~~; permanent, routine, or frequent loads; under actual loads already in effect; or under snow, wind, rain, flood, earthquake, or other environmental loads when such loads are imminent.

Reason: This proposal solves a problem with the definition of Dangerous going back to 2010. This proposal presents the consensus of the proponents, the IBC-S committee, and the Public Comment voters regarding proposal G4-16 in the last cycle.

The problem involves the words "service loads" in the current definition. With IBC Interpretation 23-10 (issued 12/8/2010), ICC interpreted "service loads" to be the same as "nominal" or unfactored loads, but this is incorrect and contrary to the intent of the definition when it was written.

In the last cycle, the IBC-S committee deliberated over a number of ways to clarify the intent and settled on the best solution: simply to remove the words "service loads" and replace them with the text shown here. This solution avoids any conflict with definitions or interpretations of "service loads" in other codes or standards. With this consensus, the IBC-S committee Disapproved G4 and asked the proponent to revise the proposal accordingly with a public comment.

At the PCH, G4-16 was easily approved as modified (and as shown here) by a show of hands. 58% of OGV voters supported the modified proposal, but since the PCH hand votes could not be added, the OGV vote fell short of the 2/3 requirement, and the clear consensus from the IBC-S committee, the proponent, and the PCH voters could not be approved.

For those concerned about interpretation of any of the new text, note: 1. This issue was already considered by IBC-S and by the PCH voters, who approved the text as shown. 2. The CURRENT definition already includes wording -- "necessary support," "significant risk" -- that requires some interpretation and judgment. 3. The whole purpose of this definition, as documented clearly in the reason statements when the definition was changed several cycles ago, is to give discretion to the code official and to rely on the code official's judgment, so that a designation of dangerous, and protection of the public, need not wait for the results of a quantitative test or analysis.

Bibliography: IBC Interpretation 23-10 is available at https://www2.iccsafe.org/cs/committeeArea/pdf_file/EB_09_23_10.pdf.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposal merely clarifies the current code intent.

G2-19

Public Hearing Results

Committee Action:**As Submitted**

Committee Reason: This proposal solves a problem with the definition of Dangerous going back to 2010. This proposal presents the consensus of the proponents, the IBC-S committee, and the Public Comment voters regarding proposal G4-16 in the last cycle. The problem involves the words "service loads" in the current definition. Individual Consideration Agenda

Public Comment 1:

IBC®: [BS] 202; IEBC®: [BS] 202

Proponents:

David Bonowitz, representing Self (dbonowitz@att.net)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

[BS] DANGEROUS. Any building, structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation or lacks the necessary support of the ground.
2. There exists a significant risk of collapse, detachment or dislodgment of any portion, member, appurtenance or ornamentation of the building or structure under permanent, routine, or frequent loads; under actual loads already in effect; or under snow, wind, rain, flood, earthquake, or other environmental loads, when any such loads are imminent.

2018 International Existing Building Code

[BS] DANGEROUS. Any building, structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation, or lacks the necessary support of the ground.
2. There exists a significant risk of collapse, detachment or dislodgement of any portion, member, appurtenance or ornamentation of the building or structure under permanent, routine, or frequent loads; under actual loads already in effect; or under snow, wind, rain, flood, earthquake, or other environmental loads, when any such loads are imminent.

Commenter's Reason: The IBC-S committee unanimously approved G2 as submitted, referencing a broad consensus developed over the past several cycles. During testimony, one committee member suggested that the meaning of the final phrase could be clarified by adding a comma to clarify that "such loads" refers to all of the load types covered in the proposal's final phrase (snow, wind, etc.), and not just the immediate antecedent, "other environmental loads."

This comment implements that suggestion.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposal merely clarifies the current code intent.

G10-19

Individual Consideration Agenda

Public Comment 1:

IBC®: [BS], 202 (New)

Proponents:

Paul Coats, representing American Wood Council (pcoats@awc.org)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

[BS] TREATED WOOD. ~~Wood products that are conditioned to enhance fire-retardant or preservative properties.~~

FIRE-RETARDANT-TREATED WOOD. Wood products meeting the requirements of Section 2303.2 that exhibit reduced surface-burning characteristics and resist propagation of fire.

PRESERVATIVE-TREATED WOOD. Wood products meeting the requirements of Section 2303.1.9 that exhibit reduced susceptibility to damage by fungi, insects or marine borers.

Commenter's Reason: Terms in the current definition have become the subject of debate because they may not accurately describe treated wood in all potential code applications. Simply referring to the respective code sections will safeguard the definitions from inconsistency with the code requirements.

A general definition of "treated wood" is unnecessary since the code always qualifies the term "treated" with one of the two terms (fire-retardant-treated or preservative-treated). This code change deletes the general definition for treated wood and elevates the current sub-definitions to general definitions.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. It will have no impact on cost.

Public Comment# 1586

Public Comment 2:

IBC®: [BS], 202 (New)

Proponents:

Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

~~**[BS] TREATED WOOD.** Wood products that are conditioned to enhance fire-retardant or preservative properties.~~

FIRE-RETARDANT-TREATED WOOD. Wood products that, when impregnated with chemicals by a pressure process or other means during manufacture, exhibit reduced surface-burning characteristics and resist propagation of fire.

PRESERVATIVE-TREATED WOOD. Wood products that, when impregnated with chemicals by a pressure process or other means during manufacture, exhibit reduced susceptibility to damage by fungi, insects or marine borers.

Commenter's Reason: This public comment deletes the definition of treated wood, which is unnecessary, and replaces it by two separate, stand-alone, definitions of "fire-retardant-treated wood" and "preservative-treated wood". Throughout the code, the terms actually used are the separate definitions. In fact, there are two examples of the use of "untreated wood" and in both cases, the context explains what is meant. In 705.2.3.1 it means non fire-retardant wood and treated wood and in 2304.1.2.3 it means non preservative treated wood. The definition of treated wood tries to cover both aspects but fails to do so properly. In particular, it does not clarify that a key issue for use in the code is that it should be treated during manufacturing.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The code proposal deals with definitions only and is clarification.

Public Comment# 1457

Public Comment 3:

IBC®: [BS], 202 (New)

Proponents:

Kristen Owen, representing Kris Owen Consultant (kowen4568@gmail.com)

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

~~**[BS] TREATED WOOD.** Wood products that are conditioned to enhance fire-retardant or preservative properties.~~

~~**Fire-retardant-treated wood.** Wood products that, when impregnated with chemicals by a pressure process or other means during manufacture, exhibit reduced surface-burning characteristics and resist propagation of fire.~~

~~**Preservative-treated wood:** Wood products that, conditioned with chemicals by a pressure process or other means, exhibit reduced susceptibility to damage by fungi, insects or marine borers.~~

FIRE-RETARDANT-TREATED WOOD. Wood products that, when impregnated with chemicals by a pressure process or other means during manufacture, exhibit reduced surface-burning characteristics and resist propagation of fire.

PRESERVATIVE -TREATED WOOD. Wood products that, when impregnated with chemicals by a pressure process or other means during manufacture,exhibit reduced susceptibility to fungi, insects and marine borers.

Commenter's Reason: Since the term "Treated Wood" is not used in the IBC, there is no need for the term to be defined. However, the terms "Fire-retardant-treated wood" and Preservative-treated wood" are used in many locations. This change will correctly define both terms and allow them to be placed in their correct location in Definitions.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. There is no increase or decrease to the cost of construction as a result of this public comment and code change.

Public Comment# 1465

G12-19 Part I

IBC®: [BS] 202

Proposed Change as Submitted

Proponents: Don Scott, Representing National Council of Structural Engineers Association, representing Representing National Council of Structural Engineers Association (dscott@pcs-structural.com)

THIS IS A TWO PART PROPOSAL. PART I WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING COMMITTEE. PLEASE CHECK THE RESPECTIVE HEARING AGENDAS.

2018 International Building Code

Revise as follows:

[BS] WINDBORNE DEBRIS REGION. Areas within hurricane-prone regions located:

1. Within 1 mile (1.61 km) of the ~~coastal~~ mean high-water line, where an Exposure D condition exists upwind at the waterline and the basic design wind speed, V , is 130 mph (58 m/s) or greater; or
2. In areas where the basic design wind speed is 140 mph (63.6 m/s) or greater.

For *Risk Category* II buildings and structures and *Risk Category* III buildings and structures, except health care facilities, the windborne debris region shall be based on Figure 1609.3.(1). For *Risk Category* IV buildings and structures and *Risk Category* III health care facilities, the windborne debris region shall be based on Figure 1609.3(2).

Reason: Significant confusion has arisen in hurricane-prone regions in trying to determine windborne debris regions because the term "coastal mean high waterline" is not a mapped or defined term. Due to this lack of definition, some jurisdictions have incorrectly interpreted areas within one mile of the mean high waterline along narrow inland tidal waterways to be in windborne debris regions. The primary intent behind paragraph No. 1, is that within one mile of the coast, hurricane wind speeds will be governed by the wind speed over the open water, i.e. an Exposure Category D rather than an inland Exposure Category C situation on which the basic wind speed and paragraph No. 2 are based. This CCP clarifies that the waterline has to be classified as an Exposure D in order for paragraph No. 1 to apply. It also deletes the word "coastal" since wind speed increases could occur at large inland waterways in hurricane-prone regions as well. Also, NOAA maintains a database of the "mean high waterline" values in the US, which can be used in conjunction with this definition.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This code change proposal is location dependent on its impact on construction costs, however by providing a definition of the windborne debris zone, it will eliminate confusion as to where to apply the windborne debris protection requirements.

G12-19 Part I

G12-19 Part I

Individual Consideration Agenda

Public Comment 1:

Proponents:

Gary Ehrlich, representing National Association of Home Builders (gehrlich@nahb.org)

requests Disapprove

Commenter's Reason: The purpose of this public comment is to urge disapproval of the proposed change to the wind-borne debris trigger. Contrary to the proponent's reason statement, this is a significant change that will cause more confusion than it eliminates and greatly expand where wind-borne debris protection is required.

The use of the word "coastal" in the current 130 mph trigger for wind-borne debris protection clearly implies an intent to trigger protection for sites near open water such as the Atlantic Ocean or the Gulf of Mexico. The current 130 mph trigger would not apply to water bodies such as fully landlocked lakes or rivers that do not feed directly into the ocean. It would not even apply to rivers that **do** open to the ocean if the shorelines of such rivers are more than one mile from the mean high-water line at the actual coast.

However, many such lakes or rivers are more than a mile wide in at least one direction and a site located upwind of that direction could be classified as Exposure D. Therefore, the proposed revision would in fact appear to capture sites near the shorelines of large inland lakes or wide rivers (whether open to the ocean or not) if the wind speed at the site also equals or exceeds 130 mph. Sites along wide bays and estuaries that are more than a mile from where such features open to the ocean or Gulf would also be captured.

A close examination of the 130-mph wind contour for Risk Category II buildings (the category that covers dwellings and most multifamily construction) identified several areas for which the revised definition would potentially trigger wind-borne debris protection where it is not already required. Notable examples include the following:

- Narraganset Bay and the Sakonnet River in RI near Providence, RI
- Shinnecock Bay on Long Island (Hampton Bays, Shinnecock Hills, East Quogue)
- Lake Mattamuskeet in Hyde County, North Carolina
- White Lake in Bladen County, North Carolina
- Lakes Moultrie and Marion in South Carolina
- Lake Houston northwest of Houston (near Atascocita)
- Lake Corpus Christi northwest of Corpus Christi

However, these areas, or similar areas, have not necessarily experienced widespread wind-borne debris damage in hurricanes. For example, sites where FEMA's MAT report on Hurricane Harvey specifically documented wind-borne debris impacts were in areas where the wind speed per the 2009 IRC and ASCE 7-05 (the locally-adopted editions at the time) required protection regardless of the proximity to the coast. Many of the sites were also within one mile of the Gulf of Mexico, so protection would be required even under the current coastal mean high-water line trigger. Similarly, where the Irma MAT report documented wind-borne debris damage in Ramrod and Little Torch Key, protection is already required based on the design wind speed and again, most of the area of both islands could be considered "within one mile of the coastal mean high-water line".

Even in Hurricane Katrina, wind-borne debris damage around Lake Pontchartrain (which is technically an estuary rather than an inland lake) was limited to specific conditions. The FEMA and NIST reports did not document wind-borne debris damage in areas such as Laplace, Madisonville, Mandeville and Lacombe, which all lie near where the 130 mph wind contour crosses Lake Pontchartrain. Reported wind-borne debris damage from Katrina primarily occurred in urban areas (e.g. downtown New Orleans) or suburban commercial areas (e.g. Slidell) where blow-off from aggregate roofs occurred, or in areas along the actual Gulf coastline where wind-borne debris protection would be required anyway as the ultimate wind speed is 140mph or higher.

The source of the change stems from discussions within the ASCE 7 committee over a request for interpretation. A corresponding change is being considered for the 2022 edition of ASCE 7, but as of the ICC public comment deadline balloting at the ASCE Wind Load Subcommittee (WLSC) level was not even complete. It is possible that based on responses to the WLSC ballot and (assuming the proposal advances) responses to Main Committee ballots, the eventual ASCE 7-22 language may have additional qualifiers or clarifications. Given the significant cost impacts that can result if impact-resistant glazing or impact-protective systems are required, it would be irresponsible for the I-Codes to get out in front of ASCE 7 and impose a huge unfunded mandate on the construction industry for limited benefit.

The Home Innovation Research Lab calculated the cost impact for installing common methods of wind-borne debris protection on a typical home with 360 square feet of glazing. The added cost was around \$1,800 a home if wood structural panels are used, \$3,400 if manually-operated hurricane shutters are used, and \$9,600 if impact-resistant glazing is provided.

Contrary to the proponent's statement the proposed revision will not increase the cost of construction, these are clearly significant impacts that can price thousands of people in an area out of a new home. This negative impact on affordability is particularly concerning where the revised definition may impact a small, rural, lower-income community that may be miles from the Atlantic or Gulf coast but just happens to be adjacent to a lake or river large enough to trigger Exposure D conditions. Homebuyers and renters in these communities or other communities impacted by this change may find themselves only able to afford older, existing houses that were not built to any edition of the IRC and are significantly less resistant to a variety of hazards than newer homes.

G12-19 Part II

IRC: [RB]202

Proposed Change as Submitted

Proponents: Don Scott, Representing National Council of Structural Engineers Association, representing Representing National Council of Structural Engineers Association (dscott@pcs-structural.com)

2018 International Residential Code

[RB] WINDBORNE DEBRIS REGION. Areas within *hurricane-prone regions* located in accordance with one of the following:

1. Within 1 mile (1.61 km) of the ~~coastal~~ mean high-water line where an Exposure D condition exists upwind at the waterline and the ultimate design wind speed, V_{ult} is 130 mph (58 m/s) or greater.

2. In areas where the ultimate design wind speed, V_{ult} is 140 mph (63.6 m/s) or greater; or Hawaii.

Reason: Significant confusion has arisen in hurricane-prone regions in trying to determine windborne debris regions because the term "coastal mean high waterline" is not a mapped or defined term. Due to this lack of definition, some jurisdictions have incorrectly interpreted areas within onemile of the mean high waterline along narrow inland tidal waterways to be in windborne debris regions. The primary intent behind paragraph No. 1, is that within one mile of the coast, hurricane wind speeds will be governed by the wind speed over the open water, i.e. an Exposure Category D rather than an inland Exposure Category C situation on which the basic wind speed and paragraph No. 2 are based. This CCP clarifies that the waterline has to be classified as an Exposure D in order for paragraph No. 1 to apply. It also deletes the word "coastal" since wind speed increases could occur at large inland waterways in hurricane-prone regions as well. Also, NOAA maintains a database of the "mean high waterline" values in the US, which can be used in conjunction with this definition.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This code change proposal is location dependent on its impact on construction costs, however by providing a definition of the windborne debris zone, it will eliminate confusion as to where to apply the windborne debris protection requirements.

G12-19 Part II

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Provides for exposure D in hurricane prone regions and areas where there is water. Outside of coastal areas you are out of hurricane prone regions. The committee agrees with removal of the word "coastal" as it is not a mapped or defined term. This more clearly indicates that we are talking about the water line and exposure D at the water line. (Vote: 8-3)

Assembly Action:

None

G12-19 Part II

Individual Consideration Agenda

Public Comment 1:

Proponents:

Gary Ehrlich, representing National Association of Home Builders (gehrlich@nahb.org)

requests Disapprove

Commenter's Reason: The purpose of this public comment is to urge disapproval of the proposed change to the wind-borne debris trigger. Contrary to the proponent's reason statement, this is a significant change that will cause more confusion than it eliminates and greatly expand where wind-borne debris protection is required.

The use of the word "coastal" in the current 130 mph trigger for wind-borne debris protection clearly implies an intent to trigger protection for sites near open water such as the Atlantic Ocean or the Gulf of Mexico. The current 130 mph trigger would not apply to

water bodies such as fully landlocked lakes or rivers that do not feed directly into the ocean. It would not even apply to rivers that **do** open to the ocean if the shorelines of such rivers are more than one mile from the mean high-water line at the actual coast.

However, many such lakes or rivers are more than a mile wide in at least one direction and a site located upwind of that direction could be classified as Exposure D. Therefore, the proposed revision would in fact appear to capture sites near the shorelines of large inland lakes or wide rivers (whether open to the ocean or not) if the wind speed at the site also equals or exceeds 130 mph. Sites along wide bays and estuaries that are more than a mile from where such features open to the ocean or Gulf would also be captured.

A close examination of the 130-mph wind contour for Risk Category II buildings (the category that covers dwellings and most multifamily construction) identified several areas for which the revised definition would potentially trigger wind-borne debris protection where it is not already required. Notable examples include the following:

- Narraganset Bay and the Sakonnet River in RI near Providence, RI
- Shinnecock Bay on Long Island (Hampton Bays, Shinnecock Hills, East Quogue)

IBC: [BS] 403.2.3.1, [BS] 403.2.3.2, [BS] 403.2.3.4

Proposed Change as Submitted

Proponents: Michael Schmeida, Gypsum Association, representing Gypsum Association

THIS CODE CHANGE WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

[BS] 403.2.3 Structural integrity of interior exit stairways and elevator hoistway enclosures. For *high-rise buildings of Risk Category III or IV* in accordance with Section 1604.5, and for all buildings that are more than 420 feet (128 m) in *building height*, enclosures for *interior exit stairways* and elevator hoistway enclosures shall comply with Sections 403.2.3.1 through 403.2.3.4.

Revise as follows:

[BS] 403.2.3.1 Wall assembly materials - Soft Body Impact. The ~~wall assemblies~~ panels making up the enclosures for *interior exit stairways* and elevator hoistway enclosures shall meet or exceed Soft Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.

[BS] 403.2.3.2 Wall assembly materials - Hard Body Impact. The ~~face of the wall assemblies~~ panels making up the enclosures for *interior exit stairways* and elevator hoistway enclosures that are not exposed to the interior of the enclosures for *interior exit stairways* or elevator hoistway enclosure shall be ~~constructed~~ in accordance with one of the following ~~methods~~:

1. The wall assembly shall incorporate ~~not no~~ fewer than two layers of impact-resistant ~~construction board~~ panels, each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.
2. The wall assembly shall incorporate ~~not no~~ fewer than one layer of impact-resistant ~~construction material~~ panels that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.
3. The wall assembly incorporates multiple layers of any material, tested in tandem, that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.

[BS] 403.2.3.3 Concrete and masonry walls. Concrete or masonry walls shall be deemed to satisfy the requirements of Sections 403.2.3.1 and 403.2.3.2.

Revise as follows:

[BS] 403.2.3.4 Other wall ~~assemblies~~ materials. Any other wall ~~assembly materials~~ that ~~provides~~ provide impact resistance equivalent to that required by Sections 403.2.3.1 and 403.2.3.2 for Hard Body Impact Classification Level 3, as measured by the test method described in ASTM C1629/C1629M, shall be permitted.

Reason: This clarifies that it is the wall panel/material that is tested per C1629/C1629M and not a full wall assembly. Full wall assembly testing is outside of the scope of C1629/C1629M. Section 1.1.1 of C1629/C1629M states, "panel product performance is not intended to classify the system for abuse resistance."

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is simply a clarification of the application of C1629/C1629M

G13-19

IBC®: [BS] 403.2.3, [BS] 403.2.3.1, [BS] 403.2.3.2, [BS] 403.2.3.3, [BS] 403.2.3.4

Proponents:

Tom Zaremba, representing Glazing Industry Code Committee (GICC), a section of the National Glass Association (NGA) (tzaremba@ralaw.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

[BS] 403.2.3 Structural integrity of interior exit stairways and elevator hoistway enclosures. For *high-rise buildings of Risk Category III or IV* in accordance with Section 1604.5, and for all buildings that are more than 420 feet (128 m) in *building height*, enclosures for *interior exit stairways* and elevator hoistway enclosures shall comply with Sections 403.2.3.1 through 403.2.3.4.

[BS] 403.2.3.1 Wall assembly materials - Soft Body Impact. The panels making up the enclosures for *interior exit stairways* and elevator hoistway enclosures shall meet or exceed Soft Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.

[BS] 403.2.3.2 Wall assembly materials - Hard Body Impact. The panels making up the enclosures for *interior exit stairways* and elevator hoistway enclosures that are not exposed to the interior of the enclosures for *interior exit stairways* or elevator hoistway enclosure shall be in accordance with one of the following :

1. The wall assembly shall incorporate no fewer than two layers of impact-resistant panels, each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.
2. The wall assembly shall incorporate no fewer than one layer of impact-resistant panels that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.
3. The wall assembly incorporates multiple layers of any material, tested in tandem, that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.

[BS] 403.2.3.3 Concrete, ~~and masonry~~ and glass walls. Concrete or masonry walls shall be deemed to satisfy the requirements of Sections 403.2.3.1 and 403.2.3.2. Glass walls complying with the Category II or Class A impact tests specified in Section 2406.2 shall be deemed to satisfy the requirements of Sections 403.2.3.1 and 403.2.3.2.

[BS] 403.2.3.4 Other wall materials. Any other wall materials that provide impact resistance equivalent to that required by Sections 403.2.3.1 and 403.2.3.2 for Hard Body Impact Classification Level 3, as measured by the test method described in ASTM C1629/C1629M, shall be permitted.

Commenter's Reason: The Glazing Industry Code Committee (GICC) urges you to modify the changes reflected in the Committee's recommendation to adopt G13-19 "as submitted" by **ADDING** the modifications to Section 403.2.3.3 proposed in this Public Comment. Adding these changes to Section 403.2.3.3 will reduce the cost of construction by avoiding the imposition of unnecessary, duplicative and costly testing on the use of glass walls.

Sections 403.2.3.1 and 403.2.3.2 require walls to be Soft or Hard Body Tested to Impact Classification Level 2 as described in ASTM C1629/ASTM C1629M. This is, at most, a 200 ft.lb. impact test that is used to assess the integrity of gypsum wall panels. Because it is only a 200 ft.lb. test, Section 403.2.3.3 provides that both concrete and masonry walls are deemed to comply with Sections 403.2.3.1 and 403.2.3.2.

The modification proposed to Section 403.2.3.3 would add glass walls that meet the 400 ft.lb. safety glazing impact tests of CPSC 16 CFR Part 1201 Cat. II or ANSI Z97.1 Cat. A, to the materials that are deemed to comply with the tests required by Sections 403.2.3.1 and 403.1.3.2. Adding glass walls to Section 403.2.3.3 is fully justified and warranted because safety glazing that meets the requirements of 16 CFR 1201 Cat. II or ANSI Z97.1 Cat. A is already tested to an impact standard that is **twice** as stringent as the Soft or Hard Body Impact tests required by Sections 403.2.3.1 and 403.2.3.2.

GICC urges you to adopt the modifications proposed to Section 403.2.3.3 (in addition to the changes reflected in the Committee's recommendation to adopt G13-19 as submitted) to ensure that glass walls are not burdened with the unnecessary and costly testing required for gypsum wall panels by Sections 403.2.3.1 and 403.2.3.2.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

When glass walls are used in applications under these Sections of the Code, adopting the changes proposed to Section 403.2.3.3 will reduce the cost of construction by eliminating the possibility that costly and unnecessary testing would otherwise be required.

Public Comment# 1607

G14-19

IBC®: [BS] 403.2.3.1, [BS] 403.2.3.2, [BS] 403.2.3.4

Proposed Change as Submitted

Proponents: Tim Earl, representing The Gypsum Association (tearl@gbhinternational.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-STRUCTURAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows:

[BS] 403.2.3.1 Wall assembly. The wall assemblies making up the enclosures for *interior exit stairways* and elevator hoistway enclosures shall meet or exceed Soft Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/1629M when tested from the exterior side of the enclosures.

[BS] 403.2.3.2 Wall assembly materials. The exterior face of the wall assemblies making up the enclosures for *interior exit stairways* and elevator hoistway enclosures ~~that are not exposed to the interior of the enclosures for interior exit stairways or elevator hoistway enclosure~~ shall be constructed in accordance with one of the following methods:

1. The wall assembly shall incorporate not fewer than two layers of impact-resistant construction board each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.
2. The wall assembly shall incorporate not fewer than one layer of impact-resistant construction material that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.
3. The wall assembly incorporates multiple layers of any material, tested in tandem, that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.

[BS] 403.2.3.4 Other wall assemblies. Any other wall assembly that provides impact resistance equivalent to that required by Sections 403.2.3.1 for Soft Body Impact Classification Level 3 and 403.2.3.2 for Hard Body Impact Classification Level 3, as measured by the test method described in ASTM C1629/C1629M, shall be permitted.

Reason: This proposal clarifies which side of these enclosure wall assemblies must be tested for abuse and impact resistance. 403.2.3.2 currently states that the exterior side is tested, but it does so in very confusing language. This proposal cleans that up and reiterates the point in 403.2.3.1. Also note that, due to the manner of construction of these enclosure wall assemblies, testing from the exterior side represents the worst case. This proposal also cleans up 403.2.3.4, which currently implies that 403.2.3.1 and 403.2.3.2 both apply to hard body impact testing, which is not the case. The first section is for soft body impact testing. This is simply a grammatical revision that clarifies the intent of the section.

For clarification, the exterior side is the side which does not face into the enclosure, as the figure below illustrates.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal simply clarifies the requirements in this section, with no technical changes.

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: The proposal does not improve the language of the current code.
(Vote: 10-4)

Assembly Action:**None**

G14-19

Individual Consideration Agenda

Public Comment 1:**IBC®:** [BS] 403.2.3.2, [BS] 403.2.3.4**Proponents:**

Tim Earl, representing The Gypsum Association (tearl@gbhinternational.com)

requests As Modified by Public Comment

Modify as follows:**2018 International Building Code**

[BS] 403.2.3.2 Wall assembly materials. The exterior face of the wall assemblies making up the enclosures for *interior exit stairways* and elevator hoistway enclosures that is not exposed to the interior of the enclosures shall be constructed in accordance with one of the following methods:

1. The wall assembly shall incorporate not fewer than two layers of impact-resistant construction board each of which meets or exceeds Hard Body Impact Classification Level 2 as measured by the test method described in ASTM C1629/C1629M.
2. The wall assembly shall incorporate not fewer than one layer of impact-resistant construction material that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.
3. The wall assembly incorporates multiple layers of any material, tested in tandem, that meets or exceeds Hard Body Impact Classification Level 3 as measured by the test method described in ASTM C1629/C1629M.

[BS] 403.2.3.4 Other wall assemblies. Any other wall assembly that provides impact resistance equivalent to that required by Sections 403.2.3.1 for Soft Body Impact Classification Level 3 and 403.2.3.2 for Hard Body Impact Classification Level 3, as measured by the test method described in ASTM C1629/C1629M, shall be permitted.

Commenter's Reason: The original proposal was intended to clarify the clumsy language of the existing section, which has led to confusion as to which side of these assemblies needs to be tested. The committee felt that the change went too far and actually introduced more confusion. This PC modifies the original proposal language to make it very clear that the side not facing the interior of the stairwell is to be tested. In practice, this is often a corridor, but not always, so the language here is appropriate.

It also corrects an error in the original proposal which inadvertently raised the bar for some assemblies from Soft Body Impact Classification Level 2 to Level 3.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This proposal simply clarifies the requirements in this section, with no technical changes.

Public Comment# 1401

S1-19

IBC: 1511.1 (IEBC 705.1)

Proposed Change as Submitted

Proponents: Wanda Edwards, representing RCI, Inc. (wedwards@rci-online.org)

2018 International Building Code

SECTION 1511 REROOFING

Revise as follows:

1511.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement or roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage and meet the requirements of Section 1608.3.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4 for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1503.4.

2018 International Existing Building Code

Revise as follows:

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the International Building Code.

Exceptions:

1. *Roof replacement or roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the International Building Code for roofs that provide positive roof drainage and meet the requirements of Section 1608.3 of the International Building Code.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the International Building Code for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the International Building Code.

Reason: The proposed change is a reference to Section 1608.3 – Ponding instability. The added language is a reminder to designers that roofs which do not provide the minimum slope required by the code, are susceptible bays and must be analyzed for ponding instability. By definition a susceptible bay is a roof or portion thereof with a slope less than 1/4" inch per foot. Roofs that do not have a minimum slope of 1/4" inch per foot must provide positive drainage **and** a ponding analysis. The requirement for the ponding analysis is often overlooked and this change will clarify that the ponding analysis is required.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The code proposal is a clarification and does not alter the requirements of the code. Therefore, the proposal has no cost impact.

S1-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the proposal was not required, especially as it only effects re-roofing.
(Vote: 12-1)

Individual Consideration Agenda

Public Comment 1:

IBC®: SECTION 1511, 1511.1; IEBC®: [BS] 705.1

Proponents:

Walter Rossiter, representing the International Institute of Building Enclosure Consultants (IIBEC), representing IIBEC (wjrossiter@verizon.net)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

SECTION 1511 REROOFING

1511.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage and meet the requirements of Section 1608.3 and Section 1611.2.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4 for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1503.4.

2018 International Existing Building Code

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the International Building Code.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the International Building Code for roofs that provide positive roof drainage and meet the requirements of Section 1608.3 and Section 1611.2 of the International Building Code.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the International Building Code for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the International Building Code.

Commenter's Reason: The purpose of this public comment is to highlight an often-overlooked Code provision that requires susceptible bays to be analyzed for ponding instability. The committee felt that the proposal was not required, especially as it only effects re-roofing. It should be noted that this proposal is especially important for re-roofing projects since they may achieve compliance without the ¼" per foot slope required for new construction. Of special note, re-roofing projects comprise about three quarters of commercial, industrial low-sloped roofing projects performed yearly in the U.S.

This proposed change does not alter the current requirements of the building code. It does, however, clarify a commonly overlooked provision of the Code. 1511.1 and 705.1 Exception 1 allows slopes less than ¼" per foot for re-roofing projects. By definition (2018 IBC Section 202), a roof or portion thereof with a slope less than ¼" per foot is a Susceptible Bay. Chapters 1608.3 and 1611.2 require that susceptible bays be evaluated for ponding instability in accordance with Chapters 7 and 8 of ASCE 7. This proposed change adds an additional pointer to another section of the code.

Note: The insertion of Section 1611.2 is to correct an error when the original proposal was prepared. It was inadvertently missing in the published version.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The code change proposal is a clarification to a current provision and does not alter the requirements of the code. Therefore, the proposal has no cost impact.

Public Comment# 1388

Modify as follows:

2018 International Building Code

SECTION 1511 REROOFING

1511.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage and meet the requirements of ~~Section~~ Sections 1608.3 and 1611.2.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4 for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1503.4.

2018 International Existing Building Code

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the International Building Code.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the International Building Code for roofs that provide positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the International Building Code.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the International Building Code for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the International Building Code.

Commenter's Reason: In my opinion, the proposed change reflected in S1-19 is a sensible addition to the code, explicitly adding a reference to a relevant code section (1611.2). This will better present a condition that is already required by the code and will provide helpful clarity to building owners and building officials regarding the code requirements for roof drainage. The code already requires that "Susceptible Bays", defined in part as roof bays with slope less than 1/4" per foot, be evaluated for ponding instability.

Roof drainage is a life safety concern, especially considering buildings with Susceptible Bays. I have investigated multiple roof collapses, including a collapse that involved a loss of life, and multiple collapses that escaped likely serious harm or loss of life only because they happened when the building was not fully occupied (at night). This change is sensible and reinforces code requirements that already exist. I view this as a clarification

of code requirements and I believe that the explicit mention of section 1611.2 in this code section will make the built environment safer for the public.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is a clarification of existing requirements and does not alter the code requirements or increase cost.

Public Comment 3:

Proponents:

Stephen Patterson, Roof Technical Services, Inc., representing Roof Technical Services Inc. (spatterson@rooftechusa.com)

requests As Submitted

Commenter's Reason: This is an important life safety issue that is already in the Code, but the reference is relatively obscure. This change reinforces the requirement to verify roofs meet the ponding instability requirements already in the code. Below is my technical support for the proposal.

Public Comment S1-19

My name is Stephen L. Patterson. I am a licensed engineer and registered roof consultant and have extensive experience in roof design and structural issues related to roofs. I have published several papers, a book, and a monograph that address drainage issues. My roofing experience includes being the general manager of a large roofing contracting company and the director of engineering/technical director for 2 roofing manufacturers. I have spent 36 years as a consulting engineer/roof consultant and have designed and inspected literally 1000's of roofs. Roof slope and drainage are among the most important design considerations for roofing and structural analysis.

Section 1611.2 of the 2018 IBC requires "Susceptible bays" of roofs to be "evaluated for ponding instability in accordance with Section 8.4 of ASCE 7." By definition (2018 IBC Section 202), a susceptible bay is a roof or portion thereof with a slope less than 1/4-inch per foot. Therefore, the 2018 IBC currently requires an evaluation for ponding instability for all reroofing projects (roof replacement or roof recover) with slopes less than 1/4-inch per foot. Proposal S1-19 merely reinforces this routinely overlooked provision of the building code.

The requirement for analyzing roof structures for ponding instability has been in the Codes since 1967 (Section 2305(f) 1967 IBC). The design requirement for ponding instability has undergone some changes, but the changes in Section 8.4 of ASCE 7-18 are vastly different and more comprehensive than prior editions.

The requirement for a minimum 1/4:12 (2%) slope was added to the Codes in 1988 (Section 3207.(a) 1988 IBC). Below is an excerpt from "Life Safety Design Issues in Roofing" (Patterson, 2010) illustrating the importance of a minimum 1/4:12 slope. The slope requirements are related to the allowable deflection for roof structures. The 1/4:12 slope requirement provide a positive slope even with the maximum allowable deflection.

└

Figure 5 - A roof slope of 1/8 in/ft provides virtually zero net slope after the roof deck assumes its allowable deflection under rain load. A 1/4 in/ft roof slope, on the other hand, leaves a net slope of 1/8 in/ft under the same condition.

Below is an aerial photograph of a roof collapse in Houston, TX in 2013. The basic failure mode of this roof collapse was ponding instability. The roof slope was 1/8:12. There was a hail event with a large amount (several inches) of small hail that caused water to back up on the roof. There was evidence of ponding water along the edge of the roof. However, the water dried up within two days of a rain with good drying conditions, so the roof met the requirements for "Positive Drainage" as defined in the IBC.

Below left is another photograph showing the same collapse shown above. Below right is a photograph (from a different roof) showing how hail blocks the flow of water on a roof and causes water to back up on the roof.

View of roof towards collapsed area

One of the changes in the evaluation of ponding instability addressed in ASCE 7-18 is the structural orientation. The load on the joists is much greater if the joists run parallel to the wall to which the water drains than if the joists are perpendicular to the

wall. Below is example of a collapse (Dallas), in which ponding instability and structural orientation was an issue. For the record, there were also issues with the size of the secondary drainage system. The buildup of water on the 1st and 2nd joists running parallel to the wall was much greater than if the joists had been perpendicular to the wall, which can result in excessive rainwater load on the joists. The photograph below left shows the roof collapse, and the photograph below right shows the orientation of the joists.

The lower the roof slope, the more water will back up on a roof and the greater the rainwater load on the structure will be. A roof with a slope of 1/8:12 backs up twice as much water as a roof with a slope of 1/4:12. Below is an excerpt from "Roof Drainage Design, Roof Collapses, and the Code" (Patterson and Mehta, 2018) showing the water distribution on a roof with different slopes.

The revised ASCE 7-16 now takes into account the structural orientation. There is much greater load on the joists if the joists are parallel to the low side of the roof than if the joists are perpendicular to the low side of the roof. Below is another illustration from "Roof Drainage Design, Roof Collapses, and the Code" (Patterson and Mehta, 2018) illustrating the ponding instability issue with joists parallel to the low side of the roof.

Suffice to say, ponding instability and the slope of the roof is a very real structural issue. Fortunately, most roofs have 1/4:12 slope and/or are

designed so that the water drains over the edge, and there is no buildup of water. The Codes have required 1/4:12 slope for a very long time, and even before the Code required 1/4:12 slope, industry standards recommended a minimum 1/4:12 slope. However, roofs with less than 1/4:12 slope and ponding water can have very serious structural problems that ultimately can collapse. A good example is the roof of a school that I recently inspected. The building is a relatively large high school, and all of the roof areas with the exception of the auditorium roof had adequate slope and no drainage issues. Below is an aerial showing a dark stain on the auditorium roof circled in yellow.

There are parapet walls around the perimeter of the auditorium roof, and there is no secondary drainage system. The roof was supposed to slope from the center of the roof toward the perimeter of the roof and into through wall drainage scuppers located along the perimeter. After 30 years, there is now a slight negative slope in the roof allowing water to pond. Below are photographs showing the water ponding on the auditorium roof and a photograph of the scupper drains along the edge of the auditorium roof. It rained the morning before I inspected the roof. It is important to understand that this water will dry within 2 days (48 hours) with good drying conditions, so the roof meets the Code requirement for “positive drainage.” However, common sense tells one that there is an issue that needs to be evaluated with this roof.

As I stated earlier, most roofs drain properly and have no issues. However, roofs with drainage problems potentially pose a significant risk and should be evaluated for ponding instability. All contractors, including roofing contractors, should know the provisions of the Code that govern their work. Clearly this roof should be evaluated for ponding instability before reroofing or recovering the roof. It simply is not that expensive or difficult for a contractor to recommend that the owner have a competent structural engineer evaluate the roof ... and it is critical. Furthermore, it is currently required by the code, even though it is oftentimes overlooked.

The proposed modification in S1-19 IBC: 1511.1 reinforces the IBC (Section 1611.2 2018 IBC) requirement to evaluate roofs with slopes less than 1/4:12 for ponding instability when reroofing or recovering a roof. A roof with slopes less than 1/4:12 that has ponding water should not be replaced or recovered without verifying the roof structure is safe and will support the rainwater loads required by Code.

S2-19

IBC: 1511.1 (IEBC 705.1)

Proposed Change as Submitted

Proponents: Wanda Edwards, Wanda Edwards Consulting, Inc., representing RCI, Inc. (wedwards@rci-online.org)

2018 International Building Code

SECTION 1511 REROOFING

Revise as follows:

1511.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement or roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage.
2. Recovering or replacing an existing roof covering shall ~~not be required to~~ meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502.2 ~~for roofs that provide for positive roof drainage~~. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1503.4.

2018 International Existing Building Code

Revise as follows:

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the International Building Code.

Exceptions:

1. *Roof replacement or roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the International Building Code for roofs that provide positive roof drainage.
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the International Building Code ~~for roofs that provide for positive roof drainage~~. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the International Building Code.

Reason: In the 2015 the IBC added Exception #2 to Section 1511.1. This exception allows a roof replacement or roof recover to omit secondary drainage if none is present on the existing roof and the roof provides positive drainage. Roofs that provide positive roof drainage do not meet the minimum slope code requirement of 1/4" inch per foot. This exception has created a serious life safety issue because roofs that do not provide adequate slope are prone to collapse when the rainwater accumulation exceeds the design values.¹

There are several reasons for roof collapses. First, many existing buildings were built before the code addressed requirements related to roof slope, roof drains or scuppers. Existing roofs may not have adequate slope or an adequate secondary drainage system and what exists does not meet any code. Most roof collapses are due to inadequate overflow drainage or inadequate slope. Roof drainage design is complicated by the fact that three designers should share in the responsibility for drainage design: the architect, structural engineer and plumbing engineer. Frequently, the structural engineer is not involved in the drainage design nor is a ponding analysis performed.

Remember, code requirements are minimum allowable standards and do not address some of the critical issues of drainage design. For instance, the code does not address flow rates through drains as a function of hydraulic head. The information contained in the IPC is the maximum drainage capacity of the roof drains with no reference to hydraulic head. Because the roof drainage is so important to performance of the roof a reroof should automatically trigger an analysis of the existing drainage system

In a white paper presented at the 2018 RCI Annual Convention, Dr. Steve Patterson, PE and Dr. Medan Mehta, PE details the problems of not installing secondary roof drainage and the failures that they have investigated. The paper gives an in-depth analysis of roof drainage design and how water accumulates on the roof and results in collapse. The paper also reviews the code history of drainage design and requirements. Their research confirmed that secondary drainage has been a code requirement since the 80's. Exception #2 of Section 1511.1 represents the deletion of a long-standing code requirement.

Ponding instability is defined as the progressive increase in the accumulation of water on the roof due to insufficient stiffness of the roof framing. As the water accumulates on the roof, the roof deflects, and the deflection continues to increase with the accumulation of more water due to the increased roof deflection. The requirement to check for ponding instability has been in the code for at least 14 years. The code does not require a ponding analysis unless the slope is less than 1/4" inch per foot one. The requirement of a ponding analyses often are overlooked and these analyses are not being performed.

"Allowing roof slopes less than 1/4" inch per foot creates many problems. Water should drain freely and quickly – let alone be allowed to remain on the roof for two days. No one tests the roof to see if there is ponding – they don't flood the roof and wait two days to see if there is any ponding on the roof. The roof could have no slope and be code compliant. If there are parapet walls and no overflow drainage, the roof is highly susceptible to ponding."²

Roof drainage is one of the most important roof design elements and the overflow drainage is its most part – the function of the overflow drainage is to prevent the roof from collapsing – an important life safety issue. For these reasons, secondary drainage should once again be required in the code. "Fundamentally, any roof that has drainage issues – including but not limited to the lack of appropriate slope or the lack of adequate overflow- should be evaluated by when a building is reroofed in the same as required for roofing."³

Individual Consideration Agenda

Public Comment 1:

IBC@: 1511.1; **IEBC@:** [BS] 705.1

Proponents:

Walter Rossiter, representing the International Institute of Building Enclosure Consultants (IIBEC), representing IIBEC (wjrossiter@verizon.net)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

1511.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage.
2. Recovering or replacing an existing roof covering shall ~~not be required to~~ not require modification to the primary drainage system to meet the requirement ~~for of Section 1502.1, provided~~ secondary (emergency overflow) drains or scuppers ~~in complying with Section 1502.2+1503.4 for roofs that provide for positive roof drainage are present or installed.~~ For the purposes of this exception, existing primary or secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by primary or secondary drains or scuppers designed and installed in accordance with Section ~~1503.4~~ 1502.

2018 International Existing Building Code

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the International Building Code.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the International Building Code for roofs that provide positive roof drainage.
2. Recovering or replacing an existing roof covering shall ~~not be required to~~ not require modification to the primary drainage system to meet the requirement ~~for of Section 1502.1, provided~~ secondary (emergency overflow) drains or scuppers ~~in complying with Section 1502.2+1502~~ of the International Building Code ~~for roofs that provide for positive roof drainage are present or installed.~~ For the purposes of this exception, existing primary or secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by primary or secondary drains or scuppers designed and installed in accordance with Section 1502 of the International Building Code.

Commenter's Reason: Prior to the 2015 IBC, emergency overflow drainage was required for all roofing projects to prevent structural failure in the event the primary drainage system became blocked for any reason. In the 2015 Code Development Cycle, Exception 2 was added to remove this requirement, thereby not allowing discharge to occur before overloading the structure. This modification returns the Code to comply with the requirements in force prior to the 2015 modification.

This modification also corrects an incorrect reference to Section 1503.4 that addresses attic ventilation and should not be part of IBC Section 1511.1.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This code change proposal will not represent a cost increase when compared to the 2012 IBC.

Public Comment# 1389

Public Comment 2:

Proponents:

Stephen Patterson, Roof Technical Services Inc., representing Roof Technical Services, Inc. (spatterson@rooftechusa.com)

requests As Submitted

Commenter's Reason: This is an important life safety code modification that restores the decades old requirement to provided overflow drainage on buildings that require overflow drains or scuppers but do not have them. Below is my technical support for this proposal.

Public Comment S2-19

My name is Stephen L. Patterson. I am a licensed engineer and registered roof consultant and have extensive experience in roof design and structural issues related to roofs. I have published several papers, a book, and a monograph that address drainage issues. My roofing experience includes being the general manager of a large roofing contracting company and the director of engineering/technical director for two roofing manufacturers. I have spent 36 years as a consulting engineer/roof consultant and have designed and inspected literally 1000's of roofs.

This proposed change to the code modifies Exemption 2 in Section 1511.1 in the 2018 IBC to reinstate the decade's old requirement to ensure that there is an overflow drainage system in accordance with the provisions of Section 1502.2 when recovering or reroofing a building. Exemption 2 was added in 2015, and Exemption 2 eliminates the requirement "to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4 (section number was changed to 1502.2 in 2018)...." This modification leaves in place the exemption deleting the requirement that

the primary drainage system meet the current plumbing code requirement when recovering or reroofing a building.

The primary drainage system is not a critical drainage element from a structural design perspective. Based on Section 1611 Rain Loads, the assumption is the primary drainage system is blocked, and the structural engineer calculates the depth of water that accumulates over the overflow (secondary) drainage system to determine that the structure is adequate to support the rainwater loads. In other words, the primary drainage system is taken out of the equation for calculating rainwater loads on a building. It is the secondary or overflow drainage system that is the critical element, and it is imperative that there is an overflow drainage system to prevent roofs from collapsing. The following is a more detail discussion of the technical reasons in support of this modification.

I have investigated well over 50 roof collapses in my career. A majority of these collapses involve the lack of an appropriate overflow drainage system. Fundamentally, overflow drainage systems are designed to prevent an unsafe build-up of water on a roof in the event the primary drainage system is blocked, restricted, or overwhelmed. Below are the key issues that will be discussed in this commentary.

First of all, this modification in the Code only affects a very small percentage of roofs that are reroofed every year. The vast majority of roofs either drain over the edge and do not require an overflow drainage system or already have an overflow drainage system. These roofs are not affected by this modification.

This discussion concerns roofs with parapet walls where water can build up on a roof if the primary drains become blocked or overwhelmed. These roofs absolutely require overflow drains. The lack of overflow is mistake; it a design and/or construction defect. An overflow drainage system is a fundamental structural design requirement for a roof structure and the roof.

In the vast majority of cases, overflow drains or scuppers can easily be added, and the cost is relatively low. The requirement to ensure there is an overflow drainage system when recovering or reroofing a building has been in the Codes for decades. For the most part, the roofing community has dealt with this issue successfully with few, if any, problems.

The only problems I am aware of are contractor liability issues. Specifically, I am talking about roofs where the roofing contractor failed to add overflow when they reroofed the building and the roof collapsed. To be sure, these are relatively rare occurrences, but the consequences are significant, and the costs associated with roof collapses are in the millions.

I sincerely believe that the underlying reason for the National Roofing Contractors Association's (NRCA's) 2015 proposed modification to eliminate the requirement for overflow drainage was an attempt to protect roofing contractors from litigation arising out of the failure of roofing contractors to meet the Code and had little to do with the cost or complexity of adding overflow drains.

The following commentary addresses the issues described above more fully.

The secondary drainage system is a fundamental element in the calculus for designing roof structures. IBC: Section 1611 Rain Loads states, **“Each portion of a roof shall be designed to sustain the load of rainwater that will accumulate on it if the primary drainage system for that portion is blocked plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow.”** Without a secondary drainage system, the roof must be able to support the weight of water that would accumulate to the height of the parapet wall, and there are very few buildings that will meet this criterion. Below is an excerpt from the 2018 IBC, showing the design rain load requirement.

SECTION 1611 RAIN LOADS

1611.1 Design rain loads. Each portion of a roof shall be designed to sustain the load of rainwater that will accumulate on it if the primary drainage system for that portion is blocked plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow. The design rainfall shall be based on the 100-year hourly rainfall rate indicated in Figure 1611.1 or on other rainfall rates determined from *approved* local weather data.

The vast majorities of roofs either drain over the edge and do not require overflow or already have overflow drainage systems. This proposed code change only affects a small percentage of buildings, e.g. roofs surrounded by parapet walls that have no overflow drainage system. Any roof with parapet walls and without an overflow drainage system is a design and/or construction defect, with very few exceptions. The requirement to provide overflow drainage systems was included in the 1st Uniform Building Code published in 1927. Below is an excerpt from Section 3206 of the 1927 Uniform Building Code stating that, **“Overflows shall be installed at each low point of the roof to which the water drains.”**

Roof Drainage

Sec. 3206. Roofs of all buildings shall be sloped so that they will drain to gutters and downspouts which shall be connected with conductors to carry the water down from the roof underneath the sidewalk to and through the curb. Overflows shall be installed at each low point of the roof to which the water drains.

These requirements were essentially unchanged in the UBC until 1967, when UBC refined the requirement for overflow. Below is an excerpt from the 1967 UBC, which provided more definitive requirements for overflow.

Roof Drainage

Sec. 3206. Roof drainage water from a building shall not be permitted to flow over the public sidewalk. Buildings of Group I or J Occupancies may be exempted from this provision.

Roof drains shall be installed when required at each low point of the roof to which the water drains, and shall be adequate in size to drain the roof.

Overflow drains shall be installed when required with the inlet flow line located two inches (2") above the low point of the roof, or overflow scuppers may be installed in parapet walls at each low point of the roof with the flow line not more than two inches (2") above the adjacent roof.

Concealed roof drainage pipe shall be installed as required for soil, waste, or vent piping.

Suffice to say, the requirement to provide overflow on Buildings has been a code requirement for a very long time. In my career of almost 50 years, I have encountered maybe 4 or 5 roofs where the roof structure would support the weight of water to the top of the parapet walls. In all cases, these roofs had cast-in-place concrete decks that had been designed as future floors.

An overflow drainage system is not only a Code requirement but is common sense. Drains will become blocked at some point during the life of a building, whether from the lack of maintenance, a natural phenomenon like hail, blowing debris during hurricanes or thunderstorms, or from debris left on a roof. There is a very real possibility of a roof collapse if there is no safety value (overflow drainage system) to prevent an unsafe build-up of water. That is why overflow drainage has been a part of the Codes since the modern codes were introduced.

One of the first collapses I investigated in Fort Worth was a grocery store that had one scupper drain and no overflow. Someone threw a Sunday Fort Worth Star Telegram newspaper onto the roof, which became lodged in and completely blocked the scupper drain. Debris tends to migrate to the low point in the roof (the drain) with the flow of rainwater on the roof. Below are photographs of a drain blocked by airborne plastic shopping bags that resulted in the collapse of a Home Depot Store.

Another issue is rainfall intensity. Climate change is impacting rainfall rates, as warm air holds more moisture than cold air. A secondary purpose for an overflow drainage system is to provide additional drainage capacity in the event the rainfall rate exceeds the design rainfall rate. Intense

weather events like hurricanes, tropical storms, and severe thunderstorms create the conditions that can result in a roof collapse when the roof does not have an overflow system. Hurricane Harvey was a good example. The rainfall rates that occurred during Hurricane/Tropical Storm Harvey significantly exceeded the 1-hour, 100-year rainfall rate, which is the current design standard for roof drains. As a result, there were numerous collapses in the Gulf Coast of Texas from Harvey. Below is a headline in the Los Angeles Times.

In 1979, the Uniform Building Code added Chapter 32 in the Appendix of the code, which included reroofing requirements. Section 3209 (Chapter 32 in the Appendix) required that, "All re-roofing shall conform to the applicable provisions of Chapter 32 of this Code," which included the requirement for overflow drainage. This requirement for ensuring there was adequate overflow drains when reroofing a building was also incorporated into the first and subsequent IBC editions until 2015. This requirement was in the Codes for 36 years with no issues other than contractor liability issues. Overflow has been a fundamental life safety design issue for decades. The lack of a secondary drainage system is a serious design defect that is relatively easy to correct. This requirement for secondary drainage as well the requirement to meet all the other drainage requirements was deleted from the 2015 IBC.

Today, a roofing contractor can reroof a building and modify the existing drainage system without any code-required limitations. The Codes typically require contractors to use a licensed plumber to modify the plumbing on a simple remodel. Yet a roofing contractor can simply change the drainage design with no restrictions. Below are photographs of a roof collapse on a large manufacturing building in Dallas, Texas and a school in Little Rock, Arkansas. Both roofs collapsed after roofing contractors modified the drainage system and failed to provide a secondary drainage system. Both reroof installations would meet the current code requirements.

Roof collapses are a serious life safety issue. Fortunately, I have only worked on one roof collapse where there were fatalities. There have been many close calls. Maintenance personnel at the Little Rock school shown above heard noises and were able to evacuate the teachers before the roof collapsed. The Home Depot roof collapsed along the checkout isle an hour before the store opened. On May 5, 1995, we had a major hailstorm in the DFW area. A large number of people were caught out in the open at Mayfest, an outdoor festival. There were serious injuries as a

result of the hailstorm but no deaths. There were, however, two fatalities from a roof collapse at the Haggar Apparel Manufacturing Plant that occurred during the 1995 hailstorm. As stated previously, hail has a tendency to block drains and can cause a roof collapse if there is no overflow system. Below are excerpts from the Dallas Morning News describing the events from the 1995 storm.

This story was originally published on May 6, 1995:

Torrential rains, winds up to 70 mph and hail as big as grapefruits blasted North Texas on Friday night, causing at least four deaths, hundreds of injuries and widespread property destruction.

Hail and rain began falling about 6 p.m., blanketing streets and flooding areas from Weatherford to Dallas. Air, street and electronic traffic was snarled, disrupting 911 service in some areas and stranding motorists and airline passengers.

Two people were confirmed dead and 12 injured after the roof reportedly collapsed at the Haggar Apparel Manufacturing office on Lemmon Avenue in Dallas, officials said.

"All of a sudden you heard a boom, and people started screaming. 'Let me out, let me out!'" said Haggar employee Angel Solis.

The costs associated with adding overflow are relatively small. A normal overflow scupper costs around \$500 to \$1,000. A normal overflow drain costs around \$1,500 to \$3,000. Below are photographs from a roof collapse in Dallas, Texas. This is a good example that helps put the costs into perspective. The cost of the loss was in the millions of dollars due to the damage to the structure, loss of inventory, and business interruption. The roof was approximately 140,000 SF, and the cost to provide a secondary drainage system was approximately \$14,000. The cost to replace the roof was approximately \$1,120,000.00. The cost to increase the insulation to meet the Energy Code was approximately \$210,000, more than 10 times the cost of the overflow system.

Below is an excerpt from the 2018 IPC showing the Secondary (**Emergency**) Roofs Drains Section 1108. Overflow drains provide emergency relief in the event the primary drains are blocked or overwhelmed during intense rain events. This requirement combined with Section 1611 in the 2018 IBC defines the issue with overflow.

**SECTION 1108
SECONDARY (EMERGENCY) ROOF DRAINS**

1108.1 Secondary (emergency overflow) drains or scuppers.

Where roof drains are required, secondary (emergency overflow) roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason. Where primary and secondary roof drains are manufactured as a single assembly, the inlet and outlet for each drain shall be independent.

1108.2 Separate systems required.

Secondary roof drain systems shall have the end point of discharge separate from the primary system. Discharge shall be above grade, in a location that would normally be observed by the building occupants or maintenance personnel.

Roofs where “water will be trapped if the primary drains allow a buildup for any reason,” absolutely require an overflow drainage system, whether it is a new roof or a reroof. To summarize ...

Roofs without an overflow drainage system where water will be entrapped is a design and/or construction defect ... a defect that needs to be corrected.

The structural design of the building relies upon the overflow system in designing the roof structure for rain loads.

The lack of an overflow drainage system is the most common cause of roof collapses, which can be catastrophic events costing millions and resulting in the loss of life.

The modification proposed by RCI/IIBEC simply reinstates this critical life safety code requirement, a requirement that has been in the Codes for decades.

We are only talking about a small percentage of buildings where there is a need to correct a design and/or construction defect that will prevent roofs from collapsing.

Meeting this code requirement was not a problem in the decades that it was in the Codes.

Thank you for your consideration.

Bibliography: None

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

This proposed change restores a decades old code requirement for overflow and will not increase the costs based on editions of the IBC prior to 2015.

It will involve a relatively modest cost increase over the current code, which is discussed in my technical support in "Reasons."

Public Comment# 1528

Public Comment 3:

Proponents:

Stewart Verhulst, representing Self (sverhulst@nelsonforensics.com)

requests As Submitted

Commenter's Reason: In my opinion, the proposed change reflected in S2-19 is an important change that will allow for safer buildings. I have investigated many roof collapses that were caused by inadequate drainage. In many cases, properly designed and installed secondary drainage would have prevented the collapse.

Roof drainage is a life safety concern. I recently investigated a structure that experienced a roof collapse over an office area due to one blocked primary drain and a lack of secondary drainage. The roof had been re-roofed years earlier and no secondary drainage was added. Luckily, the collapse happened in the night and nobody was injured or killed. I have investigated other roof collapses that happened because of a lack of proper secondary drainage and I have identified safety concerns on other buildings due to poor roof drainage. This includes a high school where the secondary drains were up to 9" above the level of the primary drains. It is in the best interest of building occupants and the safety of the public for roofs to have proper roof drainage.

The modification of this code section will make the built environment safer for the public.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

This change will increase the initial cost of construction. However, some costs will decrease over the long term due to better roof performance and less roof collapses. Also, this change will increase public safety.

Public Comment# 2080

IBC: 1511.6.1 (New)

Proposed Change as Submitted

Proponents: Bill McHugh, The McHugh Company, representing Chicago Roofing Contractors Association (bill@mc-hugh.us)

2018 International Building Code

1511.6 Flashings. Flashings shall be reconstructed in accordance with *approved* manufacturer's installation instructions. Metal flashing to which bituminous materials are to be adhered shall be primed prior to installation.

Add new text as follows:

1511.6.1 Flashing Heights. Wall and curb flashings shall be not less than 8 inches (203 mm) above the roof covering surface. A reduction of the required roof assembly thickness to accommodate the limited heights shall be in accordance with the roof covering manufacturer's instructions.

Reason: The purpose of this code proposal is to provide the code official guidance when roofing work takes place on existing buildings. When the scope of work is to replace the roof covering, (See 202 definition for roof covering replacement), the building owner and manager should not have to rebuild the rooftop to accommodate thick roofing components.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This code proposal will provide the building owner and manager with the option to not have to rebuild the roof assembly in some cases. In other cases, it does not provide cost savings.

S3-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The code change proposal's intent is unclear and may create other issues with re-roofing.

Individual Consideration Agenda

Public Comment 1:

IBC®: 1511.6.1 (New)

Proponents:

Bill McHugh, representing Chicago Roofing Contractors Association (billmchugh-jr@att.net)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1511.6.1 Flashing Heights. For roofs with slope $\leq 2:12$, wall and curb flashings shall be not less than 8 inches (203 mm) above the roof covering surface. A reduction of the required roof assembly thickness to accommodate the limited flashing heights shall be allowed, in accordance with the roof covering manufacturer's instructions.

Commenter's Reason: During the Committee Action Hearings, there were comments that skylights are allowed to be 4" above the roof surface.

The intent of the proposal was to mandate 8" flashing heights for low sloped roofs - those roofs 2:12 - and not medium or steep slope roofs. Therefore, the proposal has been modified to state the scope of the passage is for low slope roofs. The second adjustment is to address the committee statement that the proposal is unclear. The changes make the proposal focused at what was originally intended and clarifies the proposal.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The exact amount of decrease is difficult to determine. However, by limiting the thickness of the roof assembly, curbs do not have to get replaced, nor walls with doors or windows too low have to be replaced.

Public Comment# 1792

Public Comment 2:

Proponents:

Justin Koscher, representing Polyisocyanurate Insulation Manufacturers Association (jkoscher@pima.org); Marcin Pazera, Polyisocyanurate Insulation Manufacturers Association, representing Polyisocyanurate Insulation Manufacturers Association (mpazera@pima.org)

requests Disapprove

Commenter's Reason: This proposal should be disapproved because it adds unnecessary and confusing language regarding roofing wall and curb flashing heights. Flashing height requirements are appropriately addressed in manufacturer's installation instructions and existing IBC requirements.

- First, the proposal's prescriptive requirement for 8" flashing heights is improper. The prescriptive limit will restrict well-accepted roofing industry installation practices and create potential conflicts with manufacturer's installation instructions.
- Second, the proposal improperly references "required roof assembly thickness." The building code does not regulate roof assemblies by thickness. Therefore, the proposed language is unenforceable and confusing.
- Third, the proposal will create problems for existing buildings. Many existing roofs are constructed with flashing heights less than 8 inches. In a roof recover project, materials in the existing assembly may need to be removed in order to comply with the proposed minimum flashing height requirement. This could result in reduced energy efficiency in existing roof systems, and it is counter-intuitive to the intent of the IECC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. No change to code.

Public Comment# 1638

S4-19

IBC: 1511.5 (New)

Proposed Change as Submitted

Proponents: Bill McHugh, The McHugh Company, representing Chicago Roofing Contractors Association (Bill@mc-hugh.us)

2018 International Building Code

Add new text as follows:

1511.5 Roof Covering Replacement. Where an existing roof covering is removed, exposing insulation or sheathing and only a new roof covering is installed.

Reason: The purpose of this proposal is to put code language that ties in with the new definition in section 202 for Roof Covering Replacement. This provides guidance to code users for an area that is not covered at all by the code. This situation, roof covering replacement, is a question that's asked about frequently. This is where the roof covering system life can be extended by adding a new roof covering material alone by 'peeling' off the old roof covering material. There are situations where this method is not only practical but preferred. In fact, the City of Chicago added this definition through its 2016 Roofing Memorandum.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This code proposal provides an option not available to the building owner and manager. The result is it will be no increase in the cost of construction where or a big savings in cost due to not having to rework the roof assembly to accommodate roofing component thicknesses.

