~~5704.2.13.2.2~~ 5705.1.8.2.2 Out of service for 90 days.
Above-ground tanks not used for a period of 90 days shall be safeguarded in accordance with Section ~~5704.2.13.1.2~~5705.1.8.1.2 or removed in accordance with Section ~~5704.2.14~~5705.1.8.3.

Exceptions:

1. Tanks and containers connected to oil burners that are not in use during the warm season of the year or are used as a backup heating system to gas.
2. In-place, active fire protection (foam) system lines.

~~5704.2.13.2.3~~ 5705.1.8.2.3 Out of service for one year.
Above-ground tanks that have been out of service for a period of 1 year shall be removed in accordance with Section ~~5704.2.14~~5705.1.9.

Exception: Tanks within operating facilities.

~~5704.2.14~~ 5705.1.9 Removal and disposal of tanks.
Removal and disposal of tanks shall comply with Sections ~~5704.2.14.1~~5705.1.9.1 and ~~5704.2.14.2~~5705.1.9.2.

~~5704.2.14.1~~ 5705.1.9.1 Removal. Removal of above-ground and underground tanks shall be in accordance with all of the following:

1. *Flammable* and *combustible liquids* shall be removed from the tank and connected piping.
2. Piping at tank openings that is not to be used further shall be disconnected.
3. Piping shall be removed from the ground.

   Exception: Piping is allowed to be abandoned in place where the *fire code official* determines that removal is not practical. Abandoned piping shall be capped and safeguarded as required by the *fire code official*.
4. Tank openings shall be capped or plugged, leaving a $^{1}/_{8}$-inch to $^{1}/_{4}$-inch-diameter (3.2 mm to 6.4 mm) opening for pressure equalization.

5. Tanks shall be purged of vapor and inerted prior to removal.
6. All exterior above-grade fill and vent piping shall be permanently removed.

   Exception: Piping associated with bulk plants, terminal facilities and refineries.

~~5704.2.14.2~~ 5705.1.9.2 **Disposal.** Tanks shall be disposed of in accordance with federal, state and local regulations.

~~5704.2.15~~ 5705.1.10 **Maintenance.** Above-ground tanks, connected piping and ancillary equipment shall be maintained in a safe operating condition. Tanks shall be maintained in accordance with their listings. Damage to above-ground tanks, connected piping or ancillary equipment shall be repaired using materials having equal or greater strength and *fire resistance* or the equipment shall be replaced or taken out of service.

~~5704.2.7.6~~ 5705.1.11 **Repair, alteration or reconstruction of tanks and piping.**
The repair, alteration or reconstruction, including welding, cutting and hot tapping of storage tanks and piping that have been placed in service, shall be in accordance with NFPA 30. Hot work, as defined in Section 202, on such tanks shall be conducted in accordance with Section 3510.

Add new text as follows:

5705.2 Tank design, fabrication, construction, installation and protection. Design, construction, fabrication, installation and protection of tanks shall comply with Section 5705.2.1 and the following:

1. Tank Vaults shall also comply with Section 5705.2.2.
2. Aboveground tanks and protected aboveground tanks shall also comply with Section 5705.2.3.
3. Underground Tanks shall also comply with Section 5705.2.4.

Revise as follows:

~~5704.2.7~~ 5705.2.1 **Design, fabrication and construction requirements for tanks.**
The design, fabrication and construction of tanks shall comply with NFPA 30. Each tank shall bear a permanent nameplate or marking indicating the standard used as the basis of design.

~~5704.2.7.1~~ 5705.2.1.1 **Materials used in tank construction.**
The materials used in tank construction shall be in accordance with NFPA 30. The materials of construction for tanks and their appurtenances shall be compatible with the liquids to be stored.

~~5704.2.7.2~~ 5705.2.1.2 **Pressure limitations for tanks.**
Tanks shall be designed for the pressures to which they will be subjected in accordance with NFPA 30.

~~5704.2.7.3~~ 5705.2.1.3 **Tank vents for normal venting.**
Tank vents for normal venting shall be installed and maintained in accordance with Sections ~~5704.2.7.3.1~~ 5705.2.1.3.1 through ~~5704.2.7.3.5.3~~ 5705.2.1.3.5.3.

~~5704.2.7.3.1~~ 5705.2.1.3.1 **Vent lines.** Vent lines from tanks shall not be used for purposes other than venting unless *approved*.

~~5704.2.7.3.2~~ 5705.2.1.3.2 **Vent-line flame arresters and pressure-vacuum vents.**
Listed or *approved* flame arresters or pressure-vacuum (PV) vents that remain closed unless venting under pressure or vacuum conditions shall be installed in normal vents of tanks containing Class IB and IC liquids.
Vent-line flame arresters shall be installed in accordance with their listing or API 2000 and maintained in accordance with Section 21.8.6 of NFPA 30 or API 2000. In-line flame arresters in piping systems shall be installed and maintained in accordance with their listing or API 2028. Pressure-vacuum vents shall be installed in accordance with Section 21.4.3 of NFPA 30 or API 2000 and maintained in

accordance with Section 21.8.6 of NFPA 30 or API 2000.

Exception: Where determined by the *fire code official* that the use of these devices can result in damage to the tank.

~~5704.2.7.3.3~~ 5705.2.1.3.3 Vent pipe outlets. Vent pipe outlets for tanks storing Class I, II or IIIA liquids shall be located such that the vapors are released at a safe point outside of buildings and not less than 12 feet (3658 mm) above the finished ground level. Vapors shall be discharged upward or horizontally away from adjacent walls to assist in vapor dispersion. Vent outlets shall be located such that flammable vapors will not be trapped by eaves or other obstructions and shall be not less than 5 feet (1524 mm) from building openings or *lot lines* of properties that can be built on. Vent outlets on atmospheric tanks storing Class IIIB liquids are allowed to discharge inside a building where the vent is a normally closed vent.

Exception: Vent pipe outlets on tanks storing Class IIIB liquid inside buildings and connected to fuel-burning equipment shall be located such that the vapors are released to a safe location outside of buildings.

~~5704.2.7.3.4~~ 5705.2.1.3.4 Installation of vent piping.
Vent piping shall be designed, sized, constructed and installed in accordance with Section ~~5703.6~~ 5703.5. Vent pipes shall be installed such that they will drain toward the tank without sags or traps in which liquid can collect. Vent pipes shall be installed in such a manner so as not to be subject to physical damage or vibration.

~~5704.2.7.3.5~~ 5705.2.1.3.5 Manifolding. Tank vent piping shall not be manifolded unless required for special purposes such as vapor recovery, vapor conservation or air pollution control.

~~5704.2.7.3.5.1~~ 5705.2.1.3.5.1 Above-ground tanks. For above-ground tanks, manifolded vent pipes shall be adequately sized to prevent system pressure limits from being exceeded where manifolded tanks are subject to the same fire exposure.

~~5704.2.7.3.5.2~~ 5705.2.1.3.5.2 Underground tanks. For underground tanks, manifolded vent pipes shall be sized to prevent system pressure limits from being exceeded when manifolded tanks are filled simultaneously.

~~5704.2.7.3.5.3~~ 5705.2.1.3.5.3 Tanks storing Class I liquids. Vent piping for tanks storing Class I liquids shall not be manifolded with vent piping for tanks storing Class II and III liquids unless positive means are provided to prevent the vapors from Class I liquids from entering tanks storing Class II and III liquids, to prevent contamination and possible change in classification of less volatile liquid.

~~5704.2.7.4~~ 5705.2.1.4 Emergency venting.
Stationary, above-ground tanks shall be equipped with additional venting that will relieve excessive internal pressure caused by exposure to fires. Emergency vents for Class I, II and IIIA liquids shall not discharge inside buildings. The venting shall be installed and maintained in accordance with Section 22.7 of NFPA 30.

Exceptions:

1. Tanks larger than 12,000 gallons (45 420 L) in capacity storing Class IIIB liquids that are not within the diked area or the drainage path of Class I or II liquids do not require emergency relief venting.
2. Emergency vents on protected above-ground tanks complying with UL 2085 containing Class II or IIIA liquids are allowed to discharge inside the building.

~~5704.2.7.5~~ 5705.2.1.5 Tank openings other than vents.
Tank openings for other than vents shall comply with Sections ~~5704.2.7.5.1~~ 5705.2.1.5.1 through ~~5704.2.7.5.8~~ 5705.2.1.5.8.

~~5704.2.7.5.1~~ 5705.2.1.5.1 Connections below liquid level. Connections for tank openings below the liquid level shall be liquid tight.

~~5704.2.7.5.2~~ 5705.2.1.5.2 Filling, emptying and vapor recovery connections. Filling, emptying and vapor recovery connections to tanks containing Class I, II or IIIA liquids shall be located outside of buildings in accordance with Section ~~5704.2.7.5.6~~ 5705.2.1.5.6 at a location free from sources of ignition and not less than 5 feet (1524 mm) away from building openings or *lot lines* of property that can be built on. Such openings shall be properly identified and provided with a liquid-tight cap that shall be closed when not in use.Filling and emptying connections to indoor tanks containing Class IIIB liquids and connected to fuel-burning equipment shall be located at a finished ground level location outside of buildings. Such openings shall be provided with a liquid-tight cap that shall be closed when not in use. A sign in accordance with Section 5003.6 that displays the following warning shall be permanently attached at the filling location:

TRANSFERRING FUEL OTHER THAN
CLASS IIIB COMBUSTIBLE LIQUID TO
THIS TANK CONNECTION IS A VIOLATION
OF THE FIRE CODE AND IS STRICTLY
PROHIBITED

~~5704.2.7.5.3~~ 5705.2.1.5.3 Piping, connections and fittings.
Piping, connections, fittings and other appurtenances shall be installed in accordance with Section ~~5703.6~~ 5703.5.

~~5704.2.7.5.4~~ 5705.2.1.5.4 Manual gauging. Openings for manual gauging, if independent of the fill pipe, shall be provided with a liquid-tight cap or cover. Covers shall be kept closed when not gauging. If inside a building, such openings shall be protected against liquid overflow and possible vapor release by means of a spring-loaded check valve or other *approved* device.

~~5704.2.7.5.5~~ 5705.2.1.5.5 Fill pipes and discharge lines. For top-loaded tanks, a metallic fill pipe shall be designed and installed to minimize the generation of static electricity by terminating the pipe within 6 inches (152 mm) of the bottom of the tank, and it shall be installed in a manner that avoids excessive vibration.

~~5704.2.7.5.5.1~~ 5705.2.1.5.5.1 Class I liquids. For Class I liquids other than crude oil, gasoline and asphalt, the fill pipe shall be designed and installed in a manner that will minimize the possibility of generating static electricity by terminating within 6 inches (152 mm) of the bottom of the tank.

~~5704.2.7.5.5.2~~ 5705.2.1.5.5.2 Underground tanks. For underground tanks, fill pipe and discharge lines shall enter only through the top. Fill lines shall be sloped toward the tank. Underground tanks for Class I liquids having a capacity greater than 1,000 gallons (3785 L) shall be equipped with a tight fill device for connecting the fill hose to the tank.

~~5704.2.7.5.6~~ 5705.2.1.5.6 Location of connections that are made or broken. Filling, withdrawal and vapor-recovery connections for Class I, II and IIIA liquids that are made and broken shall be located outside of buildings, not more than 5 feet (1524 mm) above the finished ground level, in an *approved* location in close proximity to the parked delivery vehicle. Such location shall be away from sources of ignition and not less than 5 feet (1524 mm) away from building openings. Such connections shall be closed and liquid tight when not in use and shall be properly identified.

~~5704.2.7.5.7~~ 5705.2.1.5.7 Protection against vapor release. Tank openings provided for purposes of vapor recovery shall be protected against possible vapor release by means of a spring-loaded check valve or dry-break connections, or other *approved* device, unless the opening is a pipe connected to a vapor processing system. Openings designed for combined fill and vapor recovery shall be protected against vapor release unless connection of the liquid delivery line to the fill pipe simultaneously connects the vapor recovery line. Connections shall be vapor tight.

~~5704.2.7.5.8~~ 5705.2.1.5.8 Overfill prevention. An *approved* means or method in accordance with Section ~~5704.2.9.7.5~~ 5705.2.3.7.5 shall be provided to prevent the overfill of all Class I, II and IIIA liquid storage tanks. Storage tanks in refineries, bulk plants or terminals regulated by Section ~~5706.4~~

5707.4 or ~~5706.7~~ 5707.7 shall have overfill protection in accordance with API 2350.An *approved* means or method in accordance with Section ~~5704.2.9.7.5~~ 5705.2.3.7.5 shall be provided to prevent the overfilling of Class IIIB liquid storage tanks connected to fuel-burning equipment inside buildings.

Exception: Outside above-ground tanks with a capacity of 1,320 gallons (5000 L) or less.

~~5704.2.7.7~~ 5705.2.1.6 Design of supports.
The design of the supporting structure for tanks shall be in accordance with the *International Building Code* and NFPA 30.

~~5704.2.7.8~~ 5705.2.1.7 Locations subject to flooding.
Where a tank is located in an area where it is subject to buoyancy because of a rise in the water table, flooding or accumulation of water

from fire suppression operations, uplift protection shall be provided in accordance with Sections 22.14 and 23.14 of NFPA 30.

~~5704.2.7.9~~ 5705.2.1.8 Corrosion protection.
Where subject to external corrosion, tanks shall be fabricated from corrosion-resistant materials, coated or provided with corrosion protection in accordance with Section 23.3.5 of NFPA 30.

~~5704.2.7.10~~ 5705.2.1.9 Leak reporting and leaking tank disposition. A consistent or accidental loss of liquid, or other indication of a leak from a tank system, shall be reported immediately to the fire department, the *fire code official* and other authorities having jurisdiction. Leaking tanks shall be promptly emptied, repaired and returned to service, abandoned or removed in accordance with Section 5705.1.8 or 5705.1.9.

~~5704.2.7.10.1 Leaking tank disposition.~~
~~Leaking tanks shall be promptly emptied, repaired and returned to service, abandoned or removed in accordance with Section 5704.2.13 or 5704.2.14.~~

~~5704.2.7.11~~ 5705.2.1.10 Tank lining. Steel tanks are allowed to be lined only for the purpose of protecting the interior from corrosion or providing compatibility with a material to be stored. Only those liquids tested for compatibility with the lining material are allowed to be stored in lined tanks.

~~5704.2.10~~ 5705.2.1.11 Drainage and diking. The area surrounding a tank or group of tanks shall be provided with drainage control or shall be diked to prevent accidental discharge of liquid from endangering adjacent tanks, adjoining property or reaching waterways.

Exceptions:

1. The *fire code official* is authorized to alter or waive these requirements based on a technical report that demonstrates that such tank or group of tanks does not constitute a hazard to other tanks, waterways or adjoining property, after consideration of special features such as topographical conditions, nature of occupancy and proximity to buildings on the same or adjacent property, capacity, and construction of proposed tanks and character of liquids to be stored, and nature and quantity of private and public fire protection provided.
2. Drainage control and diking is not required for *listed* secondary containment tanks.

~~5704.2.10.1~~ 5705.2.1.11.1 Volumetric capacity. The volumetric capacity of the diked area shall be not less than the greatest amount of liquid that can be released from the largest tank within the diked area. The capacity of the diked area enclosing more than one tank shall be calculated by deducting the volume of the tanks other than the largest tank below the height of the dike.

~~5704.2.10.2~~ 5705.2.1.11.2 Diked areas containing two or more tanks.
Diked areas containing two or more tanks shall be subdivided in accordance with NFPA 30.

~~5704.2.10.3~~ 5705.2.1.11.3 Protection of piping from exposure fires. Piping shall not pass through adjacent diked areas or impounding basins, unless provided with a sealed sleeve or otherwise protected from exposure to fire.

~~5704.2.10.4~~ 5705.2.1.11.4 Combustible materials in diked areas. Diked areas shall be kept free from combustible materials, drums and barrels.

~~5704.2.10.5~~ 5705.2.1.11.5 Equipment, controls and piping in diked areas. Pumps, manifolds and fire protection equipment or controls shall not be located within diked areas or drainage basins or in a location where such equipment and controls would be endangered by fire in the diked area or drainage basin. Piping above ground shall be minimized and located as close as practical to the shell of the tank in diked areas or drainage basins.

Exceptions:

1. Pumps, manifolds and piping integral to the tanks or equipment being served, which is protected by intermediate diking, berms, drainage or fire protection such as water spray, monitors or resistive coating.

2. Fire protection equipment or controls that are appurtenances to the tanks or equipment being protected, such as foam chambers or foam piping and water or foam monitors and hydrants, or hand and wheeled extinguishers.

~~5704.2.8~~ 5705.2.2 Vaults.
Vaults shall be allowed to be either above or below grade and shall comply with Sections ~~5704.2.8.1~~ 5705.2.2.1 through ~~5704.2.8.18~~ 5705.2.2.18.

~~5704.2.8.1~~ 5705.2.2.1 Listing required.
Vaults shall be *listed* in accordance with UL 2245.

Exception: Where *approved* by the *fire code official*, below-grade vaults are allowed to be constructed on site, provided that the design is in accordance with the *International Building Code* and that special inspections are conducted to verify structural strength and compliance of the installation with the *approved* design in accordance with Section 1707 of the International Building Code. Installation plans for below-grade vaults that are constructed on site shall be prepared by, and the design shall bear the stamp of, a professional engineer. Consideration shall be given to soil and hydrostatic loading on the floors, walls and lid; anticipated seismic forces; uplifting by groundwater or flooding; and to loads imposed from above such as traffic and equipment loading on the vault lid.

~~5704.2.8.2~~ 5705.2.2.2 Design and construction.
The vault shall completely enclose each tank. There shall not be openings in the vault enclosure except those necessary for access to, inspection of, and filling, emptying and venting of the tank. The walls and floor of the vault shall be constructed of reinforced concrete not less than 6 inches (152 mm) thick. The top of an above-grade vault shall be constructed of noncombustible material and shall be designed to be weaker than the walls of the vault, to ensure that the thrust of an explosion occurring inside the vault is directed upward before significantly high pressure can develop within the vault.
The top of an at-grade or below-grade vault shall be designed to relieve safely or contain the force of an explosion occurring inside the vault. The top and floor of the vault and the tank foundation shall be designed to withstand the anticipated loading, including loading from vehicular traffic, where applicable. The walls and floor of a vault installed below grade shall be designed to withstand anticipated soil and hydrostatic loading.

Vaults shall be designed to be wind and earthquake resistant, in accordance with the *International Building Code*.

~~5704.2.8.3~~ 5705.2.2.3 Secondary containment. Vaults shall be substantially liquid tight and there shall not be backfill around the tank or within the vault. The vault floor shall drain to a sump. For premanufactured vaults, liquid tightness shall be certified as part of the listing provided by a nationally recognized testing laboratory. For field-erected vaults, liquid tightness shall be certified in an *approved* manner.

~~5704.2.8.4~~ 5705.2.2.4 Internal clearance. There shall be sufficient clearance between the tank and the vault to allow for visual inspection and maintenance of the tank and its appurtenances. Dispensing devices are allowed to be installed on tops of vaults.

~~5704.2.8.5~~ 5705.2.2.5 Anchoring. Vaults and their tanks shall be suitably anchored to withstand uplifting by ground water or flooding, including when the tank is empty.

~~5704.2.8.6~~ 5705.2.2.6 Vehicle impact protection.
Vaults shall be resistant to damage from the impact of a motor vehicle, or vehicle impact protection shall be provided in accordance with Section 312.

~~5704.2.8.7~~ 5705.2.2.7 Arrangement. Tanks shall be *listed* for above-ground use, and each tank shall be in its own vault. Compartmentalized tanks shall be allowed and shall be considered as a single tank. Adjacent vaults shall be allowed to share a common wall. The common wall shall be liquid and vapor tight and shall be designed to withstand the load imposed when the vault on either side of the wall is filled with water.

~~5704.2.8.8~~ 5705.2.2.8 Connections. Connections shall be provided to permit venting of each vault to dilute, disperse and remove vapors prior to personnel entering the vault.

~~5704.2.8.9~~ 5705.2.2.9 Ventilation.

Vaults that contain tanks of Class I liquids shall be provided with an exhaust ventilation system installed in accordance with Section 5004.3. The ventilation system shall operate continuously or be designed to operate upon activation of the vapor or liquid detection system. The system shall provide ventilation at a rate of not less than 1 cubic foot per minute (cfm) per square foot of floor area [0.00508 $m^3/(s \times m^2)$], but not less than 150 cfm (4 m^3/min). The exhaust system shall be designed to provide air movement across all parts of the vault floor. Supply and exhaust ducts shall extend to within 3 inches (76 mm), but not more than 12 inches (305 mm), of the floor. The exhaust system shall be installed in accordance with the *International Mechanical Code*.

~~5704.2.8.10~~ 5705.2.2.10 Liquid detection. Vaults shall be equipped with a detection system capable of detecting liquids, including water, and activating an alarm.

~~5704.2.8.11~~ 5705.2.2.11 Monitoring and detection. Vaults shall be provided with *approved* vapor and liquid detection systems and equipped with on-site audible and visual warning devices with battery backup. Vapor detection systems shall sound an alarm when the system detects vapors that reach or exceed 25 percent of the lower explosive limit (LEL) of the liquid stored. Vapor detectors shall be located not higher than 12 inches (305 mm) above the lowest point in the vault. Liquid detection systems shall sound an alarm upon detection of any liquid, including water. Liquid detectors shall be located in accordance with the manufacturer's instructions. Activation of either vapor or liquid detection systems shall cause a signal to be sounded at an *approved*, constantly attended location within the facility serving the tanks or at an *approved* location. Activation of vapor detection systems shall shut off dispenser pumps.

~~5704.2.8.12~~ 5705.2.2.12 Liquid removal.
Means shall be provided to recover liquid from the vault. Where a pump is used to meet this requirement, the pump shall not be permanently installed in the vault. Electric-powered portable pumps shall be suitable for use in Class I, Division 1, or Zone 0 locations, as defined in NFPA 70.

~~5704.2.8.13~~ 5705.2.2.13 Normal vents. Vent pipes that are provided for normal tank venting shall terminate not less than 12 feet (3658 mm) above ground level.

~~5704.2.8.14~~ 5705.2.2.14 Emergency vents. Emergency vents shall be vapor tight and shall be allowed to discharge inside the vault. Long-bolt manhole covers shall not be allowed for this purpose.

~~5704.2.8.15~~ 5705.2.2.15 Accessway. Vaults shall be provided with an *approved* personnel accessway with a minimum dimension of 30 inches (762 mm) and with a permanently affixed, nonferrous ladder. Accessways shall be designed to be nonsparking. Travel distance from any point inside a vault to an accessway shall not exceed 20 feet (6096 mm). At each entry point, a warning sign indicating the need for procedures for safe entry into confined spaces shall be posted. Entry points shall be secured against unauthorized entry and vandalism.

~~5704.2.8.16~~ 5705.2.2.16 Fire protection. Vaults shall be provided with a suitable means to admit a fire suppression agent.

~~5704.2.8.17~~ 5705.2.2.17 Classified area.
The interior of a vault containing a tank that stores a Class I liquid shall be designated a Class I, Division 1, or Zone 0 location, as defined in NFPA 70.

~~5704.2.8.18~~ 5705.2.2.18 Overfill protection.
Overfill protection shall be provided in accordance with Section ~~5704.2.9.7.5~~ 5705.2.3.7.5. The use of a float vent valve shall be prohibited.

~~5704.2.9~~ 5705.2.3 Above-ground tanks.
Above-ground storage of *flammable* and *combustible liquids* in tanks shall comply with Section ~~5704.2~~ 5705.1 and Sections ~~5704.2.9.1~~ 5705.2.3.1 through ~~5704.2.9.7.9~~ 5705.2.3.7.9.

~~5704.2.9.1~~ 5705.2.3.1 Existing noncompliant installations.
Existing above-ground tanks shall be maintained in accordance with the code requirements that were applicable at the time of installation. Above-ground tanks that were installed in violation of code requirements applicable at the time of installation shall be made

code compliant or shall be removed in accordance with Section ~~5704.2.14~~ 5705.1.9, regardless of whether such tank has been previously inspected (see Section 109.4).

~~5704.2.9.2~~ 5705.2.3.2 Fire protection.
Fire protection for above-ground tanks shall comply with Sections ~~5704.2.9.2.1~~ 5705.2.3.2.1 through ~~5704.2.9.2.4~~ 5705.2.3.2.4.

~~5704.2.9.2.1~~ 5705.2.3.2.1 Required foam fire protection systems. Where required by the *fire code official*, foam fire protection shall be provided for above-ground tanks, other than pressure tanks operating at or above 1 pound per square inch gauge (psig) (6.89 kPa) where such tank, or group of tanks spaced less than 50 feet (15 240 mm) apart measured shell to shell, has a liquid surface area in excess of 1,500 square feet (139 m^2), and is in accordance with one of the following:

1. Used for the storage of Class I or II liquids.
2. Used for the storage of crude oil.
3. Used for in-process products and is located within 100 feet (30 480 mm) of a fired still, heater, related fractioning or processing apparatus or similar device at a processing plant or petroleum refinery as herein defined.
4. Considered by the *fire code official* as posing an unusual exposure hazard because of topographical conditions; nature of occupancy, proximity on the same or adjoining property, and height and character of liquids to be stored; degree of private fire protection to be provided; and facilities of the fire department to cope with *flammable liquid* fires.

~~5704.2.9.2.2~~ 5705.2.3.2.2 Foam fire protection system installation.
Where foam fire protection is required, it shall be installed in accordance with NFPA 11.

~~5704.2.9.2.2.1~~ 5705.2.3.2.2.1 Foam storage. Where foam fire protection is required, foam-producing materials shall be stored on the premises.

Exception: Storage of foam-producing materials off the premises is allowed as follows:

1. Such materials stored off the premises shall be of the proper type suitable for use with the equipment at the installation where required.
2. Such materials shall be readily available at the storage location at all times.
3. Adequate loading and transportation facilities shall be provided.
4. The time required to deliver such materials to the required location in the event of fire shall be consistent with the hazards and fire scenarios for which the foam supply is intended.
5. At the time of a fire, these off-premises supplies shall be accumulated in sufficient quantities before placing the equipment in operation to ensure foam production at an adequate rate without interruption until extinguishment is accomplished.

~~5704.2.9.2.3~~ 5705.2.3.2.3 Fire protection of supports.
Supports or pilings for above-ground tanks storing Class I, II or IIIA liquids elevated more than 12 inches (305 mm) above grade shall have a *fire-resistance rating* of not less than 2 hours in accordance with the fire exposure criteria specified in ASTM E1529.

Exceptions:

1. Structural supports tested as part of a protected above-ground tank in accordance with UL 2085.
2. Stationary tanks located outside of buildings where protected by an *approved* water-spray system designed in accordance with Chapter 9 and NFPA 15.
3. Stationary tanks located inside of buildings equipped throughout with an *approved automatic sprinkler system* designed in accordance with Section 903.3.1.1.

~~5704.2.9.2.4~~ 5705.2.3.2.4 Inerting of tanks storing boilover liquids. Liquids with boilover characteristics shall not be stored in fixed roof tanks larger than 150 feet (45 720 mm) in diameter unless an *approved* gas enrichment or inerting system is provided on the tank.

Exception: Crude oil storage tanks in production fields with no other exposures adjacent to the storage tank.

~~5704.2.9.3~~ 5705.2.3.3 Supports, foundations and anchorage.
Supports, foundations and anchorages for above-ground tanks shall be designed and constructed in accordance with NFPA 30 and the *International Building Code*.

~~5704.2.9.4~~ 5705.2.3.4 Stairways, platforms and walkways.
Stairways, platforms and walkways shall be of noncombustible construction and shall be designed and constructed in accordance with NFPA 30 and the *International Building Code*.

~~5704.2.9.5~~ 5705.2.3.5 Above-ground tanks inside of buildings.
Above-ground tanks inside of buildings shall comply with Sections ~~5704.2.9.5.1~~ 5705.2.3.5.1 and ~~5704.2.9.5.2~~ 5705.2.3.5.2.

~~5704.2.9.5.1~~ 5705.2.3.5.1 Overfill prevention.
Above-ground tanks storing Class I, II and IIIA liquids inside buildings shall be equipped with a device or other means to prevent overflow into the building including, but not limited to: a float valve; a preset meter on the fill line; a valve actuated by the weight of the tank's contents; a low-head pump that is incapable of producing overflow; or a liquid-tight overflow pipe not less than one pipe size larger than the fill pipe and discharging by gravity back to the outside source of liquid or to an *approved* location. Tanks containing Class IIIB liquids and connected to fuel-burning equipment shall be provided with a means to prevent overflow into buildings in accordance with Section ~~5704.2.7.5.8~~ 5705.2.1.5.8.

~~5704.2.9.5.2~~ 5705.2.3.5.2 Fill pipe connections.
Fill pipe connections for tanks storing Class I, II and IIIA liquids and Class IIIB liquids connected to fuel-burning equipment shall be in accordance with Section ~~5704.2.9.7.6~~ 5705.2.3.7.6.

~~5704.2.9.6~~ 5705.2.3.6 Above-ground tanks outside of buildings.
Above-ground tanks outside of buildings shall comply with Sections ~~5704.2.9.6.1~~ 5705.2.3.6.1 through ~~5704.2.9.6.3~~ 5705.2.3.6.3.

~~5704.2.9.6.1~~ 5705.2.3.6.1 Locations where above-ground tanks are prohibited. Storage of Class I and II liquids in above-ground tanks outside of buildings is prohibited within the limits established by law as set forth in the fire code adoption ordinance or other regulation adopted by the jurisdiction .

~~5704.2.9.6.1.1~~ 5705.2.3.6.1.1 Location of tanks with pressures 25 psig or less.
Above-ground tanks operating at pressures not exceeding 2.5 psig (17.2 kPa) for storage of Class I, II or IIIA liquids, which are designed with a floating roof, a weak roof-to-shell seam or equipped with emergency venting devices limiting pressure to 2.5 psig (17.2 kPa), shall be located in accordance with Table 22.4.1.1(a) of NFPA 30.

Exceptions:

1. Vertical tanks having a weak roof-to-shell seam and storing Class IIIA liquids are allowed to be located at one-half the distances specified in Table 22.4.1.1(a) of NFPA 30, provided that the tanks are not within a diked area or drainage path for a tank storing Class I or II liquids.
2. Liquids with boilover characteristics and unstable liquids in accordance with Sections ~~5704.2.9.6.1.3~~ 5705.2.3.6.1.3 and ~~5704.2.9.6.1.4~~ 5705.2.3.6.1.4.
3. For protected above-ground tanks in accordance with Section ~~5704.2.9.7~~5705.2.3.7 and tanks in at-grade or above-grade vaults in accordance with Section ~~5704.2.8~~ 5705.2.2, the distances in Table 22.4.1.1(b) of NFPA 30 shall apply and shall be reduced by one-half, but not to less than 5 feet (1524 mm).

~~5704.2.9.6.1.2~~ 5705.2.3.6.1.2 Location of tanks with pressures exceeding 25 psig.
Above-ground tanks for the storage of Class I, II or IIIA liquids operating at pressures exceeding 2.5 psig (17.2 kPa) or equipped with emergency venting allowing pressures to exceed 2.5 psig (17.2 kPa) shall be located in accordance with Table 22.4.1.3 of NFPA 30.

Exception: Liquids with boilover characteristics and unstable liquids in accordance with Sections ~~5704.2.9.6.1.3~~ 5705.2.3.6.1.3 and ~~5704.2.9.6.1.4~~ 5705.2.3.6.1.4.

~~5704.2.9.6.1.3~~ 5705.2.3.6.1.3 Location of tanks storing boilover liquids.
Above-ground tanks for storage of liquids with boilover characteristics shall be located in accordance with Table 2204.1.4.1 of NFPA 30.

~~5704.2.9.6.1.4~~ 5705.2.3.6.1.4 Location of tanks storing unstable liquids.
Above-ground tanks for the storage of unstable liquids shall be located in accordance with Table 22.4.1.5 of NFPA 30.

~~5704.2.9.6.1.5~~ 5705.2.3.6.1.5 Location of tanks storing Class IIIB liquids.
Above-ground tanks for the storage of Class IIIB liquids, excluding unstable liquids, shall be located in accordance with Table 22.1.5 of NFPA 30, except where located within a diked area or drainage path for a tank or tanks storing Class I or II liquids. Where a Class IIIB liquid storage tank is within the diked area or drainage path for a Class I or II liquid, distances required by Section ~~5704.2.9.6.1.1~~ 5705.2.3.6.1.1 shall apply.

~~5704.2.9.6.1.6~~ 5705.2.3.6.1.6 Reduction of separation distances to adjacent property.
Where two tank properties of diverse ownership have a common boundary, the *fire code official* is authorized to, with the written consent of the *owners* of the two properties, apply the distances in Sections ~~5704.2.9.6.1.2~~ 5705.2.3.6.1.2 through ~~5704.2.9.6.1.5~~ 5705.2.3.6.1.5 assuming a single property.

~~5704.2.9.6.2~~ 5705.2.3.6.2 Separation between adjacent stable or unstable liquid tanks.
The separation between tanks containing stable liquids shall be in accordance with Table 22.4.2.1 of NFPA 30. Where tanks are in a diked area containing Class I or II liquids, or in the drainage path of Class I or II liquids, and are compacted in three or more rows or in an irregular pattern, the *fire code official* is authorized to require greater separation than specified in Table 22.4.2.1 of NFPA 30 or other means to make tanks in the interior of the pattern open for firefighting purposes.
The separation between tanks containing unstable liquids shall be not less than one-half the sum of their diameters.

Exception: Tanks used for storing Class IIIB liquids are allowed to be spaced 3 feet (914 mm) apart unless within a diked area or drainage path for a tank storing Class I or II liquids.

~~5704.2.9.6.3~~ 5705.2.3.6.3 Separation between adjacent tanks containing flammable or combustible liquids and LP-gas. The minimum horizontal separation between an LP-gas container and a Class I, II or IIIA liquid storage tank shall be 20 feet (6096 mm) except in the case of Class I, II or IIIA liquid tanks operating at pressures exceeding 2.5 psig (17.2 kPa) or equipped with emergency venting allowing pressures to exceed 2.5 psig (17.2 kPa), in which case the provisions of Section ~~5704.2.9.6.2~~ 5705.2.3.6.2 shall apply. An *approved* means shall be provided to prevent the accumulation of Class I, II or IIIA liquids under adjacent LP-gas containers such as by dikes, diversion curbs or grading. Where *flammable* or *combustible liquid* storage tanks are within a diked area, the LP-gas containers shall be outside the diked area and not less than 10 feet (3048 mm) away from the centerline of the wall of the diked area.

Exceptions:

1. Liquefied petroleum gas containers of 125 gallons (473 L) or less in capacity installed adjacent to fuel-oil supply tanks of 660 gallons (2498 L) or less in capacity.
2. Horizontal separation is not required between above-ground LP-gas containers and underground *flammable* and *combustible liquid* tanks.

~~5704.2.9.7~~ 5705.2.3.7 Additional requirements for protected above-ground tanks.
In addition to the requirements of this chapter for above-ground tanks, the installation of protected above-ground tanks shall be in accordance with Sections ~~5704.2.9.7.1~~ 5705.2.3.7.1 through ~~5704.2.9.7.9~~ 5705.2.3.7.9.

~~5704.2.9.7.1~~ 5705.2.3.7.1 Tank construction.
The construction of a protected above-ground tank and its primary tank shall be in accordance with Section ~~5704.2.7~~ 5705.2.1.

~~5704.2.9.7.2~~ 5705.2.3.7.2 Normal and emergency venting.
Normal and emergency venting for protected above-ground tanks shall be provided in accordance with Sections ~~5704.2.7.3~~ 5705.2.1.3 and ~~5704.2.7.4~~ 5705.2.1.4. The vent capacity reduction factor shall not be allowed.

~~5704.2.9.7.3~~ 5705.2.3.7.3 Secondary containment.
Protected above-ground tanks shall be provided with secondary containment, drainage control or diking in accordance with Section 5004.2. A means shall be provided to establish the integrity of the secondary containment in accordance with NFPA 30.

~~5704.2.9.7.4~~ 5705.2.3.7.4 Vehicle impact protection.
Where protected above-ground tanks, piping, electrical conduit or dispensers are subject to vehicular impact, they shall be protected therefrom, either by having the impact protection incorporated into the system design in compliance with the impact test protocol of UL 2085, or by meeting the provisions of Section 312, or where necessary, a combination of both. Where guard posts or other *approved* barriers are provided, they shall be independent of each above-ground tank.

~~5704.2.9.7.5~~ 5705.2.3.7.5 Overfill prevention. Protected above-ground tanks shall not be filled in excess of 95 percent of their capacity. An overfill prevention system shall be provided for each tank. During tank-filling operations, the system shall comply with one of the following:

1. The overfill prevention system shall include the following:
   1.1. An independent means of notifying the person filling the tank that the fluid level has reached 90 percent of tank capacity by providing an audible or visual alarm signal, providing a tank level gauge marked at 90 percent of tank capacity, or other *approved* means.
   1.2. Automatic shut off of the flow of fuel to the tank when the quantity of liquid in the tank reaches 95 percent of tank capacity. For rigid hose fuel-delivery systems, an *approved* means shall be provided to empty the fill hose into the tank after the automatic shutoff device is activated.
2. The system shall reduce the flow rate to not more than 15 gallons per minute (0.95 L/s) so that at the reduced flow rate, the tank will not overfill for 30 minutes, and automatically shut off flow into the tank so that none of the fittings on the top of the tank are exposed to product because of overfilling.

~~5704.2.9.7.5.1~~ 5705.2.3.7.5.1 Information signs. A permanent sign shall be provided at the fill point for the tank, documenting the filling procedure and the tank calibration chart.

Exception: Where climatic conditions are such that the sign has the potential to be obscured by ice or snow, or weathered beyond readability or otherwise impaired, said procedures and chart shall be located in the office window, lock box or other area available to the person filling the tank.

~~5704.2.9.7.5.2~~ 5705.2.3.7.5.2 Determination of available tank capacity. The filling procedure shall require the person filling the tank to determine the gallonage (literage) required to fill it to 90 percent of capacity before commencing the fill operation.

~~5704.2.9.7.6~~ 5705.2.3.7.6 Fill pipe connections. The fill pipe shall be provided with a means for making a direct connection to the tank vehicle's fuel delivery hose so that the delivery of fuel is not exposed to the open air during the filling operation. Where any portion of the fill pipe exterior to the tank extends below the level of the top of the tank, a check valve shall be installed in the fill pipe not more than 12 inches (305 mm) from the fill hose connection.

~~5704.2.9.7.7~~ 5705.2.3.7.7 Spill containers. A spill container having a capacity of not less than 5 gallons (19 L) shall be provided for each fill connection. For tanks with a top fill connection, spill containers shall be noncombustible and shall be fixed to the tank and equipped with a manual drain valve that drains into the primary tank. For tanks with a remote fill connection, a portable spill container shall be allowed.

~~5704.2.9.7.8~~ 5705.2.3.7.8 Tank openings. Tank openings in protected above-ground tanks shall be through the top only.

~~5704.2.9.7.9~~ 5705.2.3.7.9 Antisiphon devices. *Approved* antisiphon devices shall be installed in each external pipe connected to the protected above-ground tank where the pipe extends below the level of the top of the tank.

~~5704.2.11~~ 5705.2.4 Underground tanks.
Underground storage of *flammable* and *combustible liquids* in tanks shall comply with Section ~~5704.2~~ 5705.2 and Sections ~~5704.2.11.1~~

5705.2.4.1 through ~~5704.2.11.4.2.1~~ 5705.2.4.4.

~~5704.2.11.1~~ 5705.2.4.1 Location. *Flammable* and *combustible liquid* storage tanks located underground, either outside or under buildings, shall be in accordance with all of the following:

1. Tanks shall be located with respect to existing foundations and supports such that the loads carried by the latter cannot be transmitted to the tank.
2. The distance from any part of a tank storing liquids to the nearest wall of a *basement*, pit, cellar or *lot line* shall be not less than 3 feet (914 mm).
3. A minimum distance of 1 foot (305 mm), shell to shell, shall be maintained between underground tanks.

~~5704.2.11.2~~ 5705.2.4.2 Depth and cover. Excavation for underground storage tanks shall be made with due care to avoid undermining of foundations of existing structures. Underground tanks shall be set on firm foundations and surrounded with not less than 6 inches (152 mm) of noncorrosive inert material, such as clean sand.

~~5704.2.11.3~~ 5705.2.4.3 Overfill protection and prevention systems.
Fill pipes shall be equipped with a spill container and an overfill prevention system in accordance with NFPA 30.

~~5704.2.11.4~~ 5705.2.4.4 Leak prevention.
~~Leak prevention~~An *approved* method of leak detection shall be provided for underground tanks and shall comply with ~~Sections 5704.2.11.4.1 and 5704.2.11.4.2.~~the following:

1. The leak detection system shall be capable of detecting a leak from any component of the underground storage tank system.
2. The leak detection shall be designed and installed in accordance with NFPA 30.
3. Daily inventory records for underground storage tank systems shall be maintained.
4. The leak detection panel status shall be annunciated at an *approved* on-site location.

~~**5704.2.11.4.1 Inventory control.** Daily inventory records for underground storage tank systems shall be maintained.~~

~~**5704.2.11.4.2 Leak detection.**~~
~~Underground storage tank systems shall be provided with an *approved* method of leak detection from any component of the system that is designed and installed in accordance with NFPA 30.~~

~~**5704.2.11.4.2.1 Location.** The leak detection panel status shall be annunciated at an *approved* on-site location.~~

SECTION ~~5705~~5706
DISPENSING, USE, MIXING AND HANDLING

~~5705.1~~5706.1 Scope and application.
Dispensing, use, mixing and handling of *flammable liquids* shall be in accordance with the applicable provisions in Section 5703~~, and this section~~ Section 5706.2 and the following.~~ Tank vehicle and tank car loading and unloading and other special operations shall be in accordance with Section 5706.~~

> ~~**Exception:** Containers of organic coatings having no fire point and which are opened for pigmentation are not required to comply with this section.~~

1. Indoor dispensing, use, mixing and handling in quantities not exceeding the maximum allowable quantity per control area shall also comply with Section 5706.3.
2. Indoor dispensing, use, mixing and handling in quantities exceeding the maximum allowable quantity per control area shall also comply with Section 5706.4.

3. Outdoor dispensing, use, mixing and handling in quantities exceeding the maximum allowable quantity per control area shall also comply with Section 5706.5.

Tank vehicle and tank car loading and unloading and other special operations shall be in accordance with Section 5707.

~~5705.2~~5706.2 ~~Liquid transfer~~General.
Liquid transfer equipment and methods for transfer of Class I, II and IIIA liquids shall be *approved* and be in accordance with Sections ~~5705.2.1~~5706.2.1 through ~~5705.2.6~~5706.2.6.

~~5705.2.1~~5706.2.1 Pumps. Where positive-displacement pumps are used, they shall be provided with pressure relief discharging back to the tank, pump suction or other *approved* location, or shall be provided with interlocks to prevent over-pressure.

~~5705.2.2~~5706.2.2 Pressured systems. Where gases are introduced to provide for transfer of Class I liquids, or Class II and III liquids transferred at temperatures at or above their *flash points* by pressure, only inert gases shall be used. Controls, including pressure relief devices, shall be provided to limit the pressure so that the maximum working pressure of tanks, containers and piping systems cannot be exceeded. Where devices operating through pressure within a tank or container are used, the tank or container shall be a pressure vessel *approved* for the intended use. Air or oxygen shall not be used for pressurization.

Exception: Air transfer of Class II and III liquids at temperatures below their *flash points*.

~~5705.2.3~~5706.2.3 Piping, hoses and valves. Piping, hoses and valves used in liquid transfer operations shall be *approved* or *listed* for the intended use.

~~5705.2.4~~5706.2.4 Class I, II and III liquids.
Class I liquids or, when heated to or above their flash points, Class II and Class III liquids, shall be transferred by one of the following methods:

1. From safety cans complying with UL 30.
2. Through an *approved* closed piping system.
3. From containers or tanks by an *approved* pump taking suction through an opening in the top of the container or tank.
4. For Class IB, IC, II and III liquids, from containers or tanks by gravity through an *approved* self-closing or automatic-closing valve where the container or tank and dispensing operations are provided with spill control and secondary containment in accordance with Section ~~5703.4~~5004.2. Class IA liquids shall not be dispensed by gravity from tanks.
5. *Approved* engineered liquid transfer systems.

Exception: Liquids in original shipping containers not exceeding a 5.3-gallon (20 L) capacity.

~~5705.2.5~~5706.2.5 Manual container filling operations. Class I liquids or Class II and Class III liquids that are heated up to or above their *flash points* shall not be transferred into containers unless the nozzle and containers are electrically interconnected. Acceptable methods of electrical interconnection include either of the following:

1. Metallic floor plates on which containers stand while filling, where such floor plates are electrically connected to the fill stem.
2. Where the fill stem is bonded to the container during filling by means of a bond wire.

~~5705.2.6~~5706.2.6 Automatic container-filling operations for Class I liquids. Container-filling operations for Class I liquids involving conveyor belts or other automatic-feeding operations shall be designed to prevent static accumulations.

~~5705.3~~5706.2.7 Use, dispensing and mixing inside of buildings.
Indoor use, dispensing and mixing of *flammable* and *combustible liquids* shall also be in accordance with ~~Section 5705.2 and~~ Sections ~~5705.3.1~~5706.2.7.1 through ~~5705.3.5.3~~5706.2.13.9.

~~5705.3.1~~5706.2.7.1 Closure of mixing or blending vessels. Vessels used for mixing or blending of Class I liquids and Class II or III liquids heated up to or above their *flash points* shall be provided with self-closing, tight-fitting, noncombustible lids that will control a fire within such vessel.

Exception: Where such devices are impractical, *approved* automatic or manually controlled fire-extinguishing devices shall be provided.

~~5705.3.2~~5706.2.8 **Bonding of vessels.** Where differences of potential could be created, vessels containing Class I liquids or liquids handled at or above their *flash points* shall be electrically connected by bond wires, ground cables, piping or similar means to a static grounding system to maintain equipment at the same electrical potential to prevent sparking.

~~5705.3.3~~5706.2.9 **Heating, lighting and cooking appliances.** Heating, lighting and cooking appliances that utilize Class I liquids shall not be operated within a building or structure.

Exception: Operation in single-family *dwellings*.

~~5705.3.4~~5706.2.10 **Location of processing vessels.**
Processing vessels shall be located with respect to distances to *lot lines* of adjoining property that can be built on, in accordance with Tables ~~5705.3.4(1)~~5706.2.10(1) and ~~5705.3.4(2)~~5706.2.10(2).

Exception: Where the *exterior wall* facing the adjoining *lot line* is a blank wall having a *fire-resistance rating* of not less than 4 hours, the *fire code official* is authorized to modify the distances. The distance shall be not less than that set forth in the *International Building Code*, and where Class IA or unstable liquids are involved, explosion control shall be provided in accordance with Section 911.

TABLE ~~5705.3.4(1)~~5706.2.10(1) SEPARATION OF PROCESSING VESSELS FROM LOT LINES

PROCESSING VESSELS WITH EMERGENCY RELIEF VENTING	LOCATION[a]	
	Stable liquids	Unstable liquids
Not in excess of 2.5 psig	Table ~~5705.3.4(2)~~5706.2.10(2)	2.5 times Table ~~5705.3.4(2)~~5706.2.10(2)
Over 2.5 psig	1.5 times Table ~~5705.3.4(2)~~5706.2.10(2)	4 times Table ~~5705.3.4(2)~~5706.2.10(2)

For SI: 1 pound per square inch gauge = 6.895 kPa.

a. Where protection of exposures by a public fire department or private fire brigade capable of providing cooling water streams on structures is not provided, distances shall be doubled.

TABLE ~~5705.3.4(2)~~5706.2.10(2) REFERENCE TABLE FOR USE WITH TABLE ~~5705.3.4(1)~~5706.2.10(1)

TANK CAPACITY (gallons)	MINIMUM DISTANCE FROM LOT LINE OF A LOT THAT IS OR CAN BE BUILT ON, INCLUDING THE OPPOSITE SIDE OF A PUBLIC WAY (feet)	MINIMUM DISTANCE FROM NEAREST SIDE OF ANY PUBLIC WAY OR FROM NEAREST IMPORTANT BUILDING ON THE SAME PROPERTY (feet)
275 or less	5	5
276 to 750	10	5
751 to 12,000	15	5
12,001 to 30,000	20	5
30,001 to 50,000	30	10
50,001 to 100,000	50	15
100,001 to 500,000	80	25
500,001 to 1,000,000	100	35
1,000,001 to 2,000,000	135	45
2,000,001 to 3,000,000	165	55
3,000,001 or more	175	60

For SI: 1 foot = 304.8 mm, 1 gallon = 3.785 L.

~~5705.3.6~~5706.2.11 **Cleaning with flammable and combustible liquids.**
Cleaning with Class I, II and IIIA liquids shall be in accordance with Sections ~~5705.3.6.1~~5706.2.11.1 through ~~5705.3.6.2.7~~5706.2.11.2.7.

Exceptions:

1. Dry cleaning shall be in accordance with Chapter 21.
2. Spray-nozzle cleaning shall be in accordance with Section 2403.3.5.

~~5705.3.6.1~~5706.2.11.1 Cleaning operations.
Class IA liquids shall not be used for cleaning. Cleaning with Class IB, IC or II liquids shall be conducted in accordance with one of the following:

1. In a room or building, Section ~~5705.3.7~~5706.4.
2. In a parts cleaner *listed*, *labeled* and *approved* for the purpose, Section ~~5705.3.6.2~~5706.2.11.2.

Exception: Materials used in commercial and industrial process-related cleaning operations in accordance with other provisions of this code and not involving facilities maintenance cleaning operations.

~~5705.3.6.2~~5706.2.11.2 Listed and approved machines.
Parts cleaning and degreasing conducted in *listed* and *approved* machines in accordance with Section ~~5705.3.6.1~~5706.2.11.1 shall be in accordance with Sections ~~5705.3.6.2.1~~5706.2.11.2.1 through ~~5705.3.6.2.7~~5706.2.11.2.7.

~~5705.3.6.2.1~~5706.2.11.2.1 Solvents. Solvents shall be classified and shall be compatible with the machines within which they are used.

~~5705.3.6.2.2~~5706.2.11.2.2 Machine capacities. The quantity of solvent shall not exceed the *listed* design capacity of the machine for the solvent being used with the machine.

~~5705.3.6.2.3~~5706.2.11.2.3 Solvent quantity limits.
Solvent quantities shall be limited as follows:

1. Machines without remote solvent reservoirs shall be limited to quantities set forth in Section ~~5705.3.5~~5706.3.
2. Machines with remote solvent reservoirs using Class I liquids shall be limited to quantities set forth in Section ~~5705.3.5~~5706.3.
3. Machines with remote solvent reservoirs using Class II liquids shall be limited to 35 gallons (132 L) per machine. The total quantities shall not exceed an aggregate of 240 gallons (908 L) per *control area* in buildings not equipped throughout with an *approved automatic sprinkler system* and an aggregate of 480 gallons (1817 L) per *control area* in buildings equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1.
4. Machines with remote solvent reservoirs using Class IIIA liquids shall be limited to 80 gallons (303 L) per machine.

~~5705.3.6.2.4~~5706.2.11.2.4 Immersion soaking of parts. Work areas of machines with remote solvent reservoirs shall not be used for immersion soaking of parts.

~~5705.3.6.2.5~~5706.2.11.2.5 Separation. Multiple machines shall be separated from each other by a distance of not less than 30 feet (9144 mm) or by a *fire barrier* with a minimum 1-hour *fire-resistance rating*.

~~5705.3.6.2.6~~5706.2.11.2.6 Ventilation. Machines shall be located in areas adequately ventilated to prevent accumulation of vapors.

~~5705.3.6.2.7~~5706.2.11.2.7 Installation. Machines shall be installed in accordance with their listings.

~~5705.5~~5706.2.12 Alcohol-based hand rubs classified as Class I or II liquids.
The use of dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. The maximum capacity of each dispenser shall be 68 ounces (2 L).
2. The minimum separation between dispensers shall be 48 inches (1219 mm).

3. Dispensers shall not be located above, below or closer than 1 inch (25 mm) to an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor or intervening counter top shall be free of electrical receptacles, switches, appliances, devices or other ignition sources.
4. Dispensers shall be located so that the bottom of the dispenser is not less than 42 inches (1067 mm) and not more than 48 inches (1219 mm) above the finished floor.
5. Dispensers shall not obstruct required means of egress or be placed within 3 feet (914 mm) of an open flame, heating device or other ignition source.
6. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated “touch free” alcohol-based hand-rub dispensing devices with the following requirements:
   6.1. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer’s care and use instructions.
   6.2. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:
      6.2.1. Any activations of the dispenser shall only occur when an object is placed within 4 inches (98 mm) of the sensing device.
      6.2.2. The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the United States Food and Drug Administration (USFDA).
      6.2.3. An object placed within the activation zone and left in place will cause only one activation.
7. Storage and use of alcohol-based hand rubs shall be in accordance with the applicable provisions of Sections 5704 and ~~5705~~ 5706.
8. Dispensers located in occupancies with carpeted floors shall only be allowed in *smoke compartments* or *fire areas* equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

~~5705.5.1~~5706.2.12.1 Corridor installations.
In addition to the provisions of Section ~~5705.5~~5706.2.12, where dispensers containing alcohol-based hand rubs are located in *corridors* or rooms and areas open to the *corridor*, they shall be in accordance with all of the following:
1. Level 2 and 3 aerosol containers shall not be allowed in *corridors*.
2. The maximum capacity of each Class I or II liquid dispenser shall be 41 ounces (1.21 L) and the maximum capacity of each Level 1 aerosol dispenser shall be 18 ounces (0.51 kg).
3. The maximum quantity allowed in a *corridor* within a *control area* shall be 10 gallons (37.85 L) of Class I or II liquids or 1135 ounces (32.2 kg) of Level 1 aerosols, or a combination of Class I or II liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gallons (37.85 L) or 1,135 ounces (32.2 kg) such that the sum of the ratios of the liquid and aerosol quantities divided by the allowable quantity of liquids and aerosols, respectively, shall not exceed one.
4. Projections into a *corridor* shall be in accordance with Section 1003.3.3.

~~5705.4~~5706.2.13 Solvent distillation units.
Solvent distillation units shall comply with Sections ~~5705.4.1~~5706.2.13.1 through ~~5705.4.9~~5706.2.13.9.

~~5705.4.1~~5706.2.13.1 Unit with a capacity of 60 gallons or less.
Solvent distillation units used to recycle Class I, II or IIIA liquids having a distillation chamber capacity of 60 gallons (227 L) or less shall be *listed*, *labeled* and installed in accordance with Section ~~5705.4~~5706.2.13 and UL 2208.

Exceptions:
1. Solvent distillation units used in continuous through-put industrial processes where the source of heat is remotely supplied using steam, hot water, oil or other heat transfer fluids, the temperature of which is below the auto-ignition point of the solvent.

2. *Approved* research, testing and experimental processes.

~~5705.4.2~~5706.2.13.2 Units with a capacity exceeding 60 gallons.
Solvent distillation units used to recycle Class I, II or IIIA liquids, having a distillation chamber capacity exceeding 60 gallons (227 L) shall be used in locations that comply with the use and mixing requirements of Section ~~5705~~5706.2 and other applicable provisions in this chapter.

~~5705.4.3~~5706.2.13.3 Prohibited processing. Class I, II and IIIA liquids that are classified as unstable (reactive) shall not be processed in solvent distillation units.

Exception: Appliances *listed* for the distillation of unstable (reactive) solvents.

~~5705.4.4~~5706.2.13.4 Labeling. A permanent label shall be affixed to the unit by the manufacturer. The label shall indicate the capacity of the distillation chamber, and the distance the unit shall be placed away from sources of ignition. The label shall indicate the products for which the unit has been *listed* for use or refer to the instruction manual for a list of the products.

~~5705.4.5~~5706.2.13.5 Manufacturer's instruction manual. An instruction manual shall be provided. The manual shall be readily available for the user and the *fire code official*. The manual shall include installation, use and servicing instructions. It shall identify the liquids for which the unit has been *listed* for distillation purposes along with each liquid's *flash point* and auto-ignition temperature. For units with adjustable controls, the manual shall include directions for setting the heater temperature for each liquid to be instilled.

~~5705.4.6~~5706.2.13.6 Location. Solvent distillation units shall be used in locations in accordance with the listing. Solvent distillation units shall not be used in *basements*.

~~5705.4.7~~5706.2.13.7 Storage of liquids.
Distilled liquids and liquids awaiting distillation shall be stored in accordance with the applicable Sections of 5704 and 5705.

~~5705.4.8~~5706.2.13.8 Storage of residues.
Hazardous residue from the distillation process shall be stored in accordance with the applicable Sections of 5704, 5705 and Chapter 50.

~~5705.4.9~~5706.2.13.9 Portable fire extinguishers.
Approved portable fire extinguishers shall be provided in accordance with Section 906. Not less than one portable fire extinguisher having a rating of not less than 40-B shall be located not less than 10 feet (3048 mm) or more than 30 feet (9144 mm) from any solvent distillation unit.

~~5705.3.5~~5706.3 ~~Quantity limits for use~~ Quantities not exceeding the maximum allowable quantity per control area.
Quantities not exceeding the maximum allowable quantity per control area for indoor dispensing, use, mixing and handling~~Liquid use quantity limitations~~ shall comply with Sections ~~5705.3.5.1~~5706.3.1 through ~~5705.3.5.3~~5706.3.2.

~~5705.3.5.1~~5706.3.1 Maximum allowable quantity per control area.
Indoor use, dispensing and mixing of *flammable* and *combustible liquids* shall not exceed the *maximum allowable quantity per control area* indicated in Table 5003.1.1(1) and shall not exceed the additional limitations set forth in Section ~~5705.3.5~~5706.3.2.
Use of hazardous production material *flammable* and *combustible liquids* in Group H-5 occupancies shall be in accordance with Chapter 27.

Exception: Cleaning with Class I, II and IIIA liquids shall be in accordance with Section ~~5705.3.6~~5706.2.11.

~~5705.3.5.2~~5706.3.2 Occupancy quantity limits.
The following limits for quantities of *flammable* and *combustible liquids* used, dispensed or mixed based on occupancy classification shall not be exceeded:

1. Group A occupancies: Quantities in Group A occupancies shall not exceed that necessary for demonstration, treatment, laboratory work, maintenance purposes and operation of equipment, and shall not exceed quantities set forth in Table 5003.1.1(1).

2. Group B occupancies: Quantities in drinking, dining, office and school uses within Group B occupancies shall not exceed that necessary for demonstration, treatment, laboratory work, maintenance purposes and operation of equipment, and shall not exceed quantities set forth in Table 5003.1.1(1).
3. Group E occupancies: Quantities in Group E occupancies shall not exceed that necessary for demonstration, treatment, laboratory work, maintenance purposes and operation of equipment and shall not exceed quantities set forth in Table 5003.1.1(1).
4. Group F occupancies: Quantities in dining, office and school uses within Group F occupancies shall not exceed that necessary for demonstration, laboratory work, maintenance purposes and operation of equipment, and shall not exceed quantities set forth in Table 5003.1.1(1).
5. Group I occupancies: Quantities in Group I occupancies shall not exceed that necessary for demonstration, laboratory work, maintenance purposes and operation of equipment, and shall not exceed quantities set forth in Table 5003.1.1(1).
6. Group M occupancies: Quantities in dining, office and school uses within Group M occupancies shall not exceed that necessary for demonstration, laboratory work, maintenance purposes and operation of equipment, and shall not exceed quantities set forth in Table 5003.1.1(1).
7. Group R occupancies: Quantities in Group R occupancies shall not exceed that necessary for maintenance purposes and operation of equipment, and shall not exceed quantities set forth in Table 5003.1.1(1).
8. Group S occupancies: Quantities in dining and office uses within Group S occupancies shall not exceed that necessary for demonstration, laboratory work, maintenance purposes and operation of equipment and shall not exceed quantities set forth in Table 5003.1.1(1).

Exception: Cleaning with Class I, II, or IIIA liquids shall be in accordance with Section ~~5705.3.6~~5706.2.11.

~~5705.3.5.3~~5706.4 Quantities exceeding ~~limits for~~the maximum allowable quantity per control ~~areas~~area.
Quantities exceeding the *maximum allowable quantity per control area* indicated in Sections ~~5705.3.5.1~~5706.3.1 and ~~5705.3.5.2~~ 5706.3.2, or when required by Section 5706.2.11.1, shall be in accordance with the following:

1. For *open systems*, indoor use, dispensing and mixing of *flammable* and *combustible liquids* shall be within a room or building complying with the *International Building Code* and Sections ~~5705.3.7.1~~5706.4.1 through ~~5705.3.7.5.3~~5706.4.2.3.
2. For *closed systems*, indoor use, dispensing and mixing of *flammable* and *combustible liquids* shall be within a room or building complying with the *International Building Code* and Sections ~~5705.3.7~~5706.4.1 through ~~5705.3.7.4~~5706.4.1.4 and Section ~~5705.3.7.6~~5706.4.3.

~~5705.3.7~~5706.4.1 Rooms or buildings for quantities exceeding the maximum allowable quantity per control area.
Where required by Section ~~5705.3.5.3~~5706.4 or ~~5705.3.6.1~~5706.2.11.1, rooms or buildings used for the use, dispensing or mixing of *flammable* and *combustible liquids* in quantities exceeding the *maximum allowable quantity per control area* shall be in accordance with Sections ~~5705.3.7.1~~5706.4.1.1 through ~~5705.3.7.6.3~~5706.4.2.3.

~~5705.3.7.1~~5706.4.1.1 Construction, location and fire protection.
Rooms or buildings classified in accordance with the *International Building Code* as Group H-2 or H-3 occupancies based on use, dispensing or mixing of *flammable* or *combustible liquids* shall be constructed in accordance with the *International Building Code*.

~~5705.3.7.2~~5706.4.1.2 Basements.
In rooms or buildings classified in accordance with the *International Building Code* as Group H-2 or H-3, dispensing or mixing of *flammable* or *combustible liquids* shall not be conducted in *basements*.

~~5705.3.7.3~~5706.4.1.3 Fire protection.

Rooms or buildings classified in accordance with the *International Building Code* as Group H-2 or H-3 occupancies shall be equipped with an *approved automatic fire-extinguishing system* in accordance with Chapter 9.

~~5705.3.7.4~~5706.4.1.4 Doors.
Interior doors to rooms or portions of such buildings shall be self-closing fire doors in accordance with the *International Building Code*.

~~5705.3.7.5~~5706.4.2 Open systems.
Use, dispensing and mixing of *flammable* and *combustible liquids* in *open systems* shall be in accordance with Sections ~~5705.3.7.5.1~~ 5706.4.2.1 through ~~5705.3.7.5.3~~5706.4.2.3.

~~5705.3.7.5.1~~5706.4.2.1 Ventilation.
Continuous mechanical ventilation shall be provided at a rate of not less than 1 cfm per square foot [0.00508 $m^3/(s \times m^2)$] of floor area over the design area. Provisions shall be made for introduction of makeup air in such a manner to include all floor areas or pits where vapors can collect. Local or spot ventilation shall be provided where needed to prevent the accumulation of hazardous vapors. Ventilation system design shall comply with the *International Building Code* and *International Mechanical Code*.

Exception: Where natural ventilation can be shown to be effective for the materials used, dispensed or mixed.

~~5705.3.7.5.2~~5706.4.2.2 Explosion control.
Explosion control shall be provided in accordance with Section 911.

~~5705.3.7.5.3~~5706.4.2.3 Spill control and secondary containment.
Spill control shall be provided in accordance with Section ~~5703.4~~5004.2 where Class I, II or IIIA liquids are dispensed into containers exceeding a 1.3-gallon (5 L) capacity or mixed or used in open containers or systems exceeding a 5.3-gallon (20 L) capacity. Spill control and secondary containment shall be provided in accordance with Section ~~5703.4~~5004.2 where the capacity of an individual container exceeds 55 gallons (208 L) or the aggregate capacity of multiple containers or tanks exceeds 100 gallons (378.5 L).

~~5705.3.7.6~~5706.4.3 Closed systems.
Use or mixing of *flammable* or *combustible liquids* in *closed systems* shall be in accordance with Sections ~~5705.3.7.6.1~~5706.4.3.1 through ~~5705.3.7.6.3~~5706.4.3.3.

~~5705.3.7.6.1~~5706.4.3.1 Ventilation.
Closed systems designed to be opened as part of normal operations shall be provided with ventilation in accordance with Section ~~5705.3.7.5.1~~5706.4.2.1.

~~5705.3.7.6.2~~5706.4.3.2 Explosion control.
Explosion control shall be provided where an explosive environment can occur as a result of the mixing or use process. Explosion control shall be designed in accordance with Section 911.

Exception: Where process vessels are designed to contain fully the worst-case explosion anticipated within the vessel under process conditions considering the most likely failure.

~~5705.3.7.6.3~~5706.4.3.3 Spill control and secondary containment.
Spill control shall be provided in accordance with Section ~~5703.4~~5004.2.1 where *flammable* or *combustible liquids* are dispensed into containers exceeding a 1.3-gallon (5 L) capacity or mixed or used in open containers or systems exceeding a 5.3-gallon (20 L) capacity. ~~Spill control and secondary~~Secondary containment shall be provided in accordance with Section ~~5703.4~~5004.2 where the capacity of an individual container exceeds 55 gallons (208 L) or the aggregate capacity of multiple containers or tanks exceeds 1,000 gallons (3785 L).

~~5705.3.8~~5706.5 Use, dispensing and handling outside of buildings.
Outside use, dispensing and handling shall be in accordance with Sections ~~5705.3.8.1~~5706.5 through ~~5705.3.8.4~~5706.5.3. Dispensing of liquids into motor vehicle fuel tanks at motor fuel-dispensing facilities shall be in accordance with Chapter 23.

~~5705.3.8.1~~5706.5.1 Spill control.

Outside use, dispensing and handling areas shall be provided with spill control as set forth in Section ~~5703.4~~5004.2.

~~5705.3.8.2~~5706.5.2 Location on property.

Dispensing activities that exceed the quantities set forth in Table ~~5705.3.8.2~~5706.5.2 shall not be conducted within 15 feet (4572 mm) of buildings or combustible materials or within 25 feet (7620 mm) of building openings, *lot lines*, public streets, public alleys or *public ways*. Dispensing activities that exceed the quantities set forth in Table ~~5705.3.8.2~~5706.5.2 shall not be conducted within 15 feet (4572 mm) of storage of Class I, II or III liquids unless such liquids are stored in tanks that are *listed* and *labeled* as 2-hour protected tank assemblies in accordance with UL 2085.

Exceptions:

1. The requirements shall not apply to areas where only the following are dispensed: Class III liquids; liquids that are heavier than water; water-miscible liquids; and liquids with viscosities greater than 10,000 centipoise (cp) (10 Pa × s).
2. *Flammable* and *combustible liquid* dispensing in refineries, chemical plants, process facilities, gas and crude oil production facilities and oil-blending and packaging facilities, terminals and bulk plants.

TABLE ~~5705.3.8.2~~5706.5.2 MAXIMUM ALLOWABLE QUANTITIES FOR DISPENSING FLAMMABLE AND COMBUSTIBLE LIQUIDS IN OUTDOOR CONTROL AREAS[a, b]

CLASS OF LIQUID	QUANTITY (gallons)
Flammable	
Class IA	10
Class IB	15
Class IC	20
Combination Class IA, IB and IC	30[c]
Combustible	
Class II	30
Class IIIA	80
Class IIIB	3,300

For SI: 1 gallon = 3.785 L.

a. For definition of "Outdoor Control Area," see Section 202.

b. The fire code official is authorized to impose special conditions regarding locations, types of containers, dispensing units, fire control measures and other factors involving fire safety.

c. Containing not more than the maximum allowable quantity per control area of each individual class.

~~5705.3.8.3~~5706.5.2.1 Location of processing vessels.

Processing vessels shall be located with respect to distances to *lot lines* that can be built on in accordance with Table ~~5705.3.4(1)~~ 5706.2.10(1).

Exception: In refineries and distilleries.

~~5705.3.8.4~~5706.5.3 Weather protection.

Weather protection for outdoor use shall be in accordance with Section 5005.3.9.

SECTION ~~5706~~ 5707
SPECIAL OPERATIONS

~~5706.1~~ 5707.1 General.

This section shall cover the provisions for special operations that include, but are not limited to, storage, use, dispensing, mixing or handling of *flammable* and *combustible liquids*. The following special operations shall be in accordance with Sections 5701, 5703, 5704, ~~and~~ 5705 and 5706, except as ~~provided in Section 5706:~~modified by the following:

1. Storage and dispensing of *flammable* and *combustible liquids* on farms and construction sites shall comply with Section 5707.2.

2. Well drilling and operating shall comply with Section 5707.3.
3. Bulk plants or terminals shall comply with Section 5707.4.
4. Bulk transfer and process transfer operations utilizing tank vehicles and tank cars shall comply with Section 5707.5.
5. Tank vehicles and tank vehicle operation shall comply with Section 5707.6.
6. Refineries shall comply with Section 5707.7.
7. Vapor recovery and vapor-processing systems shall comply with Section 5707.8.

~~5706.2~~ 5707.2 Storage and dispensing of flammable and combustible liquids on farms and construction sites.
Permanent and temporary storage and dispensing of Class I and II liquids for private use on farms and rural areas and at construction sites, earth-moving projects, gravel pits or borrow pits shall be in accordance with Sections ~~5706.2.1~~5707.2.1 through ~~5706.2.8.1~~ 5707.2.8.1.

Exception: Storage and use of fuel oil and containers connected with oil-burning equipment regulated by Section 605 and the *International Mechanical Code*.

~~5706.2.1~~ 5707.2.1 Combustibles and open flames near tanks. Storage areas shall be kept free from weeds and extraneous combustible material. Open flames and smoking are prohibited in *flammable* or *combustible liquid* storage areas.

~~5706.2.2~~ 5707.2.2 Marking of tanks and containers. Tanks and containers for the storage of liquids above ground shall be conspicuously marked with the name of the product that they contain and the words: "FLAMMABLE—KEEP FIRE AND FLAME AWAY." Tanks shall bear the additional marking: "KEEP 50 FEET FROM BUILDINGS."

~~5706.2.3~~ 5707.2.3 Containers for storage and use.
Metal containers used for storage of Class I or II liquids shall be in accordance with DOTn requirements or shall be of an *approved* design.
Discharge devices shall be of a type that do not develop an internal pressure on the container. Pumping devices or *approved* self-closing faucets used for dispensing liquids shall not leak and shall be well-maintained. Individual containers shall not be interconnected and shall be kept closed when not in use.

Containers stored outside of buildings shall be in accordance with Section 5704 and the *International Building Code*.

~~5706.2.4~~ 5707.2.4 Permanent and temporary tanks.
The capacity of permanent above-ground tanks containing Class I or II liquids shall not exceed 1,100 gallons (4164 L). The capacity of temporary above-ground tanks containing Class I or II liquids shall not exceed 10,000 gallons (37 854 L). Tanks shall be of the single-compartment design.

Exception: Permanent above-ground tanks of greater capacity that meet the requirements of Section ~~5704.2~~5705.

~~5706.2.4.1~~ 5707.2.4.1 Fill-opening security. Fill openings shall be equipped with a locking closure device. Fill openings shall be separate from vent openings.

~~5706.2.4.2~~ 5707.2.4.2 Vents.
Tanks shall be provided with a method of normal and emergency venting. Normal vents shall be in accordance with Section ~~5704.2.7.3~~ 5705.2.1.3.
Emergency vents shall be in accordance with Section ~~5704.2.7.4~~5705.2.1.4. Emergency vents shall be arranged to discharge in a manner that prevents localized overheating or flame impingement on any part of the tank in the event that vapors from such vents are ignited.

~~5706.2.4.3~~ 5707.2.4.3 Location. Tanks containing Class I or II liquids shall be kept outside and not less than 50 feet (15 240 mm) from buildings and combustible storage. Additional distance shall be provided where necessary to ensure that vehicles, equipment and containers being filled directly from such tanks will not be less than 50 feet (15 240 mm) from structures, haystacks or other combustible storage.

~~5706.2.4.4~~ 5707.2.4.4 Locations where above-ground tanks are prohibited. The storage of Class I and II liquids in above-ground tanks is prohibited within the limits established by law as set forth in the fire code adoption ordinance or other regulation adopted by the jurisdiction .

~~5706.2.5~~ 5707.2.5 Type of tank. Tanks shall be provided with top openings only or shall be elevated for gravity discharge.

~~5706.2.5.1~~ 5707.2.5.1 Tanks with top openings only. Tanks with top openings shall be mounted in accordance with either of the following:

1. On well-constructed metal legs connected to shoes or runners designed so that the tank is stabilized and the entire tank and its supports can be moved as a unit.
2. For stationary tanks, on a stable base of timbers or blocks approximately 6 inches (152 mm) in height that prevents the tank from contacting the ground.

~~5706.2.5.1.1~~ 5707.2.5.1.1 Pumps and fittings. Tanks with top openings only shall be equipped with a tightly and permanently attached, *approved* pumping device having an *approved* hose of sufficient length for filling vehicles, equipment or containers to be served from the tank. Either the pump or the hose shall be equipped with a padlock to its hanger to prevent tampering. An effective antisiphoning device shall be included in the pump discharge unless a self-closing nozzle is provided. Siphons or internal pressure discharge devices shall not be used.

~~5706.2.5.2~~ 5707.2.5.2 Tanks for gravity discharge. Tanks with a connection in the bottom or the end for gravity-dispensing liquids shall be mounted and equipped as follows:

1. Supports to elevate the tank for gravity discharge shall be designed to carry all required loads and provide stability.
2. Bottom or end openings for gravity discharge shall be equipped with a valve located adjacent to the tank shell that will close automatically in the event of fire through the operation of an effective heat-activated releasing device. Where this valve cannot be operated manually, it shall be supplemented by a second, manually operated valve.

The gravity discharge outlet shall be provided with an *approved* hose equipped with a self-closing valve at the discharge end of a type that can be padlocked to its hanger.

~~5706.2.6~~ 5707.2.6 Spill control drainage control and diking.
Indoor storage and dispensing areas where the maximum allowable quantities per control area are exceeded and where required by Section 5004.2 shall be provided with spill control and drainage control as set forth in Section ~~5703.4~~5004.2. Outdoor storage areas shall be provided with drainage control or diking as set forth in Section ~~5704.2.10~~5705.2.1.11.

~~5706.2.7~~ 5707.2.7 Portable fire extinguishers.
Portable fire extinguishers with a minimum rating of 20-B:C and complying with Section 906 shall be provided where required by the *fire code official*.

~~5706.2.8~~ 5707.2.8 Dispensing from tank vehicles.
Where *approved*, liquids used as fuels are allowed to be transferred from tank vehicles into the tanks of motor vehicles or special equipment, provided that:

1. The tank vehicle's specific function is that of supplying fuel to motor vehicle fuel tanks.
2. The dispensing hose does not exceed 100 feet (30 480 mm) in length.
3. The dispensing nozzle is an *approved* type.
4. The dispensing hose is properly placed on an *approved* reel or in a compartment provided before the tank vehicle is moved.
5. Signs prohibiting smoking or open flames within 25 feet (7620 mm) of the vehicle or the point of refueling are prominently posted on the tank vehicle.
6. Electrical devices and wiring in areas where fuel dispensing is conducted are in accordance with NFPA 70.

7. Tank vehicle-dispensing equipment is operated only by designated personnel who are trained to handle and dispense motor fuels.
8. Provisions are made for controlling and mitigating unauthorized discharges.

~~5706.2.8.1~~ 5707.2.8.1 Location. Dispensing from tank vehicles shall be conducted not less than 50 feet (15 240 mm) from structures or combustible storage.

~~5706.3~~ 5707.3 Well drilling and operating.
Wells for oil and natural gas shall be drilled and operated in accordance with Sections ~~5706.3.1~~5707.3.1 through ~~5706.3.8~~5707.3.8.

~~5706.3.1~~ 5707.3.1 Location.
The location of wells shall comply with Sections ~~5706.3.1.1~~5707.3.1.1 through ~~5706.3.1.3.2~~5707.3.1.3.2.

~~5706.3.1.1~~ 5707.3.1.1 Storage tanks and sources of ignition. Storage tanks or boilers, fired heaters, open-flame devices or other sources of ignition shall not be located within 25 feet (7620 mm) of well heads. Smoking is prohibited at wells or tank locations except as designated and in *approved* posted areas.

Exception: Engines used in the drilling, production and serving of wells.

~~5706.3.1.2~~ 5707.3.1.2 Streets and railways. Wells shall not be drilled within 75 feet (22 860 mm) of any dedicated public street, highway or nearest rail of an operating railway.

~~5706.3.1.3~~ 5707.3.1.3 Buildings. Wells shall not be drilled within 100 feet (30 480 mm) of buildings not necessary to the operation of the well.

~~5706.3.1.3.1~~ 5707.3.1.3.1 Group A, E or I buildings. Wells shall not be drilled within 300 feet (91 440 mm) of buildings with an occupancy in Group A, E or I.

~~5706.3.1.3.2~~ 5707.3.1.3.2 Existing wells.
Where wells are existing, buildings shall not be constructed within the distances set forth in Section ~~5706.3.1~~5707.3.1 for separation of wells or buildings.

~~5706.3.2~~ 5707.3.2 Waste control. Control of waste materials associated with wells shall comply with Sections ~~5706.3.2.1~~5707.3.2.1 and ~~5706.3.2.2~~5707.3.2.2.

~~5706.3.2.1~~ 5707.3.2.1 Discharge on a street or water channel. Liquids containing crude petroleum or its products shall not be discharged into or on streets, highways, drainage canals or ditches, storm drains or flood control channels.

~~5706.3.2.2~~ 5707.3.2.2 Discharge and combustible materials on ground. The surface of the ground under, around or near wells, pumps, boilers, oil storage tanks or buildings shall be kept free from oil, waste oil, refuse or waste material.

~~5706.3.3~~ 5707.3.3 Sumps.
Sumps associated with wells shall comply with Sections ~~5706.3.3.1~~5707.3.3.1 through ~~5706.3.3.3~~5707.3.3.3.

~~5706.3.3.1~~ 5707.3.3.1 Maximum width. Sumps or other basins for the retention of oil or petroleum products shall not exceed 12 feet (3658 mm) in width.

~~5706.3.3.2~~ 5707.3.3.2 Backfilling. Sumps or other basins for the retention of oil or petroleum products larger than 6 feet by 6 feet by 6 feet (1829 mm by 1829 mm by 1829 mm) shall not be maintained longer than 60 days after the cessation of drilling operations.

~~5706.3.3.3~~ 5707.3.3.3 Security. Sumps, diversion ditches and depressions used as sumps shall be securely fenced or covered.

~~5706.3.4~~ <u>5707.3.4</u> **Prevention of blowouts.** Protection shall be provided to control and prevent the blowout of a well. Protection equipment shall meet federal, state and other applicable jurisdiction requirements.

~~5706.3.5~~ <u>5707.3.5</u> **Storage tanks.**
Storage of *flammable* or *combustible liquids* in tanks shall be in accordance with Section<u>s</u> 5704<u>and 5705</u>. Oil storage tanks or groups of tanks shall have posted in a conspicuous place, on or near such tank or tanks, an *approved* sign with the name of the *owner* or operator, or the lease number and the telephone number where a responsible person can be reached at any time.

~~5706.3.6~~ <u>5707.3.6</u> **Soundproofing.** Where soundproofing material is required during oil field operations, such material shall be noncombustible.

~~5706.3.7~~ <u>5707.3.7</u> **Signs.** Well locations shall have posted in a conspicuous place on or near such tank or tanks an *approved* sign with the name of the *owner* or operator, name of the leasee or the lease number, the well number and the telephone number where a responsible person can be reached at any time. Such signs shall be maintained on the premises from the time materials are delivered for drilling purposes until the well is abandoned.

~~5706.3.8~~ <u>5707.3.8</u> **Field-loading racks.**
Field-loading racks shall be in accordance with Section ~~5706.5~~<u>5707.5</u>.

~~5706.4~~ <u>5707.4</u> **Bulk plants or terminals.**
Portions of properties where *flammable* and *combustible liquids* are received by tank vessels, pipelines, tank cars or tank vehicles and stored or blended in bulk for the purpose of distribution by tank vessels, pipelines, tanks cars, tank vehicles or containers shall be in accordance with Sections ~~5706.4.1~~<u>5707.4.1</u> through ~~5706.4.10.4~~<u>5707.4.10.2</u>.

~~5706.4.1~~ <u>5707.4.1</u> **Building construction.**
Buildings shall be constructed in accordance with the *International Building Code*.

~~5706.4.2~~ <u>5707.4.2</u> **Means of egress.** Rooms in which liquids are stored, used or transferred by pumps shall have *means of egress* arranged to prevent occupants from being trapped in the event of fire.

~~5706.4.3~~ <u>5707.4.3</u> **Heating.** Rooms in which Class I liquids are stored or used shall be heated only by means not constituting a source of ignition, such as steam or hot water. Rooms containing heating appliances involving sources of ignition shall be located and arranged to prevent entry of flammable vapors.

~~5706.4.4~~ <u>5707.4.4</u> **Ventilation.**
Ventilation shall be provided for rooms, buildings and enclosures in which Class I liquids are pumped, used or transferred. Design of ventilation systems shall consider the relatively high specific gravity of the vapors. Where natural ventilation is used, adequate openings in outside walls at floor level, unobstructed except by louvers or coarse screens, shall be provided. Where natural ventilation is inadequate, mechanical ventilation shall be provided in accordance with the *International Mechanical Code*.

~~5706.4.4.1~~ <u>5707.4.4.1</u> **Basements and pits.** Class I liquids shall not be stored or used within a building having a *basement* or pit into which flammable vapors can travel, unless such area is provided with ventilation designed to prevent the accumulation of flammable vapors therein.

~~5706.4.4.2~~ <u>5707.4.4.2</u> **Dispensing of Class I liquids.** Containers of Class I liquids shall not be drawn from or filled within buildings unless a provision is made to prevent the accumulation of flammable vapors in hazardous concentrations. Where mechanical ventilation is required, it shall be kept in operation while flammable vapors could be present.

~~5706.4.5~~ <u>5707.4.5</u> **Storage.**
Storage of Class I, II and IIIA liquids in bulk plants shall be in accordance with the applicable provisions of Section<u>s</u> 5704 <u>and 5705</u>.

~~5706.4.6~~ <u>5707.4.6</u> **Overfill protection of Class I and II liquids.**

Manual and automatic systems shall be provided to prevent overfill during the transfer of Class I and II liquids from mainline pipelines and marine vessels in accordance with API 2350.

~~5706.4.7~~ 5707.4.7 Wharves.
This section shall apply to all wharves, piers, bulkheads and other structures over or contiguous to navigable water having a primary function of transferring liquid cargo in bulk between shore installations and tank vessels, ships, barges, lighter boats or other mobile floating craft.

Exception: Marine motor fuel-dispensing facilities in accordance with Chapter 23.

~~5706.4.7.1~~ 5707.4.7.1 Transferring approvals. Handling packaged cargo of liquids, including full and empty drums, bulk fuel and stores, over a wharf during cargo transfer shall be subject to the approval of the wharf supervisor and the senior deck officer on duty.

~~5706.4.7.2~~ 5707.4.7.2 Transferring location. Wharves at which liquid cargoes are to be transferred in bulk quantities to or from tank vessels shall be not less than 100 feet (30 480 mm) from any bridge over a navigable waterway; or from an entrance to, or superstructure of, any vehicular or railroad tunnel under a waterway. The termination of the fixed piping used for loading or unloading at a wharf shall be not less than 200 feet (60 960 mm) from a bridge or from an entrance to, or superstructures of, a tunnel.

~~5706.4.7.3~~ 5707.4.7.3 Superstructure and decking material. Superstructure and decking shall be designed for the intended use. Decking shall be constructed of materials that will afford the desired combination of flexibility, resistance to shock, durability, strength and *fire resistance*.

~~5706.4.7.4~~ 5707.4.7.4 Tanks allowed. Tanks used exclusively for ballast water or Class II or III liquids are allowed to be installed on suitably designed wharves.

~~5706.4.7.5~~ 5707.4.7.5 Transferring equipment. Loading pumps capable of building up pressures in excess of the safe working pressure of cargo hose or loading arms shall be provided with bypasses, relief valves or other arrangements to protect the loading facilities against excessive pressure. Relief devices shall be tested not less than annually to determine that they function satisfactorily at their set pressure.

~~5706.4.7.6~~ 5707.4.7.6 Piping, valves and fittings. Piping valves and fittings shall be in accordance with Section ~~5703.6~~5703.5 except as modified by the following:

1. Flexibility of piping shall be ensured by appropriate layout and arrangement of piping supports so that motion of the wharf structure resulting from wave action, currents, tides or the mooring of vessels will not subject the pipe to repeated excessive strain.
2. Pipe joints that depend on the friction characteristics of combustible materials or on the grooving of pipe ends for mechanical continuity of piping shall not be used.
3. Swivel joints are allowed in piping to which hoses are connected and for articulated, swivel-joint transfer systems, provided that the design is such that the mechanical strength of the joint will not be impaired if the packing materials fail such as by exposure to fire.
4. Each line conveying Class I or II liquids leading to a wharf shall be provided with a block valve that has *ready access* and that is on shore, near the approach to the wharf and outside of any diked area. Where more than one line is involved, the valves shall be grouped in one location.
5. Means shall be provided for easy access to cargo line valves located below the wharf deck.
6. Piping systems shall contain a sufficient number of valves to operate the system properly and to control the flow of liquid in normal operation and in the event of physical damage.
7. Piping on wharves shall be bonded and grounded where Class I and II liquids are transported. Where excessive stray currents are encountered, insulating joints shall be installed. Bonding and grounding connections on piping shall be located on the wharf side of hose riser insulating flanges, where used, and shall be in a location provided with *ready access* for inspection.

8. Hose or articulated swivel-joint pipe connections used for cargo transfer shall be capable of accommodating the combined effects of change in draft and maximum tidal range, and mooring lines shall be kept adjusted to prevent surge of the vessel from placing stress on the cargo transfer system.
9. Hoses shall be supported to avoid kinking and damage from chafing.

~~5706.4.7.7~~ 5707.4.7.7 Loading and unloading. Loading or discharging shall not commence until the wharf superintendent and officer in charge of the tank vessel agree that the tank vessel is properly moored and connections are properly made.

~~5706.4.7.8~~ 5707.4.7.8 Mechanical work. Mechanical work shall not be performed on the wharf during cargo transfer, except under special authorization by the *fire code official* based on a review of the area involved, methods to be employed and precautions necessary.

~~5706.4.10.3~~ 5707.4.7.9 Obstruction of equipment.
Material shall not be placed on wharves in such a manner that would obstruct access to firefighting equipment or important pipeline control valves.

~~5706.4.10.4~~ 5707.4.7.10 Fire apparatus access.
Where the wharf is designed for vehicular traffic, an unobstructed fire apparatus access road to the shore end of the wharf shall be maintained in accordance with Chapter 5.

~~5706.4.8~~ 5707.4.8 Sources of ignition.
Class I, II or IIIA liquids shall not be used, drawn or dispensed where flammable vapors can reach a source of ignition. Smoking shall be prohibited except in designated locations. “No Smoking” signs complying with Section 310 shall be conspicuously posted where a hazard from flammable vapors is normally present.

~~5706.4.9~~ 5707.4.9 Drainage control.
Loading and unloading areas shall be provided with drainage control in accordance with Section ~~5704.2.10~~5705.2.1.11.

~~5706.4.10~~ 5707.4.10 Fire protection.
Fire protection shall be in accordance with Chapter 9 and Sections ~~5706.4.10.1~~5707.4.10.1 through ~~5706.4.10.4~~5707.4.10.2.

~~5706.4.10.1~~ 5707.4.10.1 Portable fire extinguishers.
Portable fire extinguishers with a rating of not less than 20-B and complying with Section 906 shall be located within 75 feet (22 860 mm) of hose connections, pumps and separator tanks.

~~5706.4.10.2~~ 5707.4.10.2 Fire hoses.
Where piped water is available, ready-connected fire hose in a size appropriate for the water supply shall be provided in accordance with Section 905 so that manifolds where connections are made and broken can be reached by not less than one hose stream.

~~5706.5~~ 5707.5 Bulk transfer and process transfer operations.
Bulk transfer and process transfer operations shall be *approved* and be in accordance with Sections ~~5706.5.1~~5707.5.1 through ~~5706.5.3.3~~5707.5.3.3. Motor fuel-dispensing facilities shall comply with Chapter 23.

~~5706.5.1~~ 5707.5.1 General.
~~The provisions of Sections 5706.5.1.1 through 5706.5.1.18 shall apply to bulk transfer and process transfer operations; Sections 5706.5.2 and 5706.5.2.1 shall apply to bulk transfer operations; Sections 5706.5.3 through 5706.5.3.3 shall apply to process transfer operations and Sections 5706.5.4 through 5706.5.4.5 shall apply to dispensing from tank vehicles and tank cars.~~The provisions of this section apply to bulk transfer and process transfer as follows:

1. Sections 5707.5.1.1 through 5707.5.1.18 apply to bulk transfer and process transfer.
2. Sections 5707.5.2 through 5707.5.2.1 apply to bulk transfer.

3. <u>Sections 5707.5.3 through 5707.5.3.3 apply to process transfer.</u>

<u>See Section 5708.7 for dispensing from tank vehicles and tank cars into motor vehicles.</u>

~~5706.5.1.1~~ <u>5707.5.1.1</u> Location. Bulk transfer and process transfer operations shall be conducted in *approved* locations. Tank cars shall be unloaded only on private sidings or railroad-siding facilities equipped for transferring *flammable* or *combustible liquids*. Tank vehicles and tank cars engaged in bulk transfer or process transfer operations shall be separated from buildings, above-ground tanks, combustible materials, *lot lines*, public streets, public alleys or *public ways* by a distance of 25 feet (7620 mm) for Class I liquids and 15 feet (4572 mm) for Class II and IIIA liquids measured from the nearest loading or unloading valve on the tank vehicle or tank car.

Exception: Buildings for pumps and shelters for personnel supporting transfer operations shall not be required to be separated from tank vehicles and tank cars engaged in bulk transfer or process transfer operations.

~~5706.5.1.2~~ <u>5707.5.1.2</u> Weather protection canopies.
Where weather protection canopies are provided, they shall be constructed in accordance with Section 5004.13. Weather protection canopies shall not be located within 15 feet (4572 mm) of a building or combustible material or within 25 feet (7620 mm) of building openings, *lot lines*, public streets, public alleys or *public ways*.

~~5706.5.1.3~~ <u>5707.5.1.3</u> Ventilation.
Ventilation shall be provided to prevent accumulation of vapors in accordance with Section ~~5705.3.7.5.1~~<u>5706.4.2.1</u>.

~~5706.5.1.4~~ <u>5707.5.1.4</u> Sources of ignition.
Sources of ignition shall be controlled or eliminated in accordance with Section 5003.7.

~~5706.5.1.5~~ <u>5707.5.1.5</u> Spill control and secondary containment.
Areas where transfer operations are located shall be provided with spill control and secondary containment in accordance with Section ~~5703.4~~<u>5004.2</u>. The spill control and secondary containment system shall have a design capacity capable of containing the capacity of the largest tank compartment located in the area where transfer operations are conducted. Containment of the rainfall volume specified in Section 5004.2.2.6 is not required.

~~5706.5.1.6~~ <u>5707.5.1.6</u> Fire protection.
Fire protection shall be in accordance with Section 5703.2.

~~5706.5.1.7~~ <u>5707.5.1.7</u> Static protection. Static protection shall be provided to prevent the accumulation of static charges during transfer operations. Bonding facilities shall be provided during the transfer through open domes where Class I liquids are transferred, or where Class II and III liquids are transferred into tank vehicles or tank cars that could contain vapors from previous cargoes of Class I liquids. Protection shall consist of a metallic bond wire permanently electrically connected to the fill stem. The fill pipe assembly shall form a continuous electrically conductive path downstream from the point of bonding. The free end of such bond wire shall be provided with a clamp or equivalent device for convenient attachment to a metallic part in electrical contact with the cargo tank of the tank vehicle or tank car. For tank vehicles, protection shall consist of a flexible bond wire of adequate strength for the intended service and the electrical resistance shall not exceed 1 megohm. For tank cars, bonding shall be provided where the resistance of a tank car to ground through the rails is 25 ohms or greater.

Such bonding connection shall be fastened to the vehicle, car or tank before dome covers are raised and shall remain in place until filling is complete and all dome covers have been closed and secured.

Exceptions:

1. Where vehicles and cars are loaded exclusively with products not having a static-accumulating tendency, such as asphalt, cutback asphalt, most crude oils, residual oils and water-miscible liquids.
2. Where Class I liquids are not handled at the transfer facility and the tank vehicles are used exclusively for Class II and III liquids.
3. Where vehicles and cars are loaded or unloaded through closed top or bottom connections whether the hose is conductive or nonconductive.

Filling through open domes into the tanks of tank vehicles or tank cars that contain vapor-air mixtures within the flammable range, or where the liquid being filled can form such a mixture, shall be by means of a downspout that extends to near the bottom of the tank.

~~5706.5.1.8~~ 5707.5.1.8 Stray current protection. Tank car loading facilities where Class I, II or IIIA liquids are transferred through open domes shall be protected against stray currents by permanently bonding the pipe to not less than one rail and to the transfer apparatus. Multiple pipes entering the transfer areas shall be permanently electrically bonded together. In areas where excessive stray currents are known to exist, all pipes entering the transfer area shall be provided with insulating sections to isolate electrically the transfer apparatus from the pipelines.

~~5706.5.1.9~~ 5707.5.1.9 Top loading.
When top loading a tank vehicle with Class I and II liquids without vapor control, valves used for the final control of flow shall be of the self-closing type and shall be manually held open except where automatic means are provided for shutting off the flow when the tank is full. Where used, automatic shutoff systems shall be provided with a manual shutoff valve located at a safe distance from the loading nozzle to stop the flow if the automatic system fails.
When top loading a tank vehicle with vapor control, flow control shall be in accordance with Section ~~5706.5.1.10~~5707.5.1.10. Self-closing valves shall not be tied or locked in the open position.

~~5706.5.1.10~~ 5707.5.1.10 Bottom loading. When bottom loading a tank vehicle or tank car with or without vapor control, a positive means shall be provided for loading a predetermined quantity of liquid, together with an automatic secondary shutoff control to prevent overfill. The connecting components between the transfer equipment and the tank vehicle or tank car required to operate the secondary control shall be functionally compatible.

~~5706.5.1.10.1~~ 5707.5.1.10.1 Dry disconnect coupling. When bottom loading a tank vehicle, the coupling between the liquid loading hose or pipe and the truck piping shall be a dry disconnect coupling.

~~5706.5.1.10.2~~ 5707.5.1.10.2 Venting. When bottom loading a tank vehicle or tank car that is equipped for vapor control and vapor control is not used, the tank shall be vented to the atmosphere to prevent pressurization of the tank. Such venting shall be at a height equal to or greater than the top of the cargo tank.

~~5706.5.1.10.3~~ 5707.5.1.10.3 Vapor-tight connection. Connections to the plant vapor control system shall be designed to prevent the escape of vapor to the atmosphere when not connected to a tank vehicle or tank car.

~~5706.5.1.10.4~~ 5707.5.1.10.4 Vapor-processing equipment. Vapor-processing equipment shall be separated from above-ground tanks, warehouses, other plant buildings, transfer facilities or nearest *lot line* of adjoining property that can be built on by a distance of not less than 25 feet (7620 mm). Vapor-processing equipment shall be protected from physical damage by remote location, guard rails, curbs or fencing.

~~5706.5.1.11~~ 5707.5.1.11 Switch loading. Tank vehicles or tank cars that have previously contained Class I liquids shall not be loaded with Class II or III liquids until such vehicles and all piping, pumps, hoses and meters connected thereto have been completely drained and flushed.

~~5706.5.1.12~~ 5707.5.1.12 Loading racks.
Where provided, loading racks, *stairways* or platforms shall be constructed of noncombustible materials. Buildings for pumps or for shelter of loading personnel are allowed to be part of the loading rack. Wiring and electrical equipment located within 25 feet (7620 mm) of any portion of the loading rack shall be in accordance with Section 5703.1.1.

~~5706.5.1.13~~ 5707.5.1.13 Transfer apparatus. Bulk and process transfer apparatus shall be of an *approved* type.

~~5706.5.1.14~~ 5707.5.1.14 Inside buildings. Tank vehicles and tank cars shall not be located inside a building while transferring Class I, II or IIIA liquids, unless *approved* by the *fire code official*.

> **Exception:** Tank vehicles are allowed under weather protection canopies and canopies of automobile motor vehicle fuel-dispensing stations.

~~5706.5.1.15~~ 5707.5.1.15 Tank vehicle and tank car certification.
Certification shall be maintained for tank vehicles and tank cars in accordance with DOTn 49 CFR Parts 100–185.

~~5706.5.1.16~~ 5707.5.1.16 Tank vehicle and tank car stability.
Tank vehicles and tank cars shall be stabilized against movement during loading and unloading in accordance with Sections ~~5706.5.1.16.1~~5707.5.1.16.1 through ~~5706.5.1.16.3~~5707.5.1.16.3.

~~5706.5.1.16.1~~ 5707.5.1.16.1 Tank vehicles. When the vehicle is parked for loading or unloading, the cargo trailer portion of the tank vehicle shall be secured in a manner that will prevent unintentional movement.

~~5706.5.1.16.2~~ 5707.5.1.16.2 Chock blocks. Not less than two chock blocks not less than 5 inches by 5 inches by 12 inches (127 mm by 127 mm by 305 mm) in size and dished to fit the contour of the tires shall be used during transfer operations of tank vehicles.

~~5706.5.1.16.3~~ 5707.5.1.16.3 Tank cars. Brakes shall be set and the wheels shall be blocked to prevent rolling.

~~5706.5.1.17~~ 5707.5.1.17 Monitoring. Transfer operations shall be monitored by an *approved* monitoring system or by an attendant. Where monitoring is by an attendant, the operator or other competent person shall be present at all times.

~~5706.5.1.18~~ 5707.5.1.18 Security.
Transfer operations shall be surrounded by a noncombustible fence not less than 5 feet (1524 mm) in height. Tank vehicles and tank cars shall not be loaded or unloaded unless such vehicles are entirely within the fenced area.

Exceptions:

1. Motor fuel-dispensing facilities complying with Chapter 23.
2. Installations where adequate public safety exists because of isolation, natural barriers or other factors as determined appropriate by the *fire code official*.
3. Facilities or properties that are entirely enclosed or protected from entry.

~~5706.5.2~~ 5707.5.2 Bulk transfer.
Bulk transfer shall be in accordance with Sections ~~5706.5.1~~5707.5.1 and ~~5706.5.2.1~~5707.5.2.1.

~~5706.5.2.1~~ 5707.5.2.1 Vehicle motor. Motors of tank vehicles or tank cars shall be shut off during the making and breaking of hose connections and during the unloading operation.

Exception: Where unloading is performed with a pump deriving its power from the tank vehicle motor.

~~5706.5.3~~ 5707.5.3 Process transfer.
Process transfer shall be in accordance with Section ~~5706.5.1~~5707.5.1 and Sections ~~5706.5.3.1~~5707.5.3 through ~~5706.5.3.3~~5707.5.3.3.

~~5706.5.3.1~~ 5707.5.3.1 Piping, valves, hoses and fittings.
Piping, valves, hoses and fittings that are not a part of the tank vehicle or tank car shall be in accordance with Section ~~5703.6~~5703.5. Caps or plugs that prevent leakage or spillage shall be provided at all points of connection to transfer piping.

~~5706.5.3.1.1~~ 5707.5.3.1.1 Shutoff valves. *Approved* automatically or manually activated shutoff valves shall be provided where the transfer hose connects to the process piping, and on both sides of any exterior *fire-resistance-rated* wall through which the piping passes. Manual shutoff valves shall be arranged so that they are able to be accessed from grade. Valves shall not be locked in the open position.

~~5706.5.3.1.2~~ 5707.5.3.1.2 Hydrostatic relief. Hydrostatic pressure-limiting or relief devices shall be provided where pressure buildup in trapped sections of the system could exceed the design pressure of the components of the system.
Devices shall relieve to other portions of the system or to another *approved* location.

~~5706.5.3.1.3~~ **5707.5.3.1.3 Antisiphon valves.** Antisiphon valves shall be provided where the system design would allow siphonage.

~~5706.5.3.2~~ **5707.5.3.2 Vents.** Normal and emergency vents shall be maintained operable at all times.

~~5706.5.3.3~~ **5707.5.3.3 Motive power.** Motors of tank vehicles or tank cars shall be shut off during the making and breaking of hose connections and during the unloading operation.

Exception: When unloading is performed with a pump deriving its power from the tank vehicle motor.

~~5706.6~~ **5707.6 Tank vehicles and vehicle operation.**
Tank vehicles shall be designed, constructed, equipped and maintained in accordance with NFPA 385 and Sections ~~5706.6.1~~5707.6.1 through ~~5706.6.4~~5707.6.4.

~~5706.6.1~~ **5707.6.1 Operation of tank vehicles.**
Tank vehicles shall be utilized and operated in accordance with NFPA 385 and Sections ~~5706.6.1.1~~5707.6.1.1 through ~~5706.6.1.11~~ 5707.6.1.11.

~~5706.6.1.1~~ **5707.6.1.1 Vehicle maintenance.** Tank vehicles shall not be operated unless they are in proper state of repair and free from accumulation of grease, oil or other flammable substance, and leaks.

~~5706.6.1.2~~ **5707.6.1.2 Leaving vehicle unattended.** The driver, operator or attendant of a tank vehicle shall not remain in the vehicle cab and shall not leave the vehicle while it is being filled or discharged. The delivery hose, when attached to a tank vehicle, shall be considered to be a part of the tank vehicle.

~~5706.6.1.3~~ **5707.6.1.3 Vehicle motor shutdown.** Motors of tank vehicles or tractors shall be shut down during the making or breaking of hose connections. If loading or unloading is performed without the use of a power pump, the tank vehicle or tractor motor shall be shut down throughout such operations.

~~5706.6.1.4~~ **5707.6.1.4 Outage.** A cargo tank or compartment thereof used for the transportation of *flammable* or *combustible liquids* shall not be loaded to absolute capacity. The vacant space in a cargo tank or compartment thereof used in the transportation of *flammable* or *combustible liquids* shall be not less than 1 percent. Sufficient space shall be left vacant to prevent leakage from or distortion of such tank or compartment by expansion of the contents caused by rise in temperature in transit.

~~5706.6.1.5~~ **5707.6.1.5 Overfill protection.** The driver, operator or attendant of a tank vehicle shall, before making delivery to a tank, determine the unfilled capacity of such tank by a suitable gauging device. To prevent overfilling, the driver, operator or attendant shall not deliver in excess of that amount.

~~5706.6.1.6~~ **5707.6.1.6 Securing hatches.** During loading, hatch covers shall be secured on all but the receiving compartment.

~~5706.6.1.7~~ **5707.6.1.7 Liquid temperature.** Materials shall not be loaded into or transported in a tank vehicle at a temperature above the material's ignition temperature unless safeguarded in an *approved* manner.

~~5706.6.1.8~~ **5707.6.1.8 Bonding to underground tanks.** An external bond-wire connection or bond-wire integral with a hose shall be provided for the transferring of *flammable liquids* through open connections into underground tanks.

~~5706.6.1.9~~ **5707.6.1.9 Smoking.** Smoking by tank vehicle drivers, helpers or other personnel is prohibited while they are driving, making deliveries, filling or making repairs to tank vehicles.

~~5706.6.1.10~~ **5707.6.1.10 Hose connections.** Delivery of *flammable liquids* to underground tanks with a capacity of more than 1,000 gallons (3785 L) shall be made by means of *approved* liquid and vapor-tight connections between the delivery hose and tank fill pipe. Where underground tanks are equipped with any type of vapor recovery system, all connections required to be made for the safe and proper functioning of the particular vapor recovery process shall be made. Such connections shall be made liquid and vapor tight and remain connected throughout the unloading process. Vapors shall not be discharged at grade level during delivery.

~~**5706.6.1.10.1**~~ **5707.6.1.10.1 Simultaneous delivery.** Simultaneous delivery to underground tanks of any capacity from two or more discharge hoses shall be made by means of mechanically tight connections between the hose and fill pipe.

~~**5706.6.1.11**~~ **5707.6.1.11 Hose protection.** Upon arrival at a point of delivery and prior to discharging any *flammable* or *combustible liquids* into underground tanks, the driver, operator or attendant of the tank vehicle shall ensure that all hoses utilized for liquid delivery and vapor recovery, where required, will be protected from physical damage by motor vehicles. Such protection shall be provided by positioning the tank vehicle to prevent motor vehicles from passing through the area or areas occupied by hoses, or by other *approved* equivalent means.

~~**5706.6.2**~~ **5707.6.2 Parking.**

Parking of tank vehicles shall be in accordance with Sections ~~5706.6.2.1~~5707.6.2.1 through ~~5706.6.2.3~~5707.6.2.3.

Exception: In cases of accident, breakdown or other emergencies, tank vehicles are allowed to be parked and left unattended at any location while the operator is obtaining assistance.

~~**5706.6.2.1**~~ **5707.6.2.1 Parking near residential, educational and institutional occupancies and other high-risk areas.** Tank vehicles shall not be left unattended at any time on residential streets, or within 500 feet (152 m) of a residential area, apartment or hotel complex, educational facility, hospital or care facility. Tank vehicles shall not be left unattended at any other place that would, in the opinion of the *fire chief*, pose an extreme life hazard.

~~**5706.6.2.2**~~ **5707.6.2.2 Parking on thoroughfares.**

Tank vehicles shall not be left unattended on a public street, highway, public avenue or public alley.

Exceptions:

1. The necessary absence in connection with loading or unloading the vehicle. During actual fuel transfer, Section ~~5706.6.1.2~~ 5707.6.1.2 shall apply. The vehicle location shall be in accordance with Section ~~5706.6.2.1~~5707.6.2.1.
2. Stops for meals during the day or night, where the street is well lighted at the point of parking. The vehicle location shall be in accordance with Section ~~5706.6.2.1~~5707.6.2.1.

~~**5706.6.2.3**~~ **5707.6.2.3 Duration exceeding 1 hour.** Tank vehicles parked at one point for longer than 1 hour shall be located off of public streets, highways, public avenues or alleys, and in accordance with either of the following:

1. Inside of a bulk plant and either 25 feet (7620 mm) or more from the nearest *lot line* or within a building *approved* for such use.
2. At other *approved* locations not less than 50 feet (15 240 mm) from the buildings other than those *approved* for the storage or servicing of such vehicles.

~~**5706.6.3**~~ **5707.6.3 Garaging.** Tank vehicles shall not be parked or garaged in buildings other than those specifically *approved* for such use by the *fire code official*.

~~**5706.6.4**~~ **5707.6.4 Portable fire extinguisher.** Tank vehicles shall be equipped with a portable fire extinguisher complying with Section 906 and having a minimum rating of 2-A:20-B:C.

During unloading of the tank vehicle, the portable fire extinguisher shall be out of the carrying device on the vehicle and shall be 15 feet (4572 mm) or more from the unloading valves.

~~**5706.7**~~ **5707.7 Refineries.**

Plants and portions of plants in which *flammable liquids* are produced on a scale from crude petroleum, natural gasoline or other hydrocarbon sources shall be in accordance with Sections ~~5706.7.1~~5707.7.1 through ~~5706.7.3~~5707.7.3. Petroleum-processing plants and facilities or portions of plants or facilities in which *flammable* or *combustible liquids* are handled, treated or produced on a commercial scale from crude petroleum, natural gasoline, or other hydrocarbon sources shall also be in accordance with API 651, API 653, API 752, API 1615, API 2001, API 2003, API 2009, API 2015, API 2023, API 2201 and API 2350.

~~**5706.7.1**~~ **5707.7.1 Corrosion protection.**

Above-ground tanks and piping systems shall be protected against corrosion in accordance with API 651.

~~5706.7.2~~ 5707.7.2 Cleaning of tanks.
The safe entry and cleaning of petroleum storage tanks shall be conducted in accordance with API 2015.

~~5706.7.3~~ 5707.7.3 Storage of heated petroleum products.
Where petroleum-derived asphalts and residues are stored in heated tanks at refineries and bulk storage facilities or in tank vehicles, such products shall be in accordance with API 2023.

~~5706.8~~ 5707.8 Vapor recovery and vapor-processing systems.
Vapor-processing systems in which the vapor source operates at pressures from vacuum, up to and including 1 psig (6.9 kPa) or in which a potential exists for vapor mixtures in the flammable range, shall comply with Sections ~~5706.8.1~~5707.8.1 through ~~5706.8.5~~5707.8.5.

Exceptions:

1. Marine systems complying with federal transportation waterway regulations such as DOTn 33 CFR Parts 154 through 156, and CGR 46 CFR Parts 30, 32, 35 and 39.
2. Motor fuel-dispensing facility systems complying with Chapter 23.

~~5706.8.1~~ 5707.8.1 Over-pressure/vacuum protection.
Tanks and equipment shall have independent venting for over-pressure or vacuum conditions that might occur from malfunction of the vapor recovery or processing system.

Exception: For tanks, venting shall comply with Section ~~5704.2.7.3~~5705.2.1.3.

~~5706.8.2~~ 5707.8.2 Vent location. Vents on vapor-processing equipment shall be not less than 12 feet (3658 mm) from adjacent ground level, with outlets located and directed so that flammable vapors will disperse to below the lower flammable limit (LFL) before reaching locations containing potential ignition sources.

~~5706.8.3~~ 5707.8.3 Vapor collection systems and overfill protection.
The design and operation of the vapor collection system and overfill protection shall be in accordance with this section and Section 19.5 of NFPA 30.

~~5706.8.4~~ 5707.8.4 Liquid-level monitoring. A liquid knock-out vessel used in the vapor collection system shall have means to verify the liquid level and a high-liquid-level sensor that activates an alarm. For unpopulated facilities, the high-liquid-level sensor shall initiate the shutdown of liquid transfer into the vessel and shutdown of vapor recovery or vapor-processing systems.

~~5706.8.5~~ 5707.8.5 Overfill protection.
Storage tanks served by vapor recovery or processing systems shall be equipped with overfill protection in accordance with Section ~~5704.2.7.5.8~~5705.2.1.5.8.

SECTION ~~5707~~ 5708
~~ON-DEMAND~~ MOBILE FUELING OPERATIONS

Add new text as follows:

5708.1 General. Mobile fueling operations dispensing Class I, II or III liquids into the fuel tanks of motor vehicles shall comply with this section.
Exception: Transfer of liquid from tank vehicles to motor vehicles for private use on farms and rural areas and at construction sites, earth-moving projects, gravel pits and borrow pits is allowed when in accordance with Section 5707.2.8.

Revise as follows:

~~5707.1~~ 5708.2 ~~General~~ On-demand mobile fueling.

On-demand *mobile fueling* operations that dispense Class I, II and III liquids into the fuel tanks of motor vehicles shall comply with Sections ~~5707.1~~ 5708.2.1 through ~~5707.6.6~~ 5708.2.7.6.

Exception: Fueling from an approved portable container in cases of an emergency or for personal use.

~~5707.1.1~~ 5708.2.1 Approval required.

Mobile fueling operations shall not be conducted without first obtaining an operational permit in accordance with Section 105.5.18.

~~5707.1.2~~ 5708.2.2 Location.

Mobile fueling operations shall occur only at *approved* locations. The *fire code official* is authorized to approve individual locations or geographic areas where *mobile fueling* is allowed.

~~5707.2~~ 5708.2.3 Mobile fueling vehicle.

An on-demand *mobile fueling* vehicle shall be that which is utilized in on-demand fueling operations for the dispensing of Class I, II or III liquids into the fuel tanks of motor vehicles.

~~5707.2.1~~ 5708.2.3.1 Mobile fueling vehicle classifications.

An on-demand *mobile fueling* vehicle shall be characterized as one of the following:

1. **Tier 1 *mobile fueling* vehicle.** A tank vehicle that complies with NFPA 385 and that has chassis-mounted tanks where the aggregate capacity does not exceed 1,600 gallons (6057 L).
2. **Tier 2 *mobile fueling* vehicle.** A vehicle with one or more chassis-mounted tanks or containers that do not exceed 110 gallons (416 L) in capacity with an aggregate capacity that does not exceed 800 gallons (3028 L) or the weight capacity of the vehicle in accordance with DOTn.
3. **Tier 3 *mobile fueling* vehicle.** A vehicle that carries a maximum aggregate capacity of 60 gallons (227 L) of motor fuel in metal safety cans *listed* in accordance with UL 30 or other *approved* metal containers, each not to exceed 5 gallons (19 L) in capacity.

~~5707.2.2~~ 5708.2.3.2 Mobile fueling vehicle requirements.

Each *mobile fueling* vehicle shall comply with all local, state and federal requirements, as well as the following:

1. *Mobile fueling* vehicles with a chassis-mounted tank in excess of 110 gallons (416 L) shall also comply with the requirements of Section ~~5706.6~~5707.6 and NFPA 385.
2. The *mobile fueling* vehicle and its equipment shall be maintained in good repair.
3. Safety cans and *approved* metal containers shall be secured to the *mobile fueling* vehicle except when in use.
4. Fueling a motor vehicle from tanks or containers mounted in a trailer connected to a *mobile fueling* vehicle shall be prohibited.

~~5707.3~~ 5708.2.4 Required documents.

Documents developed to comply with Sections ~~5707.3.1~~5708.2.4.1 through ~~5707.3.3~~5708.2.4.3 shall be updated as necessary by the *owner* of the *mobile fueling* operation and shall be maintained in compliance with Section 110.3.

~~5707.3.1~~ 5708.2.4.1 Safety and emergency response plan. *Mobile fueling* operators shall have an *approved* written safety and emergency response plan that establishes policies and procedures for fire safety, spill prevention and control, personnel training and compliance with other applicable requirements of this code.

~~5707.3.2~~ 5708.2.4.2 Training records. *Mobile fueling* vehicles shall be operated only by designated personnel who are trained on proper fueling procedures and the safety and emergency response plan. Training records of operators shall be maintained.

~~5707.3.3~~ 5708.2.4.3 Site plan.

Where required by the *fire code official*, a site plan shall be developed for each location or area at which *mobile fueling* occurs. The site plan shall be in sufficient detail to indicate the following:

1. All buildings and structures.

2. *Lot lines* or property lines.
3. Electric car chargers.
4. Solar photovoltaic parking lot canopies.
5. Appurtenances on-site and their use or function.
6. All uses adjacent to the *lot lines* of the site.
7. Fueling locations.
8. Locations of all storm drain openings and adjacent waterways or wetlands.
9. Information regarding slope, natural drainage, curbing and impounding.
10. How a spill will be kept on the site property.
11. Scale of the site plan.

~~5707.4~~ 5708.2.5 Mobile fueling areas. During fueling, the *mobile fueling* vehicle and point of connection to the vehicle shall not be located on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited.

~~5707.4.1~~ 5708.2.5.1 Separation.
During fueling, the point of connection to the vehicle being fueled shall not take place within 25 feet (7620 mm) of buildings, *lot lines*, property lines or combustible storage. *Mobile fueling* vehicles shall not park within 10 feet (3048 mm) of buildings, *lot lines*, property lines or combustible storage.

Exceptions:

1. The *fire code official* shall be authorized to decrease the separation distance for dispensing from metal safety cans or other *approved* metal containers in accordance with Section ~~5707.2~~5708.2.3.1.
2. The point of fueling shall not take place within 10 feet (3048 mm) of buildings, *lot lines*, property lines or combustible storage where the *mobile fueling* vehicle has an *approved* vapor recovery system or is servicing vehicles with onboard refueling vapor recovery.

Where dispensing operations occur within 15 feet (4572 mm) of a storm drain, an *approved* storm drain cover or an *approved* equivalent method that will prevent any fuel from reaching the drain shall be used.

~~5707.4.2~~ 5708.2.5.2 Sources of ignition. Smoking, open flames and other sources of ignition shall be prohibited within 25 feet (7620 mm) of fuel dispensing activities. Signs prohibiting smoking or open flames within 25 feet (7620 mm) of the vehicle or the point of fueling shall be prominently posted on the *mobile fueling* vehicle. The engines of vehicles being fueled shall be shut off during fueling.

~~5707.4.3~~ 5708.2.5.3 Electrical equipment.
Mobile fueling shall not occur within 20 feet (6096 mm) of electrical equipment located within 18 inches (457 mm) of the ground unless such electrical equipment is rated for Class I, Division 2, hazardous locations in accordance with NFPA 70.

~~5707.5~~ 5708.2.6 Equipment.
Mobile fueling equipment shall comply with Sections ~~5707.5.1~~5708.2.6.1 through ~~5707.5.5~~5708.2.6.5.

~~5707.5.1~~ 5708.2.6.1 Dispensing hoses and nozzles. Where equipped, the dispensing hose shall not exceed 50 feet (15 240 mm) in length. The dispensing nozzles and hoses shall be of an *approved* and *listed* type. Where metal-to-metal contact cannot be made between the nozzle and the fuel fill opening, a means for bonding the *mobile fueling* vehicle to the motor vehicle shall be provided and employed during fueling operations.

~~5707.5.2~~ 5708.2.6.2 Breakaway device.
A *listed* breakaway device shall be provided at the nozzle.

Exception: *Mobile fueling* vehicles equipped with an *approved* brake interlock tied to the nozzle holder that prohibits movement of the *mobile fueling* vehicle when the nozzle is removed from its holder or tied to the delivery of fuel that prevents activation of the pumping system.

~~5707.5.3~~ 5708.2.6.3 **Shutoff valve and fuel limit.** *Mobile fueling* vehicles shall be equipped with a *listed* shutoff valve assembly and a fuel limit switch set to a maximum of 30 gallons (116 L).

~~5707.5.4~~ 5708.2.6.4 **Fire extinguisher.**
An *approved* portable fire extinguisher complying with Section 906 with a minimum rating of4-A:80-B:C shall be provided on the *mobile fueling* vehicle with signage clearly indicating its location.

~~5707.5.5~~ 5708.2.6.5 **Spill kit.** *Mobile fueling* vehicles shall contain a minimum 5-gallon (19 L) spill kit of an *approved* type.

~~5707.6~~ 5708.2.7 **Operations.** *Mobile fueling* vehicles shall be constantly attended during fueling operations with brakes set and warning lights in operation. *Mobile fueling* vehicles shall not obstruct emergency vehicle access roads.

~~5707.6.1~~ 5708.2.7.1 **Dispensing hose.** Where equipped, *mobile fueling* vehicles shall be positioned in a manner to preclude traffic from driving over the dispensing hose. The dispensing hose shall be properly placed on an *approved* reel or in an *approved* compartment prior to moving the *mobile fueling* vehicle.

~~5707.6.2~~ 5708.2.7.2 **Drip control.** Operators shall place a drip pan or an absorbent pillow under the nozzle and each fuel fill opening prior to and during dispensing operations to catch drips.

~~5707.6.3~~ 5708.2.7.3 **Safety cones.** Safety cones or other visual barriers shall be employed as warning devices to highlight the vehicle fueling area.

~~5707.6.4~~ 5708.2.7.4 **Vehicle lights.** The *mobile fueling* vehicle flasher lights shall be in operation while dispensing operations are in progress.

~~5707.6.5~~ 5708.2.7.5 **Nighttime deliveries.** Nighttime deliveries shall be made only in areas deemed adequately lighted by the *fire code official.*

~~5707.6.6~~ 5708.2.7.6 **Spill reporting.**
Spills shall be reported in accordance with Section 5003.3.1.

~~5706.5.4~~ 5708.3 **Dispensing from tank vehicles and tank cars.**
Dispensing from tank cars into the fuel tanks of motor vehicles shall be prohibited. Dispensing from tank vehicles into the fuel tanks of motor vehicles shall be prohibited unless allowed by and conducted in accordance with Sections ~~5706.5.4.1~~5708.3.1 through ~~5706.5.4.5~~ 5708.3.4 or where permitted and approved in accordance with Sections 5708.2.1 through 5708.2.7.6..

~~5706.5.4.1~~ 5708.3.1 **Marine craft and special equipment.** Liquids intended for use as motor fuels are allowed to be transferred from tank vehicles into the fuel tanks of marine craft and special equipment where *approved* by the *fire code official*, and where:

1. The tank vehicle's specific function is that of supplying fuel to fuel tanks.
2. The operation is not performed where the public has access or where there is unusual exposure to life and property.
3. The dispensing line does not exceed 50 feet (15 240 mm) in length.
4. The dispensing nozzle is *approved*.
5. The operation shall be in accordance with Sections 2310.4.1 and 2310.4.2.

~~5706.5.4.2~~ 5708.3.2 **Emergency refueling.**
Where *approved* by the *fire code official*, dispensing of motor vehicle fuel from tank vehicles into the fuel tanks of motor vehicles is allowed during emergencies. Dispensing from tank vehicles shall be in accordance with Sections ~~5706.2.8~~5708.7.2.8 and 5706.6.

~~5706.5.4.3~~ 5708.3.3 Aircraft fueling.
Transfer of liquids from tank vehicles to the fuel tanks of aircraft shall be in accordance with Chapter 20.

~~5706.5.4.4 Fueling of vehicles at farms, construction sites and similar areas.~~
~~Transfer of liquid from tank vehicles to motor vehicles for private use on farms and rural areas and at construction sites, earth-moving projects, gravel pits and borrow pits is allowed in accordance with Section 5706.2.8.~~

~~5706.5.4.5~~ 5708.3.4 Commercial, industrial, governmental or manufacturing.
Dispensing of Class I, II and III motor vehicle fuel from tank vehicles into the fuel tanks of motor vehicles located at commercial, industrial, governmental or manufacturing establishments is allowed where *approved*, provided that such dispensing operations are conducted in accordance with the following:

1. Dispensing shall occur only at sites that have been issued a permit to conduct *mobile fueling*.
2. The *owner* of a *mobile fueling* operation shall provide to the jurisdiction a written response plan that demonstrates readiness to respond to a fuel spill and carry out appropriate mitigation measures, and describes the process to dispose properly of contaminated materials.
3. A detailed site plan shall be submitted with each application for a permit. The site plan shall indicate: all buildings, structures and appurtenances on site and their use or function; all uses adjacent to the *lot lines* of the site; the locations of all storm drain openings, adjacent waterways or wetlands; information regarding slope, natural drainage, curbing, impounding and how a spill will be retained on the site property; and the scale of the site plan.
   Provisions shall be made to prevent liquids spilled during dispensing operations from flowing into buildings or off-site. Acceptable methods include, but shall not be limited to, grading driveways, raising doorsills or other *approved* means.
4. The *fire code official* is allowed to impose limits on the times and days during which *mobile fueling* operations is allowed to take place, and specific locations on a site where fueling is permitted.
5. *Mobile fueling* operations shall be conducted in areas not open to the public or shall be limited to times when the public is not present.
6. *Mobile fueling* shall not take place within 15 feet (4572 mm) of buildings, property lines, combustible storage or storm drains.
   Exceptions:
   1. The distance to storm drains shall not apply where an *approved* storm drain cover or an *approved* equivalent that will prevent any fuel from reaching the drain is in place prior to fueling or a fueling hose being placed within 15 feet (4572 mm) of the drain. Where placement of a storm drain cover will cause the accumulation of excessive water or difficulty in conducting the fueling, such cover shall not be used and the fueling shall not take place within 15 feet (4572 mm) of a drain.
   2. The distance to storm drains shall not apply for drains that direct influent to *approved* oil interceptors.
7. The tank vehicle shall comply with the requirements of NFPA 385 and local, state and federal requirements. The tank vehicle’s specific functions shall include that of supplying fuel to motor vehicle fuel tanks. The vehicle and all its equipment shall be maintained in good repair.
8. Signs prohibiting smoking or open flames within 25 feet (7620 mm) of the tank vehicle or the point of fueling shall be prominently posted on three sides of the vehicle including the back and both sides.
9. A portable fire extinguisher with a minimum rating of 40:BC shall be provided on the vehicle with signage clearly indicating its location.
10. The dispensing nozzles and hoses shall be of an *approved* and *listed* type.
11. The dispensing hose shall not be extended from the reel more than 100 feet (30 480 mm) in length.
12. Absorbent materials, nonwater-absorbent pads, a 10-foot-long (3048 mm) containment boom, an *approved* container with lid and a nonmetallic shovel shall be provided to mitigate a minimum 5-gallon (19 L) fuel spill.

13. Tank vehicles shall be equipped with a “fuel limit” switch such as a count-back switch, to limit the amount of a single fueling operation to not more than 500 gallons (1893 L) before resetting the limit switch.

    Exception: Tank vehicles where the operator carries and can utilize a remote emergency shutoff device that, when activated, immediately causes flow of fuel from the tank vehicle to cease.

14. Persons responsible for dispensing operations shall be trained in the appropriate mitigating actions in the event of a fire, leak or spill. Training records shall be maintained by the dispensing company.
15. Operators of tank vehicles used for *mobile fueling* operations shall have in their possession at all times an emergency communications device to notify the proper authorities in the event of an emergency.
16. The tank vehicle dispensing equipment shall be constantly attended and operated only by designated personnel who are trained to handle and dispense motor fuels.
17. Fuel dispensing shall be prohibited within 25 feet (7620 mm) of any source of ignition.
18. The engines of vehicles being fueled shall be shut off during dispensing operations.
19. Nighttime fueling operations shall only take place in adequately lighted areas.
20. The tank vehicle shall be positioned with respect to vehicles being fueled to prevent traffic from driving over the delivery hose.
21. During fueling operations, tank vehicle brakes shall be set, chock blocks shall be in place and warning lights shall be in operation.
22. Motor vehicle fuel tanks shall not be topped off.
23. The dispensing hose shall be properly placed on an *approved* reel or in an *approved* compartment prior to moving the tank vehicle.
24. The *fire code official* and other appropriate authorities shall be notified when a reportable spill or unauthorized discharge occurs.
25. Operators shall place a drip pan or an absorbent pillow under each fuel fill opening prior to and during dispensing operations. Drip pans shall be liquid-tight. The pan or absorbent pillow shall have a capacity of not less than 3 gallons (11.36 L). Spills retained in the drip pan or absorbent pillow need not be reported. Operators, when fueling, shall have on their person an absorbent pad capable of capturing diesel fuel overfills. Except during fueling, the nozzle shall face upward and an absorbent pad shall be kept under the nozzle to catch drips. Contaminated absorbent pads or pillows shall be disposed of regularly in accordance with local, state and federal requirements.

Reason: This proposal is a comprehensive reorganization of Chapter 57. The goals are to make the chapter easier to navigate, improve clarity for the user, and correlate the requirements with the provisions in Chapter 50. There are no changes in requirements or application. All of these revisions are entirely editorial and the majority of the changes are simply renumbering the sections to fit the reorganization of the chapter

The chapter is reorganized into the following main sections:

- 5701 General (only 5701.3 is shown in the proposal because there are no revisions to the remaining sections)
- 5702 Definitions (this section is not shown in the proposal because there are no revisions)
- 5703 General Requirements
- 5704 Storage in Containers and Portable Tanks
- 5705 Storage in Stationary Tanks (new section, requirements previously found in 5704)
- 5706 Dispensing, Use, Mixing and Handling (previously 5705)
- 5707 Special Operations (previously 5706)
- 5708 Mobile Fueling Operations (previously 5707)

Reformatting the chapter into these main sections achieves the following results:

- Storage is separated into "Containers and Portable Tanks" or "Stationary Tanks" to assist in clarifying the different requirements for each configuration (5704 and 5705)
- Tank design, fabrication and construction provisions now reside in a separate section (5705.2)

- Sections dealing with quantities above or below the MAQ are grouped
  - Indoor storage below MAQs and Indoor storage above MAQs have been separated (5704.2 and 5704.3). This provides clarity and correlates with the format in Chapter 50.
  - Indoor use/handling in quantities above or below MAQs have been separated into two sections (5706.3 and 5706.4)
  - Relocated alcohol-based hand rubs because requirements now apply both above and below MAQ (5706.2.12)
- Section 5703.4 is deleted, simply because it is repeated in several locations. This location is redundant and not needed. Spill control and secondary containment are still required.
- Section 5704.1 was reformatted to clarify is application. Section 5704 covers several methods of storage and the user is directed to the appropriate sections for each storage method.
- Application of spill control and secondary containment have been relocated and reformatted to clarify their application and correlate with secondary containment requirements in Chapter 50 (5704.3.7.3).
- Dispensing from tank vehicles is relocated from Special Operations to Mobile Fueling (5708.7) NOTE: a separate proposal has been submitted this cycle to relocate all Fueling Operations to Chapter 23. If that proposal is successful, Section 5708 should be deleted.
- The header is revised in Tables 5704.2.3.5.3(5) and 5704.2.3.5.3(6). The maximum spacing of 80 SF/head applies to the ceiling sprinkler system, not the in-rack sprinklers.
- Section 5705.2.4.4 is editorially revised to include the provisions from the subsequent three sections.
- Section 5706.1 was reformatted to clarify is application. Section 5704 covers several methods of use configurations and the user is directed to the appropriate sections for each method.
- Section 5706.4.3.3 has been revised to clarify when spill control is required vs. secondary containment
- Section 5707.5 is editorially revised and reformatted to clarify the difference between bulk transfer/process transfer and fueling operations.

A cross reference spreadsheet has been uploaded as an attachment. The spreadsheet identifies the 2024 section number and the proposed new section number for the 2027 edition.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As extensive as this proposal is, it is entirely editorial. The reformatting and editorial clarifications make no changes to the requirements or their application.

F250-24

F251-24

IFC: 5701.6 (New)

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov)

2024 International Fire Code

Add new text as follows:

5701.6 Process Hazard Analysis. Where flammable and combustible liquids are stored or used in excess of the maximum allowable quantity per control area specified in Table 5003.1.1(1) process hazard analyses shall be conducted to ensure reasonable protection of people and property from dangerous conditions involving flammable and combustible liquids. The process hazard analysis shall be conducted utilizing a methodology suitable for the complexity of the process and shall consider factors internal and external to the organization. Recommendations from such analyses shall be addressed in a timely manner.

Reason: On May 1, 2002, there was a fire at the Third Coast Industries petroleum products facility in Friendswood, TX. The fire began as a relatively small one of unknown origin that eventually spread all through the facilities operations for blending and packaging motor oils, hydraulic oils, and engine and other lubricants.

The fire began overnight while the facility was unattended. It was discovered in progress by the facility's security guard who determined it was too severe to fight. Firefighters arrived on scene within minutes, but had insufficient means to fight the fire. The fire burned for more than 24 hours and consumed 1.2 million gallons of combustible and flammable liquids destroying the site. One hundred nearby residents were evacuated, a school was temporarily closed, and significant environmental cleanup was necessary due to fumes and runoff.

Approximately 98 percent of the materials at Third Coast were Class IIIB combustible liquids meaning they had a flash point of 200 Deg F or greater. They also had 4,400 gallons of methanol (Class IB), 3,500 gallons of mineral spirits (Class II), and 9,500 gallons of petroleum distillate (Class IIIA) in storage tanks intermingled with their Class IIIB products and raw materials. Based on the high flash points of most of their raw materials and products, Third Coast may have underestimated the fire hazard present at their facility.

During its investigation the CSB concluded that Third Coast had not analyzed the hazards of their facility. If they had, the deficiencies in onsite water supply, fire detection and alarm equipment, and drainage and containment for combustible liquids could have been identified and addressed prior to the fire preventing the loss of the facility, the evacuation of the community, and the damage done to the environment.

As part of its investigation into this incident, the CSB reviewed the requirements of the International Fire Code chapters on Hazardous Materials – General Provisions and Flammable and Combustible Liquids both then and again now. Nothing in the code requires process hazard analysis unless someone wants to exercise the Performance-Based Design Alternative described at 5001.3 of the IFC.

As the result of the investigation, the CSB issued the following recommendation to the International Code Council:

CSB Recommendation No. 2002-03-I-TX-R3Revise the International Fire Code to address the following issues: For facilities that are not staffed around the clock, specify circumstances where automatic fire detection is needed. Narrow exemptions for Class IIIB liquids. Expand fire protection analysis requirements to include all areas of a facility where there may be flammable or combustible fire risks.

The language proposed is intended to satisfactorily implement the objectives of this recommendation.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$5,000

Estimated Immediate Cost Impact Justification (methodology and variables):

There are no material costs associated with this code change. The labor cost is based on 8 hours of work by an outside consultant at $500 an hour, 8 hours of work by plant management at $56 an hour, 8 hours of work by plant engineering at $48 an hour, and 4 hours of work by a plant employee at $20 an hour.

The cost can be reduced if plant personnel can conduct a PHA without the help of a consultant. The cost of conducting a PHA is directly proportional to the complexity of the process being analyzed. The process in this example represents a storage process or a simple manufacturing process.

Consultant (8 Hours x $500) + Plant Management (8 Hours x $56) + Plant Engineering (8 Hours x $48) + Plant Employee (4 Hours x $20) = $4,912 (Rounded to $5,000)

Labor Cost Source:

2024 International Fire Code

Revise as follows:

5704.2.13.1.4 Tanks abandoned in place . ~~Tanks abandoned in place shall be as follows:~~ The abandoning of underground tanks in place shall comply with all of the following:

1. *Flammable* and *combustible liquids* shall be removed from the tank and connected piping.
2. The suction, inlet, gauge, vapor return and vapor lines shall be disconnected.
3. The tank shall be filled completely with an *approved* inert solid material.
4. Remaining underground piping shall be capped or plugged.
5. A record of tank size, location and date of abandonment shall be retained.
6. All exterior above-grade fill piping shall be permanently removed when tanks are abandoned or removed.
7. The owner of tanks with automatic delivery shall notify the supplier or suppliers in writing a minimum of 24 hours prior to the abandonment, instructing them to discontinue deliveries.

5704.2.14.1 Removal. Removal of above-ground and underground tanks shall comply ~~be in accordance~~ with all of the following:

1. *Flammable* and *combustible liquids* shall be removed from the tank and connected piping.
2. Piping at tank openings that is not to be used further shall be disconnected.
3. Piping shall be removed from the ground.

   Exception: Piping is allowed to be abandoned in place where the *fire code official* determines that removal is not practical. Abandoned piping shall be capped and safeguarded as required by the *fire code official*.
4. Tank openings shall be capped or plugged, leaving a $^1/_8$-inch to $^1/_4$-inch-diameter (3.2 mm to 6.4 mm) opening for pressure equalization.
5. Tanks shall be purged of vapor and inerted prior to removal.
6. All exterior above-grade fill and vent piping shall be permanently removed.

   Exception: Piping associated with bulk plants, terminal facilities and refineries.
7. The *owner* of tanks with automatic delivery shall notify the supplier or suppliers in writing a minimum of 24 hours prior to the removal, instructing the supplier to discontinue deliveries.

Reason: This was done to help minimize the chances of a supplier attempting to fill a tank that has been abandoned or removed, resulting in a spill and costly remediation.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The notification required by this proposed change will have a slight additional cost of $11.50 at the end of the tank's life. This cost is due to office staff emailing the supplier, notifying them that service must cease as the tank is out of service.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will be a one-time fee at the end of the tank's life.

Office staff $18-23 /hr

https://www.salary.com/research/salary/listing/office-worker-hourly-wages

Estimated time to write an email to discontinue service: 30 minutes max.

0.5 hr x $23= **$11.50**

IFC: 5704.2.13.1.4, 5704.2.14, 5704.2.14.1, 5704.2.14.2

Proponents: Daniel Carroll, NYS, NYS DOS (daniel.carroll@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov); Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); Brian Tollisen, NYS Department of State, NYS Department of State (brian.tollisen@dos.ny.gov)

2024 International Fire Code

Revise as follows:

5704.2.13.1.4 Tanks abandoned in place. Tanks abandoned in place shall be as follows:

1. ~~*Flammable* and *combustible liquids* shall be removed from the tank and connected piping.~~The entire contents of the tank and related piping shall be emptied, and the tank purged of all vapor. The contents of the storage tank and related piping shall be removed from the premises or property and disposed of in accordance with applicable local, state, or federal rules and regulations.
2. The suction, inlet, gauge, vapor return and vapor lines shall be disconnected and either be permanently removed, capped, plugged, or filled completely with an *approved* inert solid material.
3. ~~The tank~~ Tanks shall be filled completely with an *approved* inert solid material.
4. Remaining underground piping shall be capped or plugged.
5. A record of tank size, location and date of abandonment shall be retained.
6. All exterior above-grade fill piping shall be permanently removed when tanks are abandoned or removed, or the fill pipe shall be filled completely with an *approved* inert solid material.

5704.2.14 Removal and disposal of tanks.
Removal and disposal of tanks shall comply with Sections 5704.2.14.1 and 5704.2.14.2.

Revise as follows:

5704.2.14.1 Removal. Removal of above-ground and underground tanks shall be in accordance with all of the following:

1. ~~*Flammable* and *combustible liquids* shall be removed from the tank and connected piping.~~The entire contents of the tank and related piping shall be emptied, purged of all vapor, and inerted.
2. Piping at tank openings that is not to be used further shall be disconnected.
3. Piping shall be removed from the ground.

   ~~Exception~~Exceptions:

   1. Piping is allowed to be abandoned in place where the *fire code official* determines that removal is not practical. Abandoned piping shall be capped and safeguarded as required by the *fire code official*.
   2. Piping that is reused for the installation of a new tank and meets the applicable requirements for the new installation shall be allowed to remain where *approved* by the *fire code official*.

4. Tank openings shall be capped or plugged, leaving a $^1/_8$-inch to $^1/_4$-inch-diameter (3.2 mm to 6.4 mm) opening for pressure equalization.
5. Tanks shall be purged of vapor and inerted prior to removal.

6. All exterior above-grade fill and vent piping shall <u>either</u> be permanently removed <u>or filled completely with an *approved* inert solid material.</u>

   .

   Exception: Piping associated with bulk plants, terminal facilities and refineries.

5704.2.14.2 Disposal. ~~Tanks shall be disposed of in accordance with federal, state and local regulations.~~
<u>The tank and related piping, and the contents of the tank and related piping shall be removed from the premises and disposed of in accordance with applicable local, state, or federal rules and regulations</u>

Reason: This change provides some additional clarity on the proper removal and disposal of the materials within tanks that are abandoned in place and those removed and disposed of. It also attempts to clarify scenarios where either reuse of existing piping is necessary for replacement tank installations, or for when removal of all piping would be unnecessarily onerous.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes provide some more flexibility in the abandonment and removal of tanks while clarifying what would already be required by local, state, and federal laws.

2024 International Fire Code

Revise as follows:

5704.3.6 Wholesale and retail sales uses.
Flammable and *combustible liquids* in Group M occupancy wholesale and retail sales uses shall be in accordance with Sections 5704.3.6.1 through 5704.3.6.5, or Sections 10.10.2, 12.3.6, 16.4.1 through 16.4.3, 16.5.1 through ~~16.5.2.12~~ 16.5.3.18, Figures 16.4.1(a) through 16.4.1(c) and Tables ~~16.5.2.1~~16.5.3.1 through ~~16.5.2.12,~~16.5.3.1.18 of NFPA 30.

5704.3.7.5.1 Fire-protection systems.
Liquid storage rooms shall be protected by *automatic sprinkler systems* installed in accordance with Chapter 9 and Tables 5704.3.6.3(4) through 5704.3.6.3(7) and Table 5704.3.7.5.1, or Sections 16.4.1 through 16.4.3, 16.5.1 through 16.5.3.18, and Figures 16.4.1(a) through 16.4.1(c) and Tables 16.5.3.1 through 16.5.3.18 of NFPA 30. In-rack sprinklers shall also comply with NFPA 13.Automatic foam-water systems and automatic aqueous film-forming foam (AFFF) water sprinkler systems shall not be used except where *approved*.
Protection criteria developed from fire modeling or full-scale fire testing conducted at an *approved* testing laboratory are allowed in lieu of the protection as shown in Tables 5704.3.6.3(2) through 5704.3.6.3(7) and Table 5704.3.7.5.1 where *approved*.

5704.3.8.4 Automatic sprinkler systems. Liquid storage warehouses shall be protected by *automatic sprinkler systems* installed in accordance with Chapter 9 and Tables 5704.3.6.3(4) through 5704.3.6.3(7) and Table 5704.3.7.5.1, or Sections 16.4.1 through 16.4.3, 16.5.1 through ~~16.5.3.12~~ 16.5.3.18, and Figures 16.4.1(a) through 16.4.1(c) and Tables 16.5.3.1 through ~~16.5.3.12~~ 16.5.3.18 of NFPA 30. In-rack sprinklers shall also comply with NFPA 13.Automatic foam-water systems and automatic AFFF water sprinkler systems shall not be used except where *approved*.
Protection criteria developed from fire modeling or full-scale fire testing conducted at an *approved* testing laboratory are allowed in lieu of the protection as shown in Tables 5704.3.6.3(2) through 5704.3.6.3(7) and Table 5704.3.7.5.1 where *approved*.

Reason: This proposal is intended to correct several inconsistencies between requirements for Flammable Liquid Storage Rooms, Flammable Liquid Storage Warehouses, and Flammable Liquids in Retail.

This proposal corrects the NFPA 30 references, and adds an the same NFPA 30 reference to the Flammable Liquid Storage Rooms.

The requirements for fire sprinkler design in Retail facilities and Flammable Liquid Storage Warehouses reference specific criteria in NFPA 30 as an acceptable alternative. The format and section numbers in NFPA 30 are slightly different in the 2024 NFPA 30 document, so the revisions to Sections 5704.3.8.4 and 5704.3.6 have been revised to correct the references.

The more significant change is for Flammable Liquid Storage Rooms. Section 5704.3.7.5.1 does not contain similar language to reference NFPA 30. The criteria in NFPA 30 contains sprinkler design for additional storage configurations, beyond what is contained in the Chapter 57, and the NFPA 30 referenced sections are also applicable to Flammable Liquid Storage Rooms. Therefore, the reference to criteria in NFPA 30 is added to the provisions for Flammable Liquid Storage Rooms.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not provide any new requirements. It allows the use of NFPA 30 sprinkler design criteria as an option to the sprinkler design criteria in Chapter 57.

~~For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 pound per square inch = 6.895 kPa, 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 gallon per minute per square foot = 40.75 L/min/m².~~

a. ~~System shall be a closed-head wet system with approved devices for proportioning aqueous film-forming foam.~~

b. ~~Except as modified herein, in-rack sprinklers shall be installed in accordance with NFPA 13.~~

c. ~~The height of storage shall not exceed 25 feet.~~

d. ~~Hose stream demand includes 1$^1/_2$-inch inside hose connections, where required.~~

Revise as follows:

TABLE ~~5704.3.6.3(8)~~ 5704.3.6.3(7) AUTOMATIC SPRINKLER PROTECTION REQUIREMENTS FOR CLASS I LIQUID STORAGE IN METAL CONTAINERS OF 1-GALLON CAPACITY OR LESS WITH UNCARTONED OR CASE-CUT SHELF DISPLAY UP TO 6.5 FEET, AND PALLETIZED STORAGE ABOVE IN A DOUBLE-ROW RACK ARRAY[a]

STORAGE HEIGHT	CEILING SPRINKLER DESIGN AND DEMAND				IN-RACK SPRINKLER ARRANGEMENT AND DEMAND				MINIMUM HOSE STREAM DEMAND (gpm)	MINIMUM DURATION SPRINKLERS AND HOSE STREAM (hours)
	Density (gpm/ft^2)	Area (square feet) High temperature	Area (square feet) Ordinary temperature	Maximum spacing	Racks up to 9 feet deep	Racks 9 to 12 feet	Minimum nozzle pressure	Number of sprinklers operating		

STORAGE HEIGHT	CEILING SPRINKLER DESIGN AND DEMAND: Density (gpm/ft)	Area (square feet): High temperature	Area (square feet): Ordinary temperature	Maximum spacing	IN-RACK SPRINKLER ARRANGEMENT AND DEMAND: Racks up to 9 feet deep	Racks 9 to 12 feet	Minimum nozzle pressure	Number of sprinklers operating	MINIMUM HOSE STREAM DEMAND (gpm)	MINIMUM DURATION SPRINKLERS AND HOSE STREAM (hours)
Maximum 20-foot storage height	0.60	2,000[b]	Not Applicable	100 ft^2/head	1. Ordinary temperature, quick-response sprinklers, maximum 8 feet 3 inches horizontal spacing 2. One line of sprinklers at the 6-foot level and the 11.5-foot level of storage 3. Locate in longitudinal flue space, staggered vertical 4. Shields required where multiple-level	Not Applicable	30 psi (standard orifice) or 14 psi (large orifice)	1. Six sprinklers each on two levels 2. Hydraulically most remote 12 sprinklers	500	2

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square foot = 0.0929 m^2, 1 pound per square inch = 6.895 kPa, 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 gallon per minute per square foot = 40.75 L/min/m^2.

a. This table shall not apply to racks with solid shelves.

b. Using extra-large orifice sprinklers under a ceiling 30 feet or less in height. Minimum aisle width is 7.5 feet.

5704.3.6.3 Fire protection and storage arrangements.

Fire protection and container storage arrangements shall be in accordance with Table 5704.3.6.3(1) or the following:

1. Storage on shelves shall not exceed 6 feet (1829 mm) in height, and shelving shall be metal.
2. Storage on pallets or in piles greater than 4 feet 6 inches (1372 mm) in height, or where the ceiling exceeds 18 feet (5486 mm) in height, shall be protected in accordance with Table 5704.3.6.3(4), and the storage heights and arrangements shall be limited to those specified in Table 5704.3.6.3(2).
3. Storage on racks greater than 4 feet 6 inches (1372 mm) in height, or where the ceiling exceeds 18 feet (5486 mm) in height shall be protected in accordance with ~~Tables~~Table 5704.3.6.3(5)~~,~~ or 5704.3.6.3(6), ~~and 5704.3.6.3(7)~~or NFPA 30, as appropriate, and the storage heights and arrangements shall be limited to those specified in Table 5704.3.6.3(3).

Combustible commodities shall not be stored above *flammable* and *combustible liquids*.

TABLE 5704.3.6.3(1) MAXIMUM STORAGE HEIGHT IN CONTROL AREA

TYPE OF LIQUID	NONSPRINKLERED AREA (feet)	SPRINKLERED AREA[a] (feet)	SPRINKLERED WITH IN-RACK PROTECTION[a, b] (feet)
Flammable liquids:			
Class IA	4	4	4
Class IB	4	8	12
Class IC	4	8	12
Combustible liquids:			
Class II	6	8	12
Class IIIA	8	12	16
Class IIIB	8	12	20

For SI: 1 foot = 304.8 mm.

a In buildings protected by an automatic sprinkler system, the storage height for containers and portable tanks shall not exceed the maximum storage height permitted for the fire protection scheme set forth in NFPA 30 or the maximum storage height demonstrated in a full-scale fire test, whichever is greater. NFPA 30 criteria and fire test results for metallic containers and portable tanks shall not be applied to nonmetallic containers and portable tanks.

b. In-rack protection shall be in accordance with Table 5704.3.6.3(5)~~,~~ or 5704.3.6.3(6), or ~~5704.3.6.3(7)~~NFPA 30.

5704.3.7.5.1 Fire-protection systems.

Liquid storage rooms shall be protected by *automatic sprinkler systems* installed in accordance with Chapter 9 and Tables 5704.3.6.3(4) through 5704.3.6.3(~~7~~6) ~~and Table 5704.3.7.5.1~~, or NFPA 30. In-rack sprinklers shall also comply with NFPA 13.
Automatic foam-water systems ~~and automatic aqueous film-forming foam (AFFF) water sprinkler systems~~ shall not be used except where *approved*.

~~Protection criteria developed from fire modeling or full-scale fire testing conducted at an *approved* testing laboratory are allowed in lieu of the protection as shown in Tables 5704.3.6.3(2) through 5704.3.6.3(7) and Table 5704.3.7.5.1 where *approved*.~~

~~For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square foot = 0.0929 m^2, 1 gallon per minute = 3.785 L/m, 1 gallon per minute per square foot = 40.75 L/min/m^2, °C = (°F – 32)/1.8.~~

a. ~~System shall be a closed-head wet system with *approved* devices for proportioning aqueous film-forming foam.~~

b. ~~Maximum ceiling height of 30 feet.~~

c. ~~Hose stream demand includes 1$^1/_2$-inch inside hose connections, where required.~~

Revise as follows:

TABLE 5704.3.4.1 MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF FLAMMABLE AND COMBUSTIBLE LIQUIDS IN WHOLESALE AND RETAIL SALES OCCUPANCIES[a]

TYPE OF LIQUID	MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA (gallons)		
	Sprinklered[b] in accordance with footnote densities and arrangements	Sprinklered in accordance with Tables 5704.3.6.3(4) through 5704.3.6.3(~~8~~7) ~~and Table 5704.3.7.5.1~~, or NFPA 30	Nonsprinklered
Class IA	60	60	30
Class IB, IC, II and IIIA	7,500[c]	15,000[c]	1,600
Class IIIB	Unlimited	Unlimited	13,200

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m^2, 1 gallon = 3.785 L, 1 gallon per minute per square foot = 40.75 L/min/m^2.

a. Control areas shall be separated from each other by not less than a 1-hour fire barrier.

b. To be considered as sprinklered, a building shall be equipped throughout with an *approved* automatic sprinkler system with a design providing minimum densities as follows:

   1. For uncartoned commodities on shelves 6 feet or less in height where the ceiling height does not exceed 18 feet, quantities are those allowed with a minimum sprinkler design density of Ordinary Hazard Group 2.

   2. For cartoned, palletized or racked commodities where storage is 4 feet 6 inches or less in height and where the ceiling height does not exceed 18 feet, quantities are those allowed with a minimum sprinkler design density of 0.21 gallon per minute per square foot over the most remote 1,500-square-foot area.

c. Where wholesale and retail sales or storage areas exceed 50,000 square feet in area, the maximum allowable quantities are allowed to be increased by 2 percent for each 1,000 square feet of area in excess of 50,000 square feet, up to not more than 100 percent of the table amounts. A control area separation is not required. The cumulative amounts, including amounts attained by having an additional control area, shall not exceed 30,000 gallons.

5704.3.8.4 Automatic sprinkler systems.

Liquid storage warehouses shall be protected by *automatic sprinkler systems* installed in accordance with Chapter 9 and Tables 5704.3.6.3(4) through 5704.3.6.3(~~7~~6) ~~and Table 5704.3.7.5.1~~, or ~~Sections 16.4.1 through 16.4.3, 16.5.1 through 16.5.3.12, and Figures 16.4.1(a) through 16.4.1(c) and Tables 16.5.3.1 through 16.5.3.12 of~~ NFPA 30. In-rack sprinklers shall also comply with NFPA 13. Automatic foam-water systems ~~and automatic AFFF water sprinkler systems~~ shall not be used except where *approved*.

~~Protection criteria developed from fire modeling or full-scale fire testing conducted at an *approved* testing laboratory are allowed in lieu of the protection as shown in Tables 5704.3.6.3(2) through 5704.3.6.3(7) and Table 5704.3.7.5.1 where *approved*.~~

Reason: This proposal is designed to eliminate the reference to AFFF (aqueous film forming foam) from the IFC. AFFF contains PFAS (polyfluoroalkyl substances or perfluoroalkyl substances). PFAS is referred to as a “forever chemical”, and U.S. EPA has determined that exposure to PFAS can have detrimental health effects. EPA and some states have taken actions to reduce PFAS exposure, and the continued requirement for AFFF foam systems needs to be removed from the code.

Industry is developing other foam agents known as NFF (nonfluorinated foam), or SFFF (synthetic fluorine free foam), which does not contain PFAS. Several foam manufacturers have developed NFF foam concentrates which have been tested and several are now listed under UL 162 Foam Equipment and Liquid Concentrates.

This proposal will retain the reference to foam fire-extinguishing systems or foam-water sprinkler systems in the code, but remove the criteria specifying AFFF. The IFC will continue to require foam systems and specify they comply with NFPA 30 and NFPA 11. NFPA 30 establishes density and application rates for foam-water sprinkler systems and NFPA 11 provides criteria on the foam equipment and acceptable foam concentrates.

The application rates and design criteria for NFF will be different than those in the IFC for AFFF so specific design criteria and references to AFFF are revised or deleted as follows:

1. Table 5704.3.6.3(7) is deleted because this table only addresses AFFF systems. The NFPA 30 criteria is more current than the table in the IFC; is more restrictive than the IFC; and offers more storage configurations than the IFC. The 2022 NFPA 30 provides criteria for this specific storage arrangement. Table 16.5.3.3 from NFPA 30 is below, and the criteria in the table for the rack storage of flammable and combustible liquids is highlighted:

2022 NFPA 30

Table 16.5.3.3 – Design Criteria for Foam-Water Sprinkler Protection of Single- or Double-Row Rack Storage of Class IB, IC, Class II, Class IIIA, and Class IIIB Liquids [Any FP, BP ≥100°F] in Metal Containers, Portable Tanks, and IBCs

Liquid Type / Flash Point	Container Capacity gallons	Container Type	Maximum Ceiling Height feet	Maximum Storage Height ft	Ceiling Sprinkler Protection				In-Rack Sprinkler Protection				Notes	Fire Test Reference
					Sprinkler Type		Design		Sprinkler Type		Design			
					K-Factor	Response / Temp / Orientation	Density (gpm/ft²)	Area (sq ft)	K-Factor	Response / Temp / Orientation	Minimum Discharge Flow (gpm)	Layout		
Class IB, IC, II and IIIA	≤6.5	Non Relieving	30	25	≥8.0	SR or QR / High / Any	0.30	2,000	≥5.6	SR or QR / Ord / Any	30	3	1, 2, 4, 5	1
		Relieving	30	25	≥8.0	SR or QR / High / Any	0.30	2,000	≥5.6	SR or QR / Ord / Any	30	4	1, 2, 4, 5	4
	>6.5 and ≤60	Non Relieving	30	25	≥8.0	SR / High / Any	0.30	3,000	≥5.6	SR or QR / Ord / Any	30	3	1, 3, 4, 5	2
		Relieving	30	25	≥8.0	SR / High / Any	0.30	3,000	≥5.6	SR or QR / Ord / Any	30	4	1, 3, 4, 5	5
	Portable tanks and IBCs	Relieving	30	25	≥8.0	SR / High / Any	0.30	3,000	≥5.6	SR or QR / Ord / Any	30	4	1, 3, 4, 5	5
Class IIIB	≤60	Non Relieving	50	40	≥8.0	SR / High / Any	0.30	2,000	≥5.6	SR or QR / Ord / Any	30	4	1, 5	3
		Relieving	50	40	≥8.0	SR / High / Any	0.30	2,000	≥5.6	SR or QR / Ord / Any	30	4	1, 5	6

For SI units, 1 gal = 3.8 L, 1 ft = 0.3 m, 1 ft² = 0.09 m², 1 gpm/ft² = 40.7 L/min/m² = 40.7 mm/min.
For definitions of abbreviations used in the Response column, see 16.5.1.9(4). See also 16.5.1.9(5).
Notes:
(1) In-rack sprinkler design based on the six most hydraulically remote sprinkler in each of the upper three levels.
(2) Design area can be reduced to 1500 ft² when using a preprimed foam-water system installed in accordance with NFPA 11 and maintained according to NFPA 25.
(3) Design area can be reduced to 2000 ft² when using a preprimed foam-water system installed in accordance with NFPA 11 and maintained according to NFPA 25.
(4) In-rack sprinkler hydraulic design can be reduced to three sprinklers operating per level, with three levels operating simultaneously, when using a preprimed foam-water system installed in accordance with NFPA 11 and maintained according to NFPA 25.
(5) See 16.5.3.3.1 for additional criteria.

2. Table 5704.3.6.3(8) is renumbered to Table 5704.3.6.3(7) which was deleted in Item 1 above.
3. Section 5704.3.6.3 is revised to replace the reference to Table 5704.3.6.3(7) which was deleted in Item 1 above. This is replaced with a reference to NFPA 30.
4. Table 5704.3.6.3(1) is revised to remove the reference to Table 5704.3.6.3(7), which was deleted in Item 1 above. A reference to NFPA 30 is added to send the user to the foam-water system criteria in NFPA 30.
5. Section 5704.3.7.5.1 is revised to remove the reference to Table 5704.3.6.3(7), which was deleted in Item 1 above. This is replaced with a reference to NFPA 30. The reference to AFFF is removed in the 2nd paragraph. The section simply requires foam systems. The 3rd paragraph is deleted. This paragraph essentially states that Alternative Methods of Compliance are acceptable. The provisions for Alternative Methods were significantly revised in the 2024 IFC, so this paragraph just states what is already in Chapter 1. The 3rd paragraph is redundant, so no code requirements are lost by removing this paragraph and Chapter 1 provisions will govern.
6. Table 5704.3.7.5.1 is deleted because this table only addresses AFFF systems. The 2022 NFPA 30 provides criteria for this specific storage arrangement. Table 16.5.3.4 from NFPA 30 is below, and the criteria in the table for storage of flammable and combustible liquids in small containers is highlighted:

2022 NFPA 30

Table 16.5.3.4 – Design Criteria for Foam-Water Sprinkler Protection of Palletized and Stacked Storage of Class IB, IC, Class II, and Class IIIA Liquids [FP <200oF, BP ≥100oF] Liquids in Metal Containers, Portable Tanks, and IBCs

Liquid Type / Flash Point	Container Capacity gallons	Container Type	Packaging	Maximum Ceiling Height feet	Maximum Storage Height ft	Ceiling Sprinkler Protection				Notes	Fire Test Reference
						Sprinkler Type		Design			
						K-Factor	Response / Temp / Orientation	Density (gpm/ft²)	Area (sq ft)		
Class IB, IC, II and IIIA	≤6.5	Non Relieving	Cartoned	30	11	≥11.2	SR or QR / High / Any	0.40	3,000	1, 2, 4, 5	1
		Non Relieving	Uncartoned	30	12	≥8.0	SR or QR / High / Any	0.30	3,000	1, 2, 4, 5	4
	>6.5 and ≤60	Non Relieving	Cartoned or Uncartoned	30	5 1 high	≥8.0	SR / High / Any	0.30	3,000	1, 3, 4, 5	2
		Relieving	Cartoned or Uncartoned	30	6.5 2 high	≥8.0	SR / High / Any	0.30	3,000	1, 3, 4, 5	5
			Cartoned or Uncartoned	33	10 3 high	≥11.2	SR / High / Any	0.45	3,000	1, 3, 4, 5	5
		Relieving	Cartoned or Uncartoned	33	13.75 4 high	≥11.2	SR / High / Any	0.60	3,000	1, 3, 4, 5	5
	Portable tanks and IBCs	Relieving	—	30	1 or 2 high	≥8.0	SR / High / Any	0.30	3,000	1, 3, 4, 5	5

For SI units, 1 gal = 3.8 L, 1 ft = 0.3 m, 1 ft² = 0.09 m², 1 gp13.75m/ft² = 40.7 L/min/m² = 40.7 mm/min.

For definitions of abbreviations used in the Response column, see 16.5.1.9(4). See also 16.5.1.9(5).

Notes:

(1) Design area can be reduced to 2000 ft2 when using a preprimed foam-water system installed in accordance with NFPA 11 and maintained according to NFPA 25.

(2) Both ¾ in. (20 mm) and 2 in. (50 mm) listed pressure-relieving mechanisms are required on containers greater than 6.5 gal (23 L) capacity. See Section 16.3.6.

(3) Drums placed on open slatted pallet, not nested, to allow pressure relief from drums on lower levels.

7. Table 5704.3.4.1 is revised to remove the reference to Tables 5704.3.6.3(7) and 5704.3.7.5.1 which were deleted in Items 1 and 6 above. This is replaced with a reference to NFPA 30.
8. Section 5704.3.8.4 is revised to remove the reference to Tables 5704.3.6.3(7) and 5704.3.7.5.1, which were deleted in Items 1 and 6 above. Additionally, the specific sections in NFPA 30 are removed leaving a simple reference to NFPA 30 for the design of the fire sprinkler system. The reference to AFFF is removed in the 2nd paragraph. The section simply requires foam systems. The 3rd paragraph is deleted. This paragraph essentially states that Alternative Methods of Compliance are acceptable. The provisions for Alternative Methods were significantly revised in the 2024 IFC, so this paragraph just states what is already in Chapter 1. The 3rd paragraph is redundant, so no code requirements are lost by removing this paragraph and Chapter 1 provisions will govern.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Bibliography: NFPA 30, 2022 Edition. National Fire Protection Association, 1 Battery March Park, Quincy, Massachusetts 02169, Tables 15.5.3.3 and 16.5.3.4.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0.00. It is only assumed that the cost for construction will increase however compliance with state regulations will likely prohibit the use of AFFF. In addition, the use of AFFF foam is not mandated by the code, it is an optional method of protection. Since AFFF is banned from use, its replacement synthetic foam, will also be an option for use as a protection scheme.

Estimated Immediate Cost Impact Justification (methodology and variables):

The increase is based on a percentage of gallon to gallon cost increase from AFFF to SFF.

Delete without substitution:

~~**5704.3.8.5 Warehouse hose lines.**~~
~~In liquid storage warehouses, either $1^1/_2$-inch (38 mm) lined or 1-inch (25 mm) hard rubber hose lines shall be provided in sufficient number to reach all liquid storage areas and shall be in accordance with Section 903 or 905.~~

Revise as follows:

TABLE 5704.3.6.3(5) AUTOMATIC SPRINKLER PROTECTION REQUIREMENTS FOR RACK STORAGE OF LIQUIDS IN METAL CONTAINERS OF 5-GALLON CAPACITY OR LESS WITH OR WITHOUT CARTONS ON CONVENTIONAL WOOD PALLETS[a]

CLASS LIQUID	CEILING SPRINKLER DESIGN AND DEMAND			IN-RACK SPRINKLER ARRANGEMENT AND DEMAND					MINIMUM HOSE STREAM DEMAND (gpm)	MINIMUM DURATION SPRINKLER AND HOSE STREAM (hours)
	Density (gpm/ft^2)	Area (square feet) High-temperature sprinklers	Area (square feet) Ordinary temperature sprinklers	Maximum spacing	Racks up to 9 feet deep	Racks more than 9 feet to 12 feet deep	30 psi (standard orifice) 14 psi (large orifice)	Number of sprinklers operating		
I (maximum 25-foot height) Option 1	0.40	3,000	5,000	80 ft^2/head	1. Ordinary temperature, quick-response sprinklers, maximum 8 feet 3 inches horizontal spacing 2. One line sprinklers above each level of storage 3. Locate in longitudinal flue space, staggered vertical 4. Shields required where multiple-level	1. Ordinary temperature, quick-response sprinklers, maximum 8 feet 3 inches horizontal spacing 2. One line sprinklers above each level of storage 3. Locate in transverse flue spaces, staggered vertical and within 20 inches of aisle 4. Shields required where multiple-level	30 psi (0.5-inch orifice)	1. Eight sprinklers if only one level 2. Six sprinklers each on two levels if only two levels 3. Six sprinklers each on top three levels, if three or more levels 4. Hydraulically most remote	750	2
I (maximum 25-foot height) Option 2	0.55	2,000[b]	Not Applicable	100 ft^2/head	1. Ordinary temperature, quick-response sprinklers, maximum 8 feet 3 inches horizontal spacing 2. See 2 above 3. See 3 above 4. See 4 above	1. Ordinary temperature, quick-response sprinklers, maximum 8 feet 3 inches horizontal spacing 2. See 2 above 3. See 3 above 4. See 4 above	14 psi (0.53-inch orifice)	See 1 through 4 above	500	2
I and II (maximum 14-foot storage height) (maximum three tiers)	0.55[c]	2,000[d]	Not Applicable	100 ft^2/head	Not Applicable None for maximum 6-foot-deep racks	Not Applicable	Not Applicable	Not Applicable	500	2
II (maximum 25-foot height)	0.30	3,000	5,000	100 ft^2/head	1. Ordinary temperature sprinklers 8 feet apart horizontally 2. One line sprinklers between levels at nearest 10-foot vertical intervals 3. Locate in longitudinal flue space, staggered vertical 4. Shields required where multiple-level	1. Ordinary temperature sprinklers 8 feet apart horizontally 2. Two lines between levels at nearest 10-foot vertical intervals 3. Locate in transverse flue spaces, staggered vertical and within 20 inches of aisle 4. Shields required where multiple-level	30 psi	Hydraulically most remote—six sprinklers at each level, up to a maximum of three levels	750	2

CLASS LIQUID	CEILING SPRINKLER DESIGN AND DEMAND			IN-RACK SPRINKLER ARRANGEMENT AND DEMAND					MINIMUM HOSE STREAM DEMAND (gpm)	MINIMUM DURATION SPRINKLER AND HOSE STREAM (hours)
	Density (gpm/ft)	Area (square feet) High-temperature sprinklers	Area (square feet) Ordinary temperature sprinklers	Maximum spacing	Racks up to 9 feet deep	Racks more than 9 feet to 12 feet deep	30 psi (standard orifice) 14 psi (large orifice)	Number of sprinklers operating		
III (40-foot height)	0.25	3,000	5,000	120 ft²/head	Same as for Class II liquids	Same as for Class II liquids	30 psi	Same as for Class II liquids	500	2

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 pound per square inch = 6.895 kPa, 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 gallon per minute per square foot = 40.75 L/min/m².

a. The ~~design area contemplates~~ sprinkler designs in this table require the installation of a standpipe system and assume the use of Class II standpipe systems. Where Class I standpipe systems are used, the area of application shall be increased by 30 percent without revising density.

b. Using listed or approved extra-large orifices, high-temperature quick-response or standard element sprinklers under a maximum 30-foot ceiling with minimum 7.5-foot aisles.

c. For friction lid cans and other metal containers equipped with plastic nozzles or caps, the density shall be increased to 0.65 gpm per square foot using listed or approved extra-large orifice, high-temperature quick-response sprinklers.

d. Using listed or approved extra-large orifice, high-temperature quick-response or standard element sprinklers under a maximum 18-foot ceiling with minimum 7.5-foot aisles and metal containers.

TABLE 5704.3.6.3(6) AUTOMATIC SPRINKLER PROTECTION REQUIREMENTS FOR RACK STORAGE OF LIQUIDS IN METAL CONTAINERS GREATER THAN 5-GALLON CAPACITY[a]

CLASS LIQUID	CEILING SPRINKLER DESIGN AND DEMAND			IN-RACK SPRINKLER ARRANGEMENT AND DEMAND					MINIMUM HOSE STREAM DEMAND (gpm)	MINIMUM DURATION SPRINKLER AND HOSE STREAM (hours)
	Density (gpm/ft²)	Area (square feet) High-temperature sprinklers	Area (square feet) Ordinary temperature sprinklers	Maximum spacing	On-side storage racks up to 9-foot-deep racks	On-end storage (on pallets) up to 9-foot-deep racks	Minimum nozzle pressure	Number of sprinklers operating		
IA (maximum 25-foot height)	0.60	3,000	5,000	80 ft²/head	1. Ordinary temperature sprinklers 8 feet apart horizontally 2. One line sprinklers above each tier of storage 3. Locate in longitudinal flue space, staggered vertical 4. Shields required where multiple-level	1. Ordinary temperature sprinklers 8 feet apart horizontally 2. One line sprinklers above each tier of storage 3. Locate in longitudinal flue space, staggered vertical 4. Shields required where multiple-level	30 psi	Hydraulically most remote—six sprinklers at each level	1,000	2
IB, IC and II (maximum 25-foot height)	0.60	3,000	5,000	100 ft²/head	1. See 1 above 2. One line sprinklers every three tiers of storage 3. See 3 above 4. See 4 above	1. See 1 above 2. See 2 above 3. See 3 above 4. See 4 above	30 psi	Hydraulically most remote—six sprinklers at each level	750	2
III (maximum 40-foot height)	0.25	3,000	5,000	120 ft²/head	1. See 1 above 2. One line sprinklers every sixth level (maximum) 3. See 3 above 4. See 4 above	1. See 1 above 2. One line sprinklers every third level (maximum) 3. See 3 above 4. See 4 above	15 psi	Hydraulically most remote—six sprinklers at each level	500	1

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 pound per square inch = 6.895 kPa, 1 gallon = 3.785 L, 1 gallon per minute =

3.785 L/m, 1 gallon per minute per square foot = 40.75 L/min/m^2.

a. The ~~design assumes~~ sprinkler designs in this table require the installation of a standpipe system and assume the use of Class II standpipe systems. Where a Class I standpipe system is used, the area of application shall be increased by 30 percent without revising density.

Reason: This proposal removes the requirement for hoselines in liquid storage warehouses. Liquid storage warehouses are a Group H occupancy and are allowed to store an unlimited amount of flammable and combustible liquids. A 1” rubber hose line in warehouse filled with 55-gallon drums of flammable and combustible liquids will have little practical effect. Liquid storage warehouses are required to be protected with a complete fire sprinkler system. The fire sprinkler system will provide better protection for the hazard in the warehouse than a 1” hose line. In many cases, a single fire sprinkler will discharge as much water as the 1” hoseline.

Hoselines and Class II standpipes at one time provided the best fire protection available. Fire sprinkler systems have improved in their effectiveness and water application capabilities over the past couple decades. It is time to remove this hoseline requirement from the code.

Tables 5704.3.6.3(5) and (6) are both based on the inclusion of a standpipe system. However, in Footnote a both tables include the option of using a Class I standpipe system. Those two footnotes are revised to specify that a standpipe system is required in order to utilize these tables.

Class II standpipes are not required in the NFPA 30 standard for these facilities. But when the IFC requires a Class II standpipe, the code requirement supersedes the standard language, even though designer uses the sprinkler design tables in NFPA 30.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00 but may be a larger reduction.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal will reduce the cost of installing fire hose and fire hose connections in liquid storage warehouses.

IFC: 5705.3.9 (New), 5705.3.9.1 (New), 5705.3.9.2 (New), 5705.3.9.3 (New), 5705.3.9.4 (New)

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov)

2024 International Fire Code

Add new text as follows:

5705.3.9 Heating Flammable and Combustible Liquids Above Their Flashpoints Indoors. Heating flammable and combustible liquids indoors shall be done in accordance with Section 5705.3.9.1 through 5705.3.9.4.

5705.3.9.1 Venting Vapors. Process vessels used to heat flammable and combustible liquids shall be sealed from the room they are located in and the vapors vented to a safe location.

5705.3.9.2 Opening the Vessel. If the vessel needs to be opened, the room ventilation shall meet the requirements of 5705.3.7.5.1 and the process heating controls shall be interlocked with the ventilation to shut down process heat if the ventilation fails or is turned off.

5705.3.9.3 Excess Temperature Control. The process vessel shall be equipped with an excess temperature control. This control shall automatically shut down heating and initiate cooling if necessary. Redundant controls shall be provided where determined necessary by risk assessment.

5705.3.9.4 Explosion Control. Explosion control shall be provided in accordance with Section 911.

Reason: On November 22, 2006, there was an explosion at the CAI/Arnel manufacturing facility in Danvers, MA. The explosion was caused by flammable liquid vapors released from a 2000-gallon tank used in the production of ink. A steam valve on the tank heater was unintentionally left open causing the flammable liquid to vaporize after which it accumulated in the building's production area where it found an ignition source and ignited. This occurred overnight after all the workers had left for the day.

At least 10 members of the public required hospital treatment for cuts and bruises. More than 300 residents were evacuated from within a half-mile radius from the facility. The explosion and subsequent fire destroyed the facility, damaged dozens of nearby homes, businesses, and boats, and shattered windows as far away as two miles. Twenty-four homes and six businesses were damaged beyond repair. During the fire, thousands of gallons of flammable liquids stored inside the building and approximately 51,000 pounds of nitrocellulose material burned. The fire lasted for more than 17 hours.

The facility had ventilation in accordance with NFPA/OSHA requirements, but the ventilation had been shut down by the employees before they left as was common. This was done to avoid neighbor complaints and reduce heat loss despite the open top mix tanks that were known to contain flammable liquids, operated in conjunction with heaters supplied by a continuously operated steam system, and which were sometimes, including this night, operated overnight. Earlier in the day, CAI employees began mixing an ink batch in Mix Tank 3. The batch was comprised of a more than 2,000-gallon flammable liquid mixture of heptane, isopropyl alcohol, and propyl alcohol. After the tank was charged with raw materials the production manager opened the steam valve around 3:00 PM to begin heating the mixture. Around 5:30 PM the production manager returned to the work platform to check the mixture temperature which he recalled was about 90 Deg F. The production manager believes they shut the steam valve at this time prior to leaving for the day.

During its investigation the CSB concluded that the production supervisor most likely forgot to perform the critical step of shutting the steam valve prior to leaving for the day due to a combination of distraction and a lack of formal work procedures. The CSB concluded further that the boiling point for the batch of ink in Mix Tank 3 was 165.6 Deg F, that between 232 to 239 Deg F. steam was supplied to the mixing tank, and that a temperature limit control could have prevented overheating the batch. Finally, the CSB concluded that had Mix Tank 3 been sealed and vented, or the ventilation system left on, flammable liquid vapor from Mix Tank 3 would likely have been exhausted out of the building preventing the buildup of the vapors within the building.

As part of its investigation into this incident, the CSB reviewed the requirements of the International Fire Code chapters on Hazardous Materials – General Provisions and Flammable and Combustible Liquids both then and again now. Nothing in the code requires temperature limit controls and/or sealed and vented process vessels when heating flammable and combustible limits above their flash points.

As the result of the investigation, the CSB issued the following recommendation to the International Code Council:

CSB Recommendation No. 2007-03-I-MA-R11

Revise the International Fire Code: Chapter 20: - Specifically include "printing inks" in the definition of "organic coating." - Define equipment specifically discussed in the standard, such as open and closed kettles. - Require heated tanks and vessels containing flammable and combustible liquids to have equipment to prevent overheating, such as: devices to stop the heating process if the temperature exceeds the safe operating limits; devices to stop the heating process if the flammable vapor control equipment malfunctions (e.g., building ventilation system or heated tank vent); and a heating medium that is unable to heat the tank above safe operating temperatures. Chapters 20, 27, and 34: -Define "open", "closed", and "sealed and vented" process tanks. -Define "non-listed" process tanks. -Prohibit heating flammable and combustible liquids above their flashpoints in tanks inside buildings unless the tanks are sealed and vented to the building exterior.

The language proposed is intended to satisfactorily implement the objectives of this recommendation.

Bibliography: U.S. Chemical Safety and Hazard Investigation Board (CSB), "Confined Vapor Cloud Explosion", 13 May 2008. [Online]. Available: https://www.csb.gov/assets/1/20/CSBFinalReportCAIExplosion.pdf?13735. [Accessed 30 November 2023].

Cost Impact: Increase

Estimated Immediate Cost Impact:

$8,240 for Venting and $21,555 for Temperature Limit Control

Estimated Immediate Cost Impact Justification (methodology and variables):

The simplest means of venting the vapors from a heated process vessel is to create an opening in the top of the vessel, install piping through the roof to the outside, and install an end of the line flame arrestor. The flame arrestor is not technically necessary to accomplish the purpose sought by the code change proposal, but is necessary for safe operation. The cost to accomplish this is $480 for piping, $2,000 for a flame arrestor, and $5,760 for labor according to the information contained within “Appendix D: Capital Cost Guidelines” of *Rules of Thumb in Engineering Practice*.

$480 (Piping) + $2,000 (Flame Arrestor) + $5,760 (Labor (All)) = $8,240

The cost of installing a temperature limit control is $21,555. $16,300 for materials and $5,255 for labor. This is according to the information contained within “Appendix D: Capital Cost Guidelines” of *Rules of Thumb in Engineering Practice*.

Temperature Sensor ($6,000 (Materials) + $1,200 (Labor) = $7,200

Hi-Lo Shutoff ($5,500 (Materials) + $3,575 (Labor) = $9,075

Control Valve ($4,800 (Materials) + $480 (Labor) = $5,280

Total: **=** $21,555

Cost Source: Woods, P. D. (2007). *Rules of Thumb in Engineering Practice.* Weinheim, Germany: Wiley-VCH.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org); Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org)

2024 International Fire Code

Revise as follows:

5705.5 Alcohol-based hand rubs classified as Class I or II liquids.
The use of dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. The maximum capacity of each dispenser shall be 68 ounces (2 L).
2. The minimum separation between dispensers shall be 48 inches (1219 mm).
3. Dispensers shall not be located above, below or closer than 1 inch (25 mm) to an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor or intervening counter top shall be free of electrical receptacles, switches, appliances, devices or other ignition sources.
4. Wall mounted ~~Dispensers~~ dispensers and dispensers on stands shall be located so that the bottom of the dispenser is not less than 42 inches (1067 mm) and not more than 48 inches (1219 mm) above the finished floor.
5. Dispensers shall not obstruct required means of egress or be placed within 3 feet (914 mm) of an open flame, heating device or other ignition source.
6. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated “touch free” alcohol-based hand-rub dispensing devices with the following requirements:
    6.1. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer’s care and use instructions.

    6.2. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:

        6.2.1. Any activations of the dispenser shall only occur when an object is placed within 4 inches (98 mm) of the sensing device.

        6.2.2. The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the United States Food and Drug Administration (USFDA).

        6.2.3. An object placed within the activation zone and left in place will cause only one activation.
7. Storage and use of alcohol-based hand rubs shall be in accordance with the applicable provisions of Sections 5704 and 5705.
8. Dispensers located in occupancies with carpeted floors shall only be allowed in *smoke compartments* or *fire areas* equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

5705.5.1 Corridor installations. In addition to the provisions of Section 5705.5, where dispensers containing alcohol-based hand rubs are located in *corridors* or rooms and areas open to the *corridor*, they shall be in accordance with all of the following:

1. Where located in a corridor, dispensers shall be wall mounted

~~1~~2. Level 2 and 3 aerosol ~~containers~~ dispensers shall not be ~~allowed~~ permitted in *corridors*.

~~2~~3. The maximum capacity of each ~~Class I or II~~ liquid dispenser shall be 41 ounces (1.21 L) and the maximum capacity of each Level 1 aerosol dispenser shall be 18 ounces (0.51 kg).

~~3~~4. The maximum quantity <u>of alcohol-based hand rub solution in dispensers </u>allowed in a *corridor* within a *control area* shall be 10 gallons (37.85 L) of Class I or II liquids or 1135 ounces (32.2 kg) of Level 1 aerosols, or a combination of Class I or II liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gallons (37.85 L) or 1,135 ounces (32.2 kg) such that the sum of the ratios of the liquid and aerosol quantities divided by the allowable quantity of liquids and aerosols, respectively, shall not exceed one.

~~4~~5. Projections into a *corridor* shall be in accordance with Section 1003.3.3.

Reason: This is a simple clean-up to the changes approved last cycle.

1. Provides a clarification of requirements to differentiate permanent wall-mounted dispenser requirements which have been in the IFC for many cycles from other types of dispensers such as floor-supported, desktop or counter located that are currently being used.

2. ABHR dispensers are often located on countertops or desktops in areas other than corridors that would not comply with the height minimum and maximum requirement. Provides correlation for the allowance for these types of free-standing dispensers permitted by this section.

3. The new Item #1 clarifies that ABHR dispensers in corridors must be wall mounted to reduce the risk of movable dispensers and dispensers on stands being tipped-over creating an obstruction to the required corridor width. Dispensers in “rooms or areas open to the corridor” can be free-standing or placed on a countertop or desktop as these would not create corridor obstructions.

4. The moved Items #2, #3 and #4 are editorial only to provide better clarity of the existing requirements.
5. Exception #4 in 5705.5 provides minor editorial changes for consistency in terminology usage with other sections of section 5705.5.*Just for easy reference*: [BE] CORRIDOR. An enclosed exit access component that defines and provides a path of egress travel.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC), ICC Committee for Healthcare (CHC) and the Pandemic Task Force Code Development Work Group (PTF CDWG).

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is simply clarifying the intended application of the ABHR requirements as revised for the 2024 IFC.

F258-24

F259-24

IFC: 5705.5

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org); Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org)

2024 International Fire Code

Revise as follows:

5705.5 Alcohol-based hand rubs classified as Class I or II liquids.
The use of dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. In health care facilities, the maximum capacity of each dispenser shall be 41 ounces (1.21 L) in rooms, corridors and areas open to corridors and 68 ounces (2.0 L) in care suites. In all other facilities, the maximum capacity of each wall-mounted dispenser shall be 68 ounces (2 L) and any other dispenser shall be 1 gallon (4 L).

2. The aggregate quantity within a control area, or smoke compartment in health care facilities, shall not exceed 30 gallons (37.85 L) of liquids or 1135 ounces (32.2 kg) of Level 1 aerosols, or a combination of liquids and aerosols not to exceed, in total, the equivalent of 30 gallons (37.85 L) or 1,135 ounces (32.2 kg) such that the sum of the ratios of the liquid and aerosol quantities divided by the allowable quantity of liquids and aerosols, respectively, shall not exceed one.
Exception: In a single story building with only one control area, the aggregate quantity limit shall be based on 1 gal per 900 sq. ft. (84 sq. m)

~~2~~3. The minimum separation between dispensers shall be 48 inches (1219 mm).

~~3~~4. Dispensers shall not be located above, below or closer than 1 inch (25 mm) to an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor or intervening counter top shall be free of electrical receptacles, switches, appliances, devices or other ignition sources.

~~4~~5. Dispensers shall be located so that the bottom of the dispenser is not less than 42 inches (1067 mm) and not more than 48 inches (1219 mm) above the finished floor.

~~5~~6. Dispensers shall not obstruct required means of egress or be placed within 3 feet (914 mm) of an open flame, heating device or other ignition source.

~~6~~7. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated "touch free" alcohol-based hand-rub dispensing devices with the following requirements:
   - ~~6~~7.1. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer's care and use instructions.
   - ~~6~~7.2. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:
     - ~~6.2.1.~~ 7.2.1 Any activations of the dispenser shall only occur when an object is placed within 4 inches (98 mm) of the sensing device.
     - ~~6.2.2.~~ 7.2.2 The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the United States Food and Drug Administration (USFDA).
     - ~~6.2.3.~~ 7.2.3 An object placed within the activation zone and left in place will cause only one activation.

~~7~~8. Storage and use of alcohol-based hand rubs shall be in accordance with the applicable provisions of Sections 5704 and 5705.

Reason: This proposal adds two new reasonable requirements for maximum quantity limitations of alcohol-based hand rub dispensers in use throughout buildings in control areas, smoke compartments, rooms, corridors and rooms that open to corridors. These MAQ limitations are based on experience over the past 4 years of the pandemic by both health care facilities and other occupancy types. The higher quantity of allowable alcohol-based hand rub solution in dispensers is increased from 10 Gallons to 30 Gallons per control area. This is a reasonable increase in MAQ and is supported by the increased quantities that have been safely utilized in all public buildings during the pandemic.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC), ICC Committee for Healthcare (CHC) and the Pandemic Task Force Code Development Work Group (PTF CDWG)

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and ICC Committee for Healthcare (CHC). FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal does not impose any requirements that would increase construction cost. There is no requirement for the installation of alcohol-based hand rub dispensers imposed by this proposal. Installation of dispensers is a choice and where installed, reasonable MAQ limitation for a Class I or Class II liquid is an appropriate safety measure.

2024 International Fire Code

Revise as follows:

5705.5 Alcohol-based hand rubs classified as Class I or II liquids.
The use of dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. The maximum capacity of each dispenser shall be 68 ounces (2 L).
2. The minimum separation between dispensers shall be 48 inches (1219 mm).
3. Dispensers shall not be located above, below or closer than 1 inch (25 mm) to an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor or intervening counter top shall be free of electrical receptacles, switches, appliances, devices or other ignition sources.
4. Dispensers shall be located so that the bottom of the dispenser is not less than 42 inches (1067 mm) and not more than 48 inches (1219 mm) above the finished floor.
5. Dispensers shall not obstruct required means of egress or be placed within 3 feet (914 mm) of an open flame, heating device or other ignition source.
6. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated “touch free” alcohol-based hand-rub dispensing devices with the following requirements:
   6.1. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer’s care and use instructions.

   6.2. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:
      6.2.1. Any activations of the dispenser shall only occur when an object is placed within 4 inches (98 mm) of the sensing device.

      6.2.2. The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the United States Food and Drug Administration (USFDA).

      6.2.3. An object placed within the activation zone and left in place will cause only one activation.

7. Storage ~~and use~~ of alcohol-based hand rub ~~rubs~~ solution not in use shall be in accordance with Section 5705.5.2 ~~the applicable provisions of Sections 5704 and 5705~~.
8. Dispensers located in occupancies with carpeted floors shall only be allowed in *smoke compartments* or *fire areas* equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

Add new text as follows:

5705.5.2 Storage of alcohol-based hand rub solutions classified as Class I or II liquids.. The indoor storage of alcohol-based hand rub solution, classified as Class I or II liquids flammable or combustible, shall be in accordance with all of the following:

Exception: Alcohol-based hand rub dispensers for personal use with an aggregate of not more than 16 oz (474 ml) at a workstation shall not be included in determining the MAQ.

1. The maximum capacity of individual alcohol-based hand rub solution storage containers shall be 1 gallon (4 L) and the container shall be constructed of a material compatible with the alcohol-based solution.

2. Storage of alcohol-based hand rub solutions in basements or below grade shall be protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

5705.5.2 TABLE MAXIMUM ALLOWABLE QUANTITY OF ALCOHOL-BASED HAND RUB SOLUTION IN STORAGEe

STORAGE LOCATION	SPRINKLERED	NONSPRINKLERED
Open storage areas[c]	60 Gal	30 Gal
Non-dedicated storage room[a]	120 Gal	60 Gal
Non-dedicated storage room; 1-HR fire separation[a,d]	240 Gal	120 Gal
Non-dedicated storage room; 2-HR fire separation[a,d]	360 Gal	240 Gal
Dedicated storage room[b]	360 Gal	240 Gal
Dedicated storage room; 1-HR fire separation[b,d]	600 Gal	240 Gal
Dedicated storage room; 2-HR fire separation[b,d]	720 Gal	240 Gal

a. Non-dedicated storage room is an enclosed storage room complying with the applicable storage requirements of this code.

b. Dedicated storage room is an enclosed storage room used only for the storage of alcohol-based hand rub solution.

c. The number of open storage areas is limited to 1 per story or fire area with a maximum, of 4 per building

d. Fire separation shall be fire resistance-rated construction separating the dedicated storage room from the remainder of the building.

e. The maximum allowable quantity is for per control area, or smoke compartment in health care facilities.

Revise as follows:

TABLE 5003.1.1(5) HAZARDOUS MATERIALS EXEMPTIONS[a]

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION
Combustible fiber	Baled cotton	Densely packed baled cotton shall not be classified as combustible fiber, provided that the bales comply with the packing requirements of ISO 8115.
Corrosive	Building materials	The quantity of commonly used building materials that are classified as corrosive materials is not limited.
	Personal and household products	The quantity of personal and household products that are classified as corrosive materials is not limited in retail displays, provided that the products are in original packaging.
	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Explosives	Groups B, F, M and S	Storage of special industrial explosive devices is not limited.
	Groups M and R-3	Storage of black powder, smokeless propellant, and small arms primers is not limited.
Flammable and combustible liquids and gases	Aerosols	Buildings and structures occupied for the storage of aerosol products, aerosol cooking spray products, or plastic aerosol 3 products shall be classified as Group S-1.
	Alcoholic beverages	The quantity of alcoholic beverages in liquor stores and distributors without bulk storage is not limited.
		The quantity of alcoholic beverages in distilling or brewing of beverages is not limited.
		The storage quantity of beer, distilled spirits and wines in barrels and casks is not limited.

		The quantity of alcoholic beverages in retail and wholesale sales occupancies is not limited. To qualify for this allowance, beverages shall be packaged in individual containers not exceeding 1.3 gallons.
	Cleaning establishments with combustible liquid solvents	The quantity of combustible liquid solvents used in closed systems and having a flash point at or above 140°F is not limited. To qualify for this allowance, equipment shall be listed by an approved testing agency and the occupancy shall be separated from all other areas of the building by 1-hour fire barriers or 1-hour horizontal assemblies, or both, constructed in accordance with the *International Building Code*.
		The quantity of combustible liquid solvents having a flash point at or above 200°F is not limited.
	Closed piping systems	The quantity of flammable and combustible liquids and gases utilized for the operation of machinery or equipment is not limited.
	Flammable finishing operations using flammable and combustible liquids	Buildings and structures occupied for the application of flammable finishes shall comply with Section 416.
	Fuel	The quantity of liquid or gaseous fuel in fuel tanks on vehicles or motorized equipment is not limited.
		The quantity of gaseous fuels in piping systems and fixed appliances regulated by the *International Fuel Gas Code* is not limited.
		The quantity of liquid fuels in piping systems and fixed appliances regulated by the *International Mechanical Code* is not limited.
	Fuel oil	The quantity of fuel oil storage complying with Section 605.4.2 is not limited.
	Hand sanitizer	The quantity of alcohol-based hand rubs (ABHR) classified as Class I or II liquids in dispensers installed in accordance with Sections 5705.5 and 5705.5.1 is not limited. The location of the ABHR shall be provided in the construction documents. The quantity of alcohol-based hand rubs classified as Class I or II liquids in storage in accordance with Section 5705.5.2.
	Retail and wholesale sales occupancies with flammable and combustible liquids	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Highly toxic and toxic materials	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Any	Agricultural materials	The quantity of agricultural materials stored or utilized for agricultural purposes on the premises is not limited.
	Energy storage	The quantity of hazardous materials in stationary storage battery systems is not limited.
		The quantity of hazardous materials in stationary fuel cell power systems is not limited.
		The quantity of hazardous materials in capacitor energy storage systems is not limited.
	Refrigeration systems	The quantity of refrigerants in refrigeration systems is not limited.

For SI: 1 gallon = 3.785 L, °C = (°F – 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with provisions of this code that are not based on exceeding maximum allowable quantities in Section 5003.