S4-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The code change is not required. The proposal creates a definition for which there are no current code requirements and is not utilized elsewhere.

(Vote: 14-0)

Assembly Action:

S4-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1511.5 (New)

Proponents:

Bill McHugh, representing Chicago Roofing Contractors Association (billmchugh-jr@att.net)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1511.5 Roof Covering-Membrane Peel and Replacement. For roofs <2:12, where an existing roof covering-membrane is removed, exposing insulation or sheathing and only a new roof membrane covering is installed, the thickness of the roof assembly shall be allowed to be reduced to the maximum amount that will accommodate existing flashing heights.

Commenter's Reason: The reason for this public comment is to address the committees concerns that the language was incomplete. Secondly, there is new information since the Committee Action Hearings.

This new language is now part of the Chicago adoption of the International Family of Codes and the Illinois Adoption of the 2018 International Energy

Conservation Code.

Roof membrane peel and replacement is a way to provide longer service life to the insulation installed on the building's rooftop. Through re-use of the insulation, life cycle costs of the insulation are reduced. If the membrane peel causes surface irregularities, the roof membrane manufacturer can recommend adequate measures such as a suitable cover board to prepare the surface.

There are over 900,000 listings in the FM Approval Guide alone, not counting UL's listings. That gives the designer the ability to find another listing, using the insulation, cover board, and new membrane and matching it to a listing, providing code compliance.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

The effect of this code change is that the building owner and manager does not need to buy new insulation for this type or roof operation. The magnitude of cost decrease is hard to calculate because each situation, each roof is different. Some roofs will be slightly less costly, some much less costly. It depends on the conditions of the existing roof assembly and flashings. The reason for the cost reduction is that the new construction thickness of insulation will not be required in the case of a technical infeasibility on an existing building.

Public Comment# 1795

Public Comment 2:

Proponents:

Justin Koscher, representing Polyisocyanurate Insulation Manufacturers Association (jkoscher@pima.org); Marcin Pazera, Polyisocyanurate Insulation Manufacturers Association, representing Polyisocyanurate Insulation Manufacturers Association (mpazera@pima.org)

requests Disapprove

Commenter's Reason: This proposal should be disapproved because it reduces building energy efficiency and creates life-safety issues for reroofing.

- This proposal introduces new category of reroofing that is not necessary because Chapter 15 of the IBC (Section 1511.3 "Roof Replacements") already offers two options for reroofing: roof replacement and roof recover. Section C1511.3.1 "Roof Recover" permits a one-time roof recover without the removal of the membrane to extend the life of the roof system.
- This proposal is in direct conflict with Section 1511.3 "Roof Replacement" provisions of the IBC, which requires removal of all materials down to the roof deck. In addition, this proposal offers other challenges and concerns. It allows for the replacement of the roof membrane alone without removal of materials below the membrane and thus does not provide an opportunity for assessing the condition of the roof deck. Roof decks are structural components of the roof system that transfer loads to the supporting structure and conditions assessment is a critical part of good reroofing practice. Recommendation for existing roof decks to be inspected from both above and below is part of the long-standing guidance from the National Roofing Contractors Association.
- In addition, this proposal will create a loophole allowing for substitution of roof covering materials that are not in compliance with recognized third-party system listings (such as FM Global or UL) with regard to wind uplift and fire resistance performance. Third-party test agencies issue roof system listings for roof recover and roof replacement systems, but not for a "peel and replaced" roof membrane project.

Bibliography: Chapter 9 Reroofing, "The NRCA Roofing Manual: Membrane Roof Systems," National Roofing Contractors Association (2019).

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction No change to code.

Public Comment# 1640

S5-19

IBC: 1511.3 (IEBC 705.3)

Proposed Change as Submitted

Proponents: Mike Fischer, Kellen Company, representing The Polyisocyanurate Insulation Manufacturers Association (mfischer@kellencompany.com); Marcin Pazera, representing The Polyisocyanurate Insulation Manufacturers Association (mpazera@pima.org)

2018 International Building Code

Revise as follows:

1511.3 Roof replacement. *Roof replacement* shall include the removal of all existing layers of roof coverings and roof assembly materials down to the roof deck.

Exception: Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507.

Reason: The current code language instructs the user to remove all roofing materials down to the deck when performing a roof replacement. The exception for ice barrier membrane illustrates that fact. The definition of roof replacement includes instructions to repair damaged substrate (such as the roof deck and supporting structure):

ROOF REPLACEMENT. The process of removing the existing *roof covering*, repairing any damaged substrate and installing a new *roof covering*.

IBC Section 1511.1 reads:

Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

Requirements for roof assemblies in Chapter 15 include assembly testing for wind and fire resistance. The assembly tests typically include all materials including fasteners, insulation, and cover boards. There have been indications of a practice known as "peel and replace" where only the outermost layer (roof covering membrane) is removed, and another membrane subsequently applied. This practice makes it impossible to meet the IBC provisions for repairing damaged substrate because the deck will not be exposed for inspection. It also conflicts with 1511.3 because the requirements for wind and fire testing are based on assembly tests with known materials, not an assembly of new and existing materials that may or may not comply with current material properties and standards.

This proposal is a clarification of the current code provisions, industry recommendations, and test requirements. The need to install new roof assembly materials in a roof replacement in a manner that is consistent with tested assemblies is necessary to demonstrate code compliance and ensure that the system will perform as intended. This interpretation of the intent of the code is consistent with industry guidance on the subject.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The proposal is a clarification to current requirements.

S5-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Bill McHugh, representing Chicago Roofing Contractors Association (billmchugh-jr@att.net)

requests Disapprove

Commenter's Reason: It is unclear that in this committee approved proposal that the roof deck now has to be removed and replaced during roof replacement. In addition, this now means tons of materials that could be reused go into landfills. Why should material - insulation, ballast - other items - that have more usable life be put in landfills? The mandate to remove all materials, is in conflict with S10-19, the NRCA's approved proposal in section 1511.5, Reinstallation of materials - that allows reuse of gravel and ballast. This proposal has made compliance difficult, at best.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

The effect of disapproval means that some materials do not have to be removed and replaced. This code proposal, if passed, will increase the cost of construction.

Public Comment# 1799

Proposed Change as Submitted

Proponents: Wanda Edwards, Wanda Edwards Consulting, Inc., representing RCI, Inc. (wedwards@rci-online.org)

2018 International Building Code**SECTION 1511
REROOFING****Revise as follows:**

1511.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

ExceptionsException:

1. ~~Roof replacement or roof recover~~ of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide positive roof drainage.
2. ~~Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4 for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1503.4.~~

Reason: In 2015 the IBC added Exception #2 to Section 1511.1. This exception allows a roof replacement or roof recover to omit secondary drainage if none is present on the existing roof and the roof provides positive drainage. Roofs that provide positive roof drainage do not meet the minimum slope code requirement of 1/4" inch per foot. This exception has created a serious life safety issue because roofs that do not provide adequate slope are prone to collapse when the rainwater accumulation exceeds the design values.

There are several reasons for roof collapses. First, many existing buildings were built before the code addressed requirements related to roof slope, roof drains or scuppers. Existing roofs may not have adequate slope or an adequate secondary drainage system and what exists does not meet any code. Most roof collapses are due to inadequate overflow drainage or inadequate slope. Frequently, the structural engineer is not involved in the drainage design nor is a ponding analysis performed, and this exception does not require the installation of secondary drainage.

In a white paper presented at the 2018 RCI Annual Convention, Dr. Steve Patterson, PE and Dr. Medan Mehta, PE details the problems of not installing secondary roof drainage and the failures that they have investigated. The paper gives an in-depth analysis of roof drainage design and how water accumulates on the roof and results in collapse. The paper also reviews the code history of drainage design and requirements. Their research confirmed that secondary drainage has been a code requirement since the 80's. Exception #2 of Section 1511.1 represents the deletion of a long-standing code requirement. Roof drainage is one of the most important roof design elements and the overflow drainage is its most part – the function of the overflow drainage is to prevent the roof from collapsing – an important life safety issue. For these reasons, secondary drainage should once again be required in the code.

Bibliography: Steve Patterson and Medan Mehta. Roof Drainage Design, Roof Collapses and the Codes. March 2018, 32nd Annual RCI Convention proceedings, page 122.

Cost Impact: The code change proposal will increase the cost of construction

When compared to the 2018 IBC, the proposal will increase the cost of construction. However, comparing the proposal to the 2012 IBC, there will be no increase in cost.

S9-19

Public Hearing Results**Committee Action:****Disapproved**

Committee Reason: Current code exception was a reasonable compromise in the previous edition of the Code. No need for change at this time. (Vote: 12-1)

Assembly Action:**None**

Individual Consideration Agenda

Public Comment 1:

Proponents:

Stephen Patterson, representing Roof Technical Services, Inc. (spatterson@rooftechusa.com)

requests As Submitted

Commenter's Reason: This proposed modification restores the decades old requirement to ensure that there is an overflow drainage system on buildings without an overflow drainage system that need an overflow drainage issues. It is an important life safety issue. Below is my technical support for this proposal.

Public Comment S9-19

My name is Stephen L. Patterson. I am a licensed engineer and registered roof consultant and have extensive experience in roof design and structural issues related to roofs. I have published several papers, a book, and a monograph that address drainage issues. My roofing experience includes being the general manager of a large roofing contracting company and the director of engineering/technical director for two roofing manufacturers. I have spent 36 years as a consulting engineer/roof consultant and have designed and inspected literally 1000's of roofs. I have investigated well over 50 roof collapses in my career.

This proposed change in the code eliminates Exemption 2 in Section 1511.1 in the 2018 IBC. Exemption 2 was added in 2015, and Exemption 2 eliminates the requirement "to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4...." It is my opinion that Exemption 2 should be removed in order to restore the requirement to meet the requirement for emergency overflow drains or scupper whenever a building is reroofed or the roof is recovered. My Public Comments on S-2 and S-8 provide a detailed discussion explaining the need for emergency overflow drains or scuppers. Please review my Public Comments on S-2 and S-8. The following simply highlights many of the point included in my Public Comments on S-2 and S-8.

Fundamentally, overflow drainage systems are designed to prevent an unsafe build-up of water on a roof in the event the primary drainage system is blocked, restricted, or overwhelmed. A majority of these collapses involve the lack of an appropriate overflow drainage system. Below are the key issues.

First of all, this modification in the Code only affects a very small percentage of roofs that are reroofed every year. The vast majority of roofs either drain over the edge and do not require an overflow drainage system or already have an overflow drainage system. These roofs are not affected by this modification.

This discussion concerns roofs with parapet walls where water can build up on a roof if the primary drains become blocked or overwhelmed. These roofs absolutely require overflow drains. The lack of overflow is mistake; it a design and/or construction defect. An overflow drainage system is a fundamental structural design requirement for a roof structure and the roof.

In the vast majority of cases, overflow drains or scuppers can easily be added, and the cost is relatively low. The requirement to ensure there is an overflow drainage system when recovering or reroofing a building has been in the Codes for decades. For the most part, the roofing community has dealt with this issue successfully with few, if any, problems.

The only problems I am aware of are contractor liability issues. Specifically, I am talking about roofs where the roofing contractor failed to add overflow when they reroofed the building and the roof collapsed. To be sure, these are relatively rare occurrences, but the consequences are significant, and the costs associated with roof collapses are in the millions.

I sincerely believe that the underlying reason for the National Roofing Contractors Association's (NRCA's) 2015 proposed modification to eliminate the requirement for overflow drainage was an attempt to protect roofing contractors from litigation arising out of the failure of roofing contractors to meet the Code and had little to do with the cost or complexity of adding overflow drains.

Based on the 2015 change and this current 2018 IBC, a roofing contractor can reroof a building and modify the existing drainage system without any code required limitations. The Codes typically require contractors to use a licensed plumber to modify the plumbing on a simple remodel. Yet a roofing contractor can simply change the drainage design with no restrictions. Below are photographs of a roof collapse on a large manufacturing building in Dallas, Texas and a school in Little Rock, Arkansas. Both roofs collapsed after roofing contractors modified the drainage system and failed to provide a secondary drainage system. Both reroof installations would meet the current code requirements.

Roofs where “water will be trapped if the primary drains allow a buildup for any reason,” absolutely require an overflow drainage system, whether it is a new roof or a reroof. To summarize ...

Roofs without an overflow drainage system where water will be entrapped is a design and/or construction defect ... a defect that needs to be corrected.

The structural design of the building relies upon the overflow system in designing the roof structure for rain loads.

The lack of an overflow drainage system is the most common cause of roof collapses, which can be catastrophic events costing millions and resulting in the loss of life.

The modification proposed by RCI/IIBEC simply reinstates this critical life safety code requirement, a requirement that has been in the Codes for decades.

We are only talking about a small percentage of buildings where there is a need to correct a design and/or construction defect that will prevent roofs from collapsing.

Meeting this code requirement was not a problem in the decades that it was in the Codes.

Thank you for your consideration.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This change will increase the construction cost on the small percentage of roofs that require overflow. The costs represent a fraction of the reroofing costs.

This change will restore the decades old requirement and would not represent a cost increase based on the IBC editions prior to 2015.

Public Comment# 1534

Public Comment 2:

Proponents:

Walter Rossiter, representing the International Institute of Building Enclosure Consultants (IIBEC), representing IIBEC

requests As Submitted

Commenter's Reason: Prior to the 2015 IBC, emergency overflow drainage was required for all roofing projects to prevent structural failure in the event the primary drainage system become blocked for any reason. In the 2015 Code Development Cycle, Exception 2 was added to remove this requirement, thereby not allowing discharge to occur before overloading the structure. This modification returns the Code to comply with the requirements in force prior to the 2015 modification.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This code change proposal will not represent a cost increase when compared to the 2012 IBC.

465 Waverly Oaks Road, Suite 421
Waltham MA 02452

GT-1-2016: Test Standard for Gutter Systems

Reason: KULIK: Studies of the aftermath of high-wind events revealed that many gutter systems did not resist the loads that occur during these high-wind events. Examples of these observations are shown below. SPRI developed the gutter test standard to address this issue. The wind resistance tests included in this standard measure the resistance of the gutter system to wind forces acting outwardly (away from the building) and to wind forces acting upwardly tending to lift the gutter off of the building. The standard also measures the resistance of the gutter system to static forces of water, snow and ice acting downward. The six figures at the end of this reason statement are examples of gutter failures during high wind events observed during investigations conducted by the Roofing Industry Committee on Weather Issues (RICOWI).

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac/>.

HICKMAN: This proposal requires that gutters that are used as part of the edge securement of single-ply roof membranes be tested to the appropriate standard for acceptable wind resistance performance.

Studies of the aftermath of high-wind events revealed that many gutter systems did not resist the loads that occur during these high-wind events. When gutters are used to secure the roof membrane, a gutter failure can become a much bigger problem as it can cause a roof failure. Examples of these observations are shown below.

SPRI developed the gutter test standard to address this issue. The wind resistance tests included in this standard measure the resistance of the gutter system to wind forces acting outwardly (away from the building) and to wind forces acting upwardly tending to lift the gutter off of the building. Following are examples of gutter failures during high wind events observed during investigations conducted by the Roofing Industry Committee on Weather Issues (RICOWI).

2.11-2. Membrane peeled away from the insulation and detached from the roof in most

2.11-10. Photo of gutter/cleat attachment is a good example of damage progression.

3-08-1. Small retail building. Close up of windblown, deflected gutter.

3-08-2. Small retail building. Roof view of lifted gutter and metal edge. Note roof membrane has not peeled back.

3-09-2. Large retail building. Gutter metal blew across the roof, puncturing the roof membrane and breaking skylights.

3-09-3. Large retail building. Broken skylights became wind-borne debris, puncturing roof membrane—SE view.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

KULIK: Even though there would be some increased cost to the manufacturer due to the testing of the gutter, it would be negligible, estimated around \$0.058 /LF. This would be a one-time cost amortized over production time of the gutter. The nominal cost would most likely not increase the cost of construction. Not every gutter is required to be tested (depends on profile and attachment type). Once the gutter is tested, it is good forever so the cost of the test is spread out over time and over all the feet of gutter produced.

HICKMAN: The code change proposal will not increase or decrease the cost of construction. This would be a one-time cost amortized over production time of the gutter. Once the gutter is tested, it is good forever so the cost of the test is spread out over time and over all the feet of gutter produced. Even though there would be some increased cost to the manufacturer due to the testing of the gutter, it would be negligible, less than \$0.05 /LF. Not every gutter is required to be tested (depends on profile and attachment type).

Staff Analysis: A review of the standard proposed for inclusion in the code, SPRIGT-1-2016 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

S17-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the gutter flange or drop are typically not tested. Unclear on the term 'extreme gutter'. The committee

felt it was inappropriate to have gutters in two different places in the code. The committee asked the proponent if gutter replacement requires a permit and were told 'no'. (Vote: 9-5)

Assembly Action:

None

S17-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1504.5.1 (New)

Proponents:

Amanda Hickman, representing Single-Ply Roofing Industry (SPRI) (amanda@thehickmangroup.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1504.5.1 Gutter securement for low-slope roofs. External Gutters that are used to secure the perimeter edge of the roof membrane on low-slope (less than 2:12 slope) built-up, modified bitumen, and single ply roofs, shall be designed, constructed and installed to resist wind loads in accordance with Section 1609 and shall be tested in accordance with Test Methods G-1 and G-2 of SPRI GT-1.

Commenter's Reason: This comment clarifies the intent of the original proposal. It also addresses the committees concerns regarding the location of the edge. This language is needed in order to prevent roof failure caused by blow-off of a gutter that is used to secure a roof membrane.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This public comment does not have a cost impact, as it is editorial in nature.

Public Comment# 1252

Public Comment 2:

IBC®: 1504.5.1 (New)

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1504.5.1 Gutter securement for low-slope roofs. ~~External gutters.~~ Gutters that are used to secure the perimeter edge of the roof membrane on low-slope (less than 2:12 slope) built-up, modified bitumen, and single ply roofs, shall be designed, constructed and installed to resist wind loads in accordance with Section 1609 and shall be tested in accordance with Test Methods G-1 and G-2 of SPRI GT-1.

Commenter's Reason: Members of BCAC as well as a number of stakeholders discussed both the need for and the specific language of this proposal at great lengths. To address the committee and stakeholder feedback only minor editorial changes have been made in this public comment. Low slope roofs that use gutters as a means to completely or in some part secure the perimeter edge of the roof membrane (see Figure 1) can be particularly vulnerable to roof failure. Therefore, it is critical that where a gutter blow-off could cause a roof membrane failure, the gutter needs to be tested appropriately for resistance to wind load.

All new construction and reroof projects must be permitted. Anytime a new gutter is included in the scope of that work, it is part of the submitted plans for permit. The proposed language is easily enforceable and will lead to safer better performing roofs.

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommitteebcac>.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

Even though there would be some increased cost to the manufacturer due to the testing of the gutter, it would be negligible, estimated around \$0.058 /LF. This would be a one-time cost amortized over production time of the gutter. The nominal cost would most likely not increase the cost of construction. Not every gutter is required to be tested (depends on profile and attachment type). Once the gutter is tested, it is good forever so the cost of the test is spread out over time and over all the feet of gutter produced. performing roofs.

2018 International Building Code

Delete and substitute as follows:

~~**1504.8 Surfacing and ballast materials in hurricane-prone regions.** For a building located in a hurricane-prone region as defined in Section 202, or on any other building with a mean roof height exceeding that permitted by Table 1504.8 based on the exposure category and basic wind speed at the site, the following materials shall not be used on the roof:~~

- ~~1. Aggregate used as surfacing for roof coverings.~~
- ~~2. Aggregate, gravel or stone used as ballast.~~

1504.8 Wind resistance of aggregate-surfaced roofs. Aggregate surfaced roofs shall comply with Table 1504.8.

TABLE 1504.8
MAXIMUM ALLOWABLE MEAN ROOF HEIGHT PERMITTED FOR BUILDINGS WITH AGGREGATE ON THE ROOF IN AREAS OUTSIDE A HURRICANE-PRONE REGION

NOMINAL DESIGN WIND SPEED, V_{asd} (mph) ^{b, d}	MAXIMUM MEAN ROOF HEIGHT (ft) ^{a, c}		
	Exposure category		
	B	C	D
85	170	60	30
90	110	35	15
95	75	20	NP
100	55	15	NP
105	40	NP	NP
110	30	NP	NP
115	20	NP	NP
120	15	NP	NP
Greater than 120	NP	NP	NP

For SI: 1 foot = 304.8 mm; 1 mile per hour = 0.447 m/s.

a. Mean roof height as defined in ASCE 7.

b. For intermediate values of V_{asd} , the height associated with the next higher value of V_{asd} shall be used, or direct interpolation is permitted.

c. NP = gravel and stone not permitted for any roof height.

d. V_{asd} shall be determined in accordance with Section 1609.3.1.

TABLE 1504.8

	150	12	14	17	19	22	24	29	34	39	18	21	23	26	29	32	37	43	48

For SI: 1 inch = 25.4 mm; 1 foot = 304.8 mm; 1 mile per hour = 0.447 m/s.

a. Interpolation shall be permitted for mean roof height and parapet height.

b. Basic design wind speed, V, and wind exposure shall be determined in accordance with Section 1609.

c. Where the minimum required parapet height is indicated to be 2 inches (51 mm), a gravel stop shall be permitted and shall extend not less than 2 inches (51 mm) from the roof surface and not less than the height of the aggregate.

d. For Exposure D, add 8 inches (203 mm) to the parapet height required for Exposure C and the parapet height shall not be less than 12 inches (305 mm).

Reason: In summary, this proposal has the following features:

1. Updates Table 1504.8 to a "basic design wind speed" basis and eliminates use of ASD wind speed to be consistent with changes made throughout the IBC in previous cycle to correlate with newer wind maps based on "ultimate" wind speeds (now called basic design wind speed).
2. Provides an engineering and scientific basis for roof design to prevent aggregate blow-off based on over 200 wind tunnel tests coupled with subsequent field studies from several different hurricane events with documented conditions and performance. See Bibliography (Kind-Wardlaw, 1976; Kind, 1977; Crandell & Smith, 2009; Crandell & Fischer, 2010; etc.)
3. Corrects unsafe conditions that the current Table 1504.8 allows based on scientifically incorrect assumptions (e.g., allows 170' tall buildings with aggregate surfaced roofs and NO PARAPET).
4. Accounts for aggregate size distribution in the referenced ASTM aggregate standards, including the minimum permitted aggregate size in the referenced mixes as addressed in the referenced wind tunnel studies for this proposal which replicated actual aggregate size distribution (Kind, 1977) as also confirmed in field studies (e.g., Crandell & Smith, 2009).
5. Has been independently confirmed by later field study subsequent to the original research with the purpose of verifying the accuracy and effectiveness of the design methodology based on actual performance of real buildings and real hurricane events (Morrison, 2011).

This proposal is consistent with S19-16 and a public comment (PC#2) that was submitted in response to the structural committee's direction in 2016. The public comment was approved at public hearing only to be spuriously overturned during the on-line governmental vote. What follows, for the record, are the reason statements from the original S19-16 proposal and PC#2 (with modest editing to fit the context of this proposal):

A) From the original S19-16 proposal (excerpt slightly edited):

The current provisions in Section 1504.8, and specifically Table 1504.8, are not based on the Kind-Wardlaw (K-W) design method (Kind Wardlaw 1976), the wind tunnel studies underlying the K-W design method (Kind 1977), or a quantitative analysis of observed good and bad roofing system

performances in real wind events. Instead, current building code requirements are based on variation in surface pressure with building height which is known to be an inappropriate predictor of aggregate blow-off or scour due to pressure equalization effects (Smith, 1997). Furthermore, these recent requirements do not address critical parameters such as aggregate size and parapet height which govern performance. This code change proposal replaces the current Table 1504.8 with one based on the K-W design method and new research by the Asphalt Roofing Manufacturers Association (ARMA) (Crandell and Fischer, 2010). Results demonstrate that the use of aggregate-surfaced roofing systems is a viable option in high wind areas with appropriate aggregate sizing and parapet design. The K-W design method has been simplified, improved, and calibrated to a number of field observations from actual hurricane events to refine its application to low-slope, built-up roof (BUR) and sprayed polyurethane foam (SPF) roof systems (Crandell Smith, 2009).

B) From PC2 on S19-16 (slightly edited):

In response to the structural committee's comments and indication that "this proposal is headed in the right direction", this public comment addresses the committee's recommendation to simplify and improve readability of the table (which was partly a font size or CDP access table formatting issue). These revisions are technically consistent with the original S19-16 proposal and the referenced research.

The 2016 committee also mentioned that questions were raised with regard to how the provisions were developed from the referenced research. The methodology (and design procedure) is clearly documented in the referenced research in an understandable, repeatable, and scientific manner (see original S19-16 proposal's reason statement (above) and bibliography (below) for referenced research reports and papers. The procedure used is consistent with the findings of many wind tunnel studies and uses the same principles as applied in the ANSI/SPRI RP-4 standard currently referenced in the code. It is also consistent with the treatment of aggregate blow-off as incorporated in wind risk models. Furthermore, the analytical procedure was evaluated by comparison to numerous documented field studies of successful and failed loose aggregate surfaced roofs systems in various high wind events to confirm its ability to reliably predict performance as a means to design roofs (or develop prescriptive provisions as proposed) to prevent roof aggregate blow-off. Thus, a robust combination of current engineering practice, wind tunnel data, and field research was used to support development of the requirements as proposed for Table 1504.8.

However, this proposal does not merely provide a more academic solution. It is necessary to correct deficiencies in the current code provisions. For example, the current Table 1504.8 allows buildings up to 170' tall or buildings in areas with design wind speeds up to 120 mph with NO PARAPET which creates a general safety hazard (e.g., falling debris from the roof) and unacceptable wind damage vulnerability (i.e., aggregate blow-off risk). This proposal corrects this safety and building performance issue based on correct scientific principles and sound engineering practices.

If implemented, this proposal will serve to prevent many past observations of roof aggregate blow-off from being repeated. Simply put, this proposal is implementing lessons learned in a rational, scientific manner based on real-world and wind tunnel laboratory data to prevent history from repeating itself in an unfavorable manner. Any argument against this proposal as being inadequate is an argument to leave the code in a far worse condition from a building safety and performance standpoint.

In closing, the following quote from Morrison (2011) provides independent, confirmation of the design methodology used for this proposal and is based on the documented performance (and aggregate and parapet conditions) of 20 buildings with aggregate surfaced roofs experiencing Hurricanes Francis and Jeanne in 2004:

"The major intent of this study was to determine the validity of Crandell's Modified Kind-Wardlaw Design Method for Buildings of All Heights [Crandell & Smith, 2009; Crandell & Fischer, 2010].

An X-value calculation was determined to compare the adjusted critical wind speed (V_{cr}) to the actual estimated wind speed (V_{roof}). Per Crandell's Method, a positive X-value would be "safe" from the standpoint of aggregate blow-off. Indeed, this was consistent with the observations.

In fact, Crandell's Method appears to be quite conservative since 12 of the 20 roofs observed had negative X-values but no observed or reported aggregate blow-off. The single roof that did experience blow-off had an X-value of -52. While this might suggest that Crandell's Method has a "safety factor" of about 50 mph wind speed, this is only one sample, and there were multiple uncertainties in this analysis."

In summary, this proposal is a significant improvement of the existing provisions in the code and will result in better performing and safer aggregate surfaced roofs based on a proven and robust design approach.

Cost Impact: The code change proposal will increase the cost of construction

Overall, the proposed new Table 1504.8 will provide additional options for use of aggregate surfaced roofs that are safer than the current provisions and which may reduce cost. In some cases, depending on current practice and the basic design wind speed condition for a building site, a parapet (or taller parapet) and/or larger aggregate may be required for compliance. In these cases, an incremental cost increase can be expected.

	150	12	14	17	19	22	24	29	34	39	18	21	23	26	29	32	37	43	48

For SI: 1 inch = 25.4 mm; 1 foot = 304.8 mm; 1 mile per hour = 0.447 m/s.

- a. Interpolation shall be permitted for mean roof height and parapet height.
- b. Basic design wind speed, V, and wind exposure shall be determined in accordance with Section 1609.
- c. Where the minimum required parapet height is indicated to be 2 inches (51 mm), a gravel stop shall be permitted and shall extend not less than 2 inches (51 mm) from the roof surface and not less than the height of the aggregate.
- d. For Exposure D, add 8 inches (203 mm) to the parapet height required for Exposure C and the parapet height shall not be less than 12 inches (305 mm).
- e. Where the topographic factor (Kzt), as determined in accordance with ASCE 7 Section 26.8, is greater than 1.0, Additional calculations are required to determine parapet height.

Commenter's Reason: When applicable, the topographic factor Kzt can have a significant impact of the wind forces applied to a structure. The parapet height will need to be accordingly increased as a result of the higher wind forces. The footnote is added to put the individual selecting the parapet height on notice of the needed analysis.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. However, overall safety will be improved.

- b. Basic design wind speed, V, and wind exposure shall be determined in accordance with Section 1609.
- c. Where the minimum required parapet height is indicated to be 2 inches (51 mm), a gravel stop shall be permitted and shall extend not less than 2 inches (51 mm) from the roof surface and not less than the height of the aggregate.
- d. For Exposure D, add 8 inches (203 mm) to the parapet height required for Exposure C and the parapet height shall not be less than 12 inches (305 mm).
- e. Any section of a roof requiring a parapet to conform with the table, shall have a parapet, or an adjacent wall which is taller than the parapet, on all sides. The minimum parapet height on any section of a roof shall be determined at the highest elevation where the parapet and roof intersect. Other portions of the parapet, on any section of a roof, shall have a height greater than this minimum, due to roof slope.

Commenter's Reason: The Table doesn't have provisions for stepped roofs. Literature referenced by the proponents, discussed averaging the parapet heights between high points and low points. In many cases, parapets are only placed on three sides of the roof of single story commercial buildings. After Hurricane Wilma, the commenter observed roofing and other debris which had been blown off the back side of such buildings

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction
However public safety will be improved.

	150	12	14	17	19	22	24	29	34	39	18	21	23	26	29	32	37	43	48

For SI: 1 inch = 25.4 mm; 1 foot = 304.8 mm; 1 mile per hour = 0.447 m/s.

- a. Interpolation shall be permitted for mean roof height and parapet height.
- b. Basic design wind speed, V, and wind exposure shall be determined in accordance with Section 1609.
- c. Where the minimum required parapet height is indicated to be 2 inches (51 mm), a gravel stop shall be permitted and shall extend not less than 2 inches (51 mm) from the roof surface and not less than the height of the aggregate.
- d. For Exposure D, add 8 inches (203 mm) to the parapet height required for Exposure C and the parapet height shall not be less than 12 inches (305 mm).

Commenter's Reason: Similar to the provisions for snow drift contained in ASCE 7-16 Section 7.7, where the aggregate is restrained from blow-off by the parapet it is possible that significant aggregate weight can build up in localized areas. With allowable parapet heights of up to 56 inches, the "aggregate drift" that can build up along the parapet can be significantly larger than the roof design dead and live loading. The effect of this weight should be accounted for in the design of the roof and parapet framing.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. However there will be an increase in safety.

Public Comment# 2129

S23-19

IBC®: 1507.1.1, TABLE 1507.1.1(1), ASTM Chapter 35 (New)

Proposed Change as Submitted

Proponents: Gregory Keeler, representing Owens Corning (greg.keeler@owenscorning.com)

2018 International Building Code

Revise as follows:

1507.1.1 Underlayment. Underlayment for asphalt shingles, clay and concrete tile, metal roof shingles, mineral-surfaced roll roofing, slate and slate-type shingles, wood shingles, wood shakes, metal roof panels and *photovoltaic shingles* shall conform to the applicable standards listed in this chapter. Underlayment materials required to comply with ASTM D226, D1970, D4869, ~~and D6757~~ and ASTM WK51913 shall bear a label indicating compliance with the standard designation and, if applicable, type classification indicated in Table 1507.1.1(1). Underlayment shall be applied in accordance with Table 1507.1.1(2). Underlayment shall be attached in accordance with Table 1507.1.1(3).

Exceptions:

1. As an alternative, self-adhering polymer modified bitumen underlayment complying with ASTM D1970 and installed in accordance with the manufacturer's installation instructions for the deck material, roof ventilation configuration and climate exposure for the roof covering to be installed shall be permitted.
2. As an alternative, a minimum 4-inch-wide (102 mm) strip of self-adhering polymer modified bitumen membrane complying with ASTM D1970 and installed in accordance with the manufacturer's installation instructions for the deck material shall be applied over all joints in the roof decking. An approved underlayment for the applicable roof covering for design wind speeds less than 120 mph (54 m/s) shall be applied over the 4-inch-wide (102 mm) membrane strips.
3. As an alternative, two layers of underlayment complying with ASTM D226 Type II ~~or~~, ASTM D4869 Type IV, ASTM WK51913 shall be permitted to be installed as follows: Apply a 19-inch (483 mm) strip of underlayment parallel with the eave. Starting at the eave, apply 36-inch-wide (914 mm) strips of underlayment ~~felt~~, overlapping successive sheets 19 inches (483 mm). The underlayment shall be attached with corrosion-resistant fasteners in a grid pattern of 12 inches (305 mm) between side laps with a 6-inch (152 mm) spacing at side and end laps. End laps shall be 4 inches (102 mm) and shall be offset by 6 feet (1829 mm). Underlayment shall be attached using metal or plastic cap nails with a nominal cap diameter of not less than 1 inch (25.4 mm). Metal caps shall have a thickness of not less than 32-gage sheet metal. Power-driven metal caps shall have a thickness of not less than 0.010 inch (mm). Thickness of the outside edge of plastic caps shall be not less than 0.035 inch (mm). The cap nail shank shall be not less than 0.083 inch for ring shank cap nails and 0.091 inch (mm) for smooth shank cap nails. The cap nail shank shall have a length sufficient to penetrate through the roof sheathing or not less than $\frac{3}{4}$ inch (19.1 mm) into the roof sheathing.
4. Structural metal panels that do not require a substrate or underlayment.

Add new text as follows:

WK51913: New Specification for Mechanically Attached Polymeric Roof Underlayment Used in Steep Slope Roofing

Reason: This proposal references an ASTM Work Item for a new ASTM Standard that will apply exclusively to synthetic underlayments. The proposal simply stipulates new performance requirements for products that are already in widespread use.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal references a proposed ASTM Standard that will, for the first time, apply specific performance requirements to synthetic underlayment products that are already in widespread use and will therefore not affect the cost of construction.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM WK51913, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

S23-19

Public Hearing Results

Committee Action: **Disapproved**

Committee Reason: Proponent requested disapproval. The provided reference standard was incomplete (WK version). (Vote: 14-0)

Assembly Action: **None**

S23-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Gregory Keeler, representing Owens Corning (greg.keeler@owenscorning.com)

requests As Submitted

Commenter's Reason: The ASTM Work Item is still in process but there is a good chance that we will have a published standard prior to the FAH in October. This will establish a standard that relates directly to synthetic underlayments.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This proposal only adds a referenced standard that applies directly and specifically to synthetic underlayments. Thus, there is no cost impact.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standard ASTM WK51913-2019, *Specification for Mechanically Attached Polymeric Roof Underlayment Used in Steep Slope Roofing*, must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

Public Comment# 2011

S26-19

IBC®: 1507.8.1

Proposed Change as Submitted

Proponents: David Roodvoets, representing Cedar Shake & Shingle Bureau (davelee@ix.netcom.com)

2018 International Building Code

Revise as follows:

1507.8.1 Deck requirements. Wood shingles shall be installed on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall be not less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners. The spaced sheathing shall be open to the building interior and shall not be backed with spray foam or other material.

Reason: Shingles installed over spaced sheathing have underlayment that interweaves with the shingles and is subject to wetting. Although most drying of the underlayment is to the outside, there is some drying that must occur into the building. Spray foam prevents this drying, allowing moisture to accumulate below the shingle. Direct backing of the shingle with insulating foam also raises the temperature of the shingle and accelerates deterioration.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This change is primarily to stop a practice that often occurs as a retrofit. It is not a normal part of any construction process or system, but can sometimes be added to a building interior during modifications.

S26-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The code change proposal was unclear and would most likely increase the cost of construction (contrary to the provided 'cost impact' statement).

(Vote: 14-0)

Assembly Action:

None

S26-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1507.8.1

Proponents:

David Roodvoets, representing Cedar Shake & Shingle Bureau (davelee@ix.netcom.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1507.8.1 Deck requirements. Wood shingles shall be installed on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall be not less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners. ~~The spaced sheathing shall be open to the building interior and shall not be backed with spray foam or other material.~~ When wood shingles are installed over spaced sheathing the attic shall be ventilated in accordance with Section 1202.2.2 and shall not be backed with materials that prevents the free movement of air on the interior side of the spaced sheathing.

Commenter's Reason: In this case the spaced sheathing serves as the roof deck, so I believe this wording belongs in 1507.8.1. **The alternative placement of this requirement is Chapter 12, but as the issue is having the inside surface of the shingle open to air movement to remove moisture that permeates the wood, the installation and requirement is most likely understood by the roofer. Placing anything that traps moisture in the shingle will shorten the shingles useful life.** Although most drying of the shingles is to the outside, there is some drying that must occur into the building. Any material that prevents the free movement of air on the interior side of the spaced sheathing prevents this drying, allowing moisture to accumulate in the bottom layer of shingles and accelerates wood deterioration. Direct backing of the shingle with insulating material of any type also raises the temperature of the shingle, changes the differential between interior and exterior temperature and accelerates deterioration.

Bibliography: Jerrold E. Winand, H. Michael Barnes, Robert H. Falk; Summer temperatures of roof assemblies using western redcedar, wood-thermoplastic composite, or fiberglass shingles: FOREST PRODUCTS JOURNAL Vol. 54, No. 11

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

This change is primarily to stop a practice that occurs in new construction and as a retrofit. Insulation and or other barrier products are sometimes added to a building attic interior directly to the interior side of wood shingles. The cost of installation and future problems associated with deterioration of the wood will be eliminated if the material that prevents moisture movement is not installed and the system is free to breathe and dry. So in this case there is a savings in material and installation cost.

Public Comment# 1522

S27-19

IBC®: 1507.8.6, 1507.9.7

Proposed Change as Submitted

Proponents: David Roodvoets, representing Cedar Shake & Shingle Bureau (davelee@ix.netcom.com)

2018 International Building Code

Revise as follows:

1507.8.6 Attachment. Fasteners for wood shingles shall be ~~corrosion resistant with hot dipped galvanized box nails, or Type 304 stainless steel box nails.~~ Where used within 15 miles of salt water coasts stainless steel box nails shall be Type 316. Fasteners for Fire retardant treated shingles or pressure impregnated preservative shingles shall be stainless steel type 316. Fasteners shall have a minimum penetration of $\frac{3}{4}$ inch (19.1 mm) into the sheathing. For sheathing less than $\frac{1}{2}$ inch (12.7 mm) in thickness, the fasteners shall extend through the sheathing. Each shingle shall be attached with not fewer than two fasteners.

1507.9.7 Attachment. Fasteners for wood shakes shall be ~~corrosion resistant with hot dipped galvanized, or Type 304 stainless steel box nails.~~ Where used within 15 miles of salt water coasts stainless steel box nails shall be Type 316. Fasteners for fire retardant treated shakes or pressure impregnated preservative treated shakes shall be stainless steel Type 316. Fasteners shall have a minimum penetration of $\frac{3}{4}$ inch (19.1 mm) into the sheathing. For sheathing less than $\frac{1}{2}$ inch (12.7 mm) in thickness, the fasteners shall extend through the sheathing. Each shake shall be attached with not fewer than two fasteners.

Reason: This change is to harmonize the text in 1507.8.6 and 1507.9.7 of the code, with the requirements in Table 1507.8 and have the same requirements in the IBC as in the IRC.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase or decrease the cost of construction. This change is primarily to stop a practice that often occurs as a retrofit. It is not a normal part of any construction process or system, but can sometimes be added to a building interior during modifications.

S27-19

Public Hearing Results

Committee Action:

Disapproved

None

S27-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1507.8.6, 1507.9.7

Proponents:

David Roodvoets, representing Cedar Shake & Shingle Bureau (davelee@ix.netcom.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1507.8.6 Attachment. Fasteners for wood shingles shall be hot dipped galvanized box nails, or Type 304 stainless steel box nails. Where used within 15 miles of salt water coasts stainless steel box nails shall be Type 316. Fasteners for Fire retardant treated shingles or pressure

impregnated preservative shingles shall be stainless steel type 316. Fasteners shall have a minimum penetration of $\frac{3}{4}$ inch (19.1 mm) into the sheathing. For sheathing less than $\frac{1}{2}$ inch (12.7 mm) in thickness, furthermore the fasteners shall extend through the sheathing. Each shingle shall be attached with not fewer than two fasteners.

1507.9.7 Attachment. Fasteners for wood shakes shall be hot dipped galvanized, or Type 304 stainless steel box nails. Where used within 15 miles of salt water coasts stainless steel box nails shall be Type 316. Fasteners for fire retardant treated shakes or pressure impregnated preservative treated shakes shall be stainless steel Type 316. Fasteners shall have a minimum penetration of $\frac{3}{4}$ inch (19.1 mm) into the sheathing. For sheathing less than $\frac{1}{2}$ inch (12.7 mm) in thickness, furthermore the fasteners shall extend through the sheathing. Each shake shall be attached with not fewer than two fasteners.

Commenter's Reason: This change is to harmonize the text in 1507.8.6 and 1507.9.7 of the IBC code, with the requirements in Table 1507.8 and have the same requirements in the IBC as in the 2018 IRC Sections 905.8.6 and 905.8.7. Currently Table 1507.8 requires Type 316 Stainless Steel for coastal areas, and the manufacturers requirements specify that Type 316 Stainless Steel is required within 15 miles of water and when fire retardant or pressure treated shingles or shakes are installed. Although Table 1507.8 is a great pointer to the requirements for installation near salt water it does not cover the requirements for pressure impregnated fire retardant treated and preservative treated wood products. The wording in the proposed change makes the requirements clear and enforceable. The Stainless Steel Institute makes it clear for optimum life of stainless products Type 316 is to be used in areas within 15 miles of water. Jurisdictions where this is not seen as an issue can exclude this requirement for their local code. The salt water coast is easily defined by the local code official. The 15 mile inland distance is easily measured with current online mapping technology.

The issue is based on the fact that wind blown salt spray can travel long distances and deteriorate stainless steel fasteners. Fasteners failure will result in loss of wood shingles or shakes resulting in potential interior water damage.

The IRC and the IBC should be harmonized for the EXACT SAME products. Despite prior code cycle attempts requesting harmonization, the CSSB has yet to see the needed response from ICC.

Consumer safety is impacted when fasteners fail and the roof slides down the deck. Consumer wallets are affected when fasteners fail and the roof starts to leak. Roofing products are unfairly blamed when fasteners fail and the fastener manufacturer will not take responsibility.

The CSSB respectfully asks that ICC harmonize the IBC with the IRC code, using the more stringent fastener requirement ALREADY LISTED in IRC, to ensure consumers and manufacturers are both protected from needless fastener failures. There is an urgent need to ensure this harmonization is implemented and the CSSB finds it difficult to understand why product durability requirements, that are based on field experience, and the recommendations of the Stainless Steel institute have not been supported.

Bibliography: Cedar Shake and Shingle Bureau New Roof Construction Manual
Stainless Steel designer Handbook for Coastal and Salt Corrosion

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The requirements as noted in this code change were first included in Table 1507.8 in the IBC in 2015, but the text did not match the table. The International Residential Code text in sections 905.8.6 and 905.7.5 beginning in the 2015 version requires that hot dipped galvanized, or stainless fasteners be used. This use of hot dipped galvanized or stainless steel was defined and has been required in the manufacture's installation literature since 2010. (Cedar Shake and Shingle Bureau; New Roof Construction Manual) Therefore code compliance has required the use of this grade of fastener, and therefore the change will not add to the cost of construction. This change is only to note that the table is correct and that the text should match.

The change also helpfully defines how far in from the coast this type of fastener is required and harmonizes the two major construction codes promoted by ICC.

IBC®: 1507.9.1

Proposed Change as Submitted

Proponents: David Roodvoets, representing Cedar Shake & Shingle Bureau (davelee@ix.netcom.com)

2018 International Building Code

Revise as follows:

1507.9.1 Deck requirements. Wood shakes shall only be used on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall be not less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners. Where 1-inch by 4-inch (25 mm by 102 mm) spaced sheathing is installed at 10 inches (254 mm) on center, additional 1-inch by 4-inch (25 mm by 102 mm) boards shall be installed between the sheathing boards. The spaced sheathing shall be open to the building interior and shall not be backed with spray foam or other material.

Reason: Shakes installed over spaced sheathing have underlayment that interweaves with the shakes and is subject to wetting. Although most drying of the underlayment is to the outside; there is some drying that must occur into the building. Spray foam prevents the drying, allowing moisture to accumulate below the shake. Direct backing of the shake with insulating foam also raises the temperature of the shake and accelerates deterioration.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The requirements as noted in this code change were first included in Table 1507.8 in the IBC in 2015, but the text did not match the table. The International Residential Code text in sections 905.8.6 and 905.7.5 beginning in the 2015 version requires that hot dipped galvanized, or stainless fasteners be used. This use of hot dipped galvanized or stainless steel was defined and has been required in the manufacturer's installation literature since 2010. (Cedar Shake and Shingle Bureau; New Roof Construction Manual) Therefore code compliance has required the use of this grade of fastener, and therefore the change will not add to the cost of construction. This change is only to note that the table is correct and that the text should match.

S29-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Proponent requested disapproval based on action on S26. Committee action is consistent with action on S26.

Individual Consideration Agenda

Public Comment 1:

IBC®: 1507.9.1

Proponents:

David Roodvoets, representing Cedar Shake & Shingle Bureau (davelee@ix.netcom.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1507.9.1 Deck requirements. Wood shakes shall only be used on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards

shall be not less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners. Where 1-inch by 4-inch (25 mm by 102 mm) spaced sheathing is installed at 10 inches (254 mm) on center, additional 1-inch by 4-inch (25 mm by 102 mm) boards shall be installed between the sheathing boards. ~~The spaced sheathing shall be open to the building interior and shall not be backed with spray foam or other material. When wood shakes are installed over spaced sheathing the attic shall be ventilated in accordance with Section 1202.2.2, the shakes shall not be backed with materials that prevents the free movement of air on the interior side of the spaced sheathing.~~

Commenter's Reason: In this case the spaced sheathing serves as the roof deck, so I believe this wording belongs in Section 1507.8.1. **The alternative placement of this requirement is Chapter 12, but as the issue is having the building interior surface of the shake open to air movement to remove moisture that permeates the wood, the installation and requirement is most likely understood by the roofer.**

Placing anything that traps moisture in the shake will shorten the shakes useful life. Although most drying of the shake is to the outside, there is some drying that must occur into the building. Any material that prevents the free movement of air on the interior side of the spaced sheathing prevents this drying, allowing moisture to accumulate in the bottom layer of shakes and accelerates wood deterioration. Direct backing of the shakes with insulating material of any type also raises the temperature of the shake, changes the differential between interior and exterior temperature of the shake and accelerates deterioration.

Bibliography: Jerrold E. Winand, H. Michael Barnes, Robert H. Falk; Summer temperatures of roof assemblies using western redcedar, wood-thermoplastic composite, or fiberglass shingles: FOREST PRODUCTS JOURNAL Vol. 54, No. 11

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

This change is primarily to stop a practice that occurs in new construction and as a retrofit. Insulation and or other barrier products are sometimes added to a building attic interior directly to the interior side of wood shakes. The cost of installation and future problems associated with deterioration of the wood will be eliminated if the material that prevents moisture movement is not installed and the system is free to breathe and dry. So in this case there is a savings in material and installation cost.

IBC: 1602.1, 1605.2, 1605.2.1, 1605.3.1, 1605.3.1.1

Proposed Change as Submitted

Proponents: Kelly Cobeen, Wiss Janney Elstner Associates, representing Federal Emergency Management Agency and Applied Technology Council Seismic Code Support Committee (FEMA/ATC SCSC) (KCobeen@wje.com); Jennifer Goupil, representing American Society of Civil Engineers (ASCE) (jgoupil@asce.org); Michael Mahoney, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

2018 International Building Code

Revise as follows:

1602.1 Notations. D = Dead load.

D_i = Weight of ice in accordance with Chapter 10 of ASCE 7.

E = Combined effect of horizontal and vertical earthquake induced forces as defined in Chapter 12 Section 2.3.6 of ASCE 7.

E_h = Effect of horizontal seismic forces as determined in Chapter 12 of ASCE 7.

E_{mh} = Effect of horizontal seismic forces including overstrength as determined in Chapter 12 of ASCE 7.

E_v = Vertical seismic effect applied in the vertical downward direction as in determined in Chapter 12 of ASCE 7.

F = Load due to fluids with well-defined pressures and maximum heights.

F_a = Flood load in accordance with Chapter 5 of ASCE 7.

H = Load due to lateral earth pressures, ground water pressure or pressure of bulk materials.

L = Roof live load greater than 20 psf (0.96 kN/m²) and floor live load.

L_r = Roof live load of 20 psf (0.96 kN/m²) or less.

R = Rain load.

S = Snow load.

T = Cumulative effects of self-straining load forces and effects.

V_{asd} = Allowable stress design wind speed, miles per hour (mph) (km/hr) where applicable.

V = Basic design wind speeds, miles per hour (mph) (km/hr) determined from Figures 1609.3(1) through 1609.3(8) or ASCE 7.

W = Load due to wind pressure.

W_i = Wind-on-ice in accordance with Chapter 10 of ASCE 7.

1605.2 Load combinations using strength design or load and resistance factor design. Where strength design or load and resistance factor design is used, buildings and other structures, and portions thereof, shall be designed to resist the most critical effects resulting from the following combinations of factored loads:

1.4(D + F) (**Equation 16-1**)

1.2(D + F) + 1.6(L + H) + 0.5(L_r or S or R) (**Equation 16-2**)

1.2(D + F) + 1.6(L_r or S or R) + 1.6H + (f_1L or 0.5W) (**Equation 16-3**)

1.2(D + F) + 1.0W + f_1L + 1.6H + 0.5(L_r or S or R) (**Equation 16-4**)

~~1.2(D + F) + 1.0E + f_1L + 1.6H + f_2S (**Equation 16-5**)~~

$0.9D + 1.0W + 1.6H$ (**Equation 16-5 6**)

~~$0.9(D + F) + 1.0E + 1.6H$ (**Equation 16-7**)~~

where:

$f_1 = 1$ for places of public assembly live loads in excess of 100 pounds per square foot (4.79 kN/m²), and parking garages; and 0.5 for other live loads.

~~$f_2 = 0.7$ for roof configurations (such as saw tooth) that do not shed snow off the structure, and 0.2 for other roof configurations.~~

Exceptions:

1. Where other factored load combinations are specifically required by other provisions of this code, such combinations shall take precedence.
2. Where the effect of H resists the primary variable *load effect*, a load factor of 0.9 shall be included with H where H is permanent and H shall be set to zero for all other conditions.

Add new text as follows:

1605.2.1 Load combinations with seismic load effects. Where a structure is subject to seismic load effects, the following load combinations shall be considered in addition to the basic combinations in Section 1605.2. The most unfavorable effects from seismic loads shall be investigated, where appropriate. The seismic loads need not be considered to act simultaneously with wind loads.

Where the prescribed seismic load effect is combined with the effects of other loads, the following seismic load combinations shall be used:

$1.2(D + F) + 1.0E_v + 1.0E_h + f_1L + 1.6H + f_2S$ (**Equation 16-6**)

$0.9(D + F) - 1.0E_v + 1.0E_h + 1.6H$ (**Equation 16-7**)

Where the seismic load effect with overstrength is combined with the effects of other loads, the following seismic load combinations shall be used:

$1.2(D + F) + 1.0E_v + 1.0E_{mh} + f_1L + 1.6H + f_2S$ (**Equation 16-8**)

$0.9(D + F) - 1.0E_v + 1.0E_{mh} + 1.6H$ (**Equation 16-9**)

where:

$f_1 = 1$ for places of public assembly live loads in excess of 100 pounds per square foot (4.79 kN/m²), and parking garages; and 0.5 for other live loads.

$f_2 = 0.7$ for roof configurations (such as saw tooth) that do not shed snow off the structure, and 0.2 for other roof configurations.

Exceptions:

1. Where other factored load combinations are specifically required by other provisions of this code, such combinations shall take precedence.
2. Where the effect of H resists the primary variable *load effect*, a load factor of 0.9 shall be included with H where H is permanent and H shall be set to zero for all other conditions.

Revise as follows:

~~**1605.2.1**~~ **1605.2.2 Other loads.** Where flood loads, F_a , are to be considered in the design, the load combinations of Section 2.3.2 of ASCE 7 shall be used. Where self-straining loads, T , are considered in design, their structural effects in combination with other loads shall be determined in accordance with Section 2.3.4 of ASCE 7. Where an ice-sensitive structure is subjected to loads due to atmospheric icing, the load combinations of Section 2.3.3 of ASCE 7 shall be considered.

1605.3 Load combinations using allowable stress design. Load combinations for allowable stress design shall be in accordance with Section 1605.3.1 or 1605.3.2.

Revise as follows:

1605.3.1 Basic load combinations. Where *allowable stress design* (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$

(Equation 16-8 10)

$$D + H + F + L$$

(Equation 16-9 11)

$$D + H + F + (L_r \text{ or } S \text{ or } R)$$

(Equation 16-10 12)

$$D + H + F + 0.75(L) + 0.75(L_r \text{ or } S \text{ or } R)$$

(Equation 16-11 13)

$$D + H + F + (0.6W \text{ or } 0.7E) \text{ (Equation 16-12 14)}$$

$$D + H + F + 0.75(0.6W) + 0.75L + 0.75(L_r \text{ or } S \text{ or } R)$$

(Equation 16-13 15)

$$D + H + F + 0.75(0.7E) + 0.75L + 0.75L_r + 0.75S \text{ (Equation 16-14)}$$

$$0.6D + 0.6W + H$$

(Equation 16-15 16)

$$0.6(D + F) + 0.7E + H \text{ (Equation 16-16)}$$

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m²) or less and roof live loads of 30 psf (1.44 kN/m²) or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m²), 20 percent shall be combined with seismic loads.
3. Where the effect of H resists the primary variable load effect, a load factor of 0.6 shall be included with H where H is permanent and H shall be set to zero for all other conditions.
4. In Equation 16-15, the wind load, W , is permitted to be reduced in accordance with Exception 2 of Section 2.4.1 of ASCE 7.
5. In Equation 16-16, $0.6D$ is permitted to be increased to $0.9D$ for the design of special reinforced masonry shear walls complying with Chapter 21.

Add new text as follows:

1605.3.1.1 Load combinations with seismic load effects. When a structure is subject to seismic load effects, the following load combinations shall be considered in addition to the basic combinations in Section 1605.3.1. The most unfavorable effects from seismic loads shall be investigated, where appropriate, but they need not be considered to act simultaneously with wind loads.

Where the prescribed seismic load effect is combined with the effects of other loads, the following seismic load combinations shall be used:

$$D + H + F + 0.7E_v + 0.7E_h \text{ (Equation 16-17)}$$

$$D + H + F + 0.525E_v + 0.525E_h + 0.75(L) + 0.75(L_r \text{ or } S \text{ or } R) \text{ (Equation 16-18)}$$

$$0.6(D + F) - 0.7E_v + 0.7E_h + H \text{ (Equation 16-19)}$$

Where the seismic load effect with overstrength is combined with the effects of other loads, the following seismic load combinations shall be used:

$$D + H + F + 0.7E_v + 0.7E_{mh} \text{ (Equation 16-20)}$$

$$D + H + F + 0.525E_v + 0.525E_{mh} + 0.75(L) + 0.75(L_r \text{ or } S \text{ or } R) \text{ (Equation 16-21)}$$

$$0.6(D + F) - 0.7E_v + 0.7E_{mh} + H \text{ (Equation 16-22)}$$

Exceptions:

1. In Equations 16-18 and 16-21, flat roof snow loads of 30 psf (1.44 kN/m²) or less and roof live loads of 30 psf (1.44 kN/m²) or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m²), 20 percent shall be combined with seismic loads.
2. Where the effect of H resists the primary variable load effect, a load factor of 0.6 shall be included with H where H is permanent and H shall be set to zero for all other conditions.
3. In Equation 16-19 and 16-22, $0.6D$ is permitted to be increased to $0.9D$ for the design of special reinforced masonry shear walls complying with Chapter 21.

Revise as follows:

1605.3.1.1 1605.3.1.2 Stress increases. Increases in allowable stresses specified in the appropriate material chapter or the referenced standards shall not be used with the load combinations of Section 1605.3.1, except that increases shall be permitted in accordance with Chapter 23.

~~1605.3.1.2~~ **1605.3.1.3 Other loads.** Where flood loads, F_a , are to be considered in design, the load combinations of Section 2.4.2 of ASCE 7 shall be used. Where self-straining loads, T , are considered in design, their structural effects in combination with other loads shall be determined in accordance with Section 2.4.4 of ASCE 7. Where an ice-sensitive structure is subjected to loads due to atmospheric icing, the load combinations of Section 2.4.3 of ASCE 7 shall be considered.

Reason: This proposal modifies the load combinations of Sections 1605.2 and 1605.3.1 to more closely align with ASCE 7-16. This editorial change is intended to aid designers by incorporating the ASCE 7 change to more specifically present vertical and horizontal components of seismic loading. See Sections 1605.2.1 and 1605.3.1.1.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal is a clarification of the use of currently existing design provisions. It will not change the cost of construction. It may modestly decrease the cost of design by providing greater clarity.

Public Comment 1:

Proponents:

Kelly Cobeen, Wiss Janney Elstner Associates, representing Federal Emergency Management Agency and Applied Technology Council Seismic Code Support Committee (FEMA/ATC SCSC) (kcobeen@wje.com); Michael Mahoney, Federal Emergency Management Agency, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

requests As Submitted

Commenter's Reason: Changes to load combinations in ASCE 7-16 make it necessary to modify Chapter 16 load combinations to coordinate. Proposals S37-19 and S47-19 provided alternative ways to implement coordination. S47-19 was determined to be the preferred method, and was supported for approval at the CAH. This public comment for approval as submitted will allow for updating of load combinations, should proposal S47-19 not be approved at the final action hearings. If S47-19 is approved, the proponent intends to withdraw this public comment. See originally submitted statement of reason for further information.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
See original code change proposal for discussion.

S40-19

IBC: 1604.3

Proposed Change as Submitted

Proponents: Jennifer Goupil, American Society of Civil Engineers (ASCE), representing American Society of Civil Engineers (ASCE) (jgoupil@asce.org)

2018 International Building Code

Revise as follows:

SECTION 1604 GENERAL DESIGN REQUIREMENTS

1604.3 Serviceability. Structural systems and members thereof shall be designed to have adequate stiffness to limit deflections as indicated in Table 1604.3. ~~Drift limits applicable to earthquake loading shall be in accordance with ASCE 7 Chapter 12, 13, 15 or 16, as applicable.~~

Reason: This sentence regarding drift limits does not belong in the section for serviceability. Serviceability and the referenced Table define requirements due to non-lateral loading. The requirements for drift from lateral loads are defined in Section 1613, along with all of the other requirements for lateral loading.

This change is not a technical change in the requirements, rather a clarification of the content of the requirements for Serviceability.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

There is no technical change from this proposal, but a clarification of the appropriate content in this section on serviceability. The drift limit requirements are already included in Section 1613 Earthquake Loading.

S40-19

Public Hearing Results

Committee Action:

Individual Consideration Agenda

Public Comment 1:

IBC@: 1604.3, 1613.1

Proponents:

Randy Shackelford, representing Simpson Strong-Tie Co. (rshackelford@strongtie.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1604.3 Serviceability. Structural systems and members thereof shall be designed to have adequate stiffness to limit deflections as indicated in Table 1604.3.

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their

supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with Chapters 11, 12, 13, 15, 17 and 18 of ASCE 7, as applicable. Drift limits applicable to earthquake loading shall be in accordance with ASCE 7 Chapter 12, 13, 15 or 16, as applicable. The *seismic design category* for a structure is permitted to be determined in accordance with Section 1613 or ASCE 7.

Exceptions:

1. Detached one- and two-family dwellings, assigned to *Seismic Design Category* A, B or C, or located where the mapped short-period spectral response acceleration, S_S , is less than 0.4 g.
2. The seismic force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.
5. References within ASCE 7 to Chapter 14 shall not apply, except as specifically required herein.

Commenter's Reason: The original code change deleted requirements to check drift limits using ASCE 7 because the requirements were in the wrong section. Drift limits for earthquake are not necessarily serviceability requirements, I agree. However this is an important statement that should be included somewhere. So it is proposed that instead of completely deleting the sentence, it be moved back to Section 1613.1.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. There should be no effect on construction, this proposal is just proposing to move the language about checking seismic drift from the Serviceability section to the Earthquake Loads section.

Public Comment# 2157

S44-19

IBC®: TABLE 1604.5

Proposed Change as Submitted

Proponents: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee
(lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

TABLE 1604.5
RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

Portions of table not shown remain unchanged.

RISK CATEGORY	NATURE OF OCCUPANCY
III	<p>Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:</p> <ul style="list-style-type: none"> •Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. <p><u>Buildings and other structures containing one or more public assembly spaces with an occupant load greater than 300 and a cumulative occupant load of the public assembly spaces of greater than 2,500.</u></p> <ul style="list-style-type: none"> •Buildings and other structures containing Group E occupancies with an occupant load greater than 250. •Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500. •Group I-2, Condition 1 occupancies with 50 or more care recipients. •Group I-2, Condition 2 occupancies not having emergency surgery or emergency treatment facilities. •Group I-3 occupancies. •Any other occupancy with an occupant load greater than 5,000.^a •Power-generating stations, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV. •Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that: <ul style="list-style-type: none"> Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the International Fire Code; and Are sufficient to pose a threat to the public if released.^b

- a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use gross floor area calculations shall be permitted to use net floor areas to determine the total occupant load.
- b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: There are examples of R-1 hotel buildings having multiple large ball rooms or other public assembly spaces but “public assembly” is not the “primary occupancy” as is currently specified in Table 1604.5 so these buildings are classified as Risk Category II. Conversely, there are smaller stand-alone buildings where the primary occupancy is “public assembly” with an occupant load just over 300 that must be designed to the higher Risk Category III even though the total occupant load is much smaller when compared with the example above. This proposal adds a new criteria for buildings containing at least one assembly space of 300 or more and also having a cumulative occupant load of all assembly spaces of 2,500 or more. This proposal would not include buildings that have multiple assembly spaces, each with an occupant load of less than 300 (like a movie theatre), in Risk Category III unless the total occupant load of the building was greater than 5,000 people. It would also not include a building having multiple assembly spaces, each with an occupant load greater than 300 but the cumulative occupant load of the assembly spaces were less than 2,500, unless the primary occupancy was public assembly or the total occupant load of the building was greater than 5,000 people.

If approved, buildings having one or more assembly rooms with an occupant load of 300 or more and a cumulative occupant load of public assembly spaces of 2,500 or more would be classified as Risk Category III.

Cost Impact: The code change proposal will increase the cost of construction

If approved, more buildings will fall under the Risk Category III which will add cost to construct the building due to a higher importance factor.

Public Hearing Results

Committee Action:

As Modified

Committee Modification:
2018 International Building Code

TABLE 1604.5

RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
III	<p>Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:</p> <ul style="list-style-type: none">•Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. <p>Buildings and other structures containing one or more public assembly spaces <u>with each having</u> an occupant load greater than 300 and a cumulative occupant load of the public assembly spaces of greater than 2,500.</p> <ul style="list-style-type: none">•Buildings and other structures containing Group E occupancies with an occupant load greater than 250.•Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.•Group I-2, Condition 1 occupancies with 50 or more care recipients.•Group I-2, Condition 2 occupancies not having emergency surgery or emergency treatment facilities.•Group I-3 occupancies.•Any other occupancy with an occupant load greater than 5,000.^a•Power-generating stations, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.•Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that: Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the International Fire Code; and Are sufficient to pose a threat to the public if released.^b

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use gross floor area calculations shall be permitted to use net floor areas to determine the total occupant load.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Committee Reason: The proposal provides a reasonable threshold for when to trigger risk category 3. The modification clarifies the intent. (Vote: 13-1)

RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
III	<p>Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:</p> <ul style="list-style-type: none"> •Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. •Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of the <u>these</u> public assembly spaces of greater than 2,500. •Buildings and other structures containing Group E occupancies with an occupant load greater than 250. •Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500. •Group I-2, Condition 1 occupancies with 50 or more care recipients. •Group I-2, Condition 2 occupancies not having emergency surgery or emergency treatment facilities. •Group I-3 occupancies. •Any other occupancy with an occupant load greater than 5,000.^a •Power-generating stations, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV. •Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that: Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the International Fire Code; and Are sufficient to pose a threat to the public if released.^b

- a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use gross floor area calculations shall be permitted to use net floor areas to determine the total occupant load.
- b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Commenter's Reason: This public comment is to follow up on a suggestion by one of the ICC Structural Committee members to change "the" to "these" in the proposed criteria for Risk Category III. This change will make it clear that only public assembly spaces with an occupant load of 300 or more are to be included in determining if the cumulative occupant load exceeds 2,500.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Very few projects will be impacted by this code change but for those that do the cost will be higher due to the structural design having to meet higher lateral force demands of Risk Category III.

Public Comment# 1158

IBC: SECTION 106, 106.1, 106.2, 106.3, 111.5 (New), SECTION 1607 (New), 1607.1 (New), 1607.7.5

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Delete without substitution:

SECTION 106 FLOOR AND ROOF DESIGN LOADS

~~**[A] 106.1 Live loads posted.** In commercial or industrial buildings, for each floor or portion thereof designed for live loads exceeding 50 psf (2.40 kN/m²), such design live loads shall be conspicuously posted by the owner or the owner's authorized agent in that part of each story in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.~~

~~**[A] 106.2 Issuance of certificate of occupancy.** A certificate of occupancy required by Section 111 shall not be issued until the floor load signs, required by Section 106.1, have been installed.~~

~~**[A] 106.3 Restrictions on loading.** It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a building, structure or portion thereof, a load greater than is permitted by this code.~~

Revise as follows:

SECTION 111 CERTIFICATE OF OCCUPANCY

Add new text as follows:

111.5 Live load posted. A certificate of occupancy required shall not be issued until floor load signs, where required by Section 1607.1.1, and maximum weight of vehicles, where required by Section 1607.7.5, have been posted.

SECTION 1607 LIVE LOADS

1607.1 General. Live loads are those loads defined in Chapter 2 of this code.

1607.1.1 Live loads posted. In commercial or industrial buildings, for each floor or portion thereof designed for live loads exceeding 50 psf (2.40 kN/m²), such design live loads shall be posted in a readily visible location by the owner or the owner's authorized agent in the portion of each story in which they apply. It shall be unlawful to remove or deface such notices.

Revise as follows:

1607.7 Heavy vehicle loads. Floors and other surfaces that are intended to support vehicle loads greater than a 10,000-pound (4536 kg) gross vehicle weight rating shall comply with Sections 1607.7.1 through 1607.7.5.

1607.7.5 Posting. The maximum weight of vehicles allowed into or on a garage or other structure shall be posted by the owner or the owner's authorized agent in ~~accordance with Section 106.1,~~ a readily visible location at the vehicle entrance of the building or other approved location. It shall be unlawful to remove or deface such notices.

Reason: The purpose of this code change is to restore the live load posting requirements to Chapter 16. These provisions had been moved to Section 106 by proposal S48-07/08 on the basis that they were administrative requirements rather than technical requirements. The BCAC reviewed the provisions and determined they are in fact technical construction requirements, not administrative enforcement requirements. It is noted they are tied to specific loading requirements in Chapter 16 and are the responsibility of the owner to provide, not the building department. Thus these requirements should be relocated to Chapter 16, with a note left in Section 110 for the building department to verify the loads have been posted. The terminology "commercial or industrial buildings" is existing text that has been in place for several code cycles and B-CAC decided to leave it unchanged. Further, separate provisions have been created for floor live loads and maximum vehicle weights. The reference to a "readily visible" location parallel those for stairway identification signs (Section 1023.9) and signage for public toilet facilities (Section 2902.4 and 2902.4.1). It is noted this signage is not tied to egress or accessibility requirements for the space. Therefore, it is not necessary to require the sign comply with ICC A117.1 or otherwise meet legibility requirements.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on

the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This relocation of requirements may reduce the cost of construction because all necessary requirements are located in the appropriate Chapter.

S52-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal appears to be intended to be administrative provisions to be located in a design chapter. Section 1607.1.1 language needs revision for clarity on intent.

Assembly Action:

None

S52-19

Individual Consideration Agenda

Public Comment 1:

IBC@: SECTION, [A], 1607.7, 1607.7.5

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

SECTION 106 FLOOR AND ROOF DESIGN LOADS

[A] 106.1 Live loads posted: In commercial or industrial buildings, for each floor or portion thereof designed for *live loads* exceeding 50 psf (2.40 kN/m²), such design *live loads* shall be conspicuously posted by the owner or the owner's authorized agent in that part of each story in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.

[A] 106.2 Issuance of certificate of occupancy: A certificate of occupancy required by Section 111 shall not be issued until the floor load signs, required by Section 106.1, have been installed.

[A] 106.3 Restrictions on loading: It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a building, structure or portion thereof, a load greater than is permitted by this code.

1607.7 Heavy vehicle loads. Floors and other surfaces that are intended to support vehicle loads greater than a 10,000-pound (4536 kg) gross vehicle weight rating shall comply with Sections 1607.7.1 through 1607.7.5.

1607.7.5 Posting. The maximum weight of vehicles allowed into or on a garage or other structure shall be posted in a readily visible location at the vehicle entrance of the building or other approved location by the owner or the owner's authorized agent in accordance with Section 106.1. It shall be unlawful to remove or deface such notices.

Commenter's Reason: There were concerns expressed by the committee with the current text:

- The requirement in Section 106.1 is too low of a weight load.
- This signage requirement is lost/hidden in Chapter 1.
- Inspectors never see it provided;
- If required there is no mechanism to make sure it is maintained.
- There is no specifics on what to do with the information provided.

The BCAC looked at increasing the weight requirements, but instead decided with the concerns raised that this requirement is better not in the code. Therefore, this public comment seeks to delete this signage requirement from Chapter 1.

Regarding the current language for garage posting currently in 1607.7.5. The current Section 106.1 referenced did not provide sufficient guidance. The committee had suggestions to improve the order of the new proposed language for additional clarity. Where this sign is required is very limited since it is only needed in parking areas inside a building for heavy vehicles.

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This will eliminate the requirements for some signs.

Public Comment# 1183

S60-19

IBC®: 1603.1.1, TABLE 1607.1

Proposed Change as Submitted

Proponents: Paul Armstrong, MHI, representing MHI

2018 International Building Code

Revise as follows:

1603.1.1 Floor live load. The uniformly distributed, concentrated and impact floor live load used in the design shall be indicated for floor areas. Use of live load reduction in accordance with Section 1607.11 shall be indicated for each type of live load used in the design.

For Group S storage warehouses the floor shall be designed for the maximum uniformly distributed or concentrated live load. In areas with storage rack, the concentrated live load shall be designed for a minimum concentrated load of 5,000 lbs (2268 kg) where the clear ceiling height is 15 feet (4572 mm) minimum. The concentrated load shall be increased an additional 2,500 lbs (1123 kg) for each additional 5 feet (1524 mm) clear ceiling height or portion thereof, over 15 feet (4572 mm). The concentrated loads shall be located on a 4 foot by 8 foot (1219 mm by 2438 mm) grid over the floor area with storage racks.

TABLE 1607.1

MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, *L₀*, AND MINIMUM CONCENTRATED LIVE LOADS^a

Portions of table not shown remain unchanged.

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (pounds)
31. Storage warehouses (shall be designed for heavier loads if required for anticipated storage)		<u>See Section 1603.1.1</u>
Heavy	250 ⁿ	
Light	125 ⁿ	

Reason: Many warehouse structures in Use Group S have storage rack located in them resulting in localized loading on the concrete floor slab. We wish to bring this to the attention of the registered design professional of the building when they are designing the new concrete floor slab if the actual floor loads are not known. New warehouse buildings are becoming taller and the 125 psf or 250 psf floor loads are no longer adequate when designing the concrete floor slab.

Cost Impact: The code change proposal will increase the cost of construction

While this might increase the cost of construction in warehouses slightly, it will serve to decrease the cost when evaluating existing warehouse slabs.

S60-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Proposal and wording needs to be vetted through ASCE 7. Proposal needs clarification of threshold.

Individual Consideration Agenda

Public Comment 1:

Proponents:

Paul Armstrong, MHI, representing MHI (paul.armstrong@pacodeservices.com)

requests As Submitted

Commenter's Reason: The Engineering Committee of the Rack Manufacturer's Institute has submitted this Public Comment to recognize new loading that is imposed by rack structures. It is understood that ultimately this loading criteria should reside in ASCE 7 but the next edition is in 2022 and that process is only just underway. The committee commits to remove this provision in the IBC once it is published in ASCE 7. Please support this Public Comment so that such storage warehouse floor systems can be properly designed.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

However, this will decrease the cost of construction when applying this criteria in existing warehouses due to the floors being adequately designed for the new rack loads.

Public Comment# 2000

S72-19

IBC®: 1607.13.5.3, 1607.13.5.4, 1607.13.5.5

Proposed Change as Submitted

Proponents: Joseph H. Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (SEIA)
(JoeCainPE@gmail.com)

2018 International Building Code

Revise as follows:

~~1607.13.5.2.1~~ **1607.13.5.3 Photovoltaic panels installed on open grid roof structures.** Structures with open grid framing and without a roof deck or sheathing supporting photovoltaic panel systems shall be designed to support the uniform and concentrated roof live loads specified in Section 1607.13.5.1, except that the uniform roof live load shall be permitted to be reduced to 12 psf (0.57 kN/m²).

~~1607.13.5.3~~ **1607.13.5.4 Photovoltaic panels or modules installed as an independent structure.** Ground-mounted photovoltaic (PV) panel systems. Solar photovoltaic panels or modules Ground-mounted photovoltaic (PV) panel systems that are independent structures and do not have accessible/occupied space underneath are not required to accommodate a roof photovoltaic live load, ~~provided that the area under the structure is restricted to keep the public away.~~ Other loads and combinations in accordance with Section 1605 shall be accommodated. ~~Solar photovoltaic panels or modules that are designed to be the roof, span to structural supports and have accessible/occupied space underneath shall have the panels or modules and all supporting structures designed to support a roof photovoltaic live load, as defined in Section 1607.13.5.1 in combination with other applicable loads. Solar photovoltaic panels or modules in this application are not permitted to be classified as "not accessible" in accordance with Section 1607.13.5.1.~~

1607.13.5.4 1607.13.5.5 Ballasted photovoltaic panel systems. Roof structures that provide support for ballasted *photovoltaic panel systems* shall be designed, or analyzed, in accordance with Section 1604.4; checked in accordance with Section 1604.3.6 for deflections; and checked in accordance with Section 1611 for ponding.

Reason: In development of the 2018 IBC, new Section 1607.13.5.2.1 was created to use language similar to ASCE 7-16. As the second paragraph of Section 1607.13.5.3 was intended to state the requirements for the same type of structure, Section 1607.13.5.3 is now redundant and outdated in the 2018 IBC. This proposal strikes out the redundancy second paragraph.

The first paragraph of Section 1607.13.5.3 is intended to state the requirements for ground-mounted PV systems, so is now updated to use that term.

Sections are re-numbered for better flow, such that:

1607.13.5.2 is for rooftop-mounted PV systems

1607.13.5.3 is for overhead structures with open-grid framing (renumbered from 1607.13.5.2.1)

1607.13.5.4 is for ground-mounted PV systems (renumbered from 1607.13.5.3)

1607.13.5.5 is for ballasted rooftop PV systems (renumbered from 1607.13.5.4)

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal clarifies the language, and will not increase or decrease cost of construction.

S72-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee expressed concerns that this change had not yet been vetted through ASCE 7.
(Vote: 12-2)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

Proponents:

Joseph H. Cain, P.E., Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (SEIA)
(JoeCainPE@gmail.com)

requests As Submitted

Commenter's Reason: In development of the 2018 IBC, new Section 1607.13.5.2.1 was created to use language similar to ASCE 7-16. As the second paragraph of Section 1607.13.5.3 was intended to state the requirements for the same type of structure, Section 1607.13.5.3 is now redundant and outdated in the 2018 IBC.

This Proposal S72-19 and this Public Comment seeks to correct a mistake that exists in the 2018 IBC, by striking out the redundant second paragraph.

NOTE: Subsection 1607 is titled "Live Loads." This proposal and public comment seek to clarify live loads on PV systems, consistent with the original intent of previous Subsection 1607.12.5 of the 2015 IBC, as developed by NCSEA in collaboration with SEAOC.

The first paragraph of Section 1607.13.5.3 is intended to state the requirements for ground-mounted PV systems, so is now updated to use that term.

Sections are re-numbered for better flow, such that:

1607.13.5.2 is for rooftop-mounted PV systems

1607.13.5.3 is for overhead structures with open-grid framing (renumbered from 1607.13.5.2.1)

1607.13.5.4 is for ground-mounted PV systems (renumbered from 1607.13.5.3)

Section 1607.13.5.4 simply replaces:

"Solar photovoltaic panels or modules that are independent structures and do not have accessible/occupied space underneath ..."

with the common industry term "ground mount" accompanied by the defined term "photovoltaic panel systems":

"Ground-mounted photovoltaic (PV) panel systems that are independent structures and do not have accessible/occupied space underneath ..."

1607.13.5.5 is for ballasted rooftop PV systems (renumbered from 1607.13.5.4, with no other changes)

When viewed as clean text, the reader should see that the proposed language will clarify the provisions applicable to overhead structures and ground-mounted systems with no occupancy beneath. These changes are editorial only, and do not change the fundamental provisions for live load for these structures.

1607.13.5.3 Photovoltaic panels installed on open grid roof structures. Structures with open grid framing and without a roof deck or sheathing supporting photovoltaic panel systems shall be designed to support the uniform and concentrated roof live loads specified in Section 1607.13.5.1, except that the uniform roof live load shall be permitted to be reduced to 12 psf (0.57 kN/m²).

1607.13.5.4 Ground-mounted photovoltaic (PV) panel systems. Ground-mounted photovoltaic (PV) panel systems that are independent structures and do not have accessible/occupied space underneath are not required to accommodate a roof photovoltaic live load. Other loads and combinations in accordance with Section 1605 shall be accommodated.

1607.13.5.5 Ballasted photovoltaic panel systems. Roof structures that provide support for ballasted photovoltaic panel systems shall be designed, or analyzed, in accordance with Section 1604.4; checked in accordance with Section 1604.3.6 for deflections; and checked in accordance with Section 1611 for ponding.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This proposal clarifies the language, and will not increase or decrease cost of construction.

S75-19

IBC: 1609.1.1, Chapter 35 AASHTO (New)

Proposed Change as Submitted

Proponents: Ray Minor, representing Self (ray.minor@hapco.com); Jay Baumgartner, Valmont Industries, representing Valmont Industries (jay.baumgartner@valmont.com)

2018 International Building Code

Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7. The type of opening protection required, the basic design wind speed, V , and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7-~~7~~7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AWC WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided that the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with ASCE 49 and Sections 31.4 and 31.5 of ASCE 7.
7. Luminaire support structures designed in accordance with AASHTO LTS-6. Athletic field lighting structures taller than 55' shall be designed to meet the 50 year design life wind load and the Fatigue Importance Category I Natural Wind Gust requirements of AASHTO LTS-6.

The wind speeds in Figures 1609.3(1) through 1609.3(8) are basic design wind speeds, V , and shall be converted in accordance with Section 1609.3.1 to *allowable stress design* wind speeds, V_{asd} , when the provisions of the standards referenced in Exceptions 4, 5 and 5~~7~~ are used.

Add new standard(s) as follows:

AASHTO

Association of State Highway and
Transportation Officials
4444 North Capitol Street, NW Suite 249
Washington DC 20001
US

LTS-6-2013: Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals

Reason: The AASHTO LTS-6 specification is based on much research and many years of experience in using primarily pole type structures to support signs, luminaires and traffic signals along roadways. These types of structures are also used for many non-roadway applications such as sports lighting and parking lot lighting which may come under the jurisdiction of the IBC. The AASHTO LTS-6 wind pressure calculations are based on ASCE 7. ASCE 7-16 C29.4 states "For the design of structural supports for highway signs, luminaires and traffic signals, see AASHTO LTS-6 (AASHTO 2013)". The AASHTO LTS-6 contains provisions for the fatigue design of structural supports for signs, luminaires and traffic signals that are exclusive to AASHTO. Several athletic field lighting structures that would not meet these fatigue requirements have failed (See Consumer Product Safety Commission link in Bibliography and Stadium Pole Failures file in Attachments). These failures most likely would not have occurred if the poles had been designed to meet the natural wind gust fatigue requirements of the AASHTO LTS-6 specification.

Bibliography: United States Consumer Product Safety Commission report "Recall to Repair: Whitco Company LP Stadium Light Poles Can Fall Over, Posing Risk of Serious Injury and Death" link:
<https://www.cpsc.gov/Recalls/2010/recall-to-repair-whitco-company-lp-stadium-light-poles-can-fall-over-posing-risk-of>

Cost Impact: The code change proposal will increase the cost of construction

The sports lighting poles that failed would not meet the transverse plate minimum thickness requirement of AASHTO LTS-6 Paragraph 5.14.3 which likely contributed to the failures. These poles would be identified as high level luminaire supports in LTS-6 Paragraph 1.4.2 which would require them to be designed for fatigue according to LTS-6 Paragraph 11.3. Fatigue design specifications of LTS-6 Section 11 generally requires heavier poles than designing for maximum wind speed alone.

Staff Analysis: A review of the standard proposed for inclusion in the code, AASHTO LTS-6-2013, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

Public Hearing Results

Committee Action:
Disapproved
Committee Reason: The committee expressed concerns as to the following:

1. why reference the older ASCE 7-05?
2. questioned the background for using a 50 year design life
3. format - many requirements are provided in the exceptions

(Vote: 12-2)

Assembly Action:
None

Individual Consideration Agenda

Public Comment 1:
IBC®: 1609.1.1 (New)
Proponents:

Jay Baumgartner, representing Valmont Industries (jay.baumgartner@valmont.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7. The type of opening protection required, the basic design wind speed, V , and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AWC WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided that the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with ASCE 49 and Sections 31.4 and 31.5 of ASCE 7.
7. Luminaire support structures designed in accordance with AASHTO LTS-6. Athletic field lighting structures taller than 55' shall be designed to meet the 50-year design life wind load and the Fatigue Importance Category I Natural Wind Gust Fatigue Importance Category I of the high-mast lighting tower fatigue requirements of AASHTO LTS-6.

The wind speeds in Figures 1609.3(1) through 1609.3(8) are basic design wind speeds, V , and shall be converted in accordance with Section 1609.3.1 to *allowable stress design* wind speeds, V_{asd} , when the provisions of the standards referenced in Exceptions 4, 5 and 7 are used.

Commenter's Reason: The inclusion of the AASHTO LTS-6 Specifications will provide safer lighting structures as well as a more refined design analysis. In accordance with Section 1609.1.1, the wind speed maps from Figures 1609.3(1) through 1609.3(8) shall be used and converted in accordance with Section 1609.3.1 for use with AASHTO. In addition, the Risk Category II wind speeds (MRI = 700 Years) are generally equivalent to the basic wind speeds found in AASHTO LTS-6 (50-year return period) based upon research referenced by ASCE 7 after moving the wind load factor for the strength design approach.

Adding the AASHTO LTS-6 Specifications will also bring consistency to Section 1609.1.1, where similar non-building structures are already addressed. Section 1609.1.1 Exceptions 4 and 5 are used for the design of flagpoles (NAAMM FP 1001) and antenna-supporting structures (TIA-222), respectively. ASCE 7-16 C29.4 also states "It is not the intent of this standard to exclude the use of other recognized literature for the design of special structures ... For the design of flagpoles, see NAAMM (2007). For the design of structural supports for highway signs, luminaires, and traffic signals, see AASHTO LTS-6 (AASHTO 2013)." I therefore urge approval of this proposal.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal would likely only increase the cost of construction for those structures requiring a fatigue design.

Public Comment# 1434

S83-19

IBC: 1703.1.3.1 (New)

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, representing American Concrete Institute (steve.szoke@concrete.org); Scott Campbell, National Ready Mixed Concrete Association, representing National Ready Mixed Concrete Association (scampbell@nrmca.org)

2018 International Building Code

1703.1.3 Personnel. An *approved agency* shall employ experienced personnel educated in conducting, supervising and evaluating tests and *special inspections*.

Add new text as follows:

1703.1.3.1 Structural concrete special inspector. Individuals with current credentials demonstrating that the requirements of ACI Concrete Construction Special Inspector or ICC Reinforced Concrete Special Inspector have been satisfied shall be permitted to act as special inspectors for structural concrete construction.

Reason: This code change proposal provides the criteria for personnel to be considered qualified to conduct special inspections of structural concrete. The American Concrete Institute Committee C630 - Construction Inspector Certification has developed a rigorous program to certify individuals as qualified to perform special inspection of concrete construction. This code change proposal does not alter any existing criteria of other individuals qualified as special inspectors, but adds provisions for individuals who are ACI or ICC certified concrete construction special inspectors to be permitted to satisfy the code criteria as special inspectors for concrete construction. This proposal provides the criteria, but does not require individuals to be certified as an ACI Concrete Construction Special Inspector. The ACI requirements are provided in the attached file, cpp-6301-15.pdf, or may be found at: https://www.concrete.org/Portals/0/Files/PDF/cpp_6301-15.pdf.

Jurisdictions are adding these requirements to their codes. As a model code, this requirement should be included in the IBC to assist the jurisdictions in having the language properly incorporated into their respective codes. For example, the Georgia Building Code now includes certified inspectors. See pages 12 through 15 of the attached file, 2014-ibcamendments.pdf.

The American Concrete Institute, as a professional society whose mission includes working to facilitate the use and adoption of current concrete technology to assure the desired performance for the benefit of the public, encourages the committee to approve of this code change as submitted.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The code change allows current practice for selection of individuals or entities to perform special inspection. The change adds qualifications for individuals to assist the building code official in approving such individuals and provides a degree of confidence that special inspections will be properly conducted.

S83-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While the committee agreed that training of special inspectors is important, they expressed concerns that the proposal is in the wrong section of the code.

(Vote: 10-4)

Assembly Action:

None

S83-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1704.2.1.1 (New), ACI Chapter 35 (New)

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

~~1703.1.3.1~~ **1704.2.1.1 Structural concrete special inspector.** Individuals satisfying the requirements of Section 1.6 of ACI 311.7 as Concrete Special Inspector with current credentials demonstrating that the requirements of ACI Concrete Construction Special Inspector or ICC Reinforced Concrete Special Inspector have been satisfied shall be permitted to act as special inspectors for structural concrete construction.

ACI

American Concrete Institute
38800 Country Club Drive
Farmington Hills MI 48331

311.7-18: Specification for Inspection of concrete Construction

Commenter's Reason: This public comment provides the criteria for personnel to be considered qualified to conduct special inspections of structural concrete. The American Concrete Institute Committee 311 has developed language that identifies individual qualified to conduct special inspection of structural concrete construction. These provisions are identified in Section 1.6 Qualifications of ACI 311.7 Inspection Services Specification for Cast-in-Place Concrete Construction. This proposal does not alter any existing criteria of other individuals qualified as special inspectors, but adds provisions for individuals certified as concrete construction special inspectors to be permitted to satisfy the code criteria as special inspectors for concrete construction. This proposal increases the pool of individuals that may be identified as qualified to conduct such inspections. These qualifications create an improved confidence that the individuals conducting inspections have had the appropriate training and demonstrated competence in conducting special inspections of structural concrete construction. During the Committee Action Hearings *the committee agreed that training of special inspectors is important, they expressed concerns that the proposal is in the wrong section of the code.* This modification relocates the provision from section 1703.3.1.3 to Section 1704.2.1 Special inspector qualifications.

Bibliography: 311.7-18: Specification for Inspection of Concrete Construction
CPP 630.1-15 Certification Policies for Concrete Construction Special Inspector

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposal allows current practice for selection of individuals or entities to perform special inspection while including qualifications for additional individuals. This increases the pool of qualified individuals and is expected to decrease costs.

IBC®: 1704.2

Proposed Change as Submitted

Proponents: Terry Kozlowski, representing Southern Nevada Chapter; Nenad Mirkovic, representing City of Las Vegas; Amanda Moss, representing SN-ICC Member; Cassidy Wilson, representing SN-ICC Member

2018 International Building Code

Revise as follows:

1704.2 Special inspections and tests. Where application is made to the *building official* for construction as specified in Section 105, the owner or the owner's authorized agent, other than the contractor, shall employ one or more *approved agencies* to provide *special inspections* and tests during construction on the types of work specified in Section 1705 and identify the *approved agencies* to the *building official*. These *special inspections* and tests are in addition to the inspections by the *building official* that are identified in Section 110.

Exceptions:

1. *Special inspections* and tests are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved by the building official*.
2. Unless otherwise required by the *building official*, *special inspections* and tests are not required for detached 1 & 2 family dwellings and Group U occupancies that are accessory to a residential occupancy including occupancy accessory structures, including but not limited to, those listed in Section 312.1.
3. *Special inspections* and tests are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.1.2 or the conventional light-frame construction provisions of Section 2308.
4. The contractor is permitted to employ the *approved agencies* where the contractor is also the owner.

Reason: Local inspectors have previously been required to inspect the shear walls and other details needed to resist lateral forces. This proposal will provide the building official with discretion in the application of special inspection requirements for residential construction and would allow the local building inspector to inspect detached 1 & 2 family dwellings and accessory structures.

Cost Impact: The code change proposal will decrease the cost of construction
This proposal will decrease the cost of construction by eliminating the requirement for special inspection.

S86-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee expressed concerns that the proposal should not eliminate all detached 1 and 2 family dwellings from special inspections.

(Vote: 12-1)

Assembly Action:

None

S86-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1704.2

Proponents:

Gary Ehrlich, representing National Association of Home Builders (gehrlich@nahb.org)

Replace as follows:

2018 International Building Code

1704.2 Special inspections and tests. Where application is made to the *building official* for construction as specified in Section 105, the owner or the owner's authorized agent, other than the contractor, shall employ one or more *approved agencies* to provide *special inspections* and tests during construction on the types of work specified in Section 1705 and identify the *approved agencies* to the *building official*. These *special inspections* and tests are in addition to the inspections by the *building official* that are identified in Section 110.

Exceptions:

1. *Special inspections* and tests are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as *approved by the building official*.
2. Unless otherwise required by the *building official*, *special inspections* and tests are not required for Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.
3. *Special inspections* and tests are not required for portions of structures designed and constructed in accordance with the cold-formed steel light-frame construction provisions of Section 2211.1.2 or the conventional light-frame construction provisions of Section 2308.
4. *Special inspections* and tests are not required for portions of one- and two-family dwellings and townhouses and their accessory structures designed in accordance with Section R301.1.3 of the *International Residential Code*.
- ~~4-5.~~ The contractor is permitted to employ the *approved agencies* where the contractor is also the owner.

Commenter's Reason: The purpose of this public comment is to replace the initial proposal with a more targeted exception for engineered portions of dwellings otherwise complying with the IRC.

Section R301.1.3 of the IRC allows for design in accordance with accepted engineering practice for portions of a detached dwelling, townhouse, or accessory structure that generally falls within the scope of the IRC but that contains structural elements which exceed an individual limit of the IRC.

Permits for such dwellings are generally issued and inspections performed under a jurisdiction's policies and procedures for residential structures. However, NAHB members have reported some building departments requiring special inspections for engineered components of a dwelling otherwise and constructed under the prescriptive structural provisions of the IRC.

Special inspections were originally conceived to address elements and systems of construction for commercial buildings that due to their unique nature or complexity needed a level of review beyond the standard building department plan review and inspections. Typical elements of a dwelling where engineering is frequently performed include tall foundation walls, structural composite lumber beams and posts, steel framing over a basement, and truss roof assemblies. Some engineers have argued these systems can be complex and require a special inspector. However, in most typical dwellings, these elements are still designed using common material strengths, standard configurations, typical connection types, and standard construction details.

Estimates obtained from the Home Innovation Research Labs suggest a minimum cost to a homeowner for a special inspection of one component (e.g. a long-span truss) is on the order of \$530. The minimum cost to a homeowner for a more extensive set of special inspections that could include the components of the wind or seismic force-resisting system could be as much as \$900. There is no need to burden homeowners with hundreds of dollars of additional costs simply because a typical size dwelling just happens to incorporate an engineered foundation wall, roof trusses, a few LVL's, or a few steel beams and posts.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

As noted in the reason statement, cost studies by Home Innovation Research Lab show a homeowner could save between \$500 and \$900 by avoiding the need for an unnecessary special inspection.

S87-19

BC: 1704.2.6 (New), ACI Chapter 35 (New)

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, representing American Concrete Institute (steve.szoke@concrete.org); Scott Campbell, National Ready Mixed Concrete Association, representing National Ready Mixed Concrete Association (scampbell@nrmca.org)

2018 International Building Code

Add new text as follows:

1704.2.6 Concrete tests. Field and laboratory technicians qualifications shall comply with ACI 311.6.

Add new standard(s) as follows:

ACI

American Concrete Institute
38800 Country Club Drive
Farmington Hills MI 48331

ACI 311.6-18: Specification for Ready Mixed Concrete Testing Services

Reason: Proper sampling, specimen preparation and acceptance testing of concrete delivered to construction projects is crucial for assuring proper performance of structural concrete. Inaccurate test results and the negative implications on the performance of concrete occur far too frequently. When field testing, preparation of samples and laboratory testing are not conducted properly there may be significant expenses and delays added to the cost of construction, such as extracting cores of hardened concrete to verify concrete strength. Improper sampling, preparation and testing often cause project delays, further increasing costs.

On many projects the qualifications for technicians are included in the construction documents. There is a need to assure cast-in-place concrete is properly sampled, prepared and tested. Cast-in-place concrete is one of the few building materials provided to the construction site in a condition other than its final state. Verification of properties should only be performed by qualified individuals.

Local jurisdictions have already begun to address this concern. In 2014 the Georgia Building Code included an amendment to the IBC which added ACI Concrete Field Testing Technician with Grade 1 certification: https://dca.ga.gov/sites/default/files/2014_ibcamendments.pdf. In 2018 the Georgia Building Code included another amendment to the IBC which added American Concrete Institute (ACI) Strength Testing Technician: https://dca.ga.gov/sites/default/files/2018_ibcamendments.pdf. This demonstrates the need to more clearly communicate the necessary qualifications for technicians conducting sampling, specimen preparation and testing of concrete.

ACI, a technical professional society, recommends that the committee approve this code change proposal as submitted to 1) improve the quality assurance processes for structural concrete, 2) reduce project cost increases due to inappropriate sampling, preparation and testing, 3) reduce the frequency of related construction delays, and 4) help assure that the concrete being used in structural elements will provide the life safety and property protection necessary to satisfy the intent of the code.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

There is no cost increase for this code change proposal, as for most projects these requirements are included in the contract documents between the owners, designers, and contractors. This code change proposal helps to assure that these requirements are included for structural concrete.

Staff Analysis: A review of the standard proposed for inclusion in the code, ACI 311.7-18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

S87-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the proponent did not clearly justify why the proposal is needed in the IBC. The proposal would greatly benefit from adding 'or equivalent' during the public comment phase. (Vote: 12-2)

Assembly Action:

None

S87-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1704.2.6 (New), ACI Chapter 35 (New)

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1704.2.6 Concrete tests. Unless otherwise approved, individuals conducting field tests of structural concrete shall satisfy the requirements of ACI 311.6 Section 1.2.1.1 Field technician. Unless otherwise approved, individuals conducting laboratory tests of structural concrete elements shall satisfy the requirements of ACI 311.6 section 1.2.1.2 Laboratory technician. ~~Field and laboratory technicians qualifications shall comply with ACI 311.6.~~

ACI

American Concrete Institute
38800 Country Club Drive
Farmington Hills MI 48331

ACI 311.6-18: Specification for Ready Mixed Concrete Testing Services

Commenter's Reason: This proposal adds criteria to the building code to help assure proper sampling, specimen preparation and acceptance testing of concrete delivered to construction projects. This is crucial for assuring proper performance of structural concrete. Inaccurate test results and the negative implications on the performance of concrete occur far too frequently and add to the cost of construction by requiring sampling and testing of cores or other verification of concrete properties. Too, there are additional costs related to delays in construction.

The language in ACI 311.6 is:

1.2.1.1 Field technician—Technicians conducting field tests of concrete shall be certified as ACI Concrete Field Testing

Technician – Grade I, unless otherwise specified.

1.2.1.2 Laboratory technician—Technicians conducting laboratory testing shall be certified as ACI Concrete Laboratory

Testing Technician – Level 1 or ACI Concrete Strength Testing Technician, unless otherwise specified.

During the Committee Action Hearings, *the committee felt that the proponent did not clearly justify why the proposal is needed in the IBC. The proposal would greatly benefit from adding 'or equivalent' during the public comment phase.* The language in the modification specifically includes “unless otherwise specified” to permit testing by any individuals approved by the building official. This language is deemed to better capture the intent of the committee than requiring an equivalent to the specific ACI requirements.

Bibliography: ACI 311.6-18: Specification for Ready Mixed Concrete Testing Services

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Testing is already required. This modifications sets criteria for technician qualifications.

Public Comment# 1273

S90-19

IBC®: 1704.6

Proposed Change as Submitted

Proponents: Gregory Robinson, representing National Council of Structural Engineers Associations (NCSEA) (grobenson@lbyd.com)

2018 International Building Code

Revise as follows:

1704.6 Structural observations. Where required by the provisions of Section 1704.6.1, 1704.6.2 or 1704.6.3, the owner or the owner's authorized agent shall employ a *registered design professional* to perform structural observations. The structural observer shall visually observe representative locations of structural systems, details, and load paths for general conformance to the design intent as defined in the approved construction documents. Structural observation does not include or waive the responsibility for the inspections in Section 110 or the *special inspections* in Section 1705 or other sections of this code.

Prior to the commencement of observations, the structural observer shall submit to the *building official* a written statement identifying the frequency and extent of structural observations.

At the conclusion of the work included in the permit, the structural observer shall submit to the *building official* a written statement that the site visits have been made and identify any reported deficiencies that, to the best of the structural observer's knowledge, have not been resolved.

Reason: The definition of structural observations in Chapter 2 is vague and disconnected from the requirements in Chapter 17. As a result, the various roles that form a comprehensive program of tests and inspections often get confused, and application is inconsistent. Including the proposed description in Chapter 17 provides a clearer understanding of what an observer is expected to "visually" observe - systems, details, and load paths. It is also intended to help address a widespread perception of overlap between special inspections and structural observation. Special inspections are very detailed inspections of smaller components. They require certification and specialized training to perform, but they don't necessarily require an understanding of how systems are designed to function as part of the overall building.

On the other hand, structural observations are broad, general, visual overviews of a bigger picture. Broad knowledge of structural design issues and specific knowledge of their application to the project is necessary, but observations do not strictly adhere to a standard written procedure like special inspections do.

The distinct levels of oversight are complimentary, but intended to address different aspects of quality assurance.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Clarification only. No additional cost is anticipated.

S90-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: After much discussion, the committee acknowledged that the proposal was a reasonable addition to explain to all parties what constitutes a 'structural observation'.

(Vote: 9-5)

Assembly Action:

None

S90-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1704.6

Proponents:

Jenifer Gilliland, representing Seattle Department of Construction and Inspections (SDCI) (jenifer.gilliland@seattle.gov); Jonathan Siu, representing City of Seattle Department of Construction and Inspections (jon.siu@seattle.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1704.6 Structural observations. Where required by the provisions of Section 1704.6.1, 1704.6.2 or 1704.6.3, the owner or the owner's authorized agent shall employ a *registered design professional* to perform structural observations. The structural observer shall visually observe representative locations of structural systems, details, and load paths for general conformance to ~~the design intent as defined in the approved construction documents~~. Structural observation does not include or waive the responsibility for the inspections in Section 110 or the *special inspections* in Section 1705 or other sections of this code.

Prior to the commencement of observations, the structural observer shall submit to the *building official* a written statement identifying the frequency and extent of structural observations.

At the conclusion of the work included in the permit, the structural observer shall submit to the *building official* a written statement that the site visits have been made and identify any reported deficiencies that, to the best of the structural observer's knowledge, have not been resolved.

Commenter's Reason:

This public comment is intended to address an issue raised by one of the members of the Structural Committee during the hearings in May.

The current proposal requires the structural observer to evaluate construction based on the design intent as defined in the *approved construction documents*. This goes further than the *structural observation* definition (see below) where conformance to the *approved construction documents* is evaluated. This PC incorporates language from the *structural observation* definition to ensure conformance with the *approved construction documents* and keeps the section aligned with the definition.

In addition, the structural observer may or may not know the "intent" of the design. While it would be ideal for the registered design professional (RDP) performing the structural observation to also be the person who designed the structure, it is not a requirement in the code. If the owner chooses to employ a different RDP, it will be difficult (and in some cases, impossible) for the structural observer to know the design intent.

[BS] STRUCTURAL OBSERVATION. The visual observation of the structural system by a registered design professional for general conformance to the approved construction documents.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Aligning the duties of the structural observer with the definition of *structural observation* brings clarification of their duties and limits the scope of the observation that they perform. Without the public comment, structural observers might see their duty as extending beyond the information found on the approved *construction documents* which could add cost.

Public Comment# 1426

S96-19

IBC®: TABLE 1705.3

Proposed Change as Submitted

Proponents: Jason Krohn, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org)

2018 International Building Code

Revise as follows:

**TABLE 1705.3
REQUIRED SPECIAL INSPECTIONS AND TESTS OF CONCRETE CONSTRUCTION**

Portions of table not shown remain unchanged.

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION	REFERENCED STANDARD ^a	IBC REFERENCE
1. Inspect reinforcement, including prestressing tendons, and verify placement.	—	X	ACI 318: Ch. 20, 25.2, 25.3, 26.6.1- 26.6.3	1908.4
2. Reinforcing bar welding: a. Verify weldability of reinforcing bars other than ASTM A706; b. Inspect single-pass fillet welds, maximum 5/16" welding of reinforcement for special moment frames, boundary elements of special structural walls, and coupling beams; c. <u>Inspect welded reinforcement splices; and</u> d. <u>Inspect all other welds.</u>	 — X X X	 X X =	 AWS D1.4 ACI 318: 26.6.4 <u>13.3</u>	 —

For SI: 1 inch = 25.4 mm.

- a. Where applicable, see Section 1705.12, Special inspections for seismic resistance.
- b. Specific requirements for special inspection shall be included in the research report for the anchor issued by an approved source in accordance with 17.8.2 in ACI 318, or other qualification procedures. Where specific requirements are not provided, special inspection requirements shall be specified by the registered design professional and shall be approved by the building official prior to the commencement of the work.

Reason: This proposal seeks to reverse a substantive change made as part of an organizational change in the 2015 IBC by Code Change S148-12. The change is shown below.

**TABLE 1705.2.2
REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION OTHER THAN
STRUCTURAL STEEL**

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD ^a
1. Material verification of cold-formed steel deck:			
a. Identification markings to conform to ASTM standards specified in the approved construction documents.	—	X	Applicable ASTM material standards
b. Manufacturers' certified test reports.	—	X	
2. Inspection of welding:	—	—	
a. Cold-formed steel deck			
1. Floor and roof deck welds		X	AWS D1.3
b. Reinforcing steel bars:			
1. Verification of weldability of reinforcing steel bars other than ASTM A 706.	—	X	AWS D1.4 ACI 318 Section 3.5.2
2. Reinforcing steel resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special structural walls of concrete and shear reinforcement.	X	—	
3. Shear reinforcement.	X	—	
4. Other reinforcing steel.	=	X	
2. <u>Single-pass fillet welds, maximum 5/16"</u>		X	
3. <u>All other welds</u>	X		

For SI: 1 inch = 25.4 mm.

- a. Where applicable, see also Section 1705.11, Special inspection for seismic resistance.

The Committee's reason for approving this code change as submitted was: "This code change simplifies the special inspections for steel by

removing requirements for reinforcing bars that don't belong under steel." This reason obviously is strictly organizational.

We believe that tying the extent of special inspection of reinforcing bars (continuous or periodic) to the function of those bars (reinforcement for special moment frames, boundary elements of special structural walls, and coupling beams) is logical. Continuous special inspection can then be mandated for welds, the failure of which is liable to have serious, even catastrophic, consequences. The logic behind mandating special inspection for all welds other than those of a particular type (and even there only up to a maximum size) is, on the other hand, difficult to see. The exception provided almost never applies. Fillet welds are used only at the ends of reinforcing bars, to connect them to plates; those welds are done at the shop using an automated welding process. Otherwise, the welds used on reinforcing bars are flare bevel groove welds or full penetration butt welds. Thus the 2015 IBC change represented an unnecessary expansion of special inspection requirements that did not result in any apparent benefit.

Modifications to the items requiring inspection have been made in ACI 318-19 Section 26.13.3. ACI 318 has determined that continuous special inspection of welding of reinforcement for intermediate moment frames is unnecessary. It has also determined that continuous special inspection of shear reinforcement is necessary only for special moment frames, boundary elements of special structural walls, and coupling beams. These determinations are reflected in this submitted code change.

Cost Impact: The code change proposal will decrease the cost of construction

The cost of precast concrete construction, where welding of reinforcing bars is not uncommon, should decrease modestly through elimination of unnecessary continuous special inspection in many cases.

S96-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee expressed concerns that the proponent did not sufficiently justify why the change was necessary. The reason statement implies that the change is 'organizational' only; however, it has technical changes included.

(Vote: 11-2)

Assembly Action:

None

S96-19

Individual Consideration Agenda

Public Comment 1:

IBC®: TABLE 1705.3

Proponents:

Edith Smith, representing Precast/Prestressed Concrete Institute (esmith@pci.org)

requests As Submitted

Commenter's Reason: We are asking for approval of S96 as submitted.

The original proposal was written to revert the special inspection criteria back to what they were in the 2012 IBC.

The proposed change ensures continuous special inspection of reinforcing bar welding in critical locations based on the loading conditions and adds continuous special inspection for shear reinforcing. It allows periodic inspection in less critical regions and continuous special inspection can then be mandated for welds, the failure of which is liable to have serious, even catastrophic, consequences. That is the way IBC Chapter 17 requirements were from the 2000 through the 2012 IBC.

This change also provides consistency with the AWS inspection requirement at "suitable intervals" and recognizes ACI 318-19 Section 26.13.3, which requires only special moment frames, boundary elements of special structural walls, and coupling beams necessitate continuous special inspection of flexural and shear reinforcement. There is no supporting evidence that other continuous inspections are necessary.

There is no evidence that suggests the 2015 IBC change was necessary due to a life safety hazard. All the proposed changes are in line with earlier versions of the code and enhance safety through inspection of critical items.

Please note, this change was approved during the public comment of the last code cycle. Unfortunately, the approval was overturned by on-line balloting. We would request that once again; the membership approve the code change proposal as submitted.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The cost of precast concrete construction, where welding of reinforcing bars is not uncommon, should decrease modestly through elimination of unnecessary continuous special inspection in many cases.

Public Comment# 1408

Proposed Change as Submitted

Proponents: Terry Kozlowski, representing Southern Nevada Chapter; Amanda Moss, representing SN-ICC Member; Cassidy Wilson, representing SN-ICC Member

2018 International Building Code

Revise as follows:

1705.4 Masonry construction. *Special inspections* and tests of masonry construction shall be performed in accordance with the quality assurance program requirements of TMS 402 and TMS 602.

Exception: Special inspections and tests shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed in accordance with Section 2109, 2110 or Chapter 14, respectively, where they are part of a structure classified as *Risk Category* I, II or III.
2. Masonry foundation walls constructed in accordance with Table 1807.1.6.3(1), 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.
4. Masonry fences less than or equal to 8'-0" in height, retaining walls less than or equal to 6'-0" in height and combined masonry fences and retaining walls less than or equal to 14'-0" in overall height with the fence portion less than or equal to 8'-0" in height provided that the walls are designed in accordance with Chapter 2 of TMS 402-16 with allowable stresses for masonry reduced by one-half and f'm does not exceed 1500 psi. Wall heights shall be measured from the top of footing to the top of wall.

Reason: This proposal, eliminating the need for an additional inspection, has been utilized and evaluated in Southern Nevada for several years without any adverse structural and/or safety-related issues.

Cost Impact: The code change proposal will decrease the cost of construction

Regionally, this has resulted in reduced design, permitting, construction and inspection time frames and reduced construction costs.

S98-19**Public Hearing Results**

Committee Action:

Disapproved

Committee Reason: The committee expressed concerns that the proposal, as written, would allow larger structures than currently permitted to be constructed without special inspections. The proponent did not sufficiently justify the increase. As written, the proposal would allow a fence to be on top of a wall to create a 'tall element' to be built without special inspections.

(Vote: 14-0)

Assembly Action:

None

3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.
4. Masonry fences less than or equal to 7 feet (2134 mm) ~~8'-0" in height from the base of the fence or-~~ retaining walls less than or equal to 4 feet (1219 mm) ~~6'-0" in height measured from the top of footing to the top of the wall-~~ ~~and combined masonry fences and retaining walls less than or equal to 14'-0" in overall height with the fence portion less than or equal to 8'-0" in height provided that the walls are designed in accordance with Chapter 2 of TMS 402-16 with allowable stresses for masonry reduced by one-half and f'm does not exceed 1500 psi. Wall heights shall be measured from the top of footing to the top of wall.~~

Commenter's Reason: The purpose of this public comment is to revise the proposed exception to correlate with the fence and retaining wall heights for which a permit is not required under Section 105.2. If a project consisted entirely of such a fence or such a retaining wall, a special inspection would never be required since no permit would be required, and application for a permit is necessary to trigger a special inspection under Section 1704.2. It stands to reason that a special inspection should therefore not be required for such a fence or retaining wall merely because it is part of a larger project for which a permit is sought and special inspections are triggered. By aligning with the heights required to trigger a permit, the additional language on reduced masonry stresses is no longer required, because the Section 105.2 exceptions are not linked to wall materials or material strengths.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. While the public comment would cover fewer masonry fences and retaining walls than the original proposal, the net effect of the comment and the proposal would still be a reduction in the cost of construction relative to current code, as fences up to 7 feet and retaining walls up to 4 feet included as part of a larger permit submittal would otherwise trigger special inspection.

S100-19

IBC: 1705.5.3 (New), TABLE 1705.5.3 (New)

Proposed Change as Submitted

Proponents: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Building Code

Add new text as follows:

1705.5.3 Mass timber construction. *Special inspections* of Mass Timber elements in Types IV-A, IV-B and IV-C construction shall be in accordance with Table 1705.5.3.

TABLE 1705.5.3
REQUIRED SPECIAL INSPECTIONS OF MASS TIMBER CONSTRUCTION

Type	Continuous Special Inspection	Periodic Special Inspection
<u>1. Inspection of anchorage and connections of mass timber construction to timber deep foundation systems.</u>		<u>X</u>
<u>2. Inspect erection of mass timber construction</u>		<u>X</u>
<u>3. Inspection of connections where installation methods are required to meet design loads.</u>		
<u>3.1. Threaded fasteners</u>		
<u>3.1.1. Verify use of proper installation equipment.</u>		<u>X</u>
<u>3.1.2. Verify use of pre-drilled holes where required.</u>		<u>X</u>
<u>3.1.3. Inspect screws, including diameter, length, head type, spacing, installation angle, and depth.</u>		<u>X</u>
<u>3.2. Adhesive anchors installed in horizontal or upwardly inclined orientation to resist sustained tension loads</u>	<u>X</u>	
<u>3.3. Adhesive anchors not defined in 3.2.</u>		<u>X</u>
<u>3.4. Bolted connections</u>		<u>X</u>
<u>3.5. Concealed connections</u>		<u>X</u>

Reason: This proposal adds special inspection provisions to Section 1705 for mass timber. This new and unique type of construction requires a level of inspection consistent with other large buildings and unique applications where milestone inspections by the jurisdictional inspectors are not rigorous enough to ensure a level of quality control or quality assurance of the construction process. The proposed special inspections are similar to what is required for other prefabricated systems such as pre-cast concrete and structural steel.

Special Inspection is the monitoring of materials, installation, fabrication, erection and placement of components and connections that require special expertise that are critical to the integrity of the building structure. The special inspectors are required to ensure compliance with the approved construction documents and referenced standards. The program allows jurisdictions to have access to highly specialized and trained inspectors. Some special inspection activities require construction activities to be continuously inspected; which would be logistically difficult for a typical building inspection program. Special inspection is a vital part of the compliance path for successful and compliant building projects constructed under the International Building Code.

The specific elements requiring special inspection are:

1. Periodic inspection of the connection of mass timber elements to wood foundation elements. These connections are critical to transfer loads from the mass timber elements to the piles, particularly for lateral loading. The connections to concrete foundations are addressed in Table 1705.3, Item #3.
2. Periodic inspection of erection of mass timber elements. Similar to pre-cast concrete (Table 1705.3, Item #10), tall wood buildings utilizing pre-fabricated elements needs to have verification that the correct elements are placed in the right location in accordance with the design drawings.
3. Inspection of specialized connections.

Connections between mass timber products that utilized threaded, bolted, or concealed connections are considered periodic in a similar manner that concrete special inspections are required in Table 1705.3. The strength of many connection designs is predicated on specific screw lengths and installation angles. Bolted connections require specific diameters, and for lag bolts, specific lengths. Concealed connectors, many of which are proprietary, must be installed correctly for structural performance. Most of these cannot be verified by the jurisdictional inspector, so special inspections are required.

Adhesive anchorage installed in horizontal or upwardly inclined positions resisting tension loads shall be continuously inspected, again similar to Table 1705.3, Item 4a. This is required because of issues with creep of the adhesives under long-term tension loading discussed in previous code change cycles. However, once again similar to the requirements for precast concrete, all other adhesive anchors need only be inspected periodically (ref. Table 1705.3, Item 4b).

If there are other unusual items not covered in the proposed table, the existing text in Section 1705.1.1 gives the building official the authority to require special inspections for those unusual items. The same section also says the building official can require special inspections where manufacturers' installation instructions prescribe requirements not contained in the code. For example, field-glued mass timber beam or panel splices, while currently rare in North America, may become more prevalent in the future. This is not an item that is covered in the proposed Table 1705.5. While the AHC-TWB is not aware of any of those types of splices that are not currently proprietary, Section 1705.1.1 would allow the building official to require special inspections for either proprietary or non-proprietary field-glued splices. Note that many design engineers will also specify

the need for special inspections for unusual conditions in their structural notes in the construction documents, or in the statement of special inspections (see Sections 1704.2.3 and 1704.3).

No changes are being proposed to address fabrication of mass timber structural elements. Mass timber structural assembled in a fabricator shop should be addressed by sections 1704.2.5 and 1704.2.5.1 of the current codes regarding fabrication

The Ad Hoc Committee for Tall Wood Buildings (AHC-TWB) was created by the ICC Board of Directors to explore the building science of tall wood buildings with the scope to investigate the feasibility of and take action on developing code changes for these buildings. Members of the AHC-TWB were appointed by the ICC Board of Directors. Since its creation in January, 2016, the AHC-TWB has held 8 open meetings and numerous Work Group conference calls. Four Work Groups were established to address over 80 issues and concerns and review over 60 code proposals for consideration by the AHC-TWB. Members of the Work Groups included AHC-TWB members and other interested parties. Related documentation and reports are posted on the AHC-TWB website at <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/>.

Cost Impact: The code change proposal will increase the cost of construction

Since all the code proposals related to Mass Timber products are to address new types of building construction, in theory this will not increase the cost of construction, but rather provides design options not currently provided for in the code. The committee took great care to not change the requirements of the pre-existing construction types, and our changes do not increase the cost of construction using those pre-existing construction types. However, based on a typically residential or office building of typical floor plates an estimate of Special Inspection costs would range from \$1,000 to \$2,000 per floor. Another approach to the cost of special inspection is a percentage of total construction costs; for typical pre-fabricated construction elements the cost of special inspection can range between 0.15% to 0.30%, depending on labor cost and complexities of the construction in the building. These estimates are based on responses to surveys of special inspection agencies in the Seattle and Las Vegas areas.

S100-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal adds special inspection provisions to Section 1705 for mass timber consistent with the findings of the Tall Wood Ad Hoc Committee and consistent with the Group A actions. This new and unique type of construction requires a level of inspection consistent with other large buildings and unique applications where milestone inspections by the jurisdictional inspectors are not rigorous enough to ensure a level of quality control or quality assurance of the construction process. The proposed special inspections are similar to what is required for other prefabricated systems such as pre-cast concrete and structural steel.

Individual Consideration Agenda

Public Comment 1:

IBC®: TABLE 1705.5.3 (New)

Proponents:

Scott Campbell, representing National Ready Mixed Concrete Association (scampbell@nrmca.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

**TABLE 1705.5.3
REQUIRED SPECIAL INSPECTIONS OF MASS TIMBER CONSTRUCTION**

Type	Continuous Special Inspection	Periodic Special Inspection
1. Inspection of anchorage and connections of mass timber construction to timber deep foundation systems.		X
2. Inspect erection of mass timber construction		X
3. Inspection of connections where installation methods are required to meet design loads		
3.1. Threaded fasteners		
3.1.1. Verify use of proper installation equipment.		X
3.1.2. Verify use of pre-drilled holes where required.		X
3.1.3. Inspect screws, including diameter, length, head type, spacing, installation angle, and depth.		X
3.2. Adhesive anchors installed in horizontal or upwardly inclined orientation to resist sustained tension loads	X	
3.3. Adhesive anchors not defined in 3.2.		X
3.4. Bolted connections		X
3.5. Concealed connections	X	X

Commenter's Reason: This public comment is attempting to incorporate the comments from the Committee on S100 and S101, and to balance the need for additional inspections on new systems with the desire to treat all superficially similar systems equally. The proposal suggests changing the periodic special inspection requirement to continuous special inspection for concealed connections in mass timber. The specific reasons why continuous special inspections are advised for concealed connections are:

(1) The tests performed and reviewed by the Tall Wood Ad-Hoc Committee indicated that the connections are crucial for not only the structural performance of the mass timber systems, but also for achieving the desired fire resistance. While many connection types can be visually inspected after installation, those connections that are concealed cannot be evaluated post-install. The criticality of the connections and the lack of ability to review after the fact are indicators that continuous special inspection should be required.

(2) The connections currently in use are almost entirely proprietary, requiring special training for installation, and thus should require continuous special inspection until such a time as sufficient experience has been gained that code officials can be confident that the contractors know how to correctly install the connections.

(3) The main argument for having periodic special inspections is that the mass timber systems are similar to precast concrete and steel framing systems. While this argument makes sense at first glance, the fact is that precast concrete systems have been widely used for over 60 years, and steel framing for over 100. Everyone involved, from the designers to the contractors to the code officials is aware of how the systems should be constructed and what to look for during inspections. This is not true for mass timber construction where most jurisdictions do not have any mass timber buildings. Until code officials can be confident that the contractors have sufficient experience to justify relaxed inspection requirements the more stringent continuous inspection requirements should be put into place.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This comment is dealing with a new system that is not currently in the code and therefore has no cost impact on current construction practice.

Public Comment# 2004

Public Comment 2:

IBC®: 1705.5.3 (New), TABLE 1705.5.3 (New)

Proponents:

Edith Smith, representing Precast/Prestressed Concrete Institute (esmith@pci.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1705.5.3 Mass timber construction. *Special inspections* of Mass Timber elements in Types IV-A, IV-B and IV-C construction shall be in accordance with Table 1705.5.3.

**TABLE 1705.5.3
REQUIRED SPECIAL INSPECTIONS OF MASS TIMBER CONSTRUCTION**

Type	Continuous Special Inspection	Periodic Special Inspection
1. Inspection of anchorage and connections of mass timber construction to timber deep foundation systems.		X
2. Inspect erection of mass timber construction		X
3. Inspection of connections where installation methods are required to meet design loads		
3.1. Threaded fasteners		
3.1.1. Verify use of proper installation equipment.		X
3.1.2. Verify use of pre-drilled holes where required.		X
3.1.3. Inspect screws, including diameter, length, head type, spacing, installation angle, and depth.		X
3.2. Adhesive anchors installed in horizontal or upwardly inclined orientation to resist sustained tension loads	X	
3.3. Adhesive anchors not defined in 3.2.		X
3.4. Bolted connections		X
3.5. Concealed connections		X
4.0. Connections where installation methods are required to meet the fire resistance design in 2304.10.1.		<u>X</u>

Commenter's Reason: This public comment adds special inspection provisions to Table 1705.5.3 for mass timber. Buildings of mass timber over 6-stories involves new challenges in the construction of tall buildings, and contractors and inspectors have little or no experience working with these systems of wood material for tall buildings. Due to the importance of connections in the successful fire performance of mass timber systems, and the lack of long term experience for involved parties constructing these taller buildings, a level of inspection beyond that commonly required of other construction methods is warranted. This is consistent with the intent of Section 1705.1.1 where special inspections are intended for unusual design applications of materials included in the code, or where adherence to manufacturer's instructions for materials and systems are not specified in the code is required.

Requiring special inspection of these connections for fire resistance is also similar to the requirements in Section 1705.14, where sprayed fire-resistant materials must undergo special inspections and tests to document acceptance. These requirements for mass timber are similar in nature to these special inspections.

Finally, this public comment adds Section 2304.10.1 to specify how the fire resistance rating of connections for the Types IV-A, IV-B and IV-C construction is to be determined. This language is identical to the language proposed by the ICC Ad-Hoc Committee on Tall Wood Buildings in S170-19, which was recommended for approval by the Structural Committee. It is included in this public comment to show how it would relate to the reference in Table 1705.5.3 and should not be considered as a separate code proposal.

We request that the membership approve the code change S100-19 AS MODIFIED.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Code proposals for mass timber address a new types of construction in the IBC. In theory this will not increase the cost of construction instead providing design alternatives in the code. However, because of the newness of mass timber as a method of construction there will be some additional costs to provide special inspections to ensure the code is met.

Material Handling Institute
8720 Red Oak Blvd. Suite 201
Charlotte NC 28217

MH16.1: 2012: Specification for the Design, Testing and Utilization of Industrial Steel Storage Racks

Reason: The design of the components that go into the storage rack are based upon minimum thickness, minimum yield strength, etc. and it is imperative that these minimum properties are complied with in the fabrication of the components and included in storage rack installations. Storage rack systems can be complex and it is important that they how they are installed complies with the permitted drawings on file with the local building department, which is why they may need to be monitored.

Cost Impact: The code change proposal will increase the cost of construction
In high seismic areas budgets will need to include this required set of inspections for installations of storage rack structures.

Staff Analysis: A review of the standard proposed for inclusion in the code, MHI MH16.1: 2012, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

Individual Consideration Agenda

Public Comment 1:

IBC®: TABLE 1705.12.7 (New), 2209.3 (New)

Proponents:

Paul Armstrong, MHI, representing MHI (paul.armstrong@pacodeservices.com)

requests As Modified by Public Comment

Further modify as follows:

**TABLE 1705.12.7
Required Inspections of Storage Rack Systems**

Type	Continuous Inspection	Periodic Inspection	Referenced Standard	IBC Reference
Verify materials used comply with one or more of the material test reports in accordance with the <u>approved construction documents, when required by the engineer of the rack structure.</u>	—	X	—	—
Fabricated storage rack elements	—	X	—	1704.2.5
Installation of storage rack anchorage	—	X	ANSI/MH16.1 Section 7.3.2	—
At final inspection of the completed storage rack system, to indicate compliance with the <u>approved construction documents, when required by the engineer of the rack structure.</u>	—	X	—	—

2209.3 Certification For rack storage structures that are 8 feet in height or greater to the top load level and assigned to Seismic Design Category D, E, or F at completion of the storage rack installation, a *certificate of compliance* shall be submitted to the owner or the owner's authorized agent stating that the work was performed in accordance with approved construction documents, when required by the engineer of the rack structure.