2024 International Building Code

Revise as follows:

TABLE 307.1.1 HAZARDOUS MATERIALS EXEMPTIONS[a]

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION
Combustible fiber	Baled cotton	Densely packed baled cotton shall not be classified as combustible fiber, provided that the bales comply with the packing requirements of ISO 8115.
Corrosive	Building materials	The quantity of commonly used building materials that are classified as corrosive materials is not limited.
	Personal and household products	The quantity of personal and household products that are classified as corrosive materials is not limited in retail displays, provided that the products are in original packaging.

	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. 		The quantity of hazardous materials in capacitor energy storage systems is not limited.
	Refrigeration Systems	The quantity of refrigerants in refrigeration systems is not limited.

For SI: 1 gallon = 3.785L, °C = (°F - 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with applicable provisions of the International Fire Code.

Reason: The main purpose of this proposal is to add a new Section (5705.5.2) for storage requirements and quantity limitations. This new section adds reasonable storage quantity limits and requirements based on experience over the past 4 years of the pandemic. Two key points to consider.1. Alcohol-based hand-sanitizer solutions at the 60 - 95% level recommended by CDC are classified as Class IB based on flashpoint. However, alcohol type polar solvents have other characteristics that differentiate them from the more volatile petroleum-based flammable (ignitable) liquids: quick evaporation, water-soluble, respond well to water based automatic fire sprinklers. 2. The proposed storage quantity allowances are for ABHR replacement solution stored in their factory containers intended for replacement qualities of one dispenser can be compared to MAQs permitted for Class IB flammable liquids in Group M Occupancies for wholesale and retail sales uses (Table5704.3.4.1) need to explain this comparison; the values don't match. The proposal addresses storage of alcohol-based rub solutions in a maximum individual container size of 1 gallon; provides maximum storage quantities for sprinklered and nonsprinklered buildings and incorporates allowances for higher storage quantities based on whether the storage room is for only alcohol-based sanitizer solutions and whether the storage room has 1 or 2 hour fire resistance rated construction for compartmentation of the hazard. The current MAQs for Class IB flammable liquids (typical classification for an alcohol-based hand rub solutions) is 120 gallons with 100% increase for sprinklers and approved storage cabinets). The quantities in Table 5705.5.2 are modeled after these MAQ allowances recognizing: the storage challenges created during the pandemic and the experience of storage in these amounts without unreasonable fire risk or notable fire incidents; the benefit of fire sprinkler protection and fire separations for hazard mitigation for ABHR solution in storage.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC), ICC Committee for Healthcare (CHC) and the Pandemic Task Force Code Development Work Group (PTF CDWG).

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

Storage of ABHR solution is not mandated by this code requirement, but the storage of large quantities of ABHR may necessitate the construction of separated storage room (fire resistance-rated construction) or the installation of an automatic fire sprinkler system. In those instances there could be a cost for construction for new buildings or a cost of construction to renovate an existing building. However, these requirements provide an increase in amounts of hazardous materials thus further avoiding classification as a Group H occupancy.

SECTION 5706
SPECIAL OPERATIONS

Delete without substitution:

~~**5706.5.4.5 Commercial, industrial, governmental or manufacturing.**~~
~~Dispensing of Class I, II and III motor vehicle fuel from tank vehicles into the fuel tanks of motor vehicles located at commercial, industrial, governmental or manufacturing establishments is allowed where *approved*, provided that such dispensing operations are conducted in accordance with the following:~~

1. ~~Dispensing shall occur only at sites that have been issued a permit to conduct *mobile fueling*.~~
2. ~~The *owner* of a *mobile fueling* operation shall provide to the jurisdiction a written response plan that demonstrates readiness to respond to a fuel spill and carry out appropriate mitigation measures, and describes the process to dispose properly of contaminated materials.~~
3. ~~A detailed site plan shall be submitted with each application for a permit. The site plan shall indicate: all buildings, structures and appurtenances on site and their use or function; all uses adjacent to the *lot lines* of the site; the locations of all storm drain openings, adjacent waterways or wetlands; information regarding slope, natural drainage, curbing, impounding and how a spill will be retained on the site property; and the scale of the site plan.~~
   ~~Provisions shall be made to prevent liquids spilled during dispensing operations from flowing into buildings or off-site. Acceptable methods include, but shall not be limited to, grading driveways, raising doorsills or other *approved* means.~~
4. ~~The *fire code official* is allowed to impose limits on the times and days during which *mobile fueling* operations is allowed to take place, and specific locations on a site where fueling is permitted.~~
5. ~~*Mobile fueling* operations shall be conducted in areas not open to the public or shall be limited to times when the public is not present.~~
6. ~~*Mobile fueling* shall not take place within 15 feet (4572 mm) of buildings, property lines, combustible storage or storm drains.~~

   ~~**Exceptions:**~~

   1. ~~The distance to storm drains shall not apply where an *approved* storm drain cover or an *approved* equivalent that will prevent any fuel from reaching the drain is in place prior to fueling or a fueling hose being placed within 15 feet (4572 mm) of the drain. Where placement of a storm drain cover will cause the accumulation of excessive water or difficulty in conducting the fueling, such cover shall not be used and the fueling shall not take place within 15 feet (4572 mm) of a drain.~~
   2. ~~The distance to storm drains shall not apply for drains that direct influent to *approved* oil interceptors.~~

7. ~~The tank vehicle shall comply with the requirements of NFPA 385 and local, state and federal requirements. The tank vehicle's specific functions shall include that of supplying fuel to motor vehicle fuel tanks. The vehicle and all its equipment shall be maintained in good repair.~~
8. ~~Signs prohibiting smoking or open flames within 25 feet (7620 mm) of the tank vehicle or the point of fueling shall be prominently posted on three sides of the vehicle including the back and both sides.~~
9. ~~A portable fire extinguisher with a minimum rating of 40:BC shall be provided on the vehicle with signage clearly indicating its location.~~

~~10. The dispensing nozzles and hoses shall be of an *approved* and *listed* type.~~

~~11. The dispensing hose shall not be extended from the reel more than 100 feet (30 480 mm) in length.~~

~~12. Absorbent materials, nonwater-absorbent pads, a 10-foot-long (3048 mm) containment boom, an *approved* container with lid and a nonmetallic shovel shall be provided to mitigate a minimum 5-gallon (19 L) fuel spill.~~

~~13. Tank vehicles shall be equipped with a "fuel limit" switch such as a count-back switch, to limit the amount of a single fueling operation to not more than 500 gallons (1893 L) before resetting the limit switch.~~

~~**Exception:** Tank vehicles where the operator carries and can utilize a remote emergency shutoff device that, when activated, immediately causes flow of fuel from the tank vehicle to cease.~~

~~14. Persons responsible for dispensing operations shall be trained in the appropriate mitigating actions in the event of a fire, leak or spill. Training records shall be maintained by the dispensing company.~~

~~15. Operators of tank vehicles used for *mobile fueling* operations shall have in their possession at all times an emergency communications device to notify the proper authorities in the event of an emergency.~~

~~16. The tank vehicle dispensing equipment shall be constantly attended and operated only by designated personnel who are trained to handle and dispense motor fuels.~~

~~17. Fuel dispensing shall be prohibited within 25 feet (7620 mm) of any source of ignition.~~

~~18. The engines of vehicles being fueled shall be shut off during dispensing operations.~~

~~19. Nighttime fueling operations shall only take place in adequately lighted areas.~~

~~20. The tank vehicle shall be positioned with respect to vehicles being fueled to prevent traffic from driving over the delivery hose.~~

~~21. During fueling operations, tank vehicle brakes shall be set, chock blocks shall be in place and warning lights shall be in operation.~~

~~22. Motor vehicle fuel tanks shall not be topped off.~~

~~23. The dispensing hose shall be properly placed on an *approved* reel or in an *approved* compartment prior to moving the tank vehicle.~~

~~24. The *fire code official* and other appropriate authorities shall be notified when a reportable spill or unauthorized discharge occurs.~~

~~25. Operators shall place a drip pan or an absorbent pillow under each fuel fill opening prior to and during dispensing operations. Drip pans shall be liquid-tight. The pan or absorbent pillow shall have a capacity of not less than 3 gallons (11.36 L). Spills retained in the drip pan or absorbent pillow need not be reported. Operators, when fueling, shall have on their person an absorbent pad capable of capturing diesel fuel overfills. Except during fueling, the nozzle shall face upward and an absorbent pad shall be kept under the nozzle to catch drips. Contaminated absorbent pads or pillows shall be disposed of regularly in accordance with local, state and federal requirements.~~

SECTION 5707
ON-DEMAND MOBILE FUELING OPERATIONS

5707.2 Mobile fueling vehicle.
An on-demand *mobile fueling* vehicle shall be that which is utilized in on-demand fueling operations for the dispensing of Class I, II or III liquids into the fuel tanks of motor vehicles.

Revise as follows:

~~5707.2.2~~ <u>5707.2.1</u> Mobile fueling vehicle requirements.
Each *mobile fueling* vehicle shall comply with all local, state and federal requirements, as well as the following:

~~1.~~ ~~*Mobile fueling* vehicles with a chassis-mounted tank in excess of 110 gallons (416 L) shall also comply with the requirements of Section 5706.6 and NFPA 385.~~

~~2.~~ 1 The on-demand *mobile fueling* vehicle and its equipment shall be maintained in good repair.

~~3.~~ 2 Safety cans ~~and *approved* metal containers~~ shall be secured to the *mobile fueling* vehicle except when in use.

~~4.~~ 3. Fueling a motor vehicle from tanks or containers mounted in a trailer connected to a *mobile fueling* vehicle shall be prohibited.

~~5707.2.1~~ 5707.2.2 Mobile fueling vehicle classifications.

An on-demand *mobile fueling* vehicle shall be characterized as one of the following:

1. ~~**Tier 1 *mobile fueling* vehicle.** A tank vehicle that complies with NFPA 385 and that has chassis-mounted tanks where the aggregate capacity does not exceed 1,600 gallons (6057 L)~~ On-demand mobile fueling vehicles complying with Section 5706.6 and NFPA 385 with one or more chassis-mounted tanks or containers not exceeding an aggregate capacity of 3,000 gallons (11,356 L)..
2. ~~**Tier 2 *mobile fueling* vehicle.** A vehicle with one or more chassis-mounted tanks or containers that do not exceed 110 gallons (416 L) in capacity with an aggregate capacity that does not exceed 800 gallons (3028 L) or the weight capacity of the vehicle in accordance with DOTn~~ On-demand mobile fueling vehicles with one or more chassis-mounted tanks or containers and each tank or container does not exceed 110 gallons (416 L) shall not exceed an aggregate capacity of 800 gallons (3028 L)..
3. ~~**Tier 3 *mobile fueling* vehicle.** A vehicle that carries a maximum aggregate capacity of 60 gallons (227 L) of motor fuel in metal safety cans *listed* in accordance with UL 30 or other *approved* metal containers, each not to exceed 5 gallons (19 L) in capacity~~ Safety cans carried on mobile fueling vehicles shall be listed in accordance with UL 30 and shall not exceed 5 gallons (19 L) in capacity. The aggregate capacity of such safety cans shall not exceed 60 gallons (227 L).

.

Reason: This proposal is intended to correct a conflict within the code, eliminate duplicate sections addressing the same activity and improve the language for On-Demand Mobile Fueling.

The proposal seeks to delete Section 5706.5.4.5 commonly known as Fleet Fueling. It is a form of mobile fueling which is now covered by Section 5707. There is no need to have two sections of the code covering the same activity.

Additionally, the addition of the Class I liquids to 5706.5.4.5 created serious conflicts between the levels of safety provided because 5706.5.4.5 was written to address hazards of Class II and Class III liquids two decades ago, and Section 5707 was written to specifically include and address the hazards of Class I liquid dispensing. See table for the serious disparities.

	Class II and III Section 5706.5.4.5	Class I Section 5707
Separation from buildings and lot lines	15′	25′
Tank Vehicle/mobile fuel vehicle fuel limits	None	1600/800/60 gal
Fuel limit switch	500 gal	30 gal
Dispensing hose length	100′	50′
Fire extinguisher rating	40:BC	4A:80-BC
Approval and listing of nozzles and hoses	None	Required
Listed breakaway at nozzle	None	Required
Safety Cones	None	Required
Vehicle Flashers	None	Required
Night delivery lighting	None	Required

What was commonly referred to as Fleet Fueling can easily comply with Section 5707 On-Demand Mobile Fueling with the proper safety protocols.

In Section 5707, Section 5707.2.1 and Section 5707.2.2 have been re-ordered to have the vehicle requirements comes first, then the vehicle classifications.

In the new Section 5707.2.1 Item 1 has been deleted and Item 1 under new Section 5707.2.2 has been modified to cover that topic.

In new Section 5707.2.1 Item 2 the "other approved metal" reference has been deleted as subjective language and to ensure "safety cans" are utilized.

In new Section 5707.2.2 The scoping has been changed from "classification" to "capacity". Though requested by industry the "tier" concept was not embraced and the core issue was always capacity.

New Section 5707.2.2 Item 1 has been modified to eliminate the tier language and to reference Section 5706.6 besides NFPA 385 to capture existing IFC requirements and the capacity has been increased to 3,000 gallons which is typically the size of a small oil delivery vehicle commonly on the road, this change recognizes that in some jurisdictions these vehicles are already in use for mobile fueling and to adjust the section due to the deletion of fleet fueling language.

New Section 5707.2.2 Item 2 has been modified to eliminate the Tier language and to eliminate a reference to DOTn weight capacity as that is an issue enforced by law enforcement agencies and DOT.

New Section 5707.2.3 has been modified to eliminate the Tier language and to delete reference to "other approved metal containers" to default to "safety cans".

The proposed changes eliminate duplication of sections covering the same topic, eliminate serious differences in safety levels provided, and increases the NFPA 385 compliant vehicle capacity to recognize capacities currently being safely utilized and which reduce the number of vehicle fills and trips necessary.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no construction cost impacts, this language regulates mobile fueling activities utilizing vehicles.

F261-24

F262-24

IFC: 5803.1.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com); Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self (jbengineer@aol.com)

2024 International Fire Code

Revise as follows:

5803.1.1 Special limitations for indoor storage and use.
Flammable gases shall not be stored or used in Group A, E, I or R occupancies or in offices in Group B occupancies.

Exceptions:

1. Cylinders of nonliquefied *compressed gases* not exceeding a capacity of 250 cubic feet (7.08 m^3) or liquefied gases not exceeding a capacity of 40 pounds (18 kg) each at *normal temperature and pressure (NTP)* used for maintenance purposes, patient care or operation of equipment.
2. Food service operations in accordance with Section 6103.2.1.7.
3. Hydrogen gas systems located in a hydrogen fuel gas room constructed in accordance with Section 421 of the International Building Code.
4. The temporary storage of Category 1B Flammable Gas refrigerants in machinery rooms during refrigeration equipment and system maintenance, that requires the refrigerant to be removed from the equipment.

Reason: During maintenance of refrigeration systems, the refrigerant is temporarily captured in compressed gas cylinders in the machinery room the refrigeration system is located within, then when maintenance or repair work is completed, the refrigerant is reloaded into the equipment. The new exception permits this necessary activity and correlates with the industry standards these activities are conducted under.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This added language addresses an operational issue not new construction. It clarifies that the prohibition in Section 5803.1.1 was not intended to apply to temporary storage of Category 1B Flammable Gas refrigerants in machinery rooms during refrigeration equipment and system maintenance.

F262-24

F263-24

IFC: TABLE 6104.3

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org)

2024 International Fire Code

Revise as follows:

TABLE 6104.3 LOCATION OF LP-GAS CONTAINERS

LP-GAS CONTAINER CAPACITY (water gallons)[h]	MINIMUM SEPARATION BETWEEN LP-GAS CONTAINERS AND BUILDINGS, PUBLIC WAYS[g] OR LOT LINES OF ADJOINING PROPERTY THAT CAN BE BUILT ON		MINIMUM SEPARATION BETWEEN LP-GAS CONTAINERS[b, c] (feet)
	Mounded or underground LP-gas containers[a] (feet)	Above-ground LP-gas containers[b] (feet)	
Less than 125[c, d]	10	5[e]	None
125 to 250	10	10	None
251 to 500	10	10	3
501 to 2,000	10	25[e, f]	3
2,001 to 30,000	50	50	5
30,001 to 70,000	50	75	(0.25 of sum of diameters of adjacent LP-gas containers)
70,001 to 90,000	50	100	
90,001 to 120,000	50	125	

For SI: 1 foot = 304.8 mm, 1 gallon = 3.785 L.

a. Minimum distance for underground LP-gas containers shall be measured from the pressure relief device and the filling or liquid-level gauge vent connection at the container, except that all parts of an underground LP-gas container shall be not less than 10 feet from a building or lot line of adjoining property that can be built on.

b. For other than installations in which the overhanging structure is 50 feet or more above the relief-valve discharge outlet. In applying the distance between buildings and ASME LP-gas containers with a water capacity of 125 gallons or more, not less than 50 percent of this horizontal distance shall also apply to all portions of the building that project more than 5 feet from the building wall and that are higher than the relief valve discharge outlet. This horizontal distance shall be measured from a point determined by projecting the outside edge of such overhanging structure vertically downward to grade or other level on which the LP-gas container is installed. Distances to the building wall shall be not less than those prescribed in this table.

c. Where underground multicontainer installations are composed of individual LP-gas containers having a water capacity of 125 gallons or more, such containers shall be installed so as to provide access at their ends or sides to facilitate working with cranes or hoists.

d. At a consumer site, if the aggregate water capacity of a multiple-container installation, comprised of individual LP-gas containers having a water capacity of less than 125 gallons, is 500 gallons or more, the minimum distance shall comply with the appropriate portion of this table, applying the aggregate capacity rather than the capacity per LP-gas container. If more than one such installation is made, each installation shall be separated from other installations by not less than 25 feet. Minimum distances between LP-gas containers need not be applied.

e. The following shall apply to above-ground containers installed alongside buildings:

1. LP-gas containers of less than a 125-gallon water capacity are allowed without a separation distance where in compliance with Items 2, 3 and 4.

2. Department of Transportation (DOTn) specification LP-gas containers shall be located and installed so that the discharge from the container pressure relief device is not less than 3 feet horizontally from building openings below the level of such discharge and shall not be beneath buildings unless the space is well ventilated to the outside and is not enclosed for more than 50 percent of its perimeter. The discharge from LP-gas container pressure relief devices shall be located not less than 5 feet from exterior sources of ignition, openings into direct-vent (sealed combustion system) appliances or mechanical ventilation air intakes.

3. ASME LP-gas containers of less than a 125-gallon water capacity shall be located and installed such that the discharge from pressure relief devices shall not terminate in or beneath buildings and shall be located not less than 5 feet horizontally from building openings below the level of such discharge and not less than 5 feet from exterior sources of ignition, openings into direct vent (sealed combustion system) appliances, or mechanical ventilation air intakes.

4. The filling connection and the vent from liquid-level gauges on either DOTn or ASME LP-gas containers filled at the point of installation shall be not less than 10 feet from exterior sources of ignition, openings into direct vent (sealed combustion system) appliances or mechanical ventilation air intakes.

f. This distance is allowed to be reduced to not less than 10 feet for a single LP-gas container of 1,200-gallon water capacity or less, provided that such container is not less than 25 feet from other LP-gas containers of more than 125-gallon water capacity.

g. Above-ground LP-gas containers with a water capacity of 2,000 gallons or less shall be separated from public ways by a distance of not less than 5 feet. Containers with a water capacity greater than 2,000 gallons shall be separated from public ways in accordance with this table.

h. Containers greater than 120,000 gallons water capacity shall comply with NFPA 58.

Reason: Table 6104.3 currently stops its entries at 120,000 gallons water capacity. NFPA 58 provides three additional entries that address containers between 120,000-200,000 gallons; 200,001-1,000,000 gallons; and, greater than 1,000,000 gallons. These installations are not addressed by the current Table 6104.3, so reference is made to NFPA 58 for the requirements.

Bibliography: NFPA 58 "Liquefied Petroleum Gas Code," 2024 edition published by the National Fire Protection Association.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost of construction will not change as a result of this proposal. This proposal is simply providing guidance on what to do when amounts exceed 120,000 gallons in size. There is no change to the cost of installing a propane container on site due to this proposal.

F263-24

F264-24

IFC: 6104.3.2, 6104.3.3 (New)

Proponents: Gregory Wilson, Federal Emergency Management Agency, FEMA (gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., FEMA Building Science (rebecca@rcquinnconsulting.com)

2024 International Fire Code

6104.3.2 Special hazards.
LP-gas containers shall be located with respect to special hazards including, but not limited to, above-ground *flammable* or *combustible liquid* tanks, oxygen or gaseous hydrogen containers, flooding or electric power lines as specified in Section 6.5.3 of NFPA 58.

Add new text as follows:

6104.3.3 Flood hazard areas. LP-gas containers located in *flood hazard areas* established in Section 1612.3 of the *International Building Code* shall be located and installed in accordance with ASCE 24.

Reason: Section 6104.3.2 requires location of LP-gas containers "with respect to flooding" but does not provide specifics on what that means. This proposal adds a pointer on the minimum I-Code requirements for LP-gas containers located in flood hazard areas. The proposed change is not a new requirement; it is simply adding a reference to existing requirements for utilities and equipment in flood hazard areas.

Bibliography: *Flood Resistant Design and Construction,* ASCE/SEI 24-14

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not increase or decrease the initial construction costs or life-cycle costs because it does not change any requirements; it only points to existing requirements for development in flood hazard areas.

F264-24

F265-24

IFC: 6107.2

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org)

2024 International Fire Code

Revise as follows:

6107.2 Smoking and other sources of ignition.
“No Smoking” signs complying with Section 310 shall be posted where required by the *fire code official*. Smoking within 25 feet (7620 mm) of a point of transfer, while filling operations are in progress at LP-gas containers or vehicles, shall be prohibited.
Control of other sources of ignition shall comply with Chapter 3 of this code and Section ~~6.25~~ 6.26 of NFPA 58.

Reason: This proposal will update the reference to the 2024 edition of NFPA 58.

Bibliography: NFPA 58 "LP-Gas Code," 2024 edition, National Fire Protection Association.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact for this proposal as it is simply updating to the correction section within the referenced standard.

F265-24

F266-24

IFC: 6107.3

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org)

2024 International Fire Code

Revise as follows:

6107.3 Clearance to combustibles. ~~Weeds, grass, brush, trash and other combustible materials shall be kept not less than 10 feet (3048 mm) from LP-gas tanks or containers.~~Combustible materials shall not accumulate or be stored within 10 ft (3048 mm) of a container.

Reason: Vegetation of any kind is not considered to be a hazard. This requirement applies to stored or accumulated fuel-dense combustible materials such as wood pallets, boxes and other materials that when ignited, can impinge flames on the container. This proposal is consistent with the current requirements in NFPA 58.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact for this proposal as it is simply clarifying intent and is consistent with NFPA 58.

F266-24

F267-24

IFC: 6108.1

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org)

2024 International Fire Code

Revise as follows:

6108.1 General.
Fire protection shall be provided for installations having LP-gas storage containers with a water capacity of more than 4,000 gallons (15 140 L), as required by Section ~~6.29~~ 6.30 of NFPA 58.

Reason: This proposal will update the text in the IFC to the current section in the 2024 edition of NFPA 58.

Bibliography: NFPA 58 "LP-Gas Code," 2024 edition, National Fire Protection Association.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact for this proposal as it is simply updating to the correct section within the referenced standard.

F267-24

F268-24

IFC: 6109.11.2

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org)

2024 International Fire Code

Revise as follows:

6109.11.2 Construction.
The construction of such buildings and rooms shall comply with requirements for Group H occupancies in the *International Building Code*, Chapter 10 of NFPA 58 and both of the following:

1. Adequate vents shall be provided to the outside at both top and bottom, located not less than 5 feet (1524 mm) from building openings.
2. The entire area shall be classified for the purposes of ignition source control in accordance with Section ~~6.25~~ 6.26 of NFPA 58.

Staff Analysis: There is an errata that corrects the edition of NFPA 58 to 2024 in the 2024 IFC.

Reason: This proposal will update the reference to the current section of the 2024 edition of NFPA 58.

Bibliography: NFPA 58 "LP-Gas Code," 2024 edition, National Fire Protection Association.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact due to this proposal as it simply updates to the correct section of the standard.

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Kris Jaggari, Nouryon/OPPSD Representative (kris.jaggari@nouryon.com)

2024 International Fire Code

CHAPTER 62 ORGANIC PEROXIDES

SECTION 6201 GENERAL

Revise as follows:

6201.1 Scope. The storage and use of *organic peroxides* shall be in accordance with this chapter and Chapter 50.Storage of ~~U~~u nclassified detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall ~~be stored in accordance~~ comply with Chapter 56.

6201.2 Permits.
Permits shall be required for organic peroxides as set forth in Section 105.5.

SECTION 6202 DEFINITION

6202.1 Definition.
The following term is defined in Chapter 2:
ORGANIC PEROXIDE.

- **Class I.**
- **Class II.**
- **Class III.**
- **Class IV.**
- **Class V.**
- **Unclassified detonable.**

SECTION 6203 GENERAL REQUIREMENTS

6203.1 Quantities not exceeding the maximum allowable quantity per control area.
The storage and use of *organic peroxides* in amounts not exceeding the *maximum allowable quantity per control area* indicated in Section 5003.1 shall be in accordance with Sections 5001, 5003, 6201 and 6203.

6203.1.1 Special limitations for indoor storage and use by occupancy.

The indoor storage and use of *organic peroxides* shall be in accordance with Sections 6203.1.1.1 through 6203.1.1.4.

Revise as follows:

6203.1.1.1 Group A, E, I or U occupancies.
In Group A, E, I or U occupancies, ~~any amount of~~ unclassified detonable and Class I organic peroxides shall be stored in accordance with the following:

1. The quantity of *detonable organic peroxides* shall not exceed 1 pound (0.5 kg).
2. The quantity of Class I *organic peroxides* shall not exceed 5 pounds (2.3 kg).
3~~1~~. Unclassified detonable and Class I *organic peroxides* shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
4~~2~~. The hazardous materials storage cabinets shall not contain other storage.

6203.1.1.2 Group R occupancies. Unclassified detonable and Class I *organic peroxides* shall not be stored or used within Group R occupancies.

6203.1.1.3 Group B, F, M or S occupancies. Unclassified detonable and Class I *organic peroxides* shall not be stored or used in offices, or retail sales areas of Group B, F, M or S occupancies.

6203.1.1.4 Classrooms.
In classrooms in Group B, F or M occupancies, any amount of unclassified detonable and Class I *organic peroxides* shall be stored in accordance with the following:

1. Unclassified detonable and Class I *organic peroxides* shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
2. The hazardous materials storage cabinets shall not contain other storage.

Revise as follows:

~~6204.1.7~~ 6203.1.2 Storage ~~arrangement~~.
Storage ~~arrangements for~~ of *organic peroxides* shall be in accordance with Table ~~6204.1.7~~ 6203.1.2 and ~~shall comply with all of~~ the following.

1. Containers and packages in storage areas shall be closed.
~~2. Bulk storage shall not be in piles or bins.~~
2. Storage in hazardous materials storage cabinets shall be in accordance with Section 5003.8.7 and be designed to vent an overpressure event.
3. Refrigerators or freezers for storage of *organic peroxides* shall be listed for Class I, Division 2 locations and be designed to vent an overpressure event.
4. A minimum separation distance of 3 feet (900 mm) shall be maintained between hazardous materials storage cabinets, refrigerators or freezers and other storage.
5~~3~~. A minimum ~~2-foot (610 mm)~~1-foot (305 mm) clear space shall be maintained between storage and uninsulated metal or combustible walls.
6. A minimum 6-inch (152 mm) clear space shall be maintained between storage and insulated metal or noncombustible walls.
7. For temperature-controlled storage areas, a minimum 3-inch (76 mm) clear space shall be maintained between pallets.
8~~4~~. Fifty-five-gallon (208 L) drums shall not be stored more than one drum high.
9. Intermediate bulk containers shall be permitted to be stacked two-high provided such storage is in accordance with the *organic peroxide* manufacturer’s storage instructions.

10. *Organic peroxides* shall be stored in a manner to prevent contamination.

TABLE ~~6204.1.7~~ 6203.1.2 STORAGE OF ORGANIC PEROXIDES

ORGANIC PEROXIDE CLASS	PILE CONFIGURATION Maximum width (feet)	Maximum height (feet)	Minimum distance to next pile (feet)	~~Minimum distance to walls (feet)~~	MAXIMUM QUANTITY PER BUILDING
I	6	8	4[a]	~~4[b]~~	Note ~~c~~b
II	10	8	4[a]	~~4[b]~~	Note ~~c~~b
III	10	8	4[a]	~~4[b]~~	Note ~~c~~b
IV	16	10	3[a, ~~d~~c]	~~4[b]~~	No Requirement
V	No Requirement	No Requirement	No Requirement	~~No Requirement~~	No Requirement

For SI: 1 foot = 304.8 mm.

a. Not less than one main aisle with a minimum width of 8 feet shall divide the storage area.

~~b. Distance to noncombustible walls is allowed to be reduced to 2 feet.~~

b~~c~~. See Table ~~6204.1.2~~6204.1.3 for maximum quantities.

c~~d~~. The distance shall be not less than one-half the pile height.

Add new text as follows:

6203.1.3 Containers. Containers in *organic peroxide* storage shall meet the following:

1. Containers and packages shall be closed when not in use.
2. Containers shall be DOTn containers approved for the specific hazard classification.
3. Glass containers shall not be permitted.
4. Class I and II *organic peroxides* shall not be stored in intermediate bulk containers.
5. Metal containers and intermediate bulk containers shall be provided with emergency vent relief in accordance with *organic peroxide* manufacturer's recommendations.
6. Containers of liquid *organic peroxides* shall not be filled to more than 90-percent capacity.
7. Empty containers shall be disposed of in compliance with applicable regulations.

6203.1.4 Storage tanks. Storage tanks containing *organic peroxides* shall comply with Section 5003.2 and the following:

1. Only Transport Type F *organic peroxides* shall be permitted to be stored in tanks.
2. Storage tanks shall be equipped with a pressure relief device. The pressure relief device shall be designed and sized in accordance with the *organic peroxide* manufacturer's recommendations.
3. Indoor storage tanks shall have the emergency relief vent ducted to the exterior of the building.
4. Storage tanks shall be constructed of materials compatible with the *organic peroxide* it is designed to contain.
5. Storage tanks shall be designed to prevent overfilling in accordance with Section 5003.2.7 and the maximum fill level shall not exceed a capacity of 90 percent.
6. Storage tanks shall not exceed a capacity of 26,500 gallons (100 m^3).
7. Storage tanks shall have a minimum shell-to-shell separation distance of 25 feet (7620 mm).

   Exception: A 2-hour fire-resistance-rated wall without openings extending not less than 30 inches (762 mm) above and to the sides of the storage tanks shall be permitted in lieu of such distance.

8. Storage tanks shall be bonded and grounded.

9. Outdoor storage tanks shall be separated from buildings, property lines, process or use areas a minimum distance of 50 feet (15 200 mm).

10. Outdoor storage tanks shall be provided with lightning protection in accordance with NFPA 780.

11 Electrical equipment related to *organic peroxide* storage tanks shall be in accordance with Article 500 of NFPA 70.

6203.1.5 Dosing vessels. *Dosing vessels* for *organic peroxides*shall comply with Section 6203.1.4 and the following:

1. *Dosing vessels* are permitted to be designed with a hinged cover to serve as the emergency relief vent.
2. *Dosing vessels* with hinged covers shall be separated from other use areas by a minimum clear space of 25 feet (7620 mm) or a 1-hour fire-resistance-rated wall without openings extending not less than 30 inches (762 mm) above and to the sides of the *dosing vessels*.
3. Individual *dosing vessels* shall not exceed the maximum capacities in Table 6203.1.5.

TABLE 6203.1.5 MAXIMUM CAPACITY OF ORGANIC PEROXIDE DOSING VESSELS

TRANSPORT TYPE	CAPACITY gallons (liters)
B	8 (30)
C	26 (100)
D	53 (200)
E	396 (1,500)
F	1321 (5,000)

6203.1.6 Incompatible materials. Any quantity of Class I and II *organic peroxides* shall be separated from incompatible materials in accordance with Section 5003.9.8. Classes III, IV and V *organic peroxides* exceeding 5 pounds (2 kg) or 0.5 gallons (2 L) shall be separated from incompatible materials in accordance with Section 5003.9.8.

6203.1.7 Temperature control. *Organic peroxide* materials that must be kept at temperatures other than normal ambient temperatures to prevent hazardous reactions shall be provided with an approved means to maintain the temperature within the manufacturer's recommended storage temperature.

6203.1.7.1 Temperature monitoring and display. Temperature controlled storage areas shall be continuously monitored in accordance with 5004.8.1 and the temperature shall be displayed near the entrance to the area.

6203.1.7.2 Storage temperature. The maximum temperature allowed in a temperature-controlled storage area shall be posted near each entrance to the storage area.

6203.1.7.3 Standby power. Standby power shall be provided in accordance with Section 1203 for equipment used to maintain the controlled temperature.

6203.1.8 Open flames prohibited. *Organic peroxide* storage areas shall be free of fire, sparks, open flames and smoking. A sign shall be affixed outside of the storage area to indicate the prohibition of ignition sources.

6203.1.9 Hot work. Hot work shall be conducted in accordance with Chapter 35. *Organic peroxides* shall be removed from the hot work area prior to, and during, all hot work operations.

6203.1.10 Heating Systems. Hot water, steam at pressures less than 15 psig (103 kPa)] or indirectly heated warm air shall be used for heating systems.

6203.1.11 Container Contact. Heating coils, radiators, air diffusers, cooling coils, piping and ducts shall be installed to ensure no direct contact with *organic peroxide* containers.

6203.1.12 Combustible waste. *Organic peroxide* storage or use areas shall be free of storage of combustible waste.

6203.1.13 Impact sensitivity. Impact sensitive *organic peroxide* materials shall be protected from impact.

6204.1.14 Use area requirements. Use and handing of *organic peroxides* shall comply with the following requirements:

1. Quantities in the use area shall not exceed amounts necessary for the planned use.
2. *Organic peroxides* shall remain in a labelled container until transferred into process equipment.
3. *Organic peroxide* containers shall be closed when not in use.
4. Residual unused *organic peroxides* shall not be returned to the original container to avoid contamination.
5. *Organic peroxides* shall be kept away from sparks, open flames, hot surfaces and other ignition sources.
6. *Organic peroxides* shall be separated from incompatible materials and flammable or combustible liquids.
7. Dispensing of *organic peroxides* shall be accomplished with dedicated equipment.
8. *Organic peroxides* shall be handled with non-sparking tools.

6203.1.15 Liquid transfer. Liquid transfer shall comply with Section 5005.1.10 and the following:

1. All equipment used to handle or transfer *organic peroxides* shall be bonded and grounded.
2. The transfer system used for the transfer of *organic peroxides* shall be designed, operated and maintained in accordance with the *organic peroxide* manufacturer's recommendations.
3. The transfer of *organic peroxide* formulations with a flash point of 100°F (38°C) or less shall be designed to avoid accumulation of vapors.

6203.2 Quantities exceeding the maximum allowable quantity per control area.
The storage and use of *organic peroxides* in amounts exceeding the *maximum allowable quantity per control area* indicated in Section 5003.1 shall be in accordance with Chapter 50 and this chapter.

SECTION 6204
STORAGE

6204.1 Indoor storage.
Indoor storage of *organic peroxides* in amounts exceeding the *maximum allowable quantity per control area* indicated in Table 5003.1.1(1) shall be in accordance with Sections 5001, 5003, 5004 and this chapter.
Indoor storage of unclassified detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

Add new text as follows:

6204.1.1 Flood Protection. Buildings and storage areas containing *organic peroxides* and required emergency equipment shall be located at or above the design flood elevation as established in Chapter 16 of the International Building Code.

Revise as follows:

~~6204.1.1~~6204.1.2 Detached storage.
Storage of *organic peroxides* shall be in detached buildings where required by Section 5003.8.2.

~~6204.1.2~~6204.1.3 Distance from detached buildings to exposures.
In addition to the requirements of the *International Building Code*, detached storage buildings for Class I, II, III, IV and V *organic peroxides* shall be located in accordance with Table ~~6204.1.2~~6204.1.3. Detached buildings containing quantities of unclassified detonable *organic peroxides* in excess of those set forth in Table 5003.8.2 shall be located in accordance with Table 5604.5.2(1).

TABLE ~~6204.1.2~~ 6204.1.3 ORGANIC PEROXIDES—DISTANCE TO EXPOSURES FROM DETACHED STORAGE BUILDINGS OR OUTDOOR STORAGE AREAS

ORGANIC PEROXIDE CLASS	MAXIMUM STORAGE QUANTITY (POUNDS) AT MINIMUM SEPARATION DISTANCE[b,c,d]					
	Distance to buildings, lot lines, public streets, public alleys, public ways or means of egress			Distance between individual detached storage buildings or individual outdoor storage areas		
	50 feet	100 feet	150 feet	20 feet	75 feet	100 feet
I	2,000	20,000	175,000	2,000	20,000	175,000
II	100,000	200,000	No Limit	100,000[a]	No Limit	No Limit
III	200,000	No Limit	No Limit	200,000[a]	No Limit	No Limit
IV	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit
V	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit

For SI: 1 foot = 304.8 mm, 1 pound = 0.454 kg.

a. Where the amount of organic peroxide stored exceeds this amount, the minimum separation shall be 50 feet.

b. When different classes of organic peroxides are stored in the same storage area, the aggregate sum of the ratios of the actual quantity divided by the allowed quantity for each class shall not exceed one.

c. Interpolation is permitted between tabular values.

d. The quantity of organic peroxides shall be allowed to be increased if a specially designed fire protection system to protect the organic peroxide storage area is acceptable to the fire code official.

~~6204.1.3~~6204.1.4 Liquid-tight floor.
In addition to the requirements of Section 5004.12, floors of storage areas shall be of liquid-tight construction.

~~6204.1.4~~6204.1.5 Electrical wiring and equipment.
In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in storage areas ~~for Class I or II organic peroxides~~ or approved cabinets of refrigerated Class I, II and III *organic peroxides* or any *organic peroxide* that gives of flammable vapors or decomposes to release flammable decomposition products, shall comply with the requirements for electrical Class I, Division 2, locations.

~~6204.1.5~~6204.1.6 Smoke detection.
~~An~~ Rooms or areas where Class I, II or III *organic peroxides* are stored shall be provided with an *approved* ~~supervised~~ smoke detection system which activates audible and visible alarms throughout the building in accordance with Section 907.~~shall be provided in rooms or areas where Class I, II or III organic peroxides are stored. Activation of the smoke detection system shall sound a local alarm.~~

~~**Exception:** A smoke detection system shall not be required in detached storage buildings equipped throughout with an *approved automatic fire-extinguishing system* complying with Chapter 9.~~

~~6204.1.6~~6204.1.7 Maximum quantities.

Maximum ~~allowable~~ quantities per building in a mixed occupancy building shall not exceed the amounts set forth in Table 5003.8.2. Maximum ~~allowable~~ quantities per building in a detached storage building shall not exceed the amounts specified in Table ~~6204.1.2~~ 6204.1.3.

6204.1.8 Location in building. The storage of Class I or II *organic peroxides* shall be on the ground floor. Class III *organic peroxides* shall not be stored in *basements*.

Revise as follows:

6204.1.9 ~~Contamination~~Separation from incompatible materials. ~~*Organic peroxides* shall be stored in their original DOTn shipping containers. *Organic peroxides* shall be stored in a manner to prevent contamination.~~Incompatible materials are prohibited in storage rooms for Class I, II and III *organic peroxides*.

Add new text as follows:

6204.1.10 Separation from flammable and combustible liquids and flammable solids. *Flammable and combustible liquids* and *flammable solids* are prohibited in storage rooms for Class I, II and III *organic peroxides*, unless those materials are also classified as *organic peroxides*.

Revise as follows:

~~6204.1.10~~6204.1.11 Explosion control.
Indoor storage rooms, areas and buildings containing unclassified detonable and Class I *organic peroxides* shall be provided with explosion control in accordance with Section 911.

Add new text as follows:

6204.1.12 Lightning. Structures containing *organic peroxides* shall be provided with lightning protection in accordance with NFPA 780.

Revise as follows:

~~6204.1.11~~6204.1.13 Standby power.
Standby power shall be provided in accordance with Section 1203 for the following systems used to protect ~~Class I and unclassified detonable~~ *organic peroxides*:

1. Exhaust ventilation system for organic peroxides also classified as flammable liquids.

   Exception: Exhaust ventilation systems are not required for temperature-controlled organic peroxides in storage.

2. Treatment system for organic peroxides also classified as toxic or highly toxic.
3. Smoke detection system.
4. Temperature control system.
5. *Fire alarm system*.
6. *Emergency alarm system*.

~~6204.1.11.1~~6204.1.13.1 Fail-safe engineered systems. Standby power shall not be required for mechanical exhaust ventilation, treatment systems and temperature control systems where *approved* fail-safe engineered systems are installed.

Add new text as follows:

6204.1.14 Separation from use areas. Storage areas shall be separated from use and dispensing areas by a clear space of not less than 25 feet (7620 mm) or by fire barriers and horizontal assemblies with a minimum fire-resistance rating of 1-hour.

6204.1.15 Use and dispensing prohibited. Use and dispensing of *organic peroxides* in the storage area is prohibited.

6204.2 Outdoor storage.
Outdoor storage of *organic peroxides* in amounts exceeding the *maximum allowable quantities per control area* indicated in Table 5003.1.1(3) shall be in accordance with Sections 5001, 5003, 5004 and this chapter.

Revise as follows:

6204.2.1 Distance from storage to exposures.
Outdoor storage areas for *organic peroxides* shall be located in accordance with Table ~~6204.1.2~~6204.1.3.

6204.2.2 Electrical wiring and equipment.
In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in outdoor storage areas containing ~~unclassified detonable, Class I or Class II~~ *organic peroxides* that release flammable vapors or when decomposing release flammable decomposition products shall comply with the requirements for electrical Class I, Division 2, locations.

6204.2.3 Maximum quantities.
Maximum quantities of *organic peroxides* in outdoor storage shall be in accordance with Table ~~6204.1.2~~6204.1.3.

6204.2.4 Storage arrangement.
Storage arrangements shall be in accordance with Table ~~6204.1.7~~6203.1.2.

6204.2.5 Separation.
In addition to the requirements of Section 5003.9.8, outdoor storage areas for *organic peroxides* in amounts exceeding those specified in Table 5003.8.2 shall be located ~~a minimum distance of 50 feet (15 240 mm)~~ the minimum separation distance specified in Table 6204.1.3 from other hazardous material storage.

SECTION 6205 USE

6205.1 General.
The use of *organic peroxides* in amounts exceeding the *maximum allowable quantity per control area* indicated in Table 5003.1.1(1) or 5003.1.1(3) shall be in accordance with Sections 5001, 5003, 5005 and this chapter.

Add new text as follows:

6205.2 Noncombustible floor. Except for surfacing, floors of areas where liquid or solid hazardous materials are dispensed or used shall be of noncombustible, liquid-tight construction.

Add new definition as follows:

DOSING VESSSEL. A vessel containing a daily use quantity of an *organic peroxide* where the *organic peroxide* is transferred to reaction vessels or process equipment. Dosing vessels can be open or closed use and can include metering vessels, mixing vessels, day storage tanks or intermediate bulk containers (IBCs).

Add new text as follows:

903.2.5.6 Organic peroxides. An automatic sprinkler system shall be provided throughout buildings where *organic peroxides* are manufactured, stored or handled in quantities exceeding the *maximum allowable quantity per control area.* The sprinkler system design criteria shall be in accordance with NFPA 400.

Revise as follows:

5003.9.8 Separation of incompatible materials. *Incompatible materials* in storage and storage of materials that are incompatible with materials in use shall be separated where the stored materials are in containers having a capacity of more than 5 pounds (2 kg), 0.5 gallon (2 L) or any amount of *compressed gases* and Class I or II *organic peroxides*. Separation shall be accomplished by:

1. Segregating *incompatible materials* in storage by a distance of not less than 20 feet (6096 mm).
2. Isolating *incompatible materials* in storage by a noncombustible partition extending not less than 18 inches (457 mm) above and to the sides of the stored material.
3. Storing liquid and solid materials in hazardous material storage cabinets.
4. Storing *compressed gases* in gas cabinets or exhausted enclosures in accordance with Sections 5003.8.5 and 5003.8.6.

Materials that are incompatible shall not be stored within the same cabinet or exhausted enclosure.

5004.8.1 Temperature control. Materials that must be kept at temperatures other than normal ambient temperatures to prevent a hazardous reaction shall be provided with an *approved* means to maintain the temperature within a safe range. Redundant temperature control equipment that will automatically operate on failure of the primary temperature control system shall be provided. Upon failure of the primary temperature control equipment, audible and visual alarm signals shall activate in the room or area and at a constantly attended location or supervising station. Where *approved*, alternative means that prevent a hazardous reaction are allowed.

2024 International Building Code

Add new text as follows:

903.2.5.6 Organic peroxides. An automatic sprinkler system shall be provided throughout buildings where *organic peroxides* are manufactured, stored or handled in quantities exceeding the *maximum allowable quantity per control area*. The sprinkler system design criteria shall be in accordance with NFPA 400.

Reason: Organic peroxides are hazardous materials with key hazard characteristics of thermal instability, explosivity and flammability with high burning rates. Organic peroxides can undergo self-accelerating decomposition and may result in fire and/or explosion when exposed to heat or when they come in contact with incompatible materials. The decomposition is further accelerated when the containers are confined. An organic peroxide safety incident can occur even when storing small quantities. There are many organic peroxides that are temperature controlled and failure of refrigeration equipment or using improper equipment even when storing even small quantities can result in fire and explosion. An organic peroxide fire can significantly impact the inventory in the storage area, the storage building itself, personnel, nearby property, local community and the environment. Exposure to heat or incompatible materials, materials of construction and addressing confinement are, therefore, very important aspects that code needs to address to ensure safe storage, handling and use of organic peroxides. The current IFC code related to organic peroxides in Chapter 62 and other chapters is missing many critical requirements for the safe storage, handling and use of organic peroxides. The comprehensive code changes proposed revise existing sections and add many additional sections with preventive and protective requirements for the safe storage, handling and use of organic peroxides. Preventive and protective requirements code changes include the following:

- Storage section with well-defined storage requirements for all organic peroxides' storage types including control area (below MAQ) storage to comply with applicable requirements of Chapter 62 in addition to Chapter 50 and other requirements.
- Containers section is added to outline container requirements for the safe storage of organic peroxides.
- Intermediate Bulk Containers (IBCs), Storage tanks and Dosing vessels are used in the industry and requirements are added for the safe storage of organic peroxides.
- Incompatible materials are required to be segregated from organic peroxides storage in control area storage.
- Temperature control section with requirements is added as temperature control, monitoring, sign display and standby power are very critical for organic peroxides storage.
- Open flames prohibited, Hot work, Heating systems, Cooling systems, Container contact, Combustible waste, Lightning sections are added, as organic peroxides can undergo self-accelerating decomposition and may result in fire and/or explosion when exposed to heat or flames.
- Impact sensitivity section is added to provide guidance to code user when storing impact sensitive organic peroxides.

- Use area requirements for safe use of organic peroxides is added.
- Liquid transfer section is added with the requirements for the safe transfer of organic peroxides.
- Flood Protection section is added as this is important for temperature controlled organic peroxides, as coming in contact with ambient flood water can result in decomposition of organic peroxides which may cause explosion and/or fire. Also, various electrically operated emergency equipment should be protected from flood water to prevent loss of power.
- Code change proposals in footnotes under Table 6204.1.3 provide clear guidance to code users on how to use the table when presented with different scenarios.
- Electrical wiring and equipment section is modified to require appropriate classification for products where needed.
- Smoke detection section code change proposal clarifies the requirement of audio and visual alarm activation when the smoke detection system is provided in organic peroxide storage areas.
- Standby power section is revised to ensure this applies to relevant organic peroxides' classes above MAQs.
- Flammable and combustible liquids, flammable solids and incompatible materials are prohibited in Group H occupancy storage rooms.
- Use and dispensing prohibited section is added as it is important that organic peroxide dispensing or transferring and using is not done in storage areas as any potential incidents that may result can jeopardize the entire organic peroxide storage.
- Noncombustible floor section with non-combustible and liquid tight requirements is added.
- Sprinkler protection requirement section is added in Chapter 9 which references NFPA 400 for sprinkler density.
- 5003.9.8 section is revised to ensure organic peroxides storage is segregated from incompatible materials in control area storage for any quantity of Class I or Class II organic peroxides. These classifications present severe explosion and fire hazards and separation from incompatible materials is appropriate even below the ½ pound or ½ gallon thresholds.
- 5004.8.1 is modified to specify where materials must be under a temperature-controlled environment, automatic operation of the backup system is necessary. Failure of the primary temperature control system will result in automatic start of the backup system and notification of primary system failure. Such notification is required in the room where the temperature-controlled materials are stored and at a constantly attended location or supervising station. Certain organic peroxide materials require temperature control and loss of temperature control can result in significant events.
- Dosing vessels are commonly used in organic peroxide industry and Chapter 62 proposed changes includes requirements for the safe storage of organic peroxides in dosing vessels. Dosing vessel is not defined in the current code and the definition as proposed addresses this deficiency.

Most of the code change proposals are already followed by the industry as the Organic Peroxide Producers Safety Division (OPPSD) has been in the lead to publish storage guidance for the safe storage, handling and use of organic peroxides and supporting users as required. With the comprehensive changes proposed, the IFC Chapter 62 and other chapters' organic peroxides code will be harmonized with Organic Peroxide Producers Safety Division (OPPSD) requirements for safe storage, handling and use of organic peroxides, NFPA 400 organic peroxides code in the USA, prominent European codes like Dutch PGS 8, German BGV B4 and French organic peroxides storage codes. The comprehensive changes took into consideration the learnings from recent and old organic peroxides fire incidents as well. The code proposals also address the Chemical Safety Board (CSB) recommendations that arose from a major organic peroxide incident in the recent years.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

Bibliography: Safety and Handling of Organic Peroxides - American Chemistry Council

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

It is expected that there will not be an increase in cost of construction with the implementation of these proposals as the code change proposals are already followed by the industry. The Organic Peroxide Producers Safety Division (OPPSD) has been at the forefront to publish storage guidance (ACC Safety-and-Handling-of-Organic-Peroxides.pdf) for the safe storage, handling and use of organic peroxides and supporting users as required. The code changes are critical requirements for safe storage, handling and use of organic peroxides. Failure to follow and implement these requirements can lead to an organic peroxide explosion and or fire that can significantly impact the inventory in the storage area, the storage building itself, personnel, nearby property, local community and the environment. Users are educated and made aware of the hazards and risk associated with storing, handling and use of organic peroxides prior to the supply of the products.

Cost impact justification is based on the fact that OPPSD has established a good product stewardship program for the safe storage, handling and use of organic peroxides. Organic peroxide manufacturers adhere to this stewardship program and also provide a good guidance to the users of the organic peroxides and ensure the storage, handling and use of these products in in compliance with the stewardship program.

2024 International Fire Code

Revise as follows:

ORGANIC PEROXIDE.
An organic compound that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by an organic radical. ~~Organic peroxides can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time.~~ Organic peroxide formulation is a pure or technically pure organic peroxide or a mixture of organic peroxides with an active oxygen (aO) concentration greater than 1 percent alone or in combination with one or more materials. Organic peroxide storage classification is based on the organic peroxide transportation type and burning rate. The transport type for organic peroxide formulations is determined by the UN Manual of Tests and Criteria, Part II. The methods used to determine the burning rate of organic peroxide formulations are spelled out in the Storage of Organic Peroxides in The Netherlands (also known as PGS 8). Terms such as accelerator, catalyst, initiator, and curing agent are sometimes used to describe organic peroxide formulations and are misleading because they can also refer to materials that are not or do not contain organic peroxides, some of which might present increased hazard when mixed with organic peroxides.

Class I. Describes those formulations that are capable of *deflagration* but not *detonation*. This class comprises of organic peroxide formulations with transport classification Type B, those with transport classification Type C and Type D with large-scale burning rate equal to or higher than 300 kg/min, and those with transport classification Type C and Type D with small-scale burning rate equal to or higher than 9.0 kg/min × m^2 unless the large-scale burning rate is lower than 300 kg/min.

Class IIA. Describes those formulations that burn very rapidly and that pose a moderate reactivity hazard. This class comprises of organic peroxide formulations with transport classification Type C and Type D with a large-scale burning rate equal to or higher than 140 kg/min but lower than 300 kg/min and those with transport classification Type E with a large-scale burning rate equal to or higher than 140 kg/min, those with Type C and Type D if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2 but lower than 9.0 kg/min × m^2, and Type E if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2.

Add new definition as follows:

Class IIB. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard. This class comprises of organic peroxide formulations with transport classification Type C with a large-scale burning rate lower than 140 kg/min, those with transport classification Type D and Type E with a large-scale burning rate equal to or higher than 60 kg/min but lower than 140 kg/min, those with transport classification Type C if the small-scale burning rate is lower than 2.2 kg/min × m^2, and those with transport classification Type D and Type E if the small-scale burning rate is equal to or higher than 0.9 kg/min × m^2 but lower than 2.2 kg/min × m^2.

Revise as follows:

Class III. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard.
This class comprises of organic peroxide formulations with transport classification Type D with a large-scale burning rate lower than 60 kg/min, those with transport classification Type E with a large-scale burning rate equal to or higher than 10 kg/min but lower than 60 kg/min, those with transport classification Type F with a large-scale burning rate equal to or higher than 10 kg/min, and those with transport classification Type D and Type E if the small-scale burning rate is lower than 0.9 kg/min × m^2, and those with transport classification Type F irrespective of the small scale burning rate.

Class IV. Describes those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard. This class comprises of organic peroxide formulations of transport classification Type E or Type F with a large-scale burning rate lower than 10 kg/min.

Class V. Describes those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard. This class comprises of organic peroxide formulations of transport classification Type G without additional subsidiary risks.

~~Unclassified detonable~~ Detonable. *Organic peroxides* that are capable of *detonation*. These peroxides pose an extremely high-explosion hazard through rapid explosive decomposition.

6201.1 Scope.
The storage and use of *organic peroxides* shall be in accordance with this chapter and Chapter 50.
~~Unclassified detonable~~ Detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

6202.1 Definition.
The following term is defined in Chapter 2:
ORGANIC PEROXIDE.

Class I.
Class IIA.
Class IIB.
Class III.
Class IV.
Class V.
~~Unclassified detonable~~ Detonable.

6203.1.1 Special limitations for indoor storage and use by occupancy.
The indoor storage and use of *organic peroxides* shall be in accordance with Sections 6203.1.1.1 through 6203.1.1.4.

Revise as follows:

6203.1.1.1 Group A, E, I or U occupancies.
In Group A, E, I or U occupancies, any amount of ~~unclassified~~ detonable and Class I organic peroxides shall be stored in accordance with the following:

1. ~~Unclassified detonable~~ Detonable and Class I *organic peroxides* shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
2. The hazardous materials storage cabinets shall not contain other storage.

6203.1.1.2 Group R occupancies. ~~Unclassified d~~Detonable and Class I *organic peroxides* shall not be stored or used within Group R occupancies.

6203.1.1.3 Group B, F, M or S occupancies. ~~Unclassified detonable~~ Detonable and Class I *organic peroxides* shall not be stored or used in offices, or retail sales areas of Group B, F, M or S occupancies.

6203.1.1.4 Classrooms.
In classrooms in Group B, F or M occupancies, any amount of ~~unclassified~~ detonable and Class I *organic peroxides* shall be stored in accordance with the following:

1. ~~Unclassified detonable~~ Detonable and Class I *organic peroxides* shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
2. The hazardous materials storage cabinets shall not contain other storage.

6204.1 Indoor storage.

Indoor storage of *organic peroxides* in amounts exceeding the *maximum allowable quantity per control area* indicated in Table 5003.1.1(1) shall be in accordance with Sections 5001, 5003, 5004 and this chapter.

Indoor storage of ~~unclassified~~ detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

6204.1.2 Distance from detached buildings to exposures.

In addition to the requirements of the *International Building Code*, detached storage buildings for Class I, IIA, IIB,III, IV and V *organic peroxides* shall be located in accordance with Table 6204.1.2. Detached buildings containing quantities of ~~unclassified~~ detonable *organic peroxides* in excess of those set forth in Table 5003.8.2 shall be located in accordance with Table 5604.5.2(1).

TABLE 6204.1.2 ORGANIC PEROXIDES—DISTANCE TO EXPOSURES FROM DETACHED STORAGE BUILDINGS OR OUTDOOR STORAGE AREAS

ORGANIC PEROXIDE CLASS	MAXIMUM STORAGE QUANTITY (POUNDS) AT MINIMUM SEPARATION DISTANCE					
	Distance to buildings, lot lines, public streets, public alleys, public ways or means of egress			Distance between individual detached storage buildings or individual outdoor storage areas		
	50 feet	100 feet	150 feet	20 feet	75 feet	100 feet
I	2,000	20,000	175,000	2,000	20,000	175,000
IIA	100,000	200,000	No Limit	100,000[a]	No Limit	No Limit
IIB	175,000	No Limit	No Limit	175,000[a]	No Limit	No Limit
III	200,000	No Limit	No Limit	200,000[a]	No Limit	No Limit
IV	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit
V	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit

For SI: 1 foot = 304.8 mm, 1 pound = 0.454 kg.

a. Where the amount of organic peroxide stored exceeds this amount, the minimum separation shall be 50 feet.

6204.1.4 Electrical wiring and equipment.

In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in storage areas for Class I, IIA or IIB *organic peroxides* shall comply with the requirements for electrical Class I, Division 2, locations.

6204.1.5 Smoke detection. An *approved* supervised smoke detection system in accordance with Section 907 shall be provided in rooms or areas where Class I, IIA, IIB or III *organic peroxides* are stored. Activation of the smoke detection system shall sound a local alarm.

Exception: A smoke detection system shall not be required in detached storage buildings equipped throughout with an *approved automatic fire-extinguishing system* complying with Chapter 9.

TABLE 6204.1.7 STORAGE OF ORGANIC PEROXIDES

ORGANIC PEROXIDE CLASS	PILE CONFIGURATION				MAXIMUM QUANTITY PER BUILDING
	Maximum width (feet)	Maximum height (feet)	Minimum distance to next pile (feet)	Minimum distance to walls (feet)	
I	6	8	4[a]	4[b]	Note c
IIA	10	8	4[a]	4[b]	Note c
IIB	10	8	4[a]	4[b]	Note c
III	10	8	4[a]	4[b]	Note c
IV	16	10	3[a, d]	4[b]	No Requirement
V	No Requirement	No Requirement	No Requirement	No Requirement	No Requirement

For SI: 1 foot = 304.8 mm.

a. Not less than one main aisle with a minimum width of 8 feet shall divide the storage area.

b. Distance to noncombustible walls is allowed to be reduced to 2 feet.

c. See Table 6204.1.2 for maximum quantities.

d. The distance shall be not less than one-half the pile height.

6204.1.8 Location in building. The storage of Class I, IIA or IIB *organic peroxides* shall be on the ground floor. Class III *organic peroxides* shall not be stored in *basements*.

6204.1.10 Explosion control.

Indoor storage rooms, areas and buildings containing ~~unclassified~~ detonable and Class I *organic peroxides* shall be provided with explosion control in accordance with Section 911.

6204.1.11 Standby power.

Standby power shall be provided in accordance with Section 1203 for the following systems used to protect Class I and ~~unclassified~~ detonable *organic peroxides*:

1. Exhaust ventilation system.
2. Treatment system.
3. Smoke detection system.
4. Temperature control system.
5. *Fire alarm system*.
6. *Emergency alarm system*.

6204.2.2 Electrical wiring and equipment.

In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in outdoor storage areas containing ~~unclassified~~ detonable, Class I, IIA or ~~Class~~ IIB *organic peroxides* shall comply with the requirements for electrical Class I, Division 2, locations.

TABLE 105.5.22 PERMIT AMOUNTS FOR HAZARDOUS MATERIALS

TYPE OF MATERIAL	AMOUNT

For SI: 1 gallon = 3.785 L, 1 pound = 0.454 kg.

a. 22 gallons where Table 5003.1.1(1) Note k applies and hazard identification signs in accordance with Section 5003.5 are provided for quantities of 22 gallons or less.

b. 220 pounds where Table 5003.1.1(1) Note k applies and hazard identification signs in accordance with Section 5003.5 are provided for quantities of 220 pounds or less.

203.6.3 High-hazard Group H-1. Buildings and structures containing materials that pose a *detonation* hazard shall be classified as Group

203.6.3 High-hazard Group H-1. Buildings and structures containing materials that pose a *detonation* hazard shall be classified as Group H-1. Such materials shall include, but not be limited to, the following:

Detonable *pyrophoric* materials

Explosives:

Division 1.1

Division 1.2

Division 1.3

Division 1.4

Division 1.5

Division 1.6

Organic peroxides, u~~nclassified detonable~~ detonable

Oxidizers, Class 4

Unstable (reactive) materials, Class 3 detonable and Class 4

203.6.5 High-hazard Group H-3. Buildings and structures containing materials that readily support combustion or that pose a *physical hazard* shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or *combustible liquids* that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less

Combustible fibers, other than densely packed baled cotton, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3 of the *International Building Code*

Consumer fireworks, 1.4G (Class C, Common)

Cryogenic fluids, oxidizing

Category 1B flammable gases having a burning velocity of 3.9 inches per second (99 mm/s) or less

Flammable solids

Organic peroxides, Class IIA, IIB and III

Oxidizers, Class 2

Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less

Oxidizing gases

Unstable (reactive) materials, Class 2

Water-reactive materials, Class 2

TABLE 911.1 EXPLOSION CONTROL REQUIREMENTS[f]

MATERIAL	CLASS	EXPLOSION CONTROL METHODS	
		Barricade construction	Explosion (deflagration) venting or explosion (deflagration) prevention systems
Hazard Category			
Combustible dusts[a]	—	Not required	Required

	3 nondetonable	Not required	Required
Water-reactive liquids and solids	3	Not required	Required
	2[e]	Not required	Required
Special Uses			

MATERIAL	CLASS	EXPLOSION CONTROL METHODS	
		Barricade construction	Explosion (deflagration) venting or explosion (deflagration) prevention systems
Hazard Category			
Acetylene generator rooms	—	Not required	Required
Electrochemical energy storage systems[g]	—	Not required	Required
Energy storage systems[g]	—	Not required	Required
Grain processing	—	Not required	Required
Liquefied petroleum gas distribution facilities	—	Not required	Required
Where explosion hazards exist[d]	Detonation	Required	Not permitted
	Deflagration	Not required	Required

For SI: 1 inch per second = 25.4 mm/s.

a. Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.2.2. See definition of “Combustible dust” in Chapter 2.

b. Storage or use.

c. In open use or dispensing.

d. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.

e. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.

f. Explosion venting is not required for Group H-5 Fabrication Areas complying with Chapter 27 and the International Building Code.

g. Where explosion control is required in Section 1207.6.3.

h. Not required for Category 1B Flammable Gases having a burning velocity not exceeding 3.9 inches per second.

i. Does not apply to consumer fireworks, 1.4G.

	1	NA	NL	NL		NL	NL		NL	NL

For SI: 1 cubic foot = 0.02832 m^3, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NA = Not Applicable, NL = Not Limited~~, UD = Unclassified Detonable.~~

a. For use of control areas, see Section 5003.8.3.

b. The aggregate quantity in use and storage shall not exceed the maximum allowance quantity for storage, including applicable increases.

c. For hazardous materials in Group B higher education laboratory occupancies, see Section 428 of the *International Building Code* and Chapter 38.

d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e applies, the increase for both notes shall be applied accumulatively.

e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, day boxes, gas cabinets, gas rooms, exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10. Where Note d applies, the increase for both notes shall be applied accumulatively.

f. Quantities shall not be limited in a building equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

g. Allowed only in buildings equipped throughout with an approved automatic sprinkler system.

h. Containing not more than the maximum allowable quantity per control area of Class IA, Class IB or Class IC flammable liquids.

i. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

j. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed where such materials are necessary for maintenance purposes, operation or sanitation of equipment where the storage containers and the manner of storage are approved.

k. Net weight of pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks including packaging shall be used.

l. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.

m. For oxidizers, unstable (reactive) materials and water-reactive materials stored or displayed in Group M occupancies or storedin Group S occupancies, see Section 5003.11..

n. For flammable and combustible liquid storage in Group M occupancy wholesale and retail sales uses, see Section 5704.3.6.

o. Quantities in this table shall be modified in accordance with Table 5003.1.1(5).

p. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.2.2.

q. "High BV" Category 1B flammable gas has a burning velocity greater than 3.9 in/s (10 cm/s). "Low BV" Category 1B flammable gas has a burning velocity of 3.9 in/s (10 cm/s) or less.

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L, 1 cubic foot = 0.02832 m^3.

a. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.

b. The aggregate quantities in storage and use shall not exceed the maximum allowable quantity for storage, including applicable increases.

c. The aggregate quantity of nonflammable solid and nonflammable or noncombustible liquid hazardous materials allowed in outdoor storage per single property under the same ownership or control used for retail or wholesale sales is allowed to exceed the maximum allowable quantity per control area where such storage is in accordance with Section 5003.11.

d. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

e. “High BV” Category 1B flammable gas has a burning velocity greater than 3.9 in/s (10 cm/s). “Low BV” Category 1B flammable gas has a burning velocity of 3.9 in/s (10 cm/s) or less.

TABLE 5003.8.2 DETACHED BUILDING REQUIRED

A DETACHED BUILDING IS REQUIRED WHERE THE QUANTITY OF MATERIAL EXCEEDS THAT LISTED HEREIN			
Material	Class	Solids and liquids (tons)[a, b]	Gases (cubic feet)[a, b]
Explosives	Division 1.1 Division 1.2 Division 1.3 Division 1.4[e] Division 1.4[c, e] Division 1.5 Division 1.6	Maximum Allowable Quantity Maximum Allowable Quantity Maximum Allowable Quantity Maximum Allowable Quantity 1 Maximum Allowable Quantity Maximum Allowable Quantity	Not Applicable
Oxidizers	Class 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Unstable (reactives) detonable	Class 3 or 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Oxidizer, liquids and solids	Class 3 Class 2	1,200 2,000	Not Applicable

A DETACHED BUILDING IS REQUIRED WHERE THE QUANTITY OF MATERIAL EXCEEDS THAT LISTED HEREIN			
Material	**Class**	**Solids and liquids (tons)**	**Gases (cubic feet)**
Organic peroxides	Detonable Class I Class IIA Class IIB Class III	Maximum Allowable Quantity Maximum Allowable Quantity 25[f] 40[f] 50[f]	Not Applicable
Unstable (reactives) nondetonable	Class 3 Class 2	125	2,000 10,000
Water reactives	Class 3 Class 2	125	Not Applicable
Pyrophoric gases[d]	Not Applicable	Not Applicable	2,000

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.02832 m^3, 1 ton = 2000 lb = 907.2 kg.

a. For materials that are detonable, the distance to other buildings or lot lines shall be in accordance with Section 415.6 of the International Building Code or Chapter 56 based on the trinitrotoluene (TNT) equivalence of the material, whichever is greater.

b. “Maximum Allowable Quantity” means the maximum allowable quantity per control area set forth in Table 5003.1.1(1).

c. Limited to Division 1.4 materials and articles, including articles packaged for shipment, that are not regulated as an explosive under Bureau of Alcohol, Tobacco, Firearms and Explosives regulations, or unpackaged articles used in process operations that do not propagate a detonation or deflagration between articles, providing the net explosive weight of individual articles does not exceed 1 pound.

d. Detached buildings are not required for gases in gas rooms that support H-5 fabrication facilities where the gas room is separated from other areas by a fire barrier with a fire-resistance rating of not less than 2 hours and the gas is located in a gas cabinet that is internally sprinklered, equipped with continuous leak detection, automatic shutdown, and is not manifolded upstream of pressure controls. The gas supply is limited to cylinders that do not exceed 125 pounds water capacity in accordance with DOTn 49 CFR 173.192 for Hazard Zone A toxic gases.

e. Does not apply to consumer fireworks, Division 1.4G.

f. Where different classes of organic peroxides are stored in the same building, the aggregate sum of the ratios of the actual quantity divided by the allowed quantity for each class shall not exceed one.

TABLE 5004.2.2 REQUIRED SECONDARY CONTAINMENT—HAZARDOUS MATERIAL SOLIDS AND LIQUIDS STORAGE

E102.1.8.1 Classification of organic peroxides ~~according to hazard~~.

~~**E102.1.8.1 Classification of organic peroxides according to hazard.**~~

~~Examples include:~~

~~Unclassified: Unclassified *organic peroxides* are capable of *detonation* and are regulated in accordance with Chapter 56.~~

~~Class I: acetyl cyclohexane sulfonyl 60-65 percent concentration by weight, fulfonyl peroxide, benzoyl peroxide over 98 percent concentration, t-butyl hydroperoxide 90 percent, t-butyl peroxyacetate 75 percent, t-butyl peroxyisopropylcarbonate 92 percent, diisopropyl peroxydicarbonate 100 percent, di-n-propyl peroxydicarbonate 98 percent, and di-n-propyl peroxydicarbonate 85 percent.~~

~~Class II: acetyl peroxide 25 percent, t-butyl hydroperoxide 70 percent (with DTBP and t-BuOH diluents), t-butyl peroxybenzoate 98 percent, t-butyl peroxy-2-ethylhexanoate 97 percent, t-butyl peroxyisobutyrate 75 percent, t-butyl peroxyisopropyl carbonate 75 percent, t-butyl peroxypivalate 75 percent, dybenzoyl peroxydicarbonate 85 percent, di-sec-butyl peroxydicarbonate 98 percent, di-secbutyl peroxydicarbonate 75 percent, 1,1-di-(t-butylperoxy)-3,5,5-trimethyecyclohexane 95 percent, di-(2-ethythexyl) peroxydicarbonate 97 percent, 2,5-dymethyl-2-5 di (benzoylperoxy) hexane 92 percent, and peroxyacetic acid 43 percent.~~

~~Class III: acetyl cyclohexane sulfonal peroxide 29 percent, benzoyl peroxide 78 percent, benzoyl peroxide paste 55 percent, benzoyl peroxide paste 50 percent peroxide/50 percent butylbenzylphthalate diluent, cumene hydroperoxide 86 percent, di-(4-butylcyclohexyl) peroxydicarbonate 98 percent, t-butyl peroxy-2-ethylhexanoate 97 percent, t-butyl peroxyneodecanoate 75 percent, decanoyl peroxide 98.5 percent, di-t-butyl peroxide 99 percent, 1,1-di-(t-butylperoxy)3,5,5-trimethylcyclohexane 75 percent, 2,4-dichlorobenzoyl peroxide 50 percent, di-isopropyl peroxydicarbonate 30 percent, 2, 5-di-methyl-2,5-di-(2-ethylhexanolyperoxy)-hexane 90 percent, 2,5-dimethyl-2,5-di-(t-butylperoxy) hexane 90 percent and methyl ethyl ketone peroxide 9 percent active oxygen diluted in dimethyl phthalate.~~

~~Class IV: benzoyl peroxide 70 percent, benzoyl peroxide paste 50 percent peroxide/15 percent water/35 percent butylphthalate diluent, benzoyl peroxide slurry 40 percent, benzoyl peroxide powder 35 percent, t-butyl hydroperoxide 70 percent, (with water diluent), t-butyl peroxy-2-ethylhexanoate 50 percent, decumyl peroxide 98 percent, di-(2-ethylhexal) peroxydicarbonate 40 percent, laurel peroxide 98 percent, p-methane hydroperoxide 52.5 percent, methyl ethyl ketone peroxide 5.5 percent active oxygen and methyl ethyl ketone peroxide 9 percent active oxygen diluted in water and glycols.Class V: benzoyl peroxide 35 percent, 1,1-di-t-butyl peroxy 3,5,5-trimethylcyclohexane 40 percent, 2,5-di-(t-butyl peroxy) hexane 47 percent and 2,4-pentanedione peroxide 4 percent active oxygen.~~

Organic peroxide requirements in the IFC are based on the hazard classification, burning rate and transport type.

Add new text as follows:

E102.1.8.1.1 Hazard classification. Organic peroxide formulations are classified into seven hazard classifications (Detonable, I, IIA, IIB, III, IV and V). These classifications are used to determine the occupancy classifications and maximum allowable quantities. Detonable organic peroxides are explosive. As such, the storage requirements for detonable organic peroxides are found in Chapter 56, and Chapter 62 contains additional use, handling and transfer provisions.

E102.1.8.1.2 Transport types. Organic peroxides are also categorized based on the explosion hazard rating—referred to as the Transport Type. The transport type for organic peroxide formulations is determined in accordance with the UN RTDG. The explosion hazard levels are divided into "Types" (Type A-G) and a corresponding UN Number is identified based on whether the formulations are liquid or solid, and whether they require temperature control. Table E102.1.8.1.2 lists the transport types, UN Numbers, explosion hazard level and the maximum size container based on the transport type.

TABLE E102.1.8.1.2 TRANSPORT TYPES FOR ORGANIC PEROXIDES

Portions of table not shown remain unchanged.

TRANSPORT TYPE	EXPLOSIVE HAZARD RATING	MAXIMUM CONTAINER SIZE		UN NUMBER			
		Solid	Liquid	Ambient Temperature		Temperature Controlled	
		pounds (kg)	gallons (L)	Liquid	Solid	Liquid	Solid
A	Explosive	NP	NP	NA	NA	NA	NA
B	Very high	55 (25)	8 (30)	3101	3102	3111	3112
C	High	110 (50)	16 (60)	3103	3104	3113	3114
D	Medium	110 (50)	16 (60)	3105	3106	3115	3116
E	Low	882 (400)	60 (225)	3107	3108	3117	3118

F	Very low	IBC or Portable Tank	IBC or Portable Tank	3109	3110	3119	3120
G	None	NL	NL	NA	NA	NA	NA

NA – Not applicable; NL = Not Limited; NP = Not Permitted

E102.1.8.1.3 Burning rate. Organic peroxides are capable of high heat release and large quantities of smoke when they are involved in fire. The burning rate varies for each organic peroxide material and is determined in accordance with PGS 8. The burning rate is calculated from results of large-scale testing or small-scale testing detailed in PGS 8. Where the burning rate is not known, the highest classification for the organic peroxide shall be used.

TABLE E102.1.8.2 STORAGE CLASSIFICATION OF ORGANIC PEROXIDES

TRANSPORT TYPE	**BURNING RATE**					
	Large Scale Test (kg/minute)	**<10**	**≥10 and <60**	**≥60 and <140**	**≥140 and <300**	**≥300**
	OR					
	Small Scale Test [a] (kg/m²/minute)	**NA**	**<0.9**	**≥0.9 and <2.2**	**≥2.2 and <9.0**	≥9.0
B		I	I	I	I	I
C		IIB	IIB	IIB	IIA	I
D		III	III	IIB	IIA	I
E		IV	III	IIB	IIA	IIA
F		IV	III	III	III	III
G		V	V	V	V	V

a. Solid materials shall be tested using the large-scale test. Liquid materials can be tested using either the large-scale test or the small-scale test.

E102.1.8.2 Classification process. The classification process is based on the definitions of the various classes of organic peroxides. The classification for use in the IFC is based on the transport type and burning rate and is shown in Table E102.1.8.2. For example, a Transport Type C organic peroxide with a burning rate equal to or greater than 300 kilograms (662 pounds) per minute will be treated a Class I organic peroxide; and another Transport Type C organic peroxide with a burning rate less than 140 kilograms (309 pounds) per minute will be treated as a Class IIB organic peroxide.

E102.1.8.3 Organic peroxide classification. Organic peroxides and their corresponding classifications are listed in Table E102.1.8.3.

TABLE E102.1.8.3 ORGANIC PEROXIDE STORAGE CLASSIFICATIONS

Organic Peroxide Storage Class	**Organic Peroxide Name**	**CAS#**	**Concentration (mass%)**	**Diluent type A**	**Diluent type B**	**Inert solid**	**Water**	**UN Number (Generic entry)**	**Transport Type**	**Subsidiary risks and remarks**

1. Diluent type B may always be replaced by Diluent type A. The boiling point of Diluent type B should be at least 60°C higher than the SADT of the organic peroxide formulation.
2. Available (or Active) oxygen less than 4.7 percent.
3. “EXPLOSIVE” subsidiary risk label required.
4. Diluent may be replaced by di-tert-butyl peroxide.
5. Available (or Active) oxygen not greater than 4.7 percent.
6. Hydrogen peroxide not greater than 9 percent, and available (or active) oxygen not greater than 10 percent.
7. Only non-metallic packaging allowed.
8. Available (or Active) oxygen greater than 10 percent but not greater than 10.7 percent, with or without water.
9. Available (or Active) oxygen not greater than 10 percent with or without water.
10. Available (or Active) oxygen not greater than 8.2 percent with or without water.
11. See 2.5.3.2.5.1 of UN RTDG.
12. Up to 2000 kg per receptacle assigned to ORGANIC PEROXIDE TYPE F on the basis of large scale trials.
13. "CORROSIVE" subsidiary risk label required.
14. Peroxyacetic acid formulations which fulfill the criteria of 2.5.3.3.2 (d) of UN RTDG.
15. Peroxyacetic acid formulations which fulfill the criteria of 2.5.3.3.2 (e) of UN RTDG.
16. Peroxyacetic acid formulations which fulfill the criteria of 2.5.3.3.2 (f) of UN RTDG.
17. Addition of water to this organic peroxide will decrease its thermal stability.
18. No "CORROSIVE" subsidiary risk label required for concentrations not greater than 80 percent.
19. Mixtures with hydrogen peroxide, water and acid(s).
20. With Diluent type A with or without water.
21. Diluent type A 25 percent or greater by mass, and in addition to ethylbenzene.
22. Diluent type A 19 percent or greater by mass, and in addition to methyl isobutyl ketone.
23. di-tert-butyl peroxide not greater than 6 percent.
24. 1-isopropylhydroperoxy-4-isopropylhydroxybenzene not greater than 8 percent.

25. Diluent type B with a boiling point greater than 230°F (110°C).

26. Hydroperoxides content not greater than 0.5 percent.

27. Concentrations greater than 56 percent require a "CORROSIVE" subsidiary risk label.

28. Available (or Active) oxygen not greater than 7.6 percent and Diluent type A with a 95-percent boil-off point between 392°F and 500°F (200°C and 260°C).

29. Not subject to the requirements of these Model Regulations for Division 5.2 per the UN RTDG.

30. Diluent type B with boiling point greater than 266°F (130°C).

31. Available (or active) oxygen not greater than 6.7 percent.

32. Tert-Butyl hydroperoxide can be transported and stored in bulk provided that polyethylene saddles are used—DOTn 49 CFR Part 173.225(g) and (h).

Unstable reactive 1	None
Water reactive 3	W3
Water reactive 2	W2
Corrosive	H3, COR
Toxic	H3
Highly toxic	H4

a. F3 = Finely divided solids, typically less than 75 micrometers (µm) (200 mesh), that pose an elevated risk of forming an ignitable dust cloud, such as finely divided sulfur, *National Electric Code* Group E dusts (for example, aluminum, zirconium and titanium) and bisphenol A. F2 = Finely divided solids less than 420 µm (40 mesh) that pose an ordinary risk of forming an ignitable dust cloud.

F—Flammable category.

R—Reactive category.

H—Health category.

W—Special hazard: water reactive.

OX—Special hazard: oxidizing properties.

COR—Corrosive.

~~UD—Unclassified detonable material.~~

4D—Class 4 detonable material.

3D—Class 3 detonable material.

3N—Class 3 nondetonable material.

a. Complete a summary report for each *control area* and Group H occupancy.

b. Storage = storage + use-closed + use-open systems.

c. Separate reports are required for use-closed and use-open systems.

d. Include increases for sprinklers or storage in cabinets, if applicable.

(This is an example; add additional hazard classes as needed.)

2024 International Building Code

Revise as follows:

[F] ORGANIC PEROXIDE. An organic compound that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by an organic radical. ~~Organic peroxides can pose an *explosion* hazard (*detonation* or *deflagration*) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time.~~Organic peroxide formulation is a pure or technically pure organic peroxide or a mixture of organic peroxides with an active oxygen (aO) concentration greater than 1 percent alone or in combination with one or more materials. Organic peroxide storage classification is based on the organic peroxide transportation type and burning rate. The transport type for organic peroxide formulations is determined by the UN Manual of Tests and Criteria, Part II. The methods used to determine the burning rate of organic peroxide formulations are spelled out in the Storage of Organic Peroxides in The Netherlands (also known as PGS 8). Terms such as accelerator, catalyst, initiator, and curing agent are sometimes used to describe organic peroxide formulations and are misleading because they can also refer to materials that are not or do not contain organic peroxides, some of which might present increased hazard when mixed with organic peroxides.

~~Unclassified detonable~~ Detonable. *Organic peroxides* that are capable of *detonation*. These peroxides pose an extremely high *explosion* hazard through rapid *explosive* decomposition.

Class IIB. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard. This class comprises of organic peroxide formulations with transport classification Type C with a large-scale burning rate lower than 140 kg/min, those with transport classification Type D and Type E with a large-scale burning rate equal to or higher than 60 kg/min but lower than 140 kg/min, those with transport classification Type C if the small-scale burning rate is lower than 2.2 kg/min × m^2, and those with transport classification Type D and Type E if the small-scale burning rate is equal to or higher than 0.9 kg/min × m^2 but lower than 2.2 kg/min × m^2.

Class I. Those formulations that are capable of *deflagration* but not *detonation*.This class comprises of organic peroxide formulations with transport classification Type B, those with transport classification Type C and Type D with large-scale burning rate equal to or higher than 300 kg/min, and those with transport classification Type C and Type D with small-scale burning rate equal to or higher than 9.0 kg/min × m^2 unless the large-scale burning rate is lower than 300 kg/min.

Class IIA. Those formulations that burn very rapidly and that pose a moderate reactivity hazard.This class comprises of organic peroxide formulations with transport classification Type C and Type D with a large-scale burning rate equal to or higher than 140 kg/min but lower than 300 kg/min and those with transport classification Type E with a large-scale burning rate equal to or higher than 140 kg/min, those with Type C and Type D if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2 but lower than 9.0 kg/min × m^2, and Type E if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2.

Class III. Those formulations that burn rapidly and that pose a moderate reactivity hazard.This class comprises of organic peroxide formulations with transport classification Type D with a large-scale burning rate lower than 60 kg/min, those with transport classification Type E with a large-scale burning rate equal to or higher than 10 kg/min but lower than 60 kg/min, those with transport classification Type F with a large-scale burning rate equal to or higher than 10 kg/min, and those with transport classification Type D and Type E if the small-scale burning rate is lower than 0.9 kg/min × m^2, and those with transport classification Type F irrespective of the small scale burning rate.

Class IV. Those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard. This class comprises of organic peroxide formulations of transport classification Type E or Type F with a large-scale burning rate lower than 10 kg/min.

Class V. Those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard. This class comprises of organic peroxide formulations of transport classification Type G without additional subsidiary risks.

For SI: 1 cubic foot = 0.028 m^3, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NL = Not Limited; NA = Not Applicable; ~~UD = Unclassified Detonable.~~

a. For use of control areas, see Section 414.2.

b. The aggregate quantity in use and storage shall not exceed the maximum allowable quantity for storage, including applicable increases.

c. For hazardous materials in Group B higher education laboratory occupancies, see Section 428 of this code and Chapter 38 of the *International Fire Code*.

d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e also applies, the increase for both notes shall be applied accumulatively.

e. Maximum allowable quantities shall be increased 100 percent when stored in approved storage cabinets, day boxes, gas cabinets, gas rooms or exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10 of the International Fire Code. Where Note d also applies, the increase for both notes shall be applied accumulatively.

f. Quantities shall not be limited in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

g. Allowed only in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

h. Containing not more than the maximum allowable quantity per control area of Class IA, IB or IC flammable liquids.

i. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

j. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed when such materials are necessary for maintenance purposes, operation or sanitation of equipment when the storage containers and the manner of storage are approved.

k. Net weight of the pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks, including packaging, shall be used.

l. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2 of the International Fire Code.

m. For oxidizers, unstable (reactive) materials, and water-reactive materials stored or displayed in Group M occupancies or stored in Group S occupancies, see Section 414.2.5.1.

n. For flammable and combustible liquid storage in Group M occupancy wholesale and retail sales uses, see Section 414.2.5.2.

o. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.

p. “High BV” Category 1B flammable gas has a burning velocity greater than 3.9 inches per second (10 cm/s). "Low BV" Category 1B flammable gas has a burning velocity of 3.9 inches per second (10 cm/s) or less.

[F] 307.3 High-hazard Group H-1.

Buildings and *structures* containing materials that pose a *detonation* hazard shall be classified as Group H-1. Such materials shall include, but not be limited to, the following:

Detonable *pyrophoric* materials

Explosives:

Division 1.1

Division 1.2

Division 1.3

Division 1.4

Division 1.5

Division 1.6

Organic peroxides, ~~unclassified detonable~~ detonable

Oxidizers, Class 4

Unstable (reactive) materials, Class 3 detonable and Class 4

[F] 307.5 High-hazard Group H-3.

Buildings and *structures* containing materials that readily support combustion or that pose a *physical hazard* shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA *flammable or combustible liquids* that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less

Combustible fibers, other than *densely packed baled cotton*, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or *explosion* hazard based on information prepared in accordance with Section 414.1.3

Consumer *fireworks*, 1.4G (Class C, Common)

Cryogenic fluids, oxidizing

Category 1B flammable gases having a burning velocity of 3.9 inches per second (10 cm/s) or less

Flammable solids

Organic peroxides, Class IIA, IIB and III

Oxidizers, Class 2

Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less

Oxidizing gases

Unstable (reactive) materials, Class 2

Water-reactive materials, Class 2

[F] TABLE 414.5.1 EXPLOSION CONTROL REQUIREMENTS[a, h]

MATERIAL	CLASS	EXPLOSION CONTROL METHODS	
		Barricade construction	Explosion (deflagration) venting or explosion (deflagration) prevention systems[b]
HAZARD CATEGORY			
Combustible dusts[c]	—	Not Required	Required
Cryogenic flammables	—	Not Required	Required
Explosives	Division 1.1	Required	Not Required
	Division 1.2	Required	Not Required
	Division 1.3	Not Required	Required
	Division 1.4[j]	Not Required	Required
	Division 1.5	Required	Not Required
	Division 1.6	Required	Not Required
Flammable gas	Gaseous	Not Required	Required[k]
	Liquefied	Not Required	Required[k]
Flammable liquid	IA[d]	Not Required	Required
	IB[e]	Not Required	Required
Organic peroxides	~~U~~Detonable	Required	Not Permitted
	I	Required	Not Permitted
Oxidizer liquids and solids	4	Required	Not Permitted
Pyrophoric gas	—	Not Required	Required
Unstable (reactive)	4	Required	Not Permitted
	3 Detonable	Required	Not Permitted
	3 Nondetonable	Not Required	Required
Water-reactive liquids and solids	3	Not Required	Required
	2[g]	Not Required	Required

MATERIAL	CLASS	EXPLOSION CONTROL METHODS	
		Barricade construction	Explosion (deflagration) venting or explosion (deflagration) prevention systems
SPECIAL USES			
Acetylene generator rooms	—	Not Required	Required
Electrochemical energy storage system[l]	—	Not Required	Required
Energy storage system[l]	—	Not Required	Required
Grain processing	—	Not Required	Required
Liquefied petroleum gas-distribution facilities	—	Not Required	Required
Where explosion hazards exist[f]	Detonation	Required	Not Permitted
	Deflagration	Not Required	Required

a. See Section 414.1.3.

b. See the International Fire Code.

c. Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.2.2 of the *International Fire Code*. See definition of "Combustible dust" in Chapter 2.

d. Storage or use.

e. In open use or dispensing.

f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.

g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.

h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code.

i. Where explosion control is required in Section 1207 of the *International Fire Code*.

j. Does not apply to consumer fireworks, Division 1.4G.

k. Not required for Category 1B Flammable Gases having a burning velocity not exceeding 3.9 inches per second (10 cm/s).

[F] TABLE 415.6.5 DETACHED BUILDING REQUIRED

A DETACHED BUILDING IS REQUIRED WHERE THE QUANTITY OF MATERIAL EXCEEDS THAT SPECIFIED HEREIN			
Material	**Class**	**Solids and Liquids (tons)[a, b]**	**Gases (cubic feet)[a, b]**
Explosives	Division 1.1	Maximum Allowable Quantity	Not Applicable
	Division 1.2	Maximum Allowable Quantity	
	Division 1.3	Maximum Allowable Quantity	
	Division 1.4 [e]	Maximum Allowable Quantity	
	Division 1.4[c, e]	1	
	Division 1.5	Maximum Allowable Quantity	
	Division 1.6	Maximum Allowable Quantity	
Oxidizers	Class 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Unstable (reactives) detonable	Class 3 or 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Oxidizer, liquids and solids	Class 3	1,200	Not Applicable
	Class 2	2,000	Not Applicable
Organic peroxides	Detonable	Maximum Allowable Quantity	Not Applicable
	Class I	Maximum Allowable Quantity	Not Applicable
	Class IIA	25[f]	Not Applicable
	Class IIB	40[f]	
	Class III	50[f]	Not Applicable
Unstable (reactives) nondetonable	Class 3	1	2,000
	Class 2	25	10,000
Water reactives	Class 3	1	Not Applicable
	Class 2	25	Not Applicable
Pyrophoric gases[d]	Not Applicable	Not Applicable	2,000

For SI: 1 ton = 906 kg, 1 cubic foot = 0.02832 m^3, 1 pound = 0.454 kg.

a. For materials that are detonable, the distance to other buildings or lot lines shall be in accordance with Section 415.6 of this code or Chapter 56 of the International Fire Code based on trinitrotoluene (TNT) equivalence of the material, whichever is greater.

b. “Maximum Allowable Quantity” means the maximum allowable quantity per control area set forth in Table 307.1(1).

c. Limited to Division 1.4 materials and articles, including articles packaged for shipment, that are not regulated as an explosive under Bureau of Alcohol, Tobacco, Firearms and Explosives (BATF) regulations or unpackaged articles used in process operations that do not propagate a detonation or deflagration between articles, provided that the net explosive weight of individual articles does not exceed 1 pound.

d. Detached buildings are not required, for gases in gas rooms that support H-5 fabrication facilities where the gas room is separated from other areas by a fire barrier with a fire-resistance rating of not less than 2 hours and the gas is located in a gas cabinet that is internally sprinklered, equipped with continuous leak detection, automatic shutdown and is not manifolded upstream of pressure controls. Additionally, the gas supply is limited to cylinders that do not exceed 125 pounds (57 kg) water capacity in accordance with 49 CFR 173.192 for Hazard Zone A toxic gases.

e. Does not apply to consumer fireworks, Division 1.4G.

f. Where different classes of organic peroxides are stored in the same building, the aggregate sum of the ratios of the actual quantity divided by the allowed quantity for each class shall not exceed one.

[F]TABLE 415.11.1.1 QUANTITY LIMITS FOR HAZARDOUS MATERIALS IN A SINGLE FABRICATION AREA IN GROUP H-5[a]

HAZARD CATEGORY		SOLIDS (pounds per square foot)	LIQUIDS (gallons per square foot)	GAS (cubic feet @ NTP/square foot)
PHYSICAL-HAZARD MATERIALS				
Combustible dust		Note b	Not Applicable	Not Applicable

	Class 2	0.5	0.05	
	Class 1	Not Limited	Not Limited	
HEALTH-HAZARD MATERIALS				
Corrosives		Not Limited	Not Limited	Not Limited
Highly toxic		Not Limited	Not Limited	Note d
Toxics		Not Limited	Not Limited	Note d

For SI: 1 pound = 0.454 kg, 1 pound per square foot = 4.882 kg/m^2, 1 gallon per square foot = 40.7 L/m^2, 1 cubic foot @ *NTP*/square foot = 0.305 m^3 @ *NTP*/m^2, 1 cubic foot = 0.02832 m^3.

a. Hazardous materials within piping shall not be included in the calculated quantities.

b. Quantity of hazardous materials in a single fabrication shall not exceed the maximum allowable quantities per control area in Tables 307.1(1) and 307.1(2).

c. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.

d. The aggregate quantity of flammable, pyrophoric, toxic and highly toxic gases shall not exceed the greater of 0.2 cubic feet at *NTP*/square foot or 9,000 cubic feet at *NTP*.

e. The aggregate quantity of pyrophoric gases in the building shall not exceed the amounts set forth in Table 415.6.5.

f. Quantity of Class 3 water-reactive solids in a single tool shall not exceed 1 pound.

Staff Analysis: A review of the standard proposed for inclusion in the code, ***Organic Peroxides: Storage – Guideline for the labour-safe, environment-safe and fire-safe storage of organic peroxides (PGS 8-2021)***, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Organic peroxides are hazardous materials with key hazard characteristics of thermal instability, explosivity and flammability with high burning rates. Organic peroxides can undergo self-accelerating decomposition and may result in fire and/or explosion when exposed to heat or when they come in contact with incompatible materials. The decomposition process is further accelerated when the containers are confined. The explosion hazard rating for organic peroxides is determined by the transport type testing in accordance with the UN Recommendations on the Transport of Dangerous Goods, Manual of tests and criteria, and is divided into Type A through G. The transport type testing addresses the explosivity hazard of the organic peroxide and the package size but not the flammability or the burning rate. The flammability aspect of organic peroxide is determined by the burning rate test methods listed in PGS8 Storage Code. Organic peroxides burn vigorously once ignited and the burning rates may be significantly high when compared to that of ordinary flammables. Organic peroxide fires may be characterized by large fire heights, high heat release, high flame temperatures and large amounts of smoke. Given the importance of both the explosivity and high flammability characteristics of organic peroxides, it is very important the storage classification takes into consideration both the transport type and burning rate test results, especially as organic peroxides in storage are stored for long term unlike in transport. An organic peroxide fire can significantly impact the inventory in the storage area, the storage building itself, personnel, nearby property, local community and the environment. The proposed storage classification of organic peroxides is based on both the transport type and the burning rate as shown in the below table (included in Appendix E) and the organic peroxide class definitions are defined accordingly. With the proposed changes, the organic peroxides storage class definitions are defined quantitively as against current qualitative definitions. The proposed storage class definitions harmonize with the definitions in NPFA 400 code and the European organic peroxides codes.

Appendix E is revised as part of this code change proposal, which provides the code official and the code user with the details of organic peroxide classification types, basis for classification, test method references, classification details and classification list of all organic peroxides with composition information included. This information provides the code official and code user the storage classification to be used for a given organic peroxide formulation and how this is determined.

STORAGE CLASSIFICATION OF ORGANIC PEROXIDES

TRANSPORT TYPE	BURNING RATE					
	Large Scale Test (kg/minute)	<10	≥10 and <60	≥60 and <140	≥140 and <300	≥300
	OR					
	Small Scale Test [a] (kg/m²/minute)	NA	<0.9	≥0.9 and <2.2	≥2.2 and <9.0	≥9.0
B		I	I	I	I	I
C		IIB	IIB	IIB	IIA	I
D		III	III	IIB	IIA	I
E		IV	III	IIB	IIA	IIA
F		IV	III	III	III	III
G		V	V	V	V	V

a. Solid materials shall be tested using the large-scale test. Liquid materials can be tested using either the large-scale te[illegible]or the small-scale test.