Commenter's Reason: In addition to the original reason statement, engineers of storage racking systems have determined that there is a need for special inspection in specific situations. With this amendment, they can have the opportunity then to have special inspectors verify that the designed rack systems are erected with the intended components approved plan and that the owner of such systems can be assured that the system will operate in its intended fashion. This is not always a requirement so Table 1705.12.7, Items 1 and 4 and Section 2209.3 are available to be used at the rack system engineer's discretion.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost of a special inspection in identified cases will increase the cost of construction.

Public Comment# 2048

Public Comment 2:

IBC®: 1705.12.7, TABLE 1705.12.7 (New)

Proponents:

Jenifer Gilliland, representing Seattle Department of Construction and Inspections (SDCI) (jenifer.gilliland@seattle.gov); Jonathan Siu, representing City of Seattle Department of Construction and Inspections (jon.siu@seattle.gov)

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

1705.12.7 Storage racks. Steel storage racks and steel cantilevered storage racks ~~Storage racks~~, that are 8 feet in height or greater and assigned to Seismic Design Category D, E, or F, shall be provided with *periodic special inspection* as required by Table 1705.12.7.

TABLE 1705.12.7
Required Inspections of Storage Rack Systems

Type	Continuous Inspection	Periodic Inspection	Referenced Standard	IBC Reference
Verify materials used comply with one or more of the material test reports in accordance with the <i>approved construction documents</i>	—	X	—	—
Fabricated storage rack elements	—	X	—	1704.2.5
Installation of storage rack anchorage				
<u>a. <i>Steel storage rack</i></u>	—	X	ANSI/MH 16.1 Section 7.3.2	—
<u>b. <i>Steel cantilevered storage rack</i></u>	—	<u>X</u>	<u>ANSI/MH 16.3</u> <u>Section 8.5.2</u>	—
At final inspection of the completed storage rack system, to indicate compliance with the <i>approved construction documents</i>	—	X	—	—

Commenter's Reason: The definition *steel cantilevered storage rack* was approved by the ICC Structural Committee in proposal S161-19. This public comment incorporates *steel cantilevered storage rack* special inspection requirements and references the appropriate ANSI standard. It also clarifies that there are now two defined storage rack systems and italicizes these terms.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. As mentioned in the proponents original proposal, the cost of construction will increase because these storage rack systems will now be subject to special inspection. The public comment clarifies that the requirement for special inspection, and therefore the cost increase, applies to *steel cantilevered storage racks*, not just *steel storage racks*.

Public Comment# 1850

S108-19

IBC®: 1709.5, AAMA Chapter 35 (New)

Proposed Change as Submitted

Proponents: Jennifer Hatfield, representing American Architectural Manufacturers Association (jen@jhatfieldandassociates.com)

2018 International Building Code

Revise as follows:

1709.5 Exterior window and door assemblies. The design pressure rating of exterior windows and doors in buildings shall be determined in accordance with Section 1709.5.1 or 1709.5.2. For exterior windows and doors tested in accordance with Sections 1709.5.1 or 1709.5.2, required design wind pressures determined from ASCE 7 shall be permitted to be converted to allowable stress design by multiplying by 0.6.

Exception: Structural wind load design pressures for window units smaller or door assemblies other than the size tested in accordance with Section 1709.5.1 or 1709.5.2 shall be permitted to be higher different than the design value of the tested unit assembly provided such higher pressures are determined by accepted engineering analysis analysis or validated by an additional test of the window or door assembly to the alternative allowable design pressure in accordance with Section 1709.5.2. Components of the small unit alternate size assembly shall be the same as the tested unit. Where such calculated design pressures are or labeled assembly. Where engineering analysis is used, they it shall be validated by an additional test of the window unit having the highest allowable design pressure, performed in accordance with the analysis procedures of AAMA 2502.

Add new standard(s) as follows:

AAMA

American Architectural Manufacturers
Association
1827 Waldon Office Square, Suite 550
Schaumburg IL 60173

2502--2019: Comparative Analysis Procedure for Window and Door Products

Reason: The current exception limits the use of comparative analysis to window units smaller than the size originally tested. If comparative analysis is used to provide a higher design pressure rating of the smaller unit, it must be verified by testing of the unit as well. Additional testing should not be required if accepted engineering analysis is used.

It is also appropriate to use comparative analysis to rate window units larger than the size originally tested to lower design pressures. Testing should not be required to verify this level of performance since a higher pressure level has already been determined by testing of the same components in a smaller window unit and accepted engineering analysis is used.

This proposal revises this section as appropriate to permit the use of comparative analysis for larger as well as smaller window units than those tested. The last sentence of the section is also revised to define accepted engineering analysis as that which is specified and performed in accordance with the analysis procedures of AAMA 2502, a reference standard being added by this proposal that provides a standardized comparative analysis procedure for determining the structural integrity of window and door products.

The proposal also replaces the term "unit" with the word "assembly," as the term "assemblies" is used in the title of section 1709.5 and is the appropriate terminology that is reflected in AAMA 2502.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The code change will not increase the cost of construction but rather it simply permits the use of comparative analysis for larger assemblies.

Staff Analysis: A review of the standard proposed for inclusion in the code, AAMA 2502-2019, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

Proposed Change as Submitted

Proponents: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com)

2018 International Building Code

1805.3.1 Floors. Floors required to be waterproofed shall be of concrete and designed and constructed to withstand the hydrostatic pressures to which the floors will be subjected.

Waterproofing shall be accomplished by placing a membrane of rubberized asphalt, butyl rubber, fully adhered/fully bonded HDPE or polyolefin composite membrane or not less than 6-mil [0.006 inch (0.152 mm)] polyvinyl chloride with joints lapped not less than 6 inches (152 mm) or other *approved* materials under the slab. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

1805.3.2 Walls. Walls required to be waterproofed shall be of concrete or masonry and shall be designed and constructed to withstand the hydrostatic pressures and other lateral loads to which the walls will be subjected.

Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (305 mm) above the maximum elevation of the ground-water table. The remainder of the wall shall be dampproofed in accordance with Section 1805.2.2 . Waterproofing shall consist of two-ply hot-mopped felts, not less than 6-mil (0.006 inch; 0.152 mm) polyvinyl chloride, 40-mil (0.040 inch; 1.02 mm) polymer-modified asphalt, 6-mil (0.006 inch; 0.152 mm) polyethylene ; a drainage layer of not less than 4 inches (100 mm) of free draining granular material; a drainage layer that can be shown to provide equivalent performance to not less than 4 inches (100 mm) of free draining granular material; or other approved methods or materials capable of bridging nonstructural cracks. Joints in the membrane or layers shall be lapped and sealed in accordance with the ~~manufacturer's~~ manufacturer's installation instructions.

1805.3.2.1 Surface preparation of walls. Prior to the application of waterproofing materials on concrete or masonry walls, the walls shall be prepared in accordance with Section 1805.2.2.1 .

1805.3.3 Joints and penetrations. Joints in walls and floors, joints between the wall and floor and penetrations of the wall and floor shall be made water tight utilizing *approved* methods and materials.

Reason: Objective:

Provide more options for foundation waterproofing and dampproofing.

This code change provides additional options for foundation waterproofing and dampproofing.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This change simply adds more options. In some cases it might decrease costs.

S113-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee did not believe that this is an 'equivalent' option as it does not bridge the nonstructural cracks and it is not suitable for heavy clay soils. In general drainage is not a substitute for waterproofing.

(Vote: 13-1)

Assembly Action:

None

S113-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1805.3.2 Walls. Walls required to be waterproofed shall be of concrete or masonry and shall be designed and constructed to withstand the hydrostatic pressures and other lateral loads to which the walls will be subjected.

Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (305 mm) above the maximum elevation of the ground-water table. The remainder of the wall shall be dampproofed in accordance with Section 1805.2.2 . Waterproofing shall consist of two-ply hot-mopped felts, not less than 6-mil (0.006 inch; 0.152 mm) polyvinyl chloride, 40-mil (0.040 inch; 1.02 mm) polymer-modified asphalt, 6-mil (0.006 inch; 0.152 mm) polyethylene; a drainage layer of not less than 4 inches (100 mm) of ~~free draining granular material~~ clean aggregate having a void ratio of not less than 35 percent or a Size Number of 4, 5, 56, or 6 as classified by ASTM C33; a drainage layer that can be shown to provide equivalent performance to not less than 4 inches (100 mm) of ~~free draining granular material~~ clean aggregate having a void ratio of not less than 35 percent or a Size Number of 4, 5, 56, or 6 as classified by ASTM C33; or other approved methods or materials capable of bridging nonstructural cracks. Joints in the membrane or layers shall be lapped and sealed in accordance with the manufacturer's installation instructions.

Commenter's Reason: Committee reason is incorrect. In general drainage is a substitute for waterproofing and recognized as such in international codes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This change does not change costs. It provides alternative means and methods of construction.

Public Comment# 1932

Proposed Change as Submitted

Proponents: Terry Kozlowski, representing Southern Nevada Chapter; Nenad Mirkovic, representing City of Las Vegas; Amanda Moss, representing SN-ICC Member; Cassidy Wilson, representing SN-ICC Member

2018 International Building Code

Revise as follows:

1807.2.3 Safety factor. Retaining walls shall be designed to resist the lateral action of soil to produce sliding and overturning with a minimum safety factor of 1.5 in each case. The load combinations of Section 1605 shall not apply to this requirement. Instead, design shall be based on 0.7 times nominal earthquake loads, 0.6 nominal wind loads, 1.0 times other *nominal loads*, and investigation with one or more of the variable loads set to zero. The safety factor against lateral sliding shall be taken as the available soil resistance at the base of the retaining wall foundation divided by the net lateral force applied to the retaining wall.

Exception: Where earthquake loads or wind are included, the minimum safety factor for retaining wall sliding and overturning shall be 1.1.

Reason: The intent is to address loads that a building is likely to experience and precludes consideration of a FACTORED LOAD which applies to limit state or strength design.

The term "nominal loads" is defined in Chapter 2 as "The magnitudes of the loads specified in Chapter 16 (dead, live, soil, wind, snow, rain, flood and earthquake)". The term "service loads" as used in the definition of "dangerous" is synonymous with the definition of "nominal loads" loads as defined in the IBC Interpretation 23-10.

The International Building Code Section 1807.2.3 covers retaining walls but it does not clearly address safety factor when the freestanding wall, fence or other structures that are constructed on top of the retaining wall or are in the close proximity of the retaining wall and supported by a retaining wall that is subject to nominal loads that include wind and not earthquake load in the load combination. This provides clarification to indicate service wind load to be used in lieu of nominal load (ultimate wind load).

Bibliography: IBC Section 1602 Definitions and Notations

FACTORED LOAD. The product of a nominal load and a load factor.

NOMINAL LOADS. The magnitudes of the loads specified in this chapter (dead, live, soil, wind, snow, rain, flood and earthquake).

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal will not increase or decrease the cost of construction but rather provides clarification to indicate service wind load to be used in lieu of nominal load (ultimate wind load).

S114-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal assumes that wind loads are typically ignored or missed; however, the committee did not concur - the load combinations include wind loads.

(Vote: 13-1)

Assembly Action:

None

S114-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

requests As Submitted

Commenter's Reason: The committee disapproved the proposal with modification because the committee felt the winds loads are not ignored or missed and the load combinations include wind loads. In rebuttal however the section clearly states that the load combinations of Section 1605 shall not apply for the retaining wall stability check requirement. In addition the section is not clear how wind loads are considered in the retaining wall stability check requirement.

This IBC section requires that retaining wall designs include a stability check for sliding and overturning and that a factor of safety be applied. Additionally, the section includes an exception that addresses where earthquake loads are included the safety factor is reduced from 1.5 to 1.1 since they are considered short-term loads. For a structural engineer to properly design a retaining wall they will need to also consider wind loads. Yet this section currently is silent when it comes to wind loads or it assumes it is considered as '*other nominal loads*' in which case the wind load case will always govern the stability of the wall when considering the load cases without earthquake loads. This is a significant structural design consideration since wind loads are generated from ASCE 7 using strength design level forces, no 0.6 load reduction factor is allowed and then required to use the 1.5 factor of safety for the wall stability check. Almost all retaining walls have a wall extension above the retained earth and exposed to wind. There are many cases where the construction of a retaining wall extends above the grade of the retained earth or where fences are directly supported on the retaining wall or constructed integral with the retaining wall.

Both earthquake and wind loads are *nominal* lateral loads generated from ASCE 7 at strength design level forces. This modification clearly includes consideration of wind loads when checking the stability of a retaining wall by multiplying the wind load by 0.6 to align the ASCE 7 strength design level wind load to an allowable stress design load as the section does for the 0.7 factor applied to ASCE 7 strength design level earthquake loads. See 2018 IBC Section 1605.3.1 using allowable stress design for the factor justification, i.e., especially Equation 16-12 which has for a combination variable (0.6W or 0.7E). The 1.1 minimum factor of safety for wind loads is consistent with the long-standing geotechnical practice of considering earthquake and wind loads interchangeably as short-term lateral loads.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

The code change proposal with modification will decrease the cost of retaining wall construction where wind loads govern the design since the ultimate design level wind loads will be reduced to an allowable stress design loads and the safety factor for the wall stability check is reduced consistent with earthquake loads.

Public Comment# 1547

S118-19

IBC®: 1808.8.1

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, representing American Concrete Institute (steve.szoke@concrete.org); Scott Campbell, National Ready Mixed Concrete Association, representing National Ready Mixed Concrete Association (scampbell@nrmca.org)

2018 International Building Code

Revise as follows:

1808.8.1 Concrete or grout strength and mix proportioning. Concrete or grout in foundations shall have a specified compressive strength (f'_c) not less than the largest applicable value indicated in Table 1808.8.1.

Where concrete is placed through a funnel hopper at the top of a deep foundation element, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 8 inches (204 mm). ~~Where concrete or grout is to be pumped, the mix design including slump shall be adjusted to produce a pumpable mixture.~~

Reason: This code change removes an inappropriate requirement. Grout to be pumped needs to satisfy more requirements than just those required to facilitate pumping. The consistency of the concrete must also satisfy other requirements including but not limited to workability, durability and structural performance requirements. ACI 301 *Specifications for Structural Concrete* provides that: "4.2.2.2 Slump—Unless otherwise specified, select a target slump or slump flow at the point of delivery for all concrete mixtures. Selected target slump shall not exceed 9 in. Selected target slump flow shall not exceed 30 in. Concrete shall not show visible signs of segregation. The target slump or slump flow value shall be enforced for the duration of the project." Current concrete technology provides for both concrete slump and flow as applicable for concrete placement and performance.

ACI 318 *Building Code Requirements for Structural Concrete* which is a reference in the IBC references ACI 301 for concrete mix design criteria. Thus the appropriate criteria are applicable for concrete are requirements of the IBC by reference. This text should be deleted to assure the appropriate criteria for concrete slump and flow are satisfied regardless of delivery methods. ACI, a technical professional society, recommends the committee approve this code change proposal as submitted.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

In general, this code change will not increase nor decrease the cost of construction except there may be cost savings due to the use of admixtures that improve pumpability of concrete while retaining the other necessary properties of the concrete.

S118-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee respected the intent of the proposal; however, as written, the proposal needs work. The committee highly encourage updating / rewording during the public comment phase.

(Vote: 9-5)

Assembly Action:

None

S118-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1808.8.1

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

1808.8.1 Concrete or grout strength and mix proportioning. Concrete or grout in foundations shall have a specified compressive strength (f'_c) not less than the largest applicable value indicated in Table 1808.8.1.

Where concrete is placed through a funnel hopper at the top of a deep foundation element, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 8 inches (204 mm). Where concrete or grout is to be pumped, the mix design ~~including slump shall be adjusted to~~ produce a pumpable mixture.

Commenter's Reason: This provision should be struck from the IBC. The current language requires that the "mix design shall be adjusted to produce a pumpable mixture." This does not specify who has the ability to adjust the mix design, the concrete producer, the pumping contractors or the design professional. Specification of the mix design for structural concrete should be by the design professional and deviations from the mix design required for structural performance should not be permitted. This language permits the mix design specified for the project to be adjusted to produce pumpable concrete. As with all concrete the mix design should be coordinated with the producer, contractors, and design professionals, regardless of method of placement, i.e. ready mixed concrete truck chute, pump, conveyor, funnel hopper, etc. This language should be removed from the IBC. The appropriate direction to the design professional is provided in ACI 318 Building Code Requirements for Structural Concrete, Section 26.5.2.1 and specifically subsection (f):

Concrete shall be placed in accordance with (1) through (5):

- (1) At a rate to provide an adequate supply of concrete at the location of placement.
- (2) At a rate so concrete at all times has sufficient workability such that it can be consolidated by the intended methods.
- (3) Without segregation or loss of materials.
- (4) Without interruptions sufficient to permit loss of workability between successive placements that would result in cold joints.
- (5) Deposited as near to its final location as practicable to avoid segregation due to rehandling or flowing.

To avoid discrepancies between the design professional, contractors, and producers with the language in the IBC should be deleted. also the issue is addressed in ACI 318 which is referenced for concrete in the IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This code change maintains that the where concrete or grout are intended to be pumped, the concrete mix design shall be pumpable and thus there should be no increase or decrease in cost. This modification retains the concept that mix designs be as specified by the design professional and not adjusted by contractors, producers, or sub-contractors without approval of the design professional.

Public Comment# 1944

S119-19

IBC®: 1808.8.1, TABLE 1808.8.1

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, representing American Concrete Institute (steve.szoke@concrete.org); Scott Campbell, representing National Ready Mixed Concrete Association (scampbell@nrmca.org)

2018 International Building Code

Revise as follows:

1808.8.1 Concrete or grout strength and mix proportioning. Concrete or grout in foundations shall have a specified compressive strength (f'_c) not less than the largest applicable value indicated in Table ~~1808.8.1~~ 19.2.1.1 of ACI 318.

Where concrete is placed through a funnel hopper at the top of a deep foundation element, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 8 inches (204 mm). Where concrete or grout is to be pumped, the mix design including slump shall be adjusted to produce a pumpable mixture.

Delete without substitution:

TABLE 1808.8.1
MINIMUM SPECIFIED COMPRESSIVE STRENGTH f'_c OF CONCRETE OR GROUT

FOUNDATION ELEMENT OR CONDITION	SPECIFIED COMPRESSIVE STRENGTH, f'_c
1. Foundations for structures assigned to <i>Seismic Design Category A, B or C</i>	2,500 psi
2a. Foundations for Group R or U occupancies of light-frame construction, two stories or less in height, assigned to <i>Seismic Design Category D, E or F</i>	2,500 psi
2b. Foundations for other structures assigned to <i>Seismic Design Category D, E or F</i>	3,000 psi
3. Precast nonprestressed driven piles	4,000 psi
4. Socketed drilled shafts	4,000 psi
5. Micropiles	4,000 psi
6. Precast prestressed driven piles	5,000 psi

For SI: 1 pound per square inch = 0.00689 MPa.

Reason: Removes the table for compressive strength requirements for the 2018 IBC and directs the user to ACI 318 Table 19.2.1.1 Limits for f'_c . The user is already required to use information from ACI 318 for foundations. For example, Table 1808.8.2 Minimum Concrete Cover directs the user to the requirements of Section 20.6 of ACI 318. By not having information in two places will reduce confusion, avoid unintended differences and reduce the potential for errors. Rather than having criteria in two locations this change places criteria on one reference and helps assure that other applicable provisions of ACI 318 as required by 2018 IBC Chapter 19 are not overlooked. Table 1 below shows the comparison of criteria in 2018 IBC and ACI 318. It is noteworthy that, consistent with the overall methodology throughout ACI 318, the user is directed to one section for all relevant criteria. Note that Table 19.2.1.1 has all limits for specified compressive strength in one location. This improves the user-friendliness provided by ACI 318. Further with criteria in two documents that user is required to refer to both to identify potential differences which can be a cumbersome process.

TABLE 1

Comparison of IBC AND ACI 318 MIN. COMPRESSIVE STRENGTH OF CONCRETE OR GROUT

2018 IBC	ACI 318	2018 IBC	ACI 318
Foundation Element of Condition		Specified Compressive Strength f'_c	Minimum f'_c , psi
1. Foundations for structures assigned to Seismic Design Category A, B or C	1. General	2,500	2,500
2a. Foundations for two stories or less in height, assigned to Seismic Design Category D, E or F	2. Special Moment Frames		
	2a. Special structural walls with Grade 60 or 80 reinforcement	2,500	3,000 ¹
2b. Foundations for other structures assigned to Seismic Design Category D, E or F2	2b. Special Structural walls with Grade 100 reinforcement	3,000	5,000
3. Precast nonprestressed driven piles		4,000 psi	4,000
4. Socketed drilled shafts		4,000 psi	4,000
5. Micropiles		4,000 psi	4,000
6. Precast prestressed driven piles		5,000 psi	5,000

¹ The f'_c for lightweight concrete in special moment frames and special structural walls shall not exceed 5000psi. The limit is permitted to be exceeded where demonstrated by experimental evidence that members made with lightweight concrete provide strength and toughness equal to or exceeding those of comparable members made with normalweight concrete of the same strength.

²Does not include foundations for stud bearing wall construction two stories or less.

ACI, a professional technical society, recommends the deletion of the specified compressive strength criteria form the IBC to better assure that all applicable requirements of ACI 318 are properly considered for design and construction of concrete foundations. ACI encourages the committee to approve this code change as submitted.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

Technical criteria remain unchanged and thus no cost impact.

S119-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Proponent requested Disapproval. For foundations such as micro piles and deep foundations, ACI 318-19 is not coordinated with the current IBC. (Vote: 14-0)

Assembly Action:

None

S119-19

Individual Consideration Agenda

Public Comment 1:

IBC@: 1808.8.1, TABLE 1808.8.1

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

1808.8.1 Concrete or grout strength and mix proportioning. Concrete or grout in shallow foundations and micropiles shall have a specified compressive strength (f'_c) not less than the largest applicable value indicated in Table 1808.8.1. Concrete or grout for deep foundations shall have specified compressive strengths in accordance with Section 13.4.2.1 of ACI 318.

Where concrete is placed through a funnel hopper at the top of a deep foundation element, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 8 inches (204 mm). Where concrete or grout is to be pumped, the mix design including slump shall be adjusted to produce a pumpable mixture.

TABLE 1808.8.1
MINIMUM SPECIFIED COMPRESSIVE STRENGTH f'_c OF CONCRETE OR GROUT

FOUNDATION ELEMENT OR CONDITION	SPECIFIED COMPRESSIVE STRENGTH, f'_c
1. Foundations for structures assigned to <i>Seismic Design Category A, B or C</i>	2,500 psi
2a. <u>Shallow</u> foundations for Group R or U occupancies of light-frame construction, two stories or less in height, assigned to <i>Seismic Design Category D, E or F</i>	2,500 psi
2b. <u>Shallow</u> foundations for other structures assigned to <i>Seismic Design Category D, E or F</i>	3,000 psi
3. Precast nonprestressed driven piles <u>Deep foundations for structures assigned to <i>Seismic Design Category D, E, or F</i></u>	4,000 psi <u>ACI 318 18.13.5</u>
4. Socketed drilled shafts	4,000 psi
5. Micropiles	4,000 psi
6. Precast prestressed driven piles	5,000 psi

For SI: 1 pound per square inch = 0.00689 MPa.

Commenter's Reason: This public comment reflects the intent of industry efforts to provide design and construction for deep foundations in ACI 318 through a coordinated effort involving ASCE. New provisions are now included in ACI 318-19 to address this need for coordination. The original proposal failed to retain provisions for shallow foundations, micropiles, and deep foundations in seismic design categories A, B, and C. This public comment retains the provisions for micropiles, shallow foundations, and deep foundations in seismic design categories A, B, and C in the IBC and directs the user to ACI 318 for deep foundations where more comprehensive discussion of requirements is provided.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Criteria are not altered. Criteria for deep foundations are provided in ACI 318 with more comprehensive discussion than in the 2018 edition of the IBC.

Public Comment# 1271

S120-19

IBC: 1808.8.2, 1808.8.2.1(New), TABLE 1808.8.2

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, representing American Concrete Institute (steve.szoke@concrete.org); Scott Campbell, representing National Ready Mixed Concrete Association (scampbell@nrmca.org)

2018 International Building Code

Revise as follows:

1808.8.2 Concrete cover. The concrete cover ~~provided for prestressed and nonprestressed reinforcement in for all concrete deep foundations shall be not less than the largest applicable value specified in Table 1808.8.2. Longitudinal bars spaced less than 1½ inches (38 mm) clear distance apart shall be considered to be bundled bars for which the concrete cover provided shall be not less than that required by Section 20.6.1.3.4 of ACI 318. Concrete cover shall be measured from the concrete surface to the outermost surface of the steel to which the cover requirement applies. Where concrete is placed in a temporary or permanent casing or a mandrel, the inside face of the casing or mandrel shall be considered to be the concrete surface, in accordance with ACI 318 Section 20.5.1.3.4 and this section.~~

Add new text as follows:

1808.8.2.1 Structural steel deep foundations. The concrete cover for structural steel cores within a steel pipe, tube or permanent casing shall not be less than 2 inches.

Delete without substitution:

**TABLE 1808.8.2
MINIMUM CONCRETE COVER**

FOUNDATION ELEMENT OR CONDITION	MINIMUM COVER
1. Shallow foundations	In accordance with Section 20.6 of ACI 318
2. Precast nonprestressed deep foundation elements Exposed to seawater Not manufactured under plant conditions Manufactured under plant control conditions	3 inches 2 inches In accordance with Section 20.6.1.3.3 of ACI 318
3. Precast prestressed deep foundation elements Exposed to seawater Other	2.5 inches In accordance with Section 20.6.1.3.3 of ACI 318
4. Cast-in-place deep foundation elements not enclosed by a steel pipe, tube or permanent casing	2.5 inches
5. Cast-in-place deep foundation elements enclosed by a steel pipe, tube or permanent casing	1 inch
6. Structural steel core within a steel pipe, tube or permanent casing	2 inches
7. Cast-in-place drilled shafts enclosed by a stable rock socket	1.5 inches

For SI: 1 inch = 25.4 mm.

Reason: This code change removes the requirements in IBC Section 1808.2 and Table 1808.2 on concrete cover for foundations to avoid confusion and conflicts between the IBC and ACI 318. Plus, the references are no longer correct, as concrete cover requirements for deep foundations are addressed in Section 20.5.1.3.4 and Table 20.5.1.3.4 of ACI 318. The 2018 IBC incorrectly directs the user to Section 20.6.1.3.3 of ACI 318.

The 2018 IBC advises that ACI 318 is to be followed in addition to any requirements in the IBC by the reference to Chapter 19 of the IBC:

“1808.8 Concrete foundations. The design, materials and construction of concrete foundations shall comply with Sections 1808.8.1 through 1808.8.6 and the provisions of Chapter 19.”

and Chapter 19 of the 2018 IBC reads:

“ 1901.2 Plain and reinforced concrete. Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318...”

There is no reason to duplicate requirements of ACI 318 in the IBC.

With regard to removal of text, there are two provisions in the text of IBC Section 1808.2.

1. There are criteria for longitudinal reinforcement and bundled bars, but the requirements in the IBC refer the user to ACI 318 Section 20.6.1.3.4. This is unnecessary language due to the IBC language in Section 1808.8 and 1901.2 as shown above.

2. The IBC language provides a definition for concrete cover which is already addressed in ACI 318: “distance between the outermost surface of embedded reinforcement and the closest outer surface of the concrete.” note that concrete cover is a specified dimension. Thus, where concrete is placed inside casings or mandrels the closest outer surface of the concrete is clearly the inside of the casing or mandrel.

With regard to the criteria in Table 1808.2, the requirements are shown as a side-by-side comparison in the Table below. The requirements remain identical for all concrete cover requirements for foundations except as follows:

1. Concrete cover for precast elements exposed to seawater is permitted to be 2 inches in ACI 318 where the 2018 IBC requires 3 inches and 2-1/2 inches for precast nonprestressed and prestressed, respectively. This modification recognizes the performance of centrifugally manufacturers precast concrete piles, which were probably not a consideration when the cover provisions were introduced into the 2018 IBC. Where additional information on cover requirements as related to manufacturing process and materials the commentary of ACI 318 directs the user to ACI 543R *Guide to Design, Manufacture, and Installation of Concrete Piles*. Now that centrifugally are becoming more commonplace, the code would be remiss in not providing for the minimum requirement that reflect current practice and materials. This lowers costs by recognizing the performance of piles manufactured using zero-slump concrete.

2. Where the 2018 IBC permits cover to be a little as 2.5 inches for deep foundations not enclosed by a steel pipe, tube or permanent casing, ACI 318 finds that the ability to assure proper cover in deep foundations is more challenging than that required for shallow foundations. ACI 318 requires the minimum cover to remain the same for deep foundations as that required for shallow foundations, 3 inches.

3. ACI 318 does not differentiate the minimum concrete cover requirements between deep foundations enclosed within a steel pipe, tube or permanent casing whether there is a structural steel core. Further ACI 318 does not consider the requirements for structural steel deep foundations to be with their purview. Section 1808.2 is retained to include the provisions for these deep foundation systems.

4. Research considered by ACI Committee 318 and Subcommittee 318-0F on Foundations showed comparable performance for cover of precast elements regardless of whether manufactured at a plant or site cast.

ACI, a 501.C.3 professional society recommends approval as submitted to reflect current concrete technology and to assure appropriate minimum requirements are provided for the protection of reinforcement.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

There is no significant increase in cost of construction. Cost is decreased for precast prestressed concrete piles by reducing cover and providing for acceptable performance of new technologies and materials. There may be a slight increase in costs where deep foundations are cast without casings or tubes because the cover is increased from 2-1/2 inches to 3 inches.

S120-19

b. Cast-in-place prestressed concrete members	<u>ACI 318: 20.5.1.3.2</u>
c. Precast non-prestressed or prestressed concrete members manufactured under plant conditions	<u>ACI 318: 20.5.1.3.3</u>
2. Precast prestressed deep foundation elements Exposed to seawater Other	2.5 inches <u>In accordance with Section 20.6.1.3.3.2 of ACI 318: 20.5.1.3.4</u>
3. Cast-in-place deep foundation elements not enclosed by a steel pipe, tube or permanent casing	2.5 inches <u>ACI 318: 20.5.1.3.4</u>
4. Cast-in-place deep foundation elements not enclosed by a steel pipe, tube or permanent casing	2.5 inches
4. Cast-in-place deep foundation elements enclosed by a steel pipe, tube or permanent casing	1 inch
5. Structural steel core within a steel pipe, tube or permanent casing	2 inches
7. Cast-in-place drilled shafts enclosed by a stable rock socket	1.5 inches

For SI: 1 inch = 25.4 mm.

Commenter's Reason: The committee recommended disapproval of the original code change. The disapproval resulted in incorrect references to section of ACI 318-19. This public comment inserts the correct references. This code change proposal aligns the IBC with the appropriate sections of ACI 318. ACI 318 Section 20.5.2.3.4 addresses deep foundations made of either cast-in-place and precast concrete and thus the separate delineation in Table of the IBC is no longer required. Further provisions in ACI 318 are more complete for foundation systems, allowing different cover for various exposures.

Table 20.5.1.3.4—Specified concrete cover for deep foundation members in ACI 318 provides that:

Concrete exposure	Deep foundation member type	Reinforcement	Specified cover, in.
Cast against and permanently in contact with ground, not enclosed by steel pipe, tube permanent casing, or stable rock socket	Cast-in-place	All	3
Enclosed by steel pipe, tube, permanent casing, or stable rock socket	Cast-in-place	All	1-1/2
Permanently in contact with ground	precast-nonprestressed	All	1-1/2
	precast-prestressed		
Exposed to sea water	Precast-non-prestressed	All	2-1/2
	Precast-prestressed	All	2

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Generally, this code change proposal will not increase or decrease cost of construction as for the most part, this change only corrects references to ACI 318. However, by referencing ACI 318, more exposure conditions are addressed, several requiring less concrete cover than required in the 2018 IBC. The IBC does not address as many exposures as ACI 318.

S123-19

IBC: 1810.2.4.1, 1810.3.2.1(New), 1810.3.2.1.1, 1810.3.2.1.2, 1810.3.2.2, 1810.3.8, 1810.3.8.1, 1810.3.8.2, 1810.3.8.2.1, 1810.3.8.2.2, 1810.3.8.2.3, 1818.3.9.3, 1810.3.9.4, 1810.3.9.4.1, 1810.3.9.4.2, 1810.3.9.4.2.1, 1810.3.9.4.2.2

Proposed Change as Submitted

Proponents: Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

2018 International Building Code

Revise as follows:

1810.2.4.1 Seismic Design Categories D through F. For structures assigned to *Seismic Design Category* D, E or F, deep foundation elements on *Site Class* E or F sites, as determined in Section 1613.2.2, shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-foundation-structure interaction coupled with foundation element deformations associated with earthquake loads imparted to the foundation by the structure.

Exception: Deep foundation elements that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. Precast prestressed concrete piles detailed in accordance with Section ~~1810.3.8.3.3~~, 18.13.5.10.5 in ACI 318.
2. Cast-in-place deep foundation elements with a minimum longitudinal reinforcement ratio of 0.005 extending the full length of the element and detailed in accordance with ~~Sections 18.7.5.2, 18.7.5.3 and 18.7.5.4 of ACI 318 as required by Section 1810.3.9.4.2.2~~, Section 18.13.5.5 of ACI 318.

Add new text as follows:

1810.3.2.1 Concrete. Concrete materials shall conform to ACI 318.

Revise as follows:

~~1810.3.2.1~~ **1810.3.2.1.1 Concrete cast in steel pipe.** Where concrete is cast in a steel pipe or where an enlarged base is formed by compacting concrete, the maximum size for coarse aggregate shall be 3/4 inch (19.1 mm). Concrete to be compacted shall have a zero slump.

Delete without substitution:

~~1810.3.2.1.1 Seismic hooks.~~ For structures assigned to *Seismic Design Category* C, D, E or F, the ends of hoops, spirals and ties used in concrete deep foundation elements shall be terminated with seismic hooks, as defined in ACI 318, and shall be turned into the confined concrete core.

~~1810.3.2.1.2 ACI 318 Equation (25.7.3.3).~~ Where this chapter requires detailing of concrete deep foundation elements in accordance with Section 18.7.5.4 of ACI 318, compliance with Equation (25.7.3.3) of ACI 318 shall not be required.

~~1810.3.2.2 Prestressing steel.~~ Prestressing steel shall conform to ASTM A416.

Revise as follows:

1810.3.8 Precast concrete piles. Precast concrete piles shall be designed and detailed in accordance with ~~Sections 1810.3.8.1 through 1810.3.8.3~~, ACI 318.

Exception: For structures assigned to *Seismic Design Category* C, D, E or F, the minimum spiral reinforcement index required by Section 18.13.5.10.4 and 18.13.5.10.5 of ACI 318 shall not apply in cases where the design includes full consideration of load combinations specified in ASCE 7, Section 2.3.6 and the applicable overstrength factor, Ω_0 . In such cases, minimum spiral reinforcement index shall be as specified in Section 13.4.5.6 of ACI 318.

Delete without substitution:

~~1810.3.8.1 Reinforcement.~~ Longitudinal steel shall be arranged in a symmetrical pattern and be laterally tied with steel ties or wire spiral spaced center to center as follows:

1. At not more than 1 inch (25 mm) for the first five ties or spirals at each end; then
2. At not more than 4 inches (102 mm), for the remainder of the first 2 feet (610 mm) from each end; and then
3. At not more than 6 inches (152 mm) elsewhere.

The size of ties and spirals shall be as follows:

1. For piles having a least horizontal dimension of 16 inches (406 mm) or less, wire shall not be smaller than 0.22 inch (5.6 mm) (No. 5 gage).

2. For piles having a least horizontal dimension of more than 16 inches (406 mm) and less than 20 inches (508 mm), wire shall not be smaller than 0.238 inch (6 mm) (No. 4 gage).

3. For piles having a least horizontal dimension of 20 inches (508 mm) and larger, wire shall not be smaller than $\frac{1}{4}$ inch (6.4 mm) round or 0.259 inch (6.6 mm) (No. 3 gage).

1810.3.8.2 Precast nonprestressed piles: Precast nonprestressed concrete piles shall comply with the requirements of Sections 1810.3.8.2.1 through 1810.3.8.2.3.

1810.3.8.2.1 Minimum reinforcement: Longitudinal reinforcement shall consist of not fewer than four bars with a minimum longitudinal reinforcement ratio of 0.008.

1810.3.8.2.2 Seismic reinforcement in *Seismic Design Categories C through F*: For structures assigned to *Seismic Design Category C, D, E or F*, precast nonprestressed piles shall be reinforced as specified in this section. The minimum longitudinal reinforcement ratio shall be 0.01 throughout the length. Transverse reinforcement shall consist of closed ties or spirals with a minimum $\frac{3}{8}$ inch (9.5 mm) diameter. Spacing of transverse reinforcement shall not exceed the smaller of eight times the diameter of the smallest longitudinal bar or 6 inches (152 mm) within a distance of three times the least pile dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm) throughout the remainder of the pile.

1810.3.8.2.3 Additional seismic reinforcement in *Seismic Design Categories D through F*: For structures assigned to *Seismic Design Category D, E or F*, transverse reinforcement shall be in accordance with Section 1810.3.9.4.2.

1810.3.8.3 Precast prestressed piles: Precast prestressed concrete piles shall comply with the requirements of Sections 1810.3.8.3.1 through 1810.3.8.3.3.

1810.3.8.3.1 Effective prestress: The effective prestress in the pile shall be not less than 400 psi (2.76 MPa) for piles up to 30 feet (9144 mm) in length, 550 psi (3.79 MPa) for piles up to 50 feet (15 240 mm) in length and 700 psi (4.83 MPa) for piles greater than 50 feet (15 240 mm) in length.

Effective prestress shall be based on an assumed loss of 30,000 psi (207 MPa) in the prestressing steel. The tensile stress in the prestressing steel shall not exceed the values specified in ACI 318.

1810.3.8.3.2 Seismic reinforcement in *Seismic Design Category C*: For structures assigned to *Seismic Design Category C*, precast prestressed piles shall have transverse reinforcement in accordance with this section. The volumetric ratio of spiral reinforcement shall not be less than the amount required by the following formula for the upper 20 feet (6096 mm) of the pile.

$$\rho_s = 0.04(f'_c/f_{yh})[2.5 + 2.34P/(f'_c A_g)] \quad \text{(Equation 18-5)}$$

where:

A_g = Pile cross-sectional area square inches (mm²).

f'_c = Specified compressive strength of concrete, psi (MPa).

f_{yh} = Yield strength of spiral reinforcement \geq 85,000 psi (586 MPa).

P = Axial load on pile, pounds (kN), as determined from Equations 16-5 and 16-7.

ρ_s = Spiral reinforcement index or volumetric ratio (vol. spiral/vol. core).

Not less than one-half the volumetric ratio required by Equation 18-5 shall be provided below the upper 20 feet (6096 mm) of the pile.

Exception: The minimum spiral reinforcement index required by Equation 18-5 shall not apply in cases where the design includes full consideration of load combinations specified in ASCE 7, Section 2.3.6 and the applicable overstrength factor, Ω_o . In such cases, minimum spiral reinforcement index shall be as specified in Section 1810.3.8.1.

1810.3.8.3.3 Seismic reinforcement in *Seismic Design Categories D through F*: For structures assigned to *Seismic Design Category D, E or F*, precast prestressed piles shall have transverse reinforcement in accordance with the following:

1. Requirements in ACI 318, Chapter 18, need not apply, unless specifically referenced.
2. Where the total pile length in the soil is 35 feet (10 668 mm) or less, the lateral transverse reinforcement in the ductile region shall occur through the length of the pile. Where the pile length exceeds 35 feet (10 668 mm), the ductile pile region shall be taken as the greater of 35 feet (10 668 mm) or the distance from the underside of the pile cap to the point of zero curvature plus three times the least pile dimension.
3. In the ductile region, the center-to-center spacing of the spirals or hoop reinforcement shall not exceed one-fifth of the least pile dimension, six times the diameter of the longitudinal strand or 8 inches (203 mm), whichever is smallest.
4. Circular spiral reinforcement shall be spliced by lapping one full turn and bending the end of each spiral to a 90-degree hook or by use of a mechanical or welded splice complying with Section 25.5.7 of ACI 318.
5. Where the transverse reinforcement consists of circular spirals, the volumetric ratio of spiral transverse reinforcement in the ductile region

shall comply with the following:

$$\rho_s = 0.06 (f'_c / f_{yh}) [2.8 + 2.34 P / (f'_c A_g)] \quad \rho_s = 0.06 (f'_c / f_{yh}) [2.8 + 2.34 P / (f'_c A_g)] \quad \text{(Equation 18-6)}$$

but not exceed:

$$\rho_s = 0.02 + \rho_s = 0.021 \quad \text{(Equation 18-7)}$$

where:

A_g = Pile cross-sectional area, square inches (mm²).

f'_c = Specified compressive strength of concrete, psi (MPa).

f_{yh} = Yield strength of spiral reinforcement = 85,000 psi (586 MPa).

P = Axial load on pile, pounds (kN), as determined from Equations 16-5 and 16-7.

ρ_s = Volumetric ratio (vol. spiral/vol. core).

This required amount of spiral reinforcement is permitted to be obtained by providing an inner and outer spiral.

Exception: The minimum spiral reinforcement required by Equation 18-6 shall not apply in cases where the design includes full

consideration of load combinations specified in ASCE 7, Section 2.3.6 and the applicable overstrength factor, Ω_o . In such cases, minimum

spiral reinforcement shall be as specified in Section 1810.3.8.1.

6. Where transverse reinforcement consists of rectangular hoops and cross ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region with spacing, s , and perpendicular dimension, h_c , shall conform to:

$$A_{sh} = 0.3 s h_c (f'_c / f_{yh}) (A_g / A_{ch} - 1.0) [0.5 + 1.4 P / (f'_c A_g)] \quad A_{sh} = 0.3 s h_c (f'_c / f_{yh}) (A_g / A_{ch} - 1.0) [0.5 + 1.4 P / (f'_c A_g)] \quad \text{(Equation 18-8)}$$

but not less than:

$$A_{sh} = 0.3 s h_c (f'_c / f_{yh}) (A_g / A_{ch} - 1.0) [0.5 + 1.4 P / (f'_c A_g)] \quad A_{sh} = 0.12 s h_c (f'_c / f_{yh}) [0.5 + 1.4 P / (f'_c A_g)] \quad \text{(Equation 18-9)}$$

where:

f_{yh} = yield strength of transverse reinforcement $\leq 70,000$ psi (483 MPa).

h_c = Cross-sectional dimension of pile core measured center to center of hoop reinforcement, inch (mm).

s = Spacing of transverse reinforcement measured along length of pile, inch (mm).

A_{sh} = Cross-sectional area of transverse reinforcement, square inches (mm²).

f'_c = Specified compressive strength of concrete, psi (MPa).

The hoops and cross ties shall be equivalent to deformed bars not less than No. 3 in size. Rectangular hoop ends shall terminate at a corner with seismic hooks.

Outside of the length of the pile requiring transverse confinement reinforcing, the spiral or hoop reinforcing with a volumetric ratio not less than one-half of that required for transverse confinement reinforcing shall be provided.

1810.3.8.3.4 Axial load limit in Seismic Design Categories C through F: For structures assigned to *Seismic Design Category C, D, E, or F*, the maximum factored axial load on precast prestressed piles subjected to a combination of seismic lateral force and axial load shall not exceed the following values:

1.0 $f'_c A_g$ for square piles

2.0 $f'_c A_g$ for circular or octagonal piles

Revise as follows:

1810.3.9 Cast-in-place deep foundations. Cast-in-place deep foundation elements shall be designed and detailed in accordance with Sections 1810.3.9.1 through ~~1810.3.9.6~~, 1810.3.9.4.

Delete without substitution:

1810.3.9.1 Design cracking moment. The design cracking moment (ΦM_{cr}) for a cast-in-place deep foundation element not enclosed by a

structural steel pipe or tube shall be determined using the following equation:

$$\phi M_n = 3 f'_c S_m \quad \text{(Equation 18-10)}$$

For SI:

$$\phi M_n = 0.25 \sqrt{f'_c} S_m$$

where:

f'_c = Specified compressive strength of concrete or grout, psi (MPa).

S_m = Elastic section modulus, neglecting reinforcement and casing, cubic inches (mm³).

1810.3.9.2 Required reinforcement. Where subject to uplift or where the required moment strength determined using the load combinations of Section 1605.2 exceeds the design cracking moment determined in accordance with Section 1810.3.9.1, cast-in-place deep foundations not enclosed by a structural steel pipe or tube shall be reinforced.

Revise as follows:

1810.3.9.3 1810.3.9.1 Placement of reinforcement. Reinforcement where required shall be assembled and tied together and shall be placed in the deep foundation element as a unit before the reinforced portion of the element is filled with concrete.

Exceptions:

1. Steel dowels embedded 5 feet (1524 mm) or less shall be permitted to be placed after concreting, while the concrete is still in a semifluid state.
2. For deep foundation elements installed with a hollow-stem auger, tied reinforcement shall be placed after elements are concreted, while the concrete is still in a semifluid state. Longitudinal reinforcement without lateral ties shall be placed either through the hollow stem of the auger prior to concreting or after concreting, while the concrete is still in a semifluid state.
3. For Group R-3 and U occupancies not exceeding two stories of light-frame construction, reinforcement is permitted to be placed after concreting, while the concrete is still in a semifluid state, and the concrete cover requirement is permitted to be reduced to 2 inches (51 mm), provided that the construction method can be demonstrated to the satisfaction of the *building official*.

1810.3.9.4 1810.3.9.2 Seismic reinforcement. Where a structure is assigned to *Seismic Design Category C*, reinforcement shall be provided in accordance with Section 1810.3.9.4.1. Where a structure is assigned to *Seismic Design Category C*, D, E, or F, reinforcement shall be provided in accordance with Section 1810.3.9.4.2, 18.13.5.7 of ACI 318.

Exceptions:

1. Isolated deep foundation elements supporting posts of Group R-3 and U occupancies not exceeding two stories of light-frame construction shall be permitted to be reinforced as required by rational analysis but with not less than one No. 4 bar, without ties or spirals, where detailed so the element is not subject to lateral loads and the soil provides adequate lateral support in accordance with Section 1810.2.1.
2. Isolated deep foundation elements supporting posts and bracing from decks and patios appurtenant to Group R-3 and U occupancies not exceeding two stories of light-frame construction shall be permitted to be reinforced as required by rational analysis but with not less than one No. 4 bar, without ties or spirals, where the lateral load, E , to the top of the element does not exceed 200 pounds (890 N) and the soil provides adequate lateral support in accordance with Section 1810.2.1.
3. Deep foundation elements supporting the concrete foundation wall of Group R-3 and U occupancies not exceeding two stories of light-frame construction shall be permitted to be reinforced as required by rational analysis but with not less than two No. 4 bars, without ties or spirals, where the design cracking moment determined in accordance with Section 1810.3.9.4 ACI 318 exceeds the required moment strength determined using the load combinations with overstrength factor in Section 2.3.6 or 2.4.5 of ASCE 7 and the soil provides adequate lateral support in accordance with Section 1810.2.1.
4. Closed ties or spirals where required by Section 1810.3.9.4.2 18.3.5.7.1 of ACI 318 shall be permitted to be limited to the top 3 feet (914 mm) of deep foundation elements 10 feet (3048 mm) or less in depth supporting Group R-3 and U occupancies of *Seismic Design Category D*, not exceeding two stories of light-frame construction.

Delete without substitution:

1810.3.9.4.1 Seismic reinforcement in *Seismic Design Category C*. For structures assigned to *Seismic Design Category C*, cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

Not fewer than four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.0025, shall be provided throughout the minimum reinforced length of the element as defined in this section starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:

1. One-third of the element length.
2. A distance of 10 feet (3048 mm).
3. Three times the least element dimension.
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2.

Transverse reinforcement shall consist of closed ties or spirals with a minimum 3/8 inch (9.5 mm) diameter. Spacing of transverse reinforcement shall not exceed the smaller of 6 inches (152 mm) or 8 longitudinal bar diameters, within a distance of three times the least element dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 16 longitudinal bar diameters throughout the remainder of the reinforced length.

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. A spiral-welded metal casing of a thickness not less than the manufacturer's standard No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

1810.3.9.4.2 Seismic reinforcement in Seismic Design Categories D through F. For structures assigned to *Seismic Design Category D, E or F*, cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

Not fewer than four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.005, shall be provided throughout the minimum reinforced length of the element as defined in this section starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:

1. One-half of the element length.
2. A distance of 10 feet (3048 mm).
3. Three times the least element dimension.
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2.

Transverse reinforcement shall consist of closed ties or spirals not smaller than No. 3 bars for elements with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger elements. Throughout the remainder of the reinforced length outside the regions with transverse confinement reinforcement, as specified in Section 1810.3.9.4.2.1 or 1810.3.9.4.2.2, the spacing of transverse reinforcement shall not exceed the least of the following:

1. 12 longitudinal bar diameters.
2. One-half the least dimension of the element.
3. 12 inches (305 mm).

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. A spiral-welded metal casing of a thickness not less than manufacturer's standard No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

1810.3.9.4.2.1 Site Classes A through D. For *Site Class A, B, C or D* sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 18.7.5.2, 18.7.5.3 and 18.7.5.4 of ACI 318 within three times the least element dimension of the bottom of the pile cap. A transverse spiral reinforcement ratio of not less than one-half of that required in Section 18.7.5.4(a) of ACI 318 shall be permitted.

1810.3.9.4.2.2 Site Classes E and F. For *Site Class E or F* sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 18.7.5.2, 18.7.5.3 and 18.7.5.4 of ACI 318 within seven times the least element dimension of the pile cap and within seven times the least element dimension of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium-stiff clay.

Reason: This Code change includes revisions and additions to the Code in an effort to eliminate conflicting provisions in ACI 318-14, ASCE 7-16 and IBC-2018 regarding design of deep foundations for earthquake resistant structures. Subcommittee F, Foundations, of ACI 318 has coordinated efforts with members from ASCE 7 to bring the concrete material design requirements for foundations to one location. ASCE 7 started this effort in their cycle ending in 2016. The changes to ACI 318 shown here is the continuation of that effort. A side-by-side comparison is provided, however, difficult to follow with all the changes and dissimilar format. For a more comprehensive look at the changes in ACI 318, please review the public comment version available at <https://www.concrete.org/publications/standards/upcomingstandards.aspx>
Summary of code change proposals:

- Section 1810.2.4.1 is updated to the latest version of ACI 318.

- The sections in Materials for the design and detailing of deep foundations were updated to the latest edition of ACI 318.
 - o Section 1810.3.2.1: A general reference to ACI 318 is made and the existing requirement is moved to 1810.3.2.1.1 as it is not covered in ACI 318.
 - o Section 1810.3.2.1.1: Is covered by Section 18.13.5.4 in ACI 318.
 - o Section 1810.3.2.1.2: Is covered by Section 25.7.3.3 in ACI 318.
 - o Section 1810.3.2.2: Is covered by Section 20.3 in ACI 318.
- Section 18.10.3.8, Precast Concrete pile, was adopted by ACI 318. The exception for minimum spiral reinforcement was retained from Sections 1810.3.8.3.2 and 1810.3.8.3.3 with the appropriate references to ACI 318. The requirements for 18.10.3.8 mostly went to Section 13.4.5 and 18.3.5 of ACI 318. A comparison is provided but for a full review please reference the public comment version of ACI 318.
 - o Section 1810.3.8.1→13.4.5.2 and 13.4.5.6
 - o Section 1810.3.8.2.1→13.4.5.3
 - o Section 1810.3.8.2.2→18.13.5.10.2
 - § Exception remains
 - o Section 1810.3.8.2.3→18.13.5.10.3
 - § Exception remains
 - o Section 1810.3.8.3.1→13.4.5.4 and 13.4.5.5
 - o Section 1810.3.8.3.2→18.13.5.10.4
 - o Section 1810.3.8.3.3→18.13.5.10.5
 - o Section 1810.3.8.3.4→18.13.5.10.6
- Section 18.10.3.9, Cast-in-place deep foundation, was adopted by ACI 318.
 - o Section 1810.3.9.1→13.4.4
 - o Section 1810.3.9.2→13.4.4
 - o Section 1810.3.9.3→Remains
 - o Section 1810.3.9.4→Remains, update reference
 - o Section 1810.3.9.4.1→18.13.5.7
 - § Exception→18.13.5.8
 - o Section 1810.3.9.4.2→18.13.5.7
 - § Exception→18.13.5.8
 - o Section 1810.3.9.4.2.1→18.13.5.5
 - o Section 1810.3.9.4.2.2→18.13.5.5

For structures assigned to Seismic Design Category C, D, E or F, the ends of hoops, spirals and ties used in concrete deep foundation elements shall be terminated with seismic hooks, as defined in ACI 318, and shall be turned into the confined concrete core.</p>	<p>18.13.5.4 For structures assigned to SDC C, D, E, or F, hoops, spirals, and ties in deep foundation members shall be terminated with seismic hooks.</p>								
<p>1810.3.2.1.2 ACI 318 Equation (25.7.3.3). Where this chapter requires detailing of concrete deep foundation elements in accordance with Section 18.7.5.4 of ACI 318, compliance with Equation (25.7.3.3) of ACI 318 shall not be required.</p>	<p>25.7.3.3 Except for transverse reinforcement in deep foundations, the volumetric spiral reinforcement ratio ρ_s shall satisfy Eq. (25.7.3.3).</p>								
<p>1810.3.2.2 Prestressing steel. Prestressing steel shall conform to ASTM A416.</p>	<p>20.3 Prestressing strands, wires, and bars</p> <p>20.3.1 Material properties</p> <p>20.3.1.1 Except as required in 20.3.1.3 for special moment frames and special structural walls, prestressing reinforcement shall conform to (a), (b), (c), or (d):</p> <p>(a) ASTM A416 – strand</p> <p>(b) ASTM A421 – wire</p> <p>(c) ASTM A421 – low-relaxation wire including Supplementary Requirement S1, “Low-Relaxation Wire and Relaxation Testing”</p> <p>(d) ASTM A722 – high-strength bar</p>								
<p>1810.3.8 Precast concrete piles. Precast concrete piles shall be designed and detailed in accordance with Sections 1810.3.8.1 through 1810.3.8.3.</p> <p>1810.3.8.1 Reinforcement. Longitudinal steel shall be arranged in a symmetrical pattern and be laterally tied with steel ties or wire spiral spaced center to center as follows:</p> <ol style="list-style-type: none"> 1. At not more than 1 inch (25 mm) for the first five ties or spirals at each end; then 2. At not more than 4 inches (102 mm), for the remainder of the first 2 feet (610 mm) from each end; and then 3. At not more than 6 inches (152 mm) elsewhere. <p>The size of ties and spirals shall be as follows:</p> <ol style="list-style-type: none"> 1. For piles having a least horizontal dimension of 16 inches (406 mm) or less, wire shall not be smaller than 0.22 inch (5.6 mm) (No. 5 gage). 2. For piles having a least horizontal dimension of more than 16 inches (406 mm) and less than 20 inches (508 mm), wire shall not be smaller than 0.238 inch (6 mm) (No. 4 gage). 3. For piles having a least horizontal dimension of 20 inches (508 mm) and larger, wire shall not be smaller than 1/4 inch (6.4 mm) round or 0.259 inch (6.6 mm) (No. 3 gage). <p>1810.3.8.2 Precast nonprestressed piles. Precast</p>	<p>13.4.5 Precast concrete piles</p> <p>13.4.5.1 Precast concrete piles supporting buildings assigned to SDC A or B shall satisfy the requirements of 13.4.5.2 through 13.4.5.6.</p> <p>13.4.5.2 Longitudinal reinforcement shall be arranged in a symmetrical pattern.</p> <p>13.4.5.3 For precast nonprestressed piles, longitudinal reinforcement shall be provided according to (a) and (b):</p> <p>(a) Minimum of 4 bars</p> <p>(b) Minimum area of $0.008A_g$</p> <p>13.4.5.4 For precast prestressed piles, the effective prestress in the pile shall provide a minimum average compressive stress in the concrete in accordance with Table 13.4.5.4.</p> <p>Table 13.4.5.4 Minimum compressive stress in precast prestressed piles</p> <table border="1" data-bbox="678 1738 1156 1927"> <tr> <th>Pile length (ft)</th><th>Minimum compressive stress (psi)</th></tr> <tr> <td>Pile length ≤ 30</td><td>400</td></tr> <tr> <td>$30 < \text{Pile length} \leq 50$</td><td>550</td></tr> <tr> <td>Pile length > 50</td><td>700</td></tr> </table>	Pile length (ft)	Minimum compressive stress (psi)	Pile length ≤ 30	400	$30 < \text{Pile length} \leq 50$	550	Pile length > 50	700
Pile length (ft)	Minimum compressive stress (psi)								
Pile length ≤ 30	400								
$30 < \text{Pile length} \leq 50$	550								
Pile length > 50	700								

nonprestressed concrete piles shall comply with the requirements of Sections 1810.3.8.2.1 through 1810.3.8.2.3.

1810.3.8.2.1 Minimum reinforcement. Longitudinal reinforcement shall consist of not fewer than four bars with a minimum longitudinal reinforcement ratio of 0.008.

...

1810.3.8.3 Precast prestressed piles. Precast prestressed concrete piles shall comply with the requirements of Sections 1810.3.8.3.1 through 1810.3.8.3.3

1810.3.8.3.1 Effective prestress. The effective prestress in the pile shall be not less than 400 psi (2.76 MPa) for piles up to 30 feet (9144 mm) in length, 550 psi (3.79 MPa) for piles up to 50 feet (15 240 mm) in length and 700 psi (4.83 MPa) for piles greater than 50 feet (15 240 mm) in length. Effective prestress shall be based on an assumed loss of 30,000 psi (207 MPa) in the prestressing steel. The tensile stress in the prestressing steel shall not exceed the values specified in ACI 318.

13.4.5.5 For precast prestressed piles, the effective prestress in the pile shall be calculated based on an assumed total loss of 30,000 psi in the prestressed reinforcement.

13.4.5.6 The longitudinal reinforcement shall be enclosed by transverse reinforcement according to Table 13.4.5.6(a) and shall be spaced according to Table 13.4.5.6(b):

Table 13.4.5.6(a) Minimum transverse reinforcement size

Least horizontal pile dimension-h (in.)	Minimum wire size transverse reinforcement ^[1]
$h \leq 16$	W4, D4
$16 < h < 20$	W4.5, D5
$h \geq 20$	W5.5, D6

[1] If bars are used, minimum of #3 bar applies to all values of h

Table 13.4.4.6(b) Maximum transverse reinforcement spacing

Reinforcement location in the pile	Maximum center-to-center spacing (in.)

24 in. from each end of pile	4
Remainder of pile	6

<p>1810.3.9 Cast-in-place deep foundations. Cast-in-place deep foundation elements shall be designed and detailed in accordance with Sections 1810.3.9.1 through 1810.3.9.6.</p> <p>1810.3.9.1 Design cracking moment. The design cracking moment (ϕM_n) for a cast-in-place deep foundation element not enclosed by a structural steel pipe or tube shall be determined using the following equation:</p> $\phi M_n = 3\sqrt{f'_c} S_m \text{ (Equation 18-10)}$ <p>For SI: $0.25\sqrt{f'_c} S_m$</p> <p>where:</p> <p>f'_c = Specified compressive strength of concrete or grout, psi (MPa).</p> <p>S_m = Elastic section modulus, neglecting reinforcement and casing, cubic inches (mm^3).</p> <p>1810.3.9.2 Required reinforcement. Where subject to uplift or where the required moment strength determined using the load combinations of Section 1605.2 exceeds the design cracking moment determined in accordance with Section 1810.3.9.1, cast-in-place deep foundations not enclosed by a structural steel pipe or tube shall be reinforced.</p>	<p>13.4.4 Cast-in-place deep foundations</p> <p>13.4.4.1 Cast-in-place deep foundations that are subject to uplift or where M_u is greater than $0.4 M_{cr}$ shall be reinforced, unless enclosed by a structural steel pipe or tube.</p> <p>Note $f_{cr} = 7.5\sqrt{f'_c}$</p>
<p>1810.3.9.4.1 Seismic reinforcement in Seismic Design Category C. For structures assigned to Seismic Design Category C, cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.</p> <p>Not fewer than four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.0025, shall be provided throughout the minimum reinforced length of the element as defined in this section starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:</p> <ol style="list-style-type: none"> 1. One-third of the element length. 2. A distance of 10 feet (3048 mm). 3. Three times the least element dimension. 4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2. <p>Transverse reinforcement shall consist of closed ties or spirals with a minimum 3/8 inch (9.5 mm) diameter. Spacing of transverse reinforcement shall not exceed the smaller of 6 inches (152 mm) or 8- longitudinal-bar diameters, within a distance of three times the least element dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 16 longitudinal bar diameters throughout the remainder of the</p>	<p>18.13.5 Deep Foundations</p> <p>18.13.5.1 This section shall apply to the following types of deep foundations</p> <ol style="list-style-type: none"> (a) uncased cast-in-place concrete drilled or augered piles (b) metal cased concrete piles (c) concrete filled pipe piles (d) precast concrete piles <p>18.13.5.2 For structures assigned to SDC C, D, E, or F, piles, piers, or caissons resisting tension loads shall have continuous longitudinal reinforcement over their length resisting to resist design tension forces.</p> <p>18.13.5.3 For structures assigned to SDC C, D, E, or F, the minimum longitudinal and transverse reinforcement required by 18.13.5.7 through 18.13.5.10 shall be extended over the entire unsupported length for the portion of pile in air or water, or in soil that is not capable of providing adequate lateral restraint to prevent buckling throughout this length.</p> <p>18.13.5.4 For structures assigned to SDC C, D, E, or F, hoops, spirals, and ties in deep foundation members shall be terminated with seismic hooks.</p>

reinforced length.	18.13.5.5 For structures assigned to SDC D, E, or F or located in Site Class E or F, concrete piles shall have transverse reinforcement in accordance with 18.7.5.2, 18.7.5.3, and Table 18.7.5.4(e) within seven pile diameters above and below the interfaces between strata that are hard or stiff and strata that are liquefiable or soft.
Exceptions:	18.13.5.6 For structures assigned to SDC D, E, or F, in foundations supporting one- and two-story stud bearing wall construction, concrete piles, piers or caissons, and foundation ties are exempt from the transverse reinforcement requirements of 18.13.5.3 through 18.13.5.5.
1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.	18.13.5.7 Uncased cast-in-place drilled or augered concrete piles or piers
2. A spiral-welded metal casing of a thickness not less than the manufacturer's standard No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.	18.13.5.7.1 For structures assigned to SDC C, D, E, or F, reinforcement shall be provided in uncased cast-in-place drilled or augered concrete piles where required by analysis and in accordance with the requirements in Table 18.13.5.7.1.
1810.3.9.4.2 Seismic reinforcement in Seismic Design Categories D through F. For structures assigned to Seismic Design Category D, E or F, cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis. Not fewer than four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.005, shall be provided throughout the minimum reinforced length of the element as defined in this section starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:	18.13.5.7.2 Minimum longitudinal and transverse reinforcement shall be provided along minimum reinforced lengths measured from the top of the pile in accordance with Table 18.13.5.7.1.
1. One-half of the element length.	18.13.5.7.3 Longitudinal reinforcement shall extend at least the development length in tension beyond the flexural length of the pile, which is defined in Table 18.13.5.7.1 as the distance from the bottom of the pile cap to where $0.4M_{cr} > M_u$.
2. A distance of 10 feet (3048 mm).	18.13.5.8 Metal-cased concrete piles
3. Three times the least element dimension.	18.13.5.8.1 For structures assigned to SDC C, D, E, or F, longitudinal reinforcement requirements and minimum reinforced lengths for metal-cased concrete piles shall be the same as for uncased concrete piles in 18.13.5.7
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2.	18.13.5.8.2 Metal-cased concrete piles shall have a spiral-welded metal casing of a thickness not less than 0.0747 in. (No. 14 gauge) that is adequately protected from possible deleterious action due to soil constituents, changing water levels, or other factors indicated by boring records of site conditions.
Transverse reinforcement shall consist of closed ties or spirals not smaller than No. 3 bars for elements with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger elements. Throughout the remainder of the reinforced length outside the regions with transverse confinement reinforcement, as specified in Section 1810.3.9.4.2.1 or 1810.3.9.4.2.2, the spacing of transverse reinforcement shall not exceed the least of the following:	18.13.5.9 Concrete-filled pipe piles
1. 12 longitudinal bar diameters.	18.13.5.9.1 For structures assigned to SDC C, D, E or F, concrete-filled pipe piles shall have longitudinal reinforcement in the top of the pile with a total area of at least $0.01A_g$ and with a minimum length within the pile equal to two times the required embedment length into the pile cap, but not less than the development length in tension of the reinforcement.
2. One-half the least dimension of the element.	
3. 12 inches (305 mm).	
Exceptions:	
1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.	
2. A spiral-welded metal casing of a thickness not less than manufacturer's standard No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the	

closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

1810.3.9.4.2.1 Site Classes A through D. For Site Class A, B, C or D sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 18.7.5.2, 18.7.5.3 and 18.7.5.4 of ACI 318 within three times the least element dimension of the bottom of the pile cap. A transverse spiral reinforcement ratio of not less than one-half of that required in Section 18.7.5.4(a) of ACI 318 shall be permitted.