This code change proposal also revises Unclassified Detonable classification name to Detonable. Organic peroxides are classified by transport type A to transport type G. There is no such class called Unclassified Detonable. If an organic peroxide is detonable, then it is classified as transport type A per the UN and DOT organic peroxides definitions. As such, Detonable is an appropriate word to denote such class. This change from Unclassified Detonable to Detonable is made throughout Chapter 62, other chapters and appendices.

This code change proposal also proposes organic peroxide classification Class II is split into two classes: Class IIA and Class IIB, since the range of burn rate for Class II is broad - lower limit is 60 kg/min and upper limit is 300 kg/min. By subdividing the range into Class IIA (burn rates of 140 kg/min to 300 kg/min) and Class IIB (60 kg/min to 140 kg/min) we have two classes with materials similarly classed for transportation (Type C, D, or E) by explosion hazard but are distinguished by their burning rate in the storage class definition. This additional distinction of the storage classification system allows better definition of separation distances versus quantity and other features that reflect the burning behavior of the materials, beyond the explosion hazard concerns identified in the transport type designation. This change is made throughout Chapter 62 and other chapters. Maximum quantities are defined for Class IIA and IIB where required. Footnote is added under the maximum quantities table in Chapter 62 which states that when multiple classes of organic peroxides are stored, the sum of the ratios is used to determine the maximum quantity allowed. So even though the proposal is adding Class IIB quantities, the aggregate of all organic peroxide materials must be considered based on the footnote which is more restrictive than the current code.

The IFC Organic Peroxides Task Group is aware of IFC's intention to align storage classification definitions with GHS classifications in this code cycle as the GHS classification is listed on a safety data sheet of each material and a fire code official can then easily determine the storage classification of that material. In the case of organic peroxides, however, the GHS classification aligns with transport type definitions. The transport type testing, as explained above, addresses only the explosivity hazard of the organic peroxide and not the flammability or the burning rate. This proposal requests that the storage classifications for organic peroxides be as proposed in this code change proposal which is based on both the transport type and the burning rate, and an exception be made for organic peroxides to not align with GHS classifications. The storage classification for all organic peroxides is easily available for a code official as this is now listed in the Appendix E.

If the organic peroxide storage classification definitions are aligned with GHS definitions:

1. 20 organic peroxide formulations which are classified as Class I based on transport type and burning rate will be classified in a less severe hazard class of Class II organic peroxides based on GHS definition.
2. 24 organic peroxide formulations which are classified as Class II (IIA or IIB) based on transport type and burning rate will be classified in a less severe hazard class of Class III organic peroxides based on GHS definition.
3. 27 organic peroxide formulations which are classified as Class III based on transport type and burning rate will be classified in a less severe hazard class of Class IV organic peroxides based on GHS definition.
4. a total of 71 organic peroxide formulations will be classified in a less severe hazard class despite the presence of high burning rate hazard. Classifying the organic peroxide formulation into a less severe hazard class means a code user would be allowed to store increased quantities and/or at a shorter separation distance which will put the code user's storage area, personnel, nearby property, local community and the environment at increased risk in case of a fire.
5. 15 organic peroxide formulations which are classified as Class IV based on transport type and burning rate will be classified in a more severe hazard class of Class III organic peroxides based on GHS definition. These Class IV formulations are those that do not burn at all, or their burning rate is significantly low due to the presence of decompositions products like carbon dioxide, and these will be reclassified to a higher hazard storage class despite their lower hazard.

Therefore, it is strongly requested that an exception be made for organic peroxides to not align with GHS classifications and classify as proposed based on both the burning rate and explosivity hazard.

Bibliography: Safety and Handling of Organic Peroxides - American Chemistry Council

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is to define and update storage classification of organic peroxides based on both the explosivity and flammability hazards. This code change proposal also revises Unclassified Detonable classification name change to Detonable and split Class II into two classes: Class IIA and Class IIB for the reasons stated in reason statement. These changes are made throughout Chapter 62, other chapters and appendices. Appendix E is revised as part of this code change proposal, which provides the code official and the code user with the details of organic peroxide classification types, basis for classification, test method references, classification details and classification list of all organic peroxides with composition information included. The information provided in this proposal helps both the code official and the code user to effectively implement the code. The proposal does not impact the cost of construction.

IFC: 6306.2, 6306.5 (New), 6306.5, 6306.6, 6306.6.1, 6306.6.2, 6306.7

Proponents: Robert Marshall, San Mateo Consolidated Fire Department, International Association of Fire Chiefs- Fire and Life Safety Section (rmarshall@smcfire.org)

2024 International Fire Code

Revise as follows:

6306.2 Information and instructions to be provided.
The seller of liquid oxygen shall provide the user with information in written form that includes, but is not limited to, the following topics:

1. Manufacturer's instructions and labeling for safe storage and use of the containers.
2. Locating containers away from ignition sources, *exits*, electrical hazards, cooking equipment and other high-temperature devices in accordance with Section 6306.3.3.
3. Restraint of containers to prevent falling in accordance with Section 6306.3.4.
4. Requirements for handling containers in accordance with Section 6306.3.5.
5. Safeguards for refilling containers in accordance with Section 6306.3.6.
6. Signage requirements in accordance with Section ~~6306.6~~ 6306.7.
7. The dangers of smoking while on oxygen
8. The use of thermal fuses provided in accordance with 6306.5

Add new text as follows:

6306.5 Thermal Fuses. Liquid oxygen concentrators and containers used in Group R occupancies shall be provided with a thermal fuse device. Such devices shall be provided by the oxygen seller at the time of installation and any time containers are refilled.

Revise as follows:

~~6306.5~~ 6306.6 Smoking prohibited. Smoking shall be prohibited in rooms or areas where liquid oxygen is in use.

~~6306.6~~ 6306.7 Signs.
Warning signs for occupancies using home health care liquid oxygen shall be in accordance with Sections 6306.6.1 and 6306.6.2.

~~6306.6.1~~ 6306.7.1 No smoking sign. A sign stating "OXYGEN— NO SMOKING" shall be posted in each room or area where liquid oxygen containers are stored, used or filled.

~~6306.6.2~~ 6306.7.2 Premises signage. Where required by the *fire code official*, each *dwelling unit* or *sleeping unit* shall have an *approved* sign indicating that the unit contains liquid oxygen home care containers.

~~6306.7~~ 6306.8 Fire department notification. ~~Where required by the *fire code official*, the liquid~~ Liquid oxygen ~~seller~~ sellers shall notify the fire department of the locations of liquid oxygen home care containers when a new installation is placed, and when the system is removed from a home.

Exception: When explicitly exempted by the fire department.

Reason: NFPA released the report *Fire and Burns Involving Home Medical Oxygen* in which they cite the Consumer Product Safety Commission (CPSC) data listing 1,041 thermal burns, 228 home fires, and 96 fire deaths per year related to home oxygen therapy use, (Hall, 2023). Because not all fire departments report to the National Fire Incident Reporting System (NFIRS), the data suggests this problem to be much more significant and under reported. According to NFPA, emergency room visits involving oxygen related burns were caused by cigarettes 59% of the time compared to the next highest cause of cooking while on oxygen at 18%. In fact, a civilian is killed at one of every three home fires in which oxygen administration equipment is used. Data suggest our home oxygen therapy fire deaths could be as high as 350 people or 12% of the US fire fatalities annually.And the fatalities are not limited to the person on home oxygen, as injuries and fatalities occur with others in the same structure who are not on oxygen.Fires involving home oxygen are a significant risk to the safety of firefighters. Two firefighters die each year fighting home oxygen therapy fires and many more are injured. “The enrichment of normal room air with oxygen increases the energy, heat release and severity of any fire. What can normally be a fairly nonflammable substance can, in the presence of oxygen, burn with vigor and produce noxious fumes very rapidly” (BPR Medical). Five firefighters in Tacoma were injured in a June 2023 fast-moving apartment fire that was later determined to be caused by smoking and home oxygen use.

This problem is not an isolated or rare anomaly. “Around 16 million people have been diagnosed with Chronic Obstructive Lung Disease (COPD) in the US (1 in 8 over the age of 45), with millions more undiagnosed. Of these, an estimated 1.5 million require home oxygen therapy” (American Thoracic Society, 2018). Research shows 1.5 million people are prescribed home oxygen. Of that number, it is estimated 52% still smoke due to the addictive nature of nicotine.

According to CDC WISQARS, in 2020 there were 281,801 fire/burn injuries in the U.S. These injuries cost $3.9 billion ($3,862,650,000) in medical costs, and $41.6 billion ($41,599,370,000) in combined medical/work/life loss costs, (National Center for Injury Prevention and Control, CDC WISQARS accessed on 8/4/2023). It costs $97,971 per day to treat an intubated patient with severe burns at a Trauma and Burn Center.   The thermal fuse is a bi-directional valve, meaning it completely shuts off the flow of oxygen – whichever way it is fitted - when exposed to fire. From 2013 – 2018 after mandated implementation in the United Kingdom, only one home fatality has been recorded associated with home oxygen use. The current cost of a thermal fuse is approximately $4.45 per unit and manufacturers recommend a thermal fuse at the oxygen concentrator and at the connection point of the nasal cannula. The thermal fuse is an FDA listed medical device manufactured in the UK with two independent medical supply wholesale companies both competitively listing the device for sale within the US. It is not required to be listed according to UL representatives due to its FDA approval. There currently does not exist another engineering solution to reduce home oxygen therapy fires.

This proposal would:

1. Require thermal fuse devices be provided to a user on the oxygen tubing of all home oxygen installations.

2. Require additional educational information on the dangers of oxygen in homes.3. Clarify that notification of the fire department is required whenever oxygen is being used in a home, rather than making it only if the AHJ requires it. The exception still exists, however, it is now an exception. The current language leads to oxygen providers not checking with the department, and the new language will at least prompt the conversation.The requirements for a thermal fuse device are not intended to be required in an institutional occupancy because of the supervised nature of oxygen use in such occupancies. The educational material requirements would still be required for all occupancies.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This is not a construction provision, so there is no cost impact to construction. The device itself costs between $5 and $15 USD.

Estimated Immediate Cost Impact Justification (methodology and variables):

The device itself is going to remain a fixed cost. There may be a labor charge for installation. Currently, these devices are mandated and paid for by the US Veterans Affairs, but not covered by Medicare. Many insurance companies will pay for this device.

Proponents: Robert Marshall, San Mateo Consolidated Fire Department, International Association of Fire Chiefs- Fire and Life Safety Section (rmarshall@smcfire.org)

2024 International Fire Code

Revise as follows:

CHAPTER 63 OXIDIZERS, OXIDIZING GASES AND OXIDIZING CRYOGENIC FLUIDS AND RESIDENTIAL OXYGEN USE

SECTION 6306
~~LIQUID~~ RESIDENTIAL OXYGEN USE ~~IN HOME HEALTH CARE~~

6306.1 General.
The storage and use of ~~liquid~~ oxygen ~~(LOX)~~ in residential occupancies and facilities located in Group I-1, I-4 and R occupancies shall comply with Sections 6306.2 through 6306.6, or shall be stored and used in accordance with Chapter 50.

6306.2 Information and instructions to be provided.
The seller of ~~liquid~~ oxygen shall provide the user and facility with information in written form that includes, but is not limited to, the following:

1. Manufacturer's instructions and labeling for safe storage and use of oxygen and the associated containers.
2. Locating containers away from ignition sources, *exits*, electrical hazards, cooking appliances and high-temperature devices in accordance with Section 6306.3.3.
3. Restraint of containers to prevent falling in accordance with Section 6306.3.4.
4. Requirements for handling containers in accordance with Section 6306.3.5.
5. Safeguards for refilling containers in accordance with Section 6306.3.6.
6. Signage requirements in accordance with Section 6306.6.

6306.3 ~~Liquid oxygen~~ Oxygen ~~home care~~ containers.
Compressed Gas Containers and Cryogenic Containers containing oxygen used in home health care settings shall be in accordance with Sections 6306.3.1 through 6306.3.6.3.

6306.3.1 Maximum individual container capacity.
~~Liquid oxygen~~ Oxygen ~~home care~~ containers shall not exceed an individual capacity of 15.8 gallons (60 L) in Group I-1, I-4 and R occupancies. ~~Liquid oxygen~~ Oxygen ~~ambulatory~~ containers intended for ambulatory use are allowed in Group I-1, I-4 and R occupancies. ~~Containers of liquid oxygen in home health care shall also be stored, used and filled in accordance with Section 6306 and Sections 5503.1 and 5503.2.~~

6306.3.2 Manufacturer's instructions and labeling. Compressed gas containers and cryogenic containers shall be stored, used and operated in accordance with the manufacturer's instructions and labeling.

6306.3.3 Locating containers. Compressed gas containers and cryogenic containers shall not be located in areas where any of the following conditions exist:

1. They can be overturned due to operation of a door.
2. They are in the direct path of egress.

3. They are subject to falling objects.
4. They can become part of an electrical circuit.
5. Open flames and high-temperature devices can cause a hazard.

6306.3.4 Restraining containers. ~~Liquid oxygen home care~~Compressed gas containers and cryogenic containers containing oxygen shall be restrained while in storage or use to prevent falling caused by contact, vibration or seismic activity. Containers shall be restrained by one of the following methods:

1. Restraining containers to a fixed object with one or more restraints.
2. Restraining containers within a framework, stand or assembly designed to secure the container.
3. ~~Restraining containers by locating a container against two points of contact such as the walls of a corner of a room or a wall and a secure furnishing or object such as a desk.~~
4. Nesting of compressed gas containers or cryogenic containers where, if dislodged, do not obstruct the required means of egress.

6306.3.5 Container handling. Containers shall be handled by use of a cart or hand truck designed for such use.

Exceptions:

1. ~~Liquid oxygen home care containers~~ Containers equipped with a roller base.
2. ~~Liquid oxygen ambulatory containers~~ Containers for ambulatory use are allowed to be hand carried.

6306.3.6 Filling of containers.

The filling of oxygen containers shall be in accordance with Sections 6306.3.6.1 through 6306.3.6.3.

6306.3.6.1 Filling location. ~~Liquid oxygen~~ Oxygen ~~home care~~ containers ~~and ambulatory containers~~ shall be filled outdoors.

Exception: ~~Liquid oxygen ambulatory containers~~ Containers are allowed to be filled indoors where the supply container is specifically designed for filling such containers and written instructions are provided by the container manufacturer.

6306.3.6.2 Incompatible surfaces. A drip pan compatible with liquid oxygen shall be provided under ~~home care~~ container fill and vent connections during the filling process in order to protect against ~~liquid oxygen~~ spillage from coming into contact with combustible surfaces, including asphalt.

6306.3.6.3 Open flames and high-temperature devices.

The use of open flames and high-temperature devices during filling shall ~~be in accordance~~ comply with Section 5003.7.2.

6306.4 Maximum aggregate quantity.

The maximum aggregate quantity ~~of liquid~~ oxygen allowed in storage and in use in each *dwelling unit* shall be ~~31.6 gallons (120 L).~~ as follows:

1. 31.6 gallons (120 L) liquid oxygen.
2. 3650 CF (103.35 m3) oxygen gas.
3. Where 1-hour fire barriers and horizontal assemblies installed in accordance with the *International Building Code* separate individual sleeping rooms within a dwelling unit, the quantities in items 1 or 2 shall be permitted to be applied per sleeping room.

Exceptions:

~~1.~~ The maximum aggregate quantity of liquid oxygen allowed in Group I-4 occupancies shall be limited by the maximum allowable quantity set forth in Table 5003.1.1(1).

2. ~~Where individual sleeping rooms are separated from the remainder of the *dwelling unit* by *fire barriers* constructed in accordance with Section 707 of the International Building Code, and *horizontal assemblies* constructed in accordance with Section 711 of the International Building Code, or both, having a minimum *fire-resistance rating* of 1 hour, the maximum aggregate quantity per *dwelling unit* shall be increased to allow not more than 31.6 gallons (120 L) of liquid oxygen per sleeping room.~~

6306.5 Smoking prohibited. Smoking shall be prohibited in rooms or areas where ~~liquid~~ oxygen is in use.

6306.6 Signs.
Warning signs for occupancies using ~~home health care liquid~~ oxygen shall be in accordance with Sections 6306.6.1 and 6306.6.2.

6306.6.1 No smoking sign. A sign stating "OXYGEN— NO SMOKING" shall be posted in each room or area where ~~liquid~~ oxygen containers are stored, used or filled.

6306.6.2 Premises signage. Where required by the *fire code official*, each *dwelling unit* or *sleeping unit* shall have an *approved* sign indicating that the unit contains ~~liquid~~ oxygen ~~home care~~ containers.

6306.7 Fire department notification. Where required by the *fire code official*, the ~~liquid~~ oxygen seller shall notify the fire department of the locations of ~~liquid~~ oxygen ~~home care~~ containers.

Reason: NFPA released the report *Fire and Burns Involving Home Medical Oxygen* in which they cite the Consumer Product Safety Commission (CPSC) data listing 1,041 thermal burns, 228 home fires, and 96 fire deaths per year related to home oxygen therapy use, (Hall, 2023). Because not all fire departments report to the National Fire Incident Reporting System (NFIRS), the data suggests this problem to be much more significant and under reported. According to NFPA, emergency room visits involving oxygen related burns were caused by cigarettes 59% of the time compared to the next highest cause of cooking while on oxygen at 18%. In fact, a civilian is killed at one of every three home fires in which oxygen administration equipment is used. Data suggests our home oxygen therapy fire deaths could be as high as 350 people or 12% of the US fire fatalities annually.

Fires involving home oxygen are a significant risk to the safety of firefighters. A fire in June of 2023 injured 2 residents and 5 firefighters in Tacoma, Washington after a resident on home oxygen lit a cigarette. (The News Tribune). Unfortunately, incidents such as this are not rare. Talk to almost any firefighter, and they will tell you a story in which a fire or burn injury occurred as the result of home oxygen use.

The NFPA report and NFIRS data does not differentiate between liquid oxygen and gaseous oxygen, yet the fire code only addresses liquid oxygen use. In practice, both liquid oxygen and gaseous oxygen is prescribed for use in patients needing supplemental oxygen therapy.

This proposal seeks to remove all references to liquid oxygen, clarifying that the safety requirements for use of oxygen in residential occupancies apply no matter what kind of oxygen a patient in a residential setting may be on.

6306.4 added a quantity for gaseous oxygen. The quantity for liquid oxygen is in the existing language, and the quantity for the gaseous oxygen matches the quantity of liquid oxygen in a gas form. The proposal purposely does not restrict the quantity to one or the other since a patient will only be on one form at any given time, and the oxygen tubing attached to the patient is usually the cause of ignition of the fire.

Bibliography: Hall, Shelby, 2023. Fires and Burns Involving Home Medical Oxygen. Accessed 1/8/24 at https://www.nfpa.org/education-and-research/research/nfpa-research/fire-statistical-reports/fires-and-burns-involving-home-medical-oxygen

The News Tribune- https://www.thenewstribune.com/news/local/article276149236.html

Cost Impact: Increase

Estimated Immediate Cost Impact:

This is not a construction issue. That said, clarifying that the regulation extends to all use of home oxygen regardless of whether the oxygen is in a liquid or gas form. While many oxygen providers comply with these requirements, the increased printing costs of the safety materials would be the only cost, as the safety regulations are largely adhered to by providers already. This could result in a price increase of around $1.00.

Estimated Immediate Cost Impact Justification (methodology and variables):

None

F272-24

F273-24

IFC: B103.2.1 (New), B103.2.2 (New), B103.2.3 (New)

Proponents: Robert Neale, Integra Code Consultants, Self (rneale1951@outlook.com)

2024 International Fire Code

Add new text as follows:

B103.2.1 Increases based on occupancy.. The required fire flow for any building with a Group M, F-1, H or S-1 fire area shall be increased by not less than 500 gpm (1893 L/m) above the value derived from Table B105.2.

B103.2.2 Increases based on fire separation distance.. The required fire flow for any building having one or more exterior walls within a fire separation distance of less than 30 feet (9144 mm) shall increase the fire flow not less than 250 gpm (948 L/m) above the value derived from Table B105.2 for each wall within the fire separation distance of less than 30 feet (9144 mm).

B103.2.3 Aggregated Values.. The values derived from Sections B103.2.1 and B103.2.2 shall be aggregated.

Reason: The fire flow values in IFC Table B105.1(2) do not include values for two important fire protection considerations: contents' combustibility and exposure protection.

For example, using Table B105.1(2) for a sample one-story Type IIB non-sprinklered building measuring 38,000 sq. ft. requires a fire flow value of 4,250 gpm for four hours. By installing an approved fire sprinkler system, that value can be reduced to 1,062.5 gpm for two hours. There is no consideration for building contents or exposures.

In this scenario, the proposed building would be assess the same fire flow value whether it stored steel or concrete pipe products or combustible wood, paper or plastic products. The proposed 500 gpm increase for any building having a Group M, F-1, H or S-1 fire area acknowledges these occupancies are "moderate" or "high" hazard occupancies that may require more water application for suppression than a light hazard occupancy. The language is written to allow the code official to increase the fire flow for these fire areas whether the building has only one or multiple fire areas of those occupancy classifications.

Similarly, the proposed increase based on fire separation distances recognizes the need for exposure protection in the event the subject building threatens one or more adjacent properties. The fire separation distance standard is selected to align with the Building Code distances.

Finally, the proposed Section B103.2.3 "Aggregated values" is to clarify for the code official that content combustibility and exposure protection both must be considered.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal may increase the cost of construction where existing infrastructure (fire protection water storage and distribution) is inadequate to support the adjusted Table B103.5(2) values. Water mains may have to be upsized to accommodate increased volumes.

The following table compares estimated* retail prices for the two most commonly used water main products: PVC C-900 and ductile iron.

Size (in)	C-900	DI
4	$ 1.88	$ 9.00
6	$ 3.00	$14.74
8	$ 6.30	$18.38
10	$ 9.59	$ 23.75
12	$ 13.51	$ 30.43
14	$ 17.51	$ 40.30

Size (in)	C-900	DI
16	$ 24.06	$ 50.17

Avg. price comparisons (linear foot) C-900 vs. ductile iron based on pipe size.

Estimated Immediate Cost Impact Justification (methodology and variables):

A web search of 27 retail outlets in 14 states using the search term "C-900 v. DI unit price" provided the price per linear foot data. The data do not include sunk costs of excavation, installation and testing that would be required regardless of pipe size.

F273-24

F274-24

IFC: D105.1

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org)

2024 International Fire Code

Revise as follows:

D105.1 Where required.
Where the vertical distance between the *grade plane* and the highest roof surface exceeds 30 feet (9144 mm), *approved* aerial fire apparatus access roads shall be provided. For purposes of this section, the highest roof surface shall be determined by measurement to the eave of a pitched roof, the intersection of the roof to the *exterior wall*, or the top of parapet walls, whichever is greater.

> **Exception:** Where *approved* by the *fire code official*, buildings of Type IA, Type IB, ~~or~~ Type IIA, Type IV-A, or Type IV-B construction equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and having firefighter access through an enclosed *stairway* with a Class I standpipe from the lowest level of fire department vehicle access to all roof surfaces.

Reason: This exception to Section D105.1 was added in the 2021 IFC by proposal F324-18. Per that reason statement, Fire Department Aerial Apparatus Access is rarely needed in these taller buildings which are equipped with an automatic sprinkler system in accordance with NFPA 13 and has fire department access through an enclosed stair with a Type I standpipe system from the lowest level of fire department access to all roof surfaces. Firefighting operations, including ventilation, can be achieved through the interior of these buildings using the enclosed stairs as a means of egress from the hazard area. The requirement for a Class I standpipe is for fire suppression and firefighter protection when operating hose lines at the roof or at a lower floor level.

These same principles and techniques to fight a fire in a taller Type I or II building could also be applied to a taller Type IV building. Because the exception of Section D105.1 was new in the 2021 IFC, it was not addressed by the ICC Ad Hoc Committee on Tall Wood Buildings in their code package for the 2021 IFC. Use of this exception requires the approval of the fire code official.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00 minimally but there could be a cost decrease for some buildings.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal creates an exception for the use of narrower streets with taller Type IV buildings. This means that an existing narrow street would not have to be widened if a Type IV building is being constructed on it. Providing additional construction type options could lower the cost of construction.

IFC: TABLE E104.2

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Lynne Kilpatrick, HMEx Assistant LLC, self (lynne.kilpatrick@hmexassistant.com)

2024 International Fire Code

Revise as follows:

TABLE E104.2 IFC AND GHS HAZARD DEFINITIONS COMPARISON[a]

IFC MATERIAL	IFC CLASS	IFC DEFINITION	GHS ~~2017 (REV 7)~~ CLASSIFICATION (H-CODE AND CATEGORY); HAZARD STATEMENT; DEFINITION	
Aerosol	—	A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level 1, Level 2 or Level 3.	Any nonrefillable receptacles made of metal, glass or plastics and containing a gas compressed, liquefied or dissolved under pressure, with or without a liquid, paste or powder, and fitted with a release device allowing the contents to be ejected as solid or liquid particles in suspension in a gas, as a foam, paste or powder or in a liquid state or in a gaseous state.	
Aerosol	Level 1	Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).	H223, Category 3; ~~Pressurized container: May burst if heated.~~ 1. Any aerosol that contains ≤ 1% flammable components (by mass) and that has a heat of combustion < 20 kJ/g. 2. Any aerosol that contains > 1% (by mass) flammable components or which has a heat of combustion of ≥ 20 kJ/g but which, based on the results of the ignition distance test, the enclosed space ignition test or the aerosol foam flammability test, does not meet the criteria for Category 1 or Category 2. and H229; Pressurized container: May burst if heated	

Aerosol	Level 2	Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).	H223, Category 2; Flammable aerosol~~. Pressurized container: May burst if heated~~: 1. Any aerosol that dispenses a spray that, based on the results of the ignition distance test, does not meet the criteria for Category 1, and which has: a. A heat of combustion of ≥ 20 kJ/g. b. A heat of combustion of < 20 kJ/g along with an ignition distance of ≥ 15 cm; or c. A heat of combustion of < 20 kJ/g and an ignition distance of < 15 cm along with either, in the enclosed space ignition test a time: i. A time equivalent of ≤ 300 s/m^3; or ii. A deflagration density of ≤ 300 g/m^3; or 2. Any aerosol that dispenses a foam that, based on the results of the aerosol foam flammability test, does not meet the criteria for Category 1, and which has a flame height of ≥ 4 cm and a flame duration of ≥ 2 s. and H229; Pressurized container: May burst if heated	

Aerosol	Level 3	Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g).	H222, Category 1; Extremely flammable aerosol~~. Pressurized container: May burst if heated~~: 1. Any aerosol that contains ≥ 85% flammable components (by mass) and has a heat of combustion of ≥ 30 kJ/g. 2. Any aerosol that dispenses a spray that, in the ignition distance test, has an ignition distance of ≥ 75 cm. 3. Any aerosol that dispenses a foam that, in the foam flammability test, has: a. A flame height of ≥ 20 cm and a flame duration of ≥ 2 s. b. A flame height of ≥ 4 cm and a flame duration of ≥ 7 s. and H229; Pressurized container: May burst if heated	
Combustible liquid	—	A liquid having a closed cup flash point at or above 100°F (38°C). Combustible liquids shall be subdivided as follows:	A flammable liquid means a liquid having a flash point of not more than 93°C.	
Combustible liquid	II	Liquids having a closed cup flash point at or above 100°F (38°C) and below 140°F (60°C).	H226, Category 3; Flammable liquid and vapor: Flash point ≥ 23°C and ≤ 60°C	
Combustible liquid	IIIA	Liquids having a closed cup flash point at or above 140°F (60°C) and below 200°F (93°C).	H227, Category 4; Combustible liquid: Flash point > 60°C and ≤ 93°C	
Combustible liquid	IIIB	Liquids having closed cup flash points at or above 200°F (93°C).	N/A	
Compressed gas	—	A material or mixture of materials that: 1. Is a gas at 68°F (20°C) or less at 14.7 psia (101 kPa) of pressure, and 2. Has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa) which is either liquefied, nonliquefied or in solution, except those gases that have no other health- or physical-hazard properties are not considered to be compressed until the pressure in the packaging exceeds 41 psia (282 kPa) at 68°F (20°C). States of compressed gases: 1. Nonliquefied compressed gases are gases, other than those in solution, that are in a packaging under the charged pressure and are entirely gaseous at a temperature of 68°F (20°C). 2. Liquefied compressed gases are gases that, in a packaging under the charged pressure, are partially liquid at a temperature of 68°F (20°C). 3. Compressed gases in solution are nonliquefied gases that are dissolved in a solvent. 4. Compressed gas mixtures consist of a mixture of two or more compressed gases contained in a packaging, the hazard properties of which are represented by the properties of the mixture as a whole.	Gases under pressure are gases which are contained in a receptacle at a pressure of 200 kPa (gauge) or more at 20°C, or which are liquefied, or liquefied and refrigerated. H280, Compressed gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is entirely gaseous at -50°C (-58°F), including all gases with a critical temperature ≤ -50°C (-58°F). H280, Liquefied gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is partially liquid at temperatures above -50°C (-58°F). H280, Dissolved gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is dissolved in a liquid phase solvent.	
Corrosive	—	A chemical that causes visible destruction of, or irreversible alterations in, living tissue by chemical action at the point of contact. A chemical shall be considered corrosive if, when tested on the intact skin of albino rabbits by the method described in DOTn 49 CFR 173.137, such chemical destroys or changes irreversibly the structure of the tissue at the point of contact following an exposure period of 4 hours. This term does not refer to action on inanimate surfaces.	H314, Category 1 (1A, 1B, 1C); Causes severe skin burns and eye damage. Skin corrosion refers to the production of irreversible damage to the skin; namely, visible necrosis through the epidermis and into the dermis occurring after exposure to a substance or mixture, or H318, Category 1; Causes serious eye damage: Serious eye damage refers to the production of tissue damage in the eye, or serious physical decay of vision, which is not fully reversible, occurring after exposure of the yed to the substance or mixture.	
Cryogenic fluid	—	A fluid having a boiling point lower than -130°F (-89.9°C) at 14.7 pounds per square inch atmosphere (psia) (an absolute pressure of 101.3 kPa).	H281, Refrigerated liquefied gas; Contains refrigerated gas: May cause cryogenic burns or injury. A gas which is made partially liquid because of its low temperature.	

Cryogenic fluid, flammable	—	A cryogenic fluid that is flammable in its vapor state.	H220, Category 1A; Extremely flammable gas. Gases, which at 20° C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points, regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases~~.~~, or H221, Category 1B; Flammable gas: Gases which meet the flammability criteria for Category 1A, but which are not pyrophoric, nor chemically unstable, and which have at least either: a lower flammability limit of more than 6% by volume in air; or (b) a fundamental burning velocity of less than 10 cm/s and H281, refrigerated liquefied gas~~, would also apply.~~	
Cryogenic fluid,~~—~~Inert	—	A cryogenic fluid that is inert.	H281, Refrigerated liquefied gas. Contains refrigerated gas: May cause cryogenic burns or injury. A gas which is made partially liquid because of its low temperature.	
Cryogenic fluid, Oxidizing	—	An oxidizing gas in the cryogenic state.	H270, Category 1: May cause or intensify fire; oxidizer. Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. and H281, refrigerated liquefied gas~~, would also apply.~~	
Explosives	—	A chemical compound, mixture or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to, dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord and igniters. The term "Explosive" includes any material determined to be within the scope of USC Title 18: Ch. 40 and also includes any material classified as an explosive other than consumer fireworks, Division 1.4G Explosives, by the hazardous materials regulations of DOTn 49 CFR Parts 100–185.	An explosive substance (or mixture) is a solid or liquid substance (or mixture of substances) which is in itself capable by chemical reaction of producing gas at such a temperature and pressure and at such a speed as to cause damage to the surroundings. Pyrotechnic substances are included even when they do not evolve gases.	
Explosives	Unstable explosives		H200; Unstable explosive. Unstable explosives are those which are thermally unstable and/or too sensitive for normal handling, transport and use. Special precautions are necessary.	
Explosives	Division 1.1	Explosives that have a mass explosion hazard. A mass explosion is one which affects almost the entire load instantaneously.	H201; Explosive; mass explosion hazard. Substances, mixtures and articles which have a mass explosion hazard (a mass explosion is one which affects almost the entire quantity present virtually instantaneously).	
Explosives	Division 1.2	Explosives that have a projection hazard but not a mass explosion hazard.	H202; Explosive; severe projection hazard. Substances, mixtures and articles which have a projection hazard but not a mass explosion hazard.	
Explosives	Division 1.3	Explosives that have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard.	H203; Explosive; fire, blast or projection hazard. Substances, mixtures and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard: 1. Combustion of which gives rise to considerable radiant heat; or 2. Which burn one after another, producing minor blast or projection effects or both.	
Explosives	Division 1.4	Explosives that pose a minor explosion hazard. The explosive effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire must not cause virtually instantaneous explosion of almost the entire contents of the package.	H204; Fire or projection hazard: Substances, mixtures and articles which present no significant hazard; substances, mixtures and articles which present only a small hazard in the event of ignition or initiation. The effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire shall not cause virtually instantaneous explosion of almost the entire contents of the package.	
Explosives	Division 1.4G	Small fireworks devices containing restricted amounts of pyrotechnic composition designed primarily to produce visual or audible effects by combustion or deflagration that complies with the construction, chemical composition and labeling regulations of the DOTn for fireworks, UN No. 0336 and the US Consumer Product Safety Commission as set forth in CPSC 16 CFR Parts 1500 and 1507.	N/A	

Explosives	Division 1.5	Very insensitive explosives. This division is comprised of substances that have a mass explosion hazard but which are so insensitive that there is very little probability of initiation or of transition from burning to detonation under normal conditions of transport.	H205; May mass explode in fire. Very insensitive substances or mixtures which have a mass explosion hazard: substances and mixtures which have a mass explosion hazard but are so insensitive that there is very little probability or initiation or of transition from burning to detonation under normal conditions.	
Explosives	Division 1.6	Extremely insensitive articles that do not have a mass explosion hazard. This division is comprised of articles that contain only extremely insensitive detonating substances and that demonstrate a negligible probability of accidental initiation or propagation.	Extremely insensitive articles which do not have a mass explosion hazard: articles which predominantly contain extremely insensitive substances or mixtures and which demonstrate a negligible probability of accidental initiation or propagation.	
Flammable gas	Gaseous or Liquefied	A material that is a gas at 68° F (20° C) or less at 14.7 psia (101 kPa) of pressure [a material that has a boiling point of 68° F (20° C) or less at 14.7 psia (101 kPa)] ~~which:~~subdivided as follows: 1. Category 1A. a. A gas which i~~I~~s ignitable at 14.7 psia (101 kPa) when in a mixture of 13% or less by volume with air; or ~~2~~ b. ~~Has~~ A gas with a flammable range at 14.7 psia (101 kPa) with air of not less than 12%, regardless of the lower limit unless data shows compliance with category 1B. 2. Category 1B. A gas which meets the flammability criteria for Category 1A, is not pyrophoric or chemically unstable, and meets one of more of the following: a. A lower flammability limit of more than 6% by volume of air; or b. A fundamental burning velocity of less than 3.9 in/s (10 cm/s). The limits specified shall be determined at 14.7 psia (101 kPa) of pressure and a temperature of 68° F (20° C) in accordance with ASTM E681. Where not otherwise specified, the term "flammable gas" includes both Category 1A and 1B.	A flammable gas is a gas having a flammable range with air at 20° C and a standard pressure of 101.3 kPa. H220, Category 1A; Extremely flammable gas. Gases, which at 20° C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases. H22~~0~~1, Category 1B; Flammable gas. Gases which meet the flammability criteria for Category 1A, but which are not pyrophoric nor chemically unstable, and which have at least either: 1. A lower flammability limit of more than 6% by volume in air; or 2. A fundamental burning velocity of less than 10 cm/s. and H280 or H281~~, compressed gas, would also apply.~~	
Flammable liquid	—	A liquid having a closed cup flash point below 100° F (38° C). Flammable liquids are further categorized into a group known as Class I liquids. The Class I category is subdivided as follows:	A liquid having a flash point of not more than 93° C. A flammable liquid is classified in one of the four categories for this class.	
Flammable liquid	IA	Liquids having a flash point below 73° F (23° C) and having a boiling point below 100° F (38° C).	H224, Category 1; Extremely flammable liquid and vapor. Flash point < 23° C and initial boiling point ≤ 35° C	
Flammable liquid	IB	Liquids having a flash point below 73° F (23° C) and having a boiling point at or above 100° F (38° C).	H225, Category 2; Highly flammable liquid and vapor. Flash point < 23° C and initial boiling point > 35° C	
Flammable liquid	IC	Liquids having a flash point at or above 73° F (23° C) and below 100° F (38° C).	H226, Category 3; Flammable liquid and vapor. Flash point ≥ 23° C and ≤ 60° C	

Flammable solid	—	A solid, other than a blasting agent or explosive, that is capable of causing fire through friction, absorption of moisture, spontaneous chemical change or retaining heat from manufacturing or processing, or which has an ignition temperature below 212°F (100°C) or which burns so vigorously and persistently when ignited as to create a serious hazard. A chemical shall be considered a flammable solid, as determined in accordance with the test method of CPSC 16 CFR Part 1500.44, if it ignites and burns with a self-sustained flame at a rate greater than 0.0866 inch (2.2 mm) per second along its major axis.	A flammable solid is a solid which is readily combustible, or may cause or contribute to fire through friction. A flammable solid is classified in one of the two categories for this class using method N.1 as described in Part III, subsection 33.2.1 of the Manual of Tests and Criteria, according to: H228, Category 1; Flammable solid: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone does not stop fire; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time ≤ 5 min H228, Category 2; Flammable solid: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone stops the fire for at least 4 min; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time > 5 min and ≤ 10 min	
Highly toxic	—	A material that produces a lethal dose or lethal concentration that falls within any of the following categories: 1. A chemical that has a median lethal dose (LD50) of 50 mg or less per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of 200 mg or less per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of 200 ppm by volume or less of gas or vapor, or 2 mg/l or less of mist, fume or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g.	Acute toxicity refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral H300, Category 1; Fatal if swallowed: LD50 ≤ 5 mg/kg bodyweight H300, Category 2; Fatal if swallowed: LD50 > 5 ≤ 50 mg/kg bodyweight Dermal H310, Category 1; Fatal in contact with skin: LD50 ≤ 50 mg/kg bodyweight H310, Category 2; Fatal in contact with skin: LD50 > 50 ≤ 200 mg/kg bodyweight Inhalation H330, Category 1; Fatal if inhaled. Gases: LC50 ≤ 100 ppm (4 hr) ≈ 200 ppm (1 hr) Vapors: LC50 ≤ 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) Dust/mist: LC50 ≤ 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) H330, Category 2; Fatal if inhaled: Dust/mist: LC50 > 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) ≤ 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr)	
Inert gas	—	A gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert gases do not exhibit either physical or health hazard properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a compressed gas. Some of the more common inert gases include argon, helium, krypton, neon, nitrogen and xenon.	Gases under pressure are gases which are contained in receptacles at a pressure of 200 kPa (gauge) or more at 20°C or which are liquefied or liquefied and refrigerated. They comprise compressed gases, liquefied gases, dissolved gases and refrigerated liquefied gases. See the description of "Compressed gas."	
Organic peroxide	—	An organic compound that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by an organic radical. Organic peroxides can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time.	Organic peroxides are liquid or solid organic substances which contain the bivalent -O-O- structure and may be considered derivatives of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties: 1. Be liable to explosive decomposition. 2. Burn rapidly. 3. Be sensitive to impact or friction. 4. React dangerously with other substances.	

Organic peroxide	UD	Organic peroxides that are capable of detonation. These peroxides pose an extremely high-explosion hazard through rapid explosive decomposition.	H240, Organic peroxide, Type A; Heating may cause an explosion. Any organic peroxide which, as packaged, can detonate or deflagrate rapidly will be defined as organic peroxide Type A.	
Organic peroxide	I	Describes those formulations that are capable of deflagration but not detonation.	H241, Organic peroxide, Type B; Heating may cause a fire or explosion. Any organic peroxide possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly but is liable to undergo a thermal explosion in that package will be defined as organic peroxide Type B.	
Organic peroxide	II	Describes those formulations that burn very rapidly and that pose a moderate reactivity hazard.	H242, Organic peroxide, Type C; Heating may cause a fire. Any organic peroxide possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as organic peroxide Type C. H242, Organic peroxide, Type D; Heating may cause a fire. Any organic peroxide which in laboratory testing: Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as organic peroxide Type D.	
Organic peroxide	III	Describes those formulations that burn rapidly and that pose a moderate reactivity hazard.	H242, Organic peroxide, Type E; Heating may cause a fire. Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide Type E.	
Organic peroxide	IV	Describes those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard.	H242, Organic peroxide, Type F; Heating may cause a fire. Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as organic peroxide Type F.	
Organic peroxide	V	Describes those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard.	Organic peroxide, Type G. Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C or higher for a 50 kg package), and for liquid mixtures, a diluent having a boiling point of not less than 150°C and used for desensitization will be defined as organic peroxide Type G. If the organic peroxide is not thermally stable or is a diluent having a boiling point less than 150°C and is used for desensitization, it shall be defined as organic peroxide Type F.	
Oxidizer	—	A material that readily yields oxygen or other oxidizing gas, or that readily reacts to promote or initiate combustion of combustible materials and, if heated or contaminated, can result in vigorous self-sustained decomposition.	An oxidizing solid is a solid which, while in itself is not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material. An oxidizing liquid is a liquid which, while in itself not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material.	
Oxidizer	4	An oxidizer that can undergo an explosive reaction due to contamination or exposure to a thermal or physical shock that causes a severe increase in the burning rate of combustible materials with which it comes into contact. Additionally, the oxidizer causes a severe increase in the burning rate and can cause spontaneous ignition of combustibles.	H271, Category 1; May cause fire or explosion; strong oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.	

Oxidizer	3	An oxidizer that causes a severe increase in the burning rate of combustible materials with which it comes in contact.	H271, Category 1; May cause fire or explosion; strong oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.	
Oxidizer	2	An oxidizer that will cause a moderate increase in the burning rate of combustible materials with which it comes in contact.	H272, Category 2; May intensify fire; oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 2:3 mixture (by mass) of potassium bromate and cellulose and the criteria for Category 1 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:1 mixture (by mass) of calcium peroxide and cellulose and the criteria for Category 1 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 40% aqueous sodium chlorate solution and cellulose and the criteria for Category 1 are not met.	
Oxidizer	1	An oxidizer that does not moderately increase the burning rate of combustible materials.	H272, Category 3; May intensify fire; oxidizer: Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 3:7 mixture (by mass) of potassium bromate and cellulose and the criteria for Categories 1 and 2 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:2 mixture (by mass) of calcium peroxide and cellulose and the criteria for Categories 1 and 2 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 65% aqueous nitric acid solution and cellulose and the criteria for Categories 1 and 2 are not met.	
Oxidizing gas	Gaseous or Liquefied	A gas that can support and accelerate combustion of other materials more than air does.	Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H270, Category 1; May cause or intensify fire; oxidizer: Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. and H280 or H281~~, compressed gas would also apply.~~	
~~Oxidizing gas~~	~~Liquified~~	~~An oxidizing gas that is liquefied [liquefied gases are gases that, in a packaging under the charged pressure, are partially liquid at 68°F (20°C)].~~	~~Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does.~~ ~~H270, Category 1; May cause or intensify fire; oxidizer. Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does.~~ ~~H280, liquefied gas, would also apply.~~	

Pyrophoric	—	A chemical with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	Separate definitions based on physical state; see each category of pyrophoric:	
Pyrophoric	Solid	A solid with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	H250, Category 1; Pyrophoric solid; Catches fire spontaneously if exposed to air. A pyrophoric solid is a solid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The solid ignites within 5 minutes of coming into contact with air.	
Pyrophoric	Liquid	A liquid with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	H250, Category 1; Pyrophoric liquid; Catches fire spontaneously if exposed to air: A pyrophoric liquid is a liquid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The liquid ignites within 5 minutes when added to an inert carrier and exposed to air, or it ignites or chars a filter paper on contact with air within 5 minutes. Testing is performed at 25 ±2°C and 50 ±5% relative humidity.	
Pyrophoric	Gas	A gas with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	H220, Category 1A; Extremely flammable gas. May ignite spontaneously if exposed to air: A pyrophoric gas is a flammable gas that is liable to ignite spontaneously in air at a temperature of 54°C or below. and H280 or H281~~, compressed (or liquefied) gas, would also apply.~~	
Toxic	—	A chemical falling within any of the following categories: 1. A chemical that has a median lethal dose (LD50) of more than 50 mg per kg, but not more than 500 mg per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of more than 200 mg per kg but not more than 1,000 mg per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of more than 200 ppm but not more than 2,000 ppm by volume or less of gas or vapor, or more than 2 mg/l but not more than 20 mg/l of mist, fume or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g	Acute toxicity refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral H301, Category 3; Toxic if swallowed: LD50 > 50 ≤ 300 mg/kg bodyweight H302, Category 4; Harmful if swallowed: LD50 > 300 ≤ 2,000 mg/kg bodyweight Dermal H311, Category 3, Toxic in contact with skin: LD50 > 200 ≤ 1,000 mg/kg bodyweight Inhalation H330, Category 2; Fatal if inhaled: Gases: LC50 > 100 ppm (4 hr) ≈ 200 ppm (1 hr) ≤ 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) Vapours: LC50 > 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) ≤ 2 mg/l (4 hr) ≈ 8 mg/l (1 hr) Dust/mist: LC50 > 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) ≤ 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) H331, Category 3; Toxic if inhaled: Gases: LC50 > 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) ≤ 2,500 ppm (4 hr) ≈ 5,000 ppm (1 hr) Vapours: LC50 > 2 mg/l (4 hr) ≈ 8 mg/l (1 hr) ≤ 10 mg/l (4 hr) ≈ 40 mg/l (1 hr) Dust/mist: LC50 > 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) ≤ 1 mg/l (4 hr) ≈ 4 mg/l (1 hr) H332, Category 4; Harmful if inhaled: Dust/mist: LC50 > 1 mg/l (4 hr) ≈ 4 mg/l (1 hr) ≤ 5 mg/l (4 hr) ≈ 20 mg/l (1 hr)	
Unstable (reactive)	—	A material, other than an explosive, which in the pure state or as commercially produced, will vigorously polymerize, decompose, condense or become self-reactive and undergo other violent chemical changes, including explosion, when exposed to heat, friction or shock, or in the absence of an inhibitor, or in the presence of contaminants, or in contact with incompatible materials. Unstable (reactive) materials are subdivided as follows:	Self-reactive substances or mixtures are thermally unstable liquids or solid substances or mixtures liable to undergo a strongly exothermic decomposition even without participation of oxygen (air). This definition excludes substances and mixtures classified under the GHS as explosives, organic peroxides or as oxidizing. A self-reactive substance or mixture is regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.	
Unstable (reactive)	4	Materials that in themselves are readily capable of detonation or of explosive decomposition or explosive reaction at normal temperatures and pressures. This class includes materials that are sensitive to mechanical or localized thermal shock at normal temperatures and pressures.	H240, Type A; Heating may cause an explosion. Any self-reactive substance or mixture which can detonate or deflagrate rapidly, as packaged, will be defined as self-reactive substance Type A.	
Unstable (reactive)	3	Materials that in themselves are capable of detonation or of explosive decomposition or explosive reaction but which require a strong initiating source or which must be heated under confinement before initiation. This class includes materials that are sensitive to thermal or mechanical shock at the elevated temperatures and pressures.	H241, Type B; Heating may cause a fire or explosion. Any self-reactive substance or mixture possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package will be defined as self-reactive substance Type B.	

Unstable (reactive)	2	Materials that in themselves are normally unstable and readily undergo violent chemical change but do not detonate. This class includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures, and that can undergo violent chemical change at elevated temperatures and pressures.	H242, Type C; Heating may cause a fire. Any self-reactive substance or mixture possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as self-reactive substance Type C. H242, Type D; Heating may cause a fire. Any self-reactive substance or mixture which in laboratory testing: Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as self-reactive substance Type D; Will be defined as self-reactive substance Type D.	
Unstable (reactive)	1	Materials that in themselves are normally stable but which can become unstable at elevated temperatures and pressures.	H242, Type E; Heating may cause a fire. Any self-reactive substance or mixture which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as self-reactive substance Type E. H242, Type F; Heating may cause a fire. Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as self-reactive substance Type F. Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C to 75°C for a 50 kg package), and for liquid mixtures, a diluent having a boiling point greater than or equal to 150°C and used for desensitization will be defined as self-reactive substance Type G. If the mixture is not thermally stable or is a diluent having a boiling point less than 150°C and is used for desensitization, the mixture shall be defined as self-reactive substance Type F.	
Unstable (reactive) gas	Gaseous or Liquefied		A chemically unstable gas is a flammable gas that is able to react explosively even in the absence of air or oxygen. H220, Category 1A, Category A; Extremely flammable gas; May react explosively even in the absence of air. Flammable gases which are chemically unstable at 20°C and a standard pressure of 101.3 kPa. H220, Category 1A, Category B; Extremely flammable gas; May react explosively even in the absence of air at elevated pressure and/or temperature. Flammable gases which are chemically unstable at a temperature greater than 20°C and/or a standard pressure greater than 101.3 kPa. and H280 or H281~~, compressed gas, would also apply.~~	
Water reactive	3	Materials that react explosively with water without requiring heat or confinement.	H260, Category 1; Contact with water releases flammable gases which may ignite spontaneously. Any substance or mixture which reacts vigorously with water at ambient temperatures and demonstrates generally a tendency for the gas produced to ignite spontaneously, or which reacts readily with water at ambient temperatures such that the rate of evolution of flammable gas is equal to or greater than 10 liters per kilogram of substance over any 1 minute. (UN/DOT test methods: Test N.5, Part III, subsection 33.4.1.4)	
Water reactive	2	Materials that react violently with water or have the ability to boil water. Materials that produce flammable, toxic or other hazardous gases, or evolve enough heat to cause autoignition of combustibles upon exposure to water or moisture.	H261, Category 2; Contact with water releases flammable gas. Any substance or mixture which reacts readily with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 20 liters per kilogram of substance per hour, and which does not meet the criteria for Category 1.	
Water reactive	1	Materials that react with water with some release of energy, but not violently.	H261, Category 3; Contact with water releases flammable gas. Any substance or mixture which reacts slowly with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 1 liter per kilogram of substance per hour, and which does not meet the criteria for Categories 1 and 2.	

—

a. The table illustrates that there is not perfect alignment between the IFC and GHS definitions and provides information on similarities and difference between the two classification systems.

Reason:

Fire Code officials must enforce the hazardous materials provisions of the International Fire Code (IFC) and the International Building Code (IBC) to ensure that people and property in our communities are safe. While code officials need to verify and validate the hazards of materials, classifying hazardous materials in accordance with definitions and hazard classes in the I-codes is the responsibility of facility owners which continues to be a challenge. Consequences of missing or incorrect classification include increased fire and life safety risk and can lead to misclassification of an occupancy.

Due to the expansion of international chemical trade, the United Nations (UN) developed a Globally Harmonized System (GHS) of classification of hazardous materials. The GHS is an internationally agreed upon standard of classification and labeling that in most cases utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials. Federal law (29 CFR 1910.1200 (OSHA) and 49 CFR 173.127 (DOT)) mandates that manufacturers selling, producing or transporting chemicals in the United States classify chemicals according to the GHS system and make the information readily available in product Safety Data Sheets (SDSs).

This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code definitions to better align with federal standards for hazardous materials classification. Proper identification of multiple hazards and the degree of hazard are likely outcomes of utilizing the GHS.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This comparison will make compliance more straightforward. In some cases, utilizing GHS definitions may more heavily regulate additional materials for new buildings; conversely, in other cases GHS definitions will result in reduced classification of materials. However, any differences are balanced out by the coordination and ease of enforcement that comes with being aligned with GHS and OSHA. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

Revise as follows:

TABLE E104.2 IFC AND GHS HAZARD DEFINITIONS COMPARISON[a]

IFC MATERIAL	IFC CLASS	IFC DEFINITION	GHS ~~2017 (REV 7)~~ CLASSIFICATION (H-CODE AND CATEGORY); HAZARD STATEMENT; DEFINITION
Aerosol	—	A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level ~~1, Level 2 or Level~~ 3, Level 2, or Level 1.	Any nonrefillable receptacles made of metal, glass or plastics and containing a gas compressed, liquefied or dissolved under pressure, with or without a liquid, paste or powder, and fitted with a release device allowing the contents to be ejected as solid or liquid particles in suspension in a gas, as a foam, paste or powder or in a liquid state or in a gaseous state.
~~Aerosol~~	~~Level 1~~	~~Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).~~	~~H223, Category 3; Pressurized container: May burst if heated.~~ ~~1.~~ ~~Any aerosol that contains ≤ 1% flammable components (by mass) and that has a heat of combustion < 20 kJ/g.~~ ~~2.~~ ~~Any aerosol that contains > 1% (by mass) flammable components or which has a heat of combustion of ≥ 20 kJ/g but which, based on the results of the ignition distance test, the enclosed space ignition test or the aerosol foam flammability test, does not meet the criteria for Category 1 or Category 2.~~
~~Aerosol~~	~~Level 2~~	~~Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).~~	~~H223, Category 2; Flammable aerosol. Pressurized container: May burst if heated.~~ ~~1.~~ ~~Any aerosol that dispenses a spray that, based on the results of the ignition distance test, does not meet the criteria for Category 1, and which has:~~ ~~a.~~ ~~A heat of combustion of ≥ 20 kJ/g.~~ ~~b.~~ ~~A heat of combustion of < 20 kJ/g along with an ignition distance of ≥ 15 cm; or~~ ~~c.~~ ~~A heat of combustion of < 20 kJ/g and an ignition distance of < 15 cm along with either, in the enclosed space ignition test a time:~~ ~~i.~~ ~~A time equivalent of ≤ 300 s/m^3; or~~ ~~ii.~~ ~~A deflagration density of ≤ 300 g/m^3; or~~ ~~2.~~ ~~Any aerosol that dispenses a foam that, based on the results of the aerosol foam flammability test, does not meet the criteria for Category 1, and which has a flame height of ≥ 4 cm and a flame duration of ≥ 2 s.~~

Aerosol	Level 3	An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g).	H222, Category 1; Extremely flammable aerosol. Pressurized container: May burst if heated: 1. Any aerosol that contains ≥ 85% flammable components (by mass) and has a heat of combustion of ≥ 30 kJ/g. 2. Any aerosol that dispenses a spray that, in the ignition distance test, has an ignition distance of ≥ 75 cm. 3. Any aerosol that dispenses a foam that, in the foam flammability test, has: a. A flame height of ≥ 20 cm and a flame duration of ≥ 2 s. b. A flame height of ≥ 4 cm and a flame duration of ≥ 7 s.	

Aerosol	Level 2	An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).	H223, Category 2; Flammable aerosol: 1. Any aerosol that dispenses a spray that, based on the results of the ignition distance test, does not meet the criteria for Category 1, and which has: a. A heat of combustion of ≥ 20 kJ/g. b. A heat of combustion of < 20 kJ/g along with an ignition distance of ≥ 15 cm; or c. A heat of combustion of < 20 kJ/g and an ignition distance of < 15 cm along with either, in the enclosed space ignition test a time: i. A time equivalent of ≤ 300 s/m^3; or ii. A deflagration density of ≤ 300 g/m^3; or 2. Any aerosol that dispenses a foam that, based on the results of the aerosol foam flammability test, does not meet the criteria for Category 1, and which has a flame height of ≥ 4 cm and a flame duration of ≥ 2 s. and H229; Pressurized container: May burst if heated	

Aerosol	Level 1	An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).	H223, Category 3: 1. Any aerosol that contains ≤ 1% flammable components (by mass) and that has a heat of combustion < 20 kJ/g. 2. Any aerosol that contains > 1% (by mass) flammable components or which has a heat of combustion of ≥ 20 kJ/g but which, based on the results of the ignition distance test, the enclosed space ignition test or the aerosol foam flammability test, does not meet the criteria for Category 1 or Category 2. and H229; Pressurized container: May burst if heated	
Combustible liquid	—	A liquid having a closed cup flash point at or above 100°F (38°C). Combustible liquids shall be subdivided as follows:	A flammable liquid means a liquid having a flash point of not more than 93°C.	
Combustible liquid	II	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 3) and having a flashpoint at or above 100°F (38°C). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a closed cup flash point at or above 100°F (38°C) and below 140°F (60°C).	H226, Category 3; Flammable liquid and vapor: Flash point ≥ 23°C and ≤ 60°C	
Combustible liquid	IIIA	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 4). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a closed cup flash point at or above 140°F (60°C) and below 200°F (93°C).	H227, Category 4; Combustible liquid: Flash point > 60°C and ≤ 93°C	
Combustible liquid	IIIB	Liquids having closed cup flash points at or above 200°F (93°C).	N/A	

Compressed gas	—	A material or mixture of materials that: 1. Is a gas at 68°F (20°C) or less at 14.7 psia (101 kPa) of pressure, and 2. Has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa) which is either liquefied, nonliquefied (gaseous) or in solution (dissolved), except those gases that have no other health- or physical-hazard properties are not considered to be compressed until the pressure in the packaging exceeds 41 psia (282 kPa) at 68°F (20°C). COMPRESSED GAS, DISSOLVED. Dissolved compressed gases, or gases in solution, are non-liquefied gases that are dissolved in a solvent. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Dissolved Gas. COMPRESSED GAS, GASEOUS. Gaseous compressed gases are non-liquefied gases, other than those in solution (dissolved), which are in a packaging under the charged pressure and are entirely gaseous at a temperature of 68°F (20°C). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Compressed Gas. COMPRESSED GAS, LIQUEFIED. Liquefied compressed gases are gases that, in a packaging under the charged pressure, are partially liquid at a temperature of 68°F (20°C). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Liquefied Gas. ~~States of compressed gases:~~ ~~1. Nonliquefied compressed gases are gases, other than those in solution, that are in a packaging under the charged pressure and are entirely gaseous at a temperature of 68°F (20°C).~~ ~~2. Liquefied compressed gases are gases that, in a packaging under the charged pressure, are partially liquid at a temperature of 68°F (20°C).~~ ~~3. Compressed gases in solution are nonliquefied gases that are dissolved in a solvent.~~ ~~4. Compressed gas mixtures consist of a mixture of two or more compressed gases contained in a packaging, the hazard properties of which are represented by the properties of the mixture as a whole.~~	Gases under pressure are gases which are contained in a receptacle at a pressure of 200 kPa (gauge) or more at 20°C, or which are liquefied, or liquefied and refrigerated. H280, Compressed gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is entirely gaseous at -50°C (-58°F), including all gases with a critical temperature ≤ -50°C (-58°F). H280, Liquefied gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is partially liquid at temperatures above -50°C (-58°F). H280, Dissolved gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is dissolved in a liquid phase solvent.	
Corrosive	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Skin Corrosion (Category 1A, 1B, or 1C), or Serious Eye Damage (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A chemical that causes visible destruction of, or irreversible alterations in, living tissue by chemical action at the point of contact. A chemical shall be considered corrosive if, when tested on the intact skin of albino rabbits by the method described in DOTn 49 CFR 173.137, such chemical destroys or changes irreversibly the structure of the tissue at the point of contact following an exposure period of 4 hours. This term does not refer to action on inanimate surfaces.	H314, Category 1 (1A, 1B, 1C); Causes severe skin burns and eye damage. Skin corrosion refers to the production of irreversible damage to the skin; namely, visible necrosis through the epidermis and into the dermis occurring after exposure to a substance or mixture.	
Cryogenic fluid	—	A fluid having a boiling point lower than -130°F (-89.9°C) at 14.7 pounds per square inch atmosphere (psia) (an absolute pressure of 101.3 kPa). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), Cryogenic Fluids are categorized as a Gas Under Pressure – Refrigerated Liquefied Gas. However, not all GHS Refrigerated Liquefied Gases are Cryogenic Fluids.	H281, Refrigerated liquefied gas; Contains refrigerated gas: May cause cryogenic burns or injury. A gas which is made partially liquid because of its low temperature.	
Cryogenic fluid~~,~~ flammable	—	A cryogenic fluid that is a *flammable gas* in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Flammable Gas, Category 1A or Category 1B and Gases Under Pressure - Refrigerated Liquefied Gas. ~~A cryogenic fluid that is flammable in its vapor state.~~	H220, Category 1A; Extremely flammable gas. Gases, which at 20°C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points, regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases~~.~~ H281, refrigerated liquefied gas, would also apply	

Cryogenic fluid, ~~—~~Inert	—	A cryogenic fluid that is an *inert* gas in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Gases Under Pressure - Refrigerated Liquefied Gas.	H281, Refrigerated liquefied gas. Contains refrigerated gas: May cause cryogenic burns or injury. A gas which is made partially liquid because of its low temperature.	
Cryogenic fluid, ~~—~~ Oxidizing	—	~~An oxidizing gas in the cryogenic state.~~A cryogenic fluid that is an *oxidizing gas* in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Oxidizing Gas, Category 1 and Gases Under Pressure - Refrigerated Liquefied Gas.	H270, Category 1: May cause or intensify fire; oxidizer. Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H281, refrigerated liquefied gas, would also apply.	
Explosives	—	A chemical compound, mixture or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to, dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord and igniters. The term "Explosive" includes any material determined to be within the scope of USC Title 18: Ch. 40 and also includes any material classified as an explosive other than consumer fireworks, Division 1.4G Explosives, by the hazardous materials regulations of DOTn 49 CFR Parts 100–185.	An explosive substance (or mixture) is a solid or liquid substance (or mixture of substances) which is in itself capable by chemical reaction of producing gas at such a temperature and pressure and at such a speed as to cause damage to the surroundings. Pyrotechnic substances are included even when they do not evolve gases.	
Explosives	Unstable explosives		H200; Unstable explosive. Unstable explosives are those which are thermally unstable and/or too sensitive for normal handling, transport and use. Special precautions are necessary.	
Explosives	Division 1.1	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.1). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a mass explosion hazard. A mass explosion is one which affects almost the entire load instantaneously.	H201; Explosive; mass explosion hazard. Substances, mixtures and articles which have a mass explosion hazard (a mass explosion is one which affects almost the entire quantity present virtually instantaneously).	
Explosives	Division 1.2	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.2). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a projection hazard but not a mass explosion hazard.	H202; Explosive; severe projection hazard. Substances, mixtures and articles which have a projection hazard but not a mass explosion hazard.	
Explosives	Division 1.3	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.3). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard.	H203; Explosive; fire, blast or projection hazard. Substances, mixtures and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard: 1. Combustion of which gives rise to considerable radiant heat; or 2. Which burn one after another, producing minor blast or projection effects or both.	
Explosives	Division 1.4	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.4). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that pose a minor explosion hazard. The explosive effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire must not cause virtually instantaneous explosion of almost the entire contents of the package.	H204; Fire or projection hazard: Substances, mixtures and articles which present no significant hazard; substances, mixtures and articles which present only a small hazard in the event of ignition or initiation. The effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire shall not cause virtually instantaneous explosion of almost the entire contents of the package.	
Explosives	Division 1.4G	Small fireworks devices containing restricted amounts of pyrotechnic composition designed primarily to produce visual or audible effects by combustion or deflagration that complies with the construction, chemical composition and labeling regulations of the DOTn for fireworks, UN No. 0336 and the US Consumer Product Safety Commission as set forth in CPSC 16 CFR Parts 1500 and 1507.	N/A	
Explosives	Division 1.5	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.5). Where the GHS category is not known, the following is acceptable for classification purposes: Very insensitive explosives. This division is comprised of substances that have a mass explosion hazard but which are so insensitive that there is very little probability of initiation or of transition from burning to detonation under normal conditions of transport.	H205; May mass explode in fire. Very insensitive substances or mixtures which have a mass explosion hazard: substances and mixtures which have a mass explosion hazard but are so insensitive that there is very little probability or initiation or of transition from burning to detonation under normal conditions.	
Explosives	Division 1.6	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.6). Where the GHS category is not known, the following is acceptable for classification purposes: Extremely insensitive articles that do not have a mass explosion hazard. This division is comprised of articles that contain only extremely insensitive detonating substances and that demonstrate a negligible probability of accidental initiation or propagation.	Extremely insensitive articles which do not have a mass explosion hazard: articles which predominantly contain extremely insensitive substances or mixtures and which demonstrate a negligible probability of accidental initiation or propagation.	

Flammable gas	Gaseous or Liquefied	A material that is a gas at 68°F (20°C) or less at 14.7 psia (101 kPa) of pressure [a material that has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa)] subdivided as follows: ~~which:~~ 1. Category 1A. a gas that meets either of the following: 1.1 ~~A gas that is~~ Ignitable at 14.7 psia (101 kPa) when in a mixture of 13% or less by volume with air; or ~~2.~~ 1.2 ~~Has a~~A flammable range at 14.7 psia (101 kPa) with air of not less than 12%, regardless of the lower limit, unless data shows compliance with Category 1B. 2. Category 1B. A gas that meets the flammability criteria for Category 1A, is not pyrophoric or chemically unstable, and meets one of more of the following: 2.1. A lower flammability limit of more than 6 percent by volume of air. 2.2. A fundamental burning velocity of less than 3.9 inches/second (99 mm/s). The limits specified shall be determined at 14.7 psia (101 kPa) of pressure and a temperature of 68°F (20°C) in accordance with ASTM E681.Where not otherwise specified, the term "flammable gas" includes both Categories 1A and 1B. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), Flammable Gases are categorized as a Flammable Gas (Category 1A or 1B).	A flammable gas is a gas having a flammable range with air at 20°C and a standard pressure of 101.3 kPa. H220, Category 1A; Extremely flammable gas. Gases, which at 20°C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases. H220, Category 1B; Flammable gas. Gases which meet the flammability criteria for Category 1A, but which are not pyrophoric nor chemically unstable, and which have at least either: 1. A lower flammability limit of more than 6% by volume in air; or 2. A fundamental burning velocity of less than 10 cm/s. ~~H280, compressed gas, would also apply.~~	
Flammable liquid	—	A liquid having a closed cup flash point below 100°F (38°C). Flammable liquids are further categorized into a group known as Class I liquids. The Class I category is subdivided as follows:	A liquid having a flash point of not more than 93°C. A flammable liquid is classified in one of the four categories for this class.	
Flammable liquid	IA	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point below 73°F (23°C) and having a boiling point below 100°F (38°C).	H224, Category 1; Extremely flammable liquid and vapor. Flash point < 23°C and initial boiling point ≤ 35°C	
Flammable liquid	IB	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point below 73°F (23°C) and having a boiling point at or above 100°F (38°C).	H225, Category 2; Highly flammable liquid and vapor. Flash point < 23°C and initial boiling point > 35°C	
Flammable liquid	IC	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 3) and having a flashpoint below 100°F (38°C). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point at or above 73°F (23°C) and below 100°F (38°C).	H226, Category 3; Flammable liquid and vapor. Flash point ≥ 23°C and ≤ 60°C	
Flammable solid	—	A solid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Solid (Category 1 or 2). Where the GHS category is not known, the following is acceptable for classification purposes: A solid, other than a blasting agent or explosive, that is capable of causing fire through friction, absorption of moisture, spontaneous chemical change or retaining heat from manufacturing or processing, or which has an ignition temperature below 212°F (100°C) or which burns so vigorously and persistently when ignited as to create a serious hazard. A chemical shall be considered a flammable solid, as determined in accordance with the test method of CPSC 16 CFR Part 1500.44, if it ignites and burns with a self-sustained flame at a rate greater than 0.0866 inch (2.2 mm) per second along its major axis.	A flammable solid is a solid which is readily combustible, or may cause or contribute to fire through friction. A flammable solid is classified in one of the two categories for this class using method N.1 as described in Part III, subsection 33.2.1 of the Manual of Tests and Criteria, according to: H228, Category 1; Flammable solid: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone does not stop fire; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time ≤ 5 min H228, Category 2; Flammable solid: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone stops the fire for at least 4 min; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time > 5 min and ≤ 10 min	

Highly toxic	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 1 or 2, Dermal Category 1 or 2, Inhalation Gases Category 1, Inhalation Vapors Category 1, or Inhalation Dusts and Mists Category 1 or 2. Where the GHS category is not known, one of the following is acceptable for classification purposes: ~~A material that produces a lethal dose or lethal concentration that falls within any of the following categories:~~ 1. A chemical that has a median lethal dose (LD50) of 50 mg or less per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of 200 mg or less per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of 200 ppm by volume or less of gas or vapor, or 2 mg/l or less of mist~~, fume~~ or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g.	Acute toxicity refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral H300, Category 1; Fatal if swallowed: LD50 ≤ 5 mg/kg bodyweight H300, Category 2; Fatal if swallowed: LD50 > 5 ≤ 50 mg/kg bodyweight Dermal H310, Category 1; Fatal in contact with skin: LD50 ≤ 50 mg/kg bodyweight H310, Category 2; Fatal in contact with skin: LD50 > 50 ≤ 200 mg/kg bodyweight Inhalation H330, Category 1; Fatal if inhaled. Gases: LC50 ≤ 100 ppm (4 hr) ≈ 200 ppm (1 hr) Vapors: LC50 ≤ 0.5 mg/l (4 hr) ≈ ~~2~~1 mg/l (1 hr) Dust/mist: LC50 ≤ 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr)	
Inert compressed gas	—	A compressed gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert compressed gases do not exhibit either physical or health hazard properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a compressed gas. Some of the more common inert compressed gases include argon, helium, krypton, neon, nitrogen and xenon.	Gases under pressure are gases which are contained in receptacles at a pressure of 200 kPa (gauge) or more at 20° C or which are liquefied or liquefied and refrigerated. They comprise compressed gases, liquefied gases, dissolved gases and refrigerated liquefied gases. See the description of "Compressed gas."	
Organic peroxide	—	Liquid or solid ~~An~~ organic substances ~~compound~~ that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by ~~an~~ organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides ~~can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time.~~ are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties: a. be liable to explosive decomposition; b. burn rapidly; c. be sensitive to impact or friction; d. react dangerously with other substances.	Organic peroxides are liquid or solid organic substances which contain the bivalent -O-O- structure and may be considered derivatives of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties: 1. Be liable to explosive decomposition. 2. Burn rapidly. 3. Be sensitive to impact or friction. 4. React dangerously with other substances.	
Organic peroxide	UD	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type A). Type A Organic Peroxides are forbidden in transportation. Where the GHS Category is not known, the following is acceptable for classification purposes: Organic peroxides that are capable of *detonation*. These peroxides pose an extremely high-explosion hazard through rapid explosive decomposition.	H240, Organic peroxide, Type A; Heating may cause an explosion. Any organic peroxide which, as packaged, can detonate or deflagrate rapidly will be defined as organic peroxide Type A.	
Organic peroxide	I	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type B). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that are capable of *deflagration* but not *detonation*.	H241, Organic peroxide, Type B; Heating may cause a fire or explosion. Any organic peroxide possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly but is liable to undergo a thermal explosion in that package will be defined as organic peroxide Type B.	

Organic peroxide	II	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type C) or (Type D). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn very rapidly and that pose a moderate reactivity hazard.	H242, Organic peroxide, Type C; Heating may cause a fire. Any organic peroxide possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as organic peroxide Type C. H242, Organic peroxide, Type D; Heating may cause a fire. Any organic peroxide which in laboratory testing: Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as organic peroxide Type D.	
Organic peroxide	III	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type E). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn rapidly and that pose a moderate reactivity hazard.	H242, Organic peroxide, Type E; Heating may cause a fire. Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide Type E.	
Organic peroxide	IV	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type F). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard.	H242, Organic peroxide, Type F; Heating may cause a fire. Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as organic peroxide Type F.	
Organic peroxide	V	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type G). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard.	Organic peroxide, Type G. Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C or higher for a 50 kg package), and for liquid mixtures, a diluent having a boiling point of not less than 150°C and used for desensitization will be defined as organic peroxide Type G. If the organic peroxide is not thermally stable or is a diluent having a boiling point less than 150°C and is used for desensitization, it shall be defined as organic peroxide Type F.	
Oxidizer	—	A material that readily yields oxygen or other oxidizing gas, or that readily reacts to promote or initiate combustion of combustible materials and, if heated or contaminated, can result in vigorous self-sustained decomposition.	An oxidizing solid is a solid which, while in itself is not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material. An oxidizing liquid is a liquid which, while in itself not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material.	
Oxidizer	4	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 1) or Oxidizing Liquids (Category 1) and which have evidence of explosive properties or are packaged for transport in Packing Group I. Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that can undergo an explosive reaction due to contamination or exposure to a thermal or physical shock that causes a severe increase in the burning rate of combustible materials with which it comes into contact. Additionally, the oxidizer causes a severe increase in the burning rate and can cause spontaneous ignition of combustibles.	H271, Category 1; May cause fire or explosion; strong oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.	

Oxidizer	3	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 1) or Oxidizing Liquids (Category 1) and is not otherwise classified as Class 4. Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that causes a severe increase in the burning rate of combustible materials with which it comes in contact.	H271, Category 1; May cause fire or explosion; strong oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.	
Oxidizer	2	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 2) or Oxidizing Liquids (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that will cause a moderate increase in the burning rate of combustible materials with which it comes in contact.	H272, Category 2; May intensify fire; oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 2:3 mixture (by mass) of potassium bromate and cellulose and the criteria for Category 1 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:1 mixture (by mass) of calcium peroxide and cellulose and the criteria for Category 1 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 40% aqueous sodium chlorate solution and cellulose and the criteria for Category 1 are not met.	
Oxidizer	1	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 3) or Oxidizing Liquids (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that does not moderately increase the burning rate of combustible materials.	H272, Category 3; May intensify fire; oxidizer: Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 3:7 mixture (by mass) of potassium bromate and cellulose and the criteria for Categories 1 and 2 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:2 mixture (by mass) of calcium peroxide and cellulose and the criteria for Categories 1 and 2 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 65% aqueous nitric acid solution and cellulose and the criteria for Categories 1 and 2 are not met.	
Oxidizing gas	Gaseous or Liquefied	A compressed gas that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Oxidizing Gas, Category 1. Where the GHS category is not known, the following is acceptable for classification purposes: A gas that can support and accelerate combustion of other materials more than air does.	Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H270, Category 1; May cause or intensify fire; oxidizer: Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. ~~H280, compressed gas would also apply.~~	

Oxidizing gas	Liquified	An oxidizing gas that is liquefied [liquefied gases are gases that, in a packaging under the charged pressure, are partially liquid at 68° F (20° C)].	Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H270, Category 1; May cause or intensify fire; oxidizer. Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H280, liquefied gas, would also apply.	
Pyrophoric	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A chemical with an autoignition temperature in air, at or below a temperature of 130° F (54° C).	Separate definitions based on physical state; see each category of pyrophoric:	
Pyrophoric	Solid	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A solid with an autoignition temperature in air, at or below a temperature of 130° F (54° C).	H250, Category 1; Pyrophoric solid; Catches fire spontaneously if exposed to air. A pyrophoric solid is a solid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The solid ignites within 5 minutes of coming into contact with air.	
Pyrophoric	Liquid	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A liquid with an autoignition temperature in air, at or below a temperature of 130° F (54° C).	H250, Category 1; Pyrophoric liquid; Catches fire spontaneously if exposed to air: A pyrophoric liquid is a liquid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The liquid ignites within 5 minutes when added to an inert carrier and exposed to air, or it ignites or chars a filter paper on contact with air within 5 minutes. Testing is performed at 25 ±2° C and 50 ±5% relative humidity.	
Pyrophoric	Gas	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A gas with an autoignition temperature in air, at or below a temperature of 130° F (54° C).	H220, Category 1A~~; Extremely flammable~~, Pyrophoric gas. ~~May ignite spontaneously if exposed to air:~~ A pyrophoric gas is a flammable gas that is liable to ignite spontaneously in air at a temperature of 54° C or below. and H232; May ignite spontaneously if exposed to air ~~H280, compressed (or liquefied) gas, would also apply.~~	
Toxic	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 3 or 4, Dermal Category 3, Inhalation Gases Category 2 or 3, Inhalation Vapors Category 2 or 3, or Inhalation Dusts and Mists Category 3 or 4. Where the GHS category is not known, one of the following is acceptable for classification purposes: ~~A chemical falling within any of the following categories:~~ 1. A chemical that has a median lethal dose (LD50) of more than 50 mg per kg, but not more than 500 mg per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of more than 200 mg per kg but not more than 1,000 mg per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of more than 200 ppm but not more than 2,000 ppm by volume or less of gas or vapor, or more than 2 mg/l but not more than 20 mg/l of mist~~, fume~~ or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g	Acute toxicity refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral H301, Category 3; Toxic if swallowed: LD50 > 50 ≤ 300 mg/kg bodyweight H302, Category 4; Harmful if swallowed: LD50 > 300 ≤ 2,000 mg/kg bodyweight Dermal H311, Category 3, Toxic in contact with skin: LD50 > 200 ≤ 1,000 mg/kg bodyweight Inhalation H330, Category 2; Fatal if inhaled: Gases: LC50 > 100 ppm (4 hr) ≈ 200 ppm (1 hr) ≤ 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) Vapours: LC50 > 0.5 mg/l (4 hr) ≈ ~~2~~1 mg/l (1 hr) ≤ 2 mg/l (4 hr) ≈ ~~8~~4 mg/l (1 hr) Dust/mist: LC50 > 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) ≤ 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) H331, Category 3; Toxic if inhaled: Gases: LC50 > 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) ≤ 2,500 ppm (4 hr) ≈ 5,000 ppm (1 hr) Vapours: LC50 > 2 mg/l (4 hr) ≈ ~~8~~4 mg/l (1 hr) ≤ 10 mg/l (4 hr) ≈ ~~4~~20 mg/l (1 hr) Dust/mist: LC50 > 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) ≤ 1 mg/l (4 hr) ≈ 4 mg/l (1 hr)	

Unstable (reactive)	—	A material, other than an explosive, which in the pure state or as commercially produced, will vigorously polymerize, decompose, condense or become self-reactive and undergo other violent chemical changes, including explosion, when exposed to heat, friction or shock, or in the absence of an inhibitor~~, or in the presence of contaminants, or in contact with incompatible materials.~~ Unstable (reactive) materials are subdivided as follows:	Self-reactive substances or mixtures are thermally unstable liquids or solid substances or mixtures liable to undergo a strongly exothermic decomposition even without participation of oxygen (air). This definition excludes substances and mixtures classified under the GHS as explosives, organic peroxides or as oxidizing. A self-reactive substance or mixture is regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.	
Unstable (reactive)	4	Materials that in themselves are readily capable of detonation or of explosive decomposition or explosive reaction at normal temperatures and pressures. This class includes materials that are sensitive to mechanical or localized thermal shock at normal temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category A) and can include compressed gases categorized as Chemically Unstable (Type A).	H240, Type A; Heating may cause an explosion. Any self-reactive substance or mixture which can detonate or deflagrate rapidly, as packaged, will be defined as self-reactive substance Type A.	
Unstable (reactive)	3	Materials that in themselves are capable of detonation or of explosive decomposition or explosive reaction but which require a strong initiating source or which must be heated under confinement before initiation. This class includes materials that are sensitive to thermal or mechanical shock at the elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category B) and can include compressed gases categorized as Chemically Unstable (Type B).	H241, Type B; Heating may cause a fire or explosion. Any self-reactive substance or mixture possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package will be defined as self-reactive substance Type B.	
Unstable (reactive)	2	Materials that in themselves are normally unstable and readily undergo violent chemical change but do not detonate. This class includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures, and that can undergo violent chemical change at elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category C or D).	H242, Type C; Heating may cause a fire. Any self-reactive substance or mixture possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as self-reactive substance Type C. H242, Type D; Heating may cause a fire. Any self-reactive substance or mixture which in laboratory testing: Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as self-reactive substance Type D; Will be defined as self-reactive substance Type D.	
Unstable (reactive)	1	Materials that in themselves are normally stable but which can become unstable at elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category E or F).	H242, Type E; Heating may cause a fire. Any self-reactive substance or mixture which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as self-reactive substance Type E. H242, Type F; Heating may cause a fire. Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as self-reactive substance Type F. Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60° C to 75° C for a 50 kg package), and for liquid mixtures, a diluent having a boiling point greater than or equal to 150° C and used for desensitization will be defined as self-reactive substance Type G. If the mixture is not thermally stable or is a diluent having a boiling point less than 150° C and is used for desensitization, the mixture shall be defined as self-reactive substance Type F.	

Unstable (reactive) gas	Gaseous		A chemically unstable gas is a flammable gas that is able to react explosively even in the absence of air or oxygen. H220, Category 1A, Chemically Unstable, Category A; Extremely flammable gas~~; May react explosively even in the absence of air.~~: Flammable gases which are chemically unstable at 20° C and a standard pressure of 101.3 kPa. and H230: May react explosively even in the absence of air or H220, Category 1A, Chemically Unstable, Category B; Extremely flammable gas~~; May react explosively even in the absence of air at elevated pressure and/or temperature.~~: Flammable gases which are chemically unstable at a temperature greater than 20° C and/or a standard pressure greater than 101.3 kPa. and H231: May react explosively even in the absence of air at elevated pressure and/or temperature ~~H280, compressed gas, would also apply.~~	
Water reactive	3	Materials that react explosively with water without requiring heat or confinement. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 1).	H260, Category 1; Contact with water releases flammable gases which may ignite spontaneously. Any substance or mixture which reacts vigorously with water at ambient temperatures and demonstrates generally a tendency for the gas produced to ignite spontaneously, or which reacts readily with water at ambient temperatures such that the rate of evolution of flammable gas is equal to or greater than 10 liters per kilogram of substance over any 1 minute. (UN/DOT test methods: Test N.5, Part III, subsection 33.4.1.4)	
Water reactive	2	Materials that react violently with water or have the ability to boil water. Materials that produce flammable, toxic or other hazardous gases, or evolve enough heat to cause autoignition of combustibles upon exposure to water or moisture. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 2).	H261, Category 2; Contact with water releases flammable gas. Any substance or mixture which reacts readily with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 20 liters per kilogram of substance per hour, and which does not meet the criteria for Category 1.	
Water reactive	1	Materials that react with water with some release of energy, but not violently. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 3).	H261, Category 3; Contact with water releases flammable gas. Any substance or mixture which reacts slowly with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 1 liter per kilogram of substance per hour, and which does not meet the criteria for Categories 1 and 2.	

—

a. The table illustrates that there is not perfect alignment between the IFC and GHS definitions and provides information on similarities and difference between the two classification systems.

E104.2 GHS hazardous materials definitions comparison table.

Table E104.2 provides a tabular presentation of the various definitions published within the *International Fire Code*. In addition, the table presents corresponding definitions, where available, from the ~~2012 edition of~~ DOL 29 CFR 1910.1200 along with applicable hazard statement codes. DOL 29 CFR 1910.1200 aligns with the UN's *Globally Harmonized System of Classification and Labelling of Chemicals (GHS)*. The table is not meant to imply perfect alignment between IFC and GHS definitions.

E104.1 Hazardous materials definitions.

The categorization and classification of hazardous materials enables the code user to determine the applicability of requirements based on hazard category and class related to the physical and health hazards of materials. The ~~current~~ definitions found in Chapter 2 have been developed using criteria found in NFPA codes and standards, model fire prevention codes, NIOSH, and requirements of the US Department of Transportation (DOTn 49 CFR) and US Department of Labor (DOL 49 CFR 1910).

The chemical industry has grown substantially since the inception of the IFC hazard definitions. Large-scale global production and distribution of common and specialty chemicals has become mainstream. In the 1990s, the United Nations (UN) developed the *Globally Harmonized System of Classification and Labelling of Chemicals (GHS)* to create international congruency among chemical suppliers.

The GHS is an internationally agreed upon standard of classification and labeling that utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials.

The DOL ~~published a~~ revised the *Hazard Communication Standard*(DOL 29 CFR 1910.1200) to align with the GHS ~~in March 2012. It became effective in May 2012.~~ All manufacturers selling, producing or transporting chemicals in the United States are ~~now~~ required to comply with the GHS and provide ~~this~~ standardized hazard information on all Safety Data Sheets (SDS).

SDS are a primary source of information for identifying hazards for chemicals and mixtures containing hazardous materials. It can be helpful for fire code officials to become familiar with the GHS definitions and how they relate to IFC hazard definitions.

Reason:

Fire Code officials must enforce the hazardous materials provisions of the International Fire Code (IFC) and the International Building Code (IBC) to ensure that people and property in our communities are safe. While code officials need to verify and validate the hazards of materials, classifying hazardous materials in accordance with definitions and hazard classes in the I-codes is the responsibility of facility owners which continues to be a challenge. Consequences of missing or incorrect classification include increased fire and life safety risk and can lead to misclassification of an occupancy.

Due to the expansion of international chemical trade, the United Nations (UN) developed a Globally Harmonized System (GHS) of classification of hazardous materials. The GHS is an internationally agreed upon standard of classification and labeling that in most cases utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials. Federal law (29 CFR 1910.1200 (OSHA) and 49 CFR 173.127 (DOT)) mandates that manufacturers selling, producing or transporting chemicals in the United States classify chemicals according to the GHS system and make the information readily available in product Safety Data Sheets (SDSs).

This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code definitions to better align with federal standards for hazardous materials classification. Proper identification of multiple hazards and the degree of hazard are likely outcomes of utilizing the GHS.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This comparison will make compliance more straightforward. In some cases, utilizing GHS definitions may more heavily regulate additional materials for new buildings; conversely, in other cases GHS definitions will result in reduced classification of materials. However, any differences are balanced out by the coordination and ease of enforcement that comes with being aligned with GHS and OSHA. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

Proponents: Mark Fessenden, Johnson Controls, Firefighter Air Coalition

2024 International Fire Code

Revise as follows:

L101.1 Scope.
Firefighter air replenishment systems (FARS) shall be provided in accordance with this appendix. The adopting ordinance shall specify building characteristics or special hazards that establish thresholds triggering a requirement for the installation of a FARS. The requirement shall be based on the fire department's capability of replenishing firefighter breathing air during sustained emergency operations. Considerations shall include:

1. Building characteristics, such as number of stories above or below *grade plane*, floor area, type of construction and fire-resistance of the primary structural *frame* to allow sustained firefighting operations based on a rating of not less than 2 hours.
2. Special hazards, other than buildings, that require unique accommodations to allow the fire department to replenish firefighter breathing air.
3. Fire department staffing level.
4. Availability of a fire department ~~breathing replenishment vehicle~~mobile air unit.

Add new text as follows:

L101.2 Where required. A fire fighter air replenishment systems (FARS) shall be installed in the following buildings:

1. High-rise buildings where the floor of an occupiable story is greater than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.
2. Underground structures that are three or more floors below grade with an area greater than 20 000 square feet (1858 m2).
3. Large area structures with an area greater than 200 000 square feet (18 580 m2) and where the travel distance from the building centerline to the closest exit is greater than 500 feet (152 m), such as warehouses, manufacturing complexes, malls, or convention centers.
4. Underground transportation or pedestrian tunnels exceeding 500 feet (152 m) in length.

L102.1 Definitions. For the purpose of this appendix, certain terms are defined as follows:

Add new definition as follows:

EXTERIOR MOBILE BREATHING AIR FILL CONNECTION. A permanently installed external connection where a mobile air unit can supply the FARS breathing air standpipe.

FIREFIGHTER AIR REPLENISHMENT SYSTEM (FARS). A permanently installed arrangement of piping, valves, fittings and equipment to facilitate the replenishment of breathing air in self-contained breathing apparatus (SCBA) for firefighters engaged in emergency operations.

Add new definition as follows:

INTERIOR CYLINDER FILL PANELS. Lockable interior panels that provide firefighters the ability to regulate breathing air pressure and refill self-contained breathing apparatus (SCBA) cylinders.

INTERIOR CYLINDER FILL STATIONS AND ENCLOSURES. Freestanding fill containment stations that provide firefighters the ability to regulate breathing air pressure and refill self-contained breathing apparatus (SCBA) cylinders.

SELF-CONTAINED BREATHING APPARATUS (SCBA). An atmosphere-supplying respirator that supplies a respirable air atmosphere to the user from a breathing air source that is independent of the ambient environment and designed to be carried by the user.

Revise as follows:

L104.5 Breathing air supply.
~~Where a fire department mobile air unit is available, the~~The FARS breathing air standpipe shall be supplied by an external mobile breathing air fill connection in accordance with Section L104.14. Where a fire department mobile air unit is not available, a stored pressure air supply shall be provided in accordance with Section L104.5.1. A stored pressure air supply shall be permitted to be added to a system supplied by an external mobile breathing air fill connection provided that a means to bypass the stored pressure air supply is located at the external mobile breathing air fill connection.

L104.5.1 Stored pressure air supply.
A stored pressure air supply shall be designed based on Chapter 24 of NFPA 1901 except that provisions applicable only to mobile apparatus or not applicable to system design shall not apply. A stored pressure air supply shall be capable of refilling not less than 50 empty 45 cu ft.(1274 L) breathing air cylinders~~ of a size and pressure used by the fire department~~.

L104.5.2 Retrofit of external mobile breathing air fill connection. A FARS not initially provided with an external mobile breathing air fill connection due to the lack of a mobile air unit shall be retrofitted with an external mobile breathing air fill connection where a mobile air unit becomes available. Where an external mobile breathing air fill connection is provided, a means to bypass the stored pressure air supply shall be located at the external mobile breathing air fill connection. The retrofit shall be completed not more than 12 months after notification by the *fire code official*.

L104.7 Pressure relief valve.
~~Pressure relief valves shall be installed at each point of supply and at the top or end of every riser. The relief valve shall meet the requirements of CGA S-1.3 and shall not be field adjustable. Pressure relief valves shall discharge in a manner that does not endanger personnel who are in the area. Valves, plugs or caps shall not be installed in the discharge of a pressure relief valve. Where discharge piping is used the end shall not be threaded.~~Pressure-relief valves shall be installed downstream of the pressure regulator inlet. The relief valve shall meet the requirements of CGA S-1.3 and shall not be field adjustable. The relief valve shall have a set-to-open pressure not exceeding 1.1 times the design pressure of the system. Pressure-relief valve discharge shall terminate so that the exhaust air stream cannot impinge upon personnel in the area. Valves, plugs, or caps shall not be installed in the discharge of a pressure-relief valve. Where discharge piping is used, the end shall not be threaded.

L104.13 Fill ~~stations~~panels.
Firefighter air replenishment fill ~~stations~~panels shall comply with Section L104.13.1 through L104.13.3.

L104.13.1 Location. Interior cylinder fill panels ~~Fill stations~~ for refilling breathing air cylinders shall be located as follows:

1. In high-rise buildings an interior cylinder fill panel or station shall be installed commencing on the third floor and every third floor thereafter above grade.
2. Underground floors in buildings with more than five underground floors, an interior cylinder fill panel or station shall be installed commencing on the third floor below grade and every three floors below grade thereafter, except for the bottom-most floor.
3. In large area structures the specific location or locations on each floor shall be approved by the *fire code official*.

~~1. Fill stations shall be provided at the fifth floor above and below the ground level floor and every third floor level thereafter.~~

~~2. On floor levels requiring fill stations, one fill station shall be provided adjacent to a required exit stair at a location designated by the *fire code official*. In buildings required to have three or more exit stairs, additional fill stations shall be provided at a ratio of one fill station for every three *stairways*.~~

L104.13.2 Design. Fill ~~stations~~panels for breathing air cylinders shall be designed to meet the following requirements:

1. A pressure gauge and pressure-regulating devices and controls shall be provided to allow the operator to control the fill pressure and fill rate on each cylinder fill hose.
2. Valves controlling cylinder fill hoses shall be slow-operating valves.
3. A separate flow restriction device shall be provided on each fill hose.
4. A method shall be provided to bleed each cylinder fill hose.
5. The <u>interior cylinder</u> fill ~~station~~ <u>stations and enclosures</u> shall be designed to provide a containment area that fully encloses any cylinder being filled and flexible cylinder fill hoses, and directs the energy from a failure away from personnel. Fill stations shall be designed to prohibit filling of cylinders that are not enclosed within the containment area.

   Exception: Where required or *approved* by the <u>*fire code official* in consultation with the</u> *fire chief*, fill ~~stations~~ <u>panels</u> providing for the direct refilling of the firefighters' breathing air cylinders using Rapid Intervention Crew/Company Universal Air Connection (RIC/UAC) fittings shall be used in lieu of cylinder fill ~~stations~~<u>panels</u> that utilize containment areas.

L104.14 External mobile <u>breathing</u> air <u>fill</u> connection.
An external mobile <u>breathing</u> air <u>fill</u> connection shall be provided for fire department mobile air ~~apparatus~~<u>units</u> where required by Section L104.5 to supply the system with breathing air.

L104.14.1 Location. The location of the external mobile <u>breathing</u> air <u>fill</u> connection shall have access for mobile air ~~apparatus~~<u>units</u> and *approved* by the *fire code official*.

L105.1 Acceptance tests.
Upon completion of the installation, a FARS shall be acceptance tested to verify compliance with equipment manufacturers' instructions and design documents. Oversight of the acceptance tests shall be provided by a *registered design professional*. Acceptance testing shall include all of the following:

1. A pneumatic test in accordance with ASME B31.3 of the complete system at a minimum test pressure of 110 percent of the system design pressure using oil free dry air, nitrogen or argon shall be conducted. Test pressure shall be maintained for not less than 24 hours. During this test, all fittings, joints and system components shall be inspected for leaks. Defects in the system or leaks detected shall be documented and repaired.
2. A cylinder-filling performance test shall be conducted to verify compliance with the required breathing air cylinder refill rate from the exterior mobile air connection and, where provided, a stored air pressure supply system.
3. The air quality monitoring system shall be tested to verify both of the following conditions:
   3.1. Visual indicators required by Section L104.15.1 function properly.
   3.2. Supervisory signals are transmitted as required by Section L104.15.2 for each sensor based on a sensor function test.
4. Connections intended for fire department use shall be confirmed as compatible with the fire department's mobile air unit, SCBA cylinders and, where provided, RIC/UAC connections.
5. Air samples shall be taken from not less than two fill ~~stations~~<u>panels</u> and submitted to an *approved* gas analysis laboratory to verify compliance with NFPA 1989. The FARS shall not be placed into service until a written report verifying compliance with NFPA 1989 has been provided to the *fire code official*.

Reason: The attached revisions to Appendix L create consistency in the in the guidance provided in the appendix, NFPA 1 Appendix D, and the UPC Appendix F. the changes include guidance on thresholds for NFPA 1 and the UPC, consistency in definitions, guidance on cascade system volume where provided, and consistency in relief valve use.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes are being made to an optional adoptable appendix.

F279-24

~~APPENDIX N INDOOR TRADE SHOWS AND EXHIBITIONS~~

~~SECTION N101~~
~~GENERAL~~

~~**N101.1 Scope.**~~
~~Indoor trade shows and exhibitions with temporary vendor displays or booths within any indoor occupancy classification shall be in accordance with this appendix and all other applicable requirements of this code.~~
~~Compliance with this appendix is not required where Section N101.1.1 or N101.1.2 is applicable.~~

~~**N101.1.1 Nonsprinklered buildings.**~~
~~In a building that is not equipped throughout with an *automatic sprinkler system*, the aggregate exhibit area must be less than 1,500 square feet (139 m^2) of floor area and meet both of the following conditions:~~

1. ~~The exhibit area does not include any covered or multiple-level exhibits or booths.~~
2. ~~Not fewer than two remote *exits* or *exit access* doors in compliance with Chapter 10 are provided.~~

~~**N101.1.2 Sprinklered buildings.**~~
~~In a building that is equipped throughout with an *automatic sprinkler system* with a minimum design density of ordinary hazard Group 1, the aggregate exhibit area must be less than 4,500 square feet (418 m^2) of floor area and meet both of the following conditions:~~

1. ~~The exhibit area does not include any covered or multiple-level exhibits or booths.~~
2. ~~Not fewer than two remote *exits* or *exit access* doors in compliance with Chapter 10 are provided.~~

~~**N101.2 Permit required.**~~
~~An operational permit for trade shows and exhibitions shall be required as set forth in Section 105.5.15.~~

~~**N101.3 Application.** A permit application for a trade show or exhibition shall be submitted to the *fire code official* prior to the start of the event in a time frame established by the jurisdiction. The application shall include documentation that identifies all of the following:~~

1. ~~The *means of egress*.~~
2. ~~The locations and widths of *exits* and *aisles*.~~
3. ~~The locations of *exit* signs.~~
4. ~~The total square footage (square meters) of spaces.~~

~~5. The location and arrangement of all booths and cooking equipment.~~

~~6. The location of all fire protection equipment.~~

~~7. The type and location of any heating and electrical equipment, where applicable.~~

~~8. The location of any covered or multiple-level booths.~~

~~9. *Construction documents* for any covered or multiple-level booths.~~

~~10. The storage locations and quantities of any highly combustible goods.~~

~~11. The location and type of any vehicle displays, where applicable.~~

~~SECTION N102~~
~~DEFINITIONS~~

~~**N102.1 Definitions.** For the purpose of this appendix, certain terms are defined as follows:~~

~~**COOKING.** Heating food products to a temperature of 145°F (63°C) or higher by baking, braising, boiling, frying or grilling.~~

~~**COVERED BOOTH.** An exhibit that has an obstruction placed over the exhibit above floor level that resembles a roof, canopy, tent or other obstruction, other than vertical signs or banners.~~

~~**MULTIPLE-LEVEL BOOTH.** An exhibit that has a second level or tier constructed on top of the exhibit or portion of the exhibit that is open to the public, or includes a live load above the exhibit area floor level.~~

~~SECTION N103~~
~~PUBLIC SAFETY FOR EVENTS~~

~~**N103.1 Fire safety and evacuation plan.** A fire safety and evacuation plan shall be provided in accordance with Section 404.2.~~

~~**Exception:** Where the *fire code official* determines that the nature of the exhibition, display or the activities therein does not pose an increased hazard to public safety.~~

~~**N103.2 Fire watch personnel.**~~

~~Where, in the opinion of the *fire code official*, it is essential for public safety in a trade show or exhibition, either because of the number or persons present or because of the nature of the performance, exhibition, display or activity, the *owner* or *owner's* authorized agent shall provide one or more *fire watch* personnel in accordance with Section 403.11.1.~~

~~**N103.3 Crowd managers.**~~

~~Where events involve a gathering of more than 1,000 people, trained crowd managers shall be provided in accordance with Section 403.11.3.~~

~~SECTION N104~~
~~INTERIOR FINISH AND DECORATIVE MATERIALS~~

~~**N104.1 General.**~~

~~Interior finish, interior trim, furniture, furnishings and decorative materials, including decorative vegetation, used in exhibition areas shall comply with the requirements of this section and Chapter 8.~~

~~**N104.2 Interior wall and ceiling finish.**~~

~~The materials used for interior wall and ceiling finish of exhibit booths and displays in exhibition areas shall comply with one of the following:~~

1. ~~Where the building is not equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the wall and ceiling finish materials are required to be Class A in accordance with Section 803.~~
2. ~~Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the wall and ceiling finish materials are required to be not less than Class B in accordance with Section 803.~~

~~SECTION N105~~
~~MULTIPLE-LEVEL BOOTHS~~

~~**N105.1 Construction documents.** *Construction documents* for all multiple-level booths shall be stamped by a *registered design professional* and shall be submitted with the permit application to the *fire code official* or the *building code official*, as appropriate.~~

~~**N105.2 Structural design.**~~

~~Multiple-level booths shall be designed and constructed in accordance with Chapter 16 of the International Building Code.~~

~~**N105.3 Means of egress.**~~

~~Upper levels of multiple-level booths with an *occupant load* greater than 10 persons shall have not fewer than two *exits* or *exit access* that are separated in accordance with Section 1007.1.1.~~

~~**N105.4 Automatic sprinkler systems.** An *approved automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided in multiple-level booths exceeding 400 square feet (37.2 m²) in floor area per level.~~

~~**N105.5 Inspection.** Inspection to verify that multiple-level booths are constructed in accordance with the *construction documents* and structural design details required by this section shall be *approved* by the *building code official*.~~

~~**N105.6 Fire alarm and detection.**~~

~~Each multiple-level booth with a floor area exceeding 120 square feet (11.1 m²) on any level shall be provided with an *approved fire alarm system* in accordance with Section 907.2.~~

~~SECTION N106~~
~~COVERED BOOTHS~~

~~**N106.1 Automatic sprinkler systems.** An *approved automatic sprinkler system* in accordance with Section 903.3.1.1 shall be provided in covered booths exceeding 100 square feet (9.3 m²) in floor area per level.~~

~~**N106.2 Fire alarm and detection.** Each covered booth with a floor area exceeding 120 square feet (11.1 m²) on any level shall be provided with an *approved fire alarm system* in accordance with Section 907.2.~~

~~SECTION N107~~
~~DISPLAY AND STORAGE OF HAZARDOUS AND COMBUSTIBLE~~

~~MATERIALS~~

~~N107.1 Hazardous materials~~.

~~The display of hazardous materials shall comply with Section 314 and Chapters 50 through 67. The storage of hazardous materials in indoor trade shows and exhibition areas shall be prohibited.~~

~~N107.1.1 Display near exit.~~ ~~The display of hazardous materials within 5 feet (1524 mm) of an *exit* shall be prohibited.~~

~~N107.2 Storage of combustible materials~~.

~~Storage of combustible materials shall comply with Section 315.~~

~~N107.3 Vehicles~~.

~~The display of liquid- or gas-fueled vehicles, boats or other motor craft in indoor trade shows and exhibition areas shall comply with Sections 314.4 and N107.3.1 through N107.3.3.~~

~~N107.3.1 Batteries in vehicles.~~ ~~Vehicle batteries shall be rendered inoperable. Batteries in liquid- and gas-fueled vehicles shall be disconnected. Batteries in electric vehicles shall be rendered inoperable by the removal of fuses or other *approved* methods but shall not be required to be disconnected.~~

~~N107.3.2 Vehicle fuel~~.

~~Vehicle fuel shall comply with Sections N107.3.2.1 through N107.3.2.4.~~

~~N107.3.2.1 Fueling within the structure.~~ ~~Vehicles shall not be fueled or defueled within the structure.~~

~~N107.3.2.2 Vehicle fuel tanks~~. ~~Vehicle fuel tanks shall contain not more than one quarter of the tank capacity or 5 gallons (18.93 L) of fuel, whichever is less.~~

~~N107.3.2.3 Vehicle fuel systems~~. ~~Vehicle fuel systems shall be inspected for leaks prior to the vehicle being brought into the structure.~~

~~N107.3.2.4 Vehicle fuel tank openings.~~ ~~Vehicle fuel tank openings shall be locked and sealed to prevent the escape of vapors.~~

~~N107.3.3 Obstruction by vehicles.~~ ~~Vehicles shall not be located in such a manner that they obstruct a *means of egress.*~~

~~N107.3.4 Gas-powered vehicles~~.

~~Compressed natural gas (CNG), liquefied petroleum gas (LPG) or hydrogen-powered vehicles present in indoor trade shows and exhibition areas shall comply with Sections N107.3.4.1 through N107.3.4.3.~~

~~N107.3.4.1 Shutoff valves.~~ ~~Shutoff valves shall be closed and the engine shall be operated until it stops. Valves shall remain closed until the vehicle is removed.~~

~~N107.3.4.2 Battery hot lead.~~ ~~The hot lead of the battery shall be disconnected.~~

~~N107.3.4.3 Dual-fuel vehicles equipped to operate on gasoline.~~

~~Dual-fuel vehicles equipped to operate on gasoline as well as on CNG, LPG or hydrogen shall comply with Section 3108.14.~~

~~**N107.3.5 Competitions or demonstrations**~~**.**

~~Competitions or demonstrations using any type of vehicle shall comply with Section 3108.14.5.~~

~~**N107.4 Fueled equipment other than vehicles**~~**.**

~~Fueled equipment other than vehicles shall comply with Section 313.~~

~~**N107.5 LP-gas containers**~~**.**

~~Liquefied petroleum (LP) gas containers shall comply with Sections N107.5.1 through N107.5.5 and Chapter 61.~~

~~**N107.5.1 LP-gas containers exceeding 12 pounds (5 kg) of water capacity.**~~ ~~The use of LP-gas containers exceeding 12 pounds (5 kg) of water capacity shall be prohibited.~~

~~**N107.5.2 Where more than one LP-gas container is present in the same area.**~~ ~~Where more than one LP-gas container is present in the same area, cylinders shall be separated from each other by a minimum of 20 feet (6096 mm).~~

~~**N107.5.3 Equipment for LP-gas containers**~~**.**

~~Equipment for LP-gas containers, including tanks, piping, hoses, fittings, valves, tubing and other related components, shall be *approved* and shall comply with Chapter 61 and with the applicable requirements of the International Fuel Gas Code.~~

~~**N107.5.4 Securing of LP-gas containers**~~**.** ~~Portable LP-gas containers shall be securely fastened in place to prevent unauthorized movement.~~

~~**N107.5.5 Spare LP-gas containers**~~**.** ~~Spare LP-gas containers not connected to an *approved* appliance shall be stored in a location and manner *approved* by the *fire code official*~~.

~~**N107.6 Cooking and open-flame devices**~~**.**

~~All cooking equipment and any open-flame devices shall comply with the requirements of Section 308 of this code and with Chapter 5 of the International Mechanical Code. Cooking equipment shall be separated from combustible material display or storage by a horizontal distance of not less than 5 feet (1524 mm).~~

~~SECTION N108~~
~~MEANS OF EGRESS~~

~~**N108.1 Means of egress from the indoor trade show or exhibition area**~~**.**

~~*Means of egress* from the indoor trade show or exhibition area shall comply with Chapter 10 and with Sections N108.2 and N108.3.~~

~~**N108.2 Design of means of egress**~~**.** ~~The design of *means of egress* shall take into consideration the exhibit layout and the anticipated crowd movement during the event.~~

~~**N108.3 Aisles and corridors**~~**.** ~~*Aisles* and *corridors* within the exhibit area shall be kept free of obstructions when the public is present. Storage of any kind in *aisles* or *corridors* within the exhibit area is not permitted.~~

~~SECTION N109~~
~~REFERENCED STANDARDS~~

~~**N109.1 General.**~~

~~See Table N109.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.~~

~~**TABLE N109.1 REFERENCED STANDARDS**~~

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
IBC—24	*International Building Code*	N105.2
IFGC—24	*International Fuel Gas Code*	N107.5.3
IMC—24	*International Mechanical Code*	N107.6

Reason: Many of the provisions in Appendix N already exist in the body of the IFC. No fire loss data exists to support many of the other provisions in Appendix N. As Appendix N is currently drafted it contains numerous sections that are difficult to effectively and consistently enforce. Last cycle the FCAC proposed moving Appendix N to the body of the IFC. However, that was disapproved in part due to testimony regarding difficulties in attempting to adopt and enforce provisions of the Appendix encountered by a major jurisdiction that hosts large indoor trade shows. The testimony indicated that as written it could not be enforced. Currently no jurisdiction is enforcing the appendix as written. Loss data does not support moving to the body of the code or retaining this Appendix.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

Enforcing this Appendix if adopted is not related to construction costs. The deletion will avoid unnecessary costs in enforcement. As noted this appendix has been seen as problematic for enforcement.

2024 International Fire Code

Add new text as follows:

APPENDIX P
SHORT-TERM RESIDENTIAL RENTAL SAFETY PROGRAM

. *The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance or legislation of the jurisdiction.*

About this appendix: This appendix prescribes minimum safeguards for life-safety to protect *transient* occupants of a s*hort-term rental property.* It is intended for distribution to a *responsible party* to highlight select requirements of the International Fire Code and International Property Maintenance Code plus prescribe additional requirements that are uniquely applicable to *short-term rental properties.*

-

SECTION P101
GENERAL

P101.1 Scope. *Dwelling units*, *sleeping units*, and portions thereof classified as a *short-term rental property* shall comply with this appendix.

P101.2 Definitions. For the purpose of this appendix, certain terms are defined as follows:

Add new definition as follows:

RESPONSIBLE PARTY. An *owner* or manager operating a *short-term rental* property.

SHORT-TERM RENTAL PROPERTY.
A *dwelling unit*, *sleeping unit*, or portion thereof providing one or more *sleeping spaces*, made available for temporary occupancy, whether rented or swapped, for a period of 30 days or less.

SLEEPING SPACE.
A bedroom or other location intended to provide sleeping accommodations.

Add new text as follows:

P101.3 Permit. A permit shall be required for each short-term rental property. Where two or more sleeping rooms are available for separate rental or exchange in a single *dwelling unit* or *sleeping unit*, only one permit for the *dwelling unit* or *sleeping unit* shall be required. A permit application shall be accompanied by a floor plan that identifies every *sleeping space* and a copy of the safety plan required by this appendix.

SECTION P102
GENERAL SAFETY FEATURES AND PRECAUTIONS

P102.1 General. *Short-term rental properties* shall comply with Sections P102.2 through P102.10.

P102.2 Permissible locations. *Short-term rental properties* shall be located in buildings that were constructed with an *approved* building code and are maintained in accordance with the International Property Maintenance Code.

Exception: The *fire code official* is authorized to accept *short-term rental properties* of a different type where justified in accordance with Section 104.2.3 or 104.2.4.

P102.3 Smoke alarms. *Smoke alarms* shall be installed and maintained in accordance with Section 907.2.11.

P102.3.1 Additional smoke alarms. Where a *sleeping space* would otherwise not require a *smoke alarm* based on the requirements of 907.2.11, a *smoke alarm* shall be installed in such space.

P102.3.2 Replacement. If a smoke alarm stops functioning or is more than 10-years old, based on the date marked on the back of the device, or if there is no marked date, such smoke alarm shall be replaced.

P102.4 Carbon monoxide alarms. Carbon monoxide alarms shall be provided and maintained in accordance with Section 915.

P102.5 Portable Fire extinguishers. A minimum of one portable fire extinguisher with a minimum rating of 2-A:10-B:C shall be provided on each story of a *short-term rental unit*, secured on a mounting bracket in a conspicuous and unobstructed location along a normal path of travel.

P102.6 Fire protection system maintenance. *Fire alarm systems* and *automatic sprinkler systems*, where provided, shall be inspected, tested, and maintained operational in accordance with this code.

P102.7 Electrical safety. Use of current taps, relocatable power taps and extension cords shall be in a safe manner and that complies with Sections 603.5 and 603.6.

P102.8 Portable heater safety. Portable heaters shall be listed and labeled and shall be located not less than 3 feet (914 mm) from any combustible material. Portable electric heaters shall be plugged directly into a permanent receptacle. Portable fuel-fired heaters shall not be placed in a *sleeping space* or within 5 feet (1524 mm) of an exit.

P102.9 Outdoor cooking. Outdoor cooking shall not be conducted on combustible balconies or decks or within 10 feet (3048 mm) of combustible construction.

P102.10 Clothes dryer maintenance. The lint trap, mechanical and heating components, and the exhaust duct system of clothes dryers shall be maintained free of lint accumulation.

SECTION P103
OCCUPANCY AND USE LIMITS

P103.1 Overcrowding. The number of occupants in a *short-term rental property* shall not exceed the limits established by Section 404 of the International Property Maintenance Code.

P103.2 Prohibited sleeping spaces. Kitchens and non-habitable spaces shall not be used as *sleeping spaces*.

SECTION P104
MEANS OF EGRESS AND ESCAPE

P104.1 Minimum access. Where more than one *sleeping space* is located in a *dwelling unit* or *sleeping unit*, a *sleeping space* shall not constitute the only means of access to other *sleeping spaces* or *habitable spaces* and shall not serve as the only means of egress from other *habitable spaces*.

P104.2 Exit identification. Where the egress path to an exit is not readily apparent, photoluminescent exit signs shall be installed to clearly mark the egress path.

P104.3 Emergency escape and rescue opening. Each *sleeping space* shall have an *emergency escape and rescue opening* that complies with the code that was in effect at the time of construction, and openings shall be maintained such that they are operational from the inside without the use of keys or tools. Where bars, grilles, grates or similar devices are placed over an *emergency escape and rescue opening*, the minimum net clear opening size that complies with the code that was in effect at the time of construction shall be maintained.

P104.4 Escape ladders. Where a *sleeping space* is located more than one *story* above *grade plane*, an emergency escape ladder complying with ASTM F2175 shall be provided at not less than one *emergency escape and rescue opening* on each such story.

SECTION P105
SAFETY PLAN

P105.1 General. The *responsible party* shall prepare, implement, and maintain a written safety plan for each *short-term rental property*.

P105.2 Approval. The safety plan shall be submitted to the *Fire Code Official* and *approved* before a permit is issued.

P105.3 Safety plan elements. *Short-term rental property* safety plans shall include the following:

1. Name and contact information of *responsible party*.
2. The procedure for a transient occupant to report an emergency and the means of communicating that procedure to transient occupants.
3. A graphic illustration of the full floor plan of the *dwelling unit* or *sleeping unit* with a *short-term rental property* that includes the following:
   - 3.1. The location of each *sleeping space*.
   - 3.2. Two escape paths for each *sleeping space*, including the path to the nearest outside exit door and to a designated *emergency escape and rescue opening* for the *sleeping space*.
   - 3.3. The location of *portable fire extinguishers*, *smoke alarms*, *carbon monoxide alarms*, and emergency escape ladders if provided.
4. Safety equipment records, including the following:
   - 4.1. Location and manufacturing date of each *smoke alarm*, as marked on the back of the alarm.
   - 4.2. Location and manufacturing date of each *carbon monoxide alarm*, as marked on the back of the alarm.
5. Location of fuel-fired equipment and *appliances*.

SECTION P106
FIRE SAFETY INSPECTIONS

P106.1 Responsible party inspections. The *responsible party* shall complete a monthly fire safety inspection of the *short-term rental property* to verify compliance with this appendix. All indoor and outdoor areas associated with the *short-term rental property* shall be inspected.

P106.1.1 Inspection of automatic sprinkler systems. Inspection of automatic sprinkler systems, where provided, shall include the following on a monthly basis unless otherwise indicated:

1. Control valves shall be verified as being in the open position.
2. Leaking, damaged, corroded, or painted sprinklers shall be replaced.
3. Decorations or other materials obstructing sprinkler discharge or attached to sprinklers shall be removed.
4. Water tanks or other stored water sources, if present, shall be verified as full.
5. Instruction signs and tags shall be installed near the main valve.
6. The owner's manual for the system shall be onsite.
7. Water pumps, if present, shall be tested annually to confirm proper operation.
8. Waterflow devices that initiate alarms, if present, shall be tested annually to confirm proper operation.

P106.2 Official inspections. Where required by the *fire code official*, an annual inspection by the *fire code official* or an approved third-party inspector shall be conducted at the *responsible party's* expense to verify compliance with this appendix. The results of each inspection shall be documented and maintained at the *short-term rental property* in a conspicuous location for transient occupants to review.

SECTION P107 VIOLATIONS

P107.1 General. Failure to comply with this appendix shall constitute an unlawful act in accordance with Section 113.1 and shall result in the issuance of a notice of violation to the short-term rental owner in accordance with Section 113.3.

SECTION P108 REFERENCED STANDARDS

E108.1 General. See Table P108.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.

TABLE P108.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ASTM F2175-2015	Standard Specification for Portable and Permanent Emergency Escape Ladders for Residential Use	P104.4

Staff Analysis: A review of the standard proposed for inclusion in the code, ***Standard Specification for Portable and Permanent Emergency Escape Ladders for Residential Use (ASTM F2175-2015)***, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Regulation of short-term rental (STR) properties is largely done by a patchwork of jurisdiction-by-jurisdiction requirements with little consistency from what I've found. My focus in submitting this proposal is gaining a level of consistency and education of STR owners and operators via a understandable consolidation of the "most important" safety requirements in ICC codes. Although the ICC codes, such as the IFC and IEBC, include a large number of safety-related provisions that are applicable to STRs (and served as the basis for much of the appendix content), they are currently dispersed in a way that does not promote understanding or compliance by people who don't live in the code world. "Most important" reflects my personal opinion of code requirements that I felt were appropriate to include/duplicate/reference in the new appendix to have the greatest impact on improving safety (primarily fire safety) if understood and followed by responsible parties. Certainly, others may have different perspectives, and hopefully the framework provided by the proposed appendix can be further populated as needed to address considerations raised by others during the code development process.

Some additional requirements, that are not otherwise provided for by current codes and seem appropriate for regulation of STRs, are also included in the proposal. These include, among others, as escape ladders for second story sleeping areas, declaration of sleeping spaces, and requiring that sleeping spaces are treated as bedrooms even though such spaces in a STR might be repurposed common areas that wouldn't have previously been considered or regulated as a bedroom.

It's important to note that while fires are not known to be frequent in STRs, they have resulted in significant life loss. Also note that the content of this appendix deliberately sidesteps some of the most controversial issues surrounding regulation of STRs by a jurisdiction, particularly nuisance complaints related to noise, parking and trash; neighborhood STR density limits; licensing; and collection of fees/lodging taxes.

Although I serve as a consultant to the National Fire Sprinkler Association, and while this proposal includes regulations that affect sprinklers, this proposal was not reviewed or endorsed by NFSA. And, I am not representing NFSA on this issue.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Actually, the proposal is not entirely editorial, but it should have no impact on the cost of construction because, for the most part, it simply consolidates/duplicates a selection of existing ICC code requirements into a single location. That's not to say that there wouldn't be costs associated with upgrading an otherwise non-compliant STR property or the required administrative oversight or safety feature additions, but these are not construction costs.

TENTATIVE ORDER OF DISCUSSION
2024 PROPOSED CHANGES TO THE
INTERNATIONAL FUEL GAS CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some FG code change proposals may not be included on this list, as they are being heard by another committee.

IFGC: 303.3

Proponents: Guy McMann, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2024 International Fuel Gas Code

Revise as follows:

303.3 Prohibited locations.
Appliances shall not be located in ~~sleeping rooms~~, bedrooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The *appliance* is a direct-vent *appliance* installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative *appliances*, vented gas fireplaces, vented gas *fireplace* heaters and decorative *appliances* for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
5. The *appliance* is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an *approved* self-closing device. *Combustion air* shall be taken directly from the outdoors in accordance with Section 304.6.
6. A clothes dryer is installed in a residential bathroom or toilet room having a permanent opening with an area of not less than 100 square inches (0.06 m^2) that communicates with a space outside of a bedroom, bathroom, toilet room or storage closet.

Reason: 1. Replacing the words sleeping room with bedroom in the first paragraph of the code will align it with the exceptions. Nowhere in the exceptions is sleeping room used.

2. The question is, what is the difference between a sleeping room and a bedroom? The Miriam Webster dictionary defines a bedroom as: a room furnished with a bed and intended primarily for sleeping. There is no definition in Miriam Webster for sleeping room. A definition of sleeping area can be found in the Collins dictionary where a sleeping area is defined as: an area in a room or house where people can sleep but there is no definition of sleeping room. Law Insider has multiple citations for sleeping room from many different municipalities across the country. Most of the citations have differing opinions of what a sleeping room is or is not. In Chapter 2 of the IFGC, IMC, IBC or IRC sleeping room is not defined so anyone using the International Codes is left to figure out on their own what the term sleeping room encompasses. In summation, the words sleeping room are too vague for proper interpretation of what the code is trying to describe.

3. Sleeping room is a holdover from the 2003 IFGC Section 303.3 Prohibited locations code. There is no definition for sleeping room in Chapter 2 of the 2003 IFGC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost as this is editorial in nature.

FG2-24

IFGC: 303.3

Proponents: Guy McMann, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2024 International Fuel Gas Code

Revise as follows:

303.3 Prohibited locations.
Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The *appliance* is a direct-vent *appliance* installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative *appliances*, vented gas fireplaces, vented gas *fireplace* heaters and decorative *appliances* for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
5. The *appliance* is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an *approved* self-closing device. *Combustion air* shall be taken directly from the outdoors in accordance with Section 304.6, <u>or obtained from any adjacent space or spaces outside of a bedroom, bathroom, toilet room, storage closet or surgical room. Sizing for indoor combustion air volume shall be in accordance with Section 304.5. Sizing and location of the openings used to connect the indoor spaces shall be in accordance with Section 304.5.3.</u>
6. A clothes dryer is installed in a residential bathroom or toilet room having a permanent opening with an area of not less than 100 square inches (0.06 m^2) that communicates with a space outside of a sleeping room, bathroom, toilet room or storage closet.

Reason: As written, when appliances are located in a room or space that opens only in a bedroom or bathroom there is only one option for obtaining combustion air for the appliances located in the space, bring it into the room or space from the outside. There are situations where this is not a feasible or a cost effective solution. For example, the room may not be located near an outside wall making it difficult to get the combustion air duct/ducts into the room or space. The total BTU load in the room may require very large combustion air duct/ducts to be installed. Bringing outside combustion air into a room located within the building envelope does not consider all the insulation requirements of IECC R402.4.4 (Rooms containing fuel-burning appliances).

benefits

1. Having this second option for obtaining combustion air for appliances located in a room or space accessed through a bedroom will allow the homeowner or contractor to safely provide combustion air to the appliance using IFGC 304.5 (Indoor combustion air) and 304.5.3 (Indoor opening size and location).

2. Combustion air requirements for the appliances can be met even if the room or space is not located on an outside wall.

3. Using indoor combustion air is more energy efficient than bringing in cold or hot outside combustion air into the room or space located within the building envelope.

4. Combustion air ducts can be, and sometimes are, plugged by the homeowner to prevent cold air from entering into the mechanical room during the winter months. High/low grilles are rarely intentionally blocked off.

5. Installing grilles is more cost effective than installing combustion air duct/ducts especially when the prohibited location is not adjacent to an outside wall.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

There will be no added cost to industry. There could be savings to the industry. Grilles are relatively inexpensive to purchase especially when compared to the price of sheet metal and fabrication of ducts. Cutting holes in an interior wall and installing grilles is less labor intensive than cutting a hole/holes in an outside wall and installing combustion air duct/ducts.

Estimated Immediate Cost Impact Justification (methodology and variables):

The savings could range from $0 to $500 based on not having to spend labor dollars drilling holes and by not having to insulate the room to meet Energy code requirements.

FG2-24

FG3-24

IFGC: 303.7

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us)

2024 International Fuel Gas Code

Revise as follows:

303.7 Pit locations. *Appliances* installed in pits or excavations shall not come in direct contact with the surrounding soil. The sides of the pit or excavation shall be held back not less than 12 inches (305 mm) from the *appliance*. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry, such concrete or masonry shall extend not less than 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. <u>Excavation on the control side of the appliance shall extend horizontally not less than 30 inches (762 mm).</u> The *appliance* shall be protected from flooding in an *approved* manner.

Reason: This text is extracted from IRC Section1305.1.3.2 and makes the IFGC consistent with the IRC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is important to the installer to have this information in order to make adjustments if necessary to the install thus saving time at a later date.

FG3-24

FG4-24

IFGC: SECTION 202, SECTION 315 (New), 315.1 (New), 315.1.2 (New)

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Fuel Gas Code

Delete without substitution:

~~**[M] NONCOMBUSTIBLE MATERIALS.** Materials that, where tested in accordance with ASTM E136, have not fewer than three of four specimens tested meeting all of the following criteria:~~

1. ~~The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than 54ºF (30ºC) above the furnace temperature at the beginning of the test.~~
2. ~~There shall not be flaming from the specimen after the first 30 seconds.~~
3. ~~If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.~~

Add new text as follows:

SECTION 315
NONCOMBUSTIBLE MATERIALS

315.1 Testing. Noncombustible materials shall be those materials that comply with Section 703.3.1 of the International Building Code.

315.1.2 Inherently noncombustible materials. Inherently noncombustible materials, such as concrete and steel, shall not be required to be tested to be acceptable as noncombustible materials.

Reason: The so-called definition contained in the 2024 IFGC is said to be under the jurisdiction of the IMC (in accordance with the [M] in front of it). In fact it is not identical to the definition in the IMC, which reads: "Noncombustible material: a material that passes ASTM E136." Furthermore, the present definition in the IFGC is no longer consistent with the language contained in ASTM E136 and also addresses only one of the two options included in ASTM E136 for a material to be considered noncombustible. Finally, the "definition" in the IFGC is actually a "requirement" since it requires materials to meet certain criteria to be classified as a noncombustible material. ICC definitions should not contain requirements.

In the area of material regulation, materials that pass ASTM E136 have long been considered to be those that are noncombustible materials, and that concept is consistent with the flawed "definition" in the IFGC.

This proposal recommends including a correct requirement for what materials shall be considered noncombustible materials and it is to comply with the IBC section 703.3.1. A second proposed section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested, for example to ASTM E136.

Note that ASTM E136 is one of the very few ASTM fire test standards that has acceptance criteria. The acceptance criteria are different from the theoretical definition of a noncombustible material.

If no requirement exists for what is a noncombustible material, experience indicates that some material manufacturers have claimed that their material is noncombustible when it simply exhibits improved fire performance. When searching the internet, multiple web sites offer materials or products that are alleged to be noncombustible when that claim is incorrect. There is often confusion in the public mind between how to consider a material that performs better than typical combustible materials, but is not enough for the material to be considered noncombustible.

This proposal recommends including a correct requirement for what materials shall be considered noncombustible materials and that is that they need to comply with the IBC section 703.3.1. A second section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested, for example to ASTM E136.

Equivalent proposals are being submitted to the IFC (by FCAC), the IPC, and the IMC, all of which use noncombustible materials.

Another proposal revises the definitions of "combustible material" in the IMC and IFGC to clarify that the whether a material is or is not noncombustible is the result of a classification. The IBC does not "define" a noncombustible material but contains requirements for such materials.

The language in section 703.3.1 of the IBC reads as follows:*703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.*

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply moves a requirement (that is not consistent with the present edition of ASTM E136) into a place where the requirement can be enforced.

FG4-24

FG5-24

IFGC: 404.11.2

Proponents: Jonathan Sargeant, OmegaFlex, OmegaFlex (jonathan.sargeant@omegaflex.com)

2024 International Fuel Gas Code

Revise as follows:

404.11.2 Protection methods.
Underground *piping* shall comply with one or more of the following:

1. The *piping* shall be made of corrosion-resistant material that is suitable for the environment in which it will be installed.
2. Pipe shall have a factory-applied, electrically-insulating coating. Fittings and joints between sections of coated pipe shall be coated in accordance with the coating manufacturer's instructions.
3. The *piping* shall have a cathodic protection system installed and the system shall be monitored and maintained in accordance with an *approved* program.
4. The piping shall employ an encasement system listed for underground installation.

Reason: The proposal adds listed encasement systems currently permitted in 404.14 for installation underground beneath buildings. Listed encasement systems have a long history of successful use below grade both within and outside of the building footprint.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The material cost for a 20 foot run of 1" piping installed below grade:

Polyethylene with tracer wire and two risers: $217.44

Listed encasement system with two end fittings: $178.84

Savings for listed encasement system: $38.60

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal permits a manufactured listed encasement system for gas lines below grade outside the building. The most common, and least expensive, material used for this application is polyethylene. Polyethylene on a per foot material is less expensive than a listed encasement system but polyethylene requires a tracer wire and risers where they penetrate grade which is not required for a metallic listed encasement system. Because of the additional requirements, a metallic listed encasement system is often less expensive for shorter piping runs. This estimate assumes a twenty foot run of 1" piping. For longer runs, polyethylene, with the added requirements, would be less expensive to install and the proposal leaves that option intact for the contractor should he choose that alternative.

Estimated Life Cycle Cost Impact:

The proposal has no additional impact on the life cycle of the project.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The only protection method that would have life cycle costs would be cathodic protection. However, the anode replacement schedule is highly variable (dependent on the corrosiveness of the environment). The length of the replacement schedule coupled with the minimal cost of replacement anodes would make the life cycle cost of the activity trivial.

FG5-24

FG6-24

IFGC: 407.2

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Fuel Gas Code

Revise as follows:

407.2 Design and installation.
Piping shall be supported with metal pipe hooks, metal pipe straps, metal bands, metal brackets, hangers or building structural components, suitable for the size of *piping*, of adequate strength and quality, and located at intervals so as to prevent or damp out excessive vibration. *Piping* shall be anchored to prevent undue strains on connected *appliances* and shall not be supported by other *piping.* Pipe hangers and supports shall conform to the requirements of MSS SP-58 and shall be spaced in accordance with Section 415. Supports, hangers and anchors shall be installed so as not to interfere with the free expansion and contraction of the *piping* between anchors. The components of the supporting *equipment* shall be designed and installed so that they will not be disengaged by movement of the supported *piping*.

Reason: The standards ANSI Z223 and NFPA 54 require metal support hardware. This proposal reverses the action of FG3-21 and aligns with IFGC with those standards.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Support hardware for any gas piping project is a minimal cost as compared to the entire job. The difference between lowest cost support hardware and metal hardware is insignificant in the big picture.

FG6-24

FG7-24

IFGC: 410.2

Proponents: Jonathan Sargeant, OmegaFlex, OmegaFlex (jonathan.sargeant@omegaflex.com)

2024 International Fuel Gas Code

Revise as follows:

410.2 MP regulators.
MP *pressure regulators* shall comply with the following:

1. The MP regulator shall be *approved* and shall be suitable for the inlet and outlet gas pressures for the application.
2. The MP regulator shall maintain a reduced outlet pressure under lock-up (no-flow) conditions.
3. The capacity of the MP regulator, determined by published ratings of its manufacturer, shall be adequate to supply the *appliances* served.
4. The MP *pressure regulator* shall be provided with *access.* Where located indoors, the regulator shall be vented to the outdoors or shall be equipped with a leak-limiting device, in either case complying with Section 410.3.
5. A tee fitting with one opening capped or plugged shall be installed between the MP regulator and its upstream shutoff valve. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument and to serve as a sediment trap.
6. ~~A tee fitting with one opening capped or plugged shall be installed not less than 10 pipe diameters downstream of the MP regulator outlet. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument. The tee fitting is not required where the MP regulator serves an *appliance* that has a pressure test port on the gas control inlet side and the *appliance* is located in the same room as the MP regulator.~~ Means shall be provided downstream of, and in the same room as, the MP regulator for the connection of a pressure measuring instrument. Such means shall be a dedicated test port on a regulator, appliance gas control, or manifold, a plugged tee fitting or a plugged manifold port.
7. Where connected to rigid *piping*, a union shall be installed within 1 foot (304 mm) of either side of the MP regulator.

Reason: This proposal expands the list of acceptable pressure test ports beyond a simple tee fitting by recognizing that regulator, appliance gas control, and pre-fabricated manifold manufacturers often provide integral test ports in their devices that meet the intent of the code. The proposal eliminates the requirement that the test port be 10 pipe diameters downstream of the MP regulator because this requirement is overly restrictive and provides no real world advantage. Bench testing reveals that, at maximum flow, the pressure differential between the regulator test port and a test port located 10 pipe diameters downstream of the regulator is within 1/4 inch water column of each other. This proposal eliminates unnecessary fittings, joints, and potential leak paths in the gas piping system and, in so doing, reduces installation cost while also increasing safety.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal reduces costs by eliminating the requirement that the plumber install additional fittings to fabricate a test port downstream of the regulator. The eliminated test port assembly is estimated to save roughly $49.46 - $50.77 for a typical installation.

Estimated Immediate Cost Impact Justification (methodology and variables):

Estimated savings reflects the cost of a Tee fitting, pipe nipple and end cap needed to fabricate a test port in from malleable iron but does not reflect the cost of pipe dope or thread tape. A labor rate of $100 per hour was used and assembly time was estimated at 20 minutes. The cost for fabricating the test port out of 1/2" malleable iron is estimated to be $49.46 and the cost of fabricating it out of 3/4 malleable iron is estimated to be $50.77. Variables include fluctuations in material costs and differential labor rates.

Estimated Life Cycle Cost Impact:

There would be no life cycle cost impact.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

FG7-24

FG8-24

IFGC: 502.1

2024 International Fuel Gas Code

Revise as follows:

502.1 General.
Vents, except as provided in Section 503.7, shall be *listed* and *labeled*. Type B and BW vents shall be tested in accordance with UL 441. Type L vents shall be tested in accordance with UL 641. Vents for Category II ~~and~~, III, and IV *appliances* shall be tested in accordance with UL 1738. ~~Plastic vents for Category IV *appliances* shall not be required to be *listed* and *labeled* where such vents are as specified by the *appliance* manufacturer and are installed in accordance with the *appliance* manufacturer's instructions~~.

Reason: The current venting standard, UL 1738, should be designated as the exclusive standard for listing and labeling combustion gas venting products within the International Fuel Gas Code (IFGC). The current language allows appliance manufacturers to determine what materials can be used for the venting of their appliances, as long as said materials are listed to a testing standard. This has led to the common practice of using PVCs listed to ASTM D1785. The problem associated with this is that this standard is a plumbing standard without provisions for the application of flue gas venting. The first page of ASTM D1785 states:

"NOTE 2: This standard specifies dimensional, performance and test requirements for plumbing and fluid handling applications only. It does not include provisions for the use of these products for venting of combustion gases. UL 1738 is a standard that does include specific testing and marking requirements for flue gas venting products, including PVC."

The current code is both allowing the application of a plumbing standard to the venting of combustion gases and also allowing the application of a standard to be used for a purpose which it explicitly states it is not to be used for. ASTM even goes as far as citing the correct standard (UL 1738) to use in these applications. CPVC, which is also commonly used in these applications, suffers from the same issue with its plumbing standard, ASTM F441. The misapplication of materials and testing standards poses a significant safety hazard, necessitating urgent attention and rectification within the code.

Additionally, the ASTM plumbing standards do not test several critical conditions that venting materials experience, such as elevated and low-temperatures, UV exposure, and elbow load. These conditions, commonplace in vent systems, demand a standard that comprehensively evaluates them.

UL 1738 also incorporates provisions to ensure uniformity in material throughout the entire venting system, emphasizing the need for consistency in properties like expansion/contraction rates. Such considerations as these are unique to flue gas venting systems, further emphasizing the importance of specifying a universal venting standard for these applications.

Numerous countries and municipalities have already established a single standard to which venting products must adhere, such as Canada requiring the ULC S636 standard nationwide in 2007, and NYC recently accepting UL 1738 listing for the venting of Category IV appliances.

The IFGC commentary even supports a robust stance, clarifying that un-listed plastic pipes like PVC, ABS, and CPVC are not included in the definition of "vent" and should not be used for the venting of appliances; see below excerpt from section 503.4.1 of the 2018 IFGC Code Commentary:

"… The definition of 'Vent' does not include plastic pipe, such as PVC, ABS, and CPVC, because such pipes are not currently listed as factory-built venting systems… The PVC, ABS, and CPVC pipe manufacturers do not recommend that their pipes be used for appliance venting because such products are not currently listed for such applications. There are polypropylene and possibly other types of plastic venting systems on the market that are listed to UL 1738 as appliance venting systems, and they would fall under the definition of 'Vent'."

Considering all these factors, it is evident that UL 1738 should be mandated as the required testing standard for any material used in the venting of combustion gases. This is paramount for enhancing installation safety and mitigating the potential risks associated with improper installations that can ultimately jeopardize lives.

2. 2018 IFGC Code Commentary, Section 503.4.1.
3. Canadian adds 2007 Supplement to Natural Gas & Propane Installation Code (CSA B149-1S1-07), requiring all plastic vent piping to

be certified to ULC S636. https://www.achrnews.com/articles/topic/2670-canada?page=32

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

UL systems are already installed on a daily occurrence, these edits clarify the listing standards that flue gas venting fall under.

FG8-24

FG9-24

IFGC: [M] 614.9.6

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS PROPOSAL WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Fuel Gas Code

Revise as follows:

[M] 614.9.6 Exhaust duct required. Where space for a gas-fired clothes dryer is provided, an exhaust duct system shall be installed. Where the clothes dryer is not installed at the time of occupancy, the exhaust duct shall be capped at the location of the future dryer.

~~**Exception:** Where a *listed* condensing clothes dryer is installed prior to occupancy of the structure.~~

Reason: Clarifies that these provisions in the IFGC and Fuel Gas Chapter 24 of the IRC only apply to cases where provisions for a gas clothes dryer have been provided. These provisions would be identified by the presence of a gas outlet in the laundry area. Because condensing-type and heat pump clothes dryers (which do not require exhaust ducts) would not coincide with provisions for a gas outlet in new construction, then the exception is not needed.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These comments are editorial clarifications for code usability and do not change the substantive requirements.

FG9-24

FG10-24

IFGC: 704.1.2.4

Proponents: Christopher Adam Smith, Viega, LLC, Codes and Standards Manager for Viega, LLC

2024 International Fuel Gas Code

Revise as follows:

704.1.2.4 Joints.
Joints in *piping* and tubing in hydrogen service shall be *listed* as complying with ASME B31.3 to include the use of welded, brazed, flared, socket, press-connect, and slip and compression fittings. Gaskets and sealants used in hydrogen service shall be *listed* as complying with ASME B31.12. Threaded and flanged connections shall not be used in areas other than hydrogen cutoff rooms and outdoors.

Reason: When approved by the manufacturer and meeting all of the required standards, press-connect technology is an acceptable joining method for hydrogen piping that provides a joint that is equal to or better than traditional pipe joining methods. The addition of this joining method to the list of approved joints will allow for more options available to the installer.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of joint type does not increase the cost of construction. The additional joint type allows for a wider selection of materials but does not make their use mandatory. By including this additional joint type in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

FG10-24

FG11-24 Part I

IFGC: SECTION 202, SECTION 202 (New), 301.3.1 (New), 301.3.2 (New), 301.5, 634.1, 701.1, 705.5.4

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE FUEL GAS CODE COMMITTEE. PART II WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Fuel Gas Code

Revise as follows:

FUEL GAS. A natural gas, manufactured gas, liquefied petroleum gas or mixtures of these gases including up to 5-percent hydrogen gas by volume.

Add new definition as follows:

HYDROGEN ADMIXTURE.
Fuel gas to which hydrogen is blended or mixed by the fuel supplier or at the point of delivery greater than 5% and less than 95%.

Add new text as follows:

301.3.1 Appliances and equipment listed and labeled for use with hydrogen admixture. Appliances and equipment operating on hydrogen admixtures shall be listed and labeled for operation on the hydrogen admixture limits defined under Section 101.2.1.1.

301.3.2 Piping systems listed and labeled for use with hydrogen admixture. Piping systems and fuel gas system components shall be listed and labeled for the applicable hydrogen admixture limits.

Revise as follows:

301.5 Label information. A permanent factory-applied nameplate(s) shall be affixed to *appliances* on which shall appear in legible lettering, the manufacturer's name or trademark, the model number, serial number and, for *listed appliances*, the seal or mark of the testing agency. A label shall include the hourly rating in British thermal units per hour (Btu/h) (W); the type of fuel gas *approved* for use with the *appliance*; and the minimum *clearance* requirements.

634.1 Installation.
The installation of gaseous hydrogen systems shall be in accordance with ~~the applicable requirements~~ Chapter 7 of this code, the *International Fire Code* ~~and~~ the *International Building Code* and NFPA 2.

701.1 Scope.
The installation of *gaseous hydrogen systems* shall comply with this chapter, ~~and~~ Chapters 53 and 58 of the International Fire Code and NFPA 2. Compressed gases shall also comply with Chapter 50 of the International Fire Code for general requirements.

705.5.4 Placing equipment in operation.
After the *piping* has been placed in operation, all *equipment* shall be purged in accordance with ~~Section 707.2~~ NFPA 2 and then placed in operation, as necessary.

Reason: FUEL GAS

Natural gas utilities are implementing projects to blend gaseous hydrogen into natural gas to reduce their systems and consumers' "carbon footprints." Hydrogen admixtures have raised questions of compatibility of these blends with existing appliances, equipment, and piping systems and components.

Following the submission of a request for interpretation, CSA Group standards Technical Committees were provided access to a range of test data from a variety of sources, and upon careful review and analysis, agree that natural gas containing up to and including 5% of

Hydrogen is covered by testing with Test Gas A. The Request for Interpretation (RFI), and the position of the Technical Committees, have been published here:https://www.csagroup.org/documents/Formal_Interpretations.pdf

As a result, PMG CAC sees no reason to add specifications for such blends in ANSI accredited standards. However, code officials using the ICC Codes would be aided in understanding through the definition of ‘fuel gas’ that such blends are covered through the revised definition.

HYDROGEN ADMIXTURE

The proposed definition is to address Hydrogen Admixtures in the IFGC. Currently provisions do not exist to address Hydrogen Admixtures and their ranges when introduced to natural gas. Chapter 7 of the IFGC regulates Gaseous Hydrogen Systems which are defined as being 95% or higher GH2. This definition will help address ranges of hydrogen admixtures from 6%-94%.

Section 301.3.1

This is one of several proposals that address the potential for hydrogen admixtures. This specific proposal is designed to clarify that Appliances which operate on hydrogen admixtures are treated the same way all other fuel burning appliances are considered. They need to be listed and labeled for the specific fuel mixture that is supplied. This section is applicable to the IRC Chapter 24 as well as the IFGC.

Section 301.3.2

This is one of several proposals that address the potential for hydrogen admixtures. This specific proposal is designed to clarify that all piping and components which are intended to carry hydrogen admixtures are treated the same way all other piping and system components are considered. They need to be listed and labeled for the specific fuel mixture that is being transported. This section is applicable to the IRC Chapter 24 as well as the IFGC.

Section 301.5This proposal updates the current word fuel to fuel gas to ensure correlation to the revised definition for fuel gas that includes up to 5% hydrogen admixture by volume. All other fuels in accordance with Section 301.1.1 shall be regulated by the International Mechanical Code.

Section [A]101.2.1 scopes gaseous hydrogen systems directly to Chapter 7 which is complete for the for the piping system. A direct link to NFPA 2 has been provided for additional provisions that standard provides for.

Section 701.1

Once the user gets to the IFC references they find pointers to NFPA 2. This provides for a direct linkage which is important for those jurisdictions that do not use the IFC for construction purposes.Section 705.5.4

The IFC relies on NFPA 2 for this requirement and this change provides for consistency, Section 707.2 is proposed to be modified to point to NFPA 2.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of different fuel types to address the trend towards blended fuels.

FG11-24 Part I

FG11-24 Part II

IFGC: [F] 633.1, [F] 703.4, [F] 706.1, [F] 707.1, [F] 707.2, [F] 708.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Fuel Gas Code

Revise as follows:

[F] 633.1 General. Stationary fuel-cell power systems having a power output not exceeding 10 MW shall be ~~tested~~ listed in accordance with ANSI/CSA FC 1 and shall be installed in accordance with the manufacturer's instructions, NFPA 853, the *International Building Code* and the *International Fire Code* . Hydrogen fuel cell power systems shall also comply with Chapter 7 of this code and NFPA 2.

[F] 703.4 Venting.
Relief device vents shall be terminated in an *approved* location in accordance with ~~Section 2309 of the International Fire Code~~ NFPA 2.

[F] 706.1 General.
The location and installation of *gaseous hydrogen systems* shall be in accordance with Sections 706.2 and 706.3.

~~**Exception:** Stationary fuel-cell power plants in accordance with Section 633.~~

[F] 707.1 Maintenance.
Gaseous hydrogen systems and detection devices shall be maintained in accordance with the *International Fire Code*, ~~and~~ the manufacturer's installation instructions and NFPA 2.

[F] 707.2 Purging.
Purging of *gaseous hydrogen systems*, other than *piping* systems purged in accordance with Section 705.5, shall be in accordance ~~with Sections 2309.6 and 2309.6.1 of the International Fire Code or in accordance~~ with the system manufacturer's instructions and NFPA 2.

[F] 708.1 General.
The design of liquefied hydrogen systems shall comply with Chapters 55 and 58 of the International Fire Code and NFPA 2.

Reason: .

Section [F] 633.1

The word "tested" has been changed to "listed", FC1 is a listing standard. A general reference to NFPA 2 has been added for linkage without having to traverse through the IFC.

Section [F] 703.4

The IFC does not contain the vent termination requirements, that is contained in NFPA 2. Plus, the IFC section pointed to only applies to motor vehicle fueling and repair activities.

Section [F] 706.1

The exception should be deleted, gaseous hydrogen piping systems associated with fuel cell power plants need to be installed in accordance with Chapter 7.

Section [F] 706.2

The IFC has requirements and should be linked here, the "or "should be a "and".

Section [F] 706.3

Section 2309.3.1.1 is the incorrect reference; it only applies to motor fueling. The correct references are Chapters 55 and 58 of the IFC along with NFPA 2.

Section [F] 707.1

NFPA 2 is an important reference, particularly where the IFC is not utilized.

Section [F] 707.2

The IFC relies on NFPA 2 for purging and the IFC sections referenced are limited to motor vehicle fueling.

Section [F]708.1Chapter 58 of the IFC should have been included as the flammable gas chapter. The bulk of the requirements for these systems are found in NFPA 2.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of different fuel types to address the trend towards blended fuels.

TENTATIVE ORDER OF DISCUSSION
2024 PROPOSED CHANGES TO THE
INTERNATIONAL MECHANICAL CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some M code change proposals may not be included on this list, as they are being heard by another committee.

IMC®: SECTION 202

Proponents: Kevin Gebke, DuctSox, DuctSox/Engineering Manager (kgebke@ductsox.com)

2024 International Mechanical Code

Revise as follows:

AIR DISPERSION SYSTEM. Any diffuser system designed to both convey air within a room, space or area and diffuse air into or out of that space while operating under positive or negative pressure. Systems are commonly constructed of, but not limited to, fabric or plastic film.

Reason: UL 2518 Standard for Air Dispersion Systems was updated and published on April 6, 2023. The update recognized that Air Dispersion Systems can be operated in both positive and negative pressure modes if the correct products are specified. This proposal looks to align the IMC and the UL 2518 standard.

Bibliography: UL 2518 Standard for Air Dispersion Systems - April 6, 2023

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply aligns the UL 2518 standard and the IMC and has no impact on cost of construction.

M1-24

M2-24

IMC®: CHAPTER 2, SECTION 202, CHAPTER 4, SECTION 403, 403.3.2, 403.3.2.1, 403.3.2.3, TABLE 403.3.2.3

Proponents: Gayathri Vijayakumar, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (gayathri@swinter.com); Dylan Martello, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (dmartello@swinter.com)

2024 International Mechanical Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

BALANCED VENTILATION SYSTEM. A ventilation system that simultaneously supplies outdoor air to and exhausts air from a space, where the mechanical supply airflow rate and the mechanical exhaust airflow rate are each within 10 percent of the average of the two airflow rates.

CHAPTER 4 VENTILATION

SECTION 403 MECHANICAL VENTILATION

403.3.2 Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and ventilation systems for outdoor air in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1) \quad \textbf{(Equation 4-9)}$$

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The whole-house ventilation system is a *balanced ventilation system*.

Revise as follows:

403.3.2.3 Local exhaust. Local exhaust systems shall be provided in kitchens, bathrooms and toilet rooms and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.3.

Exception: Where the outdoor air ventilation system is a *balanced ventilation system*, the minimum continuous kitchen exhaust rate shall be reduced to 25 cfm and the minimum continuous bathroom exhaust rate shall be reduced to 20 cfm.

TABLE 403.3.2.3 MINIMUM REQUIRED LOCAL EXHAUST RATES FOR GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Attached Files

- **2027 IMC balanced dwelling unit ventilation examples.xlsx**
  https://www.cdpaccess.com/proposal/10566/30527/files/download/4344/

Reason: There is an exception 2.2 allowed in 403.3.2.1 which is impractical for use since there isn't a corresponding exception in 403.3.2.3. In a balanced system, if you reduce the supply air, you must also allow for a reduction in the exhaust air flows. This proposal creates that needed exception. The attached excel file demonstrates that these lower proposed continuous exhaust values (25cfm/kitchen and 20 cfm/bath) make the exception 2.2 more feasible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no expected change in cost - maybe a cost decrease since it could reduce the capacity needed for the balanced ventilation system.

M2-24

M3-24

IMC®: SECTION 202 (New), CHAPTER 4, SECTION 405, 405.1, 405.2 (New)

Proponents: Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org)

2024 International Mechanical Code

Add new definition as follows:

BUILDING READINESS PLAN. A plan that documents the engineering controls that the facility mechanical systems will use for the facility to achieve its goals in non-normal mode.

CHAPTER 4 VENTILATION

SECTION 405
SYSTEMS CONTROL

405.1 General. Mechanical ventilation systems shall be provided with manual or automatic controls that will operate such systems whenever the spaces are occupied. Air-conditioning systems that supply required *ventilation air* shall be provided with controls designed to automatically maintain the required outdoor air supply rate during occupancy.

Add new text as follows:

405.2 Alternate Operation Capabilities. Where facilities are designed to operate in various modes in response to natural or manmade threat to/exposure of the building, the following shall be documented through an approved Building Readiness Plan (BRP). The BRP shall include the operations and maintenance (O&M) procedures involved in this operating mode, the mechanical equipment affected, final design drawings, critical asset inventory management plan, maintenance schedules, the maintenance requirements, frequencies, and establish a return to normal mode review period.

Reason: The Pandemic has demonstrated that it may be required to change operating mode of building mechanical ventilation systems under certain circumstances. These circumstances may include natural disasters such as forest fire, hurricane, pandemic, etc. or manmade such as terrorism, civil unrest, etc.

Building mechanical ventilation systems are now being built with different operating modes to reduce economic impact on the building and its occupant activities.

When such mode is created, they shall be documented for building operator to be aware of the capabilities available to operate the building.

The code does not mandate the need for alternative operating mode.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal documents alternate operational capabilities and does not impact construction.

M4-24

IMC®: SECTION 202

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

~~BRAZED~~ JOINT, BRAZED. A gastight joint obtained by the joining of metal parts with metallic mixtures or alloys that melt at a liquidus temperature above ~~1,000~~ 840°F (~~538~~ 450°C), but lower than the melting solidus ~~temperature~~ temperatures of the parts to be joined.

JOINT, SOLDERED. A gastight joint obtained by the joining of metal parts with metallic mixtures of alloys that melt at liquidus temperatures between 400°F (~~204~~ 205°C) and ~~1,000~~ 840°F (~~538~~ 450°C).

Reason: The updated definitions are better aligned with ASHRAE 15 and standards for welding. The previous temperature values would lead to a "dead zone" in the weld.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change only impacts welding settings; it does not change requirements related to construction costs.

M4-24

M5-24

IMC®: SECTION 202

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

BOILER.
A closed heating *appliance* intended to supply *hot water* or steam for space heating, processing or power purposes. Low-pressure boilers operate at pressures less than or equal to 15 pounds per square inch (psi) (103 kPa) for steam and 160 psi (1103 kPa) for water. High-pressure boilers operate at pressures exceeding those pressures. Multipurpose or combination boilers indirectly heat potable water through a heat exchanger.

WATER HEATER.
Any heating *appliance* or *equipment* other than a *boiler* that heats potable water and supplies such water to the potable *hot water* distribution system. Water heaters operate at pressures less than or equal to 150 pounds per square inch (psi) (1035 kPa) and 210°F (99°C). Multipurpose or combination water heaters provide space heating using the *hot water* supplied.

Reason: Clarify distinction between boilers and water heaters. Align with IMC 1002.2.2 which permits dual purpose water heaters using potable water hot water system, and IPC 608.17.3 which permits indirect heating of potable water by boilers.

The addition of water heater operating parameters provides distinction with the boiler definition which provides analogous parameters and aligns with the values in IPC 504.5.

These definitions are based on the appliance function which correlates to the standard(s) to which the appliance is listed. It is not uncommon for an appliance to be dual listed to as complying with more than one standard, and to be able to be configured for different uses. As an example, a commercial appliance may be simultaneously listed as conforming to a water heater standard, a boiler standard, and a pool and spa heater standard. The definition of this example appliance when installed would depend on how it is configured and utilized within the mechanical and plumbing system.

While some jurisdictions require compliance with ASME BPVC above certain vessel sizes and input capacities (e.g. 200,000 BTU/H input capacity and 120 gallon tank size), the distinction between a water heater and boiler is not dependent upon these parameters. The scope and requirements of the applicable product standards do not make these distinctions, and the function and requirements of the appliance within the mechanical and plumbing systems under scope of the IMC and IPC do not change based on these parameters.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal only clarifies the distinction between boilers and WHs .

M5-24

M6-24

IMC®: SECTION 202 (New), 313.1 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Add new definition as follows:

CARBON DIOXIDE ENRICHMENT SYSTEM.
A system where carbon dioxide gas is intentionally introduced into an indoor environment, typically for the purpose of stimulating plant growth.

Add new text as follows:

313.1 Bulk CO2 Storage and Piping Systems. Bulk CO2 storage and piping systems containing more than 100 pounds which are serving carbon dioxide enrichment systems for plant growthand carbonated beverage systems shall be designed and installed in accordance with the provisions of Chapter 53 of the *International Fire Code.*

Reason: The recent popularity of indoor plant growing facilities across the country has led to a marked increase in the employment of compressed gasses for the enrichment of air within the growing area, with carbon dioxide in various types of indoor growing rooms. While CO2 exposure is vital to plant growth, in the wrong concentration, it can be lethal for an individual occupying the growing room space.

Inconsistent and unclear direction has led to a lack of uniform enforcement regarding these installations. Although Section 102.9 of the International Mechanical Code provides the code official with latitude to make decisions, which is not expressly covered in the code, this pointer would offer a clear path to a definitive procedure for compliance with a safe methodology.Some jurisdictions may utilize the Fire Service, Mechanical, Plumbing, or Building Inspectors for review and inspection of these systems. The IMC currently does not provide a clear procedure or reference to a standard by which such a piping and storage system is to be installed and tested. However, Chapter 53 of the International Fire Code provides such direction. The objective of this new section is to create a pointer to the International Fire Code for the installation of these systems.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is simply a correlation between codes.

M6-24

M7-24

IMC®: SECTION 202; IFGC: SECTION 202

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Mechanical Code

Revise as follows:

COMBUSTIBLE MATERIAL. Any material not classified as a noncombustible material. ~~defined as noncombustible~~.

2024 International Fuel Gas Code

Revise as follows:

[M] COMBUSTIBLE MATERIAL. Any material not classified as a noncombustible material ~~defined as noncombustible~~.

Reason: ICC definitions should not contain requirements. The present IMC definition of "noncombustible material" does actually contain the requirement that the material passes ASTM E136. Therefore, this proposal recommends a change in language so that a combustible material is one that is not "classified" (rather than "defined") as a noncombustible material.

Section 703.3.1 of the IBC determines how to classify a material as noncombustible. If a material does not comply with those requirements it is not noncombustible. However,. the IBC does not define a material as noncombustible. This proposal addresses both the IMC and the IFGC definitions because the IFGC definition is shown as being under the responsibility of the IMC (as it is preceded by [M]).

Alternate proposals recommend that the IMC and IFGC replace their definitions of a noncombustible material by referencing section 703.3.1 of the IBC, and moving the requirements to be placed in Chapter 3, on general requirements.

IBC language:

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This simply changes a definition.

M7-24

M8-24

IMC®: SECTION 202 (New), 403.1, 403.3.2.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Add new definition as follows:

CORRIDOR. An enclosed *exit access* component that defines and provides a path of egress travel.

Revise as follows:

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air*. ~~except that mechanical *ventilation air* requirements for Group R-2, R-3 and R-4 *occupancies* shall be provided by an exhaust system, supply system or combination thereof.~~The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.
Exception: Systems that are designed and installed in accordance with Section 403.3.2.1 and Chapter 6.

403.3.2.1 Outdoor air for dwelling units. Where a *dwelling unit* of new construction opens to a corridor, *outdoor air* shall be mechanically supplied directly to the *dwelling unit*. For other *dwelling units*,~~An~~ outdoor air ~~ventilation system consisting of a~~shall be provided using a ~~mechanical exhaust system,~~ mechanical exhaust system, mechanical supply system or combination thereof~~ shall be installed for each *dwelling unit*~~. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as components of such a system.
403.3.2.2 *Outdoor air* rate for *dwelling units.*

The *dwelling unit's* outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor air~~flow~~ rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1) \qquad \textbf{(Equation 4-9)}$$

where:
Q_{OA} = outdoor air~~flow~~ rate, cfm
A_{floor} = conditioned floor area, ft^2
N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air~~flow~~ rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum ~~mechanical ventilation~~*outdoor air* rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies ~~*ventilation*~~*outdoor air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The ~~whole-house ventilation~~*outdoor air* ventilation system is a *balanced ventilation system*.

Reason: Both ASHRAE 62.2 and the IMC require outdoor air to be provided to dwelling units. Research has demonstrated that a large percentage of the leakage area for attached dwelling units opening to enclosed corridors occurs across the corridor wall.[1] If an exhaust-only system is used to provide outdoor air for such units, we cannot realistically expect one unit of exhaust air to provide one unit of outdoor air. Increasing the exhaust airflow could potentially overcome the deficit, but this would also be expected to draw more air from the enclosed corridor, which is not permitted by IBC Section 1020.5 and IMC Section 601.2 (i.e., “Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.”). To ensure that outdoor air is provided directly to dwelling units opening to corridors, 62.2 was recently amended to prohibit exhaust-only ventilation systems from providing the outdoor air required by the standard. Increasing the exhaust airflow rate could also draw more air from adjacent units. This proposal will align the IMC’s requirements for ventilation of dwelling units that open to a corridor with the requirements of ASHRAE 62.2. For clarity, this proposal cross-walks the IBC definition for corridor to the IMC. There is no need to reference an “enclosed corridor” because the enclosed nature is part of the proposed definition of corridor.

Bibliography: 1. Bohac D., and Sweeney L. 2020. Energy Code Field Studies: Low-Rise Multifamily Air Leakage Testing. Prepared by the Center for Energy and Environment, Ecotope, and The Energy Conservatory. Prepared for the U.S. Department of Energy Office of Energy Efficiency & Renewable Energy.
https://www.energycodes.gov/sites/default/files/documents/LRMF_AirLeakageTesting_FinalReport_2020-07-06.pdf. [See Table 45, which shows average leakage to “common” area of 42% for 211 tightly- constructed dwelling units in 20 buildings of new construction located in 6 states. The report also notes, “for buildings in this study, “common areas” are made up almost completely of corridors and a few small rooms such as mechanical closets and elevator rooms. The 42% leakage did not include leakage around the door separating a dwelling unit from the corridor, which would have further increased this value.]

Cost Impact: Increase

Estimated Immediate Cost Impact:

$513

Estimated Immediate Cost Impact Justification (methodology and variables):

An entry-level supply fan serving a single unit would cost about $240 (retail pricing as of May 22, 2023 through www.supplyhouse.com). According to Gordian Mechanical Costs with RSMeans data, 6” insulated flex duct would cost about $10.29/linear foot (line 233346101940; price includes installed cost for material and labor with contractor O&P and builder markup of 10%). For 20 feet of duct (to carry the supply air from an exterior wall to a supply register above the dwelling unit entryway), the ductwork is estimated at $10.29*20 = $206. A supply register is $67: $33 for the part and $34 for labor, based on an average of two HVAC contractor estimates. This provides the combined cost of $240+$206+$67 = $513.

Estimated Life Cycle Cost Impact:

$961

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Assumes the supply fan is replaced after 15 years and a discount factor of 3% for a net present value of $154, but the ductwork and register do not need to be replaced. Assumes filter replacement twice per year at $15 each, for a net present value of $294. Combining the immediate cost and replacement cost: $513 + $154+$294 = $961

Note, however, that IMC Section 601.2 prohibits corridors from serving as “ventilation air ducts.” Because the corridor is not permitted to provide the required volume of outdoor air to the dwelling unit, it is incumbent on the designer to demonstrate that an exhaust-only system has been engineered to deliver the volume of outdoor air required. The additional system components needed to do so (e.g., dedicated outdoor air inlets, exhaust fan with higher ventilation capacity and larger ducting, improved air sealing of the dwelling unit to the corridor, etc.) and associated energy costs to operate them, would help to offset the incremental cost incurred for the supply system. For example, a study (2025-T24-Final-CASE-Report-MF-IAQ.pdf (title24stakeholders.com)) found that compartmentalizing dwelling units to 0.3 cfm50/sf was approximately $450 and to 0.23 cfm50/sf was approximately $900, for an incremental sealing cost of $450 to reach the tightness required for exhaust-only systems to pull air through passive vents. (Although 0.23 cfm50/sf may not be tight enough, as discussed in Copy-of-Passive-vent-calculator-to-post-to-CARB-siteMACRO.xlsm (live.com). Assuming four passive vents at $50 each ($25 per vent, $25 for labor), an exhaust-only system has an immediate cost of approximately $450 + 4 x $50 = $650, similar to the supply-only system. Furthermore, exhaust-only systems introduce unfiltered particulate matter which can worsen IAQ, and drafts which cause discomfort to occupants.

M9-24

IMC®: SECTION 202 (New), 1104.2, 1106.3, 1106.4

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Add new definition as follows:

EFFECTIVE DISPERSAL VOLUME.
The volume of a space or connected spaces in which leaked *refrigerant* will disperse.

EFFECTIVE DISPERSAL VOLUME CHARGE (EDVC).
The maximum *refrigerant* charge permitted for an *effective dispersal volume.*

Revise as follows:

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components containing the refrigerant shall be located either outdoors or in a *machinery room* where the quantity of refrigerant in an independent circuit of a *refrigeration system* exceeds both of the following:

1. T~~t~~he amounts shown in Table 1103.1, and
2. The effective dispersal volume charge as calculated in accordance with ASHRAE 15.

For refrigerant blends not listed in Table 1103.1, the same requirement shall apply ~~where the amount for any blend component exceeds that indicated in Table 1103.1~~ for each~~that~~ component. ~~This~~These requirements shall also apply where the combined amount of the blend components exceeds a limit of 69,100 parts per million (ppm) by volume. *Machinery rooms* required by this section and containing only Group A1 or B1 refrigerants shall be constructed and maintained in accordance with Section 1105. ~~for Group A1 and B1 refrigerants and in accordance with Sections 1105 and 1106 for Group A2, B2, A3 and B3 refrigerants.~~ *Machinery rooms* required by this section and containing any Group A2, B2, A3, or B3 flammable refrigerants shall be constructed and maintained in accordance with Sections 1105 and 1106. *Machinery rooms* required by this section, containing any Group A2L or B2L flammable refrigerants and containing no Group A2, B2, A3, or B3 flammable refrigerants, shall be constructed and maintained in accordance with Section 1105 and Section 1106.4.1 through 1106.4.3.

Exceptions:

1. *Machinery rooms* are not required for *listed equipment* and *appliances* containing not more than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant's safety classification, where installed in accordance with the *equipment's* or *appliance's* listing and the *equipment* or *appliance* manufacturer's installation instructions.
2. Piping in compliance with Section 1107 is allowed in other locations to connect components installed in a *machinery room* with those installed outdoors.

1106.3 Class 2 and 3 refrigerants. Where any flammable refrigerants of Groups A2, A3, B2 and B3 are used, the *machinery room* shall conform to the Class I, Division 2, *hazardous location* classification requirements of NFPA 70.

1106.4 Group A2L and B2L refrigerants. *Machinery rooms* ~~for~~containing any Group A2L ~~and~~or B2L refrigerants and containing no refrigerants of Group A2, A3, B2, or B3 shall comply with Sections 1106.4.1 through 1106.4.3.

Reason: This proposal harmonizes with Addendum q to ASHRAE 15-2019. The latest published language of ASHRAE 15-2022 was used as the basis for this update. The revisions clarify which requirements apply in cases where a machinery room contains refrigerants from multiple safety groups. The revisions also refer to ASHRAE 15 for EDVC calculations, with the updated requirements for refrigerant charge quantity limits, for determination of when a machinery room is required.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will have no impact on the cost of construction. These changes for clarity are largely editorial in nature to better align the IMC with ASHRAE 15.

M9-24

M10-24

IMC®: CHAPTER 2, SECTION 202, CHAPTER 4, SECTION 401, 401.4, CHAPTER 5, SECTION 501, 501.3, 501.3.1

Proponents: Gayathri Vijayakumar, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (gayathri@swinter.com)

2024 International Mechanical Code

CHAPTER 2 DEFINITIONS

SECTION 202
GENERAL DEFINITIONS

ENVIRONMENTAL AIR. Air that is conveyed to or from occupied areas through ducts that are not part of the heating or air-conditioning system, such as ventilation for human usage, domestic kitchen range exhaust, bathroom exhaust, domestic clothes dryer exhaust and parking garage exhaust.

CHAPTER 4 VENTILATION

SECTION 401
GENERAL

401.4 Intake opening location.
Air intake openings shall comply with all of the following:

1. Intake openings shall be located not less than 10 feet (3048 mm) from lot lines or buildings on the same lot.
2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks, except as specified in Item 3 or Section 501.3.1. Outdoor air intake openings shall be permitted to be located less than 10 feet (3048 mm) horizontally from streets, alleys, parking lots and loading docks provided that the openings are located not less than 25 feet (7620 mm) vertically above such locations. Where openings front on a street or public way, the distance shall be measured from the closest edge of the street or public way.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening. Separation is not required between intake air openings and living space *exhaust air* openings of an individual *dwelling unit* or *sleeping unit* where a factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the fan manufacturer's instructions.
4. Intake openings on structures in flood hazard areas shall be at or above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment.

CHAPTER 5 EXHAUST SYSTEMS

SECTION 501
GENERAL

501.3 Exhaust discharge. The air removed by every mechanical exhaust system shall be discharged outdoors at a point where it will not cause a public nuisance and not less than the distances specified in Section 501.3.1. The air shall be discharged to a location from which it cannot again be readily drawn in by a ventilating system. Air shall not be exhausted into an attic or crawl space, or be directed onto walkways.

Exceptions:

1. Whole-house ventilation-type attic fans shall be permitted to discharge into the attic space of *dwelling units* having private attics.
2. Commercial cooking recirculating systems.
3. Where installed in accordance with the manufacturer's instructions and where mechanical or *natural ventilation* is otherwise provided in accordance with Chapter 4, *listed* and *labeled* domestic ductless range hoods shall not be required to discharge to the outdoors.

Revise as follows:

501.3.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings that are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings, except where the exhaust opening is located not less than 1 foot (305 mm) above the gravity air intake opening into buildings for all *occupancies* other than Group U; and <u>not less than 3 feet (914 mm) above mechanical air intakes where such intakes are located within </u>10 feet (3048 mm) <u>of the exhaust termination </u>~~from mechanical air intakes~~. Such exhaust shall not be considered hazardous or noxious. Separation is not required between intake air openings and living space *exhaust air* openings of an individual *dwelling unit* or *sleeping unit* where a factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the fan manufacturer's instructions.
4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment.
5. For specific systems, see the following sections:
   - 5.1. Clothes dryer exhaust, Section 504.4.
   - 5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
   - 5.3. Dust, stock and refuse conveying systems, Section 510.2.
   - 5.4. Subslab soil exhaust systems, Section 511.4.
   - 5.5. Smoke control systems, Section 512.10.3.
   - 5.6. Refrigerant discharge, Section 1105.7.
   - 5.7. *Machinery room* discharge, Section 1105.6.1.

Reason: This proposal seeks to align requirements in Chapter 4 and 5 for the minimum distance required between outdoor air intakes and terminations of environmental exhaust air. Specifically for dwelling units in multifamily, it seems the intent of the requirements is to maintain either 10 ft separation OR a minimum of 3 ft vertical distance between the dwelling unit exhaust from bathrooms and kitchens and their outdoor air intakes. The proposed edit in Chapter 5 uses language from Chapter 4 to create consistency.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact since the requirement in Chapter 5 is being revised to be consistent with the requirement in Chapter 4.

M10-24

M11-24

IMC®: SECTION 202 (New), 1104.5 (New)

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Add new definition as follows:

GROUP CONTROLLER.
An electrical or electronic control system that monitors and responds to multiple distinct inputs from two or more appliances or refrigeration machinery units.

Add new text as follows:

1104.5 Group Controller Requirements. Utilization of a group controller for multiple refrigeration systems serving the same space or connected spaces shall comply with the following:

1. The refrigerant detection system for each refrigeration system shall provide a signal to notify the group controller when mitigation actions are required in accordance with ASHRAE 15.
2. Where a group controller determines that a signal comes from one or more specific refrigeration systems, it shall be permitted for the group controller to specify which refrigeration systems activate or deactivate mitigation actions in accordance with ASHRAE 15. Where a group controller cannot determine the specific source of a signal, the group controller shall require all of the refrigeration systems serving the same space or connected spaces to activate mitigation actions in accordance with ASHRAE 15.

Reason: This code change proposal is for correlation with proposed revisions within Addendum t, ASHRAE 15-2022. Addendum t has undergone three Publication Public Reviews (PPRs) and is expected to be published in advance of the Technical Committee meetings. The requirements around group controllers contained within Addendum t are vital for data center applications, and detail how group controllers interact with refrigeration system mitigation strategies.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes will have no impact on the cost of construction. Use of a group controller is optional for refrigeration systems.

M11-24

M12-24

IMC®: SECTION 202

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

MACHINERY ROOM. ~~An enclosed space that is required by Chapter 11 to contain refrigeration *equipment* and to comply with Sections 1105 and 1106.~~
A designated space meeting the requirements of Sections 1105 and 1106 that contains one or more refrigerating systems or portions thereof.

Reason: The proposed change creates better language for a definition to avoid creating what looks like a requirement (to be enclosed), as that is better to do in the main text of Chapter 11.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial only. We consider it editorial because the original takes information from 1105 and 1106 and includes it in the definition. We are not saying this information no longer applies, but that it's not appropriate for a definition. In other words, the definition should not say when a space is to be enclosed; that should be determined between 1105 and 1106.
"Enclosed space" is now a designated space that meets 1105 and 1106 (same compliance is expected as before).

"Contain refrigerant equipment" means to contain one or more refrigerating systems or portions thereof (same meaning but probably less possibility for gaming).

M12-24

M13-24

IMC®: SECTION 202, 202

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Mechanical Code

PIPING. Where used in this code, “piping” refers to either pipe or tubing, or both.

Revise as follows:

Pipe. A rigid conduit of iron, steel, copper, copper-alloy, ~~or~~ plastic or multilayer composite. .

Tubing. Semirigid conduit of copper, copper-alloy, aluminum, plastic or steel.

Reason: Table 1202.4 of the IMC allows the use of multilayer composite pipes, such as those produced according to ASTM F1281 or F1282, or CSA B137.9 or B137.10, yet these types of approved piping materials are not included in the definition for pipe. Therefore, this code change will improve the definition for "pipe" to clarify that approved pipe materials produced using multilayer composite are included.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Table 1202.4 of the IMC allows the use of multilayer composite pipes, such as those produced according to ASTM F1281 or F1282, or CSA B137.9 or B137.10, yet these types of approved piping materials are not included in the definition for "pipe". Therefore, this proposal will improve the definition of "pipe" to clarify that approved pipe materials produced using multilayer composite are included.

M13-24

M14-24

IMC®: SECTION 202 (New), TABLE 403.3.1.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Add new definition as follows:

PRIVATE GARAGE.
A building or portion of a building in which motor vehicles used by the *owner* or tenants of the building or buildings on the premises are stored or kept, without provisions for repairing or servicing such vehicles for profit.

Revise as follows:

TABLE 403.3.1.1 MINIMUM VENTILATION RATES

Portions of table not shown remain unchanged.

OCCUPANCY CLASSIFICATION	OCCUPANT DENSITY #/1000 FT^2 [a]	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_p CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_a CFM/FT^2 [a]	EXHAUST AIRFLOW RATE CFM/FT^2 [a]
Private dwellings, single and multiple				
Private garages ~~Garages, common for~~ serving multiple units[b]	—	—	—	0.75

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 $m^3/(s \times m^2)$, °C = [(°F) – 32]/1.8, 1 square foot = 0.0929 m^2.

a. Based on net occupiable floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet, urinal or adult changing station. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

g. Mechanical exhaust is required and recirculation from such spaces is prohibited. For occupancies other than science laboratories, where there is a wheel-type energy recovery ventilation (ERV) unit in the exhaust system design, the volume of air leaked from the exhaust airstream into the outdoor airstream within the ERV shall be less than 10 percent of the outdoor air volume. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).

h. For nail salons, each manicure and pedicure station shall be provided with a source capture system capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

i. Outpatient facilities to which the rates apply are freestanding birth centers, urgent care centers, neighborhood clinics and physicians' offices, Class 1 imaging facilities, outpatient psychiatric facilities, outpatient rehabilitation facilities and outpatient dental facilities.

j. The requirements of this table provide for acceptable IAQ. The requirements of this table do not address the airborne transmission of airborne viruses, bacteria and other infectious contagions.

k. These rates are intended only for outpatient dental clinics where the amount of nitrous oxide is limited. They are not intended for dental operatories in institutional buildings where nitrous oxide is piped.

l. The occupiable floor area in warehouses shall not include the floor area of self-storage units, floor areas under rack storage or designated palletized storage floor areas.

Reason: There have been numerous instances where users of the code did not understand the existing language. A private garage serving a single unit does not require exhaust. However, where a private garage serves multiple units, exhaust is required.

The Private Garage definition comes from the IBC and is being added to the IMC to increase clarity of the term used in Table 403.3.1.1. The definition is intended to have a BG scoping.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Just to correlate the two codes.

M14-24

M15-24

IMC®: SECTION 202 (New), 917.3 (New), UL Chapter 15 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Mechanical Code

Add new definition as follows:

ROBOTIC COMMERICIAL KITCHEN EQUIPMENT. Cooking equipment with robotic or automatic systems intended to be used in lieu of, or in collaboration with, skilled commercial kitchen staff to perform cooking and /or motor-operated food preparing operations in commercial kitchens where they are not ordinarily accessed by the general public.

Add new text as follows:

917.3 Robotic Commercial Kitchen Equipment. *Robotic commercial kitchen equipment* shall be *listed* and *labeled* in accordance with UL 3320 and installed in accordance with the manufacturer's instructions.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

3320-2023 Outline of Investigation for Robotic Commercial Kitchen Equipment

Reason: Robotic kitchen equipment for commercial applications is an emerging technology. This proposal identifies UL 3320 as the standard requirements used for third party certification (listed and labeled) of robotic commercial kitchen equipment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost for obtaining listed robotic kitchen equipment may or may not represent increased product costs over obtaining non-listed produc

Obtaining and maintaining a listing for listed robotic kitchen equipment involves both product investigation costs and costs for periodic ins

M16-24

IMC®: 306.5

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

306.5 Equipment or appliances on roofs or elevated structures. Where *equipment* requiring access or *appliances* are located on an elevated structure or the roof of a building such that personnel will have to climb higher than 16 feet (4877 mm) above grade to access such *equipment* or *appliances*, an interior or exterior means of access shall be provided.<u>In buildings three or fewer stories above grade plane, the clear access opening dimensions for roof access shall be not less than 20 inches x 30 inches. In buildings four or more stories above grade plane, interior roof access openings and roof access hatches shall be sized and installed in accordance with the *International Building Code*.</u>Such access shall not require climbing over obstructions greater than 30 inches (762 mm) in height or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Such access shall not require the use of portable ladders. Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge or landing platform not less than 42 inches (1067 mm). .
2. Ladders shall have rung spacing not less than 10 inches (254 mm) and not to exceed 14 inches (356 mm) on center. The uppermost rung shall be not greater than 24 inches (610 mm) below the upper edge of the roof hatch, roof or parapet, as applicable.
3. Ladders shall have a toe spacing not less than 7 inches (178 mm) and not more than 12 inches (305 mm) deep.
4. There shall be not less than 16 inches (406 mm) between rails.
5. Rungs shall have a diameter not less than 0.75-inch (19.1 mm) and be capable of withstanding a 300-pound (136 kg) load.
6. Ladders over 30 feet (9144 mm) in height shall be provided with offset sections and landings capable of withstanding 100 pounds per square foot (488 kg/m^2). Landing dimensions shall be not less than 18 inches (457 mm) and not less than the width of the ladder served. A guard rail shall be provided on all open sides of the landing.
7. Climbing clearance. The distance from the centerline of the rungs to the nearest permanent object on the climbing side of the ladder shall be not less than 30 inches (762 mm) measured perpendicular to the rungs. This distance shall be maintained from the point of ladder access to the bottom of the roof hatch. A minimum clear width of 15 inches (381 mm) shall be provided on both sides of the ladder measured from the midpoint of and parallel with the rungs except where cages or wells are installed.
8. Landing required. The ladder shall be provided with a clear and unobstructed bottom landing area having a minimum dimension of 30 inches (762 mm) by 30 inches (762 mm) centered in front of the ladder.
9. Ladders shall be protected against corrosion by *approved* means.
10. Access to ladders shall be provided at all times.
11. Top landing required. The ladder shall be provided with a clear and unobstructed landing on the exit side of the roof hatch, having a minimum space of 30 inches (762 mm) deep and being the same width as the hatch.

Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

Exception: This section shall not apply to Group R-3 *occupancies*.

Reason: This clarifies the minimum size required for roof hatch openings. The proposed text replicates the minimum size requirements already identified in the IMC for attic access (IMC 306.3). The IBC already contains the provisions in relation to minimum size roof hatches for buildings 4 stories and more. These openings often impact service and access to the HVAC installations. This is merely a pointer to assist the mechanical/building designers and installers as to what is required if a roof hatch is utilized to access appliances and equipment.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The IMC covers roof access for where personnel will have to climb higher than 16 feet.
The IBC covers roof access where buildings are four or more stories above grade plane and a stairway is required (see IBC code sections below.)

2024 IBC

1011.12 Stairway to roof.

In *buildings* four or more *stories above grade plane*, one *stairway* shall extend to the roof surface unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope).

> **Exception:** Other than where required by Section 1011.12.1, in *buildings* without an *occupiable roof* access to the roof from the top *story* shall be permitted to be by an *alternating tread device*, a ship's ladder or a permanent ladder.

1011.12.1 Stairway to elevator equipment.

Roofs and *penthouses* containing elevator equipment that must be accessed for maintenance are required to be accessed by a *stairway*.

1011.12.2 Roof access.

Where a *stairway* is provided to a roof, access to the roof shall be provided through a *penthouse* complying with Section 1511.2.

> **Exception:** In *buildings* without an *occupiable roof*, access to the roof shall be permitted to be a roof hatch or trap door not less than 16 square feet (1.5 m^2) in area and having a minimum dimension of 2 feet (610 mm).

M17-24

IMC®: 306.5, DOL (New)

Proponents: MICHELE ORAS, LadderTech LLC DBA LadderPort, LadderTech LLC DBA LadderPort (michele@ladderport.com)

2024 International Mechanical Code

Revise as follows:

306.5 Equipment or appliances on roofs or elevated structures.
Where *equipment* requiring access or *appliances* are located on an elevated structure or the roof of a building such that personnel will have to climb higher than 16 feet (4877 mm) above grade to access such *equipment* or *appliances*, an interior or exterior means of access shall be provided. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) in height or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Such access shall not require the use of portable ladders. Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall. Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge or landing platform not less than 42 inches (1067 mm). .
2. Ladders shall have rung spacing not less than 10 inches (254 mm) and not to exceed 14 inches (356 mm) on center. The uppermost rung shall be not greater than 24 inches (610 mm) below the upper edge of the roof hatch, roof or parapet, as applicable.
3. Ladders shall have a toe spacing not less than 7 inches (178 mm) and not more than 12 inches (305 mm) deep.
4. There shall be not less than 16 inches (406 mm) between rails.
5. Rungs shall have a diameter not less than 0.75-inch (19.1 mm) and be capable of withstanding a 300-pound (136 kg) load.
6. Ladders over 30 feet (9144 mm) in height shall be provided with offset sections and landings capable of withstanding 100 pounds per square foot (488 kg/m^2). Landing dimensions shall be not less than 18 inches (457 mm) and not less than the width of the ladder served. A guard rail shall be provided on all open sides of the landing.
7. Climbing clearance. The distance from the centerline of the rungs to the nearest permanent object on the climbing side of the ladder shall be not less than 30 inches (762 mm) measured perpendicular to the rungs. This distance shall be maintained from the point of ladder access to the bottom of the roof hatch. A minimum clear width of 15 inches (381 mm) shall be provided on both sides of the ladder measured from the midpoint of and parallel with the rungs except where cages or wells are installed.
8. Landing required. The ladder shall be provided with a clear and unobstructed bottom landing area having a minimum dimension of 30 inches (762 mm) by 30 inches (762 mm) centered in front of the ladder.
9. Ladders shall be protected against corrosion by *approved* means.
10. Access to ladders shall be provided at all times.
11. Top landing required. The ladder shall be provided with a clear and unobstructed landing on the exit side of the roof hatch, having a minimum space of 30 inches (762 mm) deep and being the same width as the hatch.

Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

~~Exception~~ <u>Exceptions</u>:

1. This section shall not apply to Group R-3 *occupancies*.
2. <u>An approved, permanent building-mounted ladder receiver which prevents the ladder from sliding sideways off the building or slipping backward and meets the ladder safety standard of OSHA regulation 29 CFR 1926.1053 (b)(1) shall be permitted as an interior or exterior means of access on buildings under 24 ft (7315 mm) in height above grade to access such equipment or appliances.</u>

Add new standard(s) as follows:

DOL

U.S. Department of Labor
Occupational Safety and Health Administration c/o Superintendent of Documents U.S. Government Printing Office
Washington
, DC 20210

29 CFR Part 1926.1053(b)(1) (2023) Ladders

Staff Analysis: New Referenced A review of the standard proposed for inclusion in the code, DOL CFR Part 1926.1053(b)(1)Ladders, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Attached Files

- **Ladder receiver power point.pdf**
  https://www.cdpaccess.com/proposal/9086/28211/files/download/3887/
- **TOC ITEMS 1-6.pdf**
  https://www.cdpaccess.com/proposal/9086/28211/files/download/3886/

Reason: Currently Section 306.5 of the code requires a permanent means of access when accessing a roof over 16'. "Where equipment requiring access or appliances are located on an elevated structure or the roof of a building such that personnel will have to climb higher than 16 feet (4877 mm) above grade to access such equipment or appliances, an interior or exterior means of access shall be provided". **LadderTech is requesting the following exception:**

An approved, permanent building-mounted ladder receiver which prevents the ladder from sliding sideways off the building or slipping backward and meets the ladder safety standard of OSHA regulations (Standard - 29 CFR) Ladders - 1926.1053 (b)(1) is acceptable as an interior or exterior means of access on buildings under 24' in height above grade to access such equipment or appliances.

In 2012, the Michigan Mechanical Code Council added the above exception for buildings up to 20'. **Amended in 2022 to include buildings less than 24'.**

An approved ladder receiver holding an extension ladder in place is safer to climb than a permanent vertical ladder, as your body leans forward.

An approved ladder receiver allows for ladder removal for greater building security.

In 2015, Hartland Deerfield Fire Marshal wrote a similar ordinance for all new unsprinkled buildings in the city 30' or under. In their jurisdiction, an authorized ladder receiver must be installed even if another means of access is present. Other fire departments in Michigan have followed suit. It is the opinion of the fire departments that authorized ladder receivers provide safer access to fire fighters and allow them to concentrate on fighting fires rather than holding ladders. They based this determination on the following:

Vertical ladders are difficult to climb with the amount and weight of the equipment fire fighters must wear and/or carry.

Ladder receivers negate the need for TWO fire fighters to hold the ladder in place while a third climbs to the roof, leaving two additional fire fighters to actually fight the fire.

Authorized Ladder Receiver Description

A permanently building mounted ladder receiver that securely holds an extension ladder in place, even when ice, wind or uneven ground is present. The side plates and hooks keep the ladder from falling to either side. Hooks are curved for easy ladder placement yet hold the ladder firmly in place. Grab bars with hand stops extend above the roof per OSHA requirements providing secure walk-through access on/off the roof, eliminating the dangerous transition around the ladder. An angled extension ladder held securely in place is much safer than a vertical ladder especially when carrying parts or tools to the roof. Several different models are available to accommodate multiple building facades. The different models are detailed in attached documentation.

Advantages of authorized ladder receivers vs permanent mount ladders:

P= Problem **S= Solution**

P: Permanent Mount Vertical Ladders make it almost impossible to safely carry items to the roof as one's body naturally falls away from the ladder.**S: A ladder receiver secures the extension ladder at the proper safe angle allowing for the natural tendency of one's body to lean toward the ladder.**

P: Permanent ladders provide roof access to anyone including children, vandals, and thieves. Even when gated, permanent ladders are scalable.**S: Ladder receivers can only be accessed with an extension ladder. When done remove the extension ladder and there is no easy access. Schools especially appreciate this as it removes the temptation for students to access the roof.**

P: OSHA requires a ladder tie-off, many buildings fail to provide any means to properly tie-off.

S: No need to tie-off with an authorized ladder receiver as the rungs and side plates prevent the ladder from moving.

P: An extension ladder must extend 36" above the roof line creating the dangerous "walk around the ladder to access the roof" routine.

S: Authorized ladder receivers provide comfortable, secure grab bars with hand stops, meeting OSHA requirements with a safe walk-through directly from the ladder to the roof, where many ladder fall accidents occur.

P: Ladders damage gutters and building facade.

S: Authorized ladder receivers protect building gutters and finishes while keeping ladders in assigned location away from pedestrian traffic for greater public safety and preventing costly repairs.

Additional Advantages:

Authorized ladder receivers are independently tested to meet the OSHA pull rate standard and comply with other OSHA regulations.

Authorized ladder receivers are Installed throughout the United States and Canada and are well field tested to rave reviews.

The current code is shown as an exception in the Michigan Mechanical Code Book for buildings up to 20' - the new exception for 24' is approved but the new book is not yet published.

Cost Impact: The code change proposal will decrease the cost of construction

The code change generally will lower the cost of the installation both in material costs and installation costs. In most cases the LadderPort ladder receiver is less expensive than a permanent mount vertical ladder, especially if a gate is required on the permanent ladder. Additionally, it is less expensive to install the LadderPort ladder receiver.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost impact will vary based as vertical ladders with security gates have a wide price range. Vertical ladders can range in price from $ 700 ish to $ 5000+ based on many variables. Ladder receivers currently do not exceed

$ 1000, based on variables, and average $ 739 give or take.

The request for this exception does not remove the need for safe access from the ground up rather allows an additional approved method for this access,. which means the cost impact difference is solely based on which model vertical ladder is purchased. Again, vertical ladders tend to be higher in price than a ladder receiver.

Attached are examples of the cost of a ladder receiver vs. a vertical ladder of similar attributes.

Estimated Immediate Cost Impact Justification (methodology and variables):

Ladder Receiver Example (See attached doc for links to pricing)

Ladder Receiver $ 739

Total $ 739

Vertical Ladder w/ Security Gate Example (See attached doc for links to pricing)

16' Vertical Ladder $ 761.99

Security Gate $ 485.95

Total **$ 1,247.94**

Estimated Life Cycle Cost Impact:

Life cycle of both the ladder receiver and vertical ladder is approximately the same amount as they are both made of steel and should have same life cycle.

The impact of the life cycle cost for a ladder receiver lies in its increased safety and deterent to vandals and theives, which cannot easily be put into a dollar amount.

A ladder receiver has the following benefits over a vertical ladder:

1. It is safer to climb an extension ladder held by a ladder receiver as the body leans forward vs. the backward tendency of a body climbing a vertical ladder.

2. OSHA requires 7" mounting extensions on vertical ladders, even with a security gate vandals can climb the vertical ladder using those extensions.

3. A security gate can be vandalized and removed leaving a vertical ladder to climb - vandals can take advantage of that. Once a person is finished using the ladder receiver the extension ladder is removed, leaving no easy roof access.

4. Security gates are often left unlocked due to employee error. When using a ladder receiver there is no worry about leaving a gate unlocked.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Since both items are made of steel they require the same maintenance and have the same life time cycle.

If both the ladder receiver and the vertical ladder are coated in the same material (i.e. galvanized or powder coated) the life cycle should be identical.

M17-24

M18-24

IMC®: 307.2.1.1; IPC: [M] 314.2.1.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Mechanical Code

Revise as follows:

307.2.1.1 Condensate discharge. Condensate drains shall not directly connect to any plumbing drain, waste or vent pipe. Condensate drains shall not discharge into a plumbing fixture other than a floor sink, floor drain, trench drain, mop sink, hub drain, standpipe, utility sink or laundry sink. ~~Condensate drain connections to a lavatory wye branch tailpiece or to a bathtub overflow pipe shall not be considered as discharging to a plumbing fixture.~~ <u>Condensate drains shall be installed in accordance with Section 802.1.5 of the International Plumbing Code.</u> Except where discharging to grade outdoors, the point of discharge of condensate drains shall be located within the same occupancy, tenant space or dwelling unit as the source of the condensate.

2024 International Plumbing Code

Revise as follows:

[M] 314.2.1.1 Condensate discharge.
Condensate drains shall not directly connect to any plumbing drain, waste or vent pipe. Condensate drains shall not discharge into a plumbing fixture other than a floor sink, floor drain, trench drain, mop sink, hub drain, standpipe, utility sink or laundry sink. ~~Condensate drain connections to a lavatory wye branch tailpiece or to a bathtub overflow pipe shall not be considered as discharging to a plumbing fixture.~~ <u>Condensate drains shall be installed in accordance with Section 802.1.5.</u>Except where discharging to grade outdoors, the point of discharge of condensate drains shall be located within the same occupancy, tenant space or dwelling unit as the source of the condensate.

Reason: This proposal is intended to correct an issue that was created by an approved proposal in the IMC. The IMC should never dictate what fixtures are permitted to receive waste or to supersede requirements already in place in the IPC. The allowance by the IMC to connect condensate discharge to a lavatory tailpiece or a bathtub overflow, this proposal was intended to get around requirements in the IPC. The IPC provides all direction necessary to deal with waste discharge including condensate. The stricken language allows for condensate discharge to connect to lavatory tailpiece as well as bathtub overflow connections, these are the two primary fixture to experience blockages due to hair clogs. Striking the language will prevent unintended flooding that would result from such a clog. A blockage wouldn't need to be a complete blockage, it would only need to be sufficient to keep the drain from keeping up with the4 condensate discharge produced by the equipment. Adding "**Condensate drains shall be installed in accordance with IPC 802.1.5."** provides a more correct path for compliance with the requirements in the IPC.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Condensate disposal is already required, if anything this proposal will eliminate potential costs associated to damage that could be the result of the portion removed.