1810.3.9.4.2.2 Site Classes E and F. For Site Class E or F sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 18.7.5.2, 18.7.5.3 and 18.7.5.4 of ACI 318 within seven times the least element dimension of the pile cap and within seven times the least element dimension of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft- to medium-stiff clay.

Table 18.13.5.7.1 Minimum reinforcement for uncased cast-in-place or augered concrete piles or pier:

Minimum Reinforcement		SDC C – All Site Classes	SDC D, E, and F – Site Class A, B, C, and D	SDC D, E, and F – Site Class E and F
Minimum Longitudinal Reinforcement Ratio (minimum number of bars)		0.0025 (minimum number of bars in accordance with 10.7.3.1)	0.005 (minimum number of bars in accordance with 10.7.3.1)	0.005 (minimum number of bars in accordance with 10.7.3.1)
Minimum Reinforced Pile Length		Longest of (a) through (d): (a) 1/3 pile length (b) 10 ft. (c) 3 times the pile diameter (d) flexural length of pile - distance from bottom of pile cap to where $0.4M_{cr}$ exceeds M_u .	Longest of (a) through (d): (a) 1/2 pile length (b) 10 ft. (c) 3 times the pile diameter (d) flexural length of pile - distance from bottom of pile cap to where $0.4M_{cr}$ exceeds M_u .	Full length of pile except in accordance with [1] or [2].
Transverse Confinement Reinforcement Zone	Length of Reinforcement Zone	3 times the pile diameter from the bottom of the pile cap	3 times the pile diameter from the bottom of the pile cap.	7 times the pile diameter from the bottom of the pile cap.
	Type of Transverse Reinforcement	Closed ties or spirals with a minimum 3/8 in. diameter.	Minimum of No. 3 closed tie or 3/8 in. diameter spiral for piles ≤ 20 in. diameter. Minimum No. 4 closed tie or 1/2 in. diameter spiral for piles > 20 in. diameter.	
			In accordance with 18.7.5.2	

	Spacing and Amount of Transverse Reinforcement	Spacing shall not exceed lesser of 6 in. or 8 longitudinal bar diameters	In accordance with 18.7.5.3 and not less than one-half the requirement of Table 18.7.5.4(e)	In accordance with 18.7.5.3 and not less than the requirement of Table 18.7.5.4(e).
Transverse Reinforcement in Remainder of Reinforced Pile Length	Type of Transverse Reinforcement	Closed ties or spirals with minimum 3/8 in. diameter.	Minimum of No. 3 closed tie or 3/8 in. diameter spiral for piles ≤ 20 in. diameter.	
			Minimum of No. 4 closed tie or 1/2 in. diameter spiral for piles > 20 in. diameter.	
	In accordance with 18.7.5.2			
	Spacing and Amount of Transverse Reinforcement	Maximum spacing of 16 longitudinal bar diameters.	Spacing shall not exceed the least of (a) through (c):	
			(a) 12 longitudinal bar diameters	
			(b) ½ the pile diameter	
			(c) 12 in.	

[1] For piles sufficiently embedded in firm soil or rock, reinforcement shall be permitted to be terminated a length above the tip equal to the lesser of 5 percent of the pile length and 33 percent of the length of the pile within rock or firm soil.

[2] In lieu of providing full length minimum flexural reinforcement, the deep foundation element shall be designed to withstand maximum imposed curvatures from the earthquake ground motions and structural response. Curvatures shall include free-field soil strains modified for soil-foundation-structure interaction coupled with foundation element deformations associated with earthquake loads imparted to the foundation by the structure. Minimum reinforced length shall not be less than the requirement for SDC D, E, or F; Site Class D.

<p>1810.3.8.2 Precast nonprestressed piles.</p> <p>...</p> <p>1810.3.8.2.2 Seismic reinforcement in Seismic Design Categories C through F. For structures assigned to Seismic Design Category C, D, E or F, precast nonprestressed piles shall be reinforced as specified in this section. The minimum longitudinal reinforcement ratio shall be 0.01 throughout the length. Transverse reinforcement shall consist of closed ties or spirals with a minimum 3/8 inch (9.5 mm) diameter. Spacing of transverse reinforcement shall not exceed the smaller of eight times the diameter of the smallest longitudinal bar or 6 inches (152 mm) within a distance of three times the least pile dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm) throughout the remainder of the pile.</p> <p>1810.3.8.2.3 Additional seismic reinforcement in Seismic Design Categories D through F. For structures assigned to Seismic Design Category D, E or F, transverse reinforcement shall be in accordance with Section 1810.3.9.4.2.</p> <p>...</p> <p>1810.3.8.3 Precast prestressed piles.</p> <p>...</p>	<p>18.13.5.10 Precast concrete piles</p> <p>18.13.5.10.1 For precast concrete driven piles, the length of transverse reinforcement provided shall be sufficient to account for potential variations in the elevation of pile tips.</p> <p>18.13.5.10.2 Precast nonprestressed concrete piles for structures assigned to SDC C shall satisfy (a) through (d):</p> <p>(a) Minimum longitudinal steel reinforcement ratio shall be 0.01</p> <p>(b) Longitudinal reinforcement shall be enclosed within a minimum of No. 3 closed ties or 3/8-in. diameter spirals, for up to 20-in. diameter piles, and No. 4 closed ties or ½-in. diameter spirals, for larger diameter piles</p> <p>(c) Spacing of transverse reinforcement within a distance of 3 times the least cross-sectional dimension of the pile from the bottom of the pile cap shall not exceed the lesser of 8 times the diameter of the smallest longitudinal bar and 6 in.</p> <p>(d) Transverse reinforcement shall be provided throughout the length of the pile at a spacing not exceeding 6 in.</p>
--	--

1810.3.8.3.2 Seismic reinforcement in Seismic Design Category C. For structures assigned to Seismic Design Category C, precast prestressed piles shall have transverse reinforcement in accordance with this section. The volumetric ratio of spiral reinforcement shall not be less than the amount required by the following formula for the upper 20 feet (6096 mm) of the pile.

$$\rho_s = 0.04(f'_c/f_{yh})[2.8 + 2.34P/f'_c A_g] \text{ (Equation 18-5)}$$

where:

A_g = Pile cross-sectional area square inches (mm²).

f'_c = Specified compressive strength of concrete, psi (MPa).

f_{yh} = Yield strength of spiral reinforcement \leq 85,000 psi (586 MPa).

P = Axial load on pile, pounds (kN), as determined from Equations 16-5 and 16-7.

ρ_s = Spiral reinforcement index or volumetric ratio (vol. spiral/vol. core).

Not less than one-half the volumetric ratio required by Equation 18-5 shall be provided below the upper 20 feet (6096 mm) of the pile.

Exception: The minimum spiral reinforcement index required by Equation 18-5 shall not apply in cases where the design includes full consideration of load combinations specified in ASCE 7, Section 2.3.6 and the applicable overstrength factor, Ω_0 . In such cases, minimum spiral reinforcement index shall be as specified in Section 1810.3.8.1.

1810.3.8.3.3 Seismic reinforcement in Seismic Design Categories D through F. For structures assigned to Seismic Design Category D, E or F, precast prestressed piles shall have transverse reinforcement in accordance with the following:

1. Requirements in ACI 318, Chapter 18, need not apply, unless specifically referenced.

2. Where the total pile length in the soil is 35 feet (10 668 mm) or less, the lateral transverse reinforcement in the ductile region shall occur through the length of the pile. Where the pile length exceeds 35 feet (10 668 mm), the ductile pile region shall be taken as the greater of 35 feet (10 668 mm) or the distance from the underside of the pile cap to the point of zero curvature plus three times the least pile dimension.

3. In the ductile region, the center-to-center spacing of the spirals or hoop reinforcement shall not exceed one-fifth of the least pile dimension, six times the diameter of the longitudinal strand or 8 inches (203 mm), whichever is smallest.

18.13.5.10.3 For structures assigned to SDC D, E, or F, precast nonprestressed concrete piles shall satisfy the requirements of 18.13.5.10.2 and the requirements for uncased cast-in-place or augered concrete piles in SDC D, E, or F in Table 18.13.5.7.1.

18.13.5.10.4 For structures assigned to SDC C, precast prestressed concrete piles shall satisfy (a) and (b):

(a) If the transverse reinforcement consists of spirals or circular hoops, the volumetric ratio of transverse reinforcement, ρ_s , in the upper 20 ft shall not be less than that calculated by Eq. (18.13.5.10.4a) or calculated from a more detailed analysis by Eq. (18.13.5.10.4b):

$$0.15(f'_c/f_{yt}) \text{ (18.13.5.10.4a)}$$

$$0.04(f'_c/f_{yt})[2.8 + 2.3P_u/f'_c A_g] \text{ (18.13.5.10.4b)}$$

and f_{yt} shall not be taken greater than 100,000 psi

(b) A minimum of one-half of the volumetric ratio of spiral reinforcement required by Eq. (18.13.5.10.4a) or Eq. (18.13.5.10.4b) shall be provided for the remaining length of the pile.

18.13.5.10.5 For structures assigned to SDC D, E, or F, precast prestressed concrete piles shall satisfy (a) through (e) and the ductile pile region shall be defined as the length of pile measured from the bottom of the pile cap to the point of zero curvature plus 3 times the least pile dimension, but not less than 35 ft. If the total pile length in the soil is 35 ft or less, the ductile pile region shall be taken as the entire length of the pile:

(a) In the ductile pile region, the center-to-center spacing of spirals or hoop reinforcement shall not exceed the least of 0.2 times the least pile dimension, 6 times the diameter of the longitudinal strand, and 6 in.

(b) Spiral reinforcement shall be spliced by lapping one full turn, by welding, or by the use of a mechanical splice. If spiral reinforcement is lap spliced, the ends of the spiral shall terminate in a seismic hook. Mechanical and welded splices of deformed bars shall comply with 25.5.7.

(c) If the transverse reinforcement consists of spirals, or circular hoops, the volumetric ratio of transverse reinforcement, ρ_s , in the ductile pile region shall not be less than that calculated by Eq. (18.13.5.10.5a) or calculated from a more detailed analysis by Eq. (18.13.5.10.5b), and the required volumetric ratio shall be permitted to be obtained by providing an inner and outer spiral.

$$0.2(f'_c/f_{yt}) \text{ (18.13.5.10.5a)}$$

<p>4. Circular spiral reinforcement shall be spliced by lapping one full turn and bending the end of each spiral to a 90-degree hook or by use of a mechanical or welded splice complying with Section 25.5.7 of ACI 318.</p>	<p>$0.06(f'_c/f_{yt})[2.8 + 2.3P_u/f'_c A_g]$ (18.13.5.10.5b)</p> <p>and f_{yt} shall not be taken as greater than 100,000 psi</p>
<p>5. Where the transverse reinforcement consists of circular spirals, the volumetric ratio of spiral transverse reinforcement in the ductile region shall comply with the following:</p> <p>$\rho_s = 0.06(f'_c/f_{yh})[2.8 + 2.34P_u/f'_c A_g]$ (Equation 18-6) but not exceed: $\rho_s = 0.021$ (Equation 18-7)</p> <p>where:</p> <p>A_g = Pile cross-sectional area, square inches (mm²).</p> <p>f'_c = Specified compressive strength of concrete, psi (MPa).</p> <p>f_{yh} = Yield strength of spiral reinforcement $\leq 85,000$ psi (586 MPa).</p> <p>P_u = Axial load on pile, pounds (kN), as determined from Equations 16-5 and 16-7.</p> <p>ρ_s = Volumetric ratio (vol. spiral/vol. core).</p> <p>This required amount of spiral reinforcement is permitted to be obtained by providing an inner and outer spiral.</p> <p>Exception: The minimum spiral reinforcement required by Equation 18-6 shall not apply in cases where the design includes full consideration of load combinations specified in ASCE 7, Section 2.3.6 and the applicable overstrength factor, Ω_0. In such cases, minimum spiral reinforcement shall be as specified in Section 1810.3.8.1.</p>	<p>(d) Outside of the ductile pile region, spiral or hoop reinforcement shall be provided with a volumetric ratio not less than one-half of that required within the ductile pile region, and the maximum spacing shall be in accordance with Table 13.4.4.6(b).</p> <p>(e) If transverse reinforcement consists of rectangular hoops and cross-ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region shall be the greater of Eq. (18.13.5.10.5c) and Eq. (18.13.5.10.5d). The hoops and cross-ties shall be equivalent to deformed bars not less than No. 3 in size, and rectangular hoop ends shall terminate at a corner with seismic hooks.</p> <p>$A_{sh} = 0.3sb_c (f'_c/f_{yt})(A_g/A_{ch} - 1.0)[0.5 + 1.4P_u/(f'_c A_g)]$ (18.13.5.10.5c)</p> <p>$A_{sh} = 0.12sb_c (f'_c/f_{yh}) [0.5 + 1.4P_u/(f'_c A_g)]$ (18.13.5.10.5d)</p> <p>and f_{yt} shall not be taken as greater than 100,000 psi</p> <p>18.13.5.10.6 For structures assigned to SDC C, D, E, or F, the maximum factored axial load for precast prestressed piles subjected to a combination of earthquake lateral force and axial load shall not exceed the following values:</p> <p>(a) $0.2 f'_c A_g$ for square piles</p> <p>(b) $0.4 f'_c A_g$ for circular or octagonal piles</p>
<p>6. Where transverse reinforcement consists of rectangular hoops and cross ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region with spacing, s, and perpendicular dimension, h_c, shall conform to:</p> <p>$A_{sh} = 0.3sh_c(f'_c/f_{yh})(A_g/A_{ch} - 1.0)[0.5 + 1.4P_u/(f'_c A_g)]$ (Equation 18-8)</p> <p>but not less than:</p> <p>$A_{sh} = 0.12sh_c(f'_c/f_{yh}) [0.5 + 1.4P_u/(f'_c A_g)]$ (Equation 18-9)</p> <p>where:</p> <p>f_{yh} = yield strength of transverse reinforcement $\leq 70,000$ psi (483 MPa).</p> <p>h_c = Cross-sectional dimension of pile core measured center to center of hoop reinforcement, inch (mm).</p> <p>s = Spacing of transverse reinforcement measured along length of pile, inch (mm).</p>

---	--

Cost Impact: The code change proposal will not increase or decrease the cost of construction
There is no cost increase or decrease associated with this code change proposal with eliminates requirements addressed in ACI 318 from the IBC to avoid confusion and potential conflicts.

S123-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee expressed concerns over the uncoordinated terminology utilized in the proposal specifically the inconsistencies between ACI 318 and IBC. Some on the committee stated that they recognized that the concept of the proposal satisfied the long-term intent of moving technical requirements from the code to the appropriate standards; however, this proposal still needs modifications to satisfy the inconsistencies. (Vote: 8-6)

Assembly Action:

None

S123-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1810.2.4.1, 1810.3.9

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1810.2.4.1 Seismic Design Categories D through F. For structures assigned to *Seismic Design Category* D, E or F, deep foundation elements on *Site Class* E or F sites, as determined in Section ~~1813.2.2~~ 18.13.5.10.5 in ACI 318 shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-foundation-structure interaction coupled with foundation element deformations associated with earthquake loads imparted to the foundation by the structure.

Exception: Deep foundation elements that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. Precast prestressed concrete piles detailed in accordance with Section 18.13.5.10.5 in ACI 318.
2. Cast-in-place deep foundation elements with a minimum longitudinal reinforcement ratio of 0.005 extending the full length of the element and detailed in accordance with Section 18.13.5.5 of ACI 318.

1810.3.9 Cast-in-place deep foundations. Cast-in-place deep foundation elements shall be designed and detailed in accordance with Sections 1810.3.9.1 through ~~1810.3.9.4~~ 1810.3.9.2 and ACI 318 Section 18.13.

Commenter's Reason: This modification includes revisions and additions to the Code in an effort to eliminate conflicting provisions in ACI 318-19, ASCE 7-16 and IBC-2018 regarding design of deep foundations for earthquake resistant structures. Subcommittee F, Foundations, of ACI 318 has coordinated efforts with members from ASCE 7 to bring the concrete material design requirements for foundations to one location. ASCE 7 started this effort in their cycle ending in 2016. The changes to ACI 318 shown here is the continuation of that effort. A side-by-side comparison was provided with the original code change proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. There is no cost increase or decrease associated with this code change proposal which eliminates requirements addressed in ACI 318 from the IBC to avoid confusion and potential conflicts.

Public Comment# 1280

Public Comment 2:

Proponents:

Thomas Schaeffer, Structural Design Group, representing Self (toms@sdg-structure.com)

requests As Submitted

Commenter's Reason: As I viewed the hearing from the ICC website, I was disappointed to see that S123-19 did not pass. And as someone who worked on the foundation provisions in ACI 318-19 for the last 5 years I would like share my knowledge of this proposal and hopefully clear up some of the misconceptions I heard stated during the hearing. This process was a large undertaking by ACI 318 to assemble and organize all of the concrete deep foundation provisions from ASCE, IBC, and ACI in one Code and it is understandable that all of the aspects of the proposal S123-19 could not be adequately discussed in only a couple of minutes. Also, because S123-19 covers so much material and not just one or two provisions it was apparent that a lot of the subjects presented by the people in opposition were not accurate because they had only looked at bits and pieces and not studied S123-19 as a whole. As an engineer who has been designing structures for almost 40 years, I think it will be a great improvement if all of the provisions related to the design of concrete foundations can be located in one Code. In this Public Discussion Comment I will do my best to address each of the negatives presented by the opposition at the hearing that led to the motion to disapprove, and hopefully you will reconsider that motion and approve S123-19 as originally submitted.

I was chairman of the ACI 318 subcommittee on foundations that was responsible for writing the foundation change proposals that the full 318 committee voted on and adopted into ACI 318-19. The subcommittee was formed because of a study that had been performed outside of ACI showing the inconsistencies that occurred in the current provisions for deep foundations in seismic areas between ASCE-7, IBC, and ACI 318. The task of the subcommittee was to assemble the provisions for the concrete deep foundations all in one place, and that would be ACI 318. Many of the provisions in the IBC originated from the previous model codes and are based on ATC 3-06 and NEHRP, and they have essentially remained unchanged for some time. The goal of the ACI subcommittee was not to develop new provisions, but to organize the provisions from the three documents and assemble them in one Code document. If the concrete foundation provisions can reside in ACI 318 they will be evaluated each code cycle by the members of ACI 318 Building Code Committee and updated or revised as necessary. The 318 committee consists of professional engineers, professors, contractors, and building officials, all proficient in the knowledge of concrete design and construction. The foundation subcommittee for this code cycle included practicing engineers, some of whom that also serve on other ACI technical committees that deal specifically with foundations; 336 – Footings, Mats, and Drilled Piers and 543 – Concrete Piles. We held subcommittee meetings twice a year at the ACI Conventions and the meetings were open to the public. It is true as stated in the hearing that no pile foundation contractor associations were formally contacted, however, Dale Biggers, who is a member of the Pile Driver Contractor Association and stated in the hearing that ACI did not contact them regarding the ACI foundation work, actually attended 5 of the ACI 318-F subcommittee meetings. The ACI foundation subcommittee

also worked closely with a number of PCI members and researchers to update the recommended practice for the design of precast piling and include it in 318-19. In addition, ACI 318 has a Public Discussion period where all submitted public comments are considered and voted on by the committee. In fact, one of the opposition speakers made several public comments on the 318-19 provisions, all of which were considered and some were incorporated into 318-19. Therefore, the deep foundation provisions that are now included in ACI 318 have been fully vetted and successfully completed the consensus process.

The deep foundation provisions in 318-19 are essentially exactly the same as the related provisions that are currently in ASCE-7 and IBC. There are only very minor revisions where provisions needed to be updated. Opposition testimony stated that we are substituting a Code that works with one that is unproven, however, that can't be true because the related provisions in 318 are taken directly from ASCE 7 and the IBC.

There was discussion about the omission of SDC A and B in 318-19. In 1.4.7 of 318-19 it states the applicability of the Code, and that it includes Precast Piles in SDC A through F and Cast-in-place Concrete Piles in SDC C through F. The reason that SDC A and B for cast-in-place piles is not explicitly included is that it is not currently explicitly included in the IBC. In Section 1810.3.9 – Cast-in-place deep foundations, there is no provision that includes a statement for SDC A and B. It can be assumed that IBC Sections 1810.3.9.1 and 1810.3.9.2 include all of the Seismic Design Categories, and these two IBC provisions also appear in ACI 318-19 in Section 13.4.4, so a similar assumption can be made in ACI 318 that all SDC's are included. The remainder of the sections in IBC 1810.3.9 refer only to SDC C through F. The opposition testimony also stated that 1810.3.9.1 and 1810.3.9.2 are not included in ACI 318 and therefore must remain in the IBC, however this is incorrect, as stated above these provisions appear in 13.4.4 of ACI 318-19.

There was opposition testimony that ACI 318-19 mixes terminology for deep foundation members and the definitions are not consistent with IBC, which is not correct. The definitions in 318 are almost verbatim the definitions in IBC, except for the fact that "drilled shaft" in IBC is referred to as "drilled pier" in 318, and drilled pier is consistent with ASCE-7.

There was opposition testimony that stated that ACI 318-19 does not have provisions for reinforcement below the 1/3 pile length for a cast-in-place pile or pier in SDC. This is not correct, and the provisions for this pile or pier in ACI 318-19 [18.13.5.7] are exactly the same requirements as in IBC 1810.3.9.4.1. In addition, ACI 318 states that the longitudinal reinforcement shall extend at least the development length in tension beyond the flexural length of the pile, which is defined in ACI 318-19 [18.13.5.7].

Another statement made in opposition was that ACI 318-19 deviates from IBC with respect to provisions for piles/piers with casing. The provisions for cast-in-place concrete piles with spiral welded casing are the same in both IBC and 318. However, it should be noted that a pile with this type of casing is a mandrel driven pile that is unique and is typically known as a Raymond Pile, and since this unique type of pile is not used anymore, it should be considered to be removed from both Codes. With regards to concrete filled pipe piles or cast-in-place concrete piles with permanent casing, IBC Table 1810.3.2.6 contains allowable stress limitations for steel pipes and tubes in tension or compression. In this Table, the term "permanent casing" does not appear, but it can be assumed that permanent casing could be included as a steel pipe or tube. There was a statement made at the hearing that ACI 318-19 does not account for the presence of casing and that was a "hole" in the ACI provisions, but that is not correct. It is correct that for the maximum allowable compressive strength for deep foundation members ACI 318-19 Table 13.4.2.1 has a footnote that states that As in the equations does not include the steel in the casing, pipe, or tube; however, the commentary states that "Provisions for members designed to be composite with steel pipe or casing are covered in AISC 360". And this statement in the 318-19 Commentary is perfectly consistent with IBC 2205.1 that states "The design, fabrication and erection of structural steel elements in buildings, structures and portions thereof shall be in accordance with AISC 360". Therefore, ACI 318-19 and IBC are consistent with regards to provisions for the design of cast-in-place concrete piles in steel casing, pipe, or tube. However, this could be noted as a conflict in IBC in that 2205.1 states that steel design shall be in accordance with AISC 360 and that is not consistent with the allowable stresses given for structural steel elements in IBC Table 1810.3.2.6.

Therefore, based on the above discussion of the subjects presented by the opposition at the hearing I respectfully ask that S123-19 be reconsidered for adoption.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction S123-19, which is basically the incorporation of the deep foundation provisions from ASCE-7 and IBC into ACI 318-19, will not effectively increase or decrease the cost of construction.

Public Comment# 1134

Proposed Change as Submitted

Proponents: Jon-Paul Cardin, American Iron and Steel Institute, representing American Institute of Steel Construction (JCardin@steel.org)

2018 International Building Code

Revise as follows:

1810.3.5.3.1 Structural steel H-piles. Sections of structural steel H-piles shall comply with the requirements for HP shapes in ASTM A6, or the following:

1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall be not less than 80 percent of the depth of the section.
2. The nominal depth in the direction of the web shall be not less than 8 inches (203 mm).
3. Flanges and web shall have a minimum nominal thickness of $\frac{3}{8}$ inch (9.5 mm).

For structures assigned to Seismic Design Category D, E, or F, design and detailing of H-piles shall also conform to the requirements of AISC 341.

1810.3.11.2 Seismic Design Categories D through F. For structures assigned to *Seismic Design Category D, E or F*, deep foundation element resistance to uplift forces or rotational restraint shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop not less than 25 percent of the strength of the element in tension. Anchorage into the pile cap shall comply with the following:

1. In the case of uplift, the anchorage shall be capable of developing the least of the following:
 - 1.1. The nominal tensile strength of the longitudinal reinforcement in a concrete element. .
 - 1.2. The nominal tensile strength of a steel element. .
 - 1.3. The frictional force developed between the element and the soil multiplied by 1.3.

Exception: The anchorage is permitted to be designed to resist the axial tension force resulting from the seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

2. In the case of rotational restraint, the anchorage shall be designed to resist the axial and shear forces, and moments resulting from the seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7 or the anchorage shall be capable of developing the full axial, bending and shear nominal strength of the element.

3. The connection between the pile cap and the steel H-piles or unfilled steel pipe piles in structures assigned to Seismic Design Category D, E, or F shall be designed for a tensile force of not less than 10 percent of the pile compression capacity.

Exception: Connection tensile capacity need not exceed the strength required to resist seismic load effects including overstrength of ASCE 7 Section 12.4.3 or 12.14.3.2. Connections need not be provided where the foundation or supported structure does not rely on the tensile capacity of the piles for stability under the design seismic force.

Where the vertical lateral-force-resisting elements are columns, the pile cap flexural strengths shall exceed the column flexural strength. The connection between batter piles and pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be designed to resist forces and moments that result from the application of seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

Reason: The purpose of this proposal is to correct an oversight and bring in modifications from ASCE 7-16, Section 14.1.8 to IBC Chapter 18. Interestingly, the language has been part of ASCE 7 since the 2005 edition, but not been brought forward to the IBC previously. Since ASCE 7 Chapter 14 is not typically adopted in the IBC for steel, it is necessary to add the language directly.

ASCE 7-16 Commentary states: "Steel piles used in higher SDCs are expected to yield just under the pile cap or foundation because of combined bending and axial load. Design and detailing requirements of AISC 341 for H-piles are intended to produce stable plastic hinge formation in the piles. Because piles can be subjected to tension caused by overturning moment, mechanical means to transfer such tension must be designed for the required tension force, but not less than 10% of the pile compression capacity."

Bibliography: AISC (2016), *Seismic Provisions for Structural Steel Buildings*, ANSI/AISC 341-16, American Institute of Steel Construction, Chicago, IL.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal is not intended to make technical changes to the design or construction of H-piles. It is simply intended to clarify the currently accepted practice.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASCE 4-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

S132-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

2018 International Building Code

1810.3.11.2 Seismic Design Categories D through F.

For structures assigned to *Seismic Design Category* D, E or F, deep foundation element resistance to uplift forces or rotational restraint shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop not less than 25 percent of the strength of the element in tension. Anchorage into the pile cap shall comply with the following:

1. In the case of uplift, the anchorage shall be capable of developing the least of the following:

1.1 The nominal tensile strength of the longitudinal reinforcement in a concrete element.

1.2 The nominal tensile strength of a steel element.

1.3. The frictional force developed between the element and the soil multiplied by 1.3.

Exception: The anchorage is permitted to be designed to resist the axial tension force resulting from the seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

2. In the case of rotational restraint, the anchorage shall be designed to resist the axial and shear forces, and moments resulting from the seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7 or the anchorage shall be capable of developing the full axial, bending and shear nominal strength of the element.

3. The connection between the pile cap and the steel H-piles or unfilled steel pipe piles in structures assigned to Seismic Design Category D, E, or F shall be designed for a tensile force of not less than 10 percent of the pile compression capacity.

Exception- Exceptions:

1. Connection tensile capacity need not exceed the strength required to resist seismic load effects including overstrength of ASCE 7 Section 12.4.3 or 12.14.3.2.

2. Connections need not be provided where the foundation or supported structure does not rely on the tensile capacity of the piles for stability under the design seismic force.

Where the vertical lateral-force-resisting elements are columns, the pile cap flexural strengths shall exceed the column flexural strength. The connection between batter piles and pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be designed to resist forces and moments that result from the application of seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

Committee Reason: Corrects a current code oversight by specifically allowing H-piles in the IBC for high seismic. The modification clarified the exceptions. (Vote: 13-0-1 abstaining)

Assembly Action:

None

S132-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1810.3.11.2

Proponents:

Daniel Stevenson, representing GeoCoalition (dstevenson@berkelapg.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1810.3.11.2 Seismic Design Categories D through F. For structures assigned to *Seismic Design Category* D, E or F, deep foundation element resistance to uplift forces or rotational restraint shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop not less than 25 percent of the strength of the element in tension. For piles required to resist uplift forces or provide rotational restraint, A anchorage into the pile cap shall comply with the following:

1. In the case of uplift, the anchorage shall be capable of developing the least of the following:
 - 1.1. The nominal tensile strength of the longitudinal reinforcement in a concrete element. .
 - 1.2. The nominal tensile strength of a steel element. .
 - 1.3. The frictional force developed between the element and the soil multiplied by 1.3.

Exception: The anchorage is permitted to be designed to resist the axial tension force resulting from the seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

2. In the case of rotational restraint, the anchorage shall be designed to resist the axial and shear forces, and moments resulting from the seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7 or the anchorage shall be capable of developing the full axial, bending and shear nominal strength of the element.
3. The connection between the pile cap and the steel H-piles or unfilled steel pipe piles in structures assigned to Seismic Design Category D, E, or F shall be designed for a tensile force of not less than 10 percent of the pile compression capacity.

Exceptions:

1. Connection tensile capacity need not exceed the strength required to resist seismic load effects including overstrength of ASCE 7 Section 12.4.3 or 12.14.3.2.
2. Connections need not be provided where the foundation or supported structure does not rely on the tensile capacity of the piles for stability under the design seismic force.

Where the vertical lateral-force-resisting elements are columns, the pile cap flexural strengths shall exceed the column flexural strength. The connection between batter piles and pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be designed to resist forces and moments that result from the application of seismic load effects including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

Commenter's Reason: The existing code language is confusing and can appear contradictory. The requirements of "...not less than 25 percent of the strength of the element in tension.", and then later "The nominal tensile strength..." can appear contradictory of one does not realize that the more restrictive requirement is only required for piles required to resist uplift forces. The added phrase clarifies that the intent of the code is that the more restrictive requirements apply only to piles required to resist uplift forces or provide rotational restraint.

The added phrase is taken verbatim from ASCE-7 section 12.13.6.5, upon which this code section is based. ASCE-7 12.13.6 contains the sentence "For piles required to resist uplift forces or provide rotational restraint, anchorage into the pile cap shall comply with the following:" Following this sentence, ASCE-7 12.13.6.5 contains the same requirements as IBC 1810.3.11.2. Adding the phrase from ASCE-7 into the code will provide consistency between the code and referenced standard ASCE-7.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This only clarifies existing code requirements.

Proposed Change as Submitted

Proponents: Dale Biggers, P.E. GeoCoalition, representing GeoCoalition (dbiggers@bohbro.com); Daniel Stevenson, P.E., representing GeoCoalition (dstevenson@berkelapg.com); Lori Simpson, P.E., G.E., representing GeoCoalition (lsimpson@langan.com)

2018 International Building Code

Revise as follows:

1810.3.6 Splices. Splices shall be constructed so as to provide and maintain true alignment and position of the component parts of the deep foundation element during installation and subsequent thereto and shall be designed to resist the axial and shear forces and moments occurring at the location of the splice during driving and for design load combinations. Where deep foundation elements of the same type are being spliced, splices shall develop not less than 50 percent of the bending strength of the weaker section. Where deep foundation elements of different materials or different types are being spliced, splices shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section. Where structural steel cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

Exception: Splices conforming to generally accepted engineering practices where approved by the *building official*.

Splices occurring in the upper 10 feet (3048 mm) of the embedded portion of an element shall be designed to resist at allowable stresses the moment and shear that would result from an assumed eccentricity of the axial load of 3 inches (76 mm), or the element shall be braced in accordance with Section 1810.2.2 to other deep foundation elements that do not have splices in the upper 10 feet (3048 mm) of embedment.

Reason: 1. Section 1810.3.6 already requires that splices "...shall be designed to resist the axial and shear forces and moments occurring at the location of the splice...". Conformance with this requirement already ensures the structural integrity of the splice. Section 1810.3.6.1 contains more restrictive splice requirements for structures assigned to seismic design categories C through F.

2. The current specification precludes commonly available splices that would be acceptable in many design situations, such as a splice located at significant depth. (i.e., where significant tension or bending demands are not expected or possible. Load requirements at the splice diminish due to soil resistance above the splice as the splice is located deeper.).

3. The depth of the splice is known when you are driving to a predefined depth. For example where 240-ft long friction piles are driven to a predefined depth, the splice between two 120-ft sections will be 120-ft below grade.

4. The current code causes unnecessary costs.

Example a.) To make a welded splice on a 20-inch diameter pipe pile costs \$ 1,015 in labor and equipment. To buy a drive-fit pipe-to-pipe splicer costs \$ 495. For 211 piles at \$520 extra, the added cost was \$ 109,720.

Example b.) A tension splice for a 14-inch square prestressed concrete pile costs \$ 553 to purchase. A drive-fit splice for that pile costs \$ 201. For 2,420 piles at \$ 352 extra, the added cost was \$ 851,000.

These are real costs on real jobs, not hypothetical examples.

5. Drive-fit splices were used successfully on the New Orleans Superdome, 52-story Shell Square, 50-story Sheraton Hotel, and many other New Orleans structures. These buildings are more than 40 years old.

6. "Supporting data" may include a geotechnical investigation and/or a load test; this requirement is similar to Section 1810.3.2.8.

Click here to see the members of the GeoCoalition : <http://www.piledrivers.org/2019-geocoalition-members/>

Cost Impact: The code change proposal will decrease the cost of construction

The proposed change will decrease the cost of construction but only in some areas of the country.

Where structural steel cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

Exception: Splices conforming to generally accepted engineering practices ~~and~~ where approved by the *building official* for buildings assigned to Seismic Design Category A or B.

Splices occurring in the upper 10 feet (3048 mm) of the embedded portion of an element shall be designed to resist at allowable stresses the moment and shear that would result from an assumed eccentricity of the axial load of 3 inches (76 mm), or the element shall be braced in accordance with Section 1810.2.2 to other deep foundation elements that do not have splices in the upper 10 feet (3048 mm) of embedment.

Committee Reason: This proposal recognizes the condition with lower stresses to engineer the splice. The modifications clarified that the exception is only for SDC A or B and deleted the word 'and' in the exception. (Vote: 14-0)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

IBC@: 1810.3.6 (New)

Proponents:

Dale Biggers, representing GeoCoalition (dbiggers@bohbro.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1810.3.6 Splices. Splices shall be constructed so as to provide and maintain true alignment and position of the component parts of the deep foundation element during installation and subsequent thereto and shall be designed to resist the axial and shear forces and moments occurring at the location of the splice during driving and for design load combinations. Where deep foundation elements of the same type are being spliced, splices shall develop not less than 50 percent of the bending strength of the weaker section. Where deep foundation elements of different materials or different types are being spliced, splices shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section. Where structural steel cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

~~**Exception:** Splices conforming to generally accepted engineering practices where approved by the *building official* for buildings assigned to Seismic Design Category A or B.~~

Exception: For buildings assigned to Seismic Design Category A or B, splices need not comply with the 50 percent tension and bending strength requirements where justified by supporting data.

Splices occurring in the upper 10 feet (3048 mm) of the embedded portion of an element shall be designed to resist at allowable stresses the moment and shear that would result from an assumed eccentricity of the axial load of 3 inches (76 mm), or the element shall be braced in accordance with Section 1810.2.2 to other deep foundation elements that do not have splices in the upper 10 feet (3048 mm) of embedment.

Commenter's Reason: After the Committee Action Hearing, we received a comment that the Exception, as originally written and approved by the Committee, was overly broad. As previously written, it could be interpreted to mean that splices would not have to be designed for the forces at the splice location during driving or at the final splice location nor would the steel core requirements apply if approved by the building official. The

intent was only to exempt splices in low seismic design categories from having to be designed to the 50 percent of the tension and bending strength of the pile material. All other requirements of this section should still apply.

The Committee approved the intent of the original proposal and this current change reflects the original intent.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The proposed change will decrease the cost of construction in some areas. Additionally, the change is intended to eliminate any misinterpretations of the intent of the code.

Public Comment# 1268

S138-19

IBC®: 1810.4.1.3

Proposed Change as Submitted

Proponents: Daniel Stevenson, P.E., representing GeoCoalition (dstevenson@berkelapg.com); Dale Biggers, P.E. GeoCoalition, representing GeoCoalition (dbiggers@bohbro.com); Lori Simpson, P.E., G.E., representing GeoCoalition (lsimpson@langan.com)

2018 International Building Code

Revise as follows:

1810.4.1.3 Driving near uncased concrete. Deep foundation elements shall not be driven within six element diameters center to center in granular soils or within one-half the element length in cohesive soils of an uncased element filled with concrete less than 48 hours old unless *approved by the building official*. ~~During driving near uncased concrete, if the concrete surface in any completed element rises or drops significantly or bleeds additional water, the previously completed element shall be replaced.~~ Driven uncased deep foundation elements shall not be installed in soils that could cause heave.

Reason: 1. Minor rises or drops are normal due to consolidation of the concrete, etc. Only significant changes in elevation are of concern.
2. There are other possible areas of concern in addition to a change of elevation of the top surface of a previously completed element. It is common to get some minimal bleed water due to concrete consolidation, but if there is excessive bleed water due to installation of another nearby pile then there is likely a problem.

3. In locations of high water table, installing piles can force ground water into previously installed piles.

4. The change clarifies the current guidelines and calls attention to conditions that should already be under consideration.

5. The proposal also clarifies that the previously completed element is the one to be replaced.

Click here to see the members of the GeoCoalition : <http://www.piledrivers.org/2019-geocoalition-members/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction
These requirements are current industry standard quality control practice.

It will decrease costs in some cases since it may allow higher design loads where the geotechnical capacity is sufficiently higher than the structural strength.

S138-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee agreed that the proposal clarifies the guidelines concerning 'what needs to be replaced'. The committee expressed concerns that re-wording maybe required during the public comment phase to clarify 'which previously completed elements' and 'who makes the call'. (Vote: 13-1)

Assembly Action:

None

S138-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1810.4.1.3

Proponents:

Daniel Stevenson, representing GeoCoalition (dstevenson@berkelapg.com)

Modify as follows:

2018 International Building Code

1810.4.1.3 Driving near uncased concrete. Deep foundation elements shall not be driven within six element diameters center to center in granular soils or within one-half the element length in cohesive soils of an uncased element filled with concrete less than 48 hours old unless *approved* by the *building official*. ~~During~~ If driving near uncased concrete ~~elements~~, causes ~~if~~ the concrete surface in any completed element ~~to rise~~ or drops significantly or bleeds additional water, the ~~previously~~ completed element shall be replaced. Driven uncased deep foundation elements shall not be installed in soils that could cause heave.

Commenter's Reason: The proposed modifications do not change the requirements of the code section. They clarify this code section by using more concise language.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This will clarify the code, but not change the code requirements.

Public Comment# 1928

S140-19

IBC®: 1810.4.5

Proposed Change as Submitted

Proponents: Dale Biggers, P.E. GeoCoalition, representing GeoCoalition (dbiggers@bohbro.com); Daniel Stevenson, P.E., representing GeoCoalition (dstevenson@berkelapg.com); Lori Simpson, representing GeoCoalition (lsimpson@langan.com)

2018 International Building Code

Revise as follows:

1810.4.5 Vibratory driving. Vibratory drivers shall only be used to install deep foundation elements where the element load capacity is verified by load tests in accordance with Section 1810.3.3.1.2. The installation of production elements shall be controlled according to power consumption, rate of penetration or other *approved* means that ensure element capacities equal or exceed those of the test elements.

Exceptions:

1. The pile installation is completed by driving with an impact hammer in accordance with Section 1810.3.3.1.1.
2. The pile is to be used only for lateral resistance.

Reason: 1. Axial load tests are only needed when there are axial loads and the capacity is in doubt.

2. This proposal adds the exception for "the pile installation is completed by driving with an impact hammer..." because piles that are started using a vibratory hammer but completed using an impact hammer should be treated as piles that are installed by an impact hammer.

3. An impact hammer can be used to assure that you have achieved or exceeded the minimum required axial capacity. Section 1810.3.3.1.1. details how capacity might be determined from impact driving.

4. The exception for "the pile is to be used only for lateral resistance" is needed because a load test for axial capacity (as implied by 1810.3.3.1.2) is not needed for piles used only for lateral resistance. Lateral load capacity requirements are covered in Section 1810.3.3.2.

Click here to see the members of the GeoCoalition : <http://www.piledrivers.org/2019-geocoalition-members/>

Cost Impact: The code change proposal will decrease the cost of construction

Will not increase the cost of construction. In fact, it will likely decrease cost as an axial load test will not be required where piles are used only for lateral resistance or where the pile installation is completed using an impact hammer.

S140-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee felt the new exceptions are appropriate and added clarification.

(Vote: 14-0)

Assembly Action:

None

S140-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1810.4.5

Proponents:

Dale Biggers, representing GeoCoalition (dbiggers@bohbro.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1810.4.5 Vibratory driving. Vibratory drivers shall only be used to install deep foundation elements where the element load capacity is verified by load tests in accordance with Section 1810.3.3.1.2. ~~The installation of production elements shall be controlled according to power consumption, rate of penetration or other approved means that ensure element capacities equal or exceed those of the test elements.~~

Exceptions:

1. Load testing is not required where ~~±~~ the pile installation is completed by driving with an impact hammer in accordance with Section 1810.3.3.1.1.
2. Load testing is not required where ~~±~~ the vertical pile is to be used only for lateral resistance

The installation of production elements shall be controlled according to power consumption, rate of penetration or other *approved* means that ensure element capacities equal or exceed those of the test elements.

Commenter's Reason: This change is made to improve the Exceptions by making full sentences. This also narrows the scope of the Exceptions. There is no change to the original intent of the Exceptions.

The last sentence of the code has been moved unchanged to a location following the Exception to clarify that the installation still must be controlled.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

This can save costs in some instances where a load test will not be required. An axial load test will not be required where piles are used only for lateral resistance or where the pile installation is completed using an impact hammer.

Public Comment# 1258

Public Comment 2:

IBC®: 1810.4.5

Proponents:

Daniel Stevenson, representing GeoCoalition (dstevenson@berkelapg.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1810.4.5 Vibratory driving. Vibratory drivers shall only be used to install deep foundation elements where the element load capacity is verified by load tests in accordance with Section 1810.3.3.1.2. ~~The installation of production elements shall be controlled according to power consumption, rate of penetration or other approved means that ensure element capacities equal or exceed those of the test elements.~~

Exceptions:

1. Load testing is not required when ~~±~~ the pile element installation is completed by driving with an impact hammer in accordance with Section 1810.3.3.1.1.
2. Load testing is not required when a vertical element ~~The pile~~ is to be used only for lateral resistance.

The installation of production elements shall be controlled according to power consumption, rate of penetration or other *approved* means that ensure element capacities equal or exceed those of the test elements.

Commenter's Reason: The second sentence has been moved to after the exceptions to clarify that the exceptions do not apply to the requirements contained in the second sentence.

The phrase "Load testing is not required when..." has been added to both exceptions to clarify that the exceptions only apply to the load test requirement, and to make both exceptions complete sentence.

The word "pile" has been replaced with the word "element" to be consistent with the terminology used throughout the code, including this code section.

The word "vertical" has been added to the second exception to clarify that the exception will not apply to a battered element that resists lateral load from the horizontal component of its axial load.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction
The cost savings are less by not requiring unnecessary tests.

Public Comment# 1641

S144-19

IBC: 1901.2, SECTION 1907, 1907.1, 1907.2, 1907.3

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, representing American Concrete Institute (steve.szoke@concrete.org); Scott Campbell, representing National Ready Mixed Concrete Association (scampbell@nrmca.org)

2018 International Building Code

Revise as follows:

1901.2 Plain and reinforced concrete. Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 as amended in Section 1905 of this code. ~~Except for the provisions of Sections 1904 and 1907, the design and construction of slabs on grade shall not be governed by this chapter unless they transmit vertical loads or lateral forces from other parts of the structure to the soil.~~ Precast concrete diaphragms in buildings assigned to *Seismic Design Category* C, D, E or F shall be designed in accordance with the requirements of ASCE 7, Section 14.2.4.

SECTION 1907 **MINIMUM SLAB PROVISIONS SLABS-ON-GROUND**

1907.1 General. Slabs-on-ground not transmitting vertical loads or lateral forces from other parts of the structure to the soil shall be designed and constructed in accordance with section 1904 and this section. ~~The thickness of concrete floor slabs supported directly on the ground shall be not less than 3¹/₂ inches (89 mm). A 6-mil (0.006 inch; 0.15 mm) polyethylene vapor retarder with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other approved equivalent methods or materials shall be used to retard vapor transmission through the floor slab.~~

Exceptions: ~~A vapor retarder is not required:~~

- ~~1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.~~
- ~~2. For unheated storage rooms having an area of less than 70 square feet (6.5 m²) and carports attached to occupancies in Group R-3.~~
- ~~3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.~~
- ~~4. For driveways, walks, patios and other flatwork that will not be enclosed at a later date.~~
- ~~5. Where approved based on local site conditions.~~

Add new text as follows:

1907.1.1 Slabs-on-ground transmitting loads. Where slabs-on-ground transmit vertical loads or lateral forces from other parts of the structure to the soil all provisions in this Chapter shall be applicable.

1907.2 Thickness. The thickness of concrete floor slabs supported directly on the ground shall be not less than 3¹/₂ inches (89 mm).

1907.3 Vapor retarder. A polyethylene vapor retarder having a minimum 6-mil (0.006 inch; 0.15 mm) polyethylene vapor retarder thickness and with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other approved equivalent methods or materials shall be used to retard vapor transmission through the floor slab.

Exceptions: A vapor retarder is not required:

1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.
2. For unheated storage rooms having an area of less than 70 square feet (6.5 m²) and carports attached to occupancies in Group R-3.
3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.
4. For driveways, walks, patios and other flatwork that will not be enclosed at a later date.
5. Where approved based on local site conditions.

Reason: Reason: The current language is not clear. First the provisions are only applicable to slabs on ground and this should be more clearly stated. Further it is generally understood that all provisions of the IBC are minimum requirements. This code change places all provisions uniquely applicable to slabs-on-ground in one section rather than having provisions in sections 1901.2 and 1907.

Modifications shown as new section 1907.1.1. This portion of the proposed revision is editorial, deleting slab-on-ground provisions from Section 1901.2 (shown above as deleted text) and moving the provisions to the more appropriate section, 1907. This places provisions for concrete slabs-on-ground in one section.

Modifications shown as new section 1907.1.2. This portion of the proposed revision is editorial and clarifies that thickness criteria are for concrete slabs-on-ground.

Modifications shown as new section 1907.1.3. This portion of the proposed revision is editorial and appropriately assigns provisions for vapor retarders to vapor retarders and not to slabs-on-ground.

ACI, a 501.C.3 professional society, encourages the approval of this code change proposal to improve the IBC by more clearly advising the user that these provisions are only applicable to slabs-on-ground and relocates slab-on-ground provisions in one section.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
No change to cost of design or construction, change places slab related criteria in one section.

S144-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee's majority opinion was that the proposed wording was less clear than the existing code wording (especially for section 1907.1.1).
(Vote: 10-4)

Assembly Action:

None

S144-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 1901.2, SECTION 1907, 1907.1, 1907.1.1 (New), 1907.2 (New), 1907.3 (New)

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1901.2 Plain and reinforced concrete. Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 as amended in Section 1905 of this code. Precast concrete diaphragms in buildings assigned to *Seismic Design Category C, D, E or F* shall be designed in accordance with the requirements of ASCE 7, Section 14.2.4.

SECTION 1907 SLABS-ON-GROUND

1907.1 General. Slabs-on-ground ~~not transmitting vertical loads or lateral forces from other parts of the structure to the soil shall be~~ designed and constructed in accordance with section 1904 and this section.

1907.1.1 Slabs-on-ground transmitting loads. Where slabs-on-ground transmit vertical loads or lateral forces from other parts of the structure to the soil design and construction of slabs-on-ground shall comply with all applicable provisions of this chapter ~~all provisions in this Chapter shall be applicable.~~

1907.2 Thickness. The thickness of concrete floor slabs supported directly on the ground shall be not less than 3¹/₂ inches (89 mm).

1907.3 Vapor retarder. A polyethylene vapor retarder having a minimum 6-mil (0.006 inch; 0.15 mm) polyethylene vapor retarder thickness and with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other *approved* equivalent methods or materials shall be used to retard vapor transmission through the floor slab.

Exceptions: A vapor retarder is not required:

1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.

2. For unheated storage rooms having an area of less than 70 square feet (6.5 m²) and carports attached to occupancies in Group R-3.
3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.
4. For driveways, walks, patios and other flatwork that will not be enclosed at a later date.
5. Where *approved* based on local site conditions.

Commenter's Reason: This public comment clarifies that provisions of the code for slabs-on-ground are not altered. This code change proposal corrects the IBC by clearly communicating that the provisions are only minimum requirements for slabs-on-ground and not applicable to all slabs, including interim floor slabs.

This change is not intended to alter any the requirements of the code but places vapor retard provisions in a section titled vapor retarders, thickness in a section title thickness, and design and construction requirements in the appropriate section.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. No change to the provisions, language changed and reorganized for clarity.

Public Comment# 1333

S146-19

IBC®: 1901.5

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, representing American Concrete Institute (steve.szoke@concrete.org); Scott Campbell, National Ready Mixed Concrete Association, representing National Ready Mixed Concrete Association (scampbell@nrmca.org); Amy Trygestad, representing Concrete Reinforcing Steel Institute (atrygestad@crsi.org)

2018 International Building Code

Delete without substitution:

1901.5 Construction documents. ~~The construction documents for structural concrete construction shall include:~~

- ~~1. The specified compressive strength of concrete at the stated ages or stages of construction for which each concrete element is designed.~~
- ~~2. The specified strength or grade of reinforcement.~~
- ~~3. The size and location of structural elements, reinforcement and anchors.~~
- ~~4. Provision for dimensional changes resulting from creep, shrinkage and temperature.~~
- ~~5. The magnitude and location of prestressing forces.~~
- ~~6. Anchorage length of reinforcement and location and length of lap splices.~~
- ~~7. Type and location of mechanical and welded splices of reinforcement.~~
- ~~8. Details and location of contraction or isolation joints specified for plain concrete.~~
- ~~9. Minimum concrete compressive strength at time of posttensioning.~~
- ~~10. Stressing sequence for posttensioning tendons.~~
- ~~11. For structures assigned to Seismic Design Category D, E or F, a statement if slab on grade is designed as a structural diaphragm.~~

Reason: This code change proposal removes an incomplete list of criteria necessary for the construction documents applicable to structural concrete. The list in the IBC is not as comprehensive as the list in referenced ACI documents. Many of the omissions from the IBC list are shown in the table below. Since the IBC supersedes referenced ACI documents the partial list in the IBC is all that would be required although ACI documents have significantly more extensive requirements. If the list in the IBC is to indicate what may be of particular importance to the building code official, then that list might be best included in the commentary to the IBC, but not provided as the applicable requirements for construction documents. Further maintaining duplicate lists becomes problematic and results code change proposals that would not alter the requirements. The list in the IBC is outdate and many important items recently added to ACI documents are not addressed, in particular note the requirements for anchors and qualifications for personnel.

IBC Requirements	ACI Requirements
	Loads used in design
	Design work delegated to contractor
	Cementitious materials and combinations
	Water cement ratio
	Aggregates
	Mixing water
	Admixtures
	If water reducing – amount of modification
	If retarding – modification in setting time
	Where expansive cements are used – admixture compatibility
	Steel fiber reinforcement
Compressive strength of concrete	Compressive strength of concrete
	Test age for compressive strengths
	Maximum water cement ratio
	Maximum size of aggregate
	Exposure Category F – air content
	Exposure Class C – chloride ion limits
	Exposure Class S – types of cement
	Density of lightweight aggregate

	Volumetric fracture of aggregates where required in design
	Where used for shear – requirements for steel-fiber reinforced concrete
	Exposure class at option of engineer
	Compressive strength as various phases at option of engineer.
	Concrete mix proportions
	Material storage
	Concrete batching, mixing, and transport/delivery
	Pump pipe requirements
	Concrete placement
	Vertical lift requirements
	Field cured specimens if required
	Temperature of high early strength concrete
	Accelerated curing requirements if employed

	Materials and details of corrosion protection for tendons, couplers, end fittings, post-tensioning anchorages, and anchorage regions.
	Requirements for grouting of bonded tendons, including maximum water-soluble chloride ion
	Formwork, including removal
	Qualifications of filed technicians
	Qualifications of inspectors
	Qualifications of testing agency and technicians
Slab on grade resisting seismic forces.	Identify if a slab-on-ground is designed as a structural diaphragm or part of the seismic-force-resisting system

ACI, a 501.C.3. professional technical society, recommends approval of this code change as submitted to assure that all relevant requirements for structural concrete as included on construction documents and to reduce confusion and eliminate the need to maintain duplicate lists.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This code change proposal removes potential conflicts between the IBC and ACI requirements for construction documents.

S146-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee expressed concerns that the proposal would make it harder to find requirements. The committee encourages ACI to update to the IBC list.

(Vote: 12-2)

Assembly Action:

None

S146-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Submitted

Commenter's Reason: The truncated list that appears in the IBC is substantially different from the requirements in ACI 318 creating a conflict within the IBC. Section 1901.1 requires compliance with ACI 318, yet the provisions of section 1901.5 of the IBC provides a less complete list of information required on the construction documents. Maintaining different lists in the IBC than the referenced documents is not appropriate and is

misleading when the intent is that all the requirements listed in ACI 318 are applicable.

As stated in the reason statement for the original proposal reason statement and in testimony, if a truncated list is important to highlight items of importance to the building official then this list should be in commentary and not the code.

One committee person suggested that ACI should duplicate the list in the IBC. There is no reason to duplicate the entire list in the IBC since the list is complete in ACI 318 which is a referenced standard. Further, it is not efficient use of anyone's time to maintain and coordinate duplicate lists.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This public comment and the original proposal to not increase or decrease costs. The provisions of ACI 318 remain applicable.

Public Comment# 1336

S153-19

IBC®: 1907.1, ASTM Chapter 35 (New)

Proposed Change as Submitted

Proponents: Terry Kozlowski, representing Southern Nevada Chapter; Nenad Mirkovic, representing City of Las Vegas; Amanda Moss, representing SN-ICC Member; Cassidy Wilson, representing SN-ICC Member

2018 International Building Code

Revise as follows:

1907.1 General. The thickness of concrete floor slabs supported directly on the ground shall be not less than 3½ inches (89 mm). A ~~6-mil (0.006 10-mil (0.010 inch; 0.15-0.254 mm)~~ polyethylene vapor retarder conforming to ASTM E 1745 Class A requirements with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other *approved* equivalent methods or materials shall be used to retard vapor transmission through the floor slab.

Exception: A vapor retarder is not required:

1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.
2. For unheated storage rooms having an area of less than 70 square feet (6.5 m²) and carports attached to occupancies in Group R-3.
3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.
4. For driveways, walks, patios and other flatwork that will not be enclosed and heated at a later date.
5. Where *approved* based on local site conditions.

Add new text as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken PA 19428-2959

E1745-17: Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs

Reason: By coordinating the requirements for the vapor retarder with the American Concrete Institute (ACI) recommendations, this proposal will promote consistency across codes and standards for various moisture conditions.

Bibliography: ACI 302.2R Section 9.3:

"...ACI 302.1R recommends a minimum 10 mil (0.25 mm) vapor retarder thickness when the retarder is protected with a granular fill. When the vapor retarder is not protected by a fill, some specifiers require a 15 mil (0.38 mm) thickness or greater..."

Cost Impact: The code change proposal will increase the cost of construction

This proposal will increase the cost of construction by an estimated \$0.045/sq foot, based on cost analysis in current market conditions. For example, a 50,000 square foot commercial building will have an estimated increase of \$2,250.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM E1745-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

S153-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee did not feel there was sufficient justification to increase the thickness from 6mil to 10mil.
(Vote: 14-0)

Individual Consideration Agenda

Public Comment 1:

IBC®: 1907.1

Proponents:

Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

1907.1 General. The thickness of concrete floor slabs supported directly on the ground shall be not less than 3½ inches (89 mm). A ~~6-mil to 10-mil (0.006 to 0.010 inch; 0.152 mm mm)~~ polyethylene vapor retarder conforming to at least the Class C requirements of ASTM E 1745 ~~Class A requirements~~ with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other *approved* equivalent methods or materials shall be used to retard vapor transmission through the floor slab.

Exception: A vapor retarder is not required:

1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.
2. For unheated storage rooms having an area of less than 70 square feet (6.5 m²) and carports attached to occupancies in Group R-3.
3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.
4. For driveways, walks, patios and other flatwork that will not be enclosed and heated at a later date.
5. Where *approved* based on local site conditions.

Commenter's Reason: This code change proposal reduces the minimum thickness from 10 mil to 6 mil and reduces the specified class of materials conforming to ASTM E1745 from Class A to Class C.

These changes are intended to better align the provisions in the IRC with the recommendations of ACI Committee 302 on Construction of Concrete Floors as published in ACI 302.2R Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials which reads: "In the past, 4, 6, 8, and 10 mil (0.10, 0.15, 0.20, and 0.25 mm) low-density polyethylene sheets have been used as belowslab vapor retarder material. Any material used as a belowslab vapor retarder/barrier, however, should conform to the requirements of ASTM E 1745, 'Standard Specification for Water Vapor Retarders Used in Contact with Soil or Granular Fill Under Concrete Slabs.'"

Since ACI 302.2R does not specify class, this public comment reduces the class to the minimum requirements of ASTM E1745 which is Class C.

Since ACI 302.2R does not specify thickness, as long as the material satisfies ASTM E1745 it would be preferable to not specify minimum thickness in the IBC. However, during the Committee Action Hearings arguments were made that 6 mil polyethylene sheet is not sufficiently durable for applications as belowslab vapor retarders. ASTM E1745 does not specify materials and thus arguments made that 6 mil polyethylene sheet might not be sufficiently durable may not be applicable to 6 mil membranes made of other materials. Since 6 mil was permitted in the 2018 IBC, this public comment reverts back to that as the minimum thickness. Regardless of thickness, the material must conform to ASTM E1745.

Bibliography: 302.2R-06 Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

By limiting the criteria of this provision to any material conforming to ASTM E1745 and allowing minimum thickness of 6 mil, this provision should not significantly increase the cost of construction as compared to the 2018 edition of the IBC, but could reduce costs compared to the the new provision presented as S153-19.