M18-24

M19-24

IMC®: 307.2.2

Proponents: Robert Sterling, Robert, Robert Sterling

2024 International Mechanical Code

Revise as follows:

307.2.2 Drain pipe materials and sizes.
Components of the condensate disposal system shall be ABS, cast iron, copper and copper alloy, CPVC, cross-linked polyethylene, galvanized steel, stainless steel, PE-RT, polyethylene, polypropylene, PVC or PVDF pipe or tubing. Components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the International Plumbing Code relative to the material type. Condensate waste and drain line size shall be not less than $^{3}/_{4}$-inch pipe size and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized in accordance with Table 307.2.2.

Reason: 307.2.2 of the 2024 edition of the International Mechanical Code allows specific materials for condensate drains, but overlooks Stainless Steel as an allowable material even though this is required in many food and pharma processing applications. This proposal seeks to add "stainless steel" after the words "galvanized steel" in section 307.2.2 to ensure that the use of stainless steel is permitted.

Bibliography: International Mechanical Code, 2024 Edition, Paragraph 307.2.2

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The choice of drain material remains in the hands of the designer. The change proposal seeks to expand the allowable materials, and does not force the use of any one material.

M19-24

M20-24

IMC®: TABLE 308.4.2

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

TABLE 308.4.2 CLEARANCE REDUCTION METHODS[a, b, c]

TYPE OF PROTECTIVE ASSEMBLY[~~a~~b]	REDUCED CLEARANCE WITH PROTECTION (inches)[~~a~~b]							
	Horizontal combustible assemblies located above the heat source				Horizontal combustible assemblies located beneath the heat source and all vertical combustible assemblies			
	Required clearance to combustibles without protection (inches)[~~a~~b]				Required clearance to combustibles without protection (inches)			
	36	**18**	**9**	**6**	**36**	**18**	**9**	**6**
Galvanized sheet steel, having a minimum thickness of 0.0236 inch (No. 24 gage), mounted on 1-inch glass fiber or mineral wool batt reinforced with wire on the back, 1 inch off the combustible assembly	18	9	5	3	12	6	3	3
Galvanized sheet steel, having a minimum thickness of 0.0236 inch (No. 24 gage), spaced 1 inch off the combustible assembly	18	9	5	3	12	6	3	2
Two layers of galvanized sheet steel, having a minimum thickness of 0.0236 inch (No. 24 gage), having a 1-inch airspace between layers, spaced 1 inch off the combustible assembly	18	9	5	3	12	6	3	3
Two layers of galvanized sheet steel, having a minimum thickness of 0.0236 inch (No. 24 gage), having 1 inch of fiberglass insulation between layers, spaced 1 inch off the combustible assembly	18	9	5	3	12	6	3	3
0.5-inch inorganic insulating board, over 1 inch of fiberglass or mineral wool batt, against the combustible assembly	24	12	6	4	18	9	5	3
$3^1/_2$-inch brick wall, spaced 1 inch off the combustible wall	—	—	—	—	12	6	6	6
$3^1/_2$-inch brick wall, against the combustible wall	—	—	—	—	24	12	6	5

For SI: 1 inch = 25.4 mm, °C = [(°F) – 32]/1.8, 1 pound per cubic foot = 16.02 kg/m^3, 1.0 Btu × in/(ft^2 × h × °F) = 0.144 W/m^2 × K.

a. Reduction of clearances from *combustible materials* shall not interfere with *combustion air*, draft hood clearance and relief, and accessibility of servicing.

~~a~~ b. Mineral wool and glass fiber batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of 1,500°F. Insulation material utilized as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu × in/(ft^2 × h × °F) or less. Insulation board shall be formed of noncombustible material.

~~b~~ c. For limitations on clearance reduction for solid fuel-burning appliances, masonry chimneys, connector pass-throughs, masonry fireplaces and kitchen ducts, see Sections 308.4.2.1 through 308.4.2.5.

Reason: The reduction of clearance tables in the IFGC (Table 308.2) and in the IRC (Tables M1306.2 and G2409.2) contain the footnote that the reduction of clearances shall not interfere with combustion air, draft hood clearance and relief, and accessibility of servicing. This footnote should also apply to the same table in the mechanical code.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifies requirements and aligns with the other reduction of clearance tables in the IRC (Mechanical and Fuel Gas) and IFGC.

M20-24

M21-24

IMC®: SECTION 202, SECTION 313 (New), 313.1 (New), 313.2 (New)

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Mechanical Code

Delete without substitution:

~~**NONCOMBUSTIBLE MATERIAL.** A material that passes ASTM E136.~~

Add new text as follows:

SECTION 313 NONCOMBUSTIBLE MATERIALS

313.1 Testing. Noncombustible materials shall be those materials that comply with Section 703.3.1 of the International Building Code.

313.2 Inherently noncombustible materials. Inherently noncombustible materials, such as concrete and steel, shall not be required to be tested to be acceptable as noncombustible materials.

Reason: The definition contained in the 2024 IMC is actually a requirement rather than a definition and ICC definitions should not contain requirements.

In the area of material regulation, materials that pass ASTM E136 have long been considered to be those that are noncombustible materials, and that concept is consistent with the definition presently in the IMC but that "definition" is actually a requirement, which should be moved out of Chapter 2. Chapter 3 is the chapter for general requirements.

Note that ASTM E136 is one of the very few ASTM fire test standards that has acceptance criteria. The acceptance criteria are different from the theoretical definition of a noncombustible material.

Unless a requirement exists, experience indicates that some material manufacturers have claimed that their material is noncombustible when it simply exhibits improved fire performance. When searching the internet, multiple web sites offer materials or products that are alleged to be noncombustible when that claim is incorrect. There is often a confusion in the public mind when considering a material that performs better than typical combustible materials, but should not be considered noncombustible.

This proposal recommends including a correct requirement for what materials shall be considered noncombustible materials and it is to comply with the IBC section 703.3.1. A second section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested, for example to ASTM E136.

Equivalent proposals are being submitted to the IFC (by FCAC), the IPC, and the IFGC, all of which use noncombustible materials.

Another proposal revises the definitions of "combustible material" in the IMC and IFGC to clarify that the whether a material is or is not noncombustible is the result of a classification. The IBC does not "define" a noncombustible material but contains requirements for such materials.

The language in section 703.3.1 of the IBC reads as follows:

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as *noncombustible.*

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This simply moves a requirement from a definition into a section where it can be actually applied, without changing the content.

M22-24

IMC®: 401.1, 401.2, SECTION 403, 403.1, 403.3, 403.3.1, 403.3.2, 403.3.2.1, 403.3.2.2, 403.3.2.3, TABLE 403.3.2.3

Proponents: Mike Moore, Stator LLC, Broan-NuTone (mmoore@statorllc.com)

2024 International Mechanical Code

401.1 Scope. This chapter shall govern the ventilation of spaces within a *building* intended to be occupied. Mechanical exhaust systems, including exhaust systems serving clothes dryers and cooking *appliances*; hazardous exhaust systems; dust, stock and refuse conveyor systems; subslab soil exhaust systems; smoke control systems; energy recovery ventilation systems and other systems specified in Section 502 shall comply with Chapter 5.

Revise as follows:

401.2 Ventilation required. ~~Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403.~~ *Dwelling units* complying with the air leakage requirements of the *International Energy Conservation Code* or ASHRAE 90.1 shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 *occupancies* shall be ventilated by mechanical means in accordance with Section 407. Enclosed parking garages shall be ventilated by mechanical means in accordance with Section 404. Every other occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403.

SECTION 403
MECHANICAL VENTILATION

Revise as follows:

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* except that mechanical *ventilation air* requirements for *dwelling units* in Group R-2, R-3 and R-4 *occupancies* shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

403.3 Outdoor air and local exhaust airflow rates. *Dwelling units* in Group R-2, R-3 and R-4 occupancies ~~three stories and less in height above grade plane~~ shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. Other spaces within *buildings* intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

Exceptions:

1. Enclosed parking garages complying with Section 404.
2. Spaces in ambulatory care facilities and Group I-2 occupancies complying with Section 407.

403.3.1 Spaces other than dwelling units in Group R-2, R-3, and R-4 occupancies~~Other buildings intended to be occupied~~. The design of local exhaust systems and ventilation systems for outdoor air for spaces ~~*occupancies*~~other than *dwelling units* in Group~~s~~ R-2, R-3 and R-4 occupancies shall comply with Sections 403.3.1.1 through 403.3.1.4.

403.3.2 Dwelling units in Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and ventilation systems for outdoor air for *dwelling units* in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1) \quad \textbf{(Equation 4-9)}$$

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The ~~whole-house~~ outdoor air ventilation system is a *balanced ventilation system*.

Delete without substitution:

~~**403.3.2.2 Outdoor air for other spaces.** Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per square foot [0.0003 $m^3/(s \times m^2)$] of floor area.~~

Revise as follows:

~~**403.3.2.3**~~ **403.3.2.2 Local exhaust.** Local exhaust systems shall be provided in kitchens, bathrooms and toilet rooms and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.~~3~~2.

TABLE ~~403.3.2.3~~ 403.3.2.2 MINIMUM REQUIRED LOCAL EXHAUST RATES FOR DWELLING UNITS IN GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Reason: These modifications are needed to clarify ventilation requirements for sleeping units, dwelling units, and other spaces within Group R-2, R-3, and R-4 occupancies. A summary of the results of the proposed modifications is as follows:

1. All dwelling units in Group R-2, R-3, and R-4 occupancies shall comply with Section 403.3.2. This is consistent with the prior IMC cycle's action on proposal M19-21.

2. Where provided with mechanical ventilation, all spaces other than dwelling units in Group R-2, R-3, and R-4 occupancies shall comply with Section 403.3.1 (this is meant to parallel the scope divisions of ASHRAE 62.2 and ASHRAE 62.1), with the exception of enclosed parking garages, ambulatory care facilities, and Group I-2 occupancies are addressed elsewhere.

Section 403.3.2 should be restricted to dwelling units because it is based on ASHRAE 62.2 (whose scope is restricted to dwelling units) and is poorly equipped to address spaces in Group R-2, R-3, and R-4 occupancies that are not dwelling units (e.g., dormitory sleeping units, public bathrooms, public laundry rooms, exercise rooms, meeting rooms, etc.). There is currently a subsection to address outdoor air requirements for "corridors and other common areas" within Section 403.3.2, but it is not clear how to apply this section to the myriad of spaces that are better addressed in Section 403.3.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal primarily clarifies existing requirements for ventilation.

M22-24

M23-24

IMC®: 401.2, SECTION 407, 407.1

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. *Dwelling units* complying with the air leakage requirements of the *International Energy Conservation Code* or ASHRAE 90.1 shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities <u>,</u> ~~and~~ <u>Group I-1 and</u> Group I-2 *occupancies* shall be ventilated ~~by mechanical means~~ in accordance with ~~Section 407~~ <u>this code, ASHRAE/ASHE 170 and NFPA 99</u>.

Delete without substitution:

~~SECTION 407~~ ~~AMBULATORY CARE FACILITIES AND GROUP I-2 OCCUPANCIES~~

~~**407.1 General.** Mechanical ventilation for ambulatory care facilities and Group I-2 *occupancies* shall be designed and installed in accordance with this code, ASHRAE/ASHE 170 and NFPA 99.~~

Reason: Currently, the code requires in Section 401.2 that ambulatory care facilities and Group I-2 occupancies are only to be ventilated by mechanical means. Both ASHRAE/ASHE 170 and NFPA 99 have been revised to permit ventilation by natural means under specific conditions. The ventilation for these facilities and occupancies are unique, which is why the references to both ASHRAE/ASHE 170 and NFPA 99. By requiring compliance in Section 401.2 to those two standards, Section 407 is not needed.

Adding Group I-1 for required compliance with ASHRAE/ASHE and NFPA 99 aligns the code with the requirements for licensing of these health care facilities for numerous years.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Healthcare facilities, both I-1 and I-2, have already had to comply with ASHRAE/ASHE 170 and NFPA 99 for numerous years. By providing an option for hybrid ventilation in certain applications (i.e. natural assisted by mechanical ventilation) can reduce the costs of installation.

M23-24

M24-24

IMC®: 401.2, SECTION 407, 407.1, ASHRAE Chapter 15 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402or by mechanical means in accordance with Section 403. *Dwelling units* complying with the air leakage requirements of the *International Energy Conservation Code* or ASHRAE 90.1 shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-1 and I-2 *occupancies* shall be ventilated ~~by mechanical means~~ in accordance with ~~Section 407~~ this code, ASHRAE/ASHE 170 and NFPA 99.

Delete without substitution:

~~SECTION 407~~
~~AMBULATORY CARE FACILITIES AND GROUP I-2 OCCUPANCIES~~

~~**407.1 General.** Mechanical ventilation for ambulatory care facilities and Group I-2 *occupancies* shall be designed and installed in accordance with this code, ASHRAE/ASHE 170 and NFPA 99.~~

Add new standard(s) as follows:

ASHRAE

ASHRAE
180 Technology Parkway
Peachtree Corners, GA 30092

ANSI/ASHRAE/ASHE 170-2021 Ventilation of Health Care Facilities with addenda c, d, e, f, g, h, and j

Reason: [BEVIS]: Currently, the code requires in Section 401.2 that ambulatory care facilities and Group I-2 occupancies are only to be ventilated by mechanical means. Both ASHRAE/ASHE 170 and NFPA 99 have been revised to permit ventilation by natural means under specific conditions. The ventilation for these facilities and occupancies are unique, which is why the references to both ASHRAE/ASHE 170 and NFPA 99. By requiring compliance in Section 401.2 to those two standards, Section 407 is not needed.

Adding Group I-1 for required compliance with ASHRAE/ASHE and NFPA 99 aligns the code with the requirements for licensing of these health care facilities for numerous years.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

[TOTO]:

The ventilation for ambulatory care facilities and Group I-2 occupancies are unique. Different ventilation means are identified in ASHRAE 170 and NFPA 99, including a modified method of both natural and mechanical means of ventilation. ASHRAE 170 is jointly published with ASHE. Establishing a separate section in the beginning of Chapter 4 specifically for these facilities and occupancies provides clarity as to what types of ventilation is required.

Ventilation design for health care spaces is a combination of tasks that leads to a set of documents used in construction. One such task requires medical planners to develop departmental programs of spaces. These programs include space names that suggest the use for which the space is intended, and health care ventilation designers depend upon these names to determine the ventilation parameters for their designs. This standard provides these ventilation parameters.

Without high-quality ventilation in health care facilities, patients, health care workers, and visitors can become infected through normal respiration of particles in the air. Poorly ventilated health care facilities are places where the likelihood of pathogenic particles occurring in the air is quite high. These air-transmitted pathogens can be found everywhere in poorly ventilated health care facilities, and although most individuals can cope using their healthy immune systems, some patients are susceptible to these pathogens or even to normal environmental air-borne organisms such as fungal spores. Because these organisms are found in higher concentrations in hospitals, additional care must be taken in design of the ventilation systems.

Bibliography: ANSI/ASHRAE/ASHE 170—2021: Ventilation of Health Care Facilities, with addenda c, d, e, f, g, h, and j (available online: https://www.ashrae.org/technical-resources/standards-and-guidelines/standards-addenda)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

[BEVIS]: Healthcare facilities, both I-1 and I-2, have already had to comply with ASHRAE/ASHE 170 and NFPA 99 for numerous years. By providing an option for hybrid ventilation in certain applications (i.e. natural assisted by mechanical ventilation) can reduce the costs of installation.

[TOTO]: This change provides clarity about existing requirements that are already covered in the design and installation standards referenced in this code.

M25-24 Part I

IMC®: 401.2.1 (New), 502.21 (New), 502.21.1 (New), 502.21.2 (New), 502.21.3 (New), 502.21.4 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICALCODE COMMITTEE. PART II WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Mechanical Code

Add new text as follows:

401.2.1 Hazardous materials processes. Natural ventilation shall not be permitted for manufacturing where hazardous materials are used. Mechanical ventilation shall be designed and installed in accordance with Section 403 and the International Fire Code.

502.21 Plant processing or plant extraction facilities. Plant processing or plant extraction facilities shall comply with Sections 502.21.1 through 502.21.4.

502.21.1 Processes using flammable gases or flammable liquids. Plant extraction processes using flammable gases or flammable liquids shall be provided with continuous mechanical exhaust. An airflow rate of not less than 5 cfm/ft2 (0.0038 m3/(s*m2)) of floor area shall be provided. The mechanical exhaust system shall prevent an accumulation of flammable vapors from exceeding 25 percent of the lower explosive limit (LEL). Recirculation of such air shall be prohibited.

> **Exception:** Where a registered design professional demonstrates that an engineered mechanical exhaust system design will prevent the maximum concentration of contaminants from exceeding 25% of the LEL, the minimum required rate of exhaust shall be reduced in accordance with such engineered system design.

502.21.2 Processes using compressed asphyxiant or inert gases. Mechanical exhaust systems for plant extraction processes using compressed asphyxiant or inert gases shall operate continuously. Recirculation of such air shall be prohibited.

502.21.3 Interlocks. Electrical equipment and appliances used in plant extraction processes shall be interlocked with ventilation fans so that the equipment cannot be operated unless the exhaust and ventilation systems are in operation.

502.21.4 Fire interlock prohibited. Exhaust systems used in plant extraction processes shall not be interlocked with the fire alarm system and shall remain in operation during a fire alarm condition.

M25-24 Part I

M25-24 Part II

IFC: 2311.8.8, 5705.3.7.5.1; IMC®: [F] 502.16.2, [F] 502.9.5.4

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

2311.8.8 Exhaust ventilation system.
Repair garages used for the repair of CNG, LNG, or other lighter-than-air motor fuels other than hydrogen shall be provided with an *approved* mechanical ventilation system. The mechanical exhaust ventilation system shall be in accordance with the *International Mechanical Code* and Sections 2311.8.8.1 and 2311.8.8.2.

~~**Exception:** Where *approved* by the *fire code official*, natural ventilation shall be permitted in lieu of mechanical exhaust ventilation.~~

5705.3.7.5.1 Ventilation.
Continuous mechanical ventilation shall be provided at a rate of not less than 1 cfm per square foot [0.00508 $m^3/(s \times m^2)$] of floor area over the design area. Provisions shall be made for introduction of makeup air in such a manner to include all floor areas or pits where vapors can collect. Local or spot ventilation shall be provided where needed to prevent the accumulation of hazardous vapors. Ventilation system design shall comply with the *International Building Code* and *International Mechanical Code*.

~~**Exception:** Where natural ventilation can be shown to be effective for the materials used, dispensed or mixed.~~

2024 International Mechanical Code

Revise as follows:

[F] 502.16.2 Exhaust ventilation system. Repair garages used for the repair of compressed natural gas, liquefied natural gas or other lighter-than-air motor fuel, other than hydrogen, shall be provided with an *approved* mechanical exhaust ventilation system. The mechanical exhaust ventilation system shall be in accordance with this code and Sections 502.16.2.1 and 502.16.2.2.

~~**Exception:** Where *approved* , *natural ventilation* shall be an alternative to mechanical exhaust *ventilation*.~~

[F] 502.9.5.4 Use, dispensing and mixing. Continuous mechanical ventilation shall be provided for the use, dispensing and mixing of flammable and combustible liquids in open or closed systems in amounts exceeding the maximum allowable quantity per control area and for bulk transfer and process transfer operations. The ventilation rate shall be not less than 1 cfm/ft^2 [0.00508 $m^3/(s \times m^2)$] of floor area over the design area. Provisions shall be made for the introduction of *makeup air* in a manner that will include all floor areas or pits where vapors can collect. Local or spot ventilation shall be provided where needed to prevent the accumulation of hazardous vapors.

~~**Exception:** Where *natural ventilation* can be shown to be effective for the materials used, dispensed or mixed.~~

Reason: These requirements are based on best practices and ensure basic fire and life safety measures. This section provides requirements for hazardous facilities and has been established in collaboration with the PMGCAC and FCAC. These requirements provide an understandable path for compliance.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These requirements already exist in the IBC and IFC. Adding these requirements to the IMC only provides guidance for the design and installation of systems that comply with existing code requirements. As such, this proposal does not require additional material or labor costs that would impact the cost of construction.

M25-24 Part II

M26-24

IMC®: 401.5, 501.3.2

Proponents: Amanda Hickman, The Hickman Group, Air Movement and Control Association International, Inc. (AMCA) (amanda@thehickmangroup.com)

2024 International Mechanical Code

Revise as follows:

401.5 Intake opening protection. Air intake openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in louvers, grilles and screens shall be sized in accordance with Table 401.5, and shall be protected against local weather conditions. Louvers that protect air intake openings in structures located in hurricane-prone regions, as defined in the *International Building Code*, shall be *listed* to indicate compliance~~comply~~ with AMCA 550. Outdoor air intake openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the *International Building Code* .

501.3.2 Exhaust opening protection. Exhaust openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in screens, louvers and grilles shall be sized not less than $^1/_4$ inch (6.4 mm) and not larger than $^1/_2$ inch (12.7 mm). Openings shall be protected against local weather conditions. Louvers that protect exhaust openings in structures located in hurricane-prone regions, as defined in the *International Building Code*, shall be *listed* to indicate compliance ~~comply~~ with AMCA ~~Standard~~ 550. Outdoor openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the *International Building Code*.

Reason:

The IMC already requires compliance with AMCA 550. However, to ensure code officials are able to enforce this provision, the revised language to require a *listing* is being proposed. Additionally, including a *listing* requirement will ensure that products will perform as designed and meet the performance requirements for the specified application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Because listing is common practice, especially for wind driven rain resistant louvers and the fact that the cost to list/certify a product is incurred by the manufacturer and divided across multiple projects, there is no cost increase associated with this proposal.

M26-24

M27-24

IMC®: 403.2

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

403.2 Outdoor air required. The minimum outdoor airflow rate shall be determined in accordance with Section 403.3 <u>or with the Section 6.3 Indoor Air Quality Procedure of ASHRAE 62.1</u>.

> ~~**Exception:** Where the *registered design professional* demonstrates that an engineered ventilation system design will prevent the maximum concentration of contaminants from exceeding that obtainable by the rate of outdoor air ventilation determined in accordance with Section 403.3, the minimum required rate of outdoor air shall be reduced in accordance with such engineered system design.~~

Staff Analysis: The proposed referenced standard, ASHRAE 62.1, is currently referenced in the IMC.

Reason: The International Mechanical Code (IMC) offers to pathways for determining the minimum outdoor airflow. The first pathway is a reference to Section 403.3, which involves computing minimum outdoor airflow per prescriptive ventilation rates provided in TABLE 403.3.1.1. The second pathway, currently listed as an exception, involves computing minimum outdoor airflow per an “engineered ventilation system design”. An “engineered ventilation system design” is not explicitly defined anywhere in the code language. However, it is defined in the commentary of the code. The commentary states that:

1. An engineered ventilation system design is more of a direct method of controlling air quality and would be classified as an “Indoor Air Quality Procedure” in ASHRAE 62.1

2. The exception to this section could certainly be viewed as allowing the indoor air quality (IAQ) method of that standard [ASHRAE 62.1] as one of the possible means of complying with the exception.The commentary to the exception provides the critical information on what the intent of the exception is and how it should be applied. As such, it is recommended to include a direct reference to the ASHRAE 62.1 IAQP within the body of the code. Additionally, the change aligns the IMC with ASHRAE Standard 62.1 – 2022.

We would also like to propose the following changes to the IMC commentary:

~~Section 403 represents an indirect method of control- ling air quality by diluting contaminants (ventilation rate procedure) to an acceptable level by introducing outdoor air. Although an engineered ventilation system may be approved by the code official as an alter- native design in accordance with Section 105, the exception to this section provides a direct reference to such an alternative design in this section. An engineered ventilation system is more of a direct method of controlling air quality and would be classified as an “Indoor Air Quality Procedure” in ASHRAE 62.1. ASHRAE 62.1, as a whole, is not a referenced standard in the code (with the exception of a limited reference in Section 403.3.1.1.2.3.2), but, the exception to this section could certainly be viewed as allowing the indoor air quality (IAQ) method of that standard as one of the possible means of complying with the exception. The design professional is responsible for demonstrating to the code official that a proposed engineered system will result in air quality at least equivalent to that achievable by the ventilation rate method of Section 403. A demonstration of equivalence would involve detailed analysis of at least the following: the anticipated contaminants of concern in the space to be ventilated; the anticipated sources and concentrations of the contaminants of concern; the acceptable occupant exposure limits or concentration levels for those contaminants; and the means and methods to control the contaminants. The design documentation should include all criteria and assumptions regarding occupancy conditions, equipment/system performance and contaminants. An engineered ventilation system would be allowed to supply outdoor air at any rate essential to the performance of the design.~~
<u>The IAQP is a performance-based procedure. Rather than prescribing rates based on occupancy categories, rates are calculated based on contaminant source emission rates and desired indoor concentrations. The IAQP allows designers to take credit for source-control and removal measures, such as selection of low-emitting materials and air-cleaning devices.</u>

Cost Impact: Increase

Estimated Immediate Cost Impact:

The only cost of using the IAQP is the cost of air cleaning technologies that may be used to clean indoor air and the nominal cost to do post start-up IAQ testing. IAQ testing for a typical office building is $2,500-$10,000 inclusive of equipment, labor, and lab analysis. As noted above, when air cleaning systems are installed with new HVAC systems, the cost of the air cleaning system is often offset by cost savings from a downsized HVAC system. This makes the IAQP approach lower cost than the VRP approach. Where existing HVAC systems sized based on a VRP design are retrofitted with an air cleaning systems to enable a reduction in outside air according to the IAQP, there is an added cost for the retrofit that includes the cost of the air cleaning system(s) and installation costs, which are typically mechanical, electrical, and controls related. These costs are paid back from the ongoing energy savings realized by conditioning less outside air.

Estimated Immediate Cost Impact Justification (methodology and variables):

Air cleaning systems that may be used to comply with the IAQP range in cost depending on the manufacturer and product type. A typical range is from $0.50-$1.00 per ft2. Installation costs are building specific and are impacted by access to power to run the air cleaning system, the need for ducting to and from the air cleaning system (not always required), and some light controls integration work to ensure the air cleaning system(s) only run when the building is occupied and not in economizer mode.

Estimated Life Cycle Cost Impact:

According to a recent study https://enverid.com/resources/learning/iaqpcarbonstudy/ on the carbon reduction potential of the IAQP, the annual thermal load per 1,000 CFM of outdoor airflow can be reduced by up to 90,000 kBtu when using the IAQP for retrofits depending. For new construction, the reduction per 1,000 CFM reduced can be up to 50,000 kBtu. Results vary significantly by climate zone. See figures 3 and 4 in the report referenced in the last section to see these figures by climate zone broken out for heating and cooling.

These thermal load reductions lead to ongoing energy savings from the following sources:

- Cooling / heating energy usage
- Electric peak "demand" charges
- Pump and fans energy consumption
- Water consumption

When new equipment is installed, reducing the thermal load leads to capital cost savings opportunities in the following areas:

- Smaller airside systems (lower tonnage RTU/AHU/DOAS)
- Smaller chillers and cooling towers
- Smaller boilers or electric heat systems
- Smaller onsite renewable systems (e.g., solar and geothermal)
- Eliminate the need or size requirements for energy recovery (ERV can be eliminated under Standard 90.1 when the outside air requirement can be reduced to <10%)
- Eliminate the need for DCV (the IAQP can deliver greater savings with less cost)
- Reduce piping and exhaust duct sizes

Estimated Life Cycle Cost Impact Justification (methodology and variables):

In good applications, the ongoing energy savings and any first cost savings from new equipment more than offset maintenance costs and first costs, respectively, of the air cleaning system used with the IAQP.

- According to GSA's Published Findings from a Green Proving Ground evaluation of sorbent air cleaning technology, which can be used to remove gaseous contaminants from indoor air to comply with the IAQP, savings across climate zones average 1.17 kBtu/sf/yr for cooling and 1.19 kBtu/sf/yr for heating. The GSA also found that sorbent air cleaning technology delivers July peak savings of 9% on average across climate zones. The GSA Published Finding can be found at https://www.gsa.gov/climate-action-and-sustainability/center-for-emerging-building-technologies/completed-assessments/hvac/sorbent-air-cleaning.

- According to a recent study of the energy and carbon impacts of different ventilation strategies to meet the new Standard 241 ECAi targets, the most energy efficient, cost-effective compliance pathway for many buildings is to use the IAQP with MERV 13 filters for particles and pathogen control and sorbent filters for gaseous contaminant control. This study was summarized in an ASHRAE Journal article published in Sept. 2023, which can be accessed at https://www.nxtbook.com/nxtbooks/ashrae/ashraejournal_UUVCDE/index.php#/p/18. See especially Figure 2 and Table 3.

2024 International Mechanical Code

CHAPTER 4 VENTILATION

SECTION 403
MECHANICAL VENTILATION

Revise as follows:

403.3 Outdoor air and local exhaust airflow rates. Group R-2, R-3 and R-4 *occupancies* ~~three stories and less in height above grade plane~~ shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. Other *occupancies* ~~*buildings* intended to be occupied~~ shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

403.3.1 Other buildings intended to be occupied. The design of local exhaust systems and ventilation systems for outdoor air for *occupancies* other than Groups R-2, R-3 and R-4 shall comply with Sections 403.3.1.1 through 403.3.1.4.

Revise as follows:

TABLE 403.3.1.1 MINIMUM VENTILATION RATES

Portions of table not shown remain unchanged.

OCCUPANCY CLASSIFICATION	OCCUPANT DENSITY #/1000 FT^2 [a]	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_p CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_a CFM/FT^2 [a]	EXHAUST AIRFLOW RATE CFM/FT^2 [a]

~~Toilet rooms and bathrooms~~[g]	~~—~~	~~—~~	~~—~~	~~25/50~~[f]

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 m^3/(s × m^2), °C = [(°F) – 32]/1.8, 1 square foot = 0.0929 m^2.

a. Based on net occupiable floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet , urinal or adult changing station. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

g. Mechanical exhaust is required and recirculation from such spaces is prohibited. For occupancies other than science laboratories, where there is a wheel-type energy recovery ventilation (ERV) unit in the exhaust system design, the volume of air leaked from the exhaust airstream into the outdoor airstream within the ERV shall be less than 10 percent of the outdoor air volume. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).

h. For nail salons, each manicure and pedicure station shall be provided with a source capture system capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

i. Outpatient facilities to which the rates apply are freestanding birth centers, urgent care centers, neighborhood clinics and physicians' offices, Class 1 imaging facilities, outpatient psychiatric facilities, outpatient rehabilitation facilities and outpatient dental facilities.

j. The requirements of this table provide for acceptable IAQ. The requirements of this table do not address the airborne transmission of airborne viruses, bacteria and other infectious contagions.

k. These rates are intended only for outpatient dental clinics where the amount of nitrous oxide is limited. They are not intended for dental operatories in institutional buildings where nitrous oxide is piped.

l. The occupiable floor area in warehouses shall not include the floor area of self-storage units, floor areas under rack storage or designated palletized storage floor areas.

403.3.2 Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and ventilation systems for outdoor air in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

Revise as follows:

403.3.2.1 Outdoor air for dwelling units and sleeping units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit* and *sleeping unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1) \qquad \textbf{(Equation 4-9)}$$

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.

2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The ~~whole-house~~ outdoor air ventilation system is a *balanced ventilation system*.

403.3.2.2 Outdoor air and local exhaust for other spaces. Spaces other than *dwelling units* and *sleeping units* shallcomply with Sections 403.3.1.1 through 403.3.1.4~~Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per square foot [0.0003 m³/(s × m²)] of floor area~~.

403.3.2.3 Local exhaust for dwelling units and sleeping units. Local exhaust systems shall be provided in kitchens, bathrooms and toilet rooms and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.3.

TABLE 403.3.2.3 MINIMUM REQUIRED LOCAL EXHAUST RATES FOR GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Revise as follows:

403.3.2.4 System controls. Where provided within a *dwelling unit*or *sleeping unit*, controls for outdoor air ventilation systems shall include text or a symbol indicating the system's function.

403.3.2.5 Ventilating equipment. Fans providing exhaust or outdoor air shall be *listed* and *labeled* to provide the minimum required air flow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.

Reason: For Residential Group R-2, R-3 and R-4, 2024 IMC made an important change to have the same ventilation and exhaust requirements, regardless of building height.

However, it is not clear by the charging language in R403.3 and R403.3.1 what ventilation requirements are if the building exceeds 3 stories. It seems that R403.3.2 is intended to apply to all R-2, R-3 and R-4, regardless of building height, so this proposal makes that intent more explicit.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not intended to change stringency of requirements, but rather clarify the current requirements for all the occupancies within a multifamily building, regardless of building height.

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 $m^3/(s \times m^2)$, °C = [(°F) – 32]/1.8, 1 square foot = 0.0929 m^2.

a. Based on net occupiable floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet , urinal or adult changing station. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

g. Mechanical exhaust is required and recirculation from such spaces is prohibited. For occupancies other than science laboratories, where there is a wheel-type energy recovery ventilation (ERV) unit in the exhaust system design, the volume of air leaked from the exhaust airstream into the outdoor airstream within the ERV shall be less than 10 percent of the outdoor air volume. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).

h. For nail salons, each manicure and pedicure station shall be provided with a source capture system capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

i. Outpatient facilities to which the rates apply are freestanding birth centers, urgent care centers, neighborhood clinics and physicians' offices, Class 1 imaging facilities, outpatient psychiatric facilities, outpatient rehabilitation facilities and outpatient dental facilities.

j. The requirements of this table provide for acceptable IAQ. The requirements of this table do not address the airborne transmission of airborne viruses, bacteria and other infectious contagions.

k. These rates are intended only for outpatient dental clinics where the amount of nitrous oxide is limited. They are not intended for dental operatories in institutional buildings where nitrous oxide is piped.

l. The occupiable floor area in warehouses shall not include the floor area of self-storage units, floor areas under rack storage or designated palletized storage floor areas.

Reason: I am proposing the row in the ventilation table (table 403.3.1.1) labeled Ice arenas without combustion engines to be deleted.

Reason for removal: The requirement / row has been removed from ASHRAE 62.1 since the 2013 addition. As well as the values currently required in the current code do not make sense. The ventilation rate for the ice surface on an area basis is 0.30 cfm/sf which is higher than gym play area which is at 0.18 cfm/sf. My understanding of the ventilation rate for area is to account for off gassing of materials, and ice off gasses water vapor where a gym floor would be much worse and yet ventilation rate is higher for ice. As the row indicates this requirement is for ice arenas without combustion engines so I do not understand why there is a requirement for exhaust, this requirement would more be for an ice arena with combustion engines.

Cost Impact: Decrease

- **cdpAccess Ice Arena Code Change Savings.xlsx**
  https://www.cdpaccess.com/proposal/9413/28499/documentation/134102/attachments/download/4623/

Estimated Immediate Cost Impact:

Assuming desiccant style dehumidification units are used which are industry standard there would be a savings of $50,000 to $100,000 savings per ice rink. Desiccant style dehumidification units are much more expensive per unit airflow than a typical DX unit.

Estimated Immediate Cost Impact Justification (methodology and variables):

A typical NHL size ice sheet is 16,400sqft in area. If the "Ice Arenas without Combustion Engines" was removed and the ice would now fall under "Gym, Stadium, Arena (play area)", the airflow per square foot goes from 0.30 to 0.18 cfm/sf. This is a reduction close to 2,000 cfm. Ice arenas need to be positively pressurized to control humidity so if the exhaust rate is taken into account and dropped from 0.5 to 0.18, this would reduce the required airflow around 5,000 cfm. Ice arenas required dew points below what standard DX systems can supply so more expensive desiccant type dehumidification units are used.

Estimated Life Cycle Cost Impact:

Depending on controls and design conditions there is a chance to save $7,000 to $20,000 over the 15 year life of the desiccant unit, majority being fan energy but there is some gas savings.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

It is difficult to quantify the life cycle savings, the savings come from not having to condition 2,000 to 5,000 cfm for the life of the equipment and what are the outside conditions of the building. As well as most of these systems are ran with demand control ventilation or scheduled only full ventilation when there is a high occupancy event. A high school hockey team will have 8-15 home hockey games and typically have at least 2 teams (mens and womens) call the rink home ice, with high occupancy games happening between November and February with playoffs happening in March of every year. . A college hockey team will have about 20 home hockey games and typically have at least 2 teams (mens and womens) call the rink home ice, with high occupancy games happening between October and March with playoffs happening in March/April of every year. I will be using 20 events per season for calc, more event will lead to more cost savings. Life expectancy for a gas regen desiccant unit is around 15 years. The unit is ran as a constant volume unit unit supply airflow is equal to the requires outside airflow rate, so if the requires outside airflow rate can be reduced the supply airflow can be reduced saving fan energy.

M29-24

M30-24

IMC®: 403.3.2.1

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

2024 International Mechanical Code

Revise as follows:

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system shall comply with one of the following:

1. In Climate Zones 0 through 5, an outdoor ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system.
2. In Climate Zones 6, 7, and 8, an outdoor ventilation system shall be a *balanced ventilation system* in compliance with the residential provisions of the *International Energy Conservation Code*.

The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1) \quad \textbf{(Equation 4-9)}$$

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The whole-house ventilation system is a *balanced ventilation system*.

Reason: This proposal is intended to align the residential ventilation requirements in the mechanical code with the energy efficiency requirements in the 2024 IECC. Public draft #2 of the 2024 IECC requires the use of an energy recovery ventilator or heat recovery ventilator in Climate Zones 6 through 8 which are both balanced ventilation systems.

Section 403.3.2.1 of the 2024 IMC explicitly allows the use of supply-only, exhaust-only or balanced ventilation systems in low-rise multifamily buildings. This proposal is intended to clarify that supply-only and exhaust-only ventilation systems are only allowed in Climate Zones 0 through 5 and balanced ventilation systems are required in Climate Zones 6 through 8.

Bibliography: THE INTERNATIONAL RESIDENTAIL CODE-CHAPTER 11 ENERGY EFFICIENCY PUBLIC COMMENT DRAFT #2 https://www.iccsafe.org/wp-content/uploads/PCD2-IRC-CHAP-11.pdf

REPI-93-21 https://energy.cdpaccess.com/proposal/443/1236/preview/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no increased costs for this proposal, as it is simply a coordination proposal. Increased costs due to the ERV/HRV requirements have been addressed as part of the development process of the IECC-R.

M30-24

M31-24

IMC®: 403.3.2.1

Proponents: Armin Rudd, AB Systems LLC, National Association of Home Builders (arudd@absystems.us)

2024 International Mechanical Code

Revise as follows:

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$\cancel{Q_{OA} = 0.03}$ $\underline{Q_{OA} = 0.01}A_{floor} + 7.5(N_{br} + 1)$ **(Equation 4-9)**

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   - 2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:
     - 2.1.1. Living room.
     - 2.1.2. Dining room.
     - 2.1.3. Kitchen.
   - 2.2. The whole-house ventilation system is a *balanced ventilation system*.

Reason: The goal of this proposal is roll-back the mechanical ventilation rate for Group R-2, R-3 and R-4 occupancies to the previous 2021 rate.

The 2024 IMC residential ventilation rate is too high. Too much ventilation airflow wastes energy and causes humidity control difficulties and inefficiencies in warm-humid summers and cold-dry winters.

The 2024 IMC increase from (0.01*A_{floor} + 7.5*(Nbdrm+1)) to (0.03*A_{floor} to 7.5*(Nbdrm+1)) was presented as an attempt to align the IMC with ASHRAE Standard 62.2. However, 62.2 allows for an infiltration credit to reduce the ventilation rate, the 2024 IMC does not. 62.2 allows for an air filtration credit to reduce the ventilation rate, the 2024 IMC does not. As such, the effective 2024 IMC ventilation rate is greater than the ASHRAE 62.2 rate and the IMC rate change should be reversed.

Behind that is the fact that the 2013 increase in the ASHRAE 62.2 ventilation rate did not come about due to any health-based data or studies. It came about due to committee leadership maneuvering to split up a standing change proposal that involved a combined change to eliminate the default infiltration credit[1] (infiltration credit would have to be measured in the future) and to find consensus on what the ventilation rate should be based on human health data. Because the committee leadership wanted to bifurcate the change proposal, the proponents were promised that if the proposal was withdrawn, and the default infiltration credit was eliminated, the committee would act in good faith to base the new ventilation rate requirement on health-based studies rather than the current ventilation rate status which was based on qualitative judgement of the committee membership. Since the proposal had been mired in process for a long time, the proponents agreed to what the committee leadership promised and withdrew the proposal. After that, there was a swift dispensing of the default infiltration credit followed by a large ventilation rate increase without presentation of any health data studies to support it.

Fast forward a decade and there is still no health-based data or study to support the ASHRAE Standard 62.2 residential ventilation rate quantitatively. Rather, indoor air quality research, using the Disability Adjusted Life Years (DALY) analysis approach, has shifted away from concern over dilution of chemical contaminants by ventilation air exchange to fine particle filtration in the indoor environment.

Fine particle (PM2.5) filtration is now presented as the most significant indoor air health issue, being about 10 times more important than the next closest indoor air contaminant of concern which is formaldehyde, and formaldehyde is best limited by limiting the material source. As such, the primary contaminant of concern in residential indoor environments has shifted largely away from chemical compounds to fine particles. Fine particulate matter is ameliorated by air filtration, not dilution with outdoor air, since outdoor concentrations often exceed indoor concentrations[2,3,4].

Therefore, the residential ventilation rate should not have been increased in the 2024 IMC due to the following:

1. The effective 2024 IMC ventilation rate is greater than the ASHRAE Standard 62.2 rate because the 2024 IMC does not allow the credits against ventilation rate that ASHRAE 62.2 allows; and
2. There is no health-based data to support the prior or the new IMC ventilation rate, and there has been an order of magnitude shift in the indoor air quality research community to the importance of fine particle filtration over chemical dilution.

<u>Ventilation excess compared to ASHRAE Standard 62.2:</u>

By not allowing a measured infiltration credit against the ventilation rate per ASHRAE Standard 62.2, the IMC's current ventilation rate requirement is about 12 CFM or 14% higher than even the ASHRAE 62.2 rate for a 2400 ft^2, 3 bedroom, 3 ACH50 leakage dwelling-unit in Baltimore with a reference-case exhaust-only ventilation system. For the same dwelling-unit with a balanced ventilation system, the IMC's current ventilation rate requirement is about 36 CFM or 53% higher than the ASHRAE 62.2 rate. The excess ventilation rate translates to excess energy use and indoor humidity control issues.

[1] The default infiltration credit was a presumption that infiltration contributed 2 CFM per 100 ft^2 of floor area to outdoor air exchange for all dwelling units.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

<u>Equipment:</u> The proposed decrease in required ventilation rate will generally result in cost savings due to reduced size of ventilation fan equipment and reduced size of ducts. Smaller ventilation system components will generally result in reduced material costs but that can depend on the specifics of each ventilation system.

<u>Energy Use:</u> Energy modeling of residential ventilation systems show the following impacts.

For an exhaust-only ventilation system in a 2467 ft^2, 3 bedroom, 3 ACH50 dwelling unit in Washington DC, annual energy savings due to the reduced ventilation rate can be expected as follows:

89% savings for the ventilation fan energy itself;

20% or $161 savings for total HVAC system energy; and

10% or $161 savings for total dwelling unit energy including HVAC, hot water, appliances, and miscellaneous loads.

For an ERV ventilation system in the same dwelling unit and location, annual energy savings due to the reduced ventilation rate can be expected as follows:

90% savings for the ventilation fan energy itself;

10% or $76 savings for total HVAC system energy; and
5% or $76 savings for total dwelling unit energy including HVAC, hot water, appliances, and miscellaneous loads.

Estimated Immediate Cost Impact Justification (methodology and variables):

M31-24

M32-24

IMC®: 403.3.2.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1) \quad \textbf{(Equation 4-9)}$$

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exception~~s~~:

~~1.~~ The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.

~~2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:~~

~~2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:~~

~~2.1.1. Living room.~~

~~2.1.2. Dining room.~~

~~2.1.3. Kitchen.~~

~~2.2. The whole-house ventilation system is a *balanced ventilation system*.~~

Reason: ASHRAE 62.2 is the basis for this proposal.

ASHRAE 62.2 does not have this reduction for distribution or balanced systems.

For balanced systems in single-family applications ASHRAE 62.2 uses a calculation procedure to combine natural infiltration with mechanical ventilation. This procedure results in smaller air flow requirements for balanced systems compared to unbalanced systems. However, this is not fixed at 30% and depends on building envelope leakage levels and weather. This calculation is not allowed for multifamily buildings in ASHRAE 62.2 because no credit is given for natural infiltration in multifamily applications. ASHRAE 62.2 does not allow infiltration credit in multifamily buildings because infiltration calculations are very difficult to perform for multifamily buildings (note that the infiltration calculations used in ASHRAE 62.2 only apply to single zone buildings and were developed for single family dwellings - see the ASHRAE Handbook of Fundamentals Chapter 16) plus concerns about giving credit for flow from other units and adjacent spaces for which there is a substantial supporting literature.

ASHRAE 62.2 does not have this reduction for systems that supply air to specified rooms.

There are multiple reasons for this. Firstly, residences, unlike commercial buildings, are not zoned from an air flow perspective and there is insufficient advantage from delivering air to specific locations in a home to justify a 30% reduction in ventilation rates. This is for a host of reasons, primarily because other factors such as open or closed doors, magnitude and location of building envelope leakage and natural infiltration, and operation of central forced air HVAC systems, obscure any differences in ventilation system type. The bibliography has a list of several publications address these issues. Secondly, it is bad practice to supply air to kitchens. Kitchens are a major source of indoor contaminants from cooking and to prevent transfer of these contaminants to the rest of the dwelling ASHRAE 62.2 and other ventilation standards all require exhaust ventilation from kitchens.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal would have a minor, if any, change the cost of construction. Balanced and distributed systems already have additional installation costs and the current language attempts to offset this by requiring a smaller capacity system. In practical terms, however, systems come in a limited number of individual capacities. For example manufacturers offer residential ventilation fans in fixed capacities, or offer a single unit to cover a range of flow. A 30% reduction does not always result in an upfront equipment or installation costs savings.

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 $m^3/(s \times m^2)$, °C = [(°F) – 32]/1.8, 1 square foot = 0.0929 m^2.

a. Based on net occupiable floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet, urinal or adult changing station. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

g. Mechanical exhaust is required and recirculation from such spaces is prohibited. For occupancies other than science laboratories, where there is a wheel-type energy recovery ventilation (ERV) unit in the exhaust system design, the volume of air leaked from the exhaust airstream into the outdoor airstream within the ERV shall be less than 10 percent of the outdoor air volume. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).

h. For nail salons, each manicure and pedicure station shall be provided with a source capture system capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

i. Outpatient facilities to which the rates apply are freestanding birth centers, urgent care centers, neighborhood clinics and physicians' offices, Class 1 imaging facilities, outpatient psychiatric facilities, outpatient rehabilitation facilities and outpatient dental facilities.

j. The requirements of this table provide for acceptable IAQ. The requirements of this table do not address the airborne transmission of airborne viruses, bacteria and other infectious contagions.

k. These rates are intended only for outpatient dental clinics where the amount of nitrous oxide is limited. They are not intended for dental operatories in institutional buildings where nitrous oxide is piped.

l. The occupiable floor area in warehouses shall not include the floor area of self-storage units, floor areas under rack storage or designated palletized storage floor areas.

Reason: This proposal seeks to update the existing ventilation rate table in the IMC. Standard 62.1 is the source material for this table, and this updates Table 403.3.1.1 to match the appropriate ventilation rates in 62.1-2022.

Bibliography: ASHRAE Standard 62.1-2022

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal revises ventilation rates for specific spaces within varying occupancy classifications. However, this does not dictate system design to meet those requirements and therefore does not increase the cost of construction.

M33-24

M34-24

IMC®: 403.3.2.5

Proponents: Amanda Hickman, The Hickman Group, Air Movement and Control Association International, Inc. (AMCA) (amanda@thehickmangroup.com)

2024 International Mechanical Code

Revise as follows:

403.3.2.5 Ventilating equipment. Fans that supply ~~providing exhaust or~~ outdoor airto or *exhaust air* from a space shall be *listed* and *labeled* ~~to provide the minimum required air flow~~ in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51. Minimum required airflow rates shall be determined in accordance with Chapter 4 of this code.

Reason: This proposal suggests editorial changes to the language to more accurately describe how fans in ventilating equipment function and to harmonize the language with language in the standard that is referenced in this section. The original wording contains two separate requirements that are mixed. Requirement one is to have the fans listed and labeled to AMCA 210/ASHRAE 51. Requirement two is that the fans must provide the minimum required airflow. As currently stated, section 403.3.2.5 can be interpreted to state that the fans shall "provide the minimum required air flow in accordance with" AMCA 210/ASHRAE 51. However, AMCA 210/ASHRAE 51 provides no minimum air flow rates. Minimum airflow rates are regulated by Chapter 4 of the IMC.

This proposal harmonizes the following IMC-defined terms:

Outdoor air is a defined term. OUTDOOR AIR. Air taken from the outdoors, and therefore not previously circulated through the system.

Exhaust air is a defined term. AIR, EXHAUST. Air being removed from any space, appliance or piece of equipment and conveyed directly to the atmosphere by means of openings or ducts.

Supply air is a defined term. SUPPLY AIR. That air delved to each or any space supplied by the air distribution system or the total air delivered to all spaces supply by the air distribution system, which is provided for ventilating, heating, cooling, humidification, dehumidification, and other similar purposes.

The definition of Balanced ventilation system provides a basis for better wording of this section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal only updates terminology to be more consistent with referenced standard and industry practice.

M34-24

M35-24

IMC®: CHAPTER 4, 408.1 (New), 408.1.1 (New), APPENDIX D, SECTION D101, D101.1, D101.1.1

Proponents: Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org)

2024 International Mechanical Code

CHAPTER 4 VENTILATION

Add new text as follows:

408.1 Clean Air Delivery Capability. In group A, B, E, and I occupancies, each mechanical system shall meet the requirement in Section 408.1.1.

408.1.1 Airflow for increased filtration. Mechanical systems shall be sized to accommodate a design airflow at a total static pressure drop that assumes the utilization of a supply air filter with a Minimum Efficiency Reporting Value of not less than 13 (MERV 13).

Exceptions:

1. Ventilation for ambulatory care facilities, Group I-1 and Group I-2 occupancies shall be designed and installed in accordance with this code, ASHRAE/ASHE 170 and NFPA 99.
2. In group B occupancies, spaces smaller than 500 square feet (47 m^2) served by unitary or Packaged Terminal HVAC equipment.

Delete without substitution:

~~APPENDIX D CLEAN AIR DELIVERY~~

~~SECTION D101~~
~~GENERAL~~

~~**D101.1 Clean air delivery capability.**~~

~~In Group A, B, E and I *occupancies*, each mechanical system shall meet the requirements in Section D101.1.1.~~

~~**Exception:** Occupiable spaces where 100 percent of the supply air meets high-efficiency particulate air filtration.~~

~~**D101.1.1 Airflow for increased filtration.**~~

~~Mechanical systems shall be sized to accommodate a design airflow at a total static pressure drop that assumes the utilization of a supply air filter with a Minimum Efficiency Reporting Value (MERV) of not less than 13.~~

Reason: According to the World Health Organization, 3.2 million people die from household air pollution worldwide[1]. As we spend 90% of our time indoors (inclusive of any occupancy types), this is where we absorb most of the pollutants.

There is currently no requirement for filtration in the International Code. MERV 13 is critical to fight both particulate matter and airborne biological contaminants.

Since the pandemic, we have seen numerous events of wildfire affecting a large percentage of the population.

- ASHRAE 241 document that MERV-13 filters are 77% efficient at removing infectious aerosol.
- ASHRAE GPC 44 documents that filters with a MERV rating lower than 11 are not effective to at removing PM2.5

The choice of filtration level efficiency is made by the person who originally selected and engineered the HVAC system. It is frequently not feasible to upgrade to a MERV-13 in equipment that has not been sized for it.

California Title 24 requires MERV-13 for high-rise residential buildings, nonresidential and hotel/motel buildings.

This proposal will relocate language regarding clean air delivery capability from Appendix D to Chapter 4, Ventilation, of the IMC.

[1] https://www.who.int/news-room/fact-sheets/detail/household-air-pollution-and-health

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Estimated installation cost increase on a 7.5-ton rooftop air conditioning unit (serves ~3,000 ft^2 space) with MERV13 is about 2% or < $0.20 per square foot.

Estimated Immediate Cost Impact Justification (methodology and variables):

Based cost impact on a typical rooftop air conditioning unit.

M35-24

M36-24

IMC®: 501.3.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

501.3.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings that are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
3. For all environmental air exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings ~~, except where the exhaust opening is located not less than 1 foot (305 mm) above the gravity air intake opening~~ into buildings for all occupancies other than Group U; <u>except where the exhaust opening is located not less than 1 foot (305 mm) above the gravity air intake opening</u> ~~and~~ 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious. Separation is not required between intake air openings and living space exhaust air openings of an individual dwelling unit or sleeping unit where an approved factory built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the manufacturer's instructions.
4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment.
5. For specific systems, see the following sections:
   - 5.1. Clothes dryer exhaust, Section 504.4.
   - 5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
   - 5.3. Dust, stock and refuse conveying systems, Section 510.2.
   - 5.4. Subslab soil exhaust systems, Section 511.4.
   - 5.5. Smoke control systems, Section 512.10.3.
   - 5.6. Refrigerant discharge, Section 1105.7.
   - 5.7. *Machinery room* discharge, Section 1105.6.1.

Reason: This proposal fixes poor language of M28-21 so that it is understandable and clear.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no change to the technical requirements of the code. This is just simple wordsmithing to clarify what the intent of the section was requiring.

M37-24

IMC®: [F] 502.4, [F] 502.5

Proponents: Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov)

THIS PROPOSAL WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Mechanical Code

Revise as follows:

[F] 502.4 ~~Stationary storage battery~~ Energy storage systems. ~~Stationary storage battery~~ Energy storage systems (ESS) shall be regulated and ventilated in accordance with Section 1207.6.1 of the International Fire Code and the general requirements of this chapter.

Delete without substitution:

~~**[F] 502.5 Ventilation of battery systems in cabinets.**~~ ~~Stationary storage battery systems installed in cabinets shall be provided with ventilation in accordance with Section 502.4.~~

Reason: The terminology "battery storage systems" is outdated. This proposed change updates the language to utilize the current terminology found throughout the ICC code books - Energy Storage Systems (ESS). This change also removes section 502.5, as it is redundant - section 502.4 covers all ESS, including ones in cabinets.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change is editorial only - changing terminology and removing redundant provisions.

M37-24

M38-24 Part I

IMC®: 504.1, 504.9.6

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Mechanical Code

Revise as follows:

504.1 Installation. Clothes dryers shall be exhausted in accordance with the manufacturer's instructions. Dryer exhaust systems shall convey the moisture and any products of *combustion* to the outside of the *building*.

> **Exception:** This section shall not apply to *listed* and *labeled* condensing-type ~~(ductless)~~ or heat pump clothes dryers.

504.9.6 Exhaust duct required. Where space for a clothes dryer is provided, an exhaust duct system shall be installed. Where the clothes dryer is not installed at the time of occupancy, the exhaust duct shall be capped at the location of the future dryer.

> **Exception:** This section shall not apply w~~W~~here a *listed* and *labeled* condensing-type or heat pump clothes dryer is installed prior to occupancy of structure.

M38-24 Part I

M38-24 Part II

IRC: M1502.2, M1502.4.8

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Revise as follows:

M1502.2 Independent exhaust systems. Dryer exhaust systems shall be independent of all other systems and shall convey the moisture to the outdoors.

Exception: This section shall not apply to *listed* and *labeled* condensing-type ~~(ductless)~~ or heat pump clothes dryers.

M1502.4.8 Exhaust duct required.

Where space for a clothes dryer is provided, an exhaust *duct system* shall be installed. Where the clothes dryer is not installed at the time of occupancy the exhaust duct shall be capped or plugged in the space in which it originates and identified and marked “future use.”

Exception: This section shall not apply w~~W~~here a *listed* and *labeled* condensing-type or heat pump clothes dryer is installed prior to occupancy of structure.

Reason: This proposal recognizes the new technology of heat pump clothes dryers. These dryers use a refrigerant system to heat the air within the dryer and remove the moisture. Like condensing-type dryers, these dryers need to be connected to a drain line to dispose of the water. They are electric and are listed and labeled in accordance with UL 2158, which is referenced in IMC 913.1. This proposal also updates description for condensing-type dryers to industry standard terminology, and standardizes formatting of exception language.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifies scope of standards as part of existing listing requirements already applicable to all electric- powered dryers.

M38-24 Part II

M39-24

IMC®: 504.2, 504.2.1 (New)

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca)

2024 International Mechanical Code

Revise as follows:

504.2 Exhaust penetrations. Where a clothes dryer exhaust duct penetrates a non-fire-resistance rated wall or ceiling membrane, the annular space shall be sealed with noncombustible material, *approved* fire caulking or a noncombustible dryer exhaust duct wall receptacle. ~~Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draftstops or any wall, floor/ceiling or other assembly required by the *International Building Code* to be fire-resistance rated, unless such duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating is maintained in accordance with the *International Building Code*.~~ *Fire dampers*, *combination fire/smoke dampers* and any similar devices that will obstruct the exhaust flow shall be prohibited in clothes dryer exhaust ducts.

Add new text as follows:

504.2.1 Ducts penetrating fire resistance rated assemblies, fireblocks or draftstops. . Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draft stopping or any wall, floor/ceiling or other assembly required by the *International Building Code* to be fire-resistance rated, unless it complies with one of the following:

1. The duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating of any wall, floor/ceiling or other assembly required by the International Building Code to be fire- resistance rated is*maintained in accordance with Chapter 7 of the International Building Code.*
2. Ducts that are continuously covered on all sides from the point at which the duct penetrates the membrane of a wall or ceiling to the outlet terminal with a classified, listed and labeled system specifically evaluated for such purpose, in accordance with nationally recognized standards. The required fire resistance-rating shall be equal to the fire-resistance rating of the assembly being penetrated.

Reason: This proposal does several things. First, it reformats the paragraph and separates the individual criteria for better clarity. It also better differentiates the requirements based on whether the wall or ceiling is fire resistance rated, or not. Lastly, the proposal provides an additional option for ducts that penetrate fire resistance rated walls and floors. Third-party certification organizations like UL and Intertek provide listing and labelling services for fire-resistant duct systems using a variety of nationally recognized Standards and applicable ICC-ES criteria. These Listings have been in the marketplace for many years and have proven their effectiveness.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an additional option for protection of ducts. It does not remove any existing provisions or mandate additional costs.

M39-24

M40-24

IMC®: 506.3 (New), ASTM Chapter 15 (New)

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca)

2024 International Mechanical Code

Add new text as follows:

506.3.1 Special inspection and test requirements. Commercial kitchen grease ducts serving Type I hoods conforming to the provisions of Section 506.3.11 that are listed and labeled to the requirements of 506.3.11.2 or 506.3.11.3 shall undergo special inspection by an approved agency in accordance with ASTM WK70806.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

ASTM WK70806	Standard Practice for On-Site Inspection of Fire Resistive Duct Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM WK70806 Standard Practice for On-Site Inspection of Fire Resistive Duct Systems, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Commercial kitchen operations are consistently one of the leading causes of non-residential fires reported in the United States. Until recently, there has been no document produced in the industry that is a consensus of the manufacturers, installation contractors, and inspection agencies. The new ASTM Standard is a key document that provides a standard set of procedures for inspecting and reporting on the installed fire resistive duct systems. At the time of submission, the ASTM WK70806*, Standard Practice for On-Site Inspection of Fire Resistive Duct Systems* had not been published, but has gone through the full ASTM process and is awaiting final publication.

This Standard Practice provides a means to verify compliance of the installed fire resistive duct system to the inspection document, and requires all information contained in the inspection document to be submitted to the Authorizing Authority having jurisdiction. It establishes procedure to inspect products and systems, including methods for field verification and inspection.

Bibliography: ASTM WK70806, Standard Practice for On-Site Inspection of Fire Resistive Duct Systems, ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428.

Cost Impact: Increase

Estimated Immediate Cost Impact:

There are multiple jurisdictions that already require commercial grease duct inspections. The estimated cost is lower for instances where multiple duct inspections could be coordinated in the same time period, or for projects of low complexity. For those jurisdictions that already require duct inspection, the anticipated costs would be much lower as this proposal would be a replacement of existing requirements rather than an additional item.

Estimated Immediate Cost Impact Justification (methodology and variables):

For jurisdictions that do not currently require fire-resistant duct inspections, the anticipated cost increase for this proposal is between $1000 to $1500 per duct system inspected.

M40-24

M41-24

IMC®: 506.3.2.5, 506.3.2.5.1, 506.3.2.5.2, 506.3.2.5.2 (New), 506.3.2.5.3 (New)

Proponents: Joseph Summers, Mashantucket Pequot Tribal Nation, Building Code Enforcement

2024 International Mechanical Code

Revise as follows:

506.3.2.5 Grease duct test. A field test shall be performed prior to the use or concealment of any portion of a grease duct system. Grease ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the grease ducts from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. ~~A light test shall be performed to determine that all welded and brazed joints are liquid tight.~~
A test shall be performed for the entire grease duct system, including the hood-to-duct connection. The grease duct system shall be permitted to be tested in sections, provided that every joint is tested. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds. The test shall be performed in accordance with either Section 506.3.2.5.1 or 506.3.2.5.2.

~~506.3.2.5.1 Light test~~ .
~~A duct test shall be performed by passing a lamp, having not less than 1600 lumens, through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. A successful test shall be where the light from the lamp is not visible at any point on the exterior of the duct.~~

~~506.3.2.5.2~~ <u>506.3.2.5.1</u> Water spray test.
A duct test shall be performed by simulating a cleaning operation of the interior of the duct. A water pump capable of a flowing outlet pressure of not less than 1,200 psi (8274 kPa) shall be used, along with any necessary hoses and spray nozzles, to apply high-pressure water to the inside surfaces of the duct. A successful test shall be where there is no evidence of cleaning water at any point on the exterior of the duct.

Add new text as follows:

<u>**506.3.2.5.2 Positive pressure smoke test.** The positive pressure smoke test shall be performed by sealing the entire duct system from the hood exhaust opening(s) to the duct termination. Visible smoke shall be introduced to the duct system. The sealed duct shall then be pressurized to a minimum pressure of 1.0 inch water column, but shall not exceed the positive pressure capability of the system and components under test. No smoke shall emit from any exterior surface of the duct.</u>

<u>**506.3.2.5.3 Air test.** The air test shall be performed by sealing the entire duct system from the hood exhaust opening(s) to the duct termination. The sealed duct system shall then be pressurized to a minimum pressure of 1.0 inch (249 Pa) water column and shall be required to hold the initial set pressure for a minimum of 20 minutes.</u>

Reason: The light test can be easily manipulated by “bubble gum” patches. The industry criteria for a light test also requires the room to be in total darkness which is very difficult to achieve. The benefit of the water test is that is how hoods and ducts are cleaned. Very little water is used and is easily cleaned up. The other benefit is that during construction, if you can not hit a joint with the high pressure water, then an access panel is required.
The IKECA, recommends the use of a water test in their standards

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This adds alternatives to test methods the installer can use.

M42-24

IMC®: 507.1; IFC: [M] 606.2, UL Chapter 80 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Mechanical Code

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. A Type I hood shall be installed at or above appliances in accordance with Section 507.2. A Type II hood shall be installed at or above *appliances* in accordance with Section 507.3. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.

Exceptions:

1. Factory-built commercial ~~cooking recirculating systems~~ exhaust hoods that are *listed* and *labeled* in accordance with UL 710~~B~~, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.1.6, 507.2.3, 507.2.5, 507.2.8, 507.2.10, ~~and~~ 507.3.1~~,~~ and 507.3.3. ~~Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).~~
2. A hood shall not be required at or above any of the following:
   2. 1. Factory-built commercial cooking recirculating systems *listed* and *labeled* in accordance with UL 710B, and installed in accordance with Section 304.1 . Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).

   2.2. Cooking *appliances* equipped with integral down-draft exhaust systems ~~are~~ *listed* and *labeled* for the application in accordance with NFPA 96.

   2.3. Smoker ovens with ~~the~~ integral exhaust systems ~~are~~ *listed* and tested for the application.

   ~~3~~ 2.4. Ovens *listed* and *labeled* for use with wood fuel in accordance with UL 2162 and vented in accordance with the manufacturer's instructions.

   ~~4~~ 2.5. An electric cooking *appliance listed* and *labeled* in accordance with UL 197 for reduced grease emissions.

   ~~5~~ 2.6. Commercial electric dishwashers incorporating a self-contained condensing system *listed* and *labeled* in accordance with UL 921.

   ~~6~~ 2.7. Where the heat and moisture loads from dishwashers and *appliances* that produce heat or moisture and do not produce grease or smoke as a result of the cooking process are incorporated into the HVAC system design or into the design of a separate removal system. Spaces containing such cooking *appliances* that do not require Type II hoods shall be provided with exhaust at a rate of 0.70 cfm per square foot [0.00356 m^3/(s × m^2)]. For the purpose of determining the floor area required to be exhausted, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m^2). Such additional square footage shall be provided with exhaust at a rate of 0.70 cfm per square foot [0.00356 m^3/(s × m^2)].

2024 International Fire Code

Revise as follows:

[M] 606.2 Where required.

A Type I hood shall be installed at or above all commercial cooking appliances and domestic cooking appliances used for commercial purposes that produce grease vapors.

Exceptions:

1. Factory-built commercial exhaust hoods that are *listed* and *labeled* in accordance with UL 710, and installed in accordance with Section 304.1 of the International Mechanical Code, shall not be required to comply with Sections 507.1.5, 507.1.6, 507.2.3, 507.2.5, 507.2.8, 507.2.10, 507.3.1, and 507.3.3, ~~507.1.6 and 507.2.10~~ of the International Mechanical Code.
2. A hood shall not be required at or above any of the following:
   - 2.1. A Factory-built commercial cooking recirculating systems that are *listed* and *labeled* in accordance with UL 710B, and installed in accordance with Section 304.1 of the International Mechanical Code, ~~shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.1.6 and 507.2.10 of the International Mechanical Code.~~ Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1 of the International Mechanical Code. For the purpose of determining the floor area required to be ventilated, each individual appliance shall be considered as occupying not less than 100 square feet (9.3 m^2).
   - 2.2. Cooking appliances equipped with integral down-draft exhaust systems listed and labeled for the application in accordance with NFPA 96.
   - 2.3. Smoker ovens with integral exhaust systems listed and tested for the application.
   - 2.4. Ovens listed and labeled for use with wood fuel in accordance with UL 2162 and vented in accordance with the manufacturer's instructions.
   - 2.5. Electric cooking appliances listed and labeled in accordance with UL 197 for reduced grease emissions.
3. ~~Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are *listed* and *labeled* for the application in accordance with NFPA 96, a hood shall not be required at or above them.~~
4. ~~A Type I hood shall not be required for an electric cooking appliance where an *approved* testing agency provides documentation that the appliance effluent contains 5 mg/m^3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m^3/s) in accordance with UL 710B.~~

Add new standard(s) as follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook, IL 60062

197—2010	Commercial Electric Cooking Appliances—with Revisions through January 2018
2162—2014	Commercial Wood-Fired Baking Ovens—Refractory Type—with Revisions through August 2019

Staff Analysis: The proposed referenced standards, UL 197 and UL 2162, are currently referenced in the IMC. The proposed referenced standard, NFPA 96, is currently referenced in the IMC and IFC.

Reason: This proposal is an editorial cleanup of the code change proposals M40-21 through M46-21 that were approved as submitted for the 2024 codes. This clean-up is necessary to address one of the primary reasons for these proposals, which was to clarify all the exceptions to Type 1 and Type 2 hoods.

For the IMC, exception 1 was always intended to remain as an exception for exhaust hoods listed and labeled to UL 710 (not recirculating systems listed and labeled to UL 710B). This proposal reverts exception 1 back to what was originally in the 2021 code. Also, the current exceptions 3, 4, 5, and 6 were intended to be sub items of Exception 2.

In addition, the exceptions added to Section 507.1 in the IMC that applied to the requirement for Type 1 hoods were also intended to be done in Section 606.2 of the IFC. This proposal aligns the IFC exceptions with the IMC exceptions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is an editorial cleanup of the code change proposals M40-21 through M46-21 that were approved as submitted for the 2024 codes. It does not add new requirements it simply relocates existing requirements to another section of the codes.

M42-24

M43-24

IMC®: 507.1, 507.1.5, 507.1.6, 507.2; IFC: [M] 606.2

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Mechanical Code

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. A Type I hood shall be installed at or above appliances in accordance with Section 507.2. A Type II hood shall be installed at or above *appliances* in accordance with Section 507.3. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.

Exceptions:

~~1.~~ ~~Factory-built commercial cooking recirculating systems that are and *labeled* in accordance with UL 710B, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.1.6, 507.2.3, 507.2.5, 507.2.8, 507.2.10 and 507.3.1, Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).~~

~~2~~ 1. A hood shall not be required at or above any of the following:

~~2.1~~ 1.1. Factory-built commercial cooking recirculating systems *listed* and *labeled* in accordance with UL 710B, and installed in accordance with Section 304.1 . Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).

~~2.2~~ 1.2. Cooking *appliances* equipped with integral down-draft exhaust systems are *listed* and *labeled* for the application in accordance with NFPA 96.

~~2.3~~ 1.3. Smoker ovens with the integral exhaust systems are *listed* and tested for the application.

4~~3~~. Ovens *listed* and *labeled* for use with wood fuel in accordance with UL 2162 and vented in accordance with the manufacturer's instructions.

5~~4~~. An electric cooking *appliance listed* and *labeled* in accordance with UL 197 for reduced grease emissions.

6~~5~~. Commercial electric dishwashers incorporating a self-contained condensing system *listed* and *labeled* in accordance with UL 921.

7~~6~~. Where the heat and moisture loads from dishwashers and *appliances* that produce heat or moisture and do not produce grease or smoke as a result of the cooking process are incorporated into the HVAC system design or into the design of a separate removal system. Spaces containing such cooking *appliances*that do not require Type II hoods shall be provided with exhaust at a rate of 0.70 cfm per square foot [0.00356 m^3/(s × m^2)]. For the purpose of determining the floor area required to be exhausted, each individual *appliance*that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m^2). Such additional square footage shall be provided with exhaust at a rate of 0.70 cfm per square foot [0.00356 m^3/(s × m^2)].

507.1.5 Exhaust outlets. Exhaust outlets located within the hood shall be located so as to optimize the capture of particulate matter. Each outlet shall serve not more than a 12-foot (3658 mm) section of hood.

Exception: Exhaust outlets within hoods *listed* and *labeled* in accordance with UL 710 installed in accordance with the listing and the manufacturer's installation instructions.

507.1.6 Hood size and location. Hoods shall comply with the overhang, setback and height requirements in accordance with Sections 507.1.6.1 and 507.1.6.2, based on the type of hood.

Exception: Exhaust hoods *listed* and *labeled* in accordance with UL 710 installed in accordance with the listing and the manufacturer's installation instructions.

507.2 Type I hoods. Type I hoods shall be installed where cooking *appliances* produce grease or smoke as a result of the cooking process. Type I hoods shall be installed over *medium-duty, heavy-duty* and *extra-heavy-duty cooking appliances*. Type I hoods shall comply with one of the following:

1. Constructed and installed in accordance with Sections 507.2.1 through 507.2.11
2. *Listed* and *labeled* in accordance with UL 710, and installed in accordance with the listing, the manufacturer's installation instructions, and Sections 507.2.2, 507.2.4, 507.2.7 and 507.2.11.

2024 International Fire Code

Revise as follows:

[M] 606.2 Where required.

A Type I hood shall be installed at or above all commercial cooking appliances and domestic cooking appliances used for commercial purposes that produce grease vapors.

Exceptions:

~~1.~~ ~~Factory-built commercial exhaust hoods that are *listed* and *labeled* in accordance with UL 710, and installed in accordance with Section 304.1 of the International Mechanical Code, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.1.6 and 507.2.10 of the International Mechanical Code.~~

~~2~~ 1. Factory-built commercial cooking recirculating systems that are *listed* and *labeled* in accordance with UL 710B, and installed in accordance with Section 304.1 ~~of the International Mechanical Code, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.1.6 and 507.2.10~~ of the International Mechanical Code. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1 of the International Mechanical Code. For the purpose of determining the floor area required to be ventilated, each individual appliance shall be considered as occupying not less than 100 square feet (9.3 m^2).

~~3~~ 2. Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are *listed* and *labeled* for the application in accordance with NFPA 96, a hood shall not be required at or above them.

~~4~~ 3. A Type I hood shall not be required for an electric cooking appliance where an *approved* testing agency provides documentation that the appliance effluent contains 5 mg/m^3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m^3/s) in accordance with UL 710B.

Reason: This proposal recognizes two code compliance paths for Type I hoods. One path is to construct in accordance with the prescriptive code requirements and the other in accordance with requirements found within UL 710. As noted in the scope of UL 710, "These requirements cover Type I commercial kitchen exhaust hoods intended for placement over commercial cooking equipment". UL 710 is not an exception for exhaust hoods, but is the standard used to test and certify factory-built exhaust hoods. Most of the prescriptive requirements in the code for Type I hoods do not apply, because UL 710 is a performance method, which is an alternative means for determining the suitability of the exhaust hood for the installation. The previous exceptions found in the code for UL 710 hoods have not changed they have just been reformatted for clarity.

The first exception to IFC 606.2 is not an appropriate exception to the requirement, because a Type I hood is required to be placed over these cooking appliances, regardless of whether it is constructed in accordance with the code prescribed requirements or is tested and listed in accordance with UL 710. Also, IFC 606.2 is updated to align with the IMC Section 507.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This clarifies that code permits two different methods for construction and installation of a Type I exhaust hood. The certification of a factory-built exhaust hood has always been permitted as an alternative method to the prescriptive requirements in the code. Also aligns the IFC with the IMC installation requirements.

M43-24

M44-24 Part I

IMC®: 513.1

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Mechanical Code

Revise as follows:

513.1 General. Energy <u>and heat</u> recovery ventilation systems shall be installed in accordance with this section. Where required for purposes of energy conservation, energy <u>and heat</u> recovery ventilation systems shall <u>also</u> comply with the *International Energy Conservation Code* . Ducted <u>energy and</u> heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1812. Nonducted <u>energy and</u> heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1815.

Staff Analysis: Staff Analysis: The proposed referenced standards, UL 1812 and UL 1815, are currently referenced in the IMC.

M44-24 Part I

M44-24 Part II

IRC: SECTION M1905 (New), M1905.1 (New), UL Chapter 44 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Add new text as follows:

SECTION M1905 ENERGY AND HEAT RECOVERY VENTILATION SYSTEMS

M1905.1 General. Energy and heat recovery ventilation systems shall be installed in accordance with this section. Where required for purposes of energy conservation, energy and heat recovery ventilation systems shall also comply with Chapter 11. Ducted energy and heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1812. Nonducted energy and heat recovery ventilators shall be listed and labeled in accordance with UL 1815.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

1812-2013	Ducted Heat Recovery Ventilators - with revisions through May 3, 2022
1815-2012	Nonducted Heat Recovery Ventilators - with revisions December 7, 2021

Staff Analysis: The proposed referenced standards, UL 1812 and UL 1815, are currently referenced in the IMC.

Reason: The common industry terms for the equipment covered by these requirements are “Energy Recovery Ventilators (ERVs)” and “Heat Recovery Ventilators (HRVs)”. The primary difference is that ERVs have moisture permeable heat exchangers to facilitate both sensible and latent heat transfer between the air streams. HRV’s have nonpermeable heat exchangers, and thus only facilitate sensible heat transfer. Both ERVs and HRVs are in scope of the referenced standards. This proposal aligns the code terminology with industry, the IECC, and the IRC to improve clarity. This clarifies that safety requirements always apply independently of energy conservation requirements of IECC. This clarifies that this section does not mandate installation, but provides requirements where installed.

Correlates IRC with mechanical code requirements (Section 514). Chapter 11 of IRC contains energy efficiency related requirements for this equipment (see N1103.6.1), however the main body of code does not contain safety requirements for this equipment.

This equipment is becoming more common in construction. M1301.1 already requires that equipment not covered by this code refer to the IMC. This equipment is covered by 514.1 of the IMC. By also adding these requirements into the body of the IRC, it assists the user in applying code requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial, clarifies existing requirements in the IMC, and also incorporates the updated text into the IRC for ease of use.

For the IRC: E3403.3 already requires listing of electrical equipment, while this proposal clarifies the specific listing standards. IRC M1301.1 points to the IMC for requirements for equipment not covered, and the IMC already includes these requirements. Additionally the IRC, Section M1302.1, requires appliances regulated by the IRC be listed and labeled for the application.

M44-24 Part II

M45-24

IMC®: 601.5

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

601.5 Return air openings. Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another *appliance* located in the same room or space.
2. Return air for heating or air-conditioning systems shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the *appliance* or *equipment* manufacturer's installation instructions, ACCA Manual D or the design of the *registered design professional*.
5. Return air taken from one *dwelling unit* shall not be discharged into another *dwelling unit*.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air for heating or air-conditioning systems shall not be taken from a bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.
8. ~~Return air from a closet shall serve only the closet and shall not require a dedicated closet supply duct.~~Where return ~~Return~~ air taken from a closet smaller than 30 square feet (2.8 m^2) in area ~~shall require~~ the closet door shall be undercut not less than 1$^1/_2$ inches (38 mm)~~ or~~, shall have ~~either~~ a louvered door or shall include an air transfer grille, each with a net free area of not less than 30 square inches (19 355 mm^2.) Where return air is taken from a closet 30 ft^2 or larger in area, the closet shall comply with Item 4. Return air taken from closets shall serve only the closet space.
9. Return air taken from a closet smaller than 30 square feet (2.8 m^2) shall require the closet door be undercut not less than 1$^1/_2$ inches (38 mm) or have either a louvered door or an air transfer grille, each with a net free area of not less than 30 square inches (19 355 mm^2).
10. Return air for heating or air-conditioning systems shall not be taken from indoor swimming pool enclosures and associated deck areas.

    Exceptions:

    1. Where the air from such spaces is dehumidified in accordance with Section 403.2.1, Item 2.
    2. Dedicated HVAC systems serving only such spaces.

Exceptions:

1. Taking return air for heating or air-conditioning systems from a kitchen is not prohibited where such return air openings serve the kitchen and are located not less than 10 feet (3048 mm) from the cooking *appliances*.
2. Taking return air for heating or air-conditioning systems from a kitchen is not prohibited in a *dwelling unit* where the kitchen and living spaces are in a single room and the cooking *appliance* is electric and located not less than 5 feet (1524 mm) in any direction from the return air intake opening.
3. Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage.

Reason: This proposal simply fixes poor language of M53-21 to give the reader a better idea of what it required by the language.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal clarifies the intent of M53-21.

M45-24

M46-24

IMC®: 602.1.1

Proponents: Thomas Allen, Orange County - Division of Building Safety, Self (thomas.allen@ocfl.net)

2024 International Mechanical Code

Revise as follows:

602.1.1 Locations limited.
Plenums shall be limited to uninhabited crawl spaces, above a ceiling or below the floor, attic spaces, mechanical equipment rooms and the framing cavities addressed in Section 602.2.

Exception: Finished Mechanical rooms in a dwelling unit only serving that dwelling unit.

Reason: The Mechanical code has made great strides to define the plenum locations, "*Plenums* shall be limited to uninhabited crawl spaces, above a ceiling or below the floor, attic spaces, mechanical equipment rooms and the framing cavities addressed in Section 602.2." and further defines the requirements for within stud spaces and joist. The finished mechanical equipment room within a dwelling unit serving only that unit should be exempted from plenum construction requirements, it does not serve another fire area, a finished equipment room would have the rough framing space behind the finish. The current mechanical equipment room brings to mind the HVAC closets of the past that are a rough stud space with a door.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The exception for a finished equipment room not being considered a plenum is a clarification that many jurisdictions already apply this code section.

M46-24

M47-24 Part I

IMC®: 603.9.1 (New), UL Chapter 15 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Mechanical Code

Add new text as follows:

603.9.1 Collars and sleeves. Nonmetallic collars and sleeves used to join or attach flexible air ducts and air connectors shall be *listed* and *labeled* in accordance with UL 181C

Add new standard(s) as follows:

333 Pfingsten Road
Northbrook, IL 60062-2096

181C-2020	Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors

M47-24 Part I

M47-24 Part II

IRC: M1601.1.1, UL Chapter 44 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems.
Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Nonmetallic collars and sleeves used to join or attach flexible air ducts shall be *listed* and *labeled* in accordance with UL 181C
4. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.*
~~4~~5. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
~~5~~ 6. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
~~6~~ 7. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.
~~7~~ 8. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
    - ~~7~~8.1. These cavities or spaces shall not be used as a plenum for supply air.
    - ~~7~~8.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
    - ~~7~~8.3. Stud wall cavities shall not convey air from more than one floor level.
    - ~~7~~8.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.
    - ~~7~~8.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
    - ~~7~~8.6. Building cavities used as plenums shall be sealed.
~~8~~ 9. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

181C-2020 Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors

Reason: UL 181C, Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors, was developed to evaluate non-metal accessories, such as collars and sleeves, used to join or attach flexible air ducts and air connectors that comply with the requirements of UL 181, Factory-Made Air Ducts and Air Connectors.

As defined in UL 181C, a collar is a non-metal accessory used to join flexible air ducts and air connectors at their terminations to other portions of the air duct system. A sleeve is defined as a non-metal accessory used to join sections of flexible air ducts or air connectors.

The requirements for these collars and sleeves include all the applicable requirements that would be applied to factory-made air ducts (UL 181) and discrete products within plenums (UL 2043).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This does not increase of decrease cost. This does not mandate the use of these collars and sleeves. This is providing an alternative to existing methods for connecting flexible air ducts and air connectors. The proposal sets the base safety and performance requirements if these nonmetallic collars and sleeves are used.
Listing for heat pump heaters regulated by this section of the code is currently required by this code, so there is no cost impact. The proposal is a simple editorial revision to the correct (current) product standard.

M47-24 Part II

M48-24

IMC®: 603.17

Proponents: Kevin Gebke, DuctSox, DuctSox/Engineering Manager (kgebke@ductsox.com)

2024 International Mechanical Code

Revise as follows:

603.17 Air dispersion systems. Air dispersion systems shall:

1. Be installed entirely in exposed locations.

~~2. Be utilized in systems under positive pressure.~~

2.~~3.~~ Not pass through or penetrate fire-resistant-rated construction.

3.~~4.~~ Be *listed* and *labeled* in compliance with UL 2518.

Reason: UL 2518 Standard for Air Dispersion Systems was updated and published on April 6, 2023. The update recognized that Air Dispersion Systems can be operated in both positive and negative pressure modes if the correct products are specified. This proposal looks to align the IMC and the UL 2518 standard.

Bibliography: UL 2518 Standard for Air Dispersion Systems - April 6, 2023

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply aligns the UL 2518 standard and the IMC and has no impact on cost of construction.

M48-24

M49-24

IMC®: [F] 606.4

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com)

THIS PROPOSAL WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Mechanical Code

Revise as follows:

[F] 606.4 Controls operation. Upon activation, the smoke detectors shall shut down all operational capabilities of the air distribution system in accordance with the listing and labeling of *appliances* used in the system. Air distribution systems that are part of a smoke control system shall switch to the smoke control mode upon activation of a detector.

> <u>**Exception:** In a Group H-5 occupancy, automatic shutdown of the air distribution system shall not be required where a smoke detection system, with remote indication and manual shutdown capability at the emergency control station, is provided.</u>

Reason: The 2024 Edition of the IBC permits an increased travel distance in Group H-5 occupancies based upon computer modeling. One of the assumptions in the modeling, which is a requirement in the IBC, is that the ventilation system continues to operate. A proposal has been submitted to require the annunciation and manual shutdown capability at the emergency control station. This proposal correlates with the 2024 Edition of the IBC and the revisions proposed this cycle.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal correlates with 2024 IBC provisions and proposed changes related to the increased travel distance in Group H-5 occupancies.

M49-24

IMC®: CHAPTER 6, SECTION 608, 608.1, CHAPTER 15, 15 SMACNA, SMACNA Chapter 15 (New)

Proponents: Eli Howard, SMACNA, SMACNA (ehoward@smacna.org)

2024 International Mechanical Code

CHAPTER 6 DUCT SYSTEMS

SECTION 608
BALANCING

Revise as follows:

608.1 Balancing. Air distribution, ventilation and exhaust systems shall be provided with means to adjust the system to achieve the design airflow rates and shall be balanced by an *approved* method in accordance with SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, or equivalent.. *Ventilation air* distribution shall be balanced by an *approved* method in accordance with SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, or equivalent. and such balancing shall verify that the air distribution system is capable of supplying and exhausting the airflow rates required by Chapter 4.

CHAPTER 15 REFERENCED STANDARDS

Revise as follows:

SMACNA

Sheet Metal and Air Conditioning Contractors' National Association, Inc.
4201 Lafayette Center Drive
Chantilly, VA 20151-1219

2023 HVAC SYSTEMS TESTING, ADJUSTING & BALANCING, FOURTH EDITION

Staff Analysis: *New Standard

A review of the standard proposed for inclusion in the code, SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Balancing is currently required by the IMC, and this document would provide proper procedures for compliance to the code requirements.

Bibliography: SMACNA HVAC Testing, Adjusting & Balancing Manual 4th edition 2023.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Balancing of HVAC Systems is currently required by the IMC, and this would just provide a specific standard of procedure to follow.

M50-24

M51-24

IMC®: 801.20

Proponents: Abraham MURRA, Abraham Murra Consulting, Abraham Murra Consulting

2024 International Mechanical Code

Revise as follows:

801.20 Plastic vent joints. Plastic pipe and fittings used to vent *appliances* shall be installed in accordance with the *appliance* manufacturer's installation instructions <u>and with the installation instructions of the manufacturer of the venting pipe and fittings.</u>

Reason: As part of the certification process, venting piping systems must include installation instructions, as required by UL 1738. Therefore, the proposed new text is making users of the IMC, including tradespersons, aware that the pipe and fittings used for venting must be installed in accordance with the installation instructions of the piping manufacturer.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal only adds a statement for clarity.

M51-24

M52-24 Part I

IMC®: 803.6

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Mechanical Code

Revise as follows:

803.6 Automatic dampers.
Automatic dampers shall be *listed* and *labeled* in accordance with ~~UL 17~~ UL 378 for oil-fired heating *appliances*. The dampers shall be installed in accordance with the manufacturer's instructions. An automatic vent damper device shall not be installed on an existing *appliance* unless the *appliance* is *listed* and *labeled* and the device is installed in accordance with the terms of its listing. The name of the installer and date of installation shall be marked on a label affixed to the damper device.

Staff Analysis: The proposed referenced standard, UL 378, is currently referenced in the IMC and IRC.

M52-24 Part I

M52-24 Part II

IRC: M1802.2.2

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Revise as follows:

M1802.2.2 Automatically operated.
Automatically operated dampers shall conform to ~~UL 17~~ UL 378 and be installed in accordance with the terms of their *listing* and *label*. The installation shall prevent firing of the burner when the damper is not opened to a safe position.

Staff Analysis: The proposed referenced standard, UL 378, is currently referenced in the IMC and IRC.

Reason: UL 17 has been withdrawn by UL Standards & Engagement February 28, 2019. UL 378 contains appropriate listing requirements for the products referenced by these requirements. There are currently at least seven manufacturers with listed products to these requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial change to clarify correct and current listing standard in relation to existing requirements.

M52-24 Part II

M53-24

IMC®: SECTION 905, 905.1, TABLE 905.1 (New), UL Chapter 15 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Mechanical Code

Revise as follows:

SECTION 905
FIREPLACE STOVES, FIREPLACE INSERTS, AND ROOM HEATERS

905.1 General. Fireplace stoves, ~~and~~ solid-fuel-type room heaters, and fireplace inserts shall be *listed* and *labeled* in accordance with the requirements of table 905.1 and shall be installed in accordance with the ~~conditions of the~~ listing and the manufacturer's instructions. ~~Fireplace stoves shall be tested in accordance with UL 737. Solid-fuel-type room heaters shall be tested in accordance with UL 1482. Fireplace inserts intended for installation in fireplaces shall be *listed* and *labeled* in accordance with the requirements of UL 1482 and shall be installed in accordance with the manufacturer's instructions.~~ New wood-burning residential hydronic heaters shall be EPA certified.

Add new text as follows:

TABLE 905.1 FIREPLACE STOVES, FIREPLACE INSERTS, AND ROOM HEATERS STANDARDS

Stove/Heater Type	Standard
Fireplace stoves	UL 737
Solid-fuel room heaters	UL 1482
Solid-fuel fireplace inserts installed in masonry fireplaces	UL 1390
Solid-fuel fireplace inserts installed in factory-built fireplaces	UL 1391

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

1390-2024 Solid Fuel Fireplace Inserts and Hearth-Mounted Stoves for Installation into Masonry Fireplaces

1391-2024 Solid-Fuel Space Heaters for Installation into Factory-Built Fireplaces

Reason: This proposal creates a table with the information formerly found in paragraph form. Additionally since fireplace inserts are not in the scope of UL 1482 this proposal introduces two new UL standards which are the correct references for the requirements related to fireplace inserts. This proposal does not address gas-fired fireplace inserts which are covered by the IFGC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost for obtaining listed fireplace inserts may or may not represent increased product costs over obtaining non-listed products that ha

O

btaining and maintaining a listing for a listed fireplace insert involves both product investigation costs and costs for periodic inspection of p

2024 International Mechanical Code

Revise as follows:

908.1 General. A cooling tower used in conjunction with an air-conditioning *appliance* shall be installed in accordance with the manufacturer's instructions. Factory-built cooling towers shall be *listed* in accordance with ~~UL 1995 or~~ UL/CSA60335-2-40.

918.1 Forced-air furnaces. Oil-fired furnaces shall be tested in accordance with UL 727. Electric furnaces shall be tested in accordance with ~~UL 1995 or~~ UL/CSA 60335-2-40. Solid fuel furnaces shall be tested in accordance with UL 391. Forced-air furnaces shall be installed in accordance with the listings and the manufacturer's instructions.

918.2 Heat pumps. Electric heat pumps shall be tested in accordance with ~~UL 1995~~ or UL/CSA60335-2-40.

TABLE 1101.2 FACTORY-BUILT EQUIPMENT AND APPLIANCES

EQUIPMENT	STANDARDS
Air-conditioning equipment	~~UL 1995 or~~ UL/CSA 60335-2-40
Packaged terminal air conditioners and heat pumps	~~UL 484 or~~ UL/CSA 60335-2-40
Split-system air conditioners and heat pumps	~~UL 1995 or~~ UL/CSA 60335-2-40
Dehumidifiers	~~UL 474 or~~ UL/CSA 60335-2-40
Unit coolers	~~UL 412 or~~ UL/CSA 60335-2-89
Commercial refrigerators, freezers, beverage coolers and walk-in coolers	~~UL 471 or~~ UL/CSA 60335-2-89
Refrigerating units and walk-in coolers	~~UL 427 or~~ UL 60335-2-89
Refrigerant-containing components and accessories	UL 207
Drinking water coolers	UL 399
Refrigerated vending machines	UL 541
Ice makers	UL 563
Residential refrigerators, freezers, beverage coolers and walk-in coolers	UL 60335-2-24

Delete without substitution:

~~**1101.2.1 Group A2L, A2, A3 and B1 high-probability equipment.**~~
~~High-probability equipment using Group A2L, A2, A3 or B1 refrigerant shall comply with UL 484, UL/CSA 60335-2-40 or UL/CSA 60335-2-89.~~

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

399-2017 Drinking Water Coolers - with revisions through July 2023

541-2016 Refrigerated Vending Machines - with revisions through November 2020

563-2009 Ice Makers - with revisions through May 2021

60335-2-24-2022 Household and Similar Electrical Appliances – Safety – Part 2-24: Particular Requirements for Refrigerating Appliances, Ice-Cream Appliances and Ice-Makers

Reason: This proposal updates the standards used for various factory-built equipment and appliances. UL 412, UL 427, UL 471, UL 474, UL 484, and UL 1995 will be sunset in 2024. The applicable requirements from these standards are now in the harmonized standards UL 60335-2-40 and UL 60335-2-89. EPA sell-through date for products certified to these older standards will be effective before the 2027 codes will be adopted by any jurisdiction, see https://www.epa.gov/climate-hfcs-reduction/technology-transitions-hfc-restrictions-sector. Section 1101.2.1 is not necessary, because it is already covered in Table 1101.2.

This proposal further identifies the standards used for listing drinking water coolers, refrigerated vending machines, ice makers. It also provides the standard for residential refrigerators, freezers, beverage coolers and walk-in coolers.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Listing for factory-built cooling towers, oil-fired furnaces, electric heat pumps and other equipment regulated by this section of the code is currently required by this code, so there is no cost impact. The proposal is a simple editorial revision to the correct (current) product standard.

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 399-2017 *Drinking Water Coolers - with revisions through July 2023*, UL541-2016 *Refrigerated Vending Machines - with revisions through November 2020,* UL 563-2009 *Ice Makers - with revisions through May 2021*, UL 60335-2-24-2022 *Household and Similar Electrical Appliances – Safety – Part 2-24: Particular Requirements for Refrigerating Appliances, Ice-Cream Appliances and Ice-Makers,*with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

M54-24 Part I

M54-24 Part II

IRC: M1402.1, M1403.1, M1412.1, M1413.1, M2006.1

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Revise as follows:

M1402.1 General.
Oil-fired central furnaces shall be *listed* and *labeled* in accordance with UL 727. Electric *furnaces* shall be *listed* and *labeled* in accordance with ~~UL 1995 or~~ UL/CSA 60335-2-40.

M1403.1 Heat pumps.
Electric *heat pumps* shall be *listed* and *labeled* in accordance with ~~UL 1995 or~~ UL/CSA 60335-2-40.

M1412.1 Listed equipment.
Absorption systems shall be installed in accordance with the manufacturer's instructions. Absorption *equipment* shall be *listed* and *labeled* in accordance with ~~UL 1995 or~~ UL/CSA 60335-2-40.

M1413.1 General.
Evaporative cooling *equipment* and *appliances* shall comply with ~~UL 1995 or~~ UL/CSA 60335-2-40, and shall be installed:

1. In accordance with the manufacturer's instructions.
2. On level platforms in accordance with Section M1305.1.3.1.
3. So that openings in exterior walls are flashed in accordance with Section R703.4.
4. So as to protect the potable water supply in accordance with Section P2902.
5. So that air intake opening locations are in accordance with Section R325.4.1.

M2006.1 General.
Pool and spa heaters shall be installed in accordance with the manufacturer's installation instructions. Oil-fired pool heaters shall be *listed* and *labeled* in accordance with UL 726. Electric pool and spa heaters shall be listed and *labeled* in accordance with UL 1261. Pool and spa *heat pump* water heaters shall be *listed* and *labeled* in accordance with ~~UL 1995 or~~ UL/CSA~~/ANCE~~ 60335-2-40.

> **Exception:** Portable residential spas and portable residential exercise spas shall be *listed* and *labeled* in accordance with UL 1563 or CSA C22.2 No. 218.1.

Reason: This proposal updates the standards used for various furnace and heat pump and evaporative cooling equipment. The UL 1995 Standard will be sunset in 2024 and the applicable requirements from these standards are now in the harmonized standards UL 60335-2-40, therefore the reference to UL 1995 in this section is being removed by this proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Listing for oil-fired central furnaces, electric furnaces, electric heat pumps, pool and spa heaters and other equipment regulated by this section of the code is currently required by this code, so there is no cost impact. The proposal is a simple editorial revision to the correct (current) product standard.

M54-24 Part II

M54-24 Part III

ISPSC: TABLE 317.2(1)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

TABLE 317.2(1) WATER HEATERS

DEVICE	STANDARD
Electric water heater	UL 1261, UL 1563 or CSA C22.2 No. 218.1
Gas-fired water heater	ANSI Z21.56/CSA 4.7a
Heat exchanger	AHRI 400
Heat pump water heater	AHRI 1160 and one of the following: CSA C22.2 No. 236, ~~UL 1995,~~ or UL/CSA 60335-2-40

Reason: This proposal updates the standards used for various pool heaters. The UL 1995 Standard will be sunset in 2024 and the applicable requirements from this standard is now in the harmonized standard UL 60335-2-40, therefore the reference to UL 1995 in this section is being removed by this proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Listing for heat pump heaters regulated by this section of the code is currently required by this code, so there is no cost impact. The proposal is a simple editorial revision to the correct (current) product standard.

M54-24 Part III

M55-24

IMC®: 913.1

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Mechanical Code

Revise as follows:

913.1 General. Clothes dryers shall be installed in accordance with the manufacturer's instructions. Electric ~~residential~~ clothes dryers, including heat pump and condensing-type dryers, for residential use or commercial use by the general public shall be tested in accordance with UL 2158. Electric industrial and institutional ~~coin-operated~~ clothes dryers for use only by trained personnel shall be *listed* and *labeled* ~~tested in accordance with UL 2158. Electric commercial clothes dryers shall be tested~~ in accordance with UL 1240.

Reason: This proposal clarifies three things:

1. The requirements for heat pump clothes dryers: Heat pump clothes-dryers are becoming more common in the marketplace. UL 2158 was revised in 2021 to include these appliances within the scope of the standard. EPA Significant New Alternative Policy Program (SNAP) rules regarding low-GWP refrigerants will essentially require the use of refrigerants with higher flammability safety classifications per ASHRAE 34. These refrigerants introduce new hazards compared to those used previously. These concerns are addressed in the standards used to evaluate this equipment for listing.
2. The scope of the referenced standards: The scope of UL 2158 includes clothes-dryers for both home and commercial installations (such as a laundromat) where no special training is need for the operator. The scope of UL 1240 is for industrial clothes dryers not intended for use by the general public.
3. The third party certification requirements: Replaced "tested" with "listed and labeled" consistent with the requirements of 301.7 which more simply describes the compliance mechanism for code officials.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifies scope of standards as part of existing listing requirements already applicable to all electric- powered dryers.

M55-24

M56-24

IMC®: 930.1

Proponents: Amanda Hickman, The Hickman Group, Air Movement and Control Association International, Inc. (AMCA) (amanda@thehickmangroup.com)

2024 International Mechanical Code

Revise as follows:

930.1 General. Where provided, large-diameter ceiling fans shall be ~~tested~~*listed* and *labeled* in accordance with AMCA 230, *listed* and *labeled* in accordance with UL 507, and installed in accordance with the manufacturer's instructions.

Reason:

The IMC already requires compliance and *labeling* with AMCA 230. This proposal harmonizes the requirement for listing consistent with both standards that are already referenced in this section. Additionally, the *listing* requirement also will make it easier for code officials to enforce this provision. Other benefits include making it more likely that products will perform as rated, specified products will meet U.S. Department of Energy efficiency regulations for ceiling fans, and engineers will have standardized performance data they need to design and specify products for life-safety application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This section already requires a label and therefore inherently also requires the product to be *listed*. Typically, certification bodies provide a listing when providing a product labeling service. This proposal is meant to provide clarification to the language that listing is also required for the product, consistent with numerous other sections and products requiring them to be listed and labeled. There is no cost associated due to labeling already being a requirement in this section.

M56-24

M57-24 Part I

IMC®: SECTION 931 (New), 931.1 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Mechanical Code

Add new text as follows:

SECTION 931
GERMICIDAL UV IRRADIATION SYSTEMS AND EQUIPMENT

931.1 General.
Where germicidal UV irradiation systems and equipment are installed in air ducts, plenums, or within the enclosure of heating and cooling equipment, they shall be *listed* and *labeled* in accordance with UL 60335-2-40 and shall conform to all of the following requirements:

1. Shall be installed in accordance with the manufacturer's instructions.
2. Shall be installed with interlock devices and markings in accordance with the listing and the manufacturer's instructions to prevent accidental UV radiation exposure by service personnel.
3. Where field installed within the enclosure of heating and cooling equipment, the equipment listing shall identify the germicidal UV system as a field installable accessory.

M57-24 Part I

M57-24 Part II

IRC: M1416 (New), M1416.1 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Add new text as follows:

M1416
GERMICIDAL UV IRRADIATION SYSTEMS AND EQUIPMENT

M1416.1 General.
Where germicidal UV irradiation systems and equipment are installed in air ducts, plenums, or within the enclosure of heating and cooling equipment, they shall be *listed* and *labeled* in accordance with UL 60335-2-40 and shall conform to all of the following requirements:

1. Shall be installed in accordance with the manufacturer's instructions.
2. Shall be installed with interlock devices and markings in accordance with the listing and the manufacturer's instructions to prevent accidental UV radiation exposure by service personnel.
3. Where field installed within the enclosure of heating and cooling equipment, the equipment listing shall identify the germicidal UV system as a field installable accessory.

Reason: Germicidal UV systems and equipment are becoming increasingly common for indoor air quality and equipment protection. The listing standard includes specific requirements to protect personnel from accidental exposure during maintenance and servicing. Some of these features, as referenced in item 2, are installation dependent and thus rely upon instructions to provide the protection. Unique requirements apply to the scenario where the systems are duct or plenum installed, or factory or field installed within listed heating and cooling equipment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost of obtaining listed germicidal UV irradiation systems and equipment may or may not represent increased product costs over obta

Obtaining and maintaining a listing for a listed germicidal UV irradiation system or equipment involves both product investigation costs an

M58-24

IMC®: 1001.1

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Daikin U.S. (jbengineer@aol.com)

2024 International Mechanical Code

Revise as follows:

1001.1 Scope. This chapter shall govern the installation, *alteration* and repair of boilers, water heaters and pressure vessels.

Exceptions:

1. Pressure vessels used for unheated water supply.
2. Portable unfired pressure vessels and Interstate Commerce Commission containers.
3. Containers for bulk oxygen and medical gas.
4. Unfired pressure vessels having a volume of 5 cubic feet (0.14 m^3) or less operating at pressures not exceeding 250 pounds per square inch (psi) (1724 kPa) and located within *occupancies* of Groups B, F, H, M, R, S and U.
5. Pressure vessels used in *refrigeration systems* that are regulated by Chapter 11 of this code.
6. Pressure tanks used in conjunction with coaxial cables, telephone cables, power cables and other similar humidity control systems.
7. Any boiler or pressure vessel subject to inspection by federal or state inspectors.
8. Pressure vessels used in specific *appliances* and *equipment* that are regulated by ~~Chapter~~Chapters 9 and 11 of this code.

Reason: This exception was added prior to the Table in Chapter 11 being added to the code. There are many referenced standards in Table 1101.2 that regulate the pressure vessel within the appliance. This will added the reference to Chapter 11 to this exception. It should be noted that many of the standards listed in Table 1101.2 are also referenced in Chapter 9.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is basically editorial in nature since it will add Chapter 11 to the exception. The standards listed in Chapter 9 also appear in Chapter 11. This will simply clarify that both chapters have standards that regulate pressure vessels.

M58-24

M59-24 Part I

IMC®: 1101.2.1 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Mechanical Code

Add new text as follows:

1101.2.1 Field installed auxiliary electric heaters. Where auxiliary electric resistance heaters are field installed within the enclosure of listed heating and cooling equipment, the equipment shall be labeled to indicate that the heater is a field installable accessory as part of the equipment listing. The auxiliary electric resistance heater shall be listed and labeled in accordance with UL 60335-2-40 and be installed in accordance with the listing and the manufacturer's instructions.

Staff Analysis: The proposed referenced standard, UL 60335-2-40, is currently referenced in the IMC.

M59-24 Part I

M59-24 Part II

IRC: M1411.10 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Add new text as follows:

M1411.10 Field installed auxiliary electric heater kits. Where auxiliary electric resistance heaters are field installed within the enclosure of *listed* heating and cooling equipment, the equipment shall be labeled to indicate that the heater is a field installable accessory as part of the equipment listing. The auxiliary electric resistance heater shall be *listed* and *labeled* in accordance with UL 60335-2-40 and be installed in accordance with the listing and the manufacturer's instructions.

Staff Analysis: The proposed referenced standard, UL 60335-2-40, is currently referenced in the IRC.

Reason: Field installed electric heaters within the enclosure of listed air-conditioning equipment and heat pumps are covered by the scope of the end product standard (UL 60335-2-40). The heaters are required to be evaluated and tested as part of the equipment. The product standard requires that the equipment be marked to identify which field installed accessories are approved as part of the equipment listing.
The HVAC industry has seen an increase in installation of third-party manufactured electric heaters. These heaters are not approved by the equipment manufacturer and are not evaluated by the listing of the equipment. As a result, manufacturers have received numerous reports of fire incidents resulting from these installations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies that existing listing requirements of air conditioning and heat pump equipment. For IMC reference 1102.1, and general listing requirements 301.7. For IRC reference M1302.1, M1401.1, M1403 and general listing requirements M3404.3. Both codes already require installation per the listing and manufacturer's instructions so this highlights and brings attention to what is already required by the code.

IMC®: 1002.1, TABLE 1002.1 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. PART II WILL BE HEARD BY THE PLUMBING CODE COMMITTEE, PART III WILL BE HEARD BY THE IRC MECHANICAL and PLUMBING CODE COMMITTEE

2024 International Mechanical Code

Revise as follows:

1002.1 General. Potable water heaters and hot water storage tanks shall be *listed* and *labeled* ~~and installed~~ in accordance with the standards in Table 1002.1, and installed in accordance with the listing, the manufacturer's instructions, the *International Plumbing Code* and this code.Gas-fired storage tank and tankless instantaneous water heaters shall be listed and labeled and installed in accordance with the *International Fuel Gas Code.* Water heaters shall be capable of being removed without first removing a permanent portion of the *building* structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the *International Plumbing Code* . ~~Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall comply with UL 732. Solid-fuel-fired water heaters shall comply with UL 2523. Solar thermal water heating systems shall comply with Chapter 14 and ICC 900/SRCC 300.~~

Add new text as follows:

TABLE 1002.1 WATER HEATER STANDARDS

APPLIANCE/EQUIPMENT	STANDARDS
Domestic storage tank electric water heaters	UL 174
Commercial storage tank electric and commercial booster water heaters	UL 1453
Heat pump water heaters	UL 60335-2-40
Electric tankless instantaneous and booster water heaters	UL 499
Oil-fired water heaters	UL 732
Solid-fuel-fired water heaters	UL 2523
Solar thermal water heating systems	ICC 900/SRCC 300

Staff Analysis: The proposed referenced standards referenced in Table 1002.1(new) are currently referenced in the IMC.

M60-24 Part I

M60-24 Part II

IPC: 502.1, TABLE 502.1 (New), ICC Chapter 15 (New), UL Chapter 15 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

Revise as follows:

502.1 General.
Water heaters shall be *listed* and *labeled* in accordance with the standards in Table 502.1, and installed in accordance with the listing, the manufacturer's instructions, *the International Mechanical Code* and this code. Gas-fired storage tank and tankless instantaneous water heaters shall be listed and labeled and installed in accordance with the *International Fuel Gas Code.* ~~Oil-fired water heaters shall conform to the requirements of this code and the *International Mechanical Code.*~~ Electric water heaters, heat pump water heaters, and electric circuits associated with other types of water heaters shall conform to the requirements ~~of this code and provisions~~ of NFPA 70. ~~Gas-fired water heaters shall conform to the requirements of the *International Fuel Gas Code.* Solar thermal water heating systems shall conform to the requirements of the *International Mechanical Code* and ICC 900/SRCC 300.~~

Add new text as follows:

TABLE 502.1 WATER HEATER STANDARDS

APPLIANCE/EQUIPMENT	STANDARDS
Domestic storage tank electric water heaters	UL 174
Commercial storage tank electric and commercial booster water heaters	UL 1453
Heat pump water heaters	UL 60335-2-40
Electric tankless instantaneous and booster water heaters	UL 499
Oil-fired water heaters	UL 732
Solid-fuel-fired water heaters	UL 2523
Solar thermal water heating systems	ICC 900/SRCC 300

Add new standard(s) as follows:

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

ICC 900/SRCC Standard 300—2020 Solar Thermal System Standard

UL 60335-2-40—2022	Household and Similar Electrical Appliances—Safety—Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers

Staff Analysis: The proposed referenced standards referenced in new Table are referenced in the current edition of the IMC.

M60-24 Part II

M60-24 Part III

IRC: M2005.1, TABLE M2005.1 (New), UL Chapter 44 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Residential Code

Revise as follows:

M2005.1 General.
Water heaters shall be installed in accordance with Chapter 28, the manufacturer's instructions and the requirements of this code. Water heaters installed in an *attic* shall comply with the requirements of Section M1305.1.2. ~~Gas-fired water heaters shall comply with the requirements in Chapter 24. Domestic electric water heaters shall comply with UL 174. Oiled-fired water heaters shall comply with UL 732. Solar thermal water heating systems shall comply with Chapter 23 and ICC 900/SRCC 300. Solid fuel-fired water heaters shall comply with UL 2523~~. Water heaters shall comply with the requirements of standards in Table M2005.1, and the referenced chapters of this code.

Add new text as follows:

TABLE M2005.1 WATER HEATER STANDARDS/IRC CHAPTERS

APPLIANCE/EQUIPMENT	STANDARDS	IRC CHAPTER
Domestic storage tank electric water heaters	UL 174	Chapters 34-43
Heat pump water heaters	UL 60335-2-40	Chapter 14, Chapters 34-43
Electric tankless instantaneous and booster water heaters	UL 499	Chapters 34-43
Oil-fired water heaters	UL 732	
Solid-fuel-fired water heaters	UL 2523	Chapter 10
Gas-fired storage tank and tankless instantaneous water heaters	Chapter 24	Chapter 24
Solar thermal water heating systems	ICC 900/SRCC 300	Chapter 23

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

UL 499-2014 Electric Heating Appliances (with revisions through May 31, 2023)

Staff Analysis: The proposed referenced standards referenced in Table are currently referenced in the IMC.

Reason: Reformats existing requirements into table format for clarity. Adds product standards for heat pump water heaters, electric tankless, and commercial electric booster water heaters. Provide pointer for gas heaters. Water heater installation requirements are spread across several different codes. This new language is intended to clarify and simplify the pointers. This proposed language gives guidance in one place to help navigate the various requirements.

The reference to the IMC is appropriate for all water heater installations since the IMC contains the following unique information not found elsewhere 1) product standard requirements (1002.1), 2) distinction from appliances requiring ASME BPVC certification (1001, 1003), 3) Refrigerant-based heater requirements (1002.3 and Chapter 11) and 4) Hydronic heating requirements (Chapter 12) and 5) clarification of scope of IFGC requirements (101.2).
This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal does not mandate which type of water heater is to be installed. These changes only clarify the standards for which water heaters must comply with once the type of water heater is chosen by the designer. Listing is already required for this equipment. This change only clarifies the appropriate product standards for code usability.

M60-24 Part III

M61-24

IMC®: 1002.3

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

1002.3 Refrigerant-based supplemental ~~Supplemental~~ water-heating devices. Potable supplemental water-heating devices that utilize refrigerant-to-water heat exchangers shall be ~~approved~~ listed and labeled in accordance with UL 60335-2-40 and installed in accordance with the *International Plumbing Code* and the manufacturer's instructions.

Staff Analysis: The proposed referenced standard, UL 60335-40, is currently referenced in the IMC.

Reason: The concerns associated with A2L and other flammable refrigerants increase the need to provide standard requirements and third party certification. This is consistent with requirements of IMC 1101.2 for factory-built equipment. The title has been clarified to reflect the content of this section.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Impact: $0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal requires listing instead of approval by the code official. Therefore, in principle, it has potential to increase costs due to overhead and product features that may be required for certification. However, in practice a cost increase is unlikely as a result of this change, and also impractical to calculate, for the following reasons:

1. The committee is unaware of any manufacturer of these devices on the market which does not currently have listing, so it is impractical to compare the costs of a listed and not-listed product.
2. The most typical installation scenario for these devices known to the committee is that they are already a component of listed equipment.
3. The existing approval process most typically already relies on listing, but requires the code official to independently determine the appropriate requirements. This change is intended to simplify enforcement.

M61-24

M62-24

IMC®: CHAPTER 11, SECTION 1101, 1101.1, 1101.1.1, 1107.4, 1107.5, 1109.2.7, 1109.3.2, ASHRAE Chapter 15 (New)

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

CHAPTER 11 REFRIGERATION

SECTION 1101 GENERAL

1101.1 Scope. This chapter shall govern the design, installation, construction and repair of *refrigeration systems* . Permanently installed refrigerant storage systems and other components shall be considered as part of the *refrigeration system* to which they are attached.

Revise as follows:

1101.1.1 Refrigerants other than ammonia. *Refrigeration systems* using a refrigerant other than ammonia shall comply with this chapter, the International Fire Code, and either ASHRAE 15 or ASHRAE 15.2, as applicable~~and the *International Fire Code*~~. *Refrigeration systems* containing carbon dioxide as the refrigerant shall also comply with IIAR CO2 .

1107.4 Piping materials standards. Refrigerant pipe shall conform to one or more of the standards *listed* in Table 1107.4. For refrigeration systems used in residential occupancies serving only a single dwelling unit or sleeping unit, refrigerant piping and tubing shall be limited to aluminum, copper, and copper alloy. The exterior of the pipe shall be protected from corrosion and degradation.

1107.5 Pipe fittings. Refrigerant pipe fittings shall be *approved* for installation with the piping materials to be installed, and shall conform to one of more of the standards listed in Table 1107.5 or shall be *listed* and *labeled* as complying with UL 207. For refrigeration systems used in residential occupancies serving only a single dwelling unit or sleeping unit, refrigerant fittings shall be limited to aluminum, copper, copper alloys, stainless steel, and steel.

1109.2.7 Pipe identification. Refrigerant pipe located in areas other than the room or space where the refrigerating *equipment* is located shall be identified. The pipe identification shall be located at intervals not exceeding 20 feet (6096 mm) on the refrigerant piping or pipe insulation. The minimum height of lettering of the identification label shall be $^1/_2$ inch (12.7 mm). The identification shall indicate the *refrigerant designation* and safety group classification of refrigerant used in the piping system. For Group A2L and B2L refrigerants, the identification shall also include the following statement: “WARNING—Risk of Fire. Flammable Refrigerant.” For Group A2, A3, B2 and B3 refrigerants, the identification shall also include the following statement: “DANGER—Risk of Fire or Explosion. Flammable Refrigerant.” For any Group B refrigerant, the identification shall also include the following statement: “DANGER—Toxic Refrigerant.”

Exception: For refrigeration systems used in residential occupancies serving only a single dwelling unit or sleeping unit pipe identification shall not be required.

1109.3.2 Shaft ventilation. Refrigerant pipe shafts with systems using Group A2L or B2L refrigerant shall be naturally or mechanically ventilated. Refrigerant pipe shafts with one or more systems using any Group A2, A3, B2 or B3 refrigerant shall be continuously mechanically ventilated and shall include a refrigerant detector. The shaft ventilation exhaust outlet shall comply with Section 501.3.1. Naturally ventilated shafts shall have a pipe, duct or conduit not less than 4 inches (102 mm) in diameter that connects to the lowest point of the shaft and extends to the outdoors. The pipe, duct or conduit shall be level or pitched downward to the outdoors. Mechanically ventilated shafts shall have a minimum airflow velocity in accordance with Table 1109.3.2. The mechanical ventilation shall be continuously operated or activated by a refrigerant detector. Systems utilizing a refrigerant detector shall activate the mechanical ventilation at a maximum refrigerant concentration of 25 percent of the lower flammable limit of the refrigerant. The detector, or a sampling tube that draws air to the detector, shall be located in an area where refrigerant from a leak will concentrate. The shaft shall not be required to be ventilated for double-wall refrigerant pipe where the interstitial space of the double-wall pipe is vented to the outdoors. For refrigeration systems used in residential occupancies serving only a single dwelling unit or sleeping unit, shaft ventilation shall not be required where the pipe or tube is continuous without fittings in the shaft.

Add new standard(s) as follows:

ASHRAE

ASHRAE
180 Technology Parkway
Peachtree Corners, GA 30092

15.2-2022 Safety Standard for Refrigeration Systems in Residential Applications

Staff Analysis: A review of the standard proposed for inclusion in the code, ASHREA 15.2 Safety Standard for Refrigeration Systems in Residential Applications, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This code change proposal adds the reference to ASHRAE 15.2, the installation standard for residential air conditioning systems used for a single dwelling or sleeping unit. This addition addresses a gap created in the Code when ASHRAE 15 split its scope between standards 15 and 15.2. As some systems covered by the scope of ASHRAE 15.2 are also covered by the IMC, its inclusion within the IMC is necessary.With the separation between ASHRAE 15 and ASHRAE 15.2, there were certain changes that impact the refrigerant piping requirements. For residential systems, the piping material is limited to aluminum, copper, and copper alloy pipe or tube. The fitting requirements are similar material requirements with the addition of stainless steel and steel.

Pipe identification is not required for piping system regulated by ASHRAE 15.2. The reason for this is that the refrigerant piping is obvious not needing to be individually identified. Whereas in commercial buildings there are often multiple piping systems where the type of piping system is not obvious.

For shaft ventilation, there is an allowance in residential systems to eliminate the ventilation of the shaft when the piping system is continuous without fittings in the shaft. This provision was added to the end of the section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The inclusion of ASHRAE 15.2 into the IMC is editorial in nature, and as such will not impact the cost of construction. Changes to piping for ASHRAE 15.2 may actually reduce the cost of construction, by not requiring shaft ventilation when no joints are present in the shaft.

M62-24

M63-24

IMC®: 1101.1.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1101.1.1 Refrigerants other than ammonia. *Refrigeration systems* using a refrigerant other than ammonia shall comply with this chapter, ASHRAE 15 and the *International Fire Code*. *Refrigeration systems* containing carbon dioxide as the refrigerant shall also comply with IIAR CO2 <u>or be part of listed and labeled equipment</u>.

Reason: The scope of IIAR CO2 specifically excludes “Listed equipment or systems.” There are many listed refrigeration systems using carbon dioxide as the refrigerant. Field erected systems may also be evaluated by NRTLs to existing industry safety standards, such as UL 60335-2-40, UL 60335-2-89, and UL 471.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is only meant to address an inconsistency in order to maintain the intent of the scope.

M63-24

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m^3.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.

b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.

c. Class I ozone depleting substance; prohibited for new installations.

d. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighed average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

e. LFL is based on WCF @ 73.4°F (23°C) unless otherwise noted.

f. WCFF LFL @ 140°F (60°C).

g. WCFF LFL @ 73.4°F (23°C).

h. WCF LFL @ 212°F (100°C).

Reason: The Refrigerant Classifications (except Degrees of Hazard) are determined by ASHRAE SSPC 34 and published in ASHRAE Standard 34. This proposal seeks to update the refrigerant table with the new refrigerants added to Standard 34 since the last code cycle. The reasons for the additions of new refrigerants can be found at https://www.ashrae.org/standards-research--technology/standards-addenda. All proposed changes are either incorporated into ASHRAE Standard 34-2022 or the published addenda to ASHRAE Standard 34-2022 located at the link above.

Bibliography: ASHRAE Standard 34-2022, Addenda a, b, c, d, e, f, g, h, j, k, m, ac, ah to ASHRAE Standard 34-2022 - https://www.ashrae.org/standards-research--technology/standards-addenda

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Updating the table of refrigerants that could be used in systems does not add labor or material costs because the choice of refrigerant is up to the owner and designer.

M64-24

M65-24

IMC®: 1103.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. <u>Refrigerants without a refrigerant number designation or without a safety group classification in the referenced edition of ASHRAE Standard 34 shall be classified in accordance with the criteria in ASHRAE Standard 34 as a single-compound refrigerant blend of two or more compounds. Such safety classifications not assigned by ASHRAE Standard 34 shall be submitted for approval to the code official. Compliance with the requirements of this code is contingent upon use of approved safey classifications where not assigned by the referenced edition of ASHRAE Standard 34.</u>

Staff Analysis: The standard referenced within the new code text is in the current edition of the IMC.

Reason: This change accounts for the fact that new refrigerants will be approved during continuous maintenance of ASHRAE 34 that cannot all be reflected in the latest edition of the IMC due to timing. It offers flexibility to use approved refrigerants even though they are not yet specified in the IMC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will provide more choice to the user and, thus, direct costs could ultimately be lower. In general, this change is not expected to have a bearing on cost.

M65-24

M66-24

IMC®: 1104.3.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1104.3.1 ~~Air conditioning for human comfort~~High-probability air conditioners, heat pumps, and dehumidifiers. High-probability ~~systems used for human comfort~~ air conditioners, heat pumps, and dehumidifiers shall use Group A1 or A2L refrigerant.

Exceptions:

1. Equipment *listed* for and used in residential *occupancies* containing a maximum of 6.6 pounds (3 kg) of refrigerant.
2. Equipment *listed* for and used in commercial *occupancies* containing a maximum of 22 pounds (10 kg) of refrigerant.
3. Industrial *occupancies* .

Reason: This code change proposal is for correlation with provisions in Addendum e of ASHRAE 15-2022. ASHRAE 15 has removed the term "human comfort" from the standard, as it did not adequately describe the applications it covered, and replaced it with "air conditioners, heat pumps, and dehumidifiers". This proposal better aligns the IMC with the current language in ASHRAE 15.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes will have no impact on the cost of construction. They simply provide better clarity on what applications are intended by this section of the code.

M66-24

M67-24

IMC®: 1104.3.2

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1104.3.2 Group A2, A3, B2 and B3 refrigerants. Group A2 and B2 refrigerants shall not be used in high-probability systems. Group A3 and B3 refrigerants shall not be used except where *approved*.

Exceptions: ~~This section does not apply to:~~

1. Laboratories where the floor area per occupant is not less than 100 square feet (9.3 m^2).
2. *Listed* self-contained systems having a maximum of 0.331 pounds (150 g) of Group A3 refrigerant.
3. Industrial *occupancies*.
4. *Equipment listed* for and used in residential *occupancies* containing a maximum of 6.6 pounds (3 kg) of Group A2 or B2 refrigerant.
5. *Equipment listed* for and used in commercial occupancies containing a maximum of 22 pounds (10 kg) of Group A2 or B2 refrigerant.
6. <u>Self-contained *equipment* using Groups A3 and B3 refrigerants that are listed to UL 60335-2-89 and installed in accordance with the listing, the manufacturer's installation instructions, and ASHRAE 15.</u>
7. <u>Self-contained *equipment* using Groups A3 and B3 refrigerants that are listed to UL 60335-2-40 and installed in accordance with the listing, the manufacturer's installation instructions, and ASHRAE 15.</u>

Staff Analysis: The proposed referenced standard, ASHRAE 15, is currently referenced in the IMC.

Reason: This code change proposal better aligns the IMC with Addendum l of ASHRAE 15, 2019 edition (which was incorporated into the 2022 edition), which allows for larger charge sizes of Group A3 refrigerants in commercial refrigeration applications.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal involves optional equipment choices.

M67-24

M68-24

IMC®: TABLE 1107.4, ASTM Chapter 15 (New)

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Mechanical Code

Revise as follows:

TABLE 1107.4 REFRIGERANT PIPE

PIPING MATERIAL	STANDARD
Aluminum tube	ASTM B210 , ASTM B491/B491M
Brass (copper alloy) pipe	ASTM B43
Copper linesets	ASTM B280, ASTM B1003
Copper pipe	ASTM B42, ASTM B302
Copper tube[a]	ASTM B68 , ASTM B75, ASTM B88, ASTM B280, ASTM B819
Polyethylene of Raised Temperature/ Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) pipe	ASTM F3346
Steel pipe[b]	ASTM A53, ASTM A106 , ASTM A333
Steel tube	ASTM A254, ASTM A334

a. Soft annealed copper tubing larger than $1^3/_8$ inch (35 mm) O.D. shall not be used for field-assembled refrigerant piping unless it is protected from mechanical damage.

b. ASTM A53, Type F steel pipe shall only be permitted for discharge lines in pressure relief systems.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

ASTM F3346-19 Standard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F3346-19 Standard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Piping produced according to ASTM F3346 “Standard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe” is intended for the applications referred to in Section 1107.4 of the code and in Table 1107.4. It is proposed to add this piping material to Table 1107.4 to provide installers with a high-performance corrosion-resistant option for this application.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Including PE-RT/AL/PE-RT piping in Table 1107.4 provides an alternative piping option for refrigerant applications. PE-RT/AL/PE-RT piping is less expensive than some of the existing materials (e.g., copper, brass, or steel), but may be more expensive than certain other piping materials. This code change proposal may decrease the cost of construction by 0% to 10% if PE-RT/AL/PE-RT piping is selected by users, or it may increase the cost of construction by 0% to 10% if selected, or it may have no impact on the cost of construction if PE-RT/AL/PE-RT piping is not selected. It depends on which of the seven existing approved materials is used for this comparison.

To assign dollar values to this proposal, the use of PE-RT/AL/PE-RT piping could decrease construction costs over a range from $1 to $10,000, depending on the size of the project, size of piping, etc. or it could increase construction costs over a range from $1 to $10,000, depending on the size of the project, size of piping, etc., or it could have no effect on construction costs if users do not select to use PE-RT/AL/PE-RT piping. This proposal simply provides another material option.

Estimated Immediate Cost Impact Justification (methodology and variables):

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4.. This proposal simply provides another material option. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. Therefore, only a range of cost decreases or increases can be provided in this format.

Estimated Life Cycle Cost Impact:

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4. This proposal simply provides another material option. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. PE-RT/AL/PE-RT piping has a corrosion-resistant plastic inner and outer liner for long life.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4. This proposal simply provides another material option. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. PE-RT/AL/PE-RT piping has a corrosion-resistant plastic inner and outer liner for long life.

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Mechanical Code

Revise as follows:

TABLE 1107.4 REFRIGERANT PIPE

PIPING MATERIAL	STANDARD
Aluminum tube	ASTM B210 , ASTM B491/B491M
Brass (copper alloy) pipe	ASTM B43
Copper linesets	ASTM B280, ASTM B1003
Copper pipe	ASTM B42, ASTM B302
Copper tube[a]	ASTM B68 , ASTM B75, ASTM B88, ASTM B280, ASTM B819
Polyethylene of Raised Temperature/ Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT)pipe	ASTM F3506
Steel pipe[b]	ASTM A53, ASTM A106 , ASTM A333
Steel tube	ASTM A254, ASTM A334

a. Soft annealed copper tubing larger than $1^3/_8$ inch (35 mm) O.D. shall not be used for field-assembled refrigerant piping unless it is protected from mechanical damage.

b. ASTM A53, Type F steel pipe shall only be permitted for discharge lines in pressure relief systems.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F3506-21e1 Standard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe based on Inner Diameter (ID) for use in Air Conditioning and Refrigeration Line Set Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM 3506 tandard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe based on Inner Diameter (ID) for use in Air Conditioning and Refrigeration Line Set Systems, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Piping produced according to ASTM F3506 "Standard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe based on Inner Diameter (ID) for use in Air Conditioning and Refrigeration Line Set Systems" is intended specifically for the applications referred to in Section 1107.4 of the code and in Table 1107.4. It is proposed to add this piping material to Table 1107.4 to provide installers with a high-performance corrosion-resistant option for this application.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Including PE-RT/AL/PE-RT piping produced according to ASTM F3506 in Table 1107.4 provides an alternative piping option for refrigerant applications. PE-RT/AL/PE-RT piping is less expensive than some of the existing materials (e.g., copper, brass, or steel), but may be more expensive than certain other piping materials. This code change proposal may decrease the cost of construction by 0% to 10% if PE-RT/AL/PE-RT piping is selected by users, or it may increase the cost of construction by 0% to 10% if selected, or it may have no impact on the cost of construction if PERT/ AL/PE-RT piping is not selected. It depends on which of the seven existing approved materials is used for this comparison.

To assign dollar values to this proposal, the use of PE-RT/AL/PE-RT piping could decrease construction costs over a range from $1 to $10,000, depending on the size of the project, size of piping, etc. or it could increase construction costs over a range from $1 to $10,000, depending on the size of the project, size of piping, etc., or it could have no effect on construction costs if users do not select to use PERT/AL/PE-RT piping. This proposal simply provides another material option.

Estimated Immediate Cost Impact Justification (methodology and variables):

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4.. This proposal simply provides another material option. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. Therefore, only a range of cost decreases or increases can be provided in this format.

Estimated Life Cycle Cost Impact:

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4. This proposal simply provides another material option. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. PE-RT/AL/PE-RT piping has a corrosion-resistant plastic inner and outer liner for long life.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

IMC®: TABLE 1107.4, TABLE 1107.5, 1108.7 (New), 1108.8 (New), ASTM Chapter 15 (New)

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

TABLE 1107.4 REFRIGERANT PIPE

PIPING MATERIAL	STANDARD
Aluminum tube	ASTM B210 , ASTM B491/B491M
Brass (copper alloy) pipe	ASTM B43
Copper linesets	ASTM B280, ASTM B1003
Copper pipe	ASTM B42, ASTM B302
Copper tube[a]	ASTM B68 , ASTM B75, ASTM B88, ASTM B280, ASTM B819
Steel pipe[b]	ASTM A53, ASTM A106, ASTM A333
Steel tube	ASTM A254, ASTM A334
Stainless Steel Pipe	ASTM A312/A312M
Stainless Steel Tube	ASTM A269/A269M, ASTM A632

a. Soft annealed copper tubing larger than $1^3/_8$ inch (35 mm) O.D. shall not be used for field-assembled refrigerant piping unless it is protected from mechanical damage.

b. ASTM A53, Type F steel pipe shall only be permitted for discharge lines in pressure relief systems.

TABLE 1107.5 REFRIGERANT PIPE FITTINGS

FITTING MATERIAL	STANDARD
Aluminum	ASTM B361
Copper and copper alloy (brass)	ASME B16.15, ASME B16.18, ASME B16.22, ASME B16.24, ASME B16.26, ASME B16.50
Steel	ASTM A105, ASTM A181, ASTM A193, ASTM A234, ASTM A420, ASTM A707
Stainless Steel	ASTM A403/A403M, ASME B16.11

Add new text as follows:

1108.7 Stainless steel pipe. Joints between stainless steel pipe or fittings shall be brazed, mechanical, threaded, press-connect, or welded joints conforming to Section 1108.3.

1108.8 Stainless steel tube. Joints between stainless steel tube or fittings shall be brazed, flared, mechanical, press-connect, or welded joints conforming to Section 1108.3.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

ASTM A632-19 Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing (Small-Diameter) for General Service

ASTM A403/A403M-20 Standard Specification for Wrought Austenitic Stainless Steel Piping Fittings

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM A632 and A403/A403M, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: ASHRAE 15 includes the use of stainless steel pipe and stainless steel tube for refrigerant piping. This proposed change adds the requirements for stainless steel pipe and tube. The appropriate standards are listed in Table 1107.4 for the pipe and tube and Table 1107.5 for the fittings.

Section 1108.7 and 1108.8 added the joining methods. ASHRAE 15 allows brazed, mechanical, threaded, press-connect, or welded joints for stainless steel pipe and brazed, flared, mechanical, press-connect, or welded joints for stainless steel tube.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The use of stainless steel pipe or tube is optional, therefore not impacting the cost of construction.

M70-24

M71-24

IMC®: 1107.4.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Delete without substitution:

~~**1107.4.1 Steel pipe Groups A2, A3, B2 and B3.** The minimum weight of steel pipe for Group A2, A3, B2 and B3 refrigerants shall be Schedule 80 for sizes 1 1/2 inches or less in diameter.~~

Reason: ASHRAE 15 does not restrict the use of steel pipe to Schedule 80 for Group A2, A3, B2, and B3 refrigerants. By deleting this section, the requirements are consistent with ASHRAE 15.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The allowance for Schedule 40 steel pipe will lower the cost of the refrigerant piping system.
Schedule 40 (thinner) will cost less than Schedule 80 (thicker) due to material. Based on Grainger's website, use of Schedule 40 will reduce cost by $0.78 – $2.75 per foot, depending on the length installed.

	3/4" diameter unthreaded, welded Cost (Cost/ft)	
Length	Schedule 40	Schedule 80
1 foot (12 inch)	$9.00 ($9.00/ft)	$9.78 ($9.78/ft)
3 foot	$18.47 ($6.16/ft)	$26.74 ($8.91/ft)
5 foot	$30.35 ($6.07/ft)	
6 foot		$53.09 ($8.84/ft)

Estimated Immediate Cost Impact Justification (methodology and variables):

This is based on the current pricing of Schedule 40.

M71-24

M72-24

IMC®: 1107.5.1, TABLE 1107.5.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1107.5.1 Copper ~~brazed~~ field swaged. The minimum and maximum cup depth of field-fabricated copper ~~brazed~~ swaged fitting connections shall comply with Table 1107.5.1.

TABLE 1107.5.1 COPPER ~~BRAZED~~ SWAGED CUP DEPTHS

	Brazed Cup Depths		Solder Cup Depths
FITTING SIZE (inch)	MINIMUM ~~DEPTH~~ (inch)	MAXIMUM ~~DEPTH~~ (inch)	MINIMUM (inch)
$^1/_8$	0.15	0.23	0.25
$^3/_{16}$	0.16	0.24	0.31
$^1/_4$	0.17	0.26	0.31
$^3/_8$	0.20	0.30	0.38
$^1/_2$	0.22	0.33	0.50
$^5/_8$	0.24	0.36	0.62
$^3/_4$	0.25	0.38	0.75
1	0.28	0.42	0.91
1 $^1/_4$	0.31	0.47	0.97
1 $^1/_2$	0.34	0.51	1.09
2	0.40	0.60	1.34
2 $^1/_2$	0.47	0.71	1.47
3	0.53	0.80	1.66
3 $^1/_2$	0.59	0.89	1.91
4	0.64	0.96	2.16

For SI: 1 inch = 25.4 mm.

Reason: ASHRAE 15 added the minimum cup depth for copper solder swaged joint since solder joints are permitted for lower pressure Group A1 refrigerant systems. By striking the word “brazed” in the title and the section, the table results in regulations for both brazed and soldered field made swaged joints. The information on cup depth for solder joints was provided by the Copper Development Association which lists minimum depths for proper solder joints.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The use of field made swaged solder joints is optional.

M72-24

M73-24

IMC®: 1108.7, 1108.8

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1108.7 Steel pipe. Joints between steel pipe or fittings shall be brazed, mechanical ~~joints~~, threaded, press-connect or welded joints conforming to Section 1108.3.

1108.8 Steel tube. Joints between steel tubing or fittings shall be brazed, flared, mechanical, press-connect or welded joints conforming to Section 1108.3.

Reason: ASHRAE 15 includes the allowance of brazed joints for both steel pipe and steel tube. This change adds the allowance of these joining methods to the Mechanical Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The use of brazed joints is optional.

M73-24

M74-24

IMC®: 1108.9 (New)

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Mechanical Code

Add new text as follows:

1108.9 PE-RT/AL/PE-RT pipe. Joints between PE-RT/AL/PE-RT pipe or fittings shall be mechanical or press-connect joints conforming to Section 1108.3.

Reason: Following the proposal to add new standards ASTM F3346 and ASTM F3506 to Table 1107.4, this proposed new Section 1108.9 provides mandatory language regarding joints for PE-RT/AL/PE-RT pipes consistent with requirements for other piping materials found in this section. Therefore, the new section 1108.9 should be added to include these mandatory requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Following the proposals to add standards ASTM F3346 and ASTM F3506 to Table 1107.4, this proposed new Section provides mandatory language regarding joints for PE-RT/AL/PE-RT pipes consistent with requirements for other piping materials found in this section. The user has several choices for refrigeration piping materials, and the addition of this new section clarifies requirements for PE-RT/AL/PE-RT joints without decreasing or increasing the cost of construction.

M74-24

M75-24

IMC®: 1109.2.5

Proponents: Greg Johnson, Johnson & Associates Consulting Services, National Multifamily Housing Council (gjohnsonconsulting@gmail.com); Vladimir G. Kochkin, National Association of Home Builders - NAHB, NAHB (vkochkin@nahb.org); Andrew Klein, A S Klein Engineering, PLLC, BOMA International (andrew@asklein.com); Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1109.2.5 Refrigerant pipe shafts. Refrigerant piping that penetrates two or more floor/ceiling assemblies shall be enclosed in a fire-resistance-rated shaft enclosure. The fire-resistance-rated shaft enclosure shall comply with Section 713 of the International Building Code.

Exceptions:

1. *Refrigeration* systems using R-718 refrigerant (water).
2. Piping in a direct refrigeration system ~~using Group A1 refrigerant~~ where the refrigerant quantity does not exceed the limits of Table 1103.1 for the smallest occupied space through which the piping passes.
3. Piping located on the exterior of the *building* where vented to the outdoors.

Reason: JOHNSON: This will make the IMC consistent with Section 9.12.1.5 of ASHRAE 15-2022. Note that IMC Section 1109.2.2 still requires piping protection, either within building elements or protective enclosures.

TOTO: This section was added to the IMC before the completion of the changes to ASHRAE 15. ASHRAE 15 removed the limitation in exception 2 as applying only to Group A1 refrigerants. It was determined that any refrigerant meeting the limitations of Table 1103.1 are safe to install without a shaft enclosure. This modification is consistent with ASHRAE 15-2022.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

JOHNSON: Costs are estimated to be reduced by roughly $1,000 per piping run per floor of an R-2 multifamily building.
TOTO: This may reduce the cost of construction by eliminating the shaft requirements for all refrigerants that do not exceed the safe limitations in the code. $22,400 estimated avoided total cost per mechanical room.

Estimated Immediate Cost Impact Justification (methodology and variables):

JOHNSON: Lineal feet of shaft-wall system avoided estimated to be 20 feet. Height of ceiling estimated to be 9 feet. Cost of installed shaft system estimated to be $7.00 per square foot. 20 X 9 X $7 = $960. $960 was rounded to $1,000.
TOTO: This change provides a lower cost alternative to the installation of a pipe shaft. Assumed area of avoided shaft wall system = 10 ft high X 40 lineal ft ($ sided enclosure) = 400 sf of shaft wall area. Assume shaft liner wall board is $34 per sf (kamcoboston.com), assume shaft framing materials are $8 per sf (schillings.com), assume $4 per sf labor (forbes.com), = $56 per sf for installed shaft wall without finishing. $56 per sf X 400 sf = **$22,400 estimated avoided total cost per mechanical room.**

Estimated Life Cycle Cost Impact:

JOHNSON: N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

JOHNSON: N/A

M75-24

M76-24

IMC®: 1109.3.1

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Mechanical Code

Revise as follows:

1109.3.1 Protection against physical damage. In addition to the requirements of Section 305.5, aluminum, copper, multilayer composite, and and steel tube used for Group A2, A3, B2 and B3 refrigerants and located in concealed locations where tubing is installed in studs, joists, rafters or similar member spaces, and located less than $1^1/_4$ inches (32 mm) from the nearest edge of the member, shall be continuously protected by shield plates. Protective steel shield plates shall cover the area of the tube plus the area extending not less than 2 inches (51 mm) beyond both sides of the tube.

Reason: Following the proposals to add new refrigeration piping standards ASTM F3346 and ASTM F3506 to Table 1107.4, this proposed revision to Section 1109.3.1 provides mandatory language regarding protection for PE-RT/AL/PE-RT pipes, consistent with requirements for other piping materials found in this section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Following the proposals to add new refrigeration piping standards ASTM F3346 and ASTM F3506 to Table 1107.4, this proposed revision to Section 1109.3.1 provides mandatory language regarding protection for PE-RT/AL/PE-RT pipes, consistent with requirements for other piping materials found in this section. The user has several choices for refrigeration piping materials, and this revision clarifies requirements for protection of PERT/AL/PE-RT piping without decreasing or increasing the cost of construction.

M76-24

M77-24

IMC®: 1109.4

Proponents: Howard Ahern, Airex, Manufacturing (howard.ahern@airexmfg.com)

2024 International Mechanical Code

Revise as follows:

1109.4 Refrigerant pipe penetrations.
The annular space between the outside of a refrigerant pipe and the inside of a pipe sleeve or opening in a *building* envelope wall, floor or ceiling assembly penetrated by a refrigerant pipe shall be sealed in an *approved* manner with caulking material or ~~foam~~ sealant or closed with a gasketing system. The caulking material, ~~foam~~ sealant or gasketing system shall be designed for the conditions at the penetration location and shall be compatible with the pipe, sleeve and *building* materials in contact with the sealing materials.<u>Sealing shall allow for expansion and contraction of materials and mechanical vibration.</u> Refrigerant pipes penetrating fire-resistance-rated assemblies or membranes of fire-resistance-rated assemblies shall be sealed or closed in accordance with Section 714 of the International Building Code. Rodent Proofing shall comply with Section 301.17

Reason: The **2018 IECC Commerical code Air Barrier Construction C402.5.1.1 (3), and 2021 IECC C402.5.1.1 (3) , R402.4.1.1 Air Barrier, Air Sealing and Insulation Installation, 2021 IRC Table N1102.4.1.1 Air Barrier, Air Sealing and Insulation Installation states for Penetrations sealing that "sealing shall allow for expansion, contraction of materials and mechanical vibration"**.

Refrigeration Piping does have vibration. Condenser manufactures have installation instruction to isolate the refrigeration piping for vibration. Codes and standards have instruction for care to be taken in construction of refrigeration piping and joints to avoid stress from the vibration.
The US Department of Energy states on their website Caulking | Department of <u>Energy for</u> sealing. On Expanding foam " **Use in non friction areas, as material can become dry and powdery over time". as the friction caused by the vibration turns the foam into powder.**
The HVAC industry is well aware of going back to jobs where the foam has degraded substantially or is completely gone from the vibration. In Addition, it renders the pipe penetration nearly impractical for future modifications or maintenance.

Also, a serious concern is the utilization of isocyanates, particularly MDI (Methylene Diphenyl Diisocyanate), a hazardous component prevalent in numerous polyurethane foams. MDI is acknowledged for its potential as a respiratory and skin irritant, with prolonged exposure carrying the risk of severe health issues. Inhaling MDI fumes or direct skin contact can result in sensitization, allergic reactions, and potentially long-term health problems. Consequently, the inclusion of MDI in expanding foam introduces an avoidable health hazard for workers involved in its application. Plus, manufactures warn of foam getting into water were it kills aquatic life and to not allow it to lay on the ground as well

This proposal will keep with requirements from the IECC for penetration sealing and remove foam for refrigerant pipe penetration sealing only due to vibration.

Bibliography: Caulking | Department of Energy

DIY Foam Failures: The Pitfalls of Expanding Polyurethane in Cable Ducts | by Carl Pike - The Duct Sealing Man | Nov, 2023 | Medium

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change should not increase the cost of construction as these sealing requirements are already in the 2018,2021 IECC and IRC. The upcoming 2024 IECC commercial and residential had no code proposals pertain to this requirement and is unchallenged. Any cost of construction increase has already been approved in two and now almost three code cycles. There are a variety of low-cost compounds, caulking, sealants and gaskets used extensively by contractors already. There is no research or data available that was searchable on pipe penetration sealing cost that could be found.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

ASTM F2165-19 — Standard Specification for Flexible Pre-Insulated Plastic Piping

ASTM D2683-20 — Standard Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F2165-19 Standard Specification for Flexible Pre-Insulated Plastic Piping, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Certain hydronic systems operate at temperatures of 140°F or lower and are suitable for High-density Polyethylene (HDPE) piping systems. Examples include chilled water piping, indoor geothermal piping, and low temperature hydronic distribution. HDPE is often used for these applications and is approved in other codes. The six industry standards in the proposal are for HDPE pipe and tubing and are all current and up-to-date and represent piping materials that are suitable for several hydronic applications. .

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Including HDPE piping in Table 1202.4 provides an alternative piping option for hydronic applications. HDPE piping is less expensive than existing materials such as copper, iron, steel, or PEX piping, but HDPE is more expensive than certain other piping materials. This code change proposal may decrease the cost of construction by 0% to 50% if HDPE piping is selected by users, or it may increase the cost of construction by 0% to 25% if selected, or it may have no impact on the cost of construction if HDPE is not selected.

To assign dollar values to this proposal, the use of HDPE piping could decrease construction costs over a range from $1 to $100,000, depending on the size of the project, size of piping, etc. or it could increase construction costs over a range from $1 to $50,000, depending on the size of the project, size of piping, etc., or it could have no effect on construction costs if users do not select to use HDPE piping. This proposal simply provides another material option.

Estimated Immediate Cost Impact Justification (methodology and variables):

Sixteen piping materials are already approved in Table 1202.4. This proposal simply provides another material option. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. Therefore, only a range of cost decreases or increases can be provided in this format.

Estimated Life Cycle Cost Impact:

Sixteen piping materials are already approved in Table 1202.4. This proposal simply provides another material option. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. Published LCA studies indicate a reduced life cycle cost when using HDPE instead of several metallic materials.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This proposal simply provides another material option. A summary of a LCA that compares HDPE to ductile iron pipe is available at

https://www.teppfa.eu/sustainability/environmental-footprint/lca/pe-vs-di-pipe-systems-for-pressurised-water-supply/

M78-24

M79-24

IMC®: TABLE 1202.5

2024 International Mechanical Code

Revise as follows:

TABLE 1202.5 HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
Copper and copper alloys	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.24; ASME B16.26; ASME B16.51; ASSE 1061; ASTM F1974 ; ASTM F3226
CPVC	ASSE 1061; ASTM D2846; ASTM F438; ASTM F439

Ductile iron	ANSI/AWWA C153/A21.53
Gray iron	ASTM A126
HDPE fittings	ASTM D2683; ASTM D3261; ASTM F1055; CSA B137.1
Malleable iron	ASME B16.3
PE-RT fittings	ASSE 1061; ASTM D3261; ASTM F1807; ASTM F2098; ASTM F2159; ASTM F2735; ASTM F2769; ASTM F3347; ASTM F3348; CSA B137.1; CSA B137.18
PEX fittings	ASSE 1061; ASTM F877; ASTM F1807; ASTM F1960; ASTM F2080; ASTM F2159; ASTM F3253 ; ASTM F3347; ASTM F3348
Plastic	ASTM D2466; ASTM D2467; ASTM D2846; ASTM F877; ASTM F2389; ASTM F2735
Stainless steel	ASTM A269; ASTM A312; ASTM A778; ASTM F3226
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A53; ASTM A106; ASTM A234; ASTM A395; ASTM A420; ASTM A536; ASTM F1476; ASTM F1548 ; ASTM F3226

Staff Analysis: The proposed referenced standards, ASTM D2683, D3261, F1055, and CSA B137.1, are currently referenced in the IMC.

Reason: Certain hydronic systems operate at temperatures of 140°F or lower and are suitable for High-density Polyethylene (HDPE) piping systems. Examples include chilled water piping, indoor geothermal piping, and low temperature hydronic distribution. HDPE is often used for these applications and is approved in other codes. The four industry standards in the proposal are for different styles of HDPE fittings which are suitable for certain hydronic applications and are all current and up-to-date.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal is related to a proposal to add HDPE piping to Table 1202.4 as an alternative piping option for hydronic applications. If HDPE piping is approved for Table 1202.4, then suitable HDPE fittings should be added to Table 1202.5.

HDPE piping is less expensive than existing materials such as copper, iron, steel, or PEX piping, but HDPE is more expensive than certain other piping materials. This code change proposal may decrease the cost of construction by 0% to 50% if HDPE piping is selected by users, or it may increase the cost of construction by 0% to 25% if selected, or it may have no impact on the cost of construction if HDPE is not selected.

To assign dollar values to this proposal, the use of HDPE piping could decrease construction costs over a range from $1 to $100,000, depending on the size of the project, size of piping, etc. or it could increase construction costs over a range from $1 to $50,000, depending on the size of the project, size of piping, etc., or it could have no effect on construction costs if users do not select to use HDPE piping. This proposal simply provides another material option.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fittings for eleven (11) piping materials are already approved in Table 1202.5. This proposal simply provides another material option.

The amount of the cost decrease or increase is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. Therefore, only a range of cost decreases or increases can be provided in this format.

Estimated Life Cycle Cost Impact:

Fittings for eleven (11) piping materials are already approved in Table 1202.5. This proposal simply provides another material option.

The impact to Life Cycle Cost is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. Published LCA studies indicate a reduced life cycle cost when using HDPE instead of several metallic materials.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This proposal simply provides another material option. A summary of a LCA that compares HDPE to ductile iron pipe is available at https://www.teppfa.eu/sustainability/environmental-footprint/lca/pe-vs-di-pipe-systems-for-pressurised-water-supply/

Add new standard(s) as follows:

ANSI

American National Standards Institute
25 West 43rd Street, 4th Floor
New York, NY 10036

IAPMO/ANSI/CAN Z1117-2022 Standard for Press Connections

Staff Analysis: A review of the standard proposed for inclusion in the code, IAPMO/ANSI/CAN Z1117-2022 Standard for Press Connections, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: IAPMO/ANSI/CAN Z1117 is a harmonized standard for press-connect fittings used across North America. It is recognized and enforced in both the United States and Canada and encompasses multiple press-connect materials such as copper, steel, and stainless steel 304 and 316.

This addition to the Referenced Standards Chapter is in support of Proposal # 9274 that adds IAPMO/ANSI/CAN Z1117 to Table 1202.5 of the IMC.

ANSI/CAN Z1117 is a harmonized standard for all of North America recognized and enforced in both the United States and Canada. This standard encompasses multiple press-connect materials such as copper, steel, and stainless steel 304 and 316. There are already several press connect standards within the code, the addition of Z1117 seeks to add a harmonized version that makes adoption and enforcement easier across North America.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this standard does not increase the cost of construction. The addition of this standard allows for a wider selection of materials but does not make their use mandatory. By including this standard in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

Gray iron	ASTM A126
Malleable iron	ASME B16.3
PE-RT fittings	ASSE 1061; ASTM D3261; ASTM F1807; ASTM F2098; ASTM F2159; ASTM F2735; ASTM F2769; ASTM F3347; ASTM F3348; CSA B137.1; CSA B137.18; <u>ASTM F1960; ASTM F2623</u>
PEX fittings	ASSE 1061; ASTM F877; ASTM F1807; ASTM F1960; ASTM F2080; ASTM F2159; ASTM F3253 ; ASTM F3347; ASTM F3348
Plastic	ASTM D2466; ASTM D2467; ASTM D2846; ASTM F877; ASTM F2389; ASTM F2735
Stainless steel	ASTM A269; ASTM A312; ASTM A778; ASTM F3226
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A53; ASTM A106; ASTM A234; ASTM A395; ASTM A420; ASTM A536; ASTM F1476; ASTM F1548 ; ASTM F3226

Staff Analysis: The proposed referenced standards, ASTM F1960 and F2623, are currently referenced in the IMC.

Reason: This proposal is to add two industry standards for fittings for PE-RT tubing to Table 1202.5.

ASTM F1960 "Standard Specification for Cold Expansion Fittings with PEX Reinforcing Rings for Use with Cross-linked Polyethylene (PEX) and Polyethylene of Raised Temperature (PE-RT) Tubing" is for a fitting system which has recently been approved for use with PE-RT tubing (PE-RT and PEX have identical dimensions and share most of the same fitting systems).

ASTM F2623 "Standard Specification for Polyethylene of Raised Temperature (PE-RT) Systems for Non-Potable Water Applications" is a PE-RT system standard for non-potable applications, including hydronics, and includes requirements for fittings intended for use with PE-RT tubing.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Including these fitting standards for PE-RT tubing in Table 1202.5 provides alternative fitting options for hydronic applications. The fittings covered by these standards are slightly less expensive than certain existing fitting standards, but also might be slightly more expensive than other existing fitting standards. It depends on which fittings are being compared.

This code change proposal may decrease the cost of construction by 0% to 10% if these fitting standards are selected by users, or it may increase the cost of construction by 0% to 10% if these fitting standards are selected, or it may have no impact on the cost of construction if these fitting standards are not selected by users.

To assign dollar values to this proposal, the use of the fittings covered by these proposed standards could decrease construction costs over a range from $1 to $5 per fitting, depending on the size of the piping, or it could increase construction costs over a range from $1 to $5 per fitting, depending on the size of the piping, etc., or it could have no effect on construction costs if users do not select to use one of these fitting standards. This proposal simply provides other fitting options.

Estimated Immediate Cost Impact Justification (methodology and variables):

Eleven (11) fitting standards for use with PE-RT tubing are already approved in Table 1202.5. This proposal simply provides additional options. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific fitting materials and sizes, plus assembly and construction costs which vary for each individual project. Therefore, only a range of cost decreases or increases can be provided in this format.

Estimated Life Cycle Cost Impact:

Eleven (11) fitting standards for use with PE-RT tubing are already approved in Table 1202.5. This proposal simply provides additional options. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific fitting materials and sizes, plus assembly and construction costs which vary for each individual project.

The impact to Life Cycle Cost is highly dependent on exact comparisons for specific fitting materials and sizes plus assembly and construction costs which vary for each individual project.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Eleven (11) fitting standards for use with PE-RT tubing are already approved in Table 1202.5. This proposal simply provides additional options. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific fitting materials and sizes, plus assembly and construction costs which vary for each individual project.

The impact to Life Cycle Cost is highly dependent on exact comparisons for specific fitting materials and sizes plus assembly and construction costs which vary for each individual project.

Ductile iron and gray iron	ANSI/AWWA C110/A21.10; ASTM A395; ASTM A536; ASTM F1476; ASTM F1548; AWWA C153/A21.53
Ductile iron	ANSI/AWWA C153/A21.53
Gray iron	ASTM A126
Malleable iron	ASME B16.3
PE-RT fittings	ASSE 1061; ASTM D3261; ASTM F1807; ASTM F2098; ASTM F2159; ASTM F2735; ASTM F2769; ASTM F3347; ASTM F3348; CSA B137.1; CSA B137.18
PEX fittings	ASSE 1061; ASTM F877; ASTM F1807; ASTM F1960; ASTM F2080; ASTM F2159; ASTM F2735; ASTM F3253 ; ASTM F3347; ASTM F3348
Polypropylene	ASTM F2389;
~~Plastic~~ PVC	ASTM D2466; ASTM D2467; ~~ASTM D2846; ASTM F877; ASTM F2389; ASTM F2735~~
Stainless steel	ASTM A269; ASTM A312; ASTM A778; ASTM F3226
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A53; ASTM A106; ASTM A234; ASTM A395; ASTM A420; ASTM A536; ASTM F1476; ASTM F1548 ; ASTM F3226

Reason: This table looks like it had "plastic" as a legacy row, and there are already rows for other modern plastic materials, and some were missing, like PVC and PP. This proposal attempts to improve the table by reorganizing the rows with proper material names and proper standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is a reorganization of a table and is not expected to change the costs of construction.

M83-24

IMC®: 1208.1

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com)

2024 International Mechanical Code

Revise as follows:

1208.1 General. Hydronic piping systems shall be tested hydrostatically at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes.

> **Exception:** For PEX <u>and PERT</u> piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturers' instructions for the PEX <u>and PERT</u> pipe and fitting products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws or regulations outside of this code.

Reason: Current PEX and PERT manufacturers may allow for the practice of air testing.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal offers an alternative for pressure testing PERT tubing materials using compressed gas, potentially reducing the cost of testing pipes in these systems by $1 to $10,000. In situations with available water and no freezing risk, the cost decrease may be minimal, around $1 or less, as compressed gas testing is unnecessary.

If water is unavailable during pipe installation, the cost reduction could range from $1 to $1,000 by eliminating the need to transport water for testing.

In cold weather, when compressed air isn't an option, providing temporary heat to prevent freezing may cost $100 to $10,000, depending on building size and completion status. For instance, if a partially enclosed building requires temporary insulation during cold-weather testing, or occupancy is delayed due to conditions, allowing the use of compressed gas could yield a +$10,000 cost reduction.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal offers an alternative for pressure testing PERT tubing materials using compressed gas, potentially reducing the cost of testing pipes in these systems by $1 to $10,000. In situations with available water and no freezing risk, the cost decrease may be minimal, around $1 or less, as compressed gas testing is unnecessary.

Delete without substitution:

~~**1210.6.4 CPVC plastic pipe.** Joints between CPVC plastic pipe or fittings shall be solvent-cemented or threaded joints complying with Section 1203.3.~~

Reason: CPVC is a rigid piping material supplied only in short lengths of 10-20 feet and joined via solvent cement or various types of mechanical fittings (e.g., flanges). This pipe is not suitable for ground loop piping because of its lack of flexibility and requirement for many joints over a typical pipe length of 400 or more feet in a ground loop piping system. In addition, the time required for solvent cement joints to cure is not suitable for installation of pipes in a vertical borehole, which often requires more than 400 feet of two vertical pipes to be installed as quickly as possible to prevent the drilled hole from collapsing. Also, CPVC is not suitable for use with propylene glycol in the higher concentrations which are sometimes required in geothermal ground loop systems. The International Ground Source Heat Pump Association (IGSHPA), founded in 1987, has never recommended CPVC for ground source loop piping. Failures have occurred in the field when installers attempted to use CPVC piping for these applications many years ago. The *ANSI / CSA / IGSHPA C448 Series 16 Bi-National Standard for the design and installation of ground source heat pump systems for commercial and residential buildings* does not list CPVC rigid piping as an acceptable material for Geothermal ground loop installations. Additionally, the piping Task Force for the New Edition (2024) of the *ANSI / CSA / IGSHPA C448 Bi- National Standard* have reviewed all suitable piping materials for Geothermal ground loop installations and continue to NOT list CPVC material as suitable piping material for Geothermal installations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

CPVC is one of seven (7) piping materials listed in Table 1210.4 for ground loop piping and the user has several choices of better materials for this application, which are approved by IGSHPA or listed in the ANSI / CSA / IGSHPA Bi – National C448 Standard, and commonly used for this purpose. Because CPVC is known in the industry to be not suitable for these applications and is not recommended for this purpose by IGSHPA or the ANSI / CSA / IGSHPA Bi – National C448 Standard, it is rarely, if ever, used for this purpose. Therefore, the removal of CPVC piping from Table 1210.4 will neither decrease nor increase the cost of construction.

Justification for no cost impact:

PVC is one of seven (7) piping materials listed in Table 1210.4 for ground loop piping and the user has several choices of better materials for this application, which are approved by IGSHPA or listed in the ANSI / CSA / IGSHPA Bi – National C448 Standard, and commonly used for this purpose. Because PVC is known in the industry to be not suitable for these applications and is not recommended for this purpose by IGSHPA, or the ANSI / CSA / IGSHPA Bi – National C448 Standard it is rarely, if ever, used for this purpose. Therefore, the removal of PVC piping from Table 1210.4 will neither decrease nor increase the cost of construction.

M86-24

IMC®: TABLE 1210.5

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Mechanical Code

Revise as follows:

TABLE 1210.5 GROUND-SOURCE LOOP PIPE FITTINGS

PIPE MATERIAL	STANDARD (see Chapter 15)
Chlorinated polyvinyl chloride (CPVC)	ASTM D2846; ASTM F437; ASTM F438; ASTM F439; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F877; ASTM F1807; ASTM F1960; ASTM F2080; ASTM F2159; ASTM F2434; ASTM F3347; ASTM F3348; CSA B137.5; CSA C448; NSF 358-3
Polyethylene/aluminum/polyethylene (PE-AL-PE)	ASTM F1282; ASTM F2434; CSA B137.9
High-density polyethylene (HDPE)	ASTM D2683; ASTM D3261; ASTM F1055; CSA B137.1; CSA C448; NSF 358-1
Polypropylene (PP-R)	ASTM F2389; CSA B137.11; NSF 358-2
Polyvinyl chloride (PVC)	ASTM D2464; ASTM D2466; ASTM D2467; CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D3261; ASTM F1807; <u>ASTM F1960;</u> ASTM F2098; ASTM F2159; <u>ASTM F2623;</u> ASTM F2735; ASTM F2769; ASTM F3347; ASTM F3348; CSA B137.1; CSA B137.18; CSA C448; NSF 358-4

Staff Analysis: The proposed referenced standards, ASTM F1960 and F2623, are currently referenced in the IMC.

Reason: This proposal is to add two industry standards for fittings for PE-RT tubing to Table 1210.5. ASTM F1960 “Standard Specification for Cold Expansion Fittings with PEX Reinforcing Rings for Use with Cross-linked Polyethylene (PEX) and Polyethylene of Raised Temperature (PE-RT) Tubing” is for a fitting system which has recently been approved for use with PERT tubing (PE-RT and PEX have identical dimensions and share most of the same fitting systems). ASTM F2623 “Standard Specification for Polyethylene of Raised Temperature (PE-RT) Systems for Non-Potable Water Applications” is a PE-RT system standard for non-potable applications, including hydronics, and includes requirements for fittings intended for use with PERT tubing.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Including these fitting standards for PE-RT tubing in Table 1210.5 provides alternative fitting options for hydronic applications. The fittings covered by these standards are slightly less expensive than certain existing fitting standards, but also might be slightly more expensive than other existing fitting standards. It depends on which fittings are being compared. This code change proposal may decrease the cost of construction by 0% to 10% if these fitting standards are selected by users, or it may increase the cost of construction by 0% to 10% if these fitting standards are selected, or it may have no impact on the cost of construction if these fitting standards are not selected by users. To assign dollar values to this proposal, the use of the fittings covered by these proposed standards could decrease construction costs over a range from $1 to $5 per fitting, depending on the size of the piping, or it could increase construction costs over a range from $1 to $5 per fitting, depending on the size of the piping, etc., or it could have no effect on construction costs if users do not select to use one of these fitting standards. This proposal simply provides other fitting options.

Estimated Immediate Cost Impact Justification (methodology and variables):

Twelve (12) fitting standards for use with PE-RT tubing are already approved in Table 1210.5. This proposal simply provides additional options. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific fitting materials and sizes, plus assembly and construction costs which vary for each individual project. Therefore, only a range of cost decreases or increases can be provided in this format.

Estimated Life Cycle Cost Impact:

Twelve (12) fitting standards for use with PE-RT tubing are already approved in Table 1210.5. This proposal simply provides additional options. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific fitting materials and sizes, plus assembly and construction costs which vary for each individual project. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific fitting materials and sizes plus assembly and construction costs which vary for each individual project.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Twelve (12) fitting standards for use with PE-RT tubing are already approved in Table 1210.5. This proposal simply provides additional options. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific fitting materials and sizes, plus assembly and construction costs which vary for each individual project. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific fitting materials and sizes plus assembly and construction costs which vary for each individual project.

M86-24

M87-24

IMC®: TABLE 1302.3

Proponents: Christopher Adam Smith, Viega, LLC, Codes and Standards Manager for Viega, LLC

2024 International Mechanical Code

Revise as follows:

TABLE 1302.3 FUEL OIL PIPING AND FITTINGS

MATERIAL	STANDARD (see Chapter 15)
Copper or copper-alloy pipe and fittings	ASTM B42; ASTM B43; ASTM B302; ASTM F3226
Copper or copper-alloy tubing and fittings (Type K, L or M)	~~ASME B16.51;~~ ASTM B75; ASTM B88; ~~ASTM B280;~~ ASTM F3226
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D2996
Steel and stainless steel pipe and fittings	ASTM A53; ASTM A106; A312/A312M; ASTM F3226; UL 180
Steel and stainless steel tubing and fittings	ASTM A254; A269/A269M; ASTM A539; ASTM F3226; UL 180

Staff Analysis: The proposed referenced standard, UL 180, is currently referenced in the IMC.

Reason: This proposal adds UL 180 "Combustible Liquid Tank Accessories" is a standard for pipe, fittings, and accessories for use with fuel oil. This Standard has been revised since the IMC was last updated, and now includes press-connect fittings. Adding UL 180 to this table will allow press-connect fittings to be used for fuel oil applications, and inspectors will be able to verify that those fittings have been listed and labeled for the application.

This proposal will also remove the standards ASME B16.51 "Copper and Copper-Alloy Press-Connect Pressure Fittings" and ASTM B280 "Seamless Copper Tube for Air Conditioning and Refrigeration Field Service." ASME B16.51 has a scope which covers only "...pressure fittings for use with hard-drawn seamless copper water tube conforming to ASTM B88 for piping systems conveying water." ASTM B280 is a refrigerant tubing standard. It is our understanding that these standards were used in lieu of applicable standards available at the time. The Code will be more accurate and less confusing with these two inappropriate references removed from the Table. Removal of these standards from this table will decrease the likelihood of inappropriate products being used in a fuel oil application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this standard does not increase the cost of construction. The addition of this standard allows for a wider selection of materials but does not make their use mandatory. By including this standard in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

M87-24

M88-24

IMC®: 1302.9

Proponents: Christopher Adam Smith, Viega, LLC, Codes and Standards Manager for Viega, LLC

2024 International Mechanical Code

Revise as follows:

1302.9 Piping systems.
Above-ground piping systems shall be *listed* and *labeled* in accordance with UL 1369 or UL 180. Underground piping systems shall be *listed* and *labeled* in accordance with UL 971A.

Staff Analysis: The proposed referenced standard, UL 180, is currently referenced in the IMC.

Reason: This proposal adds UL 180 "Combustible Liquid Tank Accessories" is a standard for pipe, fittings, and accessories for use with fuel oil. This Standard has been revised since the IMC was last updated, and now includes press-connect fittings. Adding UL 180 to this table will allow press-connect fittings to be used for fuel oil applications, and inspectors will be able to verify that those fittings have been listed and labeled for the application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this standard does not increase the cost of construction. The addition of this standard allows for a wider selection of materials but does not make their use mandatory. By including this standard in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

M88-24

M89-24

IMC®: SECTION 202 (New), 309.2 (New)

Proponents: Clayton Trevillyan, City of Tucson, City of Tucson (clayton.trevillyan@tucsonaz.gov); Pete Quintela, Miami-Dade County, Miami-Dade County; Jane Gilbert, Miami-Dade County, Miami-Dade County (jane.gilbert@miamidade.gov); Stefano Schiavon, University of California, Berkeley, Self (schiavon@berkeley.edu); Ali Frazzini, Los Angeles County Chief Sustainability Office (afrazzini@cso.lacounty.gov); Mary Wright, City of Phoenix/Office of Heat Response and Mitigation, self

2024 International Mechanical Code

Add new definition as follows:

DESIGN COOLING DAY. A design parameter where air conditioning loads are determined.

Add new text as follows:

309.2 Cooling systems. Interior spaces intended for human occupancy shall be capable of maintaining an indoor temperature at or below 80°F (27°C) in the occupied zone 3 feet (914 mm) above the floor and at least 2 feet (610 mm) from exterior walls on the *design cooling day.* Where permanently installed fans capable of generating 120 fpm (0.6 m/s) air speed within the occupied zone, the indoor temperature during the *design cooling day* shall be maintained at or below 85°F (29°C). The installation of one or more portable systems shall not be used to achieve compliance with this section.

Exception: Cooling systems shall not be required for the following:

1. Interior spaces where the primary purpose is not associated with human comfort.
2. Group F, H, S and U occupancies.

Reason: The building code requires minimum heating of spaces for the safety of the occupants. The code is silent on requirements for cooling, despite the negative impacts of elevated exterior thermal conditions on humans. The built environment is a safe haven from the effects of weather and climatic conditions, heat not being an exception for people to seek shelter from the elements. Media attention to heat-related health emergencies on the elderly and people in underserved communities demonstrates the need for improvements in the built environment[1]. As a result of increased summer temperatures, some jurisdictions have already mandated cooling be provided in new buildings and many others are considering extreme heat related ordinances. A coordinated application in the codes that can be consistently applied to new construction is warranted due to the trend in local agencies with differing requirements throughout the county.

The proposal is a performance specification to ensure safety in the built environment due to higher expected summer thermal conditions. The solution can either be active or passive systems, or a combination of these systems to provide relief from elevated thermal conditions. The active systems would include traditional central mechanical air conditioning systems that are provided in most modern homes and do not represent a significant change to how most buildings are constructed. Passive cooling systems utilize unique design features of the building that prevent heat from entering the building and/or removing heat from the building. Passive design applications include building orientation, insulation, solar control (shading and landscaping), ventilation and other methods that naturally, and without input energy, would provide and maintain thermal comfort. Passive systems could be more cost effective in both the short term and the long term as compared to active mechanical systems for circumstances where a few design changes could comply with specified interior temperature. The interior temperature of 80°F was selected as the maximum temperature for the thermal comfort of the interior environment based on ANSI/ASHRAE Standard 55-2020[2] and generally at, or above the temperature in most local ordinances.

The second sentence recognizes that air movement provides a cooling effect as experienced by the occupants of the building. ASHRAE Standard 55-2020 states that air movement of only 120 feet per minute results in the perception of 5°F cooler temperatures. Where permanent fans are installed, the resulting interior maximum temperature can be increased 5°F above the baseline temperature of 80°F that would be required for either the active or passive systems installed in accordance with the first sentence of the code change proposal. This is an additional cost-effective manner to provide the minimum cooling effect on human bodies where thermal comfort and safety is provided in the built environment. Permanently installed fans can include ceiling fans, wall-mounted fans, bladeless ceiling fans, or any permanently installed fan that can be verified at the time of final inspection that the equipment is installed.

The third sentence is a carryover from the heating requirement, where the expectation for compliance is permanently installed equipment that can be utilized by the occupant as needed for thermal comfort and lifesaving opportunities from dangerous heat related health considerations.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 - $31+ per square foot of new or renovated habitable buildings.
The immediate cost impact to construction is for newly constructed or renovated buildings. There is no immediate cost to existing buildings. This value ranges greatly depending on variables that include but are not limited to:

- If the proposed construction would include cooling regardless of this code change. Zero cost impact will apply to many regions and project scopes for new permits.
- If the project includes a system that can be further supplemented at relatively low cost due to other air handling equipment that would have otherwise been included in the project scope.
- The method of proposed cooling and quality of equipment.
- Level of efficiency and sustainability of system design.
- The climate zone of project area.

Estimated Immediate Cost Impact Justification (methodology and variables):

1. Estimation from major HVAC contractor (Watsco)

“There are a lot of variables (i.e. size of the building, type of system, region, needs, installation costs). Below are some rough estimates"

- For commercial buildings the average cost can range from $15 to $30 per sq ft for a basic system but can go up to $40+ for more complex or high efficiency systems.
- For multi-family buildings the average cost can range from $2,500-$5,000 per unit for a basic system increasing in price for high efficiency units. ($40 pf @ 2 units for 4000 sf)

Comparison necessary to isolate cost of heating systems alone (e.g. furnace/boiler systems) to identify cost differential.

2. RSMeans Data (remeansonline.com)

TENTATIVE ORDER OF DISCUSSION
2021 PROPOSED CHANGES TO THE
INTERNATIONAL PLUMBING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some P code change proposals may not be included on this list, as they are being heard by another committee.

P1-24

IPC: SECTION 202

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us)

2024 International Plumbing Code

Revise as follows:

BATHROOM GROUP. A group of fixtures consisting of a water closet, urinal, lavatory, bathtub or shower, including or excluding a bidet, an *emergency floor drain* or both. Such fixtures are located together on the same floor level.

Reason: There doesn't seem to be a technical reason to not include a urinal in a wet vented bathroom group. Currently, the fixture can't be included and is dealt with separately.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Decrease in cost will be realized by not having to plumb the fixture separately .The estimated cost savings for a typical urinal installation is $100 to $250

Estimated Immediate Cost Impact Justification (methodology and variables):

.Material (pipe and fittings) $15 to $100 and the labor is $60 to $120 depending on the salary of the installer.

P1-24

P2-24

IPC: SECTION 202

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

Revise as follows:

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. Such fixtures include bottle filling stations.

Reason: With the onset of the worldwide pandemic of 2021, most people stopped using drinking fountains out of fear of catching the disease or, in many cases, the local jurisdictions mandated disabling the fountains to prevent their use. The use of refillable and single use water bottles became widely prevalent during the pandemic years. These water use habits have continued as now a large part of the populous no longer trust drinking fountains as a “safe” location to obtain a drink of water. To service this different way that people now obtain drinking water, the code should encourage the installation of bottle filling stations. In fact, the code already allows substitution of water dispensers in Section 410.3. The problem is that many code users did not realize that bottle filling stations are water dispensers in order to make the substitution for some drinking fountains. Therefore, the definition is being amended to add clarity to the topic in hopes that more designers will realize that substitution is allowed.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no change in technical requirement as it is a designer’s choice to substitute water dispensers for drinking fountains.

P2-24

P3-24

IPC: 303.6 (New), 303.6.1 (New)

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Plumbing Code

Add new text as follows:

303.6 Noncombustible materials. Noncombustible materials shall be those materials that comply with Section 703.3.1 of the International Building Code.

303.6.1 Inherently noncombustible materials..
Inherently noncombustible materials, such as concrete and steel, shall not be required to be tested to be acceptable as noncombustible materials.

Reason: The term noncombustible material is used multiple times in the IPC and, thus, an explanation/requirement is needed. The proposed requirement is identical to what is being proposed for the IFC (by FCAC), the IMC, and the IFGC and is consistent with the IBC requirements.

ICC definitions should not contain requirements. Therefore, this proposal adds a requirement into chapter 3 (general requirements) for how to classify a material as a noncombustible material, consistent with how the IBC does such a classification.

The 2021 edition of the IPC had a definition or "noncombustible materials" that was actually a requirement and was based on an old (now obsolete) set of criteria in ASTM E136. That definition has now been deleted but clarification on the concept is still needed.

The proposed text provides necessary clarification indicating that such materials are not required to be tested. "In the area of material regulation, materials that pass ASTM E136 have long been considered to be those that are noncombustible materials. Note that ASTM E136 is one of the very few ASTM fire test standards that has acceptance criteria. The acceptance criteria are different from the theoretical definition of a noncombustible material.

The IBC includes in Chapter 7 (section 703.3.1) added details on how to classify materials as noncombustible materials, but, appropriately, not a definition.

If no requirement exists experience indicates that some material manufacturers have claimed that their material is noncombustible when it simply exhibits improved fire performance. When searching the internet, multiple web sites offer materials or products that are alleged to be noncombustible when that claim is incorrect. There is often confusion in the public mind regarding materials that perform better than typical combustible materials, but that are not good enough for the material to be considered noncombustible in typical use. Including a correct requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry need to be tested.

The language in section 703.3.1 of the IBC reads as follows:

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code proposal simply connects with the IBC.

P4-24 Part I

IPC: 305.4

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

305.4 Freezing. Water, soil and waste pipes shall not be installed outside of ~~a~~ the building~~, in attics or crawl spaces, concealed in outside walls, or in any other place subjected to freezing temperatures unless adequate provision is made to protect such pipes from freezing by insulation or heat or both~~ thermal envelope. Exterior water supply system piping shall be installed not less than 6 inches (152 mm) below the frost line and not less than 12 inches (305 mm) below grade.

P4-24 Part I

P4-24 Part II

IRC: P2603.5

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Residential Code

Revise as follows:

P2603.5 Freezing.
In localities having a winter design temperature of 32°F (0°C) or lower as shown in Table R301.2 of this code, a water, soil or waste pipe shall not be installed outside of ~~a~~ the *building*~~, in exterior walls, in~~ ~~*attics*~~ ~~or~~ ~~*crawl spaces*~~~~, or in any other place subjected to freezing temperature unless adequate provision is made to protect it from freezing by insulation or heat or both~~ thermal envelope. Water service pipe shall be installed not less than 12 inches (305 mm) deep and not less than 6 inches (152 mm) below the frost line.

Reason: The current code text is misleading to many including owners, contractors, and even design professional. Providing "heat, insulation, or both" give them the impression that there is a choice when the reality is the piping must remain in a space that has adequate heat to prevent freezing. Insulation can serve 1 of 2 purposes, it is used to prevent the loss of heat from a space or it is used to prevent the infiltration of heat into a space. The current text technically informs users that they could just provide insulation. More importantly, without direction that the piping must remain inside the thermal envelope, we have seen installations where heat and insulation were provided yet water lines still froze. In this situation, there was a bathroom that cantilevered over a portion of a an attached garage. The portion below the bathroom was provided with adequate space for insulation and was provided with a "heat run" into that space. It was discovered later after 2 consecutive years of freezing that the entire space had been filled with insulation, leaving no way for the heat to reach the pipe to keep them from freezing. Insulation along the perimeter and the bottom portion of the space would have kept the pipes within the building thermal envelope where they would not have frozen.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal just simplifies the language in the code and will not negatively or positively affect cost of construction.

P4-24 Part II

P5-24

IPC: 305.8, 305.8.1, 305.8.2

Proponents: Brandon Adams, Image Engineering Group, self (brandon.adams@iegmep.com)

2024 International Plumbing Code

305.8 Expansive soil.
Where expansive soil is identified under buildings in accordance with Section 1803.5.3 of the *International Building Code*, but not removed in accordance with Section 1808.6.3 of the *International Building Code*, plumbing shall be protected in accordance with Section 305.8.1 or 305.8.2.

305.8.1 Nonisolated foundations.
Under foundations with slabs that are structurally supported by a subgrade, buried plumbing shall be permitted.

Revise as follows:

305.8.2 Isolated foundations.
Under foundations with a slab or framing that structurally spans over an under-floor space that isolates the slab or framing from the effects of expansive soil swelling and shrinking in accordance with Section 1808.6.1 of the *International Building Code*, the plumbing shall be suspended so that plumbing, hangers and supports are isolated, by a voidspace, from the effects of expansive soil swelling and shrinking.

Exception: Plumbing shall be permitted to be buried where it provides drainage of an under-floor space.

To protect the voidspace, soil shall be sloped, benched or retained in accordance with an *approved* design methodology. Plumbing, hangers and supports below the slab or framing shall not be permitted to be in contact with the soil or any assemblage of materials that is in contact with soil in the active zone. A slab and plumbing shall not be permitted to be lifted as an assembly to create the voidspace unless the under-floor space is a crawl space with access to allow inspection of plumbing after lifting.

Exception: Plumbing shall be permitted to be buried where it provides provides drainage of an under-floor space.

Organic materials subject to decay shall not be used for hangers, supports and soil retention systems. Materials subject to corrosion shall not be used for hangers, supports and soil retention systems unless protected in an *approved* manner. Where plumbing transitions to a buried condition beyond the perimeter of the foundation, an adequately flexible expansion joint shall be provided in the plumbing system to accommodate the effects of expansive soil swelling and shrinking. Where plumbing transitions to a buried condition, the difference in flow line elevations at each end of horizontal flexible expansion joints for horizontal drainage piping shall not be less than the sum of the minimum specified vertical dimension of the voidspace under plumbing and the product of the minimum slope required by Section 704.1 multiplied by the length of the flexible expansion joint.

  https://www.cdpaccess.com/proposal/10447/30163/files/download/4703/

Reason: This is a necessary clarification of the code to assist in code enforcement protecting the life, safety and welfare of occupants. This adds no cost whatsoever. The code already requires flexible expansion joints be designed to accommodate the swell and shrink potential of expansive soil. However, some engineers have incorrectly interpreted the 2024 IPC language to simply require a flexible expansion joint in Section 305.8.2 and they will specify that the slope of the flexible expansion joint simply meet the minimum slopes in Section 704.1, as if the fact that the flexible expansion joint can telescope and rotate at each end will "accommodate" the movement.

Doing so would certainly not accommodate the movement because it leads to a primary problem that the code language added to the 2024 IPC was resolving. For horizontal drainage plumbing draining away from a building, when expansive soil swelling causes buried plumbing outside of a building to rise, it is absolutely essential for the fixed elevation of the isolated plumbing on one end of a flexible expansion joint to be high enough above the lower end so that the slope of the flexible expansion joint will still meet the minimum slope requirements of Section 704.1 after the upward vertical expansive soil movement occurs where the plumbing is buried. For the less common case of horizontal drainage plumbing draining toward a building (e.g. a sanitary sewer line from another building that runs under a proposed building), when expansive soil shrinkage causes buried plumbing outside of a building to drop, it is absolutely essential for the fixed elevation of the isolated plumbing on one end of a flexible expansion joint to be low enough below the upper end so that the slope of the flexible expansion joint will still meet the minimum slope requirements of Section 704.1 after the downward vertical expansive soil movement occurs where the plumbing is buried. The clarification language proposed herein is written to be applicable for both of these cases. I have personally seen multiple crawlspace foundations where the buried end of DWV plumbing rises because of expansive soil and the vast majority of the suspended plumbing (that is attached to the bottom of the slab) is now too "low" for any of it to function properly because the downstream plumbing has risen up in elevation, making the suspended upstream system sometimes 6 or 12 inches too "low". If there is not sufficient slope in the flexible expansion joint at the time of initial construction, no amount of "maintenance" by replacing broken pipes can solve the problem. A major capital improvements project is required. This proposed code change is not going to change the cost of construction at all. This is a common sense application of the current code when you understand the basic problems that expansive soil presents to DWV plumbing. The multi-million dollar problems (e.g. $23M damage claim on a 100,000 square foot building footprint in one published Geoprofessional Business Association, GBA, case study) that expansive soil inflicts on plumbing and design approaches that can appropriately address these challenges are well documented today. The architecture and engineering community overall is very appreciative of the new language in the 2024 IPC that avoids any confusion over what minimum expectations are for plumbing under buildings where expansive soil is identified in a soil report. Various Plumbing Engineers, Geotechnical Engineers and Structural Engineers have been presenting nationally on this topic in the last few years since the new language in the 2024 IPC was adopted, one including another engineer from my MEP design firm. Attached are three (3) of these presentations that discuss the reasons why this is a necessary code clarification to the 2024 IPC language. Because understanding this issue involved different engineering design disciplines, each presentation was presented by a unique team consisting of a Plumbing (Mechanical) Engineer, a Geotechnical Engineer and a Structural Engineer. The three (3) presentations attached are therefore a representation from nine (9) different engineering design firms. The three (3) presentations look similar because content was shared among peers with the permission of the original presenters. However, each presentation was tailored to a different audience at a different time and so there are some substantive differences but all of the content in the presentations is supportive of this code change proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed code change only defines what the minimum slope needs to be for flexible expansion joints that are already required by the 2024 IPC, providing clarity that assists in enforcement, because the minimum slopes in Section 704.1 are not sufficient for this application.

P6-24

IPC: 306.2, 306.3, 306.5 (New)

Proponents: Brian Conner, Charlotte Pipe and Foundry (bconner@charlottepipe.com)

2024 International Plumbing Code

Revise as follows:

306.2 Trenching and bedding.
Where trenches are excavated such that the bottom of the trench forms the bed for the pipe, solid and continuous load-bearing support shall be provided between joints. Bell holes, hub holes and coupling holes shall be provided at points where the pipe is joined. Such pipe shall not be supported on blocks to grade. <u>Plastic drainage and sewer piping shall have a trench width not less than the outside diameter of the pipe plus 16 inches (406 mm) or a trench width of not less than 1.25 times the outside diameter plus 12 inches (305 mm). Bedding for plastic drainage and sewer piping shall be not less than 4 inches (102 mm) in depth.</u> In instances where the material manufacturer's installation instructions are more restrictive than those prescribed by the code, the material shall be installed in accordance with the more restrictive requirement.

306.3 Backfilling.
Backfill shall be free from discarded construction material and debris. Loose earth free from rocks, broken concrete and frozen chunks shall be placed in the trench in 6-inch (152 mm) layers and tamped in place until the crown of the pipe is covered by 12 inches (305 mm) of tamped earth. The backfill under and beside the pipe shall be compacted for pipe support. Backfill shall be brought up evenly on both sides of the pipe so that the pipe remains aligned. <u>Backfill for plastic drainage and sewer piping shall be compacted to a minimum 85 percent (%) standard proctor density</u>. In instances where the manufacturer's instructions for materials are more restrictive than those prescribed by the code, the material shall be installed in accordance with the more restrictive requirement.

Add new text as follows:

<u>**306.5 Special Inspection Required.** Special inspection required of plastic drainage and sewer piping trenching, bedding, backfill, and compaction shall be performed by a third-party approved by the code official. Inspections shall be in accordance with Sections 306.2 and 306.3 of the code.</u>

Reason: This section provides the minimum prescriptive requirements for piping installations underground. This section is being revised to contain minimum requirements for plastic drainage piping, as plastic drainage piping for drainage and sewer applications are reliant upon the soil and proper installation to maintain the sanitary nature of the installed piping system. Plastic drainage piping materials are in a failed state when they are deflected in excess of 5-7.5%. When the trenching, bedding, backfill or compaction process is not completed properly and to the correct levels, failure opportunity substantially increases. Many manufacturers of plastic drainage piping provide manufacturer's installation instruction that exceed these prescriptive requirements. Their installation instructions would be the more restrictive requirement. There are manufacturers that do not provide manufacturer installation instructions or guidance for underground installation; therefore, the products could be installed with less than necessary soil compaction, trench width, little or no bedding, or even improper backfill procedures. All of which plastic piping systems are reliant upon for their underground integrity. The special inspection section has been added in this proposal due to the backfilling and compaction requirements being outside of the normal schedule of inspections for most AHJ's. These are crucial steps to ensure that the plastic piping installation is adequate to maintain its integrity and function as intended. If the enforcement component is not done, the critical installation steps may not be completed properly, leading to sewage exfiltration into the ground, contamination, possible structural issues and costly repairs. There have been failures and issues due to improper installation occurring in a similar fashion as the code currently states, rather than the proper minimum installation as it is being revised to. This code change provides a minimum prescriptive base level of proper installation and the enforcement component to guide all users of this code to ensure safety of occupants and our environment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

All of the steps of installation are already being performed by the installer (many times, incorrectly). Installing the pipe and fitting systems correctly in accordance with these changes will not add to the cost of construction.

P6-24

P7-24

IPC: 306.2.4

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us)

2024 International Plumbing Code

Revise as follows:

306.2.4 Tracer wire.
For plastic sewer piping, an insulated copper tracer wire or other *approved* conductor shall be installed adjacent to and over the full length of the piping. Access shall be provided to the tracer wire or the tracer wire shall terminate at the cleanout between the *building drain* and *building sewer*. The tracer wire size shall be not less than ~~14~~ 18 American Wire Gauge (2.5 mm^2), shall be green in color and the insulation type shall be listed for direct burial.

Reason: Its overkill to require a 14-gauge wire when a 18 gauge wire will do the same job and is less expensive. This is consistent with what's required in the IFGC. The American Public Works Association provides color guidance for sewer pipe including blue for potable water and yellow for gas.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This will decrease the cost of construction requiring a smaller gauge wire that is less expensive than a 14 gauge wire. “The cost savings is $15 for 100 feet of tracer wire..

Estimated Immediate Cost Impact Justification (methodology and variables):

.
There is not a difference in labor to install. The current price of 18 gauge wire is $0.09 per foot and for 14 gauge wire, $0.11 per foot.

P7-24

P8-24

IPC: 308.5, MSS Chapter 15 (New)

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Plumbing Code

Revise as follows:

308.5 Interval of support. Pipe shall be supported in accordance with Table 308.5 <u>or in accordance with ANSI/MSS SP-58</u>.

Exception: The interval of support for piping systems designed to provide for expansion/contraction shall conform to the engineered design in accordance with Section 316.1.

Add new standard(s) as follows:

MSS

Manufacturers Standardization Society of the Valve and Fittings Industry, Inc.
127 Park St. NE
Vienna, VA 22180-4602

<u>SP-58-2018</u>	<u>Pipe Hangers and Supports-Materials, Design, Manufacture, Selection, Applications, and Installation (ANSI-approved American National Standard) which includes Amendment 1 Issued 10-17-2019.</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, SP-58-2018 *Pipe Hangers and Supports-Materials, Design, Manufacture, Selection, Applications, and Installation (ANSI-approved American National Standard) which includes Amendment 1 Issued 10-17-2019*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposal will harmonize requirements for the intervals of pipe supports with the 2024 IMC Section 305.4 by allowing interval spacing for pipes to also be in accordance with ANSI/MSS SP-58 *Pipe Hangers and Supports – Materials, Design, Manufacture, Selection, Application, and Installation*.

According to the ANSI press release on this standard, “ANSI/MSS SP-58 2018 is an extensive standard with information on a multitude of topics involving pipe hangers and supports. Not only does it serve as “an industry accepted basis” for those involved in the different aspects of pipe hangers and supports, but it also establishes the minimum guidelines for materials, allowable stresses, product design, testing, and load ratings for pipe hanger and support assemblies for standard and unique pipe hangers and supports.”

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will harmonize requirements for the intervals of pipe supports with the 2024 IMC Section 305.4 by allowing interval spacing for pipes to also be in accordance with ANSI/MSS SP-58 *Pipe Hangers and Supports – Materials, Design, Manufacture, Selection, Application, and Installation*. The selection of pipe support spacing according to either of these resources is a designer choice, and this proposal simply adds options.

P8-24

P9-24

IPC: 308.6

Proponents: James Walls, Cast Iron Soil Pipe Institute, Cast Iron Soil Pipe Institute (jwalls@cispi.org)

2024 International Plumbing Code

Revise as follows:

308.6 Sway bracing.
Where *horizontal pipes* 4 inches (102 mm) and larger convey drainage ~~or waste,~~ and where a pipe fitting in that piping changes the flow direction greater than 45 degrees (0.79 rad), rigid bracing or other rigid support arrangements shall be installed to resist movement of the upstream pipe in the direction of pipe flow. A change of flow direction into a vertical pipe shall not require the upstream pipe to be braced.

Reason: The term “waste” is being removed as it is redundant and a component of the term “drainage.” This change clarifies the language to users of the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change will have no impact on the cost of construction. The change is editorial and simply the removal of the term "or waste" that is already encompassed by the existing term "drainage".

P9-24

P10-24

IPC: SECTION 202 (New), 308.7, 308.7.1

Proponents: James Walls, Cast Iron Soil Pipe Institute, Cast Iron Soil Pipe Institute (jwalls@cispi.org)

2024 International Plumbing Code

Add new definition as follows:

JOINT RESTRAINT. A restraint assembly to resist axial movement at a joint in a piping system.

Revise as follows:

308.7 ~~Anchorage~~ Joint restraint. ~~Anchorage~~ Joint restraint shall be provided to restrain drainage piping from axial movement.

308.7.1 Location. For ~~pipe sizes~~ *horizontal pipes* 4 inches (102 mm) and larger that convey drainage ~~greater than 4 inches (102 mm),~~ joint restraints shall be provided ~~for drain pipes~~ at all changes in direction. ~~and~~ Joint restraints shall be provided for *horizontal pipes* 4 inches (102 mm) and larger that convey drainage at all changes in diameter greater than two pipe sizes. Braces, blocks, rodding and other suitable methods as specified by the coupling manufacturer shall be utilized.