Public Comment# 1357

S154-19

IBC: 1907.2 (New)

Proposed Change as Submitted

Proponents: Amy Dowell, Post-Tensioning Institute, representing Post-Tensioning Institute (amy.dowell@post-tensioning.org); Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

2018 International Building Code

1808.6.2 Slab-on-ground foundations. Moments, shears and deflections for use in designing slab-on-ground, mat or raft foundations on expansive soils shall be determined in accordance with *WRI/CRSI Design of Slab-on-Ground Foundations or PTI DC 10.5*. Using the moments, shears and deflections determined above, nonprestressed slabs-on-ground, mat or raft foundations on expansive soils shall be designed in accordance with *WRI/CRSI Design of Slab-on-Ground Foundations* and post-tensioned slab-on-ground, mat or raft foundations on expansive soils shall be designed in accordance with *PTI DC 10.5*. It shall be permitted to analyze and design such slabs by other methods that account for soil-structure interaction, the deformed shape of the soil support, the plate or stiffened plate action of the slab as well as both center lift and edge lift conditions. Such alternative methods shall be rational and the basis for all aspects and parameters of the method shall be available for peer review.

Add new text as follows:

1907.2 Post-tensioned concrete slabs-on-ground. Post-tensioned concrete slabs placed on expansive or stable soils shall be designed in accordance with PTI DC-10.5.

Reason: There are currently no provisions for designing post-tensioned slabs on stable soils in IBC. The updated PTI standard, PTI DC10.5-19 has been updated to include stable soils. This title of the reference document has been changed to: PTI DC10.5-19 Standard Requirements for Design and Analysis of Shallow Concrete Foundations on Expansive and Stable Soils.

Post-tensioned slabs are commonly used on stable soils for crack control as well as reduced slab thickness and nonprestressed steel use. This reduction in material use typically offsets the cost of the post-tensioning materials and labor.

Additional documentation can be viewed at [http://ww2.post-tensioning.org/PDF_FILES/190102-DC10.5-Expansive and Stable Soils-Public Review.pdf](http://ww2.post-tensioning.org/PDF_FILES/190102-DC10.5-Expansive%20and%20Stable%20Soils-Public%20Review.pdf).

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

1907.1 General. The thickness of concrete floor slabs supported directly on the ground shall be not less than 3¹/₂ inches (89 mm). Post-tensioned concrete slabs shall be designed in accordance with PTI DC10.5. A 6-mil (0.006 inch; 0.15 mm) polyethylene vapor retarder with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other *approved* equivalent methods or materials shall be used to retard vapor transmission through the floor slab.

Exception: A vapor retarder is not required:

1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.
2. For unheated storage rooms having an area of less than 70 square feet (6.5 m²) and carports attached to occupancies in Group R-3.
3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.
4. For driveways, walks, patios and other flatwork that will not be enclosed at a later date.
5. Where *approved* based on local site conditions.

Commenter's Reason: Slab-on-ground foundations on stable and expansive soils are often post-tensioned and there is currently no design standard in the code to guide designers. The PTI DC10.5: Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundations on Expansive and Stable Soils is already referenced (Section 1808.6.2) for expansive soils and there is no parallel reference for stable soils. The added reference in this section clarifies that the standard shall be used for design of a post-tensioned concrete slab, not just for expansive soil sites.

The industry has a history of successful designs of post-tensioned slab-on-ground foundations on stable soil sites. Benefits include crack reduction, as well as reduced steel and concrete use. To demonstrate the history of post-tensioned slab-on-ground foundations, the following examples are two such regions where stable soils are common and post-tensioned slab-on-ground foundations have been successfully designed using PTI DC10.5 design principles:

1. Las Vegas, NV - one designer estimates that 50% of the post-tensioned slab-on-ground foundations constructed in the region are on stable soil sites and are designed using PTI DC10.5 design principles. Examples of slab-on-ground construction on stable sites are seen in the attached photos.

2. in the Southern US, one post-tensioning supplier reports the following statistics for slabs constructed on stable soil sites:

Projects on Stable Soil Sites - Florida Example

Year	# Contractors	#Projects	Total Project Square Footage
2014	3	10	1,113,693
2015	4	12	789,948
2016	4	23	2,640,620
2017	3	12	1,074,341
2018	4	16	1,113,693
2019 (ytd)	5	16	1,970,864

Bibliography: PTI DC10.5-19: Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundations on Expansive and Stable Soils

https://www.post-tensioning.org/publications/store/productdetail.aspx?ItemID=DC105&Language=English&Units=US_AND_METRIC

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Post-tensioned slabs are commonly used on expansive and stable soils for crack control as well as reduced slab thickness and nonprestressed steel use. This reduction in material use typically offsets the cost of the post-tensioning materials and labor.

2018 International Building Code

Delete and substitute as follows:

~~**2109.2.4.8 Exterior finish.** Exterior walls constructed of unstabilized adobe units shall have their exterior surface covered with not fewer than two coats of Portland cement plaster having a minimum thickness of $\frac{3}{4}$ inch (19.1 mm) and conforming to ASTM C926. Lathing shall comply with ASTM G1063. Fasteners shall be spaced at 16 inches (406 mm) on center maximum. Exposed wood surfaces shall be treated with an approved wood preservative or other protective coating prior to lath application.~~

2109.2.4.8 Exterior finish. Exterior finishes applied to adobe masonry walls shall be of any type permitted by this code, and shall comply with the provisions of this section and with Chapter 14, except where stated otherwise in this section.

Add new text as follows:

2109.2.4.8.1 Purpose, and type. Unstabilized adobe masonry walls shall be finished on their exterior with a plaster of any type in this section to provide protection from weather in accordance with this code.

2109.2.4.8.2 Vapor retarders and vapor permeance. Class I and II vapor retarders shall not be used on any adobe masonry wall, nor shall any other material be used that has a vapor permeance rating of less than 5 perms.

2109.2.4.8.3 Plaster thickness and coats. Plaster applied to adobe masonry shall be not less than 7/8" (22 mm) and not greater than 2 inches (51 mm) thick. Plaster shall be applied in not less than two coats.

2109.2.4.8.4 Plaster application. Plaster shall be applied directly to adobe masonry walls without any type of membrane to facilitate transpiration of moisture from the masonry units, and to secure a mechanical bond between the masonry and plaster.

2109.2.4.8.5 Lath for plaster. Lath shall be provided for all plasters, except as otherwise not required in this section. Fasteners shall be spaced at 16 inches (406mm) on center maximum. Metal lath shall comply with ASTM C1063, as modified by this section, and shall be corrosion resistant. Plastic lath shall comply with ASTM C1788, as modified by this section.

2109.2.4.8.6 Cement plaster. Cement plaster shall conform to ASTM C926 and shall comply with Chapter 25, except that the proportion of lime in plaster coats shall not be less than 1 part lime to 6 parts cement to allow a minimum acceptable vapor permeability. The combined thickness of plaster coats shall not be more than 1 inch (25mm).

West Conshohocken PA 19428-2959

C1788-14: Standard Specification for Non Metallic Plaster Bases (Lath) Used with Portland Cement Based Plaster in Vertical Wall Applications

Reason: Even more than wood frame or conventional masonry structures, adobe walls require vapor permeable finishes to ensure appropriate performance and service life; moisture that is trapped within adobe wall assemblies can cause failures due to finish separation, salt attack, coving and freeze-thaw related spalling. Although it is accepted that earthen walls require vapor permeable finishes to adequately manage moisture in the assembly and prevent various structural and finish pathologies, existing code language remains based on legacy language that predates current building science. Notably, while stabilized adobes do not require any exterior finishes, unstabilized adobes are required to be finished with conventional cement stucco, a finishing system that without modification has been shown to be insufficiently permeable. Research has shown that simply increasing the lime proportion in ordinary cement plasters can increase vapor permeability to acceptable levels.

Other comments related to this proposal:

- *Necessity: Unstabilized adobe masonry walls are subject to erosion from precipitation. As most of Section 2109 presumes that adobe masonry is used in structural applications, protective finishes are required to prevent structural failures from erosion, coving, and freeze/thaw related spalling.*
- *It is accepted that earthen building materials require exterior finishes that are vapor permeable in order to facilitate drying from moisture that may enter the wall assembly through roof or finish defects, condensation, plumbing failures, flooding, and capillary action from adjacent construction. In the presence of moisture and in the absence of vapor permeable finishes, earthen wall systems are subject to failure due to loss of integrity of the clay/sand matrix, liquification and/or salt-attack. (ASTM E2392)*

- **Plaster Thickness:** The 7/8" minimum thickness requirement is identical to one that has existed successfully in the New Mexico Earthen Building Materials Code. Limits on the maximum thickness of applied plasters are required to ensure that the applied renders are securely bonded to the substrate. The New Mexico Earthen Building Materials Code includes no limit on the thickness of plasters; the 2" maximum proposed here is identical to that currently existing in IRC Appendix S.
- **Vapor Retarders:** Class I and II vapor retarders are prohibited here as they are effectively impermeable, having perm ratings of less than 1.
- **Minimum Perm Rating:** Although in many cases higher permeability would be desirable, for purposes of this proposal a minimum perm rating of 3.5 has been established as it allows the use of a 1:1:6 lime amended cement stucco with an applied siloxane water repellent (3.54 perms at 41 mm of thickness per Straube). 1:1:6 stuccos are applied with the same methods as 1:3 stuccos, at similar cost, and have similar durability. Surface applied siloxane based water repellents are effective at inhibiting water infiltration through plaster skins and desired by industry.
- **Direct application is required** as intermediate substrates may inhibit the beneficial outward movement of moisture, and introduces questions of mechanical attachment that cannot adequately be addressed within the scope of this proposal.
- **Metallic laths** are conventionally used for Portland cement based plasters. Requirements and conditions for their use need to be provided.
- **ASTM C 1063:** "Installation of Lathing and Furring to Receive Interior and Exterior Portland Cement-Based Plaster". This is the reference standard used elsewhere in the IBC to describe the material and practice requirements for the installation of metallic lathing.
- **ASTM C926:** This Standard Specification for the Application of Cement Stucco is the accepted reference standard for the materials and practices associated with cement stuccos.
- **Lime requirement:** Complimentary to the minimum vapor permeability requirements, this section requires lime to be added to cement stuccos. The constituents of conventional cement stuccos sometimes vary but are typically 1 part cement to 3 parts sand; based on Straube, this formulation yielded only 0.68 perms. The formulation proposed by this section yields 5.13 perms at 35 mm in thickness, or 3.54 perms at 41 mm of thickness when treated with siloxane, providing adequate (but not optimal) permeability while retaining desirable durability characteristics and application procedures of conventional cement stuccos. In both cases, permeability exceeds 5 perms at a 25mm (conventional applied thickness)
- **Maximum Thickness:** Limits on the thickness of applied plasters are required to ensure that the applied renders are securely bonded to the substrate. the 1 1/2" maximum proposed here is identical to that currently existing in IRC Appendix S, the 1" maximum for cement based plasters is required to achieve permeability of greater than 5 perms.
- **Vapor Permeability of various finishes (per Straube):**

Cost Impact: The code change proposal will decrease the cost of construction

In most cases, the proposed code language expands the options available to design professionals and contractors for the finishing of adobe wall systems without additional cost impact. The inclusion of earthen plasters in particular cases will decrease the cost of construction for some projects.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM C1788-14, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

2109.2.4.8 Exterior finish. Exterior finishes applied to adobe masonry walls shall be of any type permitted by this code and shall comply with the provisions of this section and or with Chapter 14, except where stated otherwise in this section.

2109.2.4.8.1 Purpose, and type Where required. Unstabilized adobe masonry walls shall be finished on their exterior with a plaster of any type in this section to provide protection from weather. receive a weather protective exterior finish in accordance with this code Section 2109.2.4.8.

2109.2.4.8.2 Vapor retarders and v Vapor permeance. ~~Glass I and II vapor retarders shall not be used on any adobe masonry wall, nor shall any other material be used that has a vapor permeance rating of less than 5 perms.~~ Plaster and finish assemblies shall have a vapor permeance of not less than 5 perms.

Exception: Insulation products applied to the exterior of stabilized adobe masonry walls in Climate Zones 2B, 3B, 4B and 5B shall have no vapor permeance requirement.

2109.2.4.8.3 Plaster thickness and coats. Plaster applied to adobe masonry shall be not less than 7/8" (22 mm) and not greater than 2 inches (51 mm) thick. Plaster shall be applied in not less than two coats.

2109.2.4.8.4 Plaster application. ~~Plaster shall be~~ Where plaster is applied directly to adobe masonry walls, no intermediate membrane shall be used, any type of membrane to facilitate transpiration of moisture from the masonry units, and to secure a mechanical bond between the masonry

and plaster.

2109.2.4.8.5 Lath for plaster. Lath shall be provided for all plasters, except ~~as otherwise where not required elsewhere in this section~~ Section 2019.2.4.8. Fasteners shall be corrosion resistant and spaced at a maximum of 16 inches (406mm) on center maximum with a minimum 1-1/2 inches (38 mm) penetration into the adobe wall. Metal lath shall comply with ASTM C1063, as modified by this section, and shall be corrosion resistant. Plastic lath shall comply with ASTM C1788, as modified by this section. Wood substrates shall be protected with #15 asphalt felt, an approved wood preservative or other protective coating prior to lath application.

2109.2.4.8.6 Cement plaster. Cement plaster shall conform to ASTM C926 and shall comply with Chapter 25, except that the proportion of lime in plaster coats shall not be less than 1 part lime to 6.4 parts cement ~~to allow a minimum acceptable vapor permeability.~~ The combined thickness of cement plaster coats shall not ~~be more than~~ exceed 1 inch (25mm).

Commenter's Reason: Proposal S156-19 was the first of a set of four proposals addressing finishes on adobe walls. This set of proposals was intended to address a serious flaw in the existing provisions related to the permeance of finishes on adobe walls, as well as add needed provisions for all finishes, and provide an appropriate place in the section for the addition of the finishes proposed in the following three proposals that were ultimately approved by the Committee.

Three factors resulted S156 being disapproved. Two were the result of confusion that was evident as the Committee heard proposal S156. The third was the result of concerns about wording specific to the proposal, which is addressed by this public comment.

First was the decision to separate these changes into four separate proposals, with the intention of making sure that the paramount concern, the permeance issue was addressed in S156, regardless of the potential outcome for the newly proposed plaster types that were in the other three proposals. Ironically, the outcome was the opposite when S156 was disapproved.

Second was the result of formatting and section numbering changes in the cdpACCESS process that made the four proposals appear as separate and independent from each other, rather than as S156 clearly being the overarching section under which the new sections for lime plasters, lime-cement plasters, and clay plasters proposed and approved in S157, S158, and S159 would exist. For clarity, we have included below, how the entire Adobe finishes section would appear if this public comment is approved, including the sections already approved from proposals S157-19, S158-19, and S159-19.

Third, were the Committee's specific concerns about language that needed improvement, resulting in S156 being disapproved. As the other three proposals were heard, greater clarity emerged about both the importance of addressing the permeance issue and added requirements for finishes, and the need for the structure that S156 provided for the other proposals. The Committee approved the other three proposals as submitted, in part to strengthen the case for approval of a public comment on S156. There were strong recommendations from committee members about the importance of addressing the permeance issue for finishes.

The specific changes made in response to the committee's comments are:

- eliminating ambiguity and removing language that was essentially commentary,
- clarifying language related to plaster thickness, permeance, substrates, the lathing exception, and the protection of wood substrates.
- clarifying language related to plaster thickness, permeance, substrates, the lathing exception, and the protection of wood substrates. An exception was added to allow less permeable insulation products in response to input from industry. Impermeable insulation products applied over asphalt-emulsion stabilized adobe walls have been used successfully for over thirty years in low humidity regions of the western United States. Their continued use is important to achieve energy code compliance until vapor permeable insulation products suitable for use beneath plaster or other finishes become readily available.

Note: In the Committee Reason for their vote to disapprove this proposal, there is mention of these provisions possibly being more suited for an appendix. Mention of an appendix was entirely the result of the mistaken comment of a person testifying in support having said these provisions were in an appendix. When it was pointed out that the Adobe provisions have been in the body of the IBC from the very first version, the person apologized and asked the Committee to disregard that part of his testimony. Nothing in the proposal, nor in other testimony or direct discussion among the Committee recommended moving this section to an appendix.

Background

Like traditional solid masonry walls, adobe masonry walls require vapor permeable finishes to ensure appropriate performance and service life. Moisture that is trapped within adobe wall assemblies behind impermeable finishes can lead to failures such as finish separation, salt attack, coving and freeze-thaw related spalling, and in extreme cases, structural collapse. Although this is widely known, existing language allowing non-permeable cement plasters remains in the code based on legacy language that predates current building science. Notably, while the current code does not require an exterior finish for stabilized adobe walls, it requires that unstabilized adobe walls be finished with conventional cement stucco, a finishing system that, without the modifications in this public comment, is vapor impermeable.

This proposal includes the addition of language for permeable finishes and is informed by code provisions and guidance from the 2015 *New Mexico*

Earthen Building Materials Code, ASTM E2392-10 Standard Guide for Design of Earthen Wall Building Systems, and IRC Committee approved changes for the 2021 IRC Appendix S - Strawbale Construction.

For overall clarity about how the four proposals (S156-19, S157-19, S158-19, and S159-19) were intended to relate to each other, below is how full Adobe Finishes section would look renumbered, and including the changes proposed in this public comment as well as those from the already approved proposals listed above, which are shown *italicized*:

2109.2.4.8 Exterior finish. Exterior finishes applied to adobe masonry walls shall be of any type permitted by this section or Chapter 14, except where stated otherwise in this section.

2109.2.4.8.1 Where required. Unstabilized adobe masonry walls shall receive a weather protective exterior finish in accordance with Section 2109.2.4.8.

2109.2.4.8.2 Vapor permeance. Plaster and finish assemblies shall have a vapor permeance of not less than 5 perms.

Exception: Insulation products applied to the exterior of stabilized adobe masonry walls in Climate Zones 2B, 3B, 4B and 5B shall have no vapor permeance requirement.

2109.2.4.8.3 Plaster thickness and coats. Plaster applied to adobe masonry shall be not less than 7/8" (22 mm) and not greater than 2 inches (51 mm) thick. Plaster shall be applied in not less than two coats.

2109.2.4.8.4 Plaster application. Where plaster is applied directly to adobe masonry walls, no intermediate membrane shall be used.

2109.2.4.8.5 Lath for plaster. Lath shall be provided for all plasters, except where not required elsewhere in section 2109.2.4.8. Fasteners shall be corrosion resistant and spaced at a maximum of 16 inches (406mm) on center with a minimum 1-1/2 inches (38 mm) penetration into the adobe wall. Metal lath shall comply with ASTM C1063, as modified by this section, and shall be corrosion resistant. Plastic lath shall comply with ASTM C1788, as modified by this section. Wood substrates shall be treated with #15 asphalt felt, an *approved* wood preservative or other protective coating prior to lath application.

2109.2.4.8.6 Cement plaster. Cement plaster shall conform to ASTM C926 and comply with Chapter 25, except that the proportion of lime in plaster coats shall not be less than 1 part lime to 4 parts cement. The combined thickness of cement plaster coats shall not exceed 1 inch (25 mm).

2109.2.4.8.7 Lime Plaster. *Lime plaster is any plaster with a binder composed of calcium hydroxide, including Type N or S hydrated lime, hydraulic lime, natural hydraulic lime, or slaked quicklime. Hydrated lime shall comply with ASTM C206. Hydraulic lime shall comply with ASTM C1707. Natural hydraulic lime shall comply with ASTM C141 and EN 459. Quicklime shall comply with ASTM C5.*

2109.2.4.8.8 Cement-lime plaster. *Cement-lime plaster shall be any plaster mix type CL, F or FL, as described in ASTM C926.*

2109.2.4.8.9 Clay Plaster. *Clay plaster shall comply with this section.*

2109.2.4.8.9.1 General. *Clay plaster shall be any plaster having a clay or clay subsoil binder. Such plaster shall contain sufficient clay to fully bind the aggregate, and shall be permitted to contain reinforcing fibers. Acceptable reinforcing fibers include chopped straw, sisal, and animal hair.*

2109.2.4.8.9.2 Clay subsoil requirements. *The suitability of clay subsoil shall be determined in accordance with the Figure 2 Ribbon Test and the Figure 3 Ball Test in the appendix of ASTM E2392/E2392M.*

2109.2.4.8.9.3 Weather exposed locations. *Clay plaster exposed to water from direct or wind-driven rain, or snow, shall be finished with an approved erosion-resistant finish. The use of clay plasters shall not be permitted on weather exposed parapets.*

2109.2.4.8.9.4 Prohibited finish coat. *Plaster containing Portland cement shall not be permitted as a finish over clay plaster.*

2109.2.4.8.9.5 Conditions where lathing is not required. *For unstabilized adobe walls finished with unstabilized clay plaster, lathing shall not be required.*

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposed change has no impact on the cost of construction. In most cases, the proposed code language expands the options available to design professionals and contractors for the finishing of adobe wall systems without additional cost impact.

S162-19

IBC: SECTION 2209, 2209.2, 2209.3 (New), 2209.4 (New), 2209.5 (New), MHI Chapter 35 (New)

Proposed Change as Submitted

Proponents: Paul Armstrong, MHI, representing MHI

2018 International Building Code

Revise as follows:

SECTION 2209 STEEL STORAGE RACKS MATERIAL HANDLING STRUCTURES

2209.1 Storage racks. The design, testing and utilization of *storage racks* made of cold-formed or hot-rolled steel structural members shall be in accordance with RMI ANSI/MH 16.1. Where required by ASCE 7, the seismic design of *storage racks* shall be in accordance with Section 15.5.3 of ASCE 7.

2209.2 Cantilevered steel storage racks. The design, testing, and utilization of cantilevered storage racks made of cold-formed or hot-rolled steel structural members shall be in accordance with RMI ANSI/MH 16.3. Where required by ASCE 7, the seismic design of cantilevered steel storage racks shall be in accordance with Section 15.5.3 of ASCE 7.

Add new text as follows:

2209.3 Industrial boltless steel shelving. The design and utilization of industrial boltless steel shelving shall be in accordance with ANSI/MH28.2.

2209.4 Industrial steel work platforms The design and utilization of industrial steel work platforms shall be in accordance with ANSI/MH28.3.

2209.5 Stairs, ladders and guards. The design and utilization of stairs, ladders and open edge guards for use with material handling structures shall be in accordance with ANSI/MH32.1.

MH28.2-2018: Design, Testing and Utilization of Industrial Boltless Steel Shelving

MHI

Material Handling Institute
8720 Red Oak Blvd. Suite 201
Charlotte NC 28217

MH32.1-2018: Stairs, Ladders, and Open-Edge Guards for Use with Material Handling Structures

Reason: SMA has developed new standards for the design, testing and installation of both steel work platforms and boltless steel shelving structures. They are ANSI accredited now and are included for review.

Cost Impact: The code change proposal will decrease the cost of construction

These standards will reduce the cost of construction by providing a uniform set of code regulations for the design and installation of such structures. Currently the imposed regulations seem to change based on the jurisdiction and/or plan reviewer.

Staff Analysis: A review of the standard proposed for inclusion in the code, MHI MH28.2-2018, MH28.3-2018 and MH32.1-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

S162-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Proponent requested disapproval. The committee felt the proposed list was incomplete and possibly being proposed for the wrong place in the code. (Vote: 10-4)

Assembly Action:

None

S162-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 2209.3 (New), 2209.4 (New)

Proponents:

Paul Armstrong, MHI, representing MHI (paul.armstrong@pacodeservices.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

2209.3 Industrial boltless steel shelving. The design and utilization of industrial boltless steel shelving shall be in accordance with ANSI/MH28.2 as amended by 2209.3.1 through 2209.3.3.

2209.3.1 Section 1.1. Modify Section 1.1, by adding a concluding paragraph as follows: "Designers are cautioned when doing seismic design to obtain more detailed information, amendments and changes to adopted codes, including applicable design ground motions to use for design, by contacting the local jurisdiction where the racks are to be installed".

2209.3.2 Section 4.6.2. Modify Section 4.6.2, by replacing the web site reference from <http://earthquake.usgs.gov/designmaps/us/application.php> to <http://www.seaoc.org/page/seismicdesignmaptool>.

2209.3.3 Section 4.6.6. Modify Section 4.6.6, by replacing b) to read as follows: "b) when the loss of seismic-resistance capacity in a single beam, post, or brace does not result in more than a 33% reduction in required seismic-resistance capacity of the structure (in the cross-aisle direction, this typically requires a minimum of two back-to-back rows interconnected); and".

2209.4 Industrial steel work platforms The design and utilization of industrial steel work platforms shall be in accordance with ANSI/MH28.3 as amended by 2209.4.1 and 2209.4.2

2209.4.1 Section 1.1. Modify Section 1.1, by adding a concluding paragraph as follows: "Designers are cautioned when doing seismic design to obtain more detailed information, amendments and changes to adopted codes, including applicable design ground motions to use for design, by contacting the local jurisdiction where the racks are to be installed".

2209.4.2 Section 4.6.3. Modify Section 4.6.3, by adding the following paragraph after "i) = 8 for a special moment frame.", "The use of any of the above listed 'R' values is permissible provided that the seismic detailing requirements per AISC 341-16 are followed for the selected seismic force-resisting system (does not apply to those force-resisting systems not design to resist seismic loads). Detailing requirements for structural systems not specifically detailed for seismic resistance are found in AISC 360-16. Platforms not specifically detailed for seismic resistance using an R = 3 per ASCE 7 Table 12.2-1 are restricted to Seismic Design Categories A, B and C.

Commenter's Reason: During the Code Development Committee Hearings, feedback was received from FEMA's Seismic Code Support Committee. Unfortunately, there wasn't enough time at the hearings to development a modification. This Public Comment has been developed with their input from the hearings and subsequent conference calls. It was agreed that a few other items would be reviewed and considered for the next edition of each standard.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This just provides design standards for the systems identified in each standard.

Public Comment# 2058

S165-19

IBC: 2303.1.9, 2303.1.9.3 (New), 2303.2, 2303.2.5, 2306.1.3

Proposed Change as Submitted

Proponents: David P Tyree, American Wood Council, representing American Wood Council (dtyree@awc.org); Paul Coats, representing American Wood Council (pcoats@awc.org)

2018 International Building Code

2303.1.9 Preservative-treated wood. Lumber, timber, plywood, piles and poles supporting permanent structures required by Section 2304.12 to be preservative treated shall conform to AWPA U1 and M4. Lumber and plywood used in permanent wood foundation systems shall conform to Chapter 18.

Add new text as follows:

2303.1.9.3 Strength Adjustments. Design values for preservative-treated wood in accordance with Section 2303.1.9 do not need adjustment for the type of preservative used. Other adjustments in accordance with AWC NDS shall apply. Load duration factors for structural members pressure-treated with water-borne preservatives shall not exceed 1.6.

Revise as follows:

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* is any wood product that, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E84 or UL 723, a *listed* flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 10¹/₂ feet (3200 mm) beyond the centerline of the burners at any time during the test.

2303.2.5 Strength adjustments. Design values for untreated lumber and wood structural panels, as specified in Section 2303.1, shall be adjusted for *fire-retardant-treated wood*. Adjustments to design values, including fastener values, shall be based on an *approved* method of investigation that takes into consideration the effects of the anticipated temperature and humidity to which the *fire-retardant-treated wood* will be subjected, the type of treatment and redrying procedures. Other adjustments in accordance with AWC NDS shall apply. Load duration factors for structural members pressure-treated with fire retardant chemicals shall not exceed 1.6.

Delete without substitution:

~~**2306.1.3 Treated wood stress adjustments.** The allowable unit stresses for *preservative-treated wood* need not be adjusted for treatment, but are subject to other adjustments.~~

~~The allowable unit stresses for *fire-retardant-treated wood*, including fastener values, shall be developed from an *approved* method of investigation that considers the effects of anticipated temperature and humidity to which the *fire-retardant-treated wood* will be subjected, the type of treatment and the redrying process. Other adjustments are applicable except that the impact load duration shall not apply.~~

Reason: Section 2306.1.3 is redundant with Section 2303.2.5 and can be deleted. Location of design value information in 2303.2.5 as opposed to 2306 on Allowable Stress Design is preferable as information in 2305 is generally applicable and addresses use for both ASD and LRFD. Portions of 2306.1.3 not addressed by 2303.2.5 are moved to 2303.2.5 and a new section (2303.1.9.3) on strength adjustments for preservative treated wood. Additional description of specific revisions follows:

Section 2303.1.9.3. Sentence 1 clarifies that no adjustment is associated with the type of preservative used. The second sentence is consistent with AWC NDS Table 2.3.2 in which load duration adjustment is not to exceed 1.6 for structural members pressure treated with water-borne preservatives and is a smaller adjustment than the factor of 2.0 associated with impact load duration.

Section 2303.2.5. The second sentence is consistent with AWC NDS Table 2.3.2 in which load duration adjustment is not to exceed 1.6 for structural members pressure treated with fire-retardant chemicals and is a smaller adjustment than the factor of 2.0 associated with impact load duration.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Clarification of current requirements and referenced standards.

S165-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee expressed apprehension that the proposal had not been vetted and coordinated throughout the industry.

Individual Consideration Agenda

Public Comment 1:

IBC®: 2303.1.9, 2303.1.9.3 (New), 2303.2, 2303.2.5, 2306.1.3

Proponents:

Christopher Athari, representing Hoover Treated Wood Products (cathari@frtw.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

2303.1.9 Preservative-treated wood. Lumber, timber, plywood, piles and poles supporting permanent structures required by Section 2304.12 to be preservative treated shall conform to AWPAC U1 and M4. Lumber and plywood used in permanent wood foundation systems shall conform to Chapter 18.

2303.1.9.3 Strength Adjustments. Design values for preservative-treated wood in accordance with Section 2303.1.9 do not need adjustment for the type of preservative used. Other adjustments in accordance with AWC NDS shall apply. Load duration factors for structural members pressure-treated with water-borne preservatives shall not exceed 1.6.

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* is any wood product that, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E84 or UL 723, a *listed* flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 10¹/₂ feet (3200 mm) beyond the centerline of the burners at any time during the test.

2303.2.5 Strength adjustments. Design values for untreated lumber and wood structural panels, as specified in Section 2303.1, shall be adjusted for *fire-retardant-treated wood*. Adjustments to design values, including fastener values, shall be based on an *approved* method of investigation that takes into consideration the effects of the anticipated temperature and humidity to which the *fire-retardant-treated wood* will be subjected, the type of treatment and redrying procedures. ~~Other adjustments in accordance with AWC NDS shall apply. Load duration factors for structural members pressure-treated with fire-retardant chemicals shall not exceed 1.6.~~ Duration of load factors, except impact load duration, in accordance AWC NDS shall apply.

2306.1.3

Treated wood stress adjustments.

Commenter's Reason: The reason statement implied that no technical changes were intended. The submission did include technical changes. This comment brings the language from 2306.1.3 into the section for FRTW.using the last sentence in the section and alerting the user to other load duration factors in the NDS.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction Updating for new material.

Public Comment# 1686

Public Comment 2:

IBC®: 2303.2.5, 2303.2.5.1, 2303.2.5.2

Proponents:

Jason Smart, American Wood Council, representing American Wood Council (jsmart@awc.org)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

2303.2.5 Strength adjustments. Design values for ~~untreated~~ fire-retardant-treated lumber and wood structural panels ~~shall be determined using published design values and adjustments for untreated lumber and wood structural panels, as specified in Section 2303.1, shall be adjusted for fire-retardant-treated wood elsewhere in this chapter, and further adjusted to account for the effects of treatment.~~ Adjustments ~~to design values for the effects of treatment~~ shall be based on an *approved* method of investigation that takes into consideration the effects of the anticipated temperature and humidity to which the *fire-retardant-treated wood* will be subjected, the type of treatment and redrying procedures.

2303.2.5.1 Wood structural panels. The effect of treatment, ~~and~~ the method of redrying after treatment, and any treatment-based degradation due to exposure to high temperatures and high humidities on the flexure properties of fire-retardant-treated softwood plywood shall be determined in accordance with ASTM D5516. The test data developed by ASTM D5516 shall be used to develop treatment adjustment factors, maximum loads and spans, or both, for untreated plywood design values in accordance with ASTM D6305. Each manufacturer shall publish the allowable maximum loads and spans for service as floor and roof sheathing for its treatment.

2303.2.5.2 Lumber. For each species of wood that is treated, the effects of the treatment, the method of redrying after treatment, and any treatment-based degradation due to exposure to high temperatures and high humidities on the allowable design properties of fire-retardant-treated lumber shall be determined in accordance with ASTM D5664. The test data developed by ASTM D5664 shall be used to develop modification treatment adjustment factors for use at or near room temperature and at elevated temperatures and humidity in accordance with ASTM D6841. Each manufacturer shall publish the modification factors for service at temperatures of not less than 80° F (27° C) and for roof framing. The roof framing modification factors shall take into consideration the climatological location.

Commenter's Reason: Section 2303.2.5 is revised to clarify that design values for fire-retardant-treated wood products are based on design values for untreated wood products that have been adjusted for end-use conditions in accordance with Chapter 23 provisions and also adjusted to account for the effect of the fire-retardant treatment. This clarification aligns with ASTM D5664/D6841 for lumber and ASTM D5516/D6305 for plywood. In both cases, the FRT adjustment factors isolate the additional effect of the fire-retardant treatment, but do not address how the constituent untreated wood materials themselves need to be adjusted for typical application conditions. For this reason, design values for FRT wood products must be adjusted by factors that are applicable to untreated wood as well as the treatment adjustment factors.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The revisions in this public comment simply provide a clarification of what is already required for designs utilizing fire-retardant-treated wood products.

Public Comment# 2012

Public Comment 3:

IBC®: 2303.1.9, 2303.1.9.3 (New), 2303.2, 2303.2.5, 2303.2.5.1, 2303.2.5.2, 2306.1.3

Proponents:

Jason Smart, American Wood Council, representing American Wood Council (jsmart@awc.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

2303.1.9 Preservative-treated wood. Lumber, timber, plywood, piles and poles supporting permanent structures required by Section 2304.12 to be preservative treated shall conform to AWPAC U1 and M4. Lumber and plywood used in permanent wood foundation systems shall conform to Chapter 18.

2303.1.9.3 Strength Adjustments. ~~Design values for preservative-treated wood in accordance with Section 2303.1.9 do not need adjustment for the type of preservative used. Other adjustments in accordance with AWC NDS shall apply. Load duration factors for structural members pressure-treated with water-borne preservatives shall not exceed 1.6.~~

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* is any wood product that, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E84 or UL 723, a *listed* flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 10^{1/2} feet (3200 mm) beyond the centerline of the burners at any time during the test.

2303.2.5 Strength adjustments. Design values for ~~untreated~~ fire-retardant-treated lumber and wood structural panels shall be determined using

~~published design values and adjustments for untreated lumber and wood structural panels, as specified in Section 2303.1, shall be adjusted for fire-retardant-treated wood elsewhere in this chapter, and further adjusted to account for the effects of treatment. Adjustments to design values, including fastener values, for the effects of treatment shall be based on an approved method of investigation that takes into consideration the effects of the anticipated temperature and humidity to which the fire-retardant-treated wood will be subjected, the type of treatment and redrying procedures. Other adjustments in accordance with AWC NDS shall apply. Load duration factors for structural members pressure-treated with fire retardant chemicals shall not exceed 1.6.~~

2303.2.5.1 Wood structural panels. The effect of treatment, ~~and~~ the method of redrying after treatment, and any treatment-based degradation due to exposure to high temperatures and high humidities on the flexure properties of fire-retardant-treated softwood plywood shall be determined in accordance with ASTM D5516. The test data developed by ASTM D5516 shall be used to develop treatment adjustment factors, maximum loads and spans, or both, for untreated plywood design values in accordance with ASTM D6305. Each manufacturer shall publish the allowable maximum loads and spans for service as floor and roof sheathing for its treatment.

2303.2.5.2 Lumber. For each species of wood that is treated, the effects of the treatment, the method of redrying after treatment, and any treatment-based degradation due to exposure to high temperatures and high humidities on the allowable design properties of fire-retardant-treated lumber shall be determined in accordance with ASTM D5664. The test data developed by ASTM D5664 shall be used to develop modification treatment adjustment factors for use at or near room temperature and at elevated temperatures and humidity in accordance with ASTM D6841. Each manufacturer shall publish the modification factors for service at temperatures of not less than 80°F (27°C) and for roof framing. The roof framing modification factors shall take into consideration the climatological location.

2306.1.3 Treated wood stress adjustments. The allowable unit stresses for preservative treated wood need not be adjusted for treatment, but are subject to other adjustments.

The allowable unit stresses for fire-retardant-treated wood, including fastener values, shall be developed from an approved method of investigation that considers the effects of anticipated temperature and humidity to which the fire-retardant-treated wood will be subjected, the type of treatment and the redrying process. Other adjustments are applicable except that the impact load duration shall not apply.

Commenter's Reason: Section 2303.1.9.3, which was proposed as a new section in S165-19, is removed by this public comment. The net result is that no changes are proposed under Section 2303.1.9, based on the 2018 IBC.

Section 2303.2.5 is revised to clarify that design values for fire-retardant-treated wood products are based on design values for untreated wood products that have been adjusted for end-use conditions in accordance with Chapter 23 provisions and also adjusted to account for the effect of the fire-retardant treatment. This clarification aligns with ASTM D5664/D6841 for lumber and ASTM D5516/D6305 for plywood. In both cases, the FRT adjustment factors isolate the additional effect of the fire-retardant treatment, but do not address how the constituent untreated wood materials themselves need to be adjusted for typical application conditions. For this reason, design values for FRT wood products must be adjusted by factors that are applicable to untreated wood as well as the treatment adjustment factors.

Section 2306.1.3, which was proposed for deletion in S165-19, is reinstated by this public comment. The net result is that no changes are proposed to Section 2306.1.3, based on the 2018 IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The revisions in this public comment simply provide a clarification of what is already required for designs utilizing fire-retardant-treated wood products.

Public Comment# 2040

Proposed Change as Submitted

Proponents: Marcelo M Hirschler, GBH International, representing GBH International (mmh@gbhint.com)

2018 International Building Code

Revise as follows:

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* is any wood product that, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E84 or UL 723, a *listed* flame spread index of 25 or less ~~and show no evidence of significant progressive combustion when the test is continued~~ Additionally, the ASTM E84 or UL 723 test shall be continued for an additional 20-minute period. ~~Additionally, and~~ the flame front shall not progress more than 10½ feet (3200 mm) beyond the centerline of the burners at any time during the ~~test~~ extended 30-minute test.

Reason: This issue has been under discussion for many years at the ICC codes, as well as at ASTM and at NFPA, but can now be resolved in the IBC code. Fire test labs have been surveyed and they all agree that there are only two fire test requirements: a flame spread index of not more than 25 in the standard ASTM E84 test and a flame front that does not progress more than 10½ feet beyond the centerline of the burners when the ASTM E84 test is extended for a total test time of 30 minutes.

The ASTM E5 committee, responsible for ASTM E84, has now, for the first time, accepted incorporating requirements for conducting a 30 minute test. Until this change ASTM E84 did not contain any information other than that it is a 10 minute test. Consequently, until this change ASTM E84 did not provide any details on how to assess either "no evidence of significant progressive combustion" or "the flame front shall not progress more than 10½ feet (3200 mm) beyond the centerline of the burners". The information for how to determine both of those characteristics is contained in ASTM E2768. The committee agreed that the next edition of ASTM E84 will state that a 30 minute test is to be conducted per ASTM E2768. In turn, ASTM E2768 explains that "no significant progressive combustion" is evidenced by lack of flame front progress beyond 10 1/2 feet. In fact ASTM E2768 states: "The flame front shall not progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the 30 min test period. This is considered evidence of no significant progressive combustion in this test method." This IBC proposal incorporates the requirements from the ASTM E84 test into the IBC and ensures that the code does not require a duplicate (and confusing) measurement.

It is likely that information will be presented stating that "no significant progressive combustion" has been in the code since the legacy codes and that the flame front progress requirement was added later. That is exactly the reason that ASTM E2768 was developed to ensure that everyone understands what is to be measured, and that is what the testing laboratories have been doing for many years now.

This change appears to alter requirements but in fact simply recognizes what the ASTM E84 standard states and what the labs are doing (and have been doing for years) and, therefore, is really clarification.

The committee E05 (on fire standards) agreed at the December 2018 meeting that the scope of ASTM E84 should read as follows:

1. Scope

1.1 This fire-test-response standard for the comparative surface burning behavior of building materials is applicable to exposed surfaces such as walls and ceilings. The test is conducted with the specimen in the ceiling position with the surface to be evaluated exposed face down to the ignition source. The material, product, or assembly shall be capable of being mounted in the test position during the test. Thus, the specimen shall either be self-supporting by its own structural quality, held in place by added supports along the test surface, or secured from the back side.

1.2 Test Method E84 is a 10-minute fire-test response method. The following standards address testing of materials in accordance with test methods that are applications or variations of the test method or apparatus used for Test Method E84:

1.2.1 Materials required by the user to meet an extended 30-min duration tunnel test shall be tested per Test Method E2768.

1.2.2 Wires and cables for use in air-handling spaces shall be tested per NFPA 262.

1.2.3 Pneumatic tubing for control systems shall be tested per UL 1820.

1.2.4 Combustible sprinkler piping shall be tested per UL 1887.

1.2.5 Optical fiber and communications raceways for use in air handling spaces shall be tested per UL 2024.

1.3 The purpose of this test method is to determine the relative burning behavior of the material by observing the flame spread along the specimen. Flame spread and smoke developed index are reported. However, there is not necessarily a relationship between these two measurements.

1.4 The use of supporting materials on the underside of the test specimen has the ability to lower the flame spread index from those which might be obtained if the specimen could be tested without such support. These test results do not necessarily relate to indices obtained by testing materials without such support.

1.5 Testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place.

1.6 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.7 The text of this standard references notes and footnotes that provide explanatory information. These notes and footnotes, excluding those in tables and figures, shall not be considered as requirements of the standard.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal recognizes what the fire test labs have been doing for years and what ASTM committee E05 has recently agreed to do in the scope of ASTM E84.

S166-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

2018 International Building Code

2303.2 Fire-retardant-treated wood. *Fire-retardant-treated wood* is any wood product that, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E84 or UL 723, a *listed* flame spread index of 25 or less. Additionally, the ASTM E84 or UL 723 test shall be continued for an additional 20-minute period and the flame front shall not progress more than 10½ feet (3200 mm) beyond the centerline of the burners at any time during the ~~extended 30-minute test~~.

Committee Reason: The committee felt that the proposal cleaned up the language and makes the code consistent with current test methods. The modification simplified the language. (Vote: 11-2)

Individual Consideration Agenda

Public Comment 1:

Proponents:

David Tyree, representing American Wood Council (dtyree@awc.org)

requests As Modified by Committee

Commenter's Reason: As recommended by the Code Development Committee at the Committee Action Hearings, this change cleans up and simplifies the language of 2303.2, while making it more consistent with the referenced test methods.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Proposal represents a simple cleaning up of existing language.

Public Comment# 1678

Public Comment 2:

Proponents:

Manny Muniz, representing Representing self (mannymuniz.mm@gmail.com)

requests Disapprove

Commenter's Reason: This proposal is similar to RB255-19 which was disapproved by a vote of 11-0. The residential committee disapproved that proposal for several reasons and stated ***"The proposal has a lower safety standard. There was a debate on the technical justification in testing. The standard in the reason statement, ASTM E05, is not referenced in the ICC."***

The lower safety standard is the deletion of a 55-year-old prescriptive requirement for showing *"no evidence of significant progressive combustion"* following the test. Such a deletion is arbitrary as there was no testing done to see if safety was being lowered. That's why it was disapproved.

The Structural committee reason statement stated *"The committee felt that the proposal cleaned up the language and makes the code consistent with current test methods. The modification simplified the language."*

Making the code consistent with current test methods, as stated in the structural committee reason, is backwards as to how you change a prescriptive requirement in the code. If, in fact, a test lab felt that **"showing no evidence of significant progressive combustion"** following the test is equivalent to the additional prescriptive requirement that **"the flame front shall not progress more than 10 ½ feet beyond the centerline of the burners at any time during the test"**, they should have performed tests to support their theory and submitted a code change to ICC with that substantiation.

Instead, a code consultant representing GBH International (fire test equipment & consulting services) is the one submitting this with no substantiation. That should be a huge red flag. You just don't delete a 55-year-old prescriptive test requirement without showing why the deletion is scientifically justified.

If you combine the total votes of both committees who heard these two proposals, there was a total of 13 votes to disapprove and 11 to approve. A historical review of the requirement for fire-retardant-treated wood may be helpful.

Requirements for Fire-retardant-treated wood first appeared in the 1964 UBC and required testing for 30 minutes in the "Tunnel Test", have a flame spread of not over 25 and show no evidence of progressive combustion.

Then, 24 years later, in the 1988 UBC, the 10.5 ft flame front limitation was added ***"To maintain the same level of performance of the material achieved under the previous flame spread calculation method."***

It is important to note that the 10.5 ft flame front limitation is evaluated during the 30-minute test whereas "progressive combustion" is evaluated at the end of the 30-minute test. Similar language is contained in the International Wildland Urban Interface Code for ignition-resistant building material (503.2, 1.1 & 503.2.1.2).

"1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall not show evidence of progressive combustion following the extended 30-minute test."

1.2. Flame front. Material shall exhibit a flame front that does not progress more than 10 ½ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test."

The proponent has previously stated that he and others did not understand what was meant by "Significant progressive combustion" even though it's been in the code for 55 years.

"Combustion" is not defined in the IBC, the IFC or the IRC, but we all understand what constitutes combustion.

"Progressive" is what it means, combustion that progresses or continues following the 30-minute test.

"Significant", while subjective, appears 9 times in the IRC, 8 times in the IBC and 5 times in the IFC.

Keep in mind that ASTM E2768, where this all originated from with the claim that the prescriptive "**showing no evidence of significant progressive combustion**" is equivalent to the additional prescriptive requirement that "**the flame front shall not progress more than 10 ½ feet beyond the centerline of the burners at any time during the test**", has previously been disapproved in two previous code cycles and was not adopted by the Admin Committee during the current 2019 code cycle.

Overturning this proposal is necessary to be consistent with what the International Residential Code Committee-Building did when it unanimously voted (11-0) to disapprove the proposed deletion of significant progressive combustion (RB255-19) without scientific justification.

Overturning this proposal will maintain the current prescriptive requirements that Fire-retardant-treated wood as well as Ignition-resistant building materials must both show no evidence of significant progressive combustion (IBC 2303.2 and IWUIC 503.2).

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No change to code.

Public Comment# 1895

S167-19

IBC: 2303.2.3, 2303.3.2.3.1 (New)

Proposed Change as Submitted

Proponents: Marcelo M Hirschler, GBH International, representing GBH International (mmh@gbhint.com)

2018 International Building Code

Revise as follows:

2303.2.3 Testing. ~~For wood products produced by other means during manufacture, other than a pressure process, all sides fire retardant treated wood products the front and back faces of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to test only the front and back faces.~~

Add new text as follows:

2303.2.3.1 Fire testing of wood structural panels Wood structural panels shall be tested with a ripped or cut longitudinal gap of 1/8 inch (3.2 mm).

Reason: Note that the sections above require that fire retardant treated wood be "impregnated with chemicals" and provide permanent protection. That requirement applies to all FRTW products, whether produced by a pressure process or produced by other means during manufacture. Section 2303.2.2 is also explicit in stating that the use of paints or coatings is not an approved method to comply with this section. This proposal thus eliminates the requirement to test a particular type of fire retardant treated wood on "all sides", since the testing is never actually conducted on all sides (as pointed out often by multiple testifiers in previous code cycles) because all sides really means front and back (you literally cannot test the edges in the ASTM E84 other than by putting multiple edge pieces into the tunnel to make up the 24 feet by 2 feet specimen). In order to test "all sides" of a lumber product it would be necessary to fasten 864 small pieces together to make one specimen, which is not realistic. The proposed new subsection will add fire safety because it recognizes an issue that was highlighted in the previous code cycle, and was also brought up in committee ASTM E05 and at the IWUIC: wood structural panels are typically installed in the field following industry practice. Industry recommendations for wood structural panels require a gap to accommodate dimensional changes caused by swelling due to changing moisture conditions. Therefore, installation in the field requires cutting and ripping of the panels and this results in the creation of "non-factory edges". Therefore, it is important to test wood structural panels with a rip or gap to ensure that the required fire test results from the charging paragraph are achieved when the interior of the panel is exposed.

Note that the IWUIC requires such a rip or gap for ignition resistant structural panels, and it sends FRTW products to this IBC section.

Cost Impact: The code change proposal will increase the cost of construction

This proposal will add fire safety and will require more testing for wood structural panels. The proposal will also require more testing for other FRTW products manufactured by a pressure process but apparently less testing for FRTW products that are manufactured by other means, except that typically just the front and back faces are tested anyway.

S167-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

2018 International Building Code

2303.2.3 Testing. ~~For fire retardant treated wood products the front and back faces of the wood product shall be tested in accordance with and produce the results required in Section 2303.2.~~

2303.2.3.1 Fire testing of wood structural panels. ~~Wood structural panels shall be tested with a ripped or cut longitudinal gap of 1/8 inch (3.2 mm).~~

Committee Reason: The proposed new subsection will add fire safety because it recognizes an issue that was highlighted in the previous code cycle, and was also brought up in committee ASTM E05 and at the IWUIC: wood structural panels are typically installed in the field following industry practice. The modification deletes unnecessary testing and therefore provides 'a level playing field'. (Vote: 11-3)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

IBC®: 2303.2.3,

2303.2.3.1

(New)

Proponents:

Christopher Athari, representing Hoover Treated Wood Products (cathari@frtw.com)

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

2303.2.3 Testing. For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to test only the front and back faces.

2303.2.3.1

Fire testing of wood structural panels. Wood structural panels shall be tested with a ripped or cut longitudinal gap of 1/8".

Commenter's Reason: 2303.2.3 is necessary to ensure that products products products by methods that are not produced by a pressure process are equivalent to materials that are. It is needed to maintain life safety.

The 1/8" gap is representative of how the product is actually installed in the field.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Returning language to code.

Public Comment# 1689

Public Comment 2:

IBC®: 2303.2.3

Proponents:

Christopher Athari, representing Hoover Treated Wood Products (cathari@frtw.com)

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

2303.2.3 Fire Testing Of Wood Structural Panels Wood structural panels shall be tested with a ripped or cut longitudinal gap of 1/8" (3.2 mm).

Commenter's Reason: The 1/8" gap is representative of how the product is installed and used in the field and products should be tested accordingly.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No cost impact, clarifying test conditions

Public Comment# 1694

Public Comment 3:

Proponents:

David Tyree, representing American Wood Council (dtyree@awc.org)

requests As Modified by Committee

Commenter's Reason: AWC supports the Committee-recommended modification. Section 2303.2 already addresses testing and performance requirements for FRTW produced either by a pressure process or by other means during manufacture, so the testing provisions of Section 2303.2.3 are redundant and unnecessary. Furthermore, the fact that Section 2303.2.3 is applicable only to FRTW produced by other means during manufacture creates a potential for double-standards when compared to the requirements for FRTW produced by a pressure process. Deletion of 2303.2.3 will remove these redundant provisions and help to ensure a 'level playing field' between FRTW product types.

With regards to the proposed new Section 2303.2.3.1, specific provisions regarding testing should be addressed in the applicable consensus-based test standard, rather than in the code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Testing provisions already addressed in code and therefore are redundant and unnecessary.

Public Comment# 1680

36. 7/8" – 1"	8d common (2½" × 0.131"); or 8d deformed (2½" × 0.131"); or deformed 2½" × 0.120"	6	12
37. 1 1/8" – 1¼"	10d common (3" × 0.148"); or 8d deformed (2½" × 0.131"); or deformed 2½" × 0.120"	6	12
Panel siding to framing			
38. 1/2" or less	6d corrosion-resistant siding (1 7/8" × 0.106"); or 6d corrosion-resistant casing (2" × 0.099")	6	12
39. 5/8"	8d corrosion-resistant siding (2 3/8" × 0.128"); or 8d corrosion-resistant casing (2½" × 0.113")	6	12
Wood structural panels (WSP), subfloor, roof and interior wall sheathing to framing and particleboard wall sheathing to framing ^a			
		Edges (inches)	Intermediate supports (inches)
Interior paneling			
40. 1/4"	4d casing (1½" × 0.080"); or 4d finish (1½" × 0.072")	6	12
41. 3/8"	6d casing (2" × 0.099"); or 6d finish (2" × 0.092") (Panel supports at 24 inches)	6	12

For SI: 1 inch = 25.4 mm.

- a. Nails spaced at 6 inches at intermediate supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.
- b. Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).
- c. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.
- d. RSRS-01 is a Roof Sheathing Ring Shank nail meeting the specifications in ASTM F1667.

Reason: IBC Table 2304.10.1 and IRC Table R602.3(1) are essentially the same table in structural connections 1 through 39. Although the descriptions are closely align, there are fasteners prescribed in the IBC table that are not in the IRC table and fasteners prescribed in the IRC table that are not in the IBC table.

This proposal is written to harmonize the fasteners between the two tables. In addition, where additional information exists in one table and not the other, this too is being harmonized.

For connections # 2,6,18,19, 20 & 23 there was a code change proposal RB272-13 entered in by the American Wood Council and adopted for the 2015 IRC. The reference nail values for the nailing schedule in these connections were based on Reference Lateral Values and Reference Withdrawal values. All other connections in the table were based on Reference Lateral Design Values. In the 2018 NDS, the reference withdrawal values for stainless steel nails were tabulated in a new NDS table (12.2D). The withdrawal values for stainless steel are lower than the values for carbon steel (bright or galvanized) nails of equivalent diameters.

As such, the lower stainless steel withdrawal values combined with the publication date of the 2018 NDS and the 2015 code proposal date would indicate that the basis of the original code proposal is relevant to only carbon steel nails and not to stainless steel nails. The added note to these connections is to exclude stainless steel from these connections based on the lower withdrawal values.

Connection 1:

Added 8d box nails to match IRC R602.3(1)

Connection 2:

Added note regarding stainless steel fasteners

Added 8d box nails from IRC R602.3(1)

Connection 6:

Added note regarding stainless steel fasteners

Changed Fastener Spacing and Location note to match IRC R602.3(1)

Connection 7:

Added 16d Box nails to match IRC R602.3(1)

Connection 11

Added 8d Box nails to match IRC R602.3(1)

Connection 13

Added 16d Box nails to match IRC R602.3(1)

Connection 16

Added 16d Box and 8d Box nails to match IRC R602.3(1)

Connection 18

Added note regarding stainless steel fasteners

Added 8d Box nails to match IRC R602.3(1)

Connection 19

Added note regarding stainless steel fasteners

Added 8d Box nails to match IRC R602.3(1)

Added 16 gage staples to match IRC R602.3(1)

Connection 20

Added note regarding stainless steel fasteners

Added 8d Box nails to match IRC R602.3(1)

Added 16 gage staples to match IRC R602.3(1)

Added subcategory "wider than 1" x 8" to match IRC R602.3(1)

Connection 21

Added 8d Box nails to match IRC R602.3(1)

Connection 22

Added a subcategory of 4' o.c. to match IRC R602.3(1)

Connection 23

Added note regarding stainless steel fasteners

Added 8d Box nails to match IRC R602.3(1)

Added 16 gage staples to match IRC R602.3(1)

Connection 24

Added 16d box nails to match IRC R602.3(1)

Changed Spacing and Location notation to match IRC R602.3(1)

Connection 25

Added 16d box nails to match IRC R602.3(1)

Connection 27

Added 16d box nails to match IRC R602.3(1)

Connection 30:

All 6 and 12 subfloor and wall fasteners were moved into one line

Connection 31:

The description **6d deformed (2" x 0.113")** is an incorrect description. ASTM F1667 does not have a classification for 6d deformed nails. The correct description is deformed (2" x 0.113")

Connection 32:

The description **8d deformed (2" x 0.131")** is an incorrect description. ASTM F1667 does not have a classification for 8d deformed nails. The correct description is deformed (2½" x 0.131")

Connections 33 & 34:

The current nail description is incomplete and is missing a shank diameter. Addition of the diameters match AWC SDPWS

Connections 35:

The description **6d deformed (2" x 0.113")** is an incorrect description. ASTM F1667 does not have a classification for 6d deformed nails. The correct description is deformed (2" x 0.113")

Connection 36 & 37:

The description **8d deformed (2" x 0.131")** is an incorrect description. ASTM F1667 does not have a classification for 8d deformed nails. The correct description is deformed (2½" x 0.131")

Connection 41:

Dimension of a 6d finish nail has been added to be consistent

Cost Impact: The code change proposal will not increase or decrease the cost of construction listing of additional fasteners should have no effect on cost of construction

S174-19

Public Hearing Results

Committee Action:**As Modified****Committee Modification:****2018 International Building Code****TABLE 2304.10.1****FASTENING SCHEDULE**

DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER ^e	SPACING AND LOCATION
Roof		
1. Blocking between ceiling joists, rafters or trusses to top plate or other framing below	4-8d box (2½" x 0.113"); or 3-8d common (2½" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Each end, toenail
Blocking between rafters or truss not at the wall top plate, to rafter or truss	2-8d common (2½" x 0.131") 2-3" x 0.131" nails 2-3" 14 gage staples	Each end, toenail
	2-16d common (3½" x 0.162") 3-3" x 0.131" nails 3-3" 14 gage staples	End nail
Flat blocking to truss and web filler	16d common (3½" x 0.162") @ 6 o.c. 3" x 0.131" nails @ 6 o.c. 3" 14 gage staples @ 6 o.c	Face nail
2. Ceiling joists to top plate	4-8d box (2½" x 0.113") 3-8d common (2½" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown Stainless Steel Fasteners are not applicable in this connection	Each joist, toenail
3. Ceiling joist not attached to parallel rafter, laps over partitions (no thrust) (see Section 2308.7.3.1, Table 2308.7.3.1)	3-16d common (3½" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Face nail
4. Ceiling joist attached to parallel rafter (heel joint) (see Section 2308.7.3.1, Table 2308.7.3.1)	Per Table 2308.7.3.1	Face nail

DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION
5. Collar tie to rafter	3-10d common (3" x 0.148"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, $\frac{7}{16}$ " crown	Face nail
6. Rafter or roof truss to top plate (See Section 2308.7.5, Table 2308.7.5)	3-10 common (3" x 0.148"); or 3-16d box ($3\frac{1}{2}$ " x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, $\frac{7}{16}$ " crown Stainless Steel Fasteners are not applicable in this connection	2 toenails on one side and 1 toenail on opposite side of rafter or truss ^c
7. Roof rafters to ridge valley or hip rafters; or roof rafter to 2-inch ridge beam	2-16d common ($3\frac{1}{2}$ " x 0.162"); or 3-16d box ($3\frac{1}{2}$ " x 0.135") or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, $\frac{7}{16}$ " crown	End nail
	3-16d common ($3\frac{1}{2}$ " x 0.148"); or 4-16d box ($3\frac{1}{2}$ " x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, $\frac{7}{16}$ " crown	Toenail
Wall		
8. Stud to stud (not at braced wall panels)	16d common ($3\frac{1}{2}$ " x 0.162");	24 o.c. face nail

9. Stud to stud and abutting studs at intersecting wallcorners (at braced wall panels)	16d common ($3\frac{1}{2}$ " x 0.162"); or	16 o.c. face nail
	16d box ($3\frac{1}{2}$ " x 0.135"); or 3" x 0.131" nails; or 3-3" 14 gage staples, $\frac{7}{16}$ " crown	12 o.c. face nail
	3" x 0.131" nails; or 3-3" 14 gage staples, $\frac{7}{16}$ " crown	12 o.c. face nail
10. Built-up header (2 to 2 header)	16d common ($3\frac{1}{2}$ " x 0.162"); or	16 o.c. each edge, face nail
	16d box ($3\frac{1}{2}$ " x 0.135")	12 o.c. each edge, face nail
11. Continuous header to stud	4-8d common ($2\frac{1}{2}$ " x 0.131"); or 4-10d box (3" x 0.128"); or 5-8d box ($2\frac{1}{2}$ " x 0.113")	Toenail
12. Top plate to top plate	16d common ($3\frac{1}{2}$ " x 0.162"); or	16 o.c. face nail
	10d box (3" x 0.128"); or 3" 0.131" nails; or 3" 14 gage staples, $\frac{7}{16}$ " crown	12 o.c. face nail
13. Top plate to top plate, at end joints	8-16d common ($3\frac{1}{2}$ " x 0.162"); or 12-16d box ($3\frac{1}{2}$ " x 0.135"); or 12-10d box (3" x 0.128); or 12-3" x 0.131 nails; or 12-3" 14 gage staples, $\frac{7}{16}$ " crown	Each side of end joint, face nail (minimum 24" lap splice length each side of end joint)
14. Bottom plate to joist, rim joist, band joist or blocking (not at braced wall panels)	16d common ($3\frac{1}{2}$ " x 0.162"); or	16 o.c. face nail
	16d box ($3\frac{1}{2}$ " x 0.135"); or 3" x 0.131" nails; or 3" 14 gage staples, $\frac{7}{16}$ " crown	12 o.c. face nail
15. Bottom plate to joist, rim joist, band joist or blocking at braced wall panels	2-16d common ($3\frac{1}{2}$ " x 0.162"); or 3-16d box ($3\frac{1}{2}$ " x 0.135); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, $\frac{7}{16}$ " crown	16 o.c. face nail
16. Stud to top or bottom plate	3-16d box ($3\frac{1}{2}$ " x 0.135"); or 4-8d common ($2\frac{1}{2}$ " x 0.131"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131"; or 4-8d box ($2\frac{1}{2}$ " x 0.113" nails; or 4-3" 14 gage staples, $\frac{7}{16}$ " crown	Toenail
	2-16d common ($3\frac{1}{2}$ " x 0.162"); or 3-16d box ($3\frac{1}{2}$ " x 0.135"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, $\frac{7}{16}$ " crown	End nail
17. Top plates, laps at corners and intersections	2-16d common ($3\frac{1}{2}$ " x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, $\frac{7}{16}$ " crown	Face nail
18. 1 brace to each stud and plate	3-8d box ($2\frac{1}{2}$ " x 0.113"); or 2-8d common ($2\frac{1}{2}$ " x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, $\frac{7}{16}$ " crown	Face nail
	Stainless Steel Fasteners are not applicable in this connection	
19. 1 6 sheathing to each bearing	3-8d box ($2\frac{1}{2}$ " x 0.113"); or 2-8d common ($2\frac{1}{2}$ " x 0.131"); or 2-10d box (3" x 0.128"); or 2-1 $\frac{3}{4}$ " 16 gage staples, 1" crown	Face nail
	Stainless Steel Fasteners are not applicable in this connection	

DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION	
20. 1 8 and wider sheathing to each bearing	3-8d common (2½"x 0.131"); or 3-8d box (2½" x 0.113"); or 3-2-10d box (3" x 0.128") or 3-1¾" 16 gage staples, 1" crown	Face nail	
	Stainless Steel Fasteners are not applicable in this connection		
	Wider than 1" x 8"		
	3-8d common (2½" x 0.131"); or 4-8d box (2½" x 0.113"); or 3-10d box (3" x 0.128"); or 4-1¾" 16 gage staples, 1" crown		
	Stainless Steel Fasteners are not applicable in this connection		
Floor			
21. Joist to sill, top plate, or girder	4 8d box (2½" x 0.113");or 3-8d common (2½" x 0.131"); or floor 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Toenail	
22. Rim joist, band joist, or blocking to top plate,sill or other framing below	4-8d box (2½" x 0.113")	4" o.c. toenail	
	8d common (2½" x 0.131); or 10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	6 o.c., toenail	
23. 1 6 subfloor or less to each joist	3-8d box (2½" x 0.113") or 2-8d common (2½" x 0.131); or 3-10d box (3" x 0.128"); or 2-1¾" 16 gage staples 1" crown	Face nail	
	Stainless Steel Fasteners are not applicable in this connection		
24. 2 subfloor to joist or girder	3-16d box (3½" x 0.135"); or 2-16d common (3½" x 0.162")	Blind and Face nail	
25. 2 planks (plank & beam floor & roof)	3-16d box (3½" x 0.135"); or 2-16d common (3½" x 0.162")	Each bearing, face nail	
26. Built-up girders and beams, 2 lumber layers	20d common (4" x 0.192")	32 o.c., face nail at top and bottom staggered on opposite sides	
	10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	24 o.c. face nail at top and bottom staggered on opposite sides	
	And: 2-20d common (4" x 0.192"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Ends and at each splice, face nail	
27. Ledger strip supporting joists or rafters	3-16d common (3½" x 0.162"); or 4-16d box (3½" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Each joist or rafter, face nail	
28. Joist to band joist or rim joist	3-16d common (3½" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	End nail	
29. Bridging or blocking to joist, rafter or truss	2-8d common (2½" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16" crown	Each end, toenail	
Wood structural panels (WSP), subfloor, roof and interior wall sheathing to framing and particleboard wall sheathing to framing ^a			
		Edges (inches)	Intermediate supports (inches)
30. 3/8 1/2	6d common or deformed (2" x 0.113"); or 23/8" x 0.113" (subfloor and wall)	6	12
	8d common or deformed (2½ x 0.131" x 0.281" head) (roof) or RSRS-01 (23/8" x 0.113") nail (roof) ^d		
	1¾" 16 gage staple, 7/16" crown (subfloor and wall)	4	8
	23/8" x 0.113" x 0.266" head nail (roof)	4	8
	1¾" 16 gage staple, 7/16" crown (roof)	3	6
	8d common (2½" x 0.131"); or deformed (2" x 0.113")(subfloor and wall)	6	12

DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION	
	8d common or deformed (2 ¹ / ₂ " x 0.131" <u>x 0.281" head</u>) (roof) or RSRS-01 (2 ³ / ₈ " x 0.113") nail (roof) ^d	6	12
	2 ³ / ₈ " x 0.113" <u>x 0.266" head</u> nail; or 2" 16 gage staple, ⁷ / ₁₆ " crown	4	8
32. 7/8 1 ¹ / ₄	10d common (3" x 0.148"); or deformed (2 ¹ / ₂ " x 0.131" <u>x 0.281" head</u>)	6	12
Other exterior wall sheathing			
33. 1/2 fiberboard sheathing ^b	1 ¹ / ₂ x 0.120" galvanized roofing nail (⁷ / ₁₆ " head diameter); or 1 ¹ / ₄ " 16 gage staple with ⁷ / ₁₆ " or 1" crown	3	6
34. 25/32 fiberboard sheathing ^b	1 ³ / ₄ " x 0.120" galvanized roofing nail (⁷ / ₁₆ " diameter head); or 1 ¹ / ₂ " 16 gage staple with ⁷ / ₁₆ " or 1" crown	3	6
Wood structural panels, combination subfloor underlayment to framing			
35. 3/4 and less	8d common (2 ¹ / ₂ " x 0.131"); or deformed (2" x 0.113"); or deformed 2" x 0.120"	6	12
36. 7/8 1	8d common (2 ¹ / ₂ " x 0.131"); or deformed (2 ¹ / ₂ " x 0.131")	6	12
37. 1 ¹ / ₈ 1 ¹ / ₄	10d common (3" x 0.148"); or deformed (2 ¹ / ₂ " x 0.131"); or deformed 2 ¹ / ₂ " x 0.120"	6	12
Panel siding to framing			
38. 1/2 or less	6d corrosion-resistant siding (1 ⁷ / ₈ " x 0.106"); or 6d corrosion-resistant casing (2" x 0.099")	6	12
39. 5/8	8d corrosion-resistant siding (2 ³ / ₈ " x 0.128"); or 8d corrosion-resistant casing (2 ¹ / ₂ " x 0.113")	6	12
Wood structural panels (WSP), subfloor, roof and interior wall sheathing to framing and particleboard wall sheathing to framing^a			
		Edges (inches)	Intermediate supports (inches)
Interior paneling			
40. 1/4	4d casing (1 ¹ / ₂ " x 0.080); or 4d finish (1 ¹ / ₂ " x 0.072")	6	12
41. 3/8	6d casing (2" x 0.099"); or 6d finish 2" x 0.092" (Panel supports at 24 inches)	6	12

For SI: 1 inch = 25.4 mm.

a. Nails spaced at 6 inches at intermediate supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.

b. Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).

c. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.

d. RSRS-01 is a Roof Sheathing Ring Shank nail meeting the specifications in ASTM F1667.

e. Nails and staples are carbon steel meeting the specifications of ASTM F1667

Committee Reason: This proposal harmonizes the IBC table with the IRC table. The modification provided coordination with the latest NDS standard (especially for stainless steel fasteners) (Vote: 14-0)

Assembly Action:

None

**TABLE 2304.10.1
FASTENING SCHEDULE**

DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER _e	SPACING AND LOCATION
Roof		
1. Blocking between ceiling joists, rafters or trusses to top plate or other framing below	4-8d box (2½" x 0.113"); or 3-8d common (2½" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Each end, toenail
Blocking between rafters or truss not at the wall top plate, to rafter or truss	2-8d common (2½" x 0.131") 2-3" x 0.131" nails 2-3" 14 gage staples	Each end, toenail
	2-16 d common (3½" x 0.162") 3-3" x 0.131" nails 3-3" 14 gage staples	End nail
Flat blocking to truss and web filler	16d common (3½" x 0.162") @ 6" o.c. 3" x 0.131" nails @ 6" o.c. 3" x 14 gage staples @ 6" o.c	Face nail
2. Ceiling joists to top plate	4-8d box (2½" x 0.113"); or 3-8d common (2½" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Each joist, toenail
3. Ceiling joist not attached to parallel rafter, laps over partitions (no thrust) (see Section 2308.7.3.1, Table 2308.7.3.1)	3-16d common (3½" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Face nail
4. Ceiling joist attached to parallel rafter (heel joint) (see Section 2308.7.3.1, Table 2308.7.3.1)	Per Table 2308.7.3.1	Face nail
5. Collar tie to rafter	3-10d common (3" x 0.148"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Face nail
6. Rafter or roof truss to top plate (See Section 2308.7.5, Table 2308.7.5)	3-10 common (3" x 0.148"); or 3-16d box (3½" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131 nails; or 4-3" 14 gage staples, 7/16" crown	2 toenails on one side and 1 toenail on opposite side of rafter or truss ^c
7. Roof rafters to ridge valley or hip rafters; or roof rafter to 2-inch ridge beam	2-16d common (3½" x 0.162"); or 3-16d box (3½" x 0.135"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown; or	End nail
	3-10d common (3½" x 0.148"); or 4-16d box (3½" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Toenail
Wall		
8. Stud to stud (not at braced wall panels)	16d common (3½" x 0.162");	24" o.c. face nail
	10d box (3" x 0.128"); or 3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	16" o.c. face nail
9. Stud to stud and abutting studs at intersecting wallcorners (at braced wall panels)	16d common (3½" x 0.162")	16" o.c. face nail
	16d box (3½" x 0.135"); or	12" o.c. face nail or 3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown
10. Built-up header (2" to 2" header)	16d common (3½" x 0.162")	16" o.c. each edge, face nail
	16d box (3½" x 0.135")	12" o.c. each edge, face nail
11. Continuous header to stud	4-8d common (2½" x 0.131"); or 4-10d box (3" x 0.128"); or 5-8d box (2½" x 0.113)	Toenail
12. Top plate to top plate	16d common (3½" x 0.162")	16" o.c. face nail
	10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	12" o.c. face nail
13. Top plate to top plate, at end joints	8-16d common (3½" x 0.162"); or 12-16d box (3½" x 0.135"); or 12-10d box (3" x 0.128"); or 12-3" x 0.131" nails; or 12-3" 14 gage staples, 7/16" crown	Each side of end joint, face nail (minimum 24" lap splice length each side of end joint)
14. Bottom plate to joist, rim joist, band joist or blocking (not at braced wall panels)	16d common (3½" x 0.162")	16" o.c. face nail
	16d box (3½" x 0.135"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	12" o.c. face nail

	1/16" crown		
15. Bottom plate to joist, rim joist, band joist or blocking at braced wall panels	2-16d common (3½" x 0.162"); or 3-16d box (3½" x 0.135"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	16" o.c. face nail	
16. Stud to top or bottom plate	3-16d box (3½" x 0.135"); or 4-8d common (2½" x 0.131"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-8d box (2½" x 0.113"); or 4-3" 14 gage staples, 7/16" crown; or	Toenail	
	2-16d common (3½" x 0.162"); or 3-16d box (3½" x 0.135"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	End nail	
17. Top plates, laps at corners and intersections	2-16d common (3½" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Face nail	
18. 1" brace to each stud and plate	3-8d box (2½" x 0.113"); or 2-8d common (2½" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16" crown	Face nail	
19. 1" x 6" sheathing to each bearing	3-8d box (2½" x 0.113"); or 2-8d common (2½" x 0.131"); or 2-10d box (3" x 0.128"); or 2-1¾ 16 gage staples, 1" crown	Face nail	
20. 1" x 8" and wider sheathing to each bearing	3-8d common (2½" x 0.131"); or 3-8d box (2½" x 0.113"); or 2-10d box (3" x 0.128"); or 3-1¾" 16 gage staples, 1" crown	Face nail	
	Wider than 1" x 8"		
	3-8d common (2½" x 0.131"); or 4-8d box (2½" x 0.113"); or 3-10d box (3" x 0.128"); or 4-1¾" 16 gage staples, 1" crown		
	Stainless Steel Fasteners are not applicable in this connection		
Floor			
21. Joist to sill, top plate, or girder	4-8d box (2½" x 0.113"); or 3-8d common (2½" x 0.131"); or floor 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Toenail	
22. Rim joist, band joist, or blocking to top plate, sill or other framing below	4-8d box (2½" x 0.113)	4" o.c. toenail	
	8d common (2½" x 0.131"); or 10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	6" o.c., toenail	
23. 1" x 6" subfloor or less to each joist	3-8d box (2½" x 0.113"); or 2-8d common (2½" x 0.131"); or 3-10d box (3" x 0.128"); or 2-1¾" 16 gage staples 1" crown	Face nail	
24. 2 subfloor to joist or girder	3-16d box (3½x 0.135"); or 2-16d common (3½" x 0.162")	Blind and Face nail	
25. 2" planks (plank & beam – floor & roof)	3-16d box (3½: x 0.135"); or 2-16d common (3½" x 0.162")	Each bearing, face nail	
26. Built-up girders and beams, 2" lumber layers	20d common (4" x 0.192")	32" o.c., face nail at top and bottom staggered on opposite sides	
	10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	24" o.c. face nail at top and bottom staggered on opposite sides	
	And: 2-20d common (4" x 0.192"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Ends and at each splice, face nail	
27. Ledger strip supporting joists or rafters	3-16d common (3½" x 0.162"); or 4-16d box (3½" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Each joist or rafter, face nail	
28. Joist to band joist or rim joist	3-16d common (3½" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	End nail	
29. Bridging or blocking to joist, rafter or truss	2-8d common (2½" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16" crown	Each end, toenail	
Wood structural panels (WSP), subfloor, roof and interior wall sheathing to framing and particleboard wall sheathing to framing ^a			
		Edges (inches)	Intermediate supports (inches)

Wood structural panels (WSP), subfloor, roof and interior wall sheathing to framing and particleboard wall sheathing to framing ^a			
		Edges (inches)	Intermediate supports (inches)
Interior paneling			
40. $\frac{1}{4}$ "	4d casing ($1\frac{1}{2}$ " x 0.080"); or 4d finish ($1\frac{1}{2}$ " x 0.072")	6	12
41. $\frac{3}{8}$ "	6d casing (2" x 0.099"); or 6d finish (2" x 0.092") (Panel supports at 24 inches)	6	12

For SI: 1 inch = 25.4 mm.

- Nails spaced at 6 inches at intermediate supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.
- Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).
- Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.
- RSRS-01 is a Roof Sheathing Ring Shank nail meeting the specifications in ASTM F1667.
- Nails and staples are carbon steel meeting the specifications of ASTM F1667. Connections using nails and staples of other materials or dimensions, such as stainless steel, shall be designed by accepted engineering practice or approved under Section 104.11.

Commenter's Reason: This public comment adds language to new footnote e in order to further clarify that the code change proposal, as approved at the CAH, deletes stainless steel nails and staples from this table. The added language is proposed because it is feared that users of the code will easily miss this change, and not necessarily understand that stainless steel is not carbon steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The public comment provides clarification of provisions only.

**TABLE 2304.10.1
FASTENING SCHEDULE**

DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER	SPACING AND LOCATION
Roof		
1. Blocking between ceiling joists, rafters or trusses to top plate or other framing below	4-8d box (2½" x 0.113"); or 3-8d common (2½" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Each end, toenail
Blocking between rafters or truss not at the wall top plate, to rafter or truss	2-8d common (2½" x 0.131") 2-3" x 0.131" nails 2-3" 14 gage staples	Each end, toenail
	2-16 d common (3½" x 0.162") 3-3" x 0.131" nails 3-3" 14 gage staples	End nail
Flat blocking to truss and web filler	16d common (3½" x 0.162") @ 6" o.c. 3" x 0.131" nails @ 6" o.c. 3" x 14 gage staples @ 6" o.c	Face nail
2. Ceiling joists to top plate	4-8d box (2½" x 0.113"); or 3-8d common (2½" x 0.131"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Each joist, toenail
3. Ceiling joist not attached to parallel rafter, laps over partitions (no thrust) (see Section 2308.7.3.1, Table 2308.7.3.1)	3-16d common (3½" x 0.162"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Face nail
4. Ceiling joist attached to parallel rafter (heel joint) (see Section 2308.7.3.1, Table 2308.7.3.1)	Per Table 2308.7.3.1	Face nail
5. Collar tie to rafter	3-10d common (3" x 0.148"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Face nail
6. Rafter or roof truss to top plate (See Section 2308.7.5, Table 2308.7.5)	3-10 common (3" x 0.148"); or 3-16d box (3½" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131 nails; or 4-3" 14 gage staples, 7/16" crown	2 toenails on one side and 1 toenail on opposite side of rafter or truss ^c
7. Roof rafters to ridge valley or hip rafters; or roof rafter to 2-inch ridge beam	2-16d common (3½" x 0.162"); or 3-16d box (3½" x 0.135"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown; or	End nail
	3-10d common (3½" x 0.148"); or 4-16d box (3½" x 0.135"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	Toenail
Wall		
8. Stud to stud (not at braced wall panels)	16d common (3½" x 0.162");	24" o.c. face nail
	10d box (3" x 0.128"); or 3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	16" o.c. face nail
9. Stud to stud and abutting studs at intersecting wallcorners (at braced wall panels)	16d common (3½" x 0.162")	16" o.c. face nail
	16d box (3½" x 0.135"); or	12" o.c. face nail or 3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown
10. Built-up header (2" to 2" header)	16d common (3½" x 0.162")	16" o.c. each edge, face nail
	16d box (3½" x 0.135")	12" o.c. each edge, face nail
11. Continuous header to stud	4-8d common (2½" x 0.131"); or 4-10d box (3" x 0.128"); or 5-8d box (2½" x 0.113)	Toenail
12. Top plate to top plate	16d common (3½" x 0.162")	16" o.c. face nail
	10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	12" o.c. face nail
13. Top plate to top plate, at end joints	8-16d common (3½" x 0.162"); or 12-16d box (3½" x 0.135"); or 12-10d box (3" x 0.128"); or 12-3" x 0.131" nails; or 12-3" 14 gage staples, 7/16" crown	Each side of end joint, face nail (minimum 24" lap splice length each side of end joint)
14. Bottom plate to joist, rim joist, band joist or blocking (not at braced wall panels)	16d common (3½" x 0.162")	16" o.c. face nail
	16d box (3½" x 0.135"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	12" o.c. face nail

	1/16" crown		
15. Bottom plate to joist, rim joist, band joist or blocking at braced wall panels	2-16d common (3 1/2" x 0.162"); or 3-16d box (3 1/2" x 0.135"); or 4-3" x 0.131" nails; or 4-3" 14 gage staples, 7/16" crown	16" o.c. face nail	
16. Stud to top or bottom plate	3-16d box (3 1/2" x 0.135"); or 4-8d common (2 1/2" x 0.131"); or 4-10d box (3" x 0.128"); or 4-3" x 0.131" nails; or 4-8d box (2 1/2" x 0.113"); or 4-3" 14 gage staples, 7/16" crown; or	Toenail	
	2-16d common (3 1/2" x 0.162"); or 3-16d box (3 1/2" x 0.135"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	End nail	
17. Top plates, laps at corners and intersections	2-16d common (3 1/2" x 0.162"); or 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Face nail	
18. 1" brace to each stud and plate	3-8d box (2 1/2" x 0.113"); or 2-8d common (2 1/2" x 0.131"); or 2-10d box (3" x 0.128"); or 2-3" x 0.131" nails; or 2-3" 14 gage staples, 7/16" crown	Face nail	
19. 1" x 6" sheathing to each bearing	3-8d box (2 1/2" x 0.113"); or 2-8d common (2 1/2" x 0.131"); or 2-10d box (3" x 0.128"); or 2-1 3/4" 16 gage staples, 1" crown	Face nail	
20. 1" x 8" and wider sheathing to each bearing	3-8d common (2 1/2" x 0.131"); or 3-8d box (2 1/2" x 0.113"); or 2-10d box (3" x 0.128"); or 3-1 3/4" 16 gage staples, 1" crown	Face nail	
	Wider than 1" x 8"		
	3-8d common (2 1/2" x 0.131"); or 4-8d box (2 1/2" x 0.113"); or 3-10d box (3" x 0.128"); or 4-1 3/4" 16 gage staples, 1" crown		
	Stainless Steel Fasteners are not applicable in this connection		
Floor			
21. Joist to sill, top plate, or girder	4-8d box (2 1/2" x 0.113"); or 3-8d common (2 1/2" x 0.131"); or floor 3-10d box (3" x 0.128"); or 3-3" x 0.131" nails; or 3-3" 14 gage staples, 7/16" crown	Toenail	
22. Rim joist, band joist, or blocking to top plate, sill or other framing below	4-8d box (2 1/2" x 0.113)	4" o.c. toenail	
	8d common (2 1/2" x 0.131"); or 10d box (3" x 0.128"); or 3" x 0.131" nails; or 3" 14 gage staples, 7/16" crown	6" o.c., toenail

41. $\frac{3}{8}$ "	6d casing (2" x 0.099"); or 6d finish (2" x 0.092") (Panel supports at 24 inches)	6	12

For SI: 1 inch = 25.4 mm.

- Nails spaced at 6 inches at intermediate supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.
- Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).
- Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.
- RSRS-01 is a Roof Sheathing Ring Shank nail meeting the specifications in ASTM F1667.
- Nails and staples are carbon steel meeting the specifications of ASTM F1667. Connections using nails and staples of other materials, such as stainless steel, shall be designed by acceptable engineering practice or approved under Section 104.11.

Commenter's Reason: This public comment adds language to a new footnote e in order to clarify that the code change proposal, as approved at the CAH, deleted stainless steel nails and staples from this table. The added language is proposed because it is feared that users of the code will easily miss this change, and not necessarily understand that stainless steel is not carbon steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The proposed comment does not add additional requirements, but rather clarifies that stainless steel (and other materials) required different considerations due to the differences in strength and withdrawal characteristics. Since stainless steel is being deleted in the approval in the CAH, this comment only provides clarification and does not add any cost effects to what is already accepted.

	32	3	4	5	3	4	6	3	6	9
	48	3	5	8	3	6	9	5	9	13

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.8 N/m².

a. 40d box (5" x 0.162") or 16d sinker (3 1/4" x 0.148") nails are 10d common (3" x 0.148") nails shall be permitted to be substituted for 16d common (3 1/2" x 0.162") nails where the required number of nails is taken as 1.2 times the required number of 16d common nails.

b. Nailing requirements are permitted to be reduced 25 percent if nails are clinche

e.b. Rafter tie heel joint connections are not required where the ridge is supported by a load-bearing wall, header or ridge beam.

d.c. Where intermediate support of the rafter is provided by vertical struts or purlins to a load-bearing wall, the tabulated heel joint connection requirements are permitted to be reduced proportionally to the reduction in span.

e.d. Equivalent nailing patterns are required for ceiling joist to ceiling joist lap splices.

f.e. Connected members shall be of sufficient size to prevent splitting due to nailing.

f.f. For snow loads less than 30 pounds per square foot, the required number of nails is permitted to be reduced by multiplying by the ratio of actual snow load plus 10 divided by 40, but not less than the number required for no snow load.

g. Applies to roof live load of 20 psf or less.

h. Tabulated heel joint connection requirements assume that ceiling joists or rafter ties are located at the bottom of the attic space. Where ceiling joists or rafter ties are located higher in the attic, heel joint connection requirements shall be increased by the following factors:

H_C/H_R	Heel Joint Connection Adjustment Factor
1/3	1.5
1/4	1.33
1/5	1.25
1/6	1.2
1/10 or less	1.11

where:

H_C = Height of ceiling joists or rafter ties measured vertically above the top of the rafter support walls.

H_R = Height of roof ridge measured vertically above the top of the rafter support walls.

i. Tabulated requirements are based on 10 psf roof dead load in combination with the specified roof snow load and roof live load.

Reason: Replace Table 2308.7.3.1 to be consistent with calculation basis of 2018 Wood Frame Construction Manual (WFCM) heel joint nailing requirements based on the 2018 National Design Specification for Wood Construction (NDS) provisions for nailed connections. The reduced number of 16d common nails required in rafter tie connections, by approximately 15%, are due to changes in penetration factor and load duration assumptions from those used to develop the existing table. The existing table used a 0.77 penetration factor (based on 1991 and 1997 NDS) for 16d common nails with less than 12d penetration in the main member and a load duration factor of 1.25 for all tabulated cells. The proposed revised nailing requirements are based on use of a 1.15 load duration factor for snow cases, 1.25 load duration factor for roof live load cases, and an effective penetration factor equal to 1.0 per 2001 NDS and later editions when nail lateral value calculations are based on the actual penetration in the wood member. The ratio of nail design values for snow cases originally used to develop nailing requirements to the current nail design values for snow cases is $(Z \times 0.77 \times 1.25)/(Z \times 1.0 \times 1.15) = 0.84$ and explains the reduced number of nails required by this proposal. Due to revised nail design provisions in the NDS, the benefit of a longer nail that is clinched is no longer recognized for this application and existing footnote b is removed. A 10d common nail option is added in new footnote "a." based on NDS lateral nail calculations. The table heading clarifies the 10psf dead load basis of the tabulated nailing requirements. Also, adjustment factors for rafter tie height, consistent with WFCM and IRC, are added in footnote "h." to increase connection requirements where the rafter tie not located in the bottom of the attic space (i.e. rafter ties located at the top of the support walls).

Bibliography: 1) 2018 Wood Frame Construction Manual (WFCM) for One- and Two-Family Dwellings. American Wood Council, Leesburg, VA. 2018. <https://awc.org/pdf/codes-standards/publications/wfcm/AWC-WFCM2018-ViewOnly-1711.pdf>
2) 2018 National Design Specification (NDS) for Wood Construction. American Wood Council, Leesburg, VA. 2018. <https://awc.org/pdf/codes-standards/publications/nds/AWC-NDS2018-ViewOnly-171117.pdf>

Cost Impact: The code change proposal will decrease the cost of construction
This code change proposal utilizes fewer nails from the wood frame construction manual at less cost.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Replace Table 2308.7.3.1 to be consistent with calculation basis of 2018 Wood Frame Construction Manual (WFCM) heel joint nailing requirements based on the 2018 National Design Specification for Wood Construction (NDS) provisions for nailed connections.

1/10 or less	1.11

where:

H_C = Height of ceiling joists or rafter ties measured vertically ~~above~~ from the top of the rafter support walls to the bottom of the ceiling joists or rafter ties.

H_R = Height of roof ridge measured vertically ~~above~~ from the top of the rafter support walls to the bottom of the roof ridge.

When H_C / H_R exceeds 1/3, connections shall be designed in accordance with accepted engineering practice.

- i. Tabulated requirements are based on 10 psf roof dead load in combination with the specified roof snow load and roof live load.

Commenter's Reason: Several clarifications were suggested by the Structural Committee, and they are contained in this public comment:

1) a column heading is changed to clarify that it applies to live loads only, with a limit of 20 lbs. per footnote "g"; 2) text is added to footnote "a" to clarify that results should be rounded to the next full nail; 3) a clarifying sentence is added beneath the table in footnote "h" to clarify that rafter tie connections higher than $H_C / H_R = 1/3$ in the attic space must be engineered; and 4) the definitions of H_C and H_R are clarified to show how they should be measured.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The public comment clarifies the intent of the original proposal, which could represent some cost savings due to efficiencies in the table content, depending on application.

Proposed Change as Submitted

Proponents: Jennifer Hatfield, representing American Architectural Manufacturers Association (jen@jhatfieldandassociates.com)

2018 International Building Code

Revise as follows:

2405.1 Scope. This section applies to the installation of glass and other transparent, translucent or opaque glazing material installed at a slope of more than 15 degrees (0.26 rad) from the vertical plane, including glazing materials in skylights, roofs and sloped walls.

2405.3 Screening. ~~Where used in monolithic glazing systems, heat-strengthened and fully tempered glass shall have screens installed below the glazing material. The screens and their fastenings~~ Broken glass retention screens, where required, shall be: capable of supporting twice the weight of the glazing; firmly and substantially fastened to the framing members; and installed within 4 inches (102 mm) of the glass. The screens shall be constructed of a noncombustible material not thinner than No. 12 B&S gage (0.0808 inch) with mesh not larger than 1 inch by 1 inch (25 mm by 25 mm). In a corrosive atmosphere, structurally equivalent noncorrosive screen materials shall be used. ~~Heat-strengthened glass, fully tempered glass and wired glass, where used in multiple-layer glazing systems as the bottom glass layer over the walking surface, shall be equipped with screening that conforms to the requirements for monolithic glazing systems.~~

Exception: ~~In monolithic and multiple-layer sloped glazing systems, the following applies:~~

- ~~1. Fully tempered glass installed without protective screens where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane shall have the highest point of the glass 10 feet (3048 mm) or less above the walking surface.~~
- ~~2. Screens are not required below any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.~~
- ~~3. Any glazing material, including annealed glass, is permitted to be installed without screens in the sloped glazing systems of commercial or detached noncombustible greenhouses used exclusively for growing plants and not open to the public, provided that the height of the greenhouse at the ridge does not exceed 30 feet (9144 mm) above grade.~~
- ~~4. Screens shall not be required in individual dwelling units in Groups R-2, R-3 and R-4 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and the following conditions are met:~~
 - ~~4.1. Each pane of the glass is 16 square feet (1.5 m²) or less in area.~~
 - ~~4.2. The highest point of the glass is 12 feet (3658 mm) or less above any walking surface or other accessible area.~~
 - ~~4.3. The glass thickness is $\frac{3}{16}$ inch (4.8 mm) or less.~~

~~5. Screens shall not be required for laminated glass with a 15-mil (0.38 mm) polyvinyl butyral (or equivalent) interlayer used in individual dwelling units in Groups R-2, R-3 and R-4 within the following limits:~~

- ~~5.1. Each pane of glass is 16 square feet (1.5 m²) or less in area.~~
- ~~5.2. The highest point of the glass is 12 feet (3658 mm) or less above a walking surface or other accessible area.~~

Add new text as follows:

2405.3.1 Screens under monolithic glazing. Heat-strengthened glass, annealed glass, wired glass and fully tempered glass shall have screens installed below the full area of the glazing material.

2405.3.2 Screens under multiple-layer glazing. Heat-strengthened glass, fully tempered glass, annealed glass and wired glass, glazing used as the bottom glass layer shall have retention screens installed below the full area of the glazing material.

2405.3.3 Screens not required. For all other types of glazing complying with Section 2405.2, retention screens shall not be required.

Exception: In monolithic and multiple-layer sloped glazing systems, the following apply; which includes laminated glass with a 30-mil interlayer.

1. Fully tempered glass shall not be required to be installed with retention screens where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane, and having the highest point of the glass 10 feet (3048 mm) or less above the walking surface.
2. Retention screens shall not be required below any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.
3. Retention screens shall not be required below any glazing material, including annealed glass, the sloped glazing systems of commercial or detached noncombustible greenhouses used exclusively for growing plants and not open to the public, provided that the height of the greenhouse at the ridge does not exceed 30 feet (9144 mm) above grade.

4.Retention screens shall not be required in individual dwelling units in Groups R-2, R-3 and R-4 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and all of the following conditions are met:

4.1.Each pane of the glass is 16 square feet (1.5 m²) or less in area.

4.2.The highest point of the glass is 12 feet (3658 mm) or less above any walking surface or other accessible area.

4.3.The glass thickness is 3/16 inch (4.8 mm) or less.

5.Retention screens shall not be required for laminated glass with a 15-mil (0.38 mm) polyvinyl butyral (or equivalent) interlayer used in individual dwelling units in Groups R-2, R-3 and R-4, and both of the following conditions are met:

5.1.Each pane of glass is 16 square feet (1.5 m²) or less in area.

5.2.The highest point of the glass is 12 feet (3658 mm) or less above a walking surface or other accessible area.

Reason: The current code language that states when screens are required below unit skylights and sloped glazing, has frequently been difficult to interpret by jurisdictions, causing consumers and others great concern when they are incorrectly told they need to install a glass retention screen below conforming (30-mil interlayer) laminated glass. Skylight and sloped glazing system manufacturers are asked to intervene far too frequently to ensure that unsightly, unnecessary screens are not installed in these instances. Furthermore, it is believed that many times an optional skylight installation is removed from submitted plans due to misinterpretation at the plan check stage, where the supplier may never know that the issue was raised because the permit applicant may surrender rather than appeal.

The current code language addresses qualifying laminated glass by simple omission from the "screens required" section. It is this omission that seems to create the confusion within the industry, especially considering Exception 5, which mentions that screens may be required when non-qualifying (15-mil interlayer) laminated glass is used.

This proposed code change simply rewrites this section to state clearly that laminated glass with 30-mil interlayer does not require screens. Specifically addressing the inapplicability of screens under laminated glass in the new section 2405.3.3 should reduce the frequency of misinterpretations that have been experienced. Adding the modifier, "broken glass retention" fully describes the screen's purpose. This is to ensure readers do not confuse them with insect screens or fall protection screens, which are physically different and will not serve as effective retention screens.

None of the proposed changes affect the current code requirements; rather, the intent and only expected outcomes of this proposal are simply for better clarity and more consistent enforcement.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The proposal should have a nominal effect on the cost of construction as the changes presented are not meant to alter the current requirements but simply meant to provide better clarity and more consistent enforcement.

S190-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that, as written, the proposed reorganization of the code appears to cause more confusion than clarity.

(Vote: 13-1)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

IBC®: 2405.1, 2405.2, 2405.3

Proponents:

Jennifer Hatfield, representing American Architectural Manufacturers Association (jen@jhatfieldandassociates.com)

requests As Modified by Public Comment

Replace as follows:

2018 International Building Code

2405.1 Scope. This section applies to the installation of glass and other transparent, translucent or opaque glazing material installed at a slope of more than 15 degrees (0.26 rad) from the vertical plane, including glazing materials in skylights, roofs and sloped walls.

2405.2 Allowable glazing materials and limitations. Sloped glazing shall be any of the following materials, subject to the listed limitations.

1. For monolithic glazing systems, the glazing material of the single light or layer shall be laminated glass with a minimum 30-mil (0.76 mm) polyvinyl butyral (or equivalent) interlayer, wired glass, light-transmitting plastic materials meeting the requirements of Section 2607, heat-strengthened glass or fully tempered glass.
2. For multiple-layer glazing systems, each light or layer shall consist of any of the glazing materials specified in Item 1.

Annealed glass is permitted to be used as specified in Exceptions 2 and 3 of Section 2405.3.

Laminated glass and plastic materials described above shall not require the screening or height restrictions provided in Section 2405.3.

For additional requirements for plastic skylights, see Section 2610. Glass-block construction shall conform to the requirements of Section 2110.1.

2405.3 Screening. Where used in monolithic glazing systems, annealed, heat-strengthened, ~~and~~ fully tempered and wired glass shall have broken glass retention screens installed below the glazing material. The screens and their fastenings shall be: capable of supporting twice the weight of the glazing; firmly and substantially fastened to the framing members; and installed within 4 inches (102 mm) of the glass. The screens shall be constructed of a noncombustible material not thinner than No. 12 B&S gage (0.0808 inch) with mesh not larger than 1 inch by 1 inch (25 mm by 25 mm). In a corrosive atmosphere, structurally equivalent noncorrosive screen materials shall be used. Annealed, H heat-strengthened ~~glass~~, fully tempered ~~glass~~ and wired glass, where used in multiple-layer glazing systems as the bottom glass layer over the walking surface, shall be equipped with screening that conforms to the requirements for monolithic glazing systems.

Exception: In monolithic and multiple-layer sloped glazing systems, the following applies:

1. Fully tempered glass installed without protective screens where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane shall have the highest point of the glass 10 feet (3048 mm) or less above the walking surface.
2. Screens are not required below any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.
3. Any glazing material, including annealed glass, is permitted to be installed without screens in the sloped glazing systems of commercial or detached noncombustible greenhouses used exclusively for growing plants and not open to the public, provided that the height of the greenhouse at the ridge does not exceed 30 feet (9144 mm) above grade.
4. Screens shall not be required in individual *dwelling units* in Groups R-2, R-3 and R-4 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and the following conditions are met:
 - 4.1. Each pane of the glass is 16 square feet (1.5 m²) or less in area.
 - 4.2. The highest point of the glass is 12 feet (3658 mm) or less above any walking surface or other accessible area.
 - 4.3. The glass thickness is $\frac{3}{16}$ inch (4.8 mm) or less.
5. Screens shall not be required for laminated glass with a 15-mil (0.38 mm) polyvinyl butyral (or equivalent) interlayer used in individual *dwelling units* in Groups R-2, R-3 and R-4 within the following limits:
 - 5.1. Each pane of glass is 16 square feet (1.5 m²) or less in area.
 - 5.2. The highest point of the glass is 12 feet (3658 mm) or less above a walking surface or other accessible area.

Commenter's Reason: The current code language that states when screens are required below unit skylights and sloped glazing, has frequently been difficult to interpret by jurisdictions, causing consumers and others great concern when they are incorrectly told they need to install a glass retention screen below conforming (30-mil interlayer) laminated glass. Skylight and sloped glazing system manufacturers are asked to intervene far too often to ensure that unsightly, unnecessary screens are not installed in these instances. Furthermore, it is believed that many times an optional skylight installation is removed from submitted plans due to misinterpretation at the plan check stage, where the supplier may never know that the issue was raised because the permit applicant may surrender rather than appeal.

The current code language addresses qualifying laminated glass by simple omission from the "screens required" section. It is the omission that seems to create the confusion within the industry, especially considering Exception 5, which mentions that screens may be required when non-qualifying (15-mil interlayer) laminated glass is used.

The initial code proposal submitted attempted to re-write the section to make it clear that laminated glass with 30-mil interlayer does not require screens. However, it was determined at the committee action hearings the initial attempt to reorganize and provide this clarity was actually more

confusing. Taking that input this public comment attempts to once again make it clear that laminated glass with 30-mil interlayer does not require screens, but in what we think is a much more clear and direct manner. We believe this addresses the committee's concerns.

In instances where screens are required, the public comment adds the modifier, "broken glass retention" to fully describe the screen's purpose. This is to ensure readers do not confuse these type of screens with insect screens or fall protection screens, which are physically different and will not serve as effective retention screens. The public comment also provides minor "clean up" to ensure all types of glass addressed in Section 2405.3, are listed in the opening paragraph.

None of what is being proposed changes the current code requirements; rather, the intent and only expected outcome of the public comment is to simply provide better clarity and more consistent enforcement.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The changes presented are not meant to alter the current code requirements but simply meant to provide clarity and more consistent enforcement.

Public Comment# 1345

Proposed Change as Submitted

Proponents: Jennifer Hatfield, representing American Architectural Manufacturers Association (jen@jhatfieldandassociates.com)

2018 International Building Code

Revise as follows:

2405.2 Allowable glazing materials and limitations. Sloped glazing shall be any of the following materials, subject to the listed limitations.

1. For monolithic glazing systems, the glazing material of the single light or layer shall be laminated glass with a minimum 30-mil (0.76 mm) polyvinyl butyral (or equivalent) interlayer, wired glass, light-transmitting plastic materials meeting the requirements of Section 2607, heat-strengthened glass or fully tempered glass.
2. For multiple-layer glazing systems, each light or layer shall consist of any of the glazing materials specified in Item 1.

Annealed glass is permitted to be used as specified in Exceptions 2 and 3 of Section 2405.3.

For additional requirements for plastic skylights, see Section 2610. ~~Glass block construction shall conform to the requirements of Section 2110.1.~~

Reason: The removal of the reference in Section 2405.2 to the "Glass block" section is suggested as it removes a non-germane statement. That section contains no provisions that would apply on roofs or sloped walls, and Section 2405 offers no guidance on the use or protections needed for glass block. The reference is out of place here and should be removed. Perhaps there is a better section in Chapter 24 for it to appear, if it is needed at all.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This change will not have an effect on cost as it is not removing the requirements in Section 2110 but just removing the reference that is not germane within Section 2405.

S191-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee consensus was that the proposal was deleting a required pointer in the code.

(Vote: 11-3)

Note: the committee vote for 'as submitted' failed 7 for and 8 against.

Assembly Action:

None

S191-19

Individual Consideration Agenda

Public Comment 1:

Proponents:

Jennifer Hatfield, representing American Architectural Manufacturers Association (jen@jhatfieldandassociates.com)

requests As Submitted

Commenter's Reason: The removal of the reference in section 2405.2 to the "Glass Block" section is suggested as it removes a non-germane statement. The glass-block construction section contains no provisions that would apply on roofs or sloped walls. Further, section 2405.2 offers no guidance on the use or protections needed for glass block. The reference is simply out of place here.

In addition, any concern that by removing this sentence one is eliminating a necessary pointer in Chapter 24 to the glass block provisions, is alleviated by the fact a reference is included in section 2406.1.3. The reference is more appropriate here in the safety glazing section where Glass Block is specifically called out in section 2406.1.3. Further, the reference here in section 2406.1.3 points you to the entire section on glass block, referring you to section 2110 whereas in Section 2405.2 it points you only to a subsection, 2110.1.

SECTION 2406 SAFETY GLAZING

2406.1 Human impact loads.

Individual glazed areas, including glass mirrors, in hazardous locations as defined in Section 2406.4 shall comply with Sections 2406.1.1 through 2406.1.4.

Exception: Mirrors and other glass panels mounted or hung on a surface that provides a continuous backing support.

2406.1.1 Impact test.

Except as provided in Sections 2406.1.2 through 2406.1.4, all glazing shall pass the impact test requirements of Section 2406.2.

2406.1.2 Plastic glazing.

Plastic glazing shall meet the weathering requirements of ANSI Z97.1.

2406.1.3 Glass block.

Glass-block walls shall comply with Section 2110.

2406.1.4 Louvered windows and jalousies.

Louvered windows and jalousies shall comply with Section 2403.5.

Bibliography: See section 2406.1.3 of the 2018 IBC

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The change will not have any effect on costs as it is not removing or changing any code requirements. Rather it is simply removing a pointer that is not germane within section 2405 and that is already included in section 2406 where it is more appropriate.

Public Comment# 1305

S193-19

IBC®: 2407.1.1 (New)

Proposed Change as Submitted

Proponents: Anthony Barnes, Trex Commercial Products, representing self (tbarnes@trexcommercial.com); Bryan Wedan, Enclos, representing self

2018 International Building Code

Revise as follows:

2407.1.1 Loads. The ~~glass panels and their support system~~ shall be designed to withstand the loads specified in Section 1607.8. Glass ~~guard elements panels~~ shall be designed using a factor of safety of four applied to the modulus of rupture.

Reason: Allowable glass stress is traditionally determined by probabilistic methods (ASTM E1300) given particular load durations. The allowable stress decreases with a longer duration load (thus the factor of safety increases). Therefore the allowable stress calculated per ASTM E1300 effectively contains a factor of safety. This appears to be the intent of section 2407.1.1 and the code commentary does suggest this (see attachments) as it mentions probability of glass breakage and that 4x the load is not to be applied to a railing system. The factor of safety of four should only be applied to glass. All other components supporting glass should be designed using the factors of safety provided in relevant material codes (AISC 360 for steel, etc.). All other glass systems such as skylights and walls are designed in the same manner and carry no less risk than guards.

There are also inconsistencies and ambiguities with the current code language. The factor of safety does not define which supports the factor of safety of 4 is to be applied to (loads must be transferred to ground, so where does glass support end?). The language is inconsistent in that other railing types are not designed with the same factor of safety of 4 even though failure modes could be similar. For example, a factor of safety of 4 may be applied to a steel post-supported glass infill railing system, but if a steel mesh panel infill is substituted for the glass, this panel and its supports would be designed with lower factors of safety per the relevant material codes and thus failure modes (including panels falling out of supports catastrophically) would occur at much lower loads.

In summary, changing this language removes ambiguity, makes guard design more consistent with other similar systems, and saves money by lowering factors of safety for supports (to those that are used by the relevant material codes).

Cost Impact: The code change proposal will decrease the cost of construction

Glass is already designed with factor of safety of 4 per 2407.1.1 so no change there. Factor of safety for steel, stainless steel, aluminum and concrete supports will be per relevant material codes and those factors are generally less than 4 (less costly) and are familiar to designers (less costly).

S193-19

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

2018 International Building Code

2407.1.1 Loads. The glass panels and their support system shall be designed to withstand the loads specified in Section 1607.8. Glass panels shall be designed using a factor of safety of four applied to the modulus of rupture.

Committee Reason: The proposal draws attention to the fact that glass panels are to be designed using a factor of safety of 4. The modification clarifies the intent of the proposal. (Vote: 11-2)

Assembly Action:

None

S193-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 2407.1.1 (New)

Proponents:

Anthony Barnes, representing Self (tbarnes@trexcommercial.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

2407.1.1 Loads. ~~The glass panels and their support system shall be designed to withstand the loads specified in Section 1607.8. Glass panels shall be designed using a factor of safety of four applied to the modulus of rupture.~~

The panels and their support system shall be designed to withstand the loads specified in Section 1607.8. When analyzed with these loads, the glass components of the handrails and guards shall be designed using the minimum allowable edge stresses as follows:

1. Fully tempered glass panels shall be designed using an allowable stress of 6.8 ksi.
2. Heat-strengthened glass panels used as guards shall be designed with an allowable stress of 3.1 ksi.

Exception: Alternate allowable stresses shall be permitted where justified by analysis using base stresses and methodology in ASTM E1300.

Commenter's Reason: The Structural Committee approved a stopgap measure (S193-19) that retained the load requirement for glass supports, but the above revised proposal enhances this approved modification is supported by technically correct, and accepted, methods for glass design. The differences between the above proposed language and the Committee-approved version (S193-19) are as follows:

- 1) This version uses accepted methods to set minimum allowable glass stresses (note that we arrive at basically the same values as were ambiguously *implied* in previous code versions using a now much more robust and technically appropriate analysis; previous code versions: $24 \text{ ksi MOR} / 4 = 6 \text{ ksi}$)
- 2) It is explicitly stated that alternate allowable stresses are permitted using the methodology outlined in ASTM E 1300

These minimum allowable edge stresses are based upon the following parameters:

- Base allowable stress values given in ASTM E1300 Table X7.1
- Glass probability or breakage equals 1 lite in 1000 (typical for life-safety applications and overhead glazing – see GANA Glazing Manual for example)
- The loads of Section 1607.8 are assumed to have a duration of 1 hour

There are three key drivers for the proposed updated language:

1. No glass design values are specified or referenced to which the “design factor” is applied;
2. Using the “design factor” terminology is technically problematic as simple design factors do not apply to brittle materials such as glass (see AAMA CW-12-84 and NCSEA Engineering Structural Glass Design Guide)
3. Allow design professionals to derive, using ASTM E 1300, and use, alternate allowable stresses

1.1 Point 1

Current **StopGap** language specifies the use of a “design factor” on the modulus of rupture (MoR), however 2407.1.1 currently does not specify a value or source to which to refer. To address this gap and fulfill the code intent, a “floor” value for glass design stress based on current accepted practice and standards is proposed. This floor value is a simplified design value based on conservative design assumptions that, when used without further analysis, would result in a safe glass guard design. Further effort to increase this floor value by rigorous engineering analysis is accommodated by reference to acceptable industry practice and standards.

1.2 Point 2

The use of Modulus of Rupture with an applied design factor is an inaccurate and outdated method by which to determine allowable design stresses (ref. GANA). Current techniques to determine allowable glass stress utilize probabilistic methods (explained in AAMA CW-12-84, GANA Glazing Manual, and ASTM E1300) based on, among other factors, a given load duration (allowable stress is greater for a short duration, and lower for a longer duration load), and acceptable risk of breakage ("probability of breakage" or $P(\text{breakage})$). These methods augment material data, obtained by experiment and documented in ASTM standards, to suit the specific design situation.

The proposed allowable stresses are derived using ASTM E1300-16 per the below calculations. For glass in handrails and guards, a $P(\text{breakage}) = 1:1000$ and a 1 hr load duration is assumed. Furthermore allowable glass stresses also vary with location of the stress on the glass panel, either on the surface or the edge: The glass edge is conservatively considered, as the allowable stresses are lower at edges than for glass surfaces.

(It is noted that typical vertical glass applications assume a 3s load duration with a $P(\text{breakage}) = 8:1000$: the proposed 1 hr at 1:1000 is a significant increase in conservatism for the specific case of glass handrails and guards to reflect the "critical application".)

Following the proposed method, the design stresses proposed are similar in magnitude to the historical $\text{MoR}/4$ values but with a more robust derivation and clearer direction for the designer. This updated approach, based on documented ASTM methods of glass design, is particularly important as the codes are extended to the use of laminated glass and no top-cap in guards – design methods and techniques must keep pace with code requirements as higher performance is demanded from the material.

1.3 Point 3

Note that the approach used to derive the proposed allowable stresses is conservative when considering most guardrail applications: the proposed stress values address the balustrade condition of a single glass leaf, without top cap, cantilevering from an embedded shoe, subjected directly to crowd loading. Where not subject to these high demands, increased allowable stress limits could be used with more rigorous engineering analysis employed. For example, a shorter duration load may be appropriate (e.g. 3s duration for wind gust), or less demanding 4-side support conditions of infill panels ensure peak stresses occur on the glass surface. Extension of glass design stresses beyond the proposed floor values is limited to reference to associated design standards and outside of IBC scope.

Base stresses

Determine probability of breakage factor to convert from $P(\text{breakage}) = 8:1000$ stresses, as documented in ASTM E 1300, to equivalent $P(\text{breakage}) = 1:1000$ stresses

$$\sigma_{\text{allowable}} = \left(\frac{P_b}{k \left(\frac{d}{3} \right)^{2m} A} \right)^{1/7} \quad (\text{X6.1})$$

$$\psi_{Pb} := \frac{\left(\frac{P_{b1}}{P_{b2}} \right)^{\left(\frac{1}{7} \right)}}{\left(\frac{1}{7} \right)} = 0.743$$

TABLE X7.1 Allowable Edge Stress

	Clean Cut Edges, MPa (psi)	Seamed Edges, MPa (psi)	Polished Edges, MPa (psi)
Annealed	16.6 (2400)	18.3 (2650)	20.0 (2900)
Heat-strengthened	N/A ^A	36.5 (5300)	36.5 (5300)
Tempered	N/A	73.0 (10 600)	73.0 (10 600)

^A N/A—Not Applicable.

Use base stress of 10.6 ksi for probability of breakage of 8:1000 (from Table X7.1)

$$\sigma_{3_FT} := 10.6 \text{ ksi} \cdot \psi_{Pb} = 7.876 \text{ ksi}$$

allowable edge stress for FT glass, 1:1000 probability of breakage, 3s load duration, $\psi_{Pb} = 0.743$ per E1300 X6.1

$$d_{FT} := \begin{pmatrix} 3\text{-s} \\ 60\text{-s} \\ 1\text{-hr} \\ 12\text{-hr} \\ 10\text{-yr} \end{pmatrix}$$

$$\sigma_{\text{all_FT}} := \sigma_{3_FT} \left(3 \cdot \frac{s}{d_{FT}} \right)^{\left(\frac{1}{48} \right)} \quad \text{per ASTM E1300-16 equation X5.1 using 'n' values found in Table 1 of ASTM E-2751}$$

$$\sigma_{\text{all_FT}} = \begin{pmatrix} 7.876 \\ 7.399 \\ 6.794 \\ 6.451 \\ 5.36 \end{pmatrix} \text{ ksi}$$

$$\sigma_{3_HS} := 5.3 \text{ ksi} \cdot \psi_{Pb} = 3.938 \text{ ksi}$$

allowable edge stress for HS glass, 1:1000 probability of breakage, 3s load duration

$$d_{HS} := \begin{pmatrix} 3\text{-s} \\ 60\text{-s} \\ 1\text{-hr} \\ 12\text{-hr} \\ 10\text{-yr} \end{pmatrix}$$

$$\sigma_{\text{all_HS}} := \sigma_{3_HS} \left(3 \cdot \frac{s}{d_{HS}} \right)^{\left(\frac{1}{32} \right)} \quad \text{per ASTM E1300-16 equation X5.1, where n = 32 per ASTM E2751 Table 1}$$

$$\sigma_{\text{all_HS}} = \begin{pmatrix} 3.938 \\ 3.586 \\ 3.155 \\ 2.92 \\ 2.211 \end{pmatrix} \text{ ksi}$$

1 Additional response to committee comments:

Note that IBC Commentary includes the following clarification:

2407.1.1 Loads. The panels and their support system shall be designed to withstand the loads specified in Section 1607.7. A safety factor of four shall be used.

❖ This section requires that railing systems using glass balusters be designed based on a safety factor of four. Nominally identical panes of glass inherently have a wide variation in strength. The safety factor of four is used in the design to minimize the likelihood that breakage will occur below the design loads. It is not intended that an in-place glass railing system be tested for or capable of withstanding four times the design load.

This reads:

"This section requires that the support system for glass guard or handrail assemblies be designed based on a factor of safety of four. Nominally identical panes of glass inherently have a wide variation in strength. The safety factor of four is used in the design to minimize the likelihood that breakage will occur below the design loads. It is not intended that an in-place glass guard or handrail system be tested for or capable of withstanding four times the design load."

2) AAMA CW-12-84

3) ASTM E 1300

4) ASTM E 2751

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

The code change proposal will decrease the cost of construction. Factors of safety for steel, stainless steel, aluminum and concrete supports will be per relevant material codes and those factors are generally less than 4 (less costly) and are familiar to designers (less costly). Costly and protracted discussion on code ambiguity with permitting jurisdictions is mitigated by clear language based on current design methods and material knowledge.

Public Comment# 1394

Public Comment 2:

Proponents:

Tom Zaremba, representing Glazing Industry Code Committee (GICC), a section of the National Glass Association (NGA) (tzaremba@ralaw.com)

requests Disapprove

Commenter's Reason: The Glazing Industry Code Committee (GICC) urges you to disapprove S193-19. The proposal as modified, would make Section 2407.1.1 inconsistent with changes made in S192-19 that were unanimously approved by the Committee and, more importantly, it would make 2407.1.1 inconsistent with the language of design requirements specified in Section 1607.8 of the IBC.

As originally proposed, S193-19 was fatally flawed. It deleted the words "and their support systems" from the first sentence of Section 2407.1.1. That deletion would have eliminated the requirement that support systems for glass guards be designed to the loads specified in Section 1607.8. That error was corrected by the Committee's adoption of a modification adding that language back into 2407.1.1. However, in addition to making that correction to S193-19, the Committee allowed two other changes from the original proposal to stand, namely, changing "guard elements" to "panels," and adding "modulus of rupture" to the safety factor required by 2407.1.1.

Adopting these two changes from the original proposal are not justified for several reasons. First, the Committee unanimously recommended the adoption of S192-19, which changed Section 2407.1.1 to read as follows: "*Glass **handrails and guards** and their support system shall be designed*

to withstand the loads specified in Section 1607.8. All glass **handrails and guards** shall be designed using a factor of safety of four." (Emphasis added). The reason for this change was to ensure consistency between Section 2407.1.1 and Section 1607.8. In that regard, 1607.8.1 provides that: "**Handrails and guards** shall be designed to resist a linear load of 50 pounds per linear foot ... in accordance with ASCE 7. Glass **handrails and guards** shall comply with Section 2407." (Emphasis added).

Please note that in order to make 2407.1.1 consistent with 1608.1.1, S192-19 changed the word "panels" to "handrails and guards" in 2407.1.1. Then, after recommending the adoption of S192-19, the Committee recommended that "handrails and guards" be changed back to "panels" in S193-19. Adopting this change from S193-19 would restore the inconsistency between Sections 2407.1.1 and 1608.1 that S192-18 resolved.

Additionally, the Committee's recommendation as to S193-19 would add the term "modulus of rupture" to the safety factor required by 2407.1.1. However, the Committee's recommendation includes no information as to how to test for the "modulus of rupture," how to determine the modulus of rupture, or, for that matter what it means in this context. In that regard, the term "modulus of rupture" is not defined in the IBC. (Unlike here, where the term "modulus of rupture" is used in the IBC, the code specifies how it is to be determined. See, therefore, Section 2109.2.1.2.4.)

Section 1608.1 requires handrails and guards to "be designed to resist a linear load of 50 pounds per linear foot ... in accordance with ASCE 7." Section 1608.1 makes no mention of testing "modulus of rupture." Instead, it refers to testing in accordance with ASCE 7. If modulus of rupture is to be added to the design considerations applicable to handrails and guards, it should either be added to Section 1607.8.1 or to ASCE 7, but not to 2407.1.1. (And, if ASCE 7 requires modulus of rupture testing, then adding it to 2407.1.1 is unnecessary.)

The use of inconsistent and undefined terms inevitably leads to misinterpretations. Adopting S193-19 will result in inconsistent terms between Sections 1608 and 2407 of the IBC and should be disapproved. The Committee's modification restoring the "and their support systems" language is unnecessary since that language already appears in 2407.1.1. More importantly, however, the Committee got it wrong when it recommended changing the language of 2407.1.1 back to "panels" from "handrails and guards" as proposed in S192-19 since "handrails and guards" is the language used in 1608.1. The Committee again got it wrong when it recommended that "modulus of rupture" be added to the safety factor referenced in 2407.1.1. "Modulus of rupture" is not defined in the IBC and, if it belongs in the design considerations for handrails and guards, it should be included, if at all, either in Section 1608.1 or ASCE 7, but it should not be included in Section 2407.1.1.

The Glazing Industry Code Committee urges you to vote to disapprove S193-19.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction No change to code.

Public Comment# 1642

Proposed Change as Submitted

Proponents: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com)

2018 International Building Code

Revise as follows:

2510.6 Water-resistive barriers. *Water-resistive barriers* shall be installed as required in Section 1403.2 and, where applied over wood-based sheathing, shall include a water-resistive ~~vapor-permeable~~ barrier with a performance water resistance at least equivalent to two layers of *water-resistive barrier* complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section 1404.4) intended to drain to the *water-resistive barrier* is directed between the layers.

Exceptions:

1. Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of a water-resistive barrier complying with ASTM E2556, ~~Type I~~ and is separated from the stucco by an intervening, ~~substantially nonwater-absorbing layer or drainage foam plastic insulating sheathing layer or by a minimum 3/16 inch space.~~
2. Where the *water-resistive barrier* is applied over wood-based sheathing ~~in Climate Zone 1A, 2A or 3A, a ventilated air~~ where the annual mean rainfall as determined by the National Oceanic and Atmospheric Administration (NOAA) exceeds 20 inches, a minimum 3/16 inch space shall be provided between the stucco and *water-resistive barrier*.

Reason: Objective:

1. Define water resistance as the primary functional requirement of the WRB and remove reference to vapor permeable.
2. Enable a single layer of WRB complying with ASTM E2556 Type 1 with a drainage space.
3. Define depth drainage space.

The existing code language gives insufficient guidance for other approved materials. The added language addresses this issue and provides a specific performance requirement for water resistance and provides consistency with other sections of the code that relate specifically to water resistive barriers.

The size of the drainage space needs to be specified. Type 1 is the appropriate water-resistive metric for the specified space. This logic is consistent with the body and intent of the text of Section 2510.6. The specified space and one layer of Type 1 provides equivalent performance to the two layers of Type 1 specified in the body of 2510.6.

Annual mean rainfall is the appropriate metric for risk not humidity.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change gives better guidance for water-resistance.

S194-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that this change only confused the code content. The committee did not find sufficient justification for undefined terms such as 'approved weather data'.

None

S194-19

Individual Consideration Agenda

Public Comment 1:

IBC®: 2510.6

Proponents:

Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

2510.6 Water-resistive barriers. *Water-resistive barriers* shall be installed as required in Section 1403.2 and, where applied over wood-based sheathing, shall include a water-resistive barrier with a water resistance at least equivalent to two layers of *water-resistive barrier* complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section 1404.4) intended to drain to the *water-resistive barrier* is directed between the layers.

Exceptions:

1. Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of a water-resistive barrier complying with ASTM E2556 Type I and is separated from the stucco by an intervening foam plastic insulating sheathing layer or by a minimum 3/16 inch space.
2. Where the *water-resistive barrier* is applied over wood-based sheathing in the moist or marine climate zones of Figure N1101.7 where the annual mean rainfall as determined by the National Oceanic and Atmospheric Administration (NOAA) exceeds 20 inches, a minimum 3/16 inch space shall be provided between the stucco and *water-resistive barrier* or a drainage layer having a drainage efficiency of not less than 90%, as measured in accordance with ASTM E2273 or Annex A2 of ASTM E2925, shall be added to the exterior side of the water-resistive barrier.

Commenter's Reason: The committee issue was and is addressed in the proposed modification.

Cleans up language relating to the function of a WRB so that S194 is now consistent with RB232 that passed in the IRC.

The modification makes the climate requirement for drainage consistent with the language in RB242 that passed in the IRC

The modification makes the requirement defining drainage consistent with the language in RB243 and RB242 that passed in the IRC

More significantly it recognizes that the most important factor relating to addressing the issues with stucco are drainage not the resistance to hydrostatic pressure. In other words drainage is more important than requiring a Type II water resistive barrier. A Type I water resistive barrier with drainage significantly outperforms a Type II water resistive barrier without drainage. ASTM E2556 does not address drainage.

ASTM E2556 requires materials to resist a water column of over 20 inches of water...a hydrostatic pressure greater than 5,000 pascals (an equivalent wind speed of 200 hundred miles per hour). The requirement is disingenuous when it is understood that sheet membranes are tested under ASTM E2556 without fasteners. Nails are required to install such products...as well as other products. Cladding fasteners then penetrate all products. The key is to control the hydrostatic pressure so the holes don't matter.

Requiring a Type II water resistive barrier creates an artificial barrier to entry for products and approaches that have been demonstrated to work. It excludes products such as OSB sheathings with integral water control layers manufactured by Georgia Pacific, Louisiana Pacific and Huber. It excludes many fluid applied water resistive barriers and it adds unnecessary expense to drainage mat and dimple mat drainage approaches where Type I water resistive barriers function well. Requiring Type II water resistive barriers favors mechanically attached sheet good based water resistive barriers despite evidence that they do not function adequately in stucco assemblies without a gap.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

Requiring materials to meet Type II requirements significantly increases costs relative to meeting Type I requirements. This requirement doubles the material per square foot cost of water resistive barriers resulting in cost increases on the order of thousands of dollars on multifamily and commercial projects. Therefore, this code change significantly reduces the cost of construction by thousands of dollars on multifamily and commercial projects.

Staff Analysis: ASTM E2925 is a new standard that was submitted to staff in accordance with CP28 in support of S196-19, in which the standard is referenced.

Note: Both S194-19 and S196-19 deal with the same section in different ways. If both are approved, please ensure the final intentions are clear.

Public Comment 2:**Proponents:**

Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

requests Disapprove

Commenter's Reason: The committee recommended disapproval of S194 and this should be upheld for the reasons given by the IBC-S committee. This proposal included a number of problems including undefined terms such as "approved weather data". There is also concern that water-resistance was being reduced by changing from a Type II to Type I WRB in accordance with ASTM E2556. There was not adequate justification given for this change. Finally, it should be noted that all of these issues were resolved in S196 which was recommended for approval (14-0) by the committee noting that it "provides update of existing provisions to the latest technology and the drainage for correct climate zones." In addition, S196 is coordinated with RB242 which also was approved for the IRC. For these reasons, we request that S194-19 remain disapproved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction No change to code.

S196-19

IBC: 2510.6, 2510.6.1 (New), 2510.6.2 (New), ASTM Chapter 35 (New)

Proposed Change as Submitted

Proponents: Mike Fischer, representing Self (mfischer@kellencompany.com); Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council

2018 International Building Code

Revise as follows:

2510.6 Water-resistive barriers. *Water-resistive barriers* shall be installed as required in Section 1403.2 and, where applied over wood-based sheathing, shall ~~comply with Section 2510.6.1 or Section 2510.6.2, include a water-resistive vapor-permeable barrier with a performance at least equivalent to two layers of water-resistive barrier complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section 1404.4) intended to drain to the water-resistive barrier is directed between the layers.~~

~~Exceptions:~~

- ~~1. Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of a water-resistive barrier complying with ASTM E2556, Type II and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or drainage space.~~
- ~~2. Where the water-resistive barrier is applied over wood-based sheathing in Climate Zone 1A, 2A or 3A, a ventilated air space shall be provided between the stucco and water-resistive barrier.~~

Add new text as follows:

2510.6.1 Dry climates. One of the following shall apply for dry (B) climate zones:

1. The water-resistive barrier shall be two layers of 10-minute Grade D paper or have a water resistance equal to or greater than two layers of water-resistive barrier complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing, installed in accordance with Section 1404.4 and intended to drain to the water-resistive barrier, is directed between the layers.
2. The water-resistive barrier shall be 60-minute Grade D paper or have a water resistance equal to or greater than one layer of water-resistive barrier complying with ASTM E2556, Type II. The water-resistive barrier shall be separated from the stucco by a layer of foam plastic insulating sheathing or other nonwater absorbing layer.

2510.6.2 Moist or marine climates. In moist (A) or marine (C) climate zones, water-resistive barrier shall comply with one of the following:

1. In addition to complying with Item 1 or 2 of Section 2510.6.1, a minimum 3/16 inch (4.8 mm) space shall be added to the exterior side of the water-resistive barrier.
2. In addition to complying with Item 2 of Section 2510.6.1, a space with a minimum drainage efficiency of 90% as measured in accordance with ASTM E2273 or Annex A2 of ASTM E2925 is added to the exterior side of the water-resistive barrier.

West Conshohocken PA 19428-2959

E2925-17: Standard Specification for Manufactured Polymeric Drainage and Ventilation Materials Used to Provide a Rainscreen Function

Reason: The proposal does two things. First, it reorganizes the provisions by deleting two exceptions (which are really a construction options or requirements) and replacing them with subsections that indicate different methods of complying with stucco water-resistive barrier requirements. Second, the proposal properly applies requirements in relation to climate zones (a defined term in Chapter 2) -- something that has been missing in the code and is needed to avoid higher risk of moisture problems in climates that are moist/rainy. The proposal will help resolve problems with stucco performance (e.g., moisture problems over wood-based sheathings) and avoid impacting cost or performance where stucco has a long-standing record of good performance (e.g., dry climates such as the southwestern region of the U.S.).

Cost Impact: The code change proposal will increase the cost of construction

The proposal will not increase cost for substrates other than wood-based sheathing. Also, it will not impact cost or change requirements in dry climates where stucco has a long record of successful performance. This also will not impact cost in moist or marine climates where similar actions are already being taken (e.g., a drainage space) to reduce risk of moisture damage.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM E2925-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

Public Hearing Results

Committee Action:

As Modified

Committee Modification:

2018 International Building Code

2510.6.1 Dry climates. One of the following shall apply for dry (B) *climate zones*:

1. The *water-resistive barrier* shall be two layers of 10-minute Grade D paper or have a water resistance equal to or greater than two layers of *water-resistive barrier* complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing, installed in accordance with Section 1404.4 and intended to drain to the *water-resistive barrier*, is directed between the layers.
2. The *water-resistive barrier* shall be 60-minute Grade D paper or have a water resistance equal to or greater than one layer of *water-resistive barrier* complying with ASTM E2556, Type II. The water-resistive barrier shall be separated from the stucco by a layer of foam plastic insulating sheathing or other nonwater absorbing layer , or a drainage space.

2510.6.2 Moist or marine climates. In moist (A) or marine (C) *climate zones*, water-resistive barrier shall comply with one of the following:

1. In addition to complying with Item 1 or 2 of Section 2510.6.1, a space or drainage material not less than minimum 3/16 inch (4.8 mm) in depth shall be applied~~added~~ to the exterior side of the *water-resistive barrier*.
2. In addition to complying with Item 2 of Section 2510.6.1, drainage on the exterior side of the water-resistive barrier shall have a space with a minimum drainage efficiency of 90% as measured in accordance with ASTM E2273 or Annex A2 of ASTM E2925 ~~is added to the exterior side of the water-resistive barrier.~~

Committee Reason: The proposal provides update of existing provisions to the latest technology and the drainage for correct climate zones. The modification adds additional options to satisfying the requirements. (Vote: 14-0)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

IBC®: 2510.6.1 (New)

Proponents:

Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com)

requests As Modified by Public Comment

Further modify as follows:

2018 International Building Code

2510.6.1 Dry climates. One of the following shall apply for dry (B) *climate zones*:

1. The *water-resistive barrier* shall be two layers of 10-minute Grade D paper or have a water resistance equal to or greater than two layers of *water-resistive barrier* complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing, installed in accordance with Section 1404.4 and intended to drain to the *water-resistive barrier*, is directed between the layers.
2. The *water-resistive barrier* shall be 60-minute Grade D paper or have a water resistance equal to or greater than one layer of *water-resistive barrier* complying with ASTM E2556, Type I or II. The water-resistive barrier shall be separated from the stucco by a layer of foam plastic insulating sheathing or other nonwater absorbing layer, or a drainage space.

Commenter's Reason: Requiring materials to meet Type II requirements significantly increases costs relative to meeting Type I requirements.

This requirement doubles the material cost per square foot of water resistive barriers resulting in cost increases on the order of thousands of dollars on multifamily and commercial projects. Therefore, this code change significantly reduces the cost of construction by thousands of dollars on multifamily and commercial projects.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction
This code change decreases costs.

Requiring materials to meet Type II requirements significantly increases costs relative to meeting Type I requirements. This requirement doubles the material cost per square foot of water resistive barriers resulting in cost increases on the order of thousands of dollars on multifamily and commercial projects. Therefore, this code change significantly reduces the cost of construction by thousands of dollars on multifamily and commercial projects.

Staff Analysis: Note: Both S194 and S196 deal with the same section in different ways. If both are approved, please ensure the final intentions are clear.

Public Comment# 1934

Public Comment 2:

Proponents:

Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

requests As Modified by Committee

Commenter's Reason: We request this proposal be approved in accordance with the Committee Action at the CAH.
The proponents testified that:

- The structure of this proposal is useful in that the more restrictive provisions are located in the main body of the text instead of placing these provisions in the exception statement.
- The problem to be solved is moisture performance issues with stucco in moist and marine climate zones. The reason for the problem is that dry climate zone installation techniques, currently required by code, are inadequate to reduce risk of moisture damage and do not provide for adequate drainage behind the stucco.
- The proposal breaks the requirements into a dry and moist/marine climate zone solution. There is a prescriptive solution – a 3/16" gap or drainage material and a performance solution which is a drainage efficiency requirement in accordance with ASTM standards.
- The water-resistive barrier requirements are retained as currently prescribed by code, and are specified in accordance with ASTM E2556, Type II, which has been in the code since 2006 and a part of ICC-ES AC-11 requirements beforehand.
- Opposition to the proposal supported the air gap and drainage plane, but also wanted to lower the WRB moisture performance by changing from a Type II down to a Type I. This was the intent of the other stucco proposals RB243/S194. This was not our original intent, as we have no supporting data or long-term performance studies to support this approach, either on a material or an assembly basis. Furthermore, the IBC-S committee ruled against S194 on lowering the WRB requirement, but both committees supported our proposals (RB242/S196) to add the air gap/drainage plane.

For the above reasons and to maintain consistency between the IRC and IBC, we therefore request your support of the committee action for approval of S196 as modified by committee.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction
Refer to the cost impact statement with the original S196 proposal. There is no change.

2018 International Building Code

Add new definition as follows:

TEMPORARY SPECIAL EVENT STRUCTURE. Any temporary ground-supported structure, platform, stage, stage scaffolding or rigging, canopy, tower supporting audio or visual effects equipment or similar structures.

Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7. The type of opening protection required, the basic design wind speed, V , and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AWC WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided that the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with ASCE 49 and Sections 31.4 and 31.5 of ASCE 7.
7. Temporary special event structures complying with Section 3103.5.5.

The wind speeds in Figures 1609.3(1) through 1609.3(8) are basic design wind speeds, V , and shall be converted in accordance with Section 1609.3.1 to *allowable stress design* wind speeds, V_{asd} , when the provisions of the standards referenced in Exceptions 4 and 5 are used.

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with Chapters 11, 12, 13, 15, 17 and 18 of ASCE 7, as applicable. The *seismic design category* for a structure is permitted to be determined in accordance with Section 1613 or ASCE 7.

Exceptions:

1. Detached one- and two-family dwellings, assigned to *Seismic Design Category* A, B or C, or located where the mapped short-period spectral response acceleration, S_S , is less than 0.4 g.
2. The seismic force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.
5. References within ASCE 7 to Chapter 14 shall not apply, except as specifically required herein.
6. Temporary special event structures complying with Section 3103.5.

3103.1.1 Conformance. Temporary structures and uses shall conform to the structural strength, durability, fire safety, *means of egress*, accessibility, light, *ventilation* and sanitary requirements of this code as necessary to ensure public health, safety and general welfare.

Add new text as follows:

3103.5 Structural. The structural design for temporary structures shall comply with the requirements in Chapter 16. Temporary special event structures erected outdoors for a period of not more than six consecutive weeks shall be designed and erected to comply with requirements ESTA ANSI E1.21 as well as the lateral forces in ASCE 37.

3103.6 Durability and maintenance. A qualified person shall inspect temporary special event structures, including components, when purchased

or acquired and at least once per year, based on the requirements in ESTA ANSI E1.21. Inspection records shall be kept and shall be made available for verification by the building official. Additionally, *temporary special event structures* shall be inspected at regular intervals when in service to ensure that the structure continues to perform as designed and initially erected.

ANSI E1.21—2013: Entertainment Technology: Temporary Ground Supported Overhead Structures Used to Cover the Stage Areas and Support Equipment in the Production of Outdoor Entertainment Event

Reason: Temporary Special Event Structures are regulated in Section 3105 of the International Fire Code and pose challenges to Building Officials and Fire Code Officials due to their temporary nature and methods of construction. The regular provisions of the IBC and IFC regulate permanent buildings and structures constructed to remain in service for long periods of time and as a consequence it is conceivable that over a 50 to 100 year services live that such buildings and structures can be expected to experience high wind and seismic. As a result when the duration of service is short for 6 weeks for example such as a sporting event, or one day such as in a concert, it is reasonable to assume that the probability of an event will not be high. Furthermore, wind events can be predicted fairly accurately to allow for adjustments or dismantling of temporary structures when an installation may be subjected to winds higher than assumed in the design. As a consequence the entertainment industry developed "ANSI E1.21—2013: Entertainment Technology: Temporary Ground Supported Overhead Structures Used to Cover the Stage Areas and Support Equipment in the Production of Outdoor Entertainment Events" to specifically address the unique issues posed by temporary structures used as a part of special events in light of the duration of use and the reuse of components used to erect the structures. Additionally, these temporary structures may be erected with scaffolding systems that were intended for the construction of permanent buildings.

The definition for Temporary Special Event Structure is proposed to be modified to delete references limiting its application to the IFC.

IFC Section 3105 adopts by reference ANSI E1.21 so this code change merely harmonizes the two codes. It is noteworthy that ANSI E1.21 was last updated in 2013 and includes out of date references to 2010 edition of ASCE 7 as well as the 2002 edition of ASCE 37.

This code change also references ASCE 37-14 Design Loads on Structures during Construction since this standard is referenced in ANSI E1.21 and since by publishing it ASCE recognizes the need for reduced seismic loads adjusted by duration. It is worth noting that ASCE 37 intends to provide the same level of safety as the IBC does through ASCE 7.

Bibliography: ANSI E1.21—2013: Entertainment Technology: Temporary Ground Supported Overhead Structures Used to Cover the Stage Areas and Support Equipment in the Production of Outdoor Entertainment Events
ASCE 37-14 Design Loads on Structures During Construction

Cost Impact: The code change proposal will decrease the cost of construction

Building Officials are requested on a regular basis to accept structural designs for concert stages and structures used in sporting events based on load reductions permitted in the two new referenced standards. As a consequence of this code change it is expected that ballast materials used to provide overturning and sliding resistance to be reduced. These standards are already in use in the motion picture and entertainment industry for work not specifically regulated by the Building Official.

Staff Analysis: A review of the standard proposed for inclusion in the code, ESTA ANSI E1.21-2013 and ASCE 37-14, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2019.

S200-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee agreed with the need for provisions relative to 'temporary special event structures'; however, the committee

could not agree with a proposal that relied on ASCE 37 for temporary loads when the type of structure being considered is outside the scope of ASCE 37. ASCE representatives specifically testified that ASCE 37 is inappropriately being referenced in this proposal. The committee expressed concerns over 'who is responsible' and 'who would do the inspections'. (Vote: 13-1)

Assembly Action:

None

S200-19

Individual Consideration Agenda

Public Comment 1:

IBC®: (New), 1609.1.1, 1613.1, 3103.1, 3103.5 (New), ANSI Chapter 35 (New), ASCE/SEI Chapter 35 (New), ESTA (New)

Proponents:

Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

~~TEMPORARY SPECIAL EVENT STRUCTURE:~~ Any temporary ground-supported structure, platform, stage, stage scaffolding or rigging, canopy, tower supporting audio or visual effects equipment or similar structures.

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7. The type of opening protection required, the basic design wind speed, V , and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AWC WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided that the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with ASCE 49 and Sections 31.4 and 31.5 of ASCE 7.
7. ~~Temporary special~~ Special event structures complying with Section 3103.5.5.

The wind speeds in Figures 1609.3(1) through 1609.3(8) are basic design wind speeds, V , and shall be converted in accordance with Section 1609.3.1 to *allowable stress design* wind speeds, V_{asch} , when the provisions of the standards referenced in Exceptions 4 and 5 are used.

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with Chapters 11, 12, 13, 15, 17 and 18 of ASCE 7, as applicable. The *seismic design category* for a structure is permitted to be determined in accordance with Section 1613 or ASCE 7.

Exceptions:

1. Detached one- and two-family dwellings, assigned to *Seismic Design Category* A, B or C, or located where the mapped short-period spectral response acceleration, S_S , is less than 0.4 g.
2. The seismic force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.

4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.
5. References within ASCE 7 to Chapter 14 shall not apply, except as specifically required herein.
6. ~~Temporary special~~ Special event structures complying with Section 3103.5.

3103.1 General. The provisions of Sections 3103.1 through ~~3103.4~~ 3103.5 shall apply to structures erected for a period of less than 180 days. Tents, umbrella structures and other membrane structures erected for a period of less than 180 days shall comply with the International Fire Code . Those erected for a longer period of time shall comply with applicable sections of this code.

3103.5 Structural. The structural design for temporary structures shall comply with the requirements in Chapter 16. ~~Temporary special~~ Special event structures erected outdoors for a period of not more than six consecutive weeks shall be designed and erected to comply with requirements ~~ESTA-ANSI E1.21 as well as the lateral forces in ASCE 37.~~

~~ANSI E1.21—2013: Entertainment Technology: Temporary Ground Supported Overhead Structures Used to Cover the Stage Areas and Support Equipment in the Production of Outdoor Entertainment Event~~

Commenter's Reason: The original proposal has been simplified from what was originally submitted and remains true to the original goal to correlate the IBC and the IFC. The IFC references the IBC numerous times in IFC Ch 31 and intends to not duplicate requirements in the IBC. Additionally the Section 108.1 of the IBC authorized the Building Official to issue a permit for temporary structures and temporary uses but does not require it. However IFC Section 3105.5 requires that certain documents (structural plans and calculations) be submitted to the fire code official and the building official for review before a permit is approved.

The definition for temporary special event structure was deleted since the definition of special event structure was added to the 2018 IBC in code change G147-18.

The reference to ASCE 37 was also removed from the proposal in response to comments from ASCE during testimony at the CAH. It is interesting that ASCE's objections are due to safety personnel being present on construction sites and the lack of public access yet ASCE 37 can be used to shore bridges constructed over freeways, used to support construction scaffolding and equipment above public sidewalks and to shore up portions of occupied buildings undergoing structural renovations.

The ANSI E1.21—2013 is adopted in the 2018 IBC and includes loading requirements for wind and earthquake. And as frequently occurs with standards mismatches ASCE 7-10 is referenced in the ANSI standard as well as ASCE 37-02. While the original proposal was trying to correct the mismatch ASCE opposed the reference to ASCE 37 directly through the IBC.

During the CAH hearing we spent a considerable amount of time discussing the code change with questions raised by almost all the committee members. While the committee voted to disapprove the code change the committee was receptive to the need to treat temporary structures differently. We had many speakers in support from numerous jurisdictions. The only speakers in opposition were from ASCE regarding the reference to ASCE 37. One comment that resonated is that Building Officials permit temporary structures to be supported on ground without a permanent concrete, masonry or wood foundation and ballast is permitted to provide for sliding resistance through friction and for wind uplift.

Supporting the original proposal were structural engineers representing firms that work on almost 75% of the temporary structures in the United

States and they are designing to what is being proposed including updates to the ANSI standard and ASCE 7.

The public comment has simplified the code change to better correlate with the fire code and the results of the group B code change. Please vote to support approval through public comment # 4 we need 2/3 of the governmental voting members to vote in the affirmative for the public comment to pass.

TENTS, TEMPORARY SPECIAL EVENT STRUCTURES AND OTHER MEMBRANE STRUCTURES

and the system shall be installed in accordance with NFPA 70. The emergency system provided shall have a minimum duration of 90 minutes when operated at full design demand.

3103.12.7 Means of egress illumination. *Means of egress* shall be illuminated with light having an intensity of not less than 1 foot-candle (11 lux) at floor level while the structure is occupied. Fixtures required for *means of egress* illumination shall be supplied from a separate circuit or source of power.

3103.12.8 Maintenance of means of egress. The required width of *exits, aisles* and passageways shall be maintained at all times to a *public way*. Guy wires, guy ropes and other support members shall not cross a *means of egress* at a height of less than 8 feet (2438 mm). The surface of *means of egress* shall be maintained in an *approved* manner.

SECTION 3104 TEMPORARY AND PERMANENT TENTS AND MEMBRANE STRUCTURES

3104.1 General. Tents and membrane structures, both temporary and permanent, shall be in accordance with this section and Sections 3105 and 3107. Permanent tents and membrane structures shall also comply with the *International Building Code*.

3104.2 Flame propagation performance treatment. Before a permit is granted, the *owner* or agent shall file with the *fire code official* a certificate executed by an *approved* testing laboratory. The certificate shall indicate that the floor coverings, tents, membrane structures and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an *approved* manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. The flame propagation performance criteria shall be effective for the period specified by the permit.

3104.3 Label. Membrane structures or tents shall have a permanently affixed label bearing the identification of size and fabric or material type.

3104.4 Certification. An affidavit or affirmation shall be submitted to the *fire code official* and a copy retained on the premises on which the tent or air-supported structure is located. The affidavit shall attest to all of the following information relative to the flame propagation performance criteria of the fabric:

1. Names and address of the *owners* of the tent or air-supported structure.
2. Date the fabric was last treated with flame-retardant solution.

3. Trade name or kind of chemical used in treatment.
4. Name of person or firm treating the material.
5. Name of testing agency and test standard by which the fabric was tested.

*

SECTION 3105 TEMPORARY SPECIAL EVENT STRUCTURES

3105.1 General. Temporary special event structures shall comply with Section 3104, Sections 3105.2 through 3105.9 and ANSI E1.21.

3105.2 Approval. Temporary special event structures in excess of 400 square feet (37 m²) shall not be erected, operated or maintained for any purpose without first obtaining approval and a permit from the *fire code official* and the building official.

3105.3 Permits. Permits shall be required as set forth in Sections 105.6 and 105.7.

3105.4 Use period. Temporary special event structures erected in accordance with ANSI E1.21 shall not be erected for a period of more than six consecutive weeks.

3105.5 Required documents. The following documents shall be submitted to the *fire code official* and the building official for review before a permit is *approved*:

1. Construction documents: *Construction documents* shall be prepared by a *registered design professional* in accordance with the *International Building Code* and ANSI E1.21 where applicable. *Construction documents* shall include:

- 1.1. A summary sheet showing the building code used, design criteria, loads and support reactions.
- 1.2. Detailed construction and installation drawings.
- 1.3. Design calculations.
- 1.4. Operating limits of the structure explicitly outlined by the *registered design professional* including environmental conditions and physical forces.
- 1.5. Effects of additive elements such as video walls, supported scenery, audio equipment, vertical and horizontal coverings.
- 1.6. Means for adequate stability including specific requirements for guying and cross-bracing, ground anchors or ballast for different ground conditions.

2. Designation of responsible party: The *owner* of the temporary special event structure shall designate in writing a person to have responsibility for the temporary special event structure on the site. The designated person shall have sufficient knowledge of the construction documents, manufacturer's recommendations and operations plan to make judgments regarding the structure's safety and to coordinate with the *fire code official*.

G147-18

IBC: SECTION 202, 202 (New), 3103.1

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance
(rnix@zoomtown.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

SPECIAL EVENT STRUCTURE. Any ground-supported structure, platform, stage, stage scaffolding or rigging, canopy, tower or similar structure supporting entertainment-related equipment or signage.

Revise as follows:

3103.1 General. The provisions of Sections 3103.1 through 3103.4 shall apply to structures erected for a period of less than 180 days. ~~Tents, special event structures, tents, umbrella structures and other membrane structures erected for a period of less than 180 days shall also comply with the International Fire Code. Those erected for a longer period of time shall comply with applicable sections of this code.~~

Reason:

These structures are covered under the scope of IBC Chapter 31, Special Construction. IBC Section 3103 addresses installations <180 days, which are considered "temporary". Temporary tents, any type of membrane covered structure and special events structures are therefore within the scope of IBC Chapter 31, section 3102 and/or section 3103. All of these structures except special event structures are referred to IFC Chapter 31. The IFC has added new requirements in Chapter 31 for special events structures, therefore special event structures must also be referred from IBC Chapter 31 to IFC Chapter 31.

Building Code Officials and others using the IBC as a primary code reference require the proper guidance and direction to IFC Chapter 31. In the last code change cycle, F308-16 replaced the IFC term temporary stage canopy with the term temporary special events structure. Therefore, Temporary special events structures are now covered under the purview of IFC Chapter 31. Coordination with IBC Chapter 31 was both implied and intended to occur as a result of F308-16, due to the special construction and temporary characteristics of these structures. However, that coordination did not occur. This CCP ensures proper coordination between IFC and IBC as intended in the last code change cycle.

This proposed definition for Special Events Structures in IBC is slightly different than that used in IFC, because the word "temporary" is implied by the corresponding IBC section 3103, where these structures are currently mentioned.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

The proposed change adds a definition for clarity along with a pointer for code coordination.

Internal ID: 311

G325

Committee Action: **Disapproved**

Committee Reason: This requirement is very limiting and doesn't allow for the alternatives that are regularly applied in the field. The language in the 2018 code extends these requirements to occupant elevators. In buildings with fire service elevators, the owners often would like them to serve multiple uses and we cannot preclude the idea that there will be other occupants in them, which drags accessibility into the mix. (Vote: 14-0)

Assembly Motion: **NONE**

G145-18

Committee Action: **Disapproved**

Committee Reason: This provision for elevator hoistway pressurization are now voluntary in lieu of providing elevator lobbies. Putting these requirements in the smoke proof enclosure requirements would create confusion. The code is clear right now regarding what protection is required outside of elevator hoistways and machine rooms and those areas are already protected. This would lead to subjective application of the code. (Vote: 13-1)

Assembly Motion: **NONE**

G146-18

Committee Action: **Approved as Submitted**

Committee Reason: This is a necessary change for correlation based on previous committee actions on the tall wood provisions. (Vote: 14-0)

Assembly Motion: **NONE**

G147-18

Committee Action: **Approved as Modified**

Committee Modification:

3103.1 General. The provisions of Sections 3103.1 through 3103.4 shall apply to structures erected for a period of less than 180 days. ~~Tents~~ Special event structures, tents, umbrella structures and other membrane structures erected for a period of less than 180 days shall also comply with the International Fire Code. Those erected for a longer period of time shall comply with applicable sections of this code.

Committee Reason: The committee approved the modification as it alleviated concerns regarding temporary structures. The committee approved the proposal based on the proponent's reason statement. (Vote: 14-0)

Assembly Motion: **NONE**

G148-18

Committee Action: **Approved as Submitted**

Committee Reason: Based on the proponents published reason and the fact that this proposal clarifies the code. (Vote: 13-1)

Assembly Motion: **NONE**

G149-18

Committee Action: **Disapproved**

Committee Reason: This proposal has some merit, but the language is too loose. "Public" could mean any building that is considered public in the Americans with Disabilities Act. "Governmental entities" may be a better term. (Vote: 9-

Bibliography: The ANSI standard is already referenced in the IFC and is widely available.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This code change merely correlate standards and reflects the State of the practice.

Public Comment# 1294

Public Comment 2:

IBC®: (New), 1609.1.1, 1613.1, 3103.1, 3103.1.1, 3103.5 (New), 3103.6 (New), ASCE/SEI Chapter 35 (New), ESTA (New)

Proponents:

Richard Nix, representing Entertainment Services and Technology Association (ESTA), and Event Safety Alliance (ESA) (rnix@zoomtown.com)

requests As Modified by Public Comment

Modify as follows:

2018 International Building Code

TEMPORARY SPECIAL EVENT STRUCTURE: Any temporary ground-supported structure, platform, stage, stage scaffolding or rigging, canopy, tower supporting audio or visual effects equipment or similar structures.

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapters 26 to 30 of ASCE 7. The type of opening protection required, the basic design wind speed, V , and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AWC WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting structures and antennas, provided that the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with ASCE 49 and Sections 31.4 and 31.5 of ASCE 7.
7. ~~Temporary special~~ Special event structures complying with Section 3103.5.5.

The wind speeds in Figures 1609.3(1) through 1609.3(8) are basic design wind speeds, V , and shall be converted in accordance with Section 1609.3.1 to *allowable stress design* wind speeds, V_{asdh} , when the provisions of the standards referenced in Exceptions 4 and 5 are used.

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with Chapters 11, 12, 13, 15, 17 and 18 of ASCE 7, as applicable. The *seismic design category* for a structure is permitted to be determined in accordance with Section 1613 or ASCE 7.

Exceptions:

1. Detached one- and two-family dwellings, assigned to *Seismic Design Category* A, B or C, or located where the mapped short-period spectral response acceleration, S_S , is less than 0.4 g.
2. The seismic force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.
5. References within ASCE 7 to Chapter 14 shall not apply, except as specifically required herein.
6. ~~Temporary special~~ Special event structures complying with Section 3103.5.

3103.1 General. The provisions of Sections 3103.1 through ~~3103.4~~ 3103.5 shall apply to structures erected for a period of less than 180 days. Tents, umbrella structures and other membrane structures erected for a period of less than 180 days shall comply with the International Fire Code. Those erected for a longer period of time shall comply with applicable sections of this code.

3103.1.1 Conformance. Temporary structures and uses shall conform to the structural strength, ~~durability~~, fire safety, *means of egress*, accessibility, light, *ventilation* and sanitary requirements of this code as necessary to ensure public health, safety and general welfare.

3103.5 Structural. The structural design for temporary structures shall comply with the requirements in Chapter 16. ~~Temporary special~~ Special event structures erected outdoors for a period of not more than six consecutive weeks shall be designed and erected to comply with requirements of ESTA-ANSI E1.21 as well as the lateral forces in ASCE 37.

3103.6 Durability and maintenance. A qualified person shall inspect ~~temporary special event structures~~, including components, when purchased or acquired and at least once per year, based on the requirements in ESTA-ANSI E1.21. Inspection records shall be kept and shall be made available for verification by the building official. Additionally, ~~temporary special event structures~~ shall be inspected at regular intervals when in service to ensure that the structure continues to perform as designed and initially erected.

37-14: Design Loads on Structures during Construction

ESTA

Entertainment Services and Technology
Association
630 Ninth Avenue, Suite 609
New York NY 10036
US

ANSI E1.21—2013: *Entertainment Technology: Temporary Ground-Supported Overhead Structures Used to Cover the Stage Areas and Support Equipment in the for Technical Production of Outdoor Entertainment Events*

Commenter's Reason: 1. The proposed definition is not necessary because a new definition for "Special Event Structure" has already been approved for inclusion in the IBC as a result of CCP G147-18.

2. Revise the proposed change to 1609.1.1 exception 7 to use the defined term as per CCP G147-18, and to correct an editorial reference to the newly proposed section 3103.5

3. Revise the proposed change to 1613.1 exception 6 to use the defined term as per CCP G147-18.

4. Revise existing wording in section 3103.1 to be inclusive of the newly proposed section 3103.5

5. Revise the proposal such that NO CHANGE is made to the existing wording of section 3103.1.1

6. Revise the wording of the proposed new section 3103.5 to use the defined term approved as a result of CCP G147-18, and to remove the proposed reference to ASCE 37-14.

7. Delete the proposed section 3103.6 from the proposal. It is not necessary. Inspections are addressed in ANSI E1.21.

8. Delete the proposed reference to ASCE/SEI 37-14.

The single objection made during CAH indicated that ASCE 37-14 is not intended to be used for temporary structures, yet it is interesting to note that its scope and associated commentary for Chapter 6 are clear that it is for use with temporary structures, as shown in the ASCE 37-14 commentary text:

This section deals with special issues of construction and temporary structures for which the basic procedures of ASCE 7-10 (ASCE/SEI 2010) are to be modified.

The environmental loads in this chapter are reduced from those in ASCE 7-10 in recognition of the anticipated lifespan of temporary structures and temporary configurations of structures under construction. Reduction to the safety of individuals is not the intent of the committee.

*Reductions of loads to the levels stated in this standard **are appropriate when loading situations can be managed through safety protocols** that limit access to hazardous locations when loadings exceed those used for temporary designs, and when loadings, including environmental loadings, can be limited (e.g., by timely snow removal) proactively. The knowledge and training of personnel in control of construction sites, the visible nature of construction elements, and the processes on construction sites are key components of protocols necessary to control of risk to personnel and property on the construction site. Risks to personnel and property adjacent to the construction site also warrant attention.*

There is a clear distinction between "construction" and "temporary structures", though the principles used to support load reductions based on duration of exposure are exactly the same. It is also interesting to note that the structures covered by ASCE 37-14 include scaffold and shoring structures, such as those used during construction of buildings and renovation of existing buildings, where they might be built over sidewalk areas that are accessible to the public. Arguments made during the CAH included assertions that ASCE 37-14 is to be used only when personnel are trained, which is also clearly addressed in ANSI E1.21 as part of its Operations Management Plan requirements. This comment asks to remove that reference from the proposal in order to alleviate that concern.

9. Revise the title of the referenced ANSI Standard as indicated. The ANSI designation is correct, but the title has been incorrectly transcribed into the ICC references. The standard (ANSI E1.21-2013) is an approved reference. (see staff note)

General commentary:

This proposal satisfies a stated ICC goal to attain better correlation between IFC and IBC. These structures have been important topics for the last two code cycles, as evidenced by the major overhaul of IFC Chapter 31 to accommodate special events and their associated structures. However, the IFC cannot adequately address structural requirements, so the simple changes requested by the proposal are necessary to better achieve overall coverage. Guidance for these structures has - until now - been essentially non-existent, so any review and approval under code purview can only be accomplished using the "Alternative Methods" approach, which drastically increases the amount of time, paperwork and resources necessary to validate conformance. This proposal reduces the amount of time and resources required to properly review and approve the structures, by introducing a recognized reference standard, ANSI E1.21, that has been an approved, consensus developed standard since 2006. It contains structural design requirements, it has been, and is now, widely used in the structural engineering community, among those who perform work on these types of structures. Many of the engineers who developed and use this standard also testified in support of the proposal at the CAH.

Questions arose during CAH testimony regarding inspections. The intent is to require inspections, however the further intent is to allow the code official the flexibility to designate who is authorized to perform such inspections. In cases where the jurisdiction has such resources, they would perform the inspection as usual, but in jurisdictions where they do not have such resources it is acceptable and reasonable to designate a 3rd-party inspector. This is addressed in ANSI E1.21. Questions also arose during CAH regarding "who is responsible". ANSI E1.21 is explicit about the responsibilities of the "designated person", who must meet the following criteria in accordance with the requirements of ANSI E1.21:

- ...has overall responsibility on-site for the temporary structure;
- ...shall have knowledge of the engineering documentation for the temporary structure's components and configurations in use;
- ...shall develop a risk assessment plan for each use, and shall provide instruction for the safe erection, use and dismantling of the temporary structure.

- ...shall prepare layout drawings consistent with the engineering documentation.

It was clear from the number and types of questions asked during the CAH that the committee was generally receptive to the proposal's intent of treating temporary structures for special events differently, and agreed that there was a deficiency in the code relating to the proposal's subject matter. Of greater importance is the reality that the number and size of special events in general - particularly those with structures - is growing significantly. The impact of this growth is clearly recognized in the current IFC's expansion of its Chapter 31 scope and coverage.

For Reference CCP G147:

- IBC Definitions - Temporary Special Event structures IBC: 3103.1, 202 (New) Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance (rnix@zoomtown.com) 2018 International Building Code 3103.1 General. The provisions of Sections 3103.1 through 3103.4 shall apply to structures erected for a period of less than 180 days. TentsSpecial event structures, tents, umbrella structures and other membrane structures erected for a period of less than 180 days shall also comply with the International Fire Code. Those erected for a longer period of time shall comply with applicable sections of this code. Add new definition as follows: SPECIAL EVENT STRUCTURE. Any ground-supported structure, platform, stage, stage scaffolding or rigging, canopy, tower or similar structure supporting entertainmentrelated equipment or signage. Reason: These structures are covered under the scope of IBC Chapter 31, Special Construction. IBC Section 3103 addresses installations <180 days, which are considered "temporary". Temporary tents, any type of membrane covered structure and special events structures are therefore within the scope of IBC Chapter 31, section 3102 and/or section 3103. All of these structures except special event structures are referred to IFC Chapter 31. The IFC has added new requirements in Chapter 31 for special events structures, therefore special event structures must also be referred from IBC Chapter 31 to IFC Chapter 31. Building Code Officials and others using the IBC as a primary code reference require the proper guidance and direction to IFC Chapter 31. In the last code change cycle, F308-16 replaced the IFC term temporary stage canopy with the term temporary special events structure. Therefore, Temporary special events structures are now covered under the purview of IFC Chapter 31. Coordination with IBC Chapter 31 was both implied and intended to occur as a result of F308-16, due to the special construction and temporary characteristics of these structures. However, that coordination did not occur. This CCP ensures proper coordination between IFC and IBC as intended in the last code change cycle. This proposed definition for Special Events Structures in IBC is slightly different than that used in IFC, because the word "temporary" is implied by the corresponding IBC section 3103, where these structures are currently mentioned. Cost Impact The code change proposal will not increase or decrease the cost of construction. The proposed change adds a definition for clarity along with a pointer for code coordination.

Please support the change proposal and this public review comment.

Bibliography: ANSI E1.21 is already an approved reference standard in the IFC. It is available for free download at https://tsp.esta.org/tsp/documents/published_docs.php

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

This proposal decreases the cost of construction by reducing or eliminating the need for additional time and resources necessary to validate an Alternate Methods design approach, by providing clear guidance to appropriate reference standards.

IRC®: R104.11, R104.11.1 (New), R104.11.1.1 (New), R104.11.2, R106.3.1.1 (New), 202 (New)

Proposed Change as Submitted

Proponents: Michael Savage, representing Compliance Code Action Committee (CCAC) (ccac@iccsafe.org)

2018 International Residential Code

R104.11 Alternative materials, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code. The *building official* shall have the authority to approve an alternative material, design or method of construction upon application of the owner or the owner's authorized agent. The *building official* shall first find that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety. Compliance with the specific performance-based provisions of the International Codes shall be an alternative to the specific requirements of this code. Where the alternative material, design or method of construction is not *approved*, the *building official* shall respond in writing, stating the reasons why the alternative was not *approved*.

Add new text as follows:

R104.11.1 Research reports. Supporting data, where necessary to assist in the approval of materials or assemblies not specifically provided for in this code, shall consist of valid research reports from *approved sources*.

R104.11.1.1 Approved sources. Agencies conducting product certification or product evaluation shall be accredited by an accreditation body. The scope of accreditation shall include the acceptance criteria referenced in the research report, for the research report to be accepted for product approval.

Revise as follows:

~~**R104.11.1**~~ **R104.11.2 Tests.** Where there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the *building official* shall have the authority to require tests as evidence of compliance to be made at no expense to the *jurisdiction*. Test methods shall be as specified in this code or by other recognized test standards. In the absence of recognized and accepted test methods, the *building official* shall approve the testing procedures. Tests shall be performed by an *approved* agency. Reports of such tests shall be retained by the *building official* for the period required for retention of public records.

Add new text as follows:

R106.3.1.1 Third-party certification. Products and materials required by the code to be in compliance with a referenced standard shall be *certified* by a *third-party certification agency* as complying with the referenced standards. Products and materials shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

Add new definition as follows:

ACCREDITATION BODY. An approved, third-party organization that is independent of the grading, product certification and inspection agencies that initially accredit and subsequently monitors agencies conducting building product certification or evaluation schemes on a continuing basis, including the competency and performance of a grading or inspection agency related to carrying out specific tasks.

Reason: The standard practice in building products conformity assessment involves accreditation of the agencies by an accreditation body such as ISO. Third party testing, manufacturing inspections and product certification or product evaluation provide a higher level of quality assurance on these activities for the building official. Approved sources that issue research reports must be accredited to the specific acceptance criteria referenced in the research report. This ensures that the approved sources have the requisite technical expertise and experience to conduct such activities on behalf of the building official. Harmonized language is proposed for inclusion a new Section R106.3.1.1 regarding third-party certification, and in Chapter 2 with a definition for accreditation body. A definition for Third-Party Certification Agency already exists in the IRC and remains unchanged. The language in the new Section R106.3.1.1 is identical to language in the International Plumbing Code Section 303.4. The added definition is the same as that proposed for inclusion in the International Building Code. These additions will improve the consistency and intent of the I-codes.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal coordinates the codes.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This would require every product to have a listing with a large cost impact. Some standards do not require testing. Every engineer and agency would require certification. This would limit innovation. This hamstring the ability of code officials to approve alternatives. The code official already has the right to choose what credentials are required in Section R104.9 so this proposal is unnecessary. (Vote: 11-0)

Assembly Action:

None

RB1-19

Individual Consideration Agenda

Public Comment 1:

IRC®: R104.11.1.1 (New), R106.3.1.1 (New)

Proponents:

Michael Savage, representing Compliance Code Action Committee (CCAC) (ccac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

R104.11.1.1 Approved sources for product certification or product evaluation. ~~Agencies conducting product certification or product evaluation shall be accredited by an accreditation body. The scope of accreditation shall include the acceptance criteria referenced in the research report, for the research report to be accepted for product approval. Product certification and product evaluations shall be performed by agencies that are accredited by an accreditation body or shall be performed by registered design professionals. The scope of accreditation shall include the standard or acceptance criteria referenced in the research report, for the research report to be accepted for product approval.~~

~~**R106.3.1.1 Third-party certification.** Products and materials required by the code to be in compliance with a referenced standard shall be certified by a third-party certification agency as complying with the referenced standards. Products and materials shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.~~

Commenter's Reason: Comments were received that the section "Approved Sources" conflicts with the definition of "Approved Source" elsewhere in the code. The section title was revised and clarified to pertain specifically to agencies conducting product certification and product evaluation.

Comments were received that in some cases, registered design professionals may already do product certification or product evaluation for certain types of building products. The text was revised to include registered design professionals.

Comments were received that the term "acceptance criteria" was limiting. This is not the case, as the term "acceptance criteria" already appears many times throughout the code, and the meaning is well understood. "Standards" were added alongside "acceptance criteria", as research reports may be based on standards or acceptance criteria.

Comments were received that requiring third-party certification by third-party certification agencies would create an undue burden and was not necessary for all building products in the code. The third-party certification requirement is consequently deleted. The definition for third-party certification agency is currently in the code and shall remain.

The new definition for "Accreditation Body" is consistent with the revised definition in ADM23-19 Part II.

For the reasons above, we strongly encourage overturning the committee and approving the code change as modified by this public comment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The public comment removes the requirement for third party certification.

Public Comment# 1469

Proposed Change as Submitted

Proponents: Lee Schwartz, representing Self (lee@hbaofmichigan.com)

2018 International Residential Code

Revise as follows:

R105.2 Work exempt from permit. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. One-story detached *accessory structures*, provided that the floor area does not exceed 200 square feet (18.58 m²).
2. Fences ~~not over 7 feet (2134 mm) high.~~
3. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge.
4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
5. Sidewalks and driveways.
6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
8. Swings and other playground equipment.
9. Window awnings supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
10. Decks not exceeding 200 square feet (18.58 m²) in area, that are not more than 30 inches (762 mm) above *grade* at any point, are not attached to a dwelling and do not serve the exit door required by Section R311.4.

Electrical:

1. *Listed* cord-and-plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Electrical wiring, devices, *appliances*, apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
5. Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical *equipment* to *approved* permanently installed receptacles.

Gas:

1. Portable heating, cooking or clothes drying *appliances*.
2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Mechanical:

1. Portable heating *appliances*.
2. Portable ventilation *appliances*.
3. Portable cooling units.
4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.

5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
6. Portable evaporative coolers.
7. Self-contained refrigeration systems containing 10 pounds (4.54 kg) or less of refrigerant or that are actuated by motors of 1 horsepower (746 W) or less.
8. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Reason: The International Residential Code contains no definition of “fence”, no listing of “fence” in the index and no sections or subsections specifically governing the material, design or method of construction for a fence. In short there are no specific code requirements for fences found in the International Residential Code. This leaves permit applicants to searching in vain thorough the entire IRC to find requirements for the construction of a fence when none exist. It also places inspectors in the unenivable position of having to inspect fences for which a permit was pulled without any criteria for approving the fence construction. How can a building official write a violation notice when there are no pertinent requirements to base the notice on?

While the IRC does contain an exemption for fences not over 7 feet high. This is an arbitrary number chosen for convenience and without without any data to back it up. Is a fence that is 7 feet two inches inherently more dangerous to the publis health, safety and general welfare than a fence that is 6 feet 11 1/2 inches?

The purpose of the code is to establish minimum requirements to safeguard the public safety, health and general welfare. Mandating the issuance of a construction permit for fences when no minimum requirements are specifically present in the code book does not safeguard the public safety, health and general welfare.

Requiring a permit for a fence, even with the under seven feet exeption, simply because the code states you must have a permit aqnd without any standards is exactly the type of overreach which leads to people not pulling permits on other, more critical, construction.

In most jurisdictions, requirements for fences have been treated as a zoning issue with zoning ordinances controlling the size, type, materials and manner of construction for a fence. The requirment for a fence permit should be totally removed from the IRC and left to local zoning.

Cost Impact: The code change proposal will decrease the cost of construction by eliminating an unnecessary permit and the fee for that permit.

RB2-19

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: There are no prescriptive requirements in the IRC for fences. This exempts requirements for permits. It does not exempt code requirements. If something needs to be regulated by the code, the code official still has the authority. It just exempts inspections. Many jurisdictions regulate fences over a certain height and that is a local issue.

In opposition: In some jurisdictions, fences are usually built of masonry and are very heavy and present structural concerns. This could allow tall fences without permits. Fences in general would be more appropriately addressed by zoning or municipal engineering requirements and the IRC is not the place to address them.

1. *Listed* cord-and-plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Electrical wiring, devices, *appliances*, apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
5. Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical *equipment* to *approved* permanently installed receptacles.

Gas:

1. Portable heating, cooking or clothes drying *appliances*.
2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.

3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Mechanical:

1. Portable heating *appliances*.
2. Portable ventilation *appliances*.
3. Portable cooling units.
4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.
5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
6. Portable evaporative coolers.
7. Self-contained refrigeration systems containing 10 pounds (4.54 kg) or less of refrigerant or that are actuated by motors of 1 horsepower (746 W) or less.
8. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

[RB] FREESTANDING WALL. A man-made structure built of rock, block, timber, concrete or similar material that does not directly support retained material or serve as a facing of a cut slope. This definition does not include standard wooden privacy fences as used in residential applications.

Commenter's Reason: This public comment adds a new definition to differentiate free standing walls from fences. By doing this, the fences that were the concern of the original proponent will not require a permit until they exceed eight feet, thereby allowing most common residential fences. The free standing walls that present a higher earthquake hazard will require permits when over four feet and constructed of heavier materials. This will help to protect the safety of the dwelling occupants and pedestrians. In most moderate to major earthquakes extensive damage to, and collapse of, free standing walls is observed. The photos below are of partially collapsed six foot high walls in the recent Searles Valley (Ridgecrest) Earthquake. This is an example of a common residential free standing wall that could cause harm.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This change will probably increase the cost of construction for heavy walls, but the increase in design and inspection will also improve the safety and durability of the walls.

Public Comment# 1464

Proposed Change as Submitted

Proponents: Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

2018 International Residential Code

Add new definition as follows:

BUILDING DESIGNER. The owner of the building or the person that contracts with the owner for the design of the building structural system or who is responsible for the preparation of the construction documents. Where required by the statutes of the jurisdiction in which the project is to be constructed, the building designer shall be a registered design professional.

Reason: The title "building designer" is currently used twice within the IRC, in Section R502.11.4 and Section R802.10.1. In each of the two sections, "building designer" refers to a person who is qualified and responsible for designing the size, connections, and anchorage of the permanent continuous lateral bracing. Therefore, a definition of the title providing the qualifications of the individual is necessary. Furthermore, nearly every State allows for individuals other than "registered design professionals" to prepare construction drawings for those buildings covered under the scope of the IRC. Therefore, it is essential to the correct interpretation of the code that the title "building designer" is clarified by definition to avoid potential confusion and misinterpretation of the actual qualifications and prerequisites required of those individuals given the responsibility to design one- and two-family dwellings and townhouses.

Standard ANSI/TPI 1 includes a definition of "building designer" and this proposal largely mirrors the ANSI/TPI 1 definition with a small deviation to remain consistent with verbiage in Section R106.1.

Standard ANSI/TPI 1 is a nationally developed consensus standard referenced by the IRC. Therefore, it makes logical sense to include the currently accepted definition of "building designer" for clarity, for consistency, and to avoid referencing two separate documents for the same information.

References:

"ANSI/TPI 1, 2.2 Definitions:

***Building Designer:** The owner of the building or the Person that contracts with the Owner for the design of the Building Structural System and/or who is responsible for the preparation of the Construction Documents. When mandated by the Legal Requirements, the Building Designer shall be a Registered Design Professional."*

"Section R106.1 Submittal Documents

...The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed..."

"R502.11.4 Truss design drawings.

*11. Maximum axial compression forces in the truss members to enable the **building designer** to design the size, connections and anchorage of the permanent continuous lateral bracing. Forces shall be shown on the truss drawing or on supplemental documents."*

"R802.10.1 Truss design drawings.

*11. Maximum axial compression forces in the truss members to enable the **building designer** to design the size, connections and anchorage of the permanent continuous lateral bracing. Forces shall be shown on the truss design drawing or on supplemental documents."*

Bibliography: ANSI/TPI 1 - 2014, August 27, 2014, Truss Plate Institute, Alexandria, VA

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal does not change the current practice of building design, or who is qualified to perform the task.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The second sentence is unnecessary. This definition is already covered in the definition of registered design professional. This would create potential conflicts with the IRC and state laws. This is confusing and needs work. (Vote: 9-2)

Assembly Action:

None

RB5-19

Individual Consideration Agenda

Public Comment 1:

IRC®: 202 (New)

Proponents:

Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

BUILDING DESIGNER. ~~The owner of the building or the person that contracts with the owner responsible for the design of the building's structural system or who is responsible for the preparation of the construction documents. Where required by the statutes of the jurisdiction in which the project is to be constructed, the building designer shall be a registered design professional.~~

Commenter's Reason: This proposal has been reworded in an effort to address the following concerns expressed by the committee upon disapproval.

- The second sentence is unnecessary.
- This is confusing and needs work.

However, I strongly disagree with the committee's position that, "This definition is already covered in the definition of a *registered design professional*." On the contrary, **this definition focuses on the function of an individual** rather than referencing only statutory requirements, which is what the definition of a *registered design professional* does.

Moreover, although both titles are used within the IRC, a *registered design professional* may be a *building designer*, but a building designer **may not have to be** a *registered design professional*. This is a distinct difference and this proposal is intended to make it clear that when the title *building designer* is used, the latter scenario may typically be the case.

I also disagree with the committee's statement, "This would create potential conflicts with the IRC and state laws." This is an example of the confusion, or bias, within the industry that this proposal seeks to clarify. Nearly every state statute allows for **persons other than registered design professionals** to design single-family dwellings, townhouses covered by the IRC are also included in the majority of states. Section 106.1 of the IRC recognizes this.

The American Institute of Building Design encourages the approval of this submittal as modified by this public comment.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. There is no cost impact, the intent of the proposal is to provide clarification, only.

Public Comment# 1803

Proposed Change as Submitted

Proponents: Lucas Pump, representing Self (l.pump@cedar-rapids.org)

2018 International Residential Code

Revise as follows:

[RB] CRAWL SPACE. An unfinished underfloor space that is not a basement.

Reason: The current definition for "crawl space" is too broad. According the current definition, I could walk into the main level of a 2-story house, and stand in the living room, and I could call that area a "crawl space". I would be under the floor of the second floor, and not in a basement, but I believe that we could all agree that this 1st floor is not a "crawl space". So, adding this additional language helps define the space better.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is just clarification of the definition, and should not have a cost impact.

RB7-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee is unsure what the term "unfinished" means. The proposal is not consistent with the intent indicated in the proponent's reason statement. (Vote: 11-0)

Assembly Action:

None

RB7-19

Proponents:

Lucas Pump, representing Self (l.pump@cedar-rapids.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

[RB] CRAWL SPACE. An ~~unfinished~~ underfloor space that is not a basement and is not habitable space.

Commenter's Reason: After listening to the reason from the Committee Action Hearings, I believe that this change to "is not habitable space" is better than "unfinished". The primary reason was that the committee didn't like "unfinished" because to was not well defined. But, I think "not habitable space" would put the area into a category of a normally unoccupied and/or uninhabitable space which is currently well defined. As stated previously, the current definition for "crawl space" is too broad. According the current definition, I could walk into the main level of a 2-story house, and stand in the living room, and I could call that area a "crawl space". I would be under the floor of the second floor, and not in a basement, but I believe that we could all agree that this 1st floor is not a "crawl space". So, adding this additional language helps define the space better.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This is just clarification of the definition which is currently very vague, and should not have a cost impact.

RB10-19

IRC®: [RB] 202

Proposed Change as Submitted

Proponents: Thomas Meyers, representing Self (codeconsultant@gmail.com)

2018 International Residential Code

Revise as follows:

[RB] FIRE SEPARATION DISTANCE. The distance measured from the building face to one of the following:

1. To the closest interior *lot line*.
2. To the centerline of a street, an alley or public way.
3. ~~To an imaginary line between two buildings on the lot.~~

The distance shall be measured at a right angle from the face of the wall.

Reason: The definition for fire separation distance is identical to that in the IBC. Unlike the IBC, the IRC does not have a requirement to use an "imaginary line" for fire separation distance assessment. It's retention in the definition creates confusion and should therefore be eliminated.

Cost Impact: The code change proposal will decrease the cost of construction

Elimination of unnecessary and confusing language may result in cost reductions where the imaginary line was erroneously applied.

RB10-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There are many cases where we basically eliminate fire separation distance requirements for dwelling units, accessory buildings, etc. But we do get multiple IRC buildings and sometimes IBC mixed uses on the same lot and without the concepts of fire separation distance and "imaginary line" the code does not work. No workable alternative has been provided. The original language provides a level of safety for multiple buildings on the same lot. (Vote: 11-0)

Assembly Action:

None

IRC®: [RB] 202, R302.1, R302.1.1 (New)

Proponents:

David Renn, PE, SE, City and County of Denver, representing Code Change Committee of Colorado Chapter of ICC (david.renn@denvergov.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

[RB] FIRE SEPARATION DISTANCE. The distance measured from the building face to one of the following:

1. To the closest interior *lot line*.
2. To the centerline of a street, an alley or public way.

3. To an imaginary line between two buildings on the lot.

The distance shall be measured at a right angle from the face of the wall.

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1(1); or *dwellings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section P2904 shall comply with Table R302.1(2).

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. Walls of *individual dwelling units* and their *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

R302.1.1 Buildings on the same lot. For the purposes of determining *fire separation distance* and the requirements of Section R302.1, buildings on the same *lot* shall have an imaginary line established between them. Imaginary lines shall extend to a *lot line* or to another imaginary line.

Where a new building is to be erected on the same *lot* as an existing building, the location of the imaginary line with relation to the existing building shall be such that the existing building meets requirements of Section R302.1.

Commenter's Reason: The discussion during the committee action hearings was that there is a need to to keep the imaginary line concept in the definition of fire separation distance. Imaginary lines are necessary to establish exterior wall requirements between buildings on a lot such as two (or more) dwellings or two (or more) buildings containing townhouse units. Because of this, the original proposal to delete the imaginary line concept was appropriately disapproved by the committee. However, the hearing discussion made it apparent that there is a need to add requirements in the body of the code for establishing imaginary lines. This public comment maintains the imaginary line concept in the definition of fire separation distance and provides a new sub-section in the code to dictate where and how to establish imaginary lines. Also, this public comment addresses the condition where a new building is added to an existing lot - this is needed so a new building doesn't cause an existing building to become non-compliant with regard to fire-resistant exterior wall requirements.

It should be noted that Exception 2 to Section R302.1 (which is included in this public comment for reference only) exempts walls between dwelling units and their accessory structures from fire-resistant exterior wall requirements and this public comment does not change this. Even though an imaginary line is established between these buildings, Exception 2 still applies and the imaginary lines are not used.

I urge your support of this public comment that brings clarity to the code by adding requirements for establishing imaginary lines between buildings on the same lot. This is an improvement that will bring consistent interpretation and enforcement of fire-resistant exterior wall requirements for buildings on the same lot.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This public comment simply clarifies current code requirements, so there should be no change in the cost of construction.

RB11-19

Proposed Change as Submitted

Proponents: Donald Sivigny, representing State of MN and Association of Minnesota Building Officials (don.sivigny@state.mn.us)

2018 International Residential Code

Add new definition as follows:

[RB] Flashing. A non-corrosive, water-resistant material, installed to resist water entry, and direct water away from or out of the building assembly.

Reason: There is a need to prevent water from seeping in and causing damage to the home's walls, ceilings and other assemblies. This water is causing structural damage to the home, or creating moisture and mold problems throughout the home. This form of protection is a necessary construction practice, and it's widely applied to commercial, residential and industrial structures within the industry. Therefore, there is a need to define flashing

Cost Impact: The code change proposal will not increase or decrease the cost of construction
There is no Cost Impact with this Change

RB11-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There is no qualification for water resistance. This proposal conflicts with Section R507.2.4, which requires "metal." The committee encourages the proponent to work on the application of other materials. (Vote: 11-0)

Assembly Action:

None

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

[RB] Flashing. A ~~non-corrosive~~ corrosion-resistant, water-resistant material or system, installed to resist water entry, and direct water away from or out of the building assembly.

Commenter's Reason: The term "flashing" appears over in 50 sections of the IRC. As described in these sections of the code, flashing is required to prevent water from entering the interior of a building at roof/wall penetrations, the perimeter of windows and doors, etc. Traditionally, flashing is thought of as metal. However, innovation has brought to the market non-metal flashings such as butyl and acrylic tapes and liquid-applied products that meet the criteria for preventing water penetration. The use of a combination of materials has resulted in flashing systems, in which the individual components are tested along with the entire system and found to meet the applicable performance criteria.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is simply adding a definition where none existed before, without creating any new technical requirements at all.

IRC®: [RB] 202 (New)

Proposed Change as Submitted

Proponents: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Residential Code

Revise as follows:

[RB] GRADE FLOOR EMERGENCY ESCAPE AND RESCUE OPENING. ~~A window or other~~ An emergency and escape and rescue opening located such that the ~~sill~~ height of the bottom of the clear opening is not more than 44 inches (1118 mm) above or below the finished ground level adjacent to the opening. (See also "Emergency escape and rescue opening.")

Reason: This definition is used only in Section IRC R310.2.1. The change to the definition is so it matches how it will be used in the technical criteria. What is a 'sill' is not clear – the modification is for consistency with technical criteria. It is important to indicate that this is to the bottom of the opening (otherwise a below grade window could be very deep). See also revisions to IRC R310.2.1. There was a similar proposal approved for Group A for IBC - G4-18(AS).

This is one of a series of proposals to coordinate the requirements for emergency escape and rescue openings in the IBC and IRC. While independent issues, if all the proposals are approved, the IRC section would appear as indicated in the reason for the proposal to revise the definition – emergency escape and rescue openings.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a coordination item for requirements for EEROs already permitted between the codes.

RB14-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The language change in the definition needs to be changed in the body of the code as well in each instance it occurs. This is a good concept that could be addressed in the public comment period. (Vote: 11-0)

Assembly Action:

None

RB14-19

Individual Consideration Agenda

Proponents:

Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

[RB] EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or similar device that provides for a means of escape and access for rescue in the event of an emergency. (See also "Grade floor emergency escape and rescue opening.")

[RB] GRADE FLOOR EMERGENCY ESCAPE AND RESCUE OPENING. An emergency escape and rescue opening located such that the height of the bottom of the clear opening is not more than 44 inches (1118 mm) above or below the finished ground level adjacent to the opening. (See also "Emergency escape and rescue opening.")

R310.2 Emergency escape and rescue openings. Emergency escape and rescue openings shall have minimum dimensions as specified in this section.

R310.2.1 Minimum opening area. Emergency and escape rescue openings shall have a net clear opening of not less than 5.7 square feet (0.530 m²). The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. The net clear height of the opening shall be not less than 24 inches (610 mm) and the net clear width shall be not less than 20 inches (508 mm).

Exception: *Grade floor emergency escape and rescue openings or below-grade openings* shall have a net clear opening area of not less than 5 square feet (0.465 m²).

Commenter's Reason: This public comment addresses the concern the code committee had at the Committee Action Hearings held in Albuquerque NM by revising the defined term in the other two locations of the IRC where the term exists.

This public comment is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Since 2017 the BCAC has held 6 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-actioncommittee-bcac>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is a coordination item for requirements for EEROs already permitted between the codes.

Public Comment# 1246

RB20-19

IRC®: (New)

Proposed Change as Submitted

Proponents: Donald Sivigny, State of Minnesota, representing State of MN and Association of Minnesota Building Officials
(don.sivigny@state.mn.us)

2018 International Residential Code

Add new definition as follows:

PORCH. An open, screened, or glazed, one story portion of a building that is separated by a thermal envelope, and has a space conditioning system exceeding 3.4 Btus or 1 watt of energy use at peak operation, or that is capable of being shut off without shutting off the space conditioning system to other areas of the building.

Reason: *There is no industry standard language as to what a porch is defined as. Many times a deck becomes a porch and then actually becomes conditioned space. The code does define decks and conditioned spaces but not a porch. Therefore there is a need for a definition of what a porch actually is. This language is very similar to the same language used to define a sunroom, in the code with some modifications*

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase the cost of construction and may actually decrease the costs because it creates a consistent definition of what a porch is, no longer do the code official and builder need to guess how it is going to be permitted, defined and built or what are the code requirements that need to be met.

RB20-19

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The changes in this proposal are not necessary. Definitions should not contain requirements. All porches are not conditioned.
(Vote: 11-0)

Assembly Action:

None

RB20-19

Individual Consideration Agenda

Public Comment 1:

IRC®: (New)

Proponents:

Ann Houske Jacklitch, representing AMBO IRC Code Committee (ajacklitch@maplegrovern.gov)

requests As Modified by Public Comment

Modify as follows:

2018 International Residential Code

PORCH. ~~An open, screened, or glazed, one story unconditioned portion of a building, that is separated by a thermal envelope, and has a space conditioning system exceeding 3.4 Btus or 1 watt of energy use at peak operation, or that is capable of being shut off without shutting off the space conditioning system to other areas of the building.~~

Commenter's Reason: We have removed the references to conditioned spaces and number of stories. Conditioned spaces are regulated as additions or sunrooms, rather than as porches, and porches can be multi-story.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The code change proposal will not increase the cost of construction and may actually decrease the cost because it creates a consistent definition of what a porch is.

Public Comment# 1523

RB22-19

IRC®: [RB] 202

Proposed Change as Submitted

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of Colorado Chapter of ICC
(david.renn@denvergov.org)

2018 International Residential Code

Revise as follows:

[RB] TOWNHOUSE. A single-family dwelling unit constructed in a group of three or more attached units in which each unit extends from foundation to roof and ~~with~~ has a yard or public way on not less than two sides that extends at least 50 percent of the length of each of these two sides.

Reason: The definition of "townhouse" requires a yard or public way on not less than two sides, which is intended to provide some degree of independence from the other townhouse units in a building; however, the definition does not dictate the length required for the yard or public way. This proposal requires a minimum of 50% of the length of a side to have a yard or public way, which is a reasonable amount to provide the degree of independence intended and to provide fire department access. There is a need for this requirement as configurations of townhouses can create situations with a side that has a relatively small proportion of the wall length that has a yard or public way; for example, townhouses that are configured around the corner of a townhouse building per the drawing below.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal provides a clarification to the current code requirements so it should not increase or decrease the cost of construction.

RB22-19