Reason: There has been a great deal of confusion between sway bracing, joint restraint, and the current code term “anchorage.” This proposal replaces the current term anchorage and replaces it with what the code is prescribing, which is joint restraint. This proposal provides a clear distinction for the users of the code as well as what is required of each. These items are specifically for drainage piping systems and the current proposal is reflective of that fact. Additionally, the language has been made consistent with related section 308.6, utilizing the language “*horizontal pipes* that convey drainage” The addition of further clarification as to change of direction as well as separating and clarifying the two distinct applications of joint restraint locations has been made. This clarifies the distinction between the two items and the requirements to accomplish each to the code official, installer, and other users of this code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is is a clarification and has no cost impact on the cost of construction.

P10-24

P11-24

IPC: 312.1, 312.6

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com)

2024 International Plumbing Code

Revise as follows:

312.1 Required tests.
The permit holder shall make the applicable tests prescribed in Sections 312.2 through 312.11 to determine compliance with the provisions of this code. The permit holder shall give reasonable advance notice to the code official when the plumbing work is ready for tests. The equipment, material, power and labor necessary for the inspection and test shall be furnished by the permit holder and he or she shall be responsible for determining that the work will withstand the test pressure prescribed in the following tests. ~~Plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air.~~ After the plumbing fixtures have been set and their traps filled with water, the entire drainage system shall be submitted to final tests. The code official shall require the removal of any cleanouts if necessary to ascertain whether the pressure has reached all parts of the system.

312.6 Water supply system test.
Upon completion of a section of or the entire water supply system, the system, or portion completed, shall be tested and proved tight under a water pressure not less than the working pressure of the system; or, for piping systems other than plastic, by an air test of not less than 50 psi (344 kPa). This pressure shall be held for not less than 15 minutes. The water utilized for tests shall be obtained from a potable source of supply. The required tests shall be performed in accordance with this section and Section 111.

> **Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by the manufacturer's instructions for the pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws or regulations outside of this code.

Reason: Language in the general section 312.1 does not allow for air testing plastic systems, but there are existing conditions in the later testing sections (Sections 312.2 through 312.11) where it is permitted, typically with products such as PEX and PERT. The restriction is therefore, deleted in 312.1, and a specific exception is placed in the supply line section, where these types of materials may also be used.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal offers an alternative for pressure testing PEX and PE-RT tubing materials using compressed gas, potentially reducing the cost of testing pipes in these systems by $1 to $10,000. In situations with available water and no freezing risk, the cost decrease may be minimal, around $1 or less, as compressed gas testing is unnecessary.

If water is unavailable during pipe installation, the cost reduction could range from $1 to $1,000 by eliminating the need to transport water for testing.

In cold weather, when compressed air isn't an option, providing temporary heat to prevent freezing may cost $100 to $10,000, depending on building size and completion status. For instance, if a partially enclosed building requires temporary insulation during cold-weather testing, allowing the use of compressed gas could yield a $10,000 cost reduction.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal offers an alternative for pressure testing PEX and PE-RT tubing materials using compressed gas, potentially reducing the cost of testing pipes in these systems by $1 to $10,000. In situations with available water and no freezing risk, the cost decrease may be minimal, around $1 or less, as compressed gas testing is unnecessary.

If water is unavailable during pipe installation, the cost reduction could range from $1 to $1,000 by eliminating the need to transport water

for testing.

In cold weather, when compressed air isn't an option, providing temporary heat to prevent freezing may cost $100 to $10,000, depending on building size and completion status. For instance, if a partially enclosed building requires temporary insulation during cold-weather testing, allowing the use of compressed gas could yield a $10,000 cost reduction.

Estimated Life Cycle Cost Impact:

There is no cost impact of air vs. water testing over the life cycle.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None.

P11-24

P12-24 Part I

IPC: 312.3

Proponents: Joseph Summers, Mashantucket Pequot Tribal Nation, Building Code Enforcement

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

312.3 Drainage and vent air test.
Plastic piping shall not be tested using air. An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi (34.5 kPa) or sufficient to balance a 10-inch (254 mm) column of mercury. <u>Test assemblies shall be equipped with a pressure regulator and pressure relief device to limit the maximum pressure to 6 psi.</u> This pressure shall be held for a test period of not less than 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperatures or the seating of gaskets shall be made prior to the beginning of the test period.

Reason: Pages 57-58 of the Cast Iron Pipe Institute handbook outlines the test procedures acceptable for the testing of cast iron piping which are not addressed in 312.3 such as limiting an air test to 6 psi max and having a pressure regulator and relief devices installed. Fernco's only listed for a little over 4 psi.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is giving the installer another option and provides safeguards during the testing of piping by regulating the maximum amount of pressure that can be introduced into the pipe.

P12-24 Part I

P12-24 Part II

IRC: P2503.5.1

Proponents: Joseph Summers, Mashantucket Pequot Tribal Nation, Building Code Enforcement

2024 International Residential Code

Revise as follows:

P2503.5.1 Rough plumbing.
DWV systems shall be tested on completion of the rough piping installation by water, by air for piping systems other than plastic, or by a vacuum of air for plastic piping systems, without evidence of leakage. The test shall be applied to the drainage system in its entirety or in sections after rough-in piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than 10 feet (3048 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes. <u>Test assemblies shall be equipped with a pressure regulator and pressure relief device to limit the maximum pressure to 6 psi.</u>
3. Vacuum test. The portion under test shall be evacuated of air by a vacuum-type pump to achieve a uniform gauge pressure of -5 pounds per square inch or a negative 10 inches of mercury column (-34 kPa). This pressure shall be held without the removal of additional air for a period of 15 minutes. <u>Test assemblies shall be equipped with a pressure regulator and pressure relief device to limit the maximum pressure to -6 psi.</u>

Reason: Pages 57-58 of the Cast Iron Pipe Institute handbook outlines the test procedures acceptable for the testing of cast iron piping which are not addressed in 312.3 such as limiting an air test to 6 psi max and having a pressure regulator and relief devices installed. Fernco’s only listed for a little over 4 psi.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This provides the installer with an additional level of safety with using air by limiting the pressure into the system.

Revise as follows:

P2503.7 Water-supply system testing.
Upon completion of the water-supply system or a section of it, the system or portion completed shall be tested and proved tight under a water pressure of not less than the working pressure of the system or, for piping systems other than plastic, by an air test of not less than 50 psi (345 kPa). This pressure shall be held for not less than 15 minutes. The water used for tests shall be obtained from a potable water source.

Exception: For PEX and PE-RT piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by the manufacturer's instructions for the PEX or PE-RT pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws or regulations outside of this code.

P13-24 Part II

P13-24 Part III

IMC®: 1208.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

1208.1 General. Hydronic piping systems shall be tested hydrostatically at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes.

> **Exception:** For PEX <u>and PE-RT</u> piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturers' instructions for the PEX <u>or PE-RT</u> pipe and fitting products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws or regulations outside of this code.

Reason: PART I: The IRC currently allows pressure testing of PEX piping systems with compressed gas in P2503.7 via an Exception. The Exception should be added to the IPC for consistency, and the Exception should apply to both PEX and PE-RT flexible piping materials.

The Exception found in IRC P2503.7 Water Supply System Testing is technically appropriate, is safe, and is supported by the plastic piping industry. In fact, this Exception should also be expanded to apply to PE-RT piping materials. A separate code change request has been submitted for that purpose. Like PEX, PE-RT is also produced from HDPE material and does not fail via brittle failure or separation of shards. The Plastics Pipe Institute's *Recommendation F* was updated in 2022 to also apply to PE-RT tubing, and is now titled "Testing PEX and PE-RT Tubing Systems with Compressed Air or Inert Gas" Recommendation F.pdf (plasticpipe.org).

PART II: The IRC currently allows pressure testing of PEX piping systems with compressed gas in P2503.7 Water Supply System Testing via an Exception. The Exception should be revised to also apply to PE-RT piping systems. Like PEX, PE-RT tubing is also produced from HDPE material and does not fail via brittle failure or separation of shards. The Plastics Pipe Institute's *Recommendation F* was updated in 2022 to also apply to PE-RT tubing, and is now titled "Testing PEX and PE-RT Tubing Systems with Compressed Air or Inert Gas" Recommendation F.pdf (plasticpipe.org).

Part III: The IRC currently allows pressure testing of PEX piping systems with compressed gas in P2503.7 via an Exception. The Exception should be added to the IPC for consistency, and the Exception should apply to both PEX and PE-RT flexible piping materials.

The Exception found in IRC P2503.7 Water Supply System Testing is technically appropriate, is safe, and is supported by the plastic piping industry. In fact, this Exception should also be expanded to apply to PE-RT piping materials. A separate code change request has been submitted for that purpose. Like PEX, PE-RT is also produced from HDPE material and does not fail via brittle failure or separation of shards. The Plastics Pipe Institute's *Recommendation F* was updated in 2022 to also apply to PE-RT tubing, and is now titled "Testing PEX and PE-RT Tubing Systems with Compressed Air or Inert Gas" Recommendation F.pdf (plasticpipe.org).

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$1 to $10,000

Estimated Immediate Cost Impact Justification (methodology and variables):

By providing the alternative to pressure test PEX and PE-RT tubing materials with compressed gas, this code change proposal may decrease the cost of pressure testing pipes in these types of systems over a range from $1 to $10,000. In situations where water is readily available and there is no risk of freezing, the cost decrease can be $1 or less, because the compressed gas test method is not used. In situations where water is not available on the jobsite at the time when pipes are installed and ready for test, the cost decrease can be $1 to $1,000 by preventing the need to transport potable water to the jobsite for testing. In cold weather situations, without the option of using compressed air for testing, the cost to provide temporary heat to the building to prevent freezing of water in pipes during testing is significant and could range from $100 to $10,000 depending on the size of the building and its level of completion during the pressure test period. For example, if the building is not yet fully enclosed and must be wrapped with temporary insulation during the use of temporary heat for a pressure test in cold weather, the cost decrease of allowing the use of compressed gas can be as high as $10,000.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

IPC: 403.1, 403.1.1, TABLE 403.1, 403.1.2; IBC: [P] 2902.1, [P] 2902.1.1, TABLE 2902.1, [P] 2902.1.2

Proponents: Eirene Knott, BRR Architecture, Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

2024 International Plumbing Code

Revise as follows:

403.1 Minimum number of fixtures.
Plumbing fixtures shall be provided in the minimum number as shown in Table ~~403.1~~ 403.1.1, based on the actual use of the building or space. Uses not shown in Table ~~403.1~~ 403.1.1 shall be considered individually by the code official. The number of occupants shall be determined by the *International Building Code*.

403.1.1 Fixture calculations.
To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table ~~403.1~~ 403.1.1. Fractional numbers resulting from applying the fixture ratios of Table ~~403.1~~ 403.1.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicate a distribution of the sexes of other than 50 percent of each sex.
2. Where multiple-user facilities are designed to serve all genders, the minimum fixture count shall be calculated 100 percent, based on total occupant load. In such multiple-user facilities, each fixture type shall be in accordance with ICC A117.1 .

TABLE ~~403.1~~ 403.1.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Section~~s 403.1.1 and~~ 403.2)
Portions of table not shown remain unchanged.

Portions of the table not shown remain unchanged

403.1.2 Fixtures in single-user toilet facilities and bathing rooms.
The plumbing fixtures located in single-user toilet facilities and single-user bathing rooms, including family or assisted-use toilet facilities and bathing rooms, shall contribute toward the total number of required plumbing fixtures for a building or tenant space. The number of fixtures in single-user toilet facilities, single-user bathing rooms and family or assisted-use toilet facilities shall be deducted proportionately from the required gender ratios of Table ~~403.1~~ 403.1.1. Single-user toilet facilities and bathing rooms, and family or assisted-use toilet facilities and bathing rooms shall be identified as being available for use by all persons regardless of their sex.The total number of fixtures shall be based on the required number of separate facilities or based on the aggregate of any combination of single-user or multiple-user facilities.

2024 International Building Code

Revise as follows:

[P] 2902.1 Minimum number of fixtures.
Plumbing fixtures shall be provided in the minimum number as shown in Table ~~2902.1~~ 2902.1.1 based on the actual use of the *building* or space. Uses not shown in Table ~~2902.1~~ 2902.1.1 shall be considered individually by the code official. The number of occupants shall be determined by this code.

[P] 2902.1.1 Fixture calculations. To determine the *occupant load* of each sex, the total *occupant load* shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the *occupant load* of each sex in accordance with Table ~~2902.1~~ 2902.1.1. Fractional numbers resulting from applying the fixture ratios of Table~~2902.1~~ 2902.1.1 shall be rounded up to the next whole number. For calculations involving multiple occupancies, such fractional numbers for each occupancy shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total *occupant load* shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Where multiple-user *facilities* are designed to serve all genders, the minimum fixture count shall be calculated 100 percent, based on total *occupant load*. In such multiple-user user *facilities*, each fixture type shall be in accordance with ICC A117.1 .

TABLE ~~2902.1~~ 2902.1.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Section~~s 2902.1.1 and~~ 2902.2)
Portions of table not shown remain unchanged.

Table removed as no changes are made

[P] 2902.1.2 Fixtures in single-user toilet facilities and bathing rooms. The plumbing fixtures located in single-user toilet *facilities* and single-user rooms, including family or assisted-use toilet *facilities* and bathing rooms, shall contribute toward the total number of required plumbing fixtures for a *building* or tenant space. The number of fixtures in single-user toilet *facilities*, single-user bathing rooms and family or assisted-use toilet *facilities* shall be deducted proportionately from the required gender ratios of Table ~~2902.1~~ 2902.1.1 . Single-user toilet facilities and bathing rooms, and family or assisted-use toilet facilities and bathing rooms shall be identified as being available for use by all *persons* regardless of their sex. The total number of fixtures shall be based on the required number of separate *facilities* or based on the aggregate of any combination of single-user or separate *facilities*.

Reason: What I have attempted to do is to renumber the fixture table so that it appears in the order in which one would apply the required number of fixtures. IPC Section 403.1 and IBC Section 2902.1 explain that fixtures are to be provided based on the table.

Why would the table come before the directions? Wouldn't the directions be first, then the table? All this code change is doing is providing for more of a logical flow as to how to determine the fixture counts. Having the table before the directions is somewhat counterintuitive.

I have also removed the reference in the table to IPC Section 403.1.1 and IBC Section 2902.1.1 since the table would now become part of that same section. By moving the table to appear after IPC Section 403.1.1 and IBC Section 2901.1.1, the reference from the table to that section can be removed, so only IPC Section 403.2 and IBC Section 2902.2 need to be referenced.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change only changes the number of the fixture table to be more consistent in the order of the content needed to determine plumbing fixture counts.

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-user toilet facility with one water closet and one lavatory serving not more than two adjacent care recipient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile classifications with an occupant load of 15 or fewer, service sinks shall not be required.

f. The required number and type of plumbing fixtures for indoor and outdoor public swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.

a. The fixtures shown are based on one fixture being the minimum required for the number of *persons* indicated or any fraction of the number of *persons* indicated. The number of occupants shall be determined by this code.

b. Toilet *facilities* for employees shall be separate from *facilities* for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient *sleeping units* shall be permitted, provided that each patient sleeping unit has direct access to the toilet room and provisions for privacy for the toilet room user are provided.

d. The *occupant load* for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of *facilities* required.

e. For business and mercantile classifications with an *occupant load* of 15 or fewer, a service sink shall not be required.

f. The required number and type of plumbing fixtures for indoor and outdoor swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.

Reason: The purpose of this change is to combine the men's and ladies' into a single cell when the numbers are the same for number of water closets required or number of lavatories required. The only time there should be separate male and female listings is when there are different ratios for the number of fixtures required.

The revised cells of the table are shown merged with the extra ratio information deleted. The intent is to simply make one cell to show the ratio applicable to both males and females.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial and has no impact on cost. There is no change to the fixture requirements. The same number of fixtures will be required. With the movement towards all-gender toilet rooms, the code will be easier to interpret.

f. The required number and type of plumbing fixtures for indoor and outdoor swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.

Reason: The provisions for an occupied roof have become more comprehensive over the last few code cycles. This code change proposal adds occupied roof to the Assembly classification in the Minimum Plumbing Fixture requirements in IPC Table 403.1 which would also be published as Table 2902.1 in the IBC. This provides clear direction on how to assign a plumbing fixture ratio when the occupied roof has a generic assembly use that is not associated with a restaurant or another more specific use in the table.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change proposal clarifies how to assign minimum plumbing fixtures for an occupied roof used for assembly that is not more closely associated with another use in IPC Table 403.1 and IBC Table 2902.1

f. The required number and type of plumbing fixtures for indoor and outdoor public swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.

2024 International Building Code

Revise as follows:

TABLE 2902.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 2902.1.1 and 2902.2)
Portions of table not shown remain unchanged.

NO.	CLASSIFICATION	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 424.2) MALE	FEMALE	LAVATORIES MALE	FEMALE	BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
7	Residential								
8	Storage	Structures for the storage of goods, warehouses, storehouse, ~~and~~ freight depots, and self storage. Low and Moderate Hazard.	1 per 100		1 per 100		—	1 per 1,000	1 service sink

a. The fixtures shown are based on one fixture being the minimum required for the number of *persons* indicated or any fraction of the number of *persons* indicated. The number of occupants shall be determined by this code.

b. Toilet *facilities* for employees shall be separate from *facilities* for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient *sleeping units* shall be permitted, provided that each patient sleeping unit has direct access to the toilet room and provisions for privacy for the toilet room user are provided.

d. The *occupant load* for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of *facilities* required.

e. For business and mercantile classifications with an *occupant load* of 15 or fewer, a service sink shall not be required.

f. The required number and type of plumbing fixtures for indoor and outdoor swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.

Reason: Self storage facilities have low occupant loads, and most visitors are only in the facility for short periods of time. Thus, the number of available fixtures needed can be minimal.

According to the Self Storage Association (SSA), the size of a facility can range from 10,000 to 100,000 square feet, with an average size of 56,900 square feet. That amounts to approximately 546 units per facility. Per SSA's "Self Storage Standards and the Modern Community," there is an average of 6.82 trips per day for every 100 units. At 546 units, that would be 30.4 trips per day.

Assuming four occupants per trip, that would total 122 visitors daily. Most self storage facilities operate from 6:00 AM to 10:00 PM (16 hours), which means the average occupancy at any one time is 7.6 occupants, plus 3.5 employees (per SSA statistics), for an average total occupant load of 11. There will likely be peak periods where the number of visitors is higher than average.

At 122 occupants, the minimum number of fixtures would provide at least one water closet and one lavatory for each sex. Using the warehouse occupant load factor of 500 gsf per occupant, a large size self storage facility would have an occupant load of 200, which would still only require one closet and one lavatory for each sex, thus not creating an unnecessary burden on self storage facilities by providing an excessive number of fixtures for such low demand. Without definitive direction in the table, some designers have been directed to utilize the "Business" plumbing fixture ratios since a self storage facility is a "business."

For facilities that include on-site residential units for employees, those units would comply with the requirements for one- and two-family dwellings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Most self storage facilities utilize the "Storage" plumbing fixture ratios as a default; however, the examples provided do not depict a self storage facility. This could cause apprehension, if not confusion when trying to apply the plumbing fixture requirements to facilities like self-storage. Pushing owners towards ratios that generate higher plumbing fixture counts may actually increase the cost of construction. The inclusion of self storage with the provided examples removes all doubt about plumbing ratios to use; thus, allowing owners to anticipate the number of fixtures and stay within their budgets.

2024 International Plumbing Code

Revise as follows:

TABLE 403.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)
Portions of table not shown remain unchanged.

NO.	CLASSIFICATION	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 424.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
			MALE	FEMALE	MALE	FEMALE			
8	Storage	Structures for the storage of goods, warehouses, storehouse and freight depots. Low and Moderate Hazard.	1 per 100		1 per 100		—	1 per 1,000	1 service sink
		Self-service storage facilities	1 per 500 units		1 per 500 units		—	1 per 1000 units	—

2024 International Building Code

Revise as follows:

TABLE 2902.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 2902.1.1 and 2902.2)
Portions of table not shown remain unchanged.

NO.	CLASSIFICATION	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 424.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
			MALE	FEMALE	MALE	FEMALE			
8	Storage	Structures for the storage of goods, warehouses, storehouse and freight depots. Low and Moderate Hazard.	1 per 100		1 per 100		—	1 per 1,000	1 service sink
		Self-service storage facilities	1 per 500 units		1 per 500 units		—	1 per 1000 units	—

Reason: Self-service storage facilities are low occupancy buildings, where the occupant load is most closely aligned with the number of units rather than the square footage of the building. Such a metric is therefore more appropriate and is being proposed. Service sinks are not needed in self-storage facilities like they are in traditional warehouses.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The average self-storage facility will save the cost of installing a service sink, about $2,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

Restrooms are currently being overdesigned in self-service storage facilities. This code change proposal attempts to provide an appropriate metric for supplying restroom facilities.Currently, the number of fixtures are tied to occupant load at 1 WC & Lavatory per 100 occupants. and 1 drinking fountain per 1,000 occupants. A total of one service sink is required. IBC Table 1004.5, assigns one occupant per 500 gross SF for warehouses. The current code requires only a single water fountain for self-storage facilities up to 500,000 SF (500 SF/occupant X 1,000 occupants) and one WC/lavatory per 50,000 SF (500 SF/occupant X 100 occupants) of building area.

The average self-storage facility is 46,000 SF of rentable space [*]. Dividing the average net rentable space by the net rentable area percentage results in an average building area of 46,000 - 61,000 gross SF. Dividing the gross building area by 500 SF/occupant results an a building occupancy of 92 - 122 persons in an average building. **The current code, per IPC Table 403.1 therefore requires 1-2 WC/lavs, 1 water fountain, and 1 service sink per average facility.**

The average self-storage unit size is 100 SF [*], and net rentable areas for self-storage facilities are between 75% to 100% of the building [*]. This code change proposal will require a water fountain for each 100,000 - 133,000 SF and a WC/lav for each 50,000 - 67,000 SF of building area.

The average self-storage facility with 46,000 SF of rentable space therefore has 460 units when the rentable area is divided by the average unit size. **This proposal results in the need for 1 WC/lav and 1 water fountain for the average facility, and no service sink.**

The average facility therefore saves on the cost of a service sink (~$1000 [2]) and its installation. Assumed installation cost is 50% of total cost.

2024 International Swimming Pool and Spa Code

Add new definition as follows:

SHOWER. A device that sprays water on the body.

Cleansing.
A shower located within a hygiene facility using warm water and soap. The purpose of showers is to remove contaminants including perianal fecal material, sweat, skin cells, personal care products, and dirt before bathers enter the aquatic venue.

Rinse. A shower typically located in the pool deck area with ambient temperature water. The main purpose is to remove dirt, sand, or organic material prior to entering the aquatic venue to reduce the introduction of contaminants and the formation of disinfection byproduct.

Add new text as follows:

SECTION 321
DRESSING AND SANITARY FACILITIES

321.1 General. Dressing and sanitary facilities for public pools, public spas and aquatic recreation facilities shall be provided in accordance with the minimum requirements of the *International Building Code*, the *International Plumbing Code* and Sections 321.2 through 321.9. These facilities shall be located within a 300 foot path of travel from the pool area.

321.2 Number of fixtures. The minimum number of required water closets, urinals, lavatories, and drinking fountains fixtures shall be provided in accordance with the minimum requirements of the *International Building Code* and the *International Plumbing Code*.

Exception: For Class C swimming pools, fixtures dedicated to the pool area shall not be required where all dwelling units meet all of the following requirements:

1. The dwelling units have private facilities.
2. The dwelling units are within a 300 feet path of travel from the pool area.
3. The dwelling units are not more than one story above or below the pool area.

For Class C swimming pools where some but not all dwelling units meet the requirements of this exception, the minimum occupant load used to calculate the minimum fixture requirements shall be reduced by a factor equal to the number of dwelling units meeting these requirements, divided by the total number of dwelling units served by the pools.

321.2.1 Dressing facilties and rinsing showers. Dressing facilities and the number of rinse showers shall be provided in accordance with Sections 321.2.1.1 and 321.2.1.2.

321.2.1.1 Dressing Facilities. Public pools, public spas and aquatic recreation facilities shall have dressing facilities.

Exception: This section shall not apply to Class C pools.

321.2.1.2 Rinse shower. In addition to the requirement for cleansing showers in the International Plumbing Code and International

Building Code, not less than one rinse shower shall be provided on the deck of, or at the entrance of, each pool.

321.3 Water heater and mixing valve. Bather access to water heaters and thermostatically controlled mixing valves for showers shall be prohibited.

321.3.1 Temperature. At each cleansing showerhead, hot or tempered water shall be provided as required by the *International Plumbing Code*.

Exception: Water supplied to rinse showers shall not be required to be heated

321.4 Soap dispensers. . Soap dispensers shall be in accordance with Sections 329.4.1 and 329.4.2.

321.4.1 Liquid or powdered soap. Soap dispensers shall be provided at each lavatory and cleansing shower. Soap dispensers shall dispense liquid or powdered soap. Reusable cake soap shall be prohibited. Soap dispensers and soap shall not be provided at rinse showers.

321.4.2 Metal or plastic dispenser. Soap dispensers shall be made of metal or plastic. Glass materials shall be prohibited.

321.5 Toilet tissue holder. A toilet tissue holder shall be provided at each water closet

321,6 Mirrors. Where provided, mirrors shall be shatter resistant

321.7 Sanitary napkin receptacles. Sanitary napkin receptacles shall be provided in each water closet compartment for females and in the cleansing area of the showers for female use only.

321.8 Sanitary napkin dispensers. A sanitary napkin dispenser shall be provided in each toilet facility for females.

321.9 Infant care. Baby-changing tables shall be provided in toilet facilities

SECTION 410
SANITARY FACILITIES

Revise as follows:

410.1 ~~Toilet facilities~~ General. ~~Class A and B pools~~ Public pools and public spas shall be provided with ~~toilet facilities~~ dressing and sanitary facilities ~~having the required number of plumbing fixtures~~ in accordance with Section 321.~~the *International Building Code* or the *International Plumbing Code*.~~

SECTION 608
NUMBER OF OCCUPANTS

Revise as follows:

608.1 Occupant load. The occupant load for the Class D-1, D-4, and D-6 pools ~~or spas~~ in the facility shall be calculated in accordance with Table 608.1~~.~~ , however the occupant load used for the minimum fixture count shall be calculated in accordance with Table 1004.5 of the International Building Code. The occupant load for all other pools shall be calculated in accordance with Table 1004.5 of the International Building Code.

~~The occupant load shall be the combined total of the number of users based on the pool or spa water surface area and the deck area surrounding the pool or spa. The deck area occupant load shall be based on the occupant load calculated where a deck is provided or based on an assumed 4-foot-wide (1219 mm) deck surrounding the entire perimeter of the pool or spa, whichever is greater.~~

TABLE 608.1 INCREASED OCCUPANT LOAD FOR CLASS D-1, D-4, AND D-6 POOLS

SHALLOW OR WADING ZERO DEPTH AREAS	DEEP AREA ~~(NOT INCLUDING THE DIVING AREA)~~	~~DIVING AREA (PER EACH DIVING BOARD)~~	DRY DECK AREA	
Vessel water surface area	8 sq. ft per user	~~10 sq. ft. per user~~	300 sq. ft. per user	—
Deck area	—	~~—~~	—	1 user per 15 sq. ft.

For SI: 1 square foot = 0.0929 m^2.

Delete without substitution:

~~**608.2 Facility capacity.** For multiple pools and spas in a single aquatic recreation facility, the total facility occupant capacity shall not be limited by the number of occupants calculated in accordance with Section 608.1.~~

SECTION 609
DRESSING AND SANITARY FACILITIES

Revise as follows:

609.1 General. Dressing and sanitary facilities shall be provided in accordance with the minimum requirements of Section 321. ~~the *International Building Code* and *International Plumbing Code* and Sections 609.2 through 609.9.~~

Delete without substitution:

~~**609.2 Number of fixtures.** The minimum number of required water closets, urinals, lavatory, and drinking fountain fixtures shall be provided as required by the *International Building Code* and *International Plumbing Code* and the dressing facilities and number of cleansing and rinse showers shall be provided in accordance with Sections 609.2.1, 609.2.2, and 609.3.1.~~

~~**609.2.1 Water area less than 7500 square feet.** Facilities that have less than 7500 gross square feet (697 m²) of water area available for bather access shall have dressing facilities and not less than one cleansing shower for males and one cleansing shower for females.~~

~~**Exception:** This requirement shall not apply to Class C semipublic pools.~~

~~**609.2.2 Water area 7500 square feet or more.** Facilities that have 7500 gross square feet (697 m²) or more of water area available for bather access shall have dressing facilities and not less than one cleansing shower for males, and one cleansing shower for females for every 7500 square feet (697 m²) or portion thereof. Where the result of the fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.~~

~~**609.3 Showers.** Showers shall be in accordance with Sections 609.3.1 through 609.3.3.~~

~~**609.3.1 Rinse shower.** In addition to the requirement for cleansing showers in Sections 609.2.1 and 609.2.2, not less than one rinse showershall be provided on the deck of or at the entrance of each pool.~~

~~**609.3.2 Water heater and mixing valve.** Bather access to water heaters and thermostatically controlled mixing valves for showers shall be prohibited.~~

~~**609.3.3 Temperature.** At each cleansing showerhead, the heated shower water temperature shall be not less than 90°F (32°C) and not greater than 120°F (49°C). Water supplied to rinse showers shall not be required to be heated.~~

~~**609.4 Soap dispensers.** Soap dispensers shall be in accordance with Sections 609.4.1 and 609.4.2.~~

~~**609.4.1 Liquid or powder.** Soap dispensers shall be provided at each lavatory and cleansing shower. Soap dispensers shall dispense liquid or powdered soap. Reusable cake soap is prohibited. Soap dispensers and soap shall not be provided at rinse showers.~~

~~**609.4.2 Metal or plastic.** Soap dispensers shall be made of metal or plastic. Glass materials shall be prohibited.~~

~~**609.5 Toilet tissue holder.** A toilet paper holder shall be provided at each water closet.~~

~~**609.6 Lavatory mirror.** Where mirrors are provided, they shall be shatter resistant.~~

~~**609.7 Sanitary napkin receptacles.** Sanitary napkin receptacles shall be provided in each water closet compartment for females and in the cleansing area of the showers for female use only.~~

~~**609.8 Sanitary napkin dispensers.** A sanitary napkin dispenser shall be provided in each toilet facility for females.~~

~~**609.9 Infant care.** Baby-changing tables shall be provided in toilet facilities having two or more water closets.~~

Reason: Background

The *2024 International Swimming Pool and Spa Code* does not have any restroom fixture requirements for class A, B, or C pools. For Class D pools, the fixture count is deferred to the *2024 International Plumbing Code.* But that code does not divide pools by class, and requires a large number of plumbing fixtures for indoor pools, but none for outdoor pools. The number of plumbing fixtures is an important public health concern as bathrooms being too far away or long lines for the bathroom will encourage some people to urinate in the pool. This is true regardless of the class of the pool and regardless of its location indoors and outdoors. That said, the number of fixtures required for indoor pools has been found to be excessive. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. Therefore we have an obvious need to reduce the fixture requirement for indoor pools, but apply the same requirement for outdoor pools, and make the requirements cover all pools according to their class.

Occupant loads assigned under existing codes

In the *2024 International Building Code*, the current occupant load factors for pools are 50 gross in the pool and 15 gross on the deck. We have found that both requirements are unrealistic for most pools today. Pools today are shallower, many have no deep end at all. As a result, people comfortably congregate in them more closely than they used to. When the deck area and pool area are equal, these factors are equivalent to ignoring the deck area and assigning one user per 12 square feet of water, or assigning one user per 24 square feet of deck and water surface area per occupant.

The *2024 International Swimming Pool and Spa Code* recommends that a *bather load* (this is not the same thing as *occupant load*) be assigned based on various factors that vary from 20 gross to 8 gross. Confusingly, the load factors get smaller as the deck area gets bigger. The result is that the *bather load* stops increasing with deck area once the deck area is equal to twice the pool area. In this case, the maximum bather load is 8 square feet of water surface area per bather, or, equivalently, 24 square feet of deck and water surface per bather. When the deck area is equal to the water surface area, again the math comes out to 24 square feet of deck and water surface area per bather.

For Class D pools only, the *2024 ISPSC* does assign an occupant load. It requires a much larger load, with the load factor varying from 10 gross to 8 gross, this time with deck area considered at 15 gross (this changed in 2015 to harmonize it with IBC Table 1004.5. Previously it was 50 gross). These occupant loads are aggressively larger, but only if the jurisdiction has adopted the *ISPSC.* This increased load might be reasonable for heavily used wave pools and leisure rivers, but other Class D pools can only be used by a few users at a time, for instance floating lily pad walks, climbing walls, water slides, etc, so that increase does not make much sense in these cases.

The *Model Aquatic Health Code* assigns occupant load factors ranging from 10 to 20 square feet for water surface area, but only one occupant per 50 square feet on the deck. This is roughly a mirror image of the current *International Building Code.*

Justification of changes occupant loads in IBC Table 1004.5 and ISPSC 608.1

- **Swimming pool areas with water depth exceeding 5 ft** – users do not lounge or congregate in these areas because keeping one's head above water requires constant effort. They are doing activities such as lap swimming, diving, synchronized swimming, and water polo. The highest density of these activities is water polo, with a pool area as small as 20 meters by 10 meters being used by two teams of seven players each. The result is one occupant per 150 square feet.
- **Spa areas –** The *Model Aquatic Health Code* and *Florida Building Code* both assign 1 occupant or bather per 10 square feet. It

would not be conservative for the *International Building Code* to ignore this guidance.

· **Catch pools –** The slides are supervised and people are not permitted to go down the slide unless the area is clear.

· **All other swimming pool areas and decks –** Currently these areas are treated very differently. We have observed users congregating in pools tighter than one per 50 square feet. As for the deck, it is reasonable to think that people congregate in deck areas similar to unconcentrated assembly seating or airport terminal waiting areas (which both get a load factor of 15), however, most of these people "reserve" a movable chair for themselves with a towel or purse and then proceed to the pool. Increasing this factor to 24 accounts for the fact that some people stay in this area, but most reserve a space in the area before moving on to another area. Assigning the same factor to both areas is logical when you consider the increased number of tanning ledges that are being installed recently. Such areas are basically used the same as deck, mainly used by people standing or in lounge chairs, yet the load factor is different. The load factor should be the same.

· **Class D-1, D-4, and D-6 pool deep areas –** These bodies of water do not tend to have deep areas, and even when they do, ropes are placed to discourage users from using them. The occupant load factors for shallow areas and decks have been left alone so that the egress requirements for these types of pools will not change. However, in past versions of the code the Class D minimum fixture count was not based on this very high number of occupants. In the 2018 code, a Leisure River with 7500 square feet of water and 7500 square feet of deck would have 1,438 occupants but only require 2 water closets for females. We are proposing that the occupant count would remain 1,438, but that number brought to the proposed revision of Table 2902 computes to 7 water closets for females. That is roughly similar to what the current code would call for on an indoor class A, B, or C pool, and that is too high. So this proposal adds a clause to Section 608 of the *ISPSC* that Table 608 should not be used for fixture count, rather Table 1004.5 of the *IBC* should be used. This way changing a pool from Class C to Class D will have no impact on the minimum fixture count, but it would have an impact on egress and other occupant count related items. The minimum fixture count for the Leisure River mentioned above would be 4 water closets for females.

· **Other Class D pools –** This includes catch pools, activity pools, and vortex pools. These pools are meant to be used by distinct groups of supervised users one at a time. Letting them default back to one occupant per 24 square feet rather than one per 8 square feet is still conservative.

Summary of changes occupant loads resulting from this proposal

The changes to 1004.5 under this proposed change would give:

Class A, B, or C Pool, 5' deep or less, with

deck area *less than* pool area

Slightly *more* occupants

deck area *equal* to pool area

The *same* number occupants

deck area *more than* pool area

Slightly *fewer* occupants

Catch Pools

~ 100x *fewer* occupants

Wave Pools, Leisure Rivers, Interactive Water Features, 5' deep or less

The *same* (very large) number of occupants

Activity Pools, Vortex Pools, Pool areas greater than 5' deep

3x *fewer* occupants

Spa Pools

5x *more* occupants

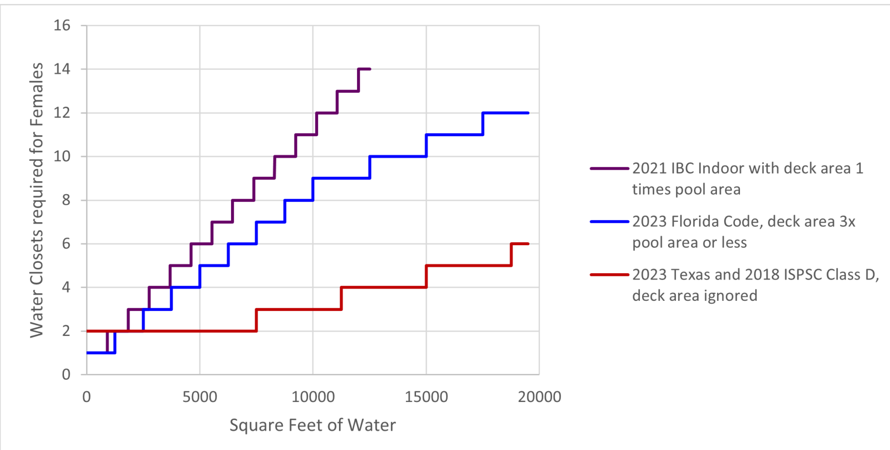
Minimum Fixture Count in 2018 I-codes

The *International Swimming Pool and Spa Code 2018* assigned a minimum fixture count to all Class D pools. This fixture count overruled Table 2902 in the *IBC.* In this code year, the result was a Class D pool would be assigned many more occupants than a Class

A, B, or C pool. But if it was indoors, it would be assigned many fewer minimum restroom fixtures than a similar Class A, B, or C pool. If it was outdoors, it would be assigned the same small number of fixtures, even though a Class A, B, or C pool would not have any minimum number of fixtures. In the 2021 code cycle, section 609 of the *International Swimming Pool and Spa Code* was truncated, leaving only a minimum number of showers, not of toilets or lavatories, for outdoor pools and Class D pools.

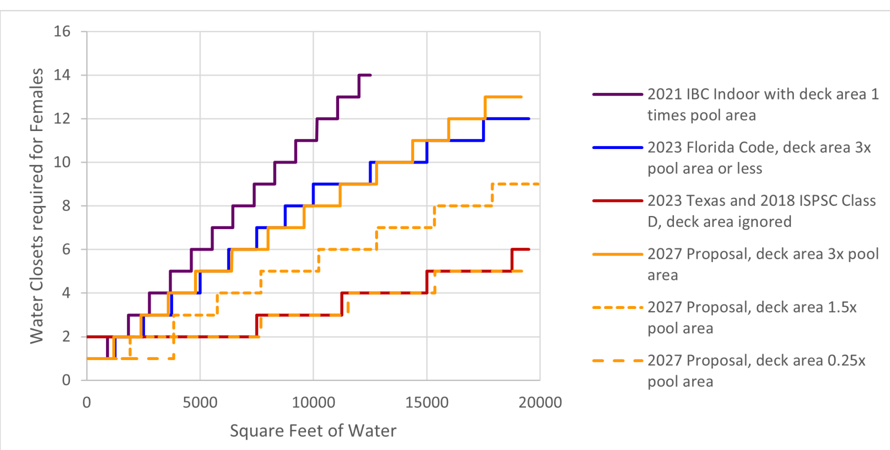
Minimum Fixture Count in current codes

The *International Building Code* assigns fixtures to occupants, of indoor pools, and assigns occupants both to the deck area and the pool water area. No fixtures are assigned to occupants of outdoor pools. In effect, fixtures are assigned both to areas of the deck and areas of the pool. The other state-level codes surveyed in this effort are for Florida and Texas. In Texas, the deck area is ignored entirely. In Florida, it is ignored for all deck area less than 3x of the pool area, which practically includes all pool decks. But in the current *IBC,* for indoor pools only, the deck area becomes a much more important factor than the pool area. The number of fixtures required by this code is already significantly more than Florida would require even when the deck is only 1x of the pool area. The reason is because the occupants of a pool and pool deck are treated the same as the occupants of a stadium or arena in terms of their need to use the bathroom. Meanwhile Texas, ignoring the pool area, their code gives a result that is much lower for the same pool. But Texas didn't make this up, rather, their table comes from section 609 of the 2018 ISPSC.



Justification of new row in IBC Table 2902.1

The intent of adding a new row, rather than using the existing rows for coliseums and arenas, is to reduce the number of fixtures required. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. The calculation results in the new orange lines shown in the graph below, with the existing codes still shown for reference. The new code proposal will agree closely with the Florida Code when the deck is 3x the pool area, and agree closely with the Texas code when only minimal deck is provided.



Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

For indoor pools and Class D pools plumbing fixture requirement will be about the same. Indoor pool plumbing fixture requirements will be reduced. Outdoor pool plumbing fixture requirements will be increased. Overall, the number of plumbing fixtures will be slightly decreased.

P20-24

IPC: 403.1.1, TABLE 403.1; IBC: TABLE 2902.1, [P] 2902.1.1

Proponents: Eirene Knott, BRR Architecture, BRR Architecture (eirene.knott@brrarch.com)

2024 International Plumbing Code

Revise as follows:

403.1.1 Fixture calculations.
To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicate a distribution of the sexes of other than 50 percent of each sex.
2. Where multiple-user facilities are designed to serve all genders, the minimum fixture count shall be calculated 100 percent, based on total occupant load. In such multiple-user facilities, each fixture type shall be in accordance with ICC A117.1.
3. <u>Where a swimming pool serves only a designated group of residential sleeping or dwelling units and not the general public, poolside sanitary facilities are not required if all such units are within a 250-foot horizontal radius of the nearest water's edge, are not over three stories in height unless serviced by an elevator, and are each equipped with private sanitary facilities.</u>

TABLE 403.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)
Portions of table not shown remain unchanged.

No changes to Table - only footnotes

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-user toilet facility with one water closet and one lavatory serving not more than two adjacent care recipient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile classifications with an occupant load of 15 or fewer, service sinks shall not be required.

f. The required number and type of plumbing fixtures for indoor and outdoor public swimming pools shall <u>also</u> be in accordance with Section 609 of the International Swimming Pool and Spa Code.

2024 International Building Code

Revise as follows:

[P] TABLE 2902.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 2902.1.1 and 2902.2)
Portions of table not shown remain unchanged.

No changes to Table - only footnotes

a. The fixtures shown are based on one fixture being the minimum required for the number of *persons* indicated or any fraction of the number of *persons* indicated. The number of occupants shall be determined by this code.

b. Toilet *facilities* for employees shall be separate from *facilities* for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient *sleeping units* shall be permitted, provided that each patient sleeping unit has direct access to the toilet room and provisions for privacy for the toilet room user are provided.

d. The *occupant load* for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of *facilities* required.

e. For business and mercantile classifications with an *occupant load* of 15 or fewer, a service sink shall not be required.

f. The required number and type of plumbing fixtures for indoor and outdoor swimming pools shall <u>also</u> be in accordance with Section 609 of the International Swimming Pool and Spa Code.

[P] 2902.1.1 Fixture calculations.
To determine the *occupant load* of each sex, the total *occupant load* shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the *occupant load* of each sex in accordance with Table 2902.1. Fractional numbers resulting from applying the fixture ratios of Table 2902.1 shall be rounded up to the next whole number. For calculations involving multiple occupancies, such fractional numbers for each occupancy shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total *occupant load* shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Where multiple-user *facilities* are designed to serve all genders, the minimum fixture count shall be calculated 100 percent, based on total *occupant load*. In such multiple-user user *facilities*, each fixture type shall be in accordance with ICC A117.1.
3. <u>Where a swimming pool serves only a designated group of residential sleeping or dwelling units and not the general public, poolside sanitary facilities are not required if all such units are within a 250-foot horizontal radius of the nearest water's edge, are not over three stories in height unless serviced by an elevator, and are each equipped with private sanitary facilities.</u>

Reason: The proposed language is attempting to do two things. The first is to clean up what appears to be a circular reference in both the IBC and IPC to the ISPSC on the required facilities for both indoor and outdoor pools. Footnote f to the fixture tables directs the user to the ISPSC for fixtures associated with an indoor or outdoor public swimming pools. However, the section referenced in the table (ISPSC 609) refers to the IBC/IPC for the toilet facilities and the ISPSC then addresses the need for the bathing room. When I amended the footnote to the table last year, my point was to not require the bathing facility for a hotel/motel or apartment/condominium complex. Then I subsequently amended the ISPSC to not require the bathing facility for pools associated with a Class C semipublic pool serving hotels, motels, apartments and condominiums. It was not until I wanted to update the toilet facility with the second part of this change that I realized there was a circular reference occurring.

The second part of the proposed language is an attempt to reduce the number of required plumbing fixtures at a swimming pool associated with a hotel/motel or apartment/condominium complex. Most people in these facilities will use the toilet room associated with their sleeping or dwelling unit rather than use the ones provided at the pool itself. Allowing for the recognition of the toilets provided within each sleeping/dwelling unit will allow for a reduction in the plumbing fixtures required at the pool itself. These pools are limited in use by those staying as guests of the hotel or residents of the apartment/condominium complex; these are not used by the general public. Per the ISPSC, this type of pool is recognized as a Class C semi-public pool, since it is operated solely for and in conjunction with a hotel, motel, apartments or condominiums.

Some concern may be raised about hotels with water parks associated with them. I believe the requirements of the ISPSC would require the bathing facility based on the area of the water area as many of these areas will be over the 7,500 square foot requirement under the

ISPSC for the bathing facility.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$65,000. If a hotel/motel or apartment/condominium facility is not required to provide additional toilet facilities within the pool area due to each guest room being within a reasonable distance to the pool side, this could provide for a reduction in overall costs, especially those associated with long term maintenance of the pool area.

Estimated Immediate Cost Impact Justification (methodology and variables):

To provide two accessible single user toilet rooms, new construction can run around $65,000 based on all associated costs such as plumbing pipe, electrical wiring, metal stud partitions, insulation, sprinkler protection, gypsum wallboard and associated finishes, including water closets, lavatories, drinking fountains, grab bars, and tiled walls. These new construction costs were provided for by a general contractor for a multi user toilet room and a ratio was used based on the square footage associated with the multi user toilet rooms and two accessible, single user toilet rooms.

This cost does not include any maintenance associated with the toilet rooms once they have been constructed. Vandalism is something to consider and the costs associated with replacement of fixtures. Water closets can cost on average to replace at least $250 just for the fixture itself, with a lavatory running slightly less at around $100. The replacement costs are based on a google search and the average pricing found for an ADA water closet and an ADA lavatory.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

P20-24

P21-24

IPC: 403.1.1; IBC: [P] 2902.1.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

Revise as follows:

403.1.1 Fixture calculations.
To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicate a distribution of the sexes of other than 50 percent of each sex.
2. Where multiple-user facilities are designed to serve all genders, the minimum fixture count shall be calculated ~~100 percent, based~~ on the total occupant load and shall be based on the method outlined in Section 403.1.1 . In such multiple-user facilities, each fixture type shall be in accordance with ICC A117.1 .

2024 International Building Code

Revise as follows:

[P] 2902.1.1 Fixture calculations.
To determine the *occupant load* of each sex, the total *occupant load* shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the *occupant load* of each sex in accordance with Table 2902.1. Fractional numbers resulting from applying the fixture ratios of Table 2902.1 shall be rounded up to the next whole number. For calculations involving multiple occupancies, such fractional numbers for each occupancy shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total *occupant load* shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Where multiple-user *facilities* are designed to serve all genders, the minimum fixture count shall be calculated ~~100 percent, based~~ on the total occupant load and shall be based on the method outlined in Section 403.1.1. In such multiple-user user *facilities*, each fixture type shall be in accordance with ICC A117.1 .

Reason: The phrase "calculated 100 percent" has caused confusion especially where Table 403.1 has different fixture ratios for males and females. This proposal points the reader to Section 403.1.1 where the standard calculation method is given and well understood.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)
PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This only clarifies how to apply the IPC Table 403.1.

2024 International Building Code

Revise as follows:

[P] 2902.1.1 Fixture calculations.
To determine the *occupant load* of each sex, the total *occupant load* shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the *occupant load* of each sex in accordance with Table 2902.1. Fractional numbers resulting from applying the fixture ratios of Table 2902.1 shall be rounded up to the next whole number. For calculations involving multiple occupancies, such fractional numbers for each occupancy shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total *occupant load* shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Where multiple-user *facilities* are designed to serve all genders, the minimum fixture count shall be calculated 100 percent, based on total *occupant load*. In such multiple-user ~~user~~ *facilities*, ~~each fixture type shall be in accordance with ICC A117.1.~~ the required number of accessible fixtures shall be determined in accordance with IBC Section 1110.

Reason: The removal of; “each fixture type shall be in accordance with ICC A117.1” is necessary for two reasons. First, the term: “each fixture type” does not accurately capture the intent of this provision. The actual intent here should be to reference the minimum “number of accessible fixtures” required, not the type of fixtures present. Second, the term “shall be in accordance with ICC A117.1” also does not accurately capture the intent of this provision because the IBC contains the scoping provisions for accessibility (i.e. the required quantities of accessible fixtures and elements), whereas the ICC A117.1 does not. Additionally, as adopted, the reference to ICC A117.1 here appears to mandate that 100% of all toilet fixtures in multiple-user facilities designed to serve all genders are required to be accessible. That’s because within the ICC A117.1 standard, there are only two (2) available design options for toilets within a multi-user restrooms:

1. A wheelchair accessible toilet compartment (per ICC A117.1 Section 604.9), or
2. An ambulatory accessible toilet compartment (per ICC A117.1 Section 604.10)

In its entirety, IBC Section 1110 fully enumerates the required quantities of accessible fixtures for all fixture types in each of the available toilet/bathing room facility types (i.e. configurations) that could possibly be provided within a building.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Because this proposal is a clarification, it neither increases nor decreases the cost of construction.

P22-24

P23-24

IPC: 403.2; IBC: [P] 2902.2

Proponents: Eirene Knott, BRR Architecture, Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

2024 International Plumbing Code

Revise as follows:

403.2 Separate facilities.
Where plumbing fixtures are required, separate toilet facilities shall be provided for each sex.

Exceptions:

1. Separate toilet facilities shall not be required for dwelling units and sleeping units.
2. Separate toilet facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate toilet facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate toilet facilities shall not be required in business <u>or residential</u> *occupancies* in which the maximum occupant load is 25 or fewer.
5. Separate toilet facilities shall not be required to be designated by sex where single-user toilet rooms are provided in accordance with Section 403.1.2.
6. Separate toilet facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by all persons regardless of sex and privacy is provided for water closets in accordance with Section 405.3.4 and for urinals in accordance with Section 405.3.5.

2024 International Building Code

Revise as follows:

[P] 2902.2 Separate facilities.
Where plumbing fixtures are required, separate *facilities* shall be provided for each sex.

Exceptions:

1. Separate toilet *facilities* shall not be required for *dwelling units* and *sleeping units*.
2. Separate toilet *facilities* shall not be required in *structures* or tenant spaces with a total *occupant load*, including both employees and customers, of 15 or fewer.
3. Separate toilet *facilities* shall not be required in mercantile occupancies in which the maximum *occupant load* is 100 or fewer.
4. Separate toilet *facilities* shall not be required in business <u>or residential</u> occupancies in which the maximum *occupant load* is 25 or fewer.
5. Separate toilet *facilities* shall not be required to be designated by sex where single-user toilet rooms are provided in accordance with Section 2902.1.2.
6. Separate toilet *facilities* shall not be required where rooms having both water closets and lavatory fixtures are designed for use by all *persons* regardless of sex and privacy is provided for water closets in accordance with Section 405.3.4 of the *International Plumbing Code* and for urinals in accordance with Section 405.3.5 of the *International Plumbing Code* .

Reason: Hotels/Motels that do not offer any public amenities should not be required to provide multiple toilet rooms, as a single user toilet room can accommodate the smaller occupant loads associated with these hotels.

Many hotel chains provide the bare minimum for guests and do not provide a breakfast service. For those, they usually only offer a fitness room that's less than 750 square feet and a guest laundry room. Any additional spaces provided are for hotel employees only and are very minimum in nature, usually comprising of a small office space and the front check-in area. In many cases, the total occupant load of all of these spaces can be calculated to be less than 25 occupants. For these hotels/motels, providing two separate sex or two unisex toilet rooms eats into space that would be used to serve these small areas. To provide a single user toilet room would meet the requirement for employees to have access to a toilet room as well as giving hotel guests the convenience of using a toilet room after working out or while doing laundry, but not necessitate the need for two toilet rooms. The code already recognizes that small business spaces with an occupant load of 25 or less need only provide one toilet facility, the same should apply here as well as most of the area in question can be classified as a business occupancy.

Cost Impact: Decrease

- **toiletrooms.pdf**
  https://www.cdpaccess.com/proposal/9235/28623/documentation/134870/attachments/download/4694/

Estimated Immediate Cost Impact:

This could reduce the estimated construction costs by $82,000 by allowing the use of a single user toilet room to serve the hotel/motel employees rather than requiring two toilet rooms to serve each sex as well as not reducing the square footage that could be used for guest amenities such as a fitness center and guest laundry.

Estimated Immediate Cost Impact Justification (methodology and variables):

See attached spreadsheet. The cost of two water closets, two lavatories, assorted accessories (paper towel dispenser, toilet paper dispenser, etc.) along with the potential need for grab bars in each toilet room and the costs of materials to build a second toilet room (studs, gypsum, wall//floor finish). Not requiring the second toilet room would allow for more space that could be rented to provide more income to the building owner.

Estimated Life Cycle Cost Impact:

The additional maintenance to support a second toilet room could be reduced. Not requiring the second toilet room would allow for more space that could be rented to provide more income to the building owner.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

It would be far less expensive to maintain one toilet room versus two used on a very seldom basis. Not requiring the second toilet room would allow for more space that could be rented to provide more income to the building owner.

2024 International Plumbing Code

Revise as follows:

403.2 Separate facilities.
Where plumbing fixtures are required, separate toilet facilities shall be provided for each sex.

Exceptions:

1. Separate toilet facilities shall not be required for dwelling units and sleeping units.
2. Separate toilet facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate toilet facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate toilet facilities shall not be required in business *occupancies* in which the maximum occupant load is 25 or fewer.
5. Separate toilet facilities shall ~~not be required to be designated by sex~~ be identified as being available for use by all persons regardless of sex where single-user toilet rooms are provided in accordance with Section 403.1.2
6. Separate toilet facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by all persons regardless of sex and privacy is provided for water closets in accordance with Section 405.3.4 and for urinals in accordance with Section 405.3.5.

2024 International Building Code

Revise as follows:

[P] 2902.2 Separate facilities.
Where plumbing fixtures are required, separate *facilities* shall be provided for each sex.

Exceptions:

1. Separate toilet *facilities* shall not be required for *dwelling units* and *sleeping units*.
2. Separate toilet *facilities* shall not be required in *structures* or tenant spaces with a total *occupant load*, including both employees and customers, of 15 or fewer.
3. Separate toilet *facilities* shall not be required in mercantile occupancies in which the maximum *occupant load* is 100 or fewer.
4. Separate toilet *facilities* shall not be required in business occupancies in which the maximum *occupant load* is 25 or fewer.
5. Separate toilet facilities shall ~~not be required to be designated by sex~~ be identified as being available for use by all persons regardless of sexwhere single-user toilet rooms are provided in accordance with Section 403.1.2
6. Separate toilet *facilities* shall not be required where rooms having both water closets and lavatory fixtures are designed for use by all *persons* regardless of sex and privacy is provided for water closets in accordance with Section 405.3.4 of the *International Plumbing Code* and for urinals in accordance with Section 405.3.5 of the *International Plumbing Code* .

Reason: Section 403.1.2 requires single-user toilet facilities to be designated as gender neutral, but Section 403.2 merely states that such facilities "may" be designated gender neutral. This change modifies Section 402.3 to match Section 403.1.2. Designating single-user toilet facilities for use by only one sex is inefficient and can cause increased wait times for bathroom use, and is unnecessary since such toilet facilities are intended for use by only one person at a time.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change aligns section 403.2 with section 403.1.2. Since section 403.1.2 already required single-user toilet facilities to be designated as gender neutral, this change does not add any requirements, but simply coordinates the sections to prevent confusion.

P24-24

P25-24

IPC: 403.2; IBC: [P] 2902.2

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self (jbengineer@aol.com)

2024 International Plumbing Code

Revise as follows:

403.2 ~~Separate~~ Toilet facilities.
~~Where~~ Required plumbing fixtures ~~are required, separate~~ ~~toilet~~ ~~facilities~~ shall be located in all gender toilet rooms or in separate toilet rooms provided for each sex.

~~**Exceptions:**~~

1. ~~Separate toilet facilities shall not be required for dwelling units and sleeping units.~~
2. ~~Separate toilet facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.~~
3. ~~Separate toilet facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.~~
4. ~~Separate toilet facilities shall not be required in business *occupancies* in which the maximum occupant load is 25 or fewer.~~
5. ~~Separate toilet facilities shall not be required to be designated by sex where single-user toilet rooms are provided in accordance with Section 403.1.2.~~
6. ~~Separate toilet facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by all persons regardless of sex and privacy is provided for water closets in accordance with Section 405.3.4 and for urinals in accordance with Section 405.3.5.~~

2024 International Building Code

Revise as follows:

[P] 2902.2 ~~Separate~~ Toilet facilities.
~~Where~~ Required plumbing fixtures ~~are required, separate~~ ~~toilet~~ ~~facilities~~ shall be located in all gender toilet rooms or in separate toilet rooms provided for each sex.

~~**Exceptions:**~~

1. ~~Separate toilet *facilities* shall not be required for *dwelling units* and *sleeping units*.~~
2. ~~Separate toilet *facilities* shall not be required in *structures* or tenant spaces with a total *occupant load*, including both employees and customers, of 15 or fewer.~~
3. ~~Separate toilet *facilities* shall not be required in mercantile occupancies in which the maximum *occupant load* is 100 or fewer.~~
4. ~~Separate toilet *facilities* shall not be required in business occupancies in which the maximum *occupant load* is 25 or fewer.~~
5. ~~Separate toilet *facilities* shall not be required to be designated by sex where single-user toilet rooms are provided in accordance with Section 2902.1.2.~~
6. ~~Separate toilet *facilities* shall not be required where rooms having both water closets and lavatory fixtures are designed for use by all *persons* regardless of sex and privacy is provided for water closets in accordance with Section 405.3.4 of the *International Plumbing Code* and for urinals in accordance with Section 405.3.5 of the *International Plumbing Code* .~~

Reason: The change allowing all gender toilet rooms during the last cycle resulted in all of the other exceptions being superfluous. The code allows fixtures to be located in all gender toilet rooms or in separate toilet rooms for each sex. Therefore, rather than confusing and contradictory code text, the code should simply state what it means, you can have all gender toilet rooms, or you can have toilet rooms for each sex. It is purely the designer's choice.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial in nature and has no impact on cost. There is no increase in the number of fixtures required, nor is there a decrease in the number of fixtures required. The exceptions being deleted only create confusion since all-gender toilet rooms have been accepted in the code. The section should have been updated during the previous cycle.

P25-24

P26-24

IPC: 403.3; IBC: [P] 2902.3

Proponents: Andrew Klein, A S Klein Engineering, PLLC, Self Storage Association (andrew@asklein.com)

2024 International Plumbing Code

Revise as follows:

403.3 Employee and public toilet facilities.
For structures and tenant spaces intended for public utilization, customers, patrons and visitors shall be provided with *public* toilet facilities. Employees associated with structures and tenant spaces shall be provided with toilet facilities. The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 403 for all users. Employee toilet facilities shall be either separate or combined employee and *public* toilet facilities.

Exception: *Public* toilet facilities shall not be required for:

1. Parking garages <u>and self-service storage facilities</u> operated without ~~parking~~ attendants.
2. Structures and tenant spaces intended for quick transactions, including takeout, pickup and drop-off, having a public access area less than or equal to 300 square feet (28 m^2).

2024 International Building Code

Revise as follows:

[P] 2902.3 Employee and public toilet facilities.
For *structures* and tenant spaces intended for public utilization, customers, patrons and visitors shall be provided with public toilet *facilities*. Employees associated with *structures* and tenant spaces shall be provided with toilet *facilities*. The number of plumbing fixtures located within the required toilet *facilities* shall be provided in accordance with Section 2902 for all users. Employee toilet *facilities* shall be either separate or combined employee and public toilet *facilities*.

Exception: Public toilet *facilities* shall not be required for:

1. Parking garages <u>and self-service storage facilities</u> operated without ~~parking~~ attendants.
2. *Structures* and tenant spaces intended for quick transactions, including takeout, pickup and drop-off, having a public access area less than or equal to 300 square feet (28 m^2).

Reason: Self-service storage facilities are low occupancy. Facilities operating without attendants are often exempted from the restroom requirements by local building code officials for the same reason unattended parking garages are exempted. Codifying this helps maintain continuity in the Code.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

- $20,000 to - $25,000 per restroom not required.

Estimated Immediate Cost Impact Justification (methodology and variables):

A single-unit restroom costs about $20,000 - $25,000.

Restroom privacy and sensible construction - Page 5 of 5 - Construction Specifier (www.constructionspecifier.com/restroom-privacy-and-sensible-construction/5/), accessed 1/26/2024

P26-24

P27-24

IPC: 403.3.3; IBC: [P] 2902.3.3

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com)

2024 International Plumbing Code

Revise as follows:

403.3.3 Location of toilet facilities in occupancies other than malls.
In *occupancies* other than covered and open mall buildings, the required *public* and employee toilet facilities shall be located not more than one story above or below the space required to be provided with toilet facilities, and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m).

Exceptions:

1. The location and maximum distances of travel to required employee facilities in <u>manufacturing areas of Group F and H</u> ~~factory and industrial~~ *occupancies* shall be permitted to exceed that required by this section, provided that the location and maximum distances of travel are *approved*.
2. The location and maximum distances of travel to required *public* and employee facilities in Group S *occupancies* shall be permitted to exceed that required by this section, provided that the location and maximum distances of travel are *approved*.

2024 International Building Code

Revise as follows:

[P] 2902.3.3 Location of toilet facilities in occupancies other than malls.
In occupancies other than covered and *open mall buildings*, the required public and employee toilet *facilities* shall be located not more than one *story* above or below the space required to be provided with toilet *facilities*, and the path of travel to such *facilities* shall not exceed a distance of 500 feet (152 m).

Exceptions:

1. The location and maximum distances of travel to required employee *facilities* in <u>manufacturing areas of Group F and H</u> ~~factory and industrial~~ *occupancies* shall be permitted to exceed that required by this section, provided that the location and maximum distances of travel are *approved*.
2. The location and maximum distances of travel to required public and employee *facilities* in Group S *occupancies* shall be permitted to exceed that required by this section, provided that the location and maximum distances of travel are *approved*.

Reason: Factory and industrial type manufacturing areas can also occur in Group H occupancies. The location and travel distance to employee facilities should not be any different from a manufacturing area in a Group F occupancy as compared to a Group H occupancy. The proposal also deletes the legacy language "factory and industrial occupancies" and replaces it with the appropriate IBC language.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 - Fewer employee facilities will be required although the fixture counts will remain the same.

Estimated Immediate Cost Impact Justification (methodology and variables):

Reduced cost associated with constructing additional, separate employee facilities. A portion of the proposal is editorial in nature.

P27-24

P28-24

IPC: 405.3.2; IBC: [P] 2903.1.2

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self (jbengineer@aol.com)

2024 International Plumbing Code

Revise as follows:

~~405.3.2~~ 403.3.7 Public lavatories.
~~In~~ Public lavatories for employee and *public* use shall be located in the immediate vicinity of ~~toilet facilities, the required lavatory shall be located in the same room as the required~~ water ~~closet~~ closets and urinals.

2024 International Building Code

Revise as follows:

[P] ~~2903.1.2~~ 2903.1.7 Public lavatories.
~~In~~ Public lavatories for employee and *public* use shall be located in the immediate vicinity of ~~toilet facilities, the required lavatory shall be located in the same room as the required~~ water ~~closet~~ closets and urinals.

Reason: Section 405.3.2 is misplaced in that fixture requirement locations are found in Section 403. The first proposed modification would be to move this section to the appropriate location in Section 403.

This section is a holdover from when the code required separate men's and ladies' rooms with the assumption that water closets were located in compartments within the same room. This has also resulted in the wording of this section being subject to various interpretations as to what constitutes a room. If a water closet has a separate room that opens into a larger room with a lavatory, is that the same room? Sometimes this is interpreted as being one big room meeting the requirement, other times it is considered two rooms thus mandating a lavatory within the same smaller room as the water closet.

The intent of the section is to mandate the use of a lavatory in the close proximity of the water closet. This may result in exiting a separate room with a water closet and entering an area with a public lavatory. For all gender toilet rooms, it is not uncommon for the lavatory to be located in a general area whereas the water closets are located in separate rooms. This still provides the necessary sanitation.

The current section only addresses "required" water closets. Not all water closets are required, yet for sanitation purposes a lavatory needs to be located in the immediate vicinity. Similarly, the code does not address urinals. A urinal also needs a lavatory to be located in the immediate vicinity of the fixture for sanitation purposes. The revised text deletes "required" and adds urinals as a fixture requiring a lavatory in the immediate vicinity.

The other option would be to delete this section in its entirety since architects, engineers and developers always locate public lavatories in the immediate vicinity of water closets and urinals.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$1,920 to $6,960 for a reduction in floor area of 8 square feet for one lavatory.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change may reduce the cost of construction by lowering the immediate floor area if the section is misinterpreted. If a floor area is reduced by the relocation of a public lavatory to a non-increase area of the building, there would be a savings in floor area of 8 square feet. This would result in a savings in the cost of construction of between $1,920 and $6,960 depending on where the building is constructed in the United States. It should be noted that these values are based on the United States, not the rest of the international world. The justification for these savings is based on a cost of commercial construction ranging from $240 to $870 per square foot. These values were published in an article written by Jennifer Carlson and edited by Kristen Cramer on January 4, 2024. Realize that this savings is per lavatory relocation. If 10 lavatories are required, the cost savings would increase to $19,200 to $69,600. Public lavatories will still be required.

P28-24

P29-24

IPC: 405.3.2; IBC: [P] 2903.1.2

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self (jbengineer@aol.com)

2024 International Plumbing Code

Delete without substitution:

~~**405.3.2 Public lavatories.**~~
~~In employee and *public* toilet facilities, the required lavatory shall be located in the same room as the required water closet.~~

2024 International Building Code

Delete without substitution:

~~**[P] 2903.1.2 Public lavatories.**~~
~~In employee and public toilet rooms, the required lavatory shall be located in the same room as the required water closet.~~

Reason: This section is misplaced as a subsection of “Setting.” The location of plumbing fixtures is regulated in Section 403, not 405. Furthermore, this is a meaningless section. There is no definition of “room” in the Plumbing Code, nor is there a definition of “room” in the Building Code. Interesting, the Building Code has a definition of Guest Room. Yet within that definition, there is a separate bathroom that is a part of the guest room. Hence, does a lavatory on the open side of a door enclosing a water closet constitute the same room.

This is a code requirement seeking to solve a problem that does not exist. The section should have never been added to the code. With the increased use of all gender toilet rooms, the water closet may be located in a room with a lockable door located within an overall toilet room. If the lavatory is on the other side of the door, is it still within the same room as the water closet?

In checking with Merriam- Webster dictionary, the first definition of room is, “an extent of space occupied by or sufficient or available for something.” Another definition is, “a partitioned part of the inside of a building.” That would seem to imply that a water closet compartment with partitions may be a room.

Section 405.3 adequately addresses the location of plumbing fixture and the proximity of a lavatory to a water closet. There is a definition of toilet facilities. This identifies that the water closet and lavatory are together. Any additional requirements, such as Section 405.3.2, does not belong in the code.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$1,920 to $6,960 for one lavatory.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change has no impact on the cost of construction if lavatories are not relocated. However, if this section is misinterpreted, the deletion may lower the cost of construction. If a floor area is reduced by the relocation of a public lavatory to a non-increase area of the building, there would be a savings in floor area of 8 square feet. This would result in a savings in the cost of construction of between $1,920 and $6,960 depending on where the building is constructed in the United States. It should be noted that these values are based on the United States, not the rest of the international world. The justification for these savings is based on a cost of commercial construction ranging from $240 to $870 per square foot. These values were published in an article written by Jennifer Carlson and edited by Kristen Cramer on January 4, 2024. Realize that this savings is per lavatory relocation. If 10 lavatories are required, the cost savings would increase to $19,200 to $69,600. Public lavatories will still be required.

P30-24

IPC: 405.3.4 (New), 405.3.4, 405.3.5, CHAPTER 15, IAPMO Chapter 15 (New)

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com)

2024 International Plumbing Code

Add new text as follows:

405.3.4 Premanufactured water closet and urinal partitions.. Premanufactured partitions for water closets or urinals shall comply with IAPMO Z124.10.

Revise as follows:

~~405.3.4~~405.3.5 Water closet privacy ~~compartment~~.
Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy. Premanufactured partitions for water closets located in separate gender toilet or bathing rooms shall comply with the Type B privacy requirements of IAPMO Z124.10. Water closets located in all gender toilet rooms shall be enclosed by premanufactured partitions complying with the Type A privacy requirements of IAPMO Z124.10 or the water closet shall be located in separate room with a lockable door.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet facilities located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

~~405.3.5~~405.3.6 Urinal ~~partitions~~ privacy.
Each urinal utilized by the public or employees shall occupy a separate area with walls or partitions to provide privacy. Premanufactured partitions for urinals located in separate gender toilet or bathing rooms shall comply with the Type C privacy requirements of IAPMO Z124.10. The horizontal dimension between walls ~~or partitions~~ at each urinal shall be not less than 30 inches (762 mm). The walls ~~or partitions~~ shall ~~begin at a height not greater than 12 inches (305 mm) from and~~ extend not less than 60 inches (1524 mm) above the finished floor surface. The walls ~~or partitions~~ shall extend from the wall surface at each side of the urinal not less than 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater. Urinals located in all gender toilet rooms shall be enclosed by premanufactured partitions complying with the Type A privacy requirements of IAPMO Z124.10 or the urinals shall be located in a separate room.

Exceptions:

1. Urinal partitions shall not be required in a single occupant or family/assisted-use toilet room with a lockable door.
2. Toilet facilities located in child day care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

CHAPTER 15 REFERENCED STANDARDS

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

Z124.10-22 Standard for Water Closets and Urinal Partitions

Staff Analysis: A review of the standard proposed for inclusion in the code, IAPMO Z124.10-22 *Standard for Water Closets and Urinal Partitions*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: IAPMO Z124.10 is a new standard that regulates water closet and urinal partitions. The standard was published in 2022. The standard specified three different privacy ratings. In addition, there are tests for the quality of the partition. The tests include load, coating, surface examination, subsurface, colorfastness, stain resistance, wear and cleanability, chemical resistance, and stress test to name a few.

Type A privacy partitions are intended for all gender toilet rooms and provide the highest level of privacy. The standard states the following privacy requirements, “The bottom edge of the partition including the door shall be located less than or equal to 100 mm (4 in) off the finished floor. The top edge of the partition including the door shall be located greater than or equal to 2.13 m (84 in) above the finished floor. The full height of the door to the partitions on both sides shall prevent any visual observation from the outside of the partition enclosure. Doors shall be lockable from the inside of the partition enclosure. The door locking device shall be readily distinguishable as locked from the outside of the partition enclosure.” Furthermore, the standard requires a visual indication that the compartment is occupied when the partition door lock is activated.

Type B privacy partitions are standard water closet partitions found in separate gender toilet rooms. The standard states the following for privacy, “The bottom edge of the partition including the door shall be located within 406 mm (16 in) of the finished floor. The top edge of the partition including the door shall be located greater than or equal to 1.75 m (69 in) above the finished floor. The door to the partitions shall have a maximum of 13 mm (½ in) gap between the edge of the door and the wall of the partition. Doors shall be lockable from the inside of the partition enclosure.”

Type C privacy partitions are urinal partitions. The standard specifies the following requirements, “The bottom of the urinal partition shall be located a maximum of 406 mm (16 in) above the finished floor. The top of the urinal partition shall be a minimum of 1.5 m (60 in) above the finished floor. The urinal partition shall extend a minimum of 457 mm (18 in) from the wall.”

With the increase in the number of all gender toilet rooms, it is important to have proper privacy requirements to assure both privacy and security. This proposed change will require water closets and urinals in all gender toilet rooms to be enclosed in Type A privacy partitions or be located in a separate room. This will provide the highest level of privacy and security.

Type B privacy partitions are standard water closet partitions found in men’s and ladies’ rooms today. However, the gap between partition sections or between the door and frame have been reduced to ½ inch. Currently, there is no regulation on the gap in partitions nor are there any regulations for the quality of the partitions.

Type C privacy partitions are urinal partitions currently found in men’s rooms. Type C partitions are only intended for separate gender toilet rooms. In all gender toilet rooms, urinals are located similar to water closets to ensure privacy.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0.12 to $6.04 per partition, dependent on partition production volume.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change could increase the cost of construction. It should be noted that manufacturers are prohibited by Federal Law to discuss prices. That being stated, one can review the cost of listing a product on-line. Compliance with the standard will add a cost to manufacturers for the testing and listing of partitions. In an attempt to find out the listing costs, one can check the ICC-ES website. The questions of what a cost of a listing is results in the following answer: Fees may vary. Contact us for a Statement of Work and/or an initial estimate. Similarly, IAPMO R&T does not publish fees. One can only request a quote for a listing. A Google search for the cost of a UL listing identified the cost as ranging between $5,000 and $50,000. Intertek advertises an annual listing fee of $6,040 for a single sanitary product, which is what a partition would likely be classified as. Hence, the exact dollar amount for a listing is unknown. That listing cost may or may not be added to the cost of the product. If it is added to the cost of the product, that additional cost will add to the cost of construction. However, manufacturers do not indicate if listing costs increase the cost of the product (construction). Hence, the impact is unknown. If one assumes the Intertek price for a listing and further assumes that the manufacturer sells 50,000 partitions a year, the increase cost of construction per partition could be assumed to be $0.12. If they only sell 1,000 partitions, the increased cost per partition would be $6.04.

P31-24

IPC: 405.4.3

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Plumbing Code

Revise as follows:

405.4.3 Securing wall-hung water closet bowls <u>and urinals</u>.
Wall-hung water closet bowls <u>and urinals</u> shall be supported by a concealed metal carrier that is attached to the building structural members so that strain is not transmitted to the fixture connector or any other part of the plumbing system. The carrier shall conform to ASME A112.6.1M or ASME A112.6.2.

Reason: The ASME A112.6.1 and ASME A112.6.2 standards includes requirements for floor-affixed supports that can be used to secure off the floor water closets and as well as urinals.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification of which fixtures the standards includes, supports already used for urinals and water closets.

P31-24

P32-24

IPC: 407.1, 419.1, 421.1, 422.1, CSA Chapter 15 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

Revise as follows:

407.1 Approval.
Bathtubs shall conform to ASME A112.19.1/CSA B45.2, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4, ~~or~~ CSA B45.5/IAPMO Z124,CSA B45.8/IAPMO Z403 or CSA B45.12/IAPMO Z402.

419.1 Approval.
Lavatories shall conform to ASME A112.19.1/CSA B45.2, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4, ~~or~~ CSA B45.5/IAPMO Z124,CSA B45.8/IAPMO Z403, CSA B45.11/IAPMO Z401 or CSA B45.12/IAPMO Z402. Group wash fixtures shall conform to the requirements of Section 402. For determining the number of lavatories required by Table 403.1, every 20 inches (508 mm) of rim space of a group wash fixture shall be considered as one lavatory.

421.1 Approval.
Prefabricated showers and shower compartments shall conform to ASME A112.19.1/CSA B45.2, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4, CSA B45.5/IAPMO Z124, CSA B45.8/IAPMO Z403 or CSA B45.12/IAPMO Z402. Shower valves for individual showers shall conform to the requirements of Section 412.3.

422.1 Approval.
Sinks shall conform to ASME A112.19.1/CSA B45.2, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4, ~~or~~ CSA B45.5/IAPMO Z124 , CSA B45.8/IAPMO Z403, CSA B45.11/IAPMO Z401 or CSA B45.12/IAPMO Z402 .

Add new standard(s) as follows:

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland, OH 44131-5516

CSA B45.8-18/IAPMO Z403-2018 Terrazzo, concrete, composite stone, and natural stone plumbing fixtures

CSA B45.11:17/IAPMO Z401-2017	Glass plumbing fixtures
CSA B45.12-13/IAPMO Z402-2013 (R2018)	Aluminum and copper plumbing fixtures

Staff Analysis: A review of the standard proposed for inclusion in the code, CSA/IAPMO CSA B45.8-18/IAPMO Z403-2018 *Terrazzo, concrete, composite stone, and natural stone plumbing*, CSA/IAPMO CSA B45.12-13/IAPMO Z402-2013 (R2018) *Aluminum and copper plumbing fixtures* and CSA/IAPMO CSA B45.11:17/IAPMO Z401-2017 *Glass plumbing fixtures* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The code needs to include fixtures that are covered by product standards in order to allow for easy approvals. These types of fixtures are becoming more prevalent in building designs.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The choice of the material type of fixtures is a designer decision.

P32-24

P33-24

IPC: SECTION 202 (New), SECTION 202, 410.4

Proponents: Eirene Knott, BRR Architecture, Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

2024 International Plumbing Code

Add new definition as follows:

BOTTLE FILLING STATION. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into water bottles or containers not less than 10 inches (254 mm) in height. Such fixture is connected to both the potable water distribution system and sanitary drainage system of the premises. See also *water dispenser.*

Revise as follows:

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. Such fixtures include bottle filling stations.

410.4 Substitution.
Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other *occupancies* ~~where three or more drinking fountains are required, *water dispensers*~~ bottle filling stations not combined with a drinking fountain shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains. Bottle filling stations combined with a drinking fountain shall be permitted to be substituted for all drinking fountains.

Reason: When Covid hit the country in 2020, every single drinking fountain in the country was no longer available. Since the IPC has been designed to make sure that the general public has access to free drinking water at all times, this created a problem. What I'm trying to do with this code change is allow the use of a bottle filling station to be used in lieu of a drinking fountain in all occupancy groups. If a bottle filling station is associated with a drinking fountain, then those can be substituted directly for a drinking fountain. If the bottle filling station does not also contain a drinking fountain, then the substitution ratio is fifty percent.

Just during the 2023 year, Michigan, Illinois, Vermont, Maine and Delaware passed legislation to require for bottle filling stations in educational occupancies. Both Maine and Vermont have language that specifically states "sanitary reasons" for the use of the bottle filler. Many states allow for the use of a combination drinking fountain/bottle filling station as an option for the required drinking fountain. In addition, the State of Washington allows for the bottle filling station and/or combination of a drinking fountain/bottle filling station for each drinking fountain required. Their point is to eliminate public waste with all the plastic bottles. Pennsylvania also has legislation encouraging the reduction in the use of plastics by allowing substitution of the bottle filling station for the required drinking fountains.

The State of Massachusetts recently enacted a ban on the purchase of single use plastic bottles for state agencies. The National Park Service began phasing out the sale of single use plastic bottles in 2022.

In September 2023, the United Nations published the "Zero Draft of the Plastics Treaty", which a portion addresses the plastics pollution concern.

Do we want plumbing fixtures to be dictated by state or even national requirements or by the building and/or plumbing code? The IPC needs to be the leader here and allow for the substitution of bottle filling stations for drinking fountains.

I have modified the definition of water dispenser to include a bottle filling station, as a bottle filling station meets these requirements. In addition, I have provided a definition of a bottle filling station to account for the minimum requirements needed to provide for a bottle or similar container. A bottle filling station would comply with the requirements of UL 399 as noted in IPC 410.1.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 to $1100

Estimated Immediate Cost Impact Justification (methodology and variables):

I opted to reflect the increase as the cost of a bottle filling station may be more than that of a drinking fountain. However, a decrease may actually occur.
There may be minimal cost impact due to the legislative requirements in many states.

Based upon pricing available online, a typical hi-lo drinking fountain runs between $1000 and $2200 depending on the aesthetics of the fountain.

A single bottle filling stating ranges from $590 to $1100 depending on aesthetics and whether or not the filling station also includes a drinking fountain.

A dual hi-lo drinking fountain combined with a bottle filling station can range from $1400 to $1900.

Based on these numbers, no increase may occur. If a dual hi-lo drinking fountain is installed and a bottle filling station is installed in addition to the drinking fountain, then an increase of up to $1100 could occur.

However, if a combination hi-lo drinking fountain combined with a bottle filling station is installed, a decrease may occur depending on the aesthetics of the units provided.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

P34-24

IPC: CHAPTER 4, SECTION 410, 410.4

Proponents: Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

CHAPTER 4 FIXTURES, FAUCETS AND FIXTURE FITTINGS

SECTION 410
DRINKING FOUNTAINS

Revise as follows:

410.4 Substitution.
Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other *occupancies* where three or more drinking fountains are required, *water dispensers* shall be permitted to be substituted for ~~not more than 50 percent of~~ the required number of drinking fountains <u>provided that at least two drinking fountains are installed in accordance with Section 410.3.</u>

Reason: Ensuring safe access to drinking water is critical for the public health and well-being of building occupants. Traditional drinking fountains have served this purpose; however, limitations on these traditional fixtures were uncovered when many drinking fountains were roped off and abandoned due to fears of disease transmission during the COVID-19 pandemic. The use of water bottles and bottle filling stations largely took the place of traditional drinking fountains during this time and persisted, as a portion of the population no longer trusts drinking fountains as a “safe” water source. Recognizing this shift in water consumption habits, the proposed cost neutral change aims to expand the existing allowance in the IPC Section 410.4 for the substitution of drinking fountains with water dispensers. This proposed change will allow additional flexibility in the interior design while maintaining water access points and a minimum of two drinking fountains for persons without receptacles or who require fountains due to accessibility reasons.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal does not mandate any change from current practices, it only increases the allowance for installing water dispensers in place of drinking fountains.

P34-24

P35-24

IPC: 410.4

Proponents: Joe Wolff, Zurn Elkay Water Solutions, Zurn Elkay Water Solutions (joe.wolff@elkay.com)

2024 International Plumbing Code

Revise as follows:

410.4 Substitution.
Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other *occupancies* where three or more drinking fountains are required, *water dispensers* shall be permitted to be substituted for ~~not more than 50~~up to 100 percent of the required number of drinking fountains, provided that at least two drinking fountains are installed in accordance with Section 410.3.

Reason: Ensuring safe access to drinking water is crucial for the public health and well-being of building occupants. Traditional drinking fountains have served this purpose; however, limitations of these traditional fixtures were uncovered when many drinking fountains were roped off and abandoned due to fears of disease transmission during the COVID pandemic. The use of water bottles and bottle filling stations largely took the place of traditional drinking fountains during this time and has persisted, as a portion of the population no longer trusts drinking fountains as a “safe” water source. Recognizing this shift in water consumption habits, the proposed cost neutral change aims to expand the existing allowance in IPC Section 410.4 for the substitution of drinking fountains with water dispensers. This proposed change will allow additional flexibility in interior design while maintaining water access points and a minimum of two drinking fountains for persons without receptacles or who require fountains due to accessibility reasons.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal does not mandate any change from current practices, it only increases the allowance for installing water dispensers in place of drinking fountains.

P35-24

P36-24

IPC: 411.2

Proponents: Greg McDaniel, Self (gmcdaniel@townofmorrisville.org)

2024 International Plumbing Code

Revise as follows:

411.2 Waste connection. Chemical waste connections shall ~~not~~ be required for emergency showers and eyewash stations where located inside laboratories or chemical handling areas.

Reason: The purpose of this Code Change to manage how the Chemical Waste is collected when having to utilize an Emergency Shower or Eyewash station in the case of a spill in a Laboratory or a Chemical Handling area.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Acid resistant piping $80.00

Flood Drain $100.00

Install Labor $100.00

Total $280.00 each

Estimated Immediate Cost Impact Justification (methodology and variables):

I used common websites for parts and matrial. The estimates are using the higher end pricepoints. Labor for install will vary with each install.

Estimated Life Cycle Cost Impact:

Once installed there is no additional cost.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Once installed there is no additional cost.

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Revise as follows:

412.3 Individual shower valves.
Individual shower and tub-shower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1. Such valves shall be installed at the point of use. Shower control valves shall be rated for the flow rate of the installed shower head. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions to provide water at a temperature not to exceed 120°F (49°C). In-line thermostatic valves shall not be utilized for compliance with this section. <u>The thermostat on a water heater shall not be used for final temperature control. at fixtures.</u>

412.4 Multiple (gang) showers.
Multiple (gang) showers supplied with a single, *tempered water* supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and that is installed at the point of use. Where a shower head is individually controlled, shower control valves shall be rated for the flow rate of the installed shower head. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions to provide water at a temperature not to exceed 120°F (49°C). *Access* shall be provided to an ASSE 1069 or CSA B125.3 valve. <u>The thermostat on the water heater shall not be used for final temperature control at fixtures.</u>

412.5 Bathtub and whirlpool bathtub valves.
Bathtubs and whirlpool bathtub valves shall have or be supplied by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or by a water heater complying with ASSE 1082 or ASSE 1084, except where such valves are combination tub/shower valves in accordance with Section 412.3. The water-temperature-limiting device required by this section shall be equipped with a means to limit the maximum setting of the device to 120°F (49°C), and, where adjustable, shall be field adjusted in accordance with the manufacturer's instructions to provide *hot water* at a temperature not to exceed 120°F (49°C). *Access* shall be provided to water-temperature-limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70. <u>The water heater thermostat shall not be used for final temperature control at fixtures.</u>

~~Exception~~ <u>Exceptions</u>:

<u>1.</u> *Access* shall not be required for nonadjustable water-temperature-limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70 and are integral with a fixture fitting, provided that the fixture fitting itself can be accessed for replacement.

<u>2.</u> <u>The thermostat on an ASSE 1084 water heater can serve as the temperature limiting device in lieu of an ASSE 1070 valve.</u>

412.10 Head shampoo sink faucets.
Head shampoo sink faucets shall be supplied with *hot water* that is limited to not more than 120°F (49°C). Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections. <u>The water heater thermostat shall not be used for final temperature control at fixtures, except for item # 2 below.</u> The means for regulating the maximum temperature shall be one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70.
2. A water heater conforming to ~~ASSE 1082 or~~ ASSE 1084.
3. A temperature-actuated, flow-reduction device conforming to ASSE 1062.

Reason: The code language prohibiting use of the water heater thermostat for final temperature control at fixtures is code language that has a long history and purpose in the plumbing codes, and it was mistakenly removed in previous code cycles.

The current language in these sections does not expressly prohibit the use of the water heater thermostat for final temperature at fixtures, and this is necessary to emphasize in order to protect against scalding at fixtures.

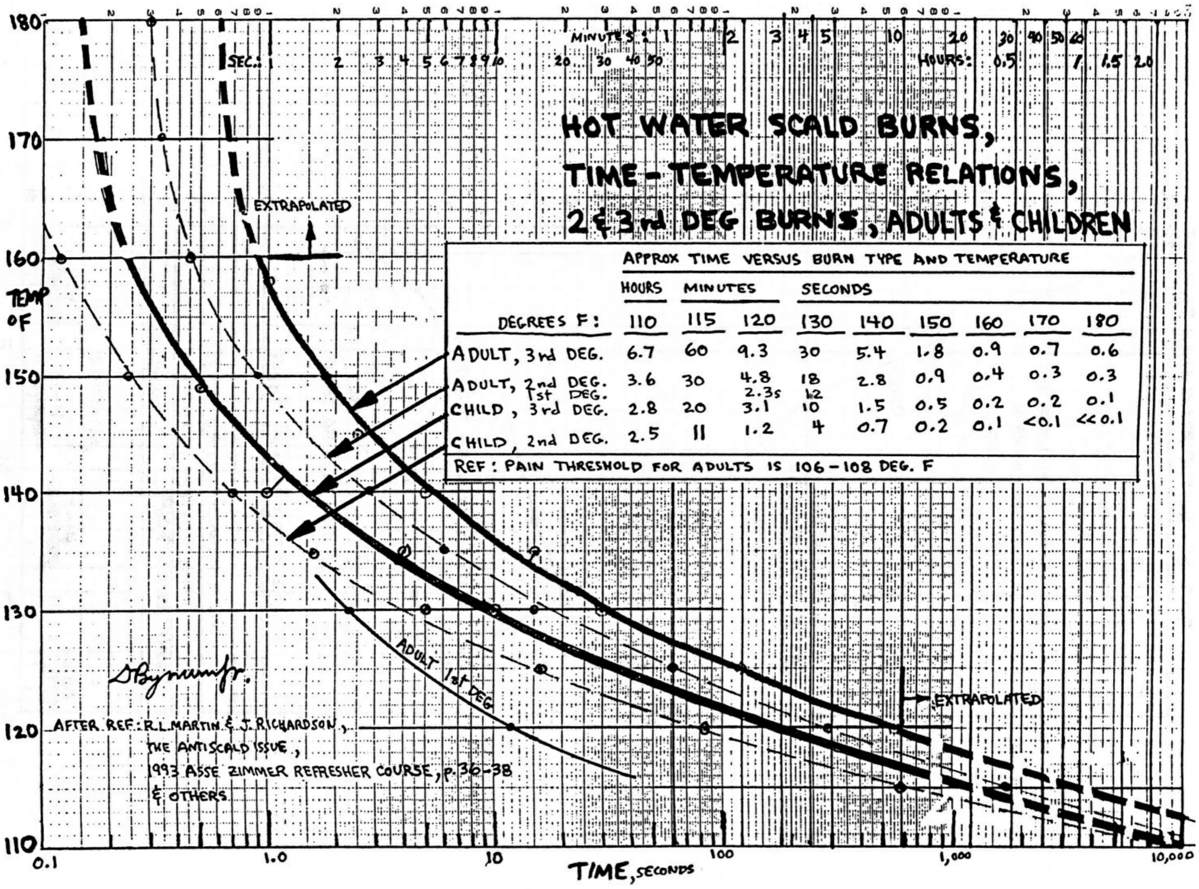
The standard for combination gas controls (thermostats) and the standard for uncirculated, tank-type water heaters (both above 75,000 btu/hr and 75,000 btu/hr or less) do not have tests to address temperature control accuracy for scald protection. It is widely known in the plumbing industry that the combination gas control (thermostat) standard allows a 10-degree variation at the thermostat level, and the water heater standards allow a 20-degree temperature differential from the thermostat level, inserted near the bottom of the tank, to the top of the water heater tank.

It is widely known in the plumbing industry that short, intermittent draws of hot water can cause thermal stacking in an uncirculated tank-type water heater, and that short, intermittent draws of hot water are a normal occurrence when cooking or cleaning. Together, these standards (standard for combination gas controls (thermostats) and the standard for uncirculated, tank-type water heaters) allow for 150F hot water to come out of a water heater when the thermostat is set to 120F. 150F hot water will cause irreversible scald burn injuries in an adult male in a less than one second, and burns can occur much quicker in women and children due to their thinner skin, compared to an adult male.

Simply relying on the thermostat on a water heater to supply hot water to a distribution system allows a variation in hot water temperature of up to 30 degrees F. If a pressure balancing type shower valve is installed, it cannot compensate for significant changes in incoming hot water temperature making it possible to significantly exceed the maximum allowable temperature after shower valve limit stops are adjusted at start-up (before stacking occurs).

A properly installed and adjusted shower or tub-shower valve, as required by these code sections, can also prevent thermal shock, as well as scalding. In addition, no water heater meeting the ASSE water heater temperature limiting control standard can address or control pressure imbalances at the fixture that lead to thermal shock. Therefore, the thermostat on any water heater used for shower and tub-shower applications should never be used for final temperature control at fixtures, as doing so will expose bathers to thermal shock, even when an ASSE water heater is installed.

This language prohibiting water heater thermostats from being the final temperature control for scald protection needs to be reinstated.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is clarifying language making it clear that the thermostat on the water heater cannot be relied on for final temperature control to prevent scalding. This is not adding new installation requirements to the code. This change does not add construction costs. This change will help prevent medical injury costs and reduce liability costs to owners.

P37-24

P38-24

IPC: 412.3, 412.4, 412.5, 412.10

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Revise as follows:

412.3 Individual shower valves.
Individual shower and tub-shower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1. Such valves shall be installed at the point of use. Shower control valves shall be rated for the flow rate of the installed shower head. ~~Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions to provide water at a temperature not to exceed 120°F (49°C).~~ The integral maximum temperature limit-stop adjustment on these valves shall be field adjusted in accordance with the manufacturer's instructions upon installation, and seasonally adjusted as in-coming cold water temperatures change, and adjusted every time there is a change to the domestic hot water distribution system temperature to limit the maximum temperature flowing from the fixture outlet to no greater than 115F (46.1C). In-line thermostatic valves shall not be utilized for compliance with this section.

412.4 Multiple (gang) showers.
Multiple (gang) showers supplied with a single, *tempered water* supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and that is installed at the point of use. Where a shower head is individually controlled, shower control valves shall be rated for the flow rate of the installed shower head. The integral maximum temperature limit-stop adjustment on these valves shall be field adjusted in accordance with the manufacturer's instructions upon installation, and seasonally adjusted as in-coming cold water temperatures change, and adjusted every time there is a change to the domestic hot water distribution system temperature to limit the maximum temperature flowing from the fixture outlet to no greater than 115F (46.1C).~~Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions to provide water at a temperature not to exceed 120°F (49°C).~~ *Access* shall be provided to an ASSE 1069 or CSA B125.3 valve.

412.5 Bathtub and whirlpool bathtub valves.
Bathtubs and whirlpool bathtub valves shall have or be supplied by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or by a water heater complying with ASSE 1082 or ASSE 1084, except where such valves are combination tub/shower valves in accordance with Section 412.3. The water-temperature-limiting device required by this section shall be equipped with a means to limit the maximum setting of the device to 115 ~~120~~°F (49°C), and, where adjustable, shall be field adjusted in accordance with the manufacturer's instructions to provide *hot water* at a temperature not to exceed 115 ~~120~~°F (49°C). *Access* shall be provided to water-temperature-limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70.

Exception: *Access* shall not be required for nonadjustable water-temperature-limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70 and are integral with a fixture fitting, provided that the fixture fitting itself can be accessed for replacement.

412.10 Head shampoo sink faucets.
Head shampoo sink faucets shall be supplied with *hot water* that is limited to not more than 115 ~~120~~°F (49°C). Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections. The means for regulating the maximum temperature shall be one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70.
2. A water heater conforming to ASSE 1082 or ASSE 1084.
3. A temperature-actuated, flow-reduction device conforming to ASSE 1062.

Reason: This code change lowers the maximum allowable shower and bathing temperature from 120 F to 115 F to improve safety.

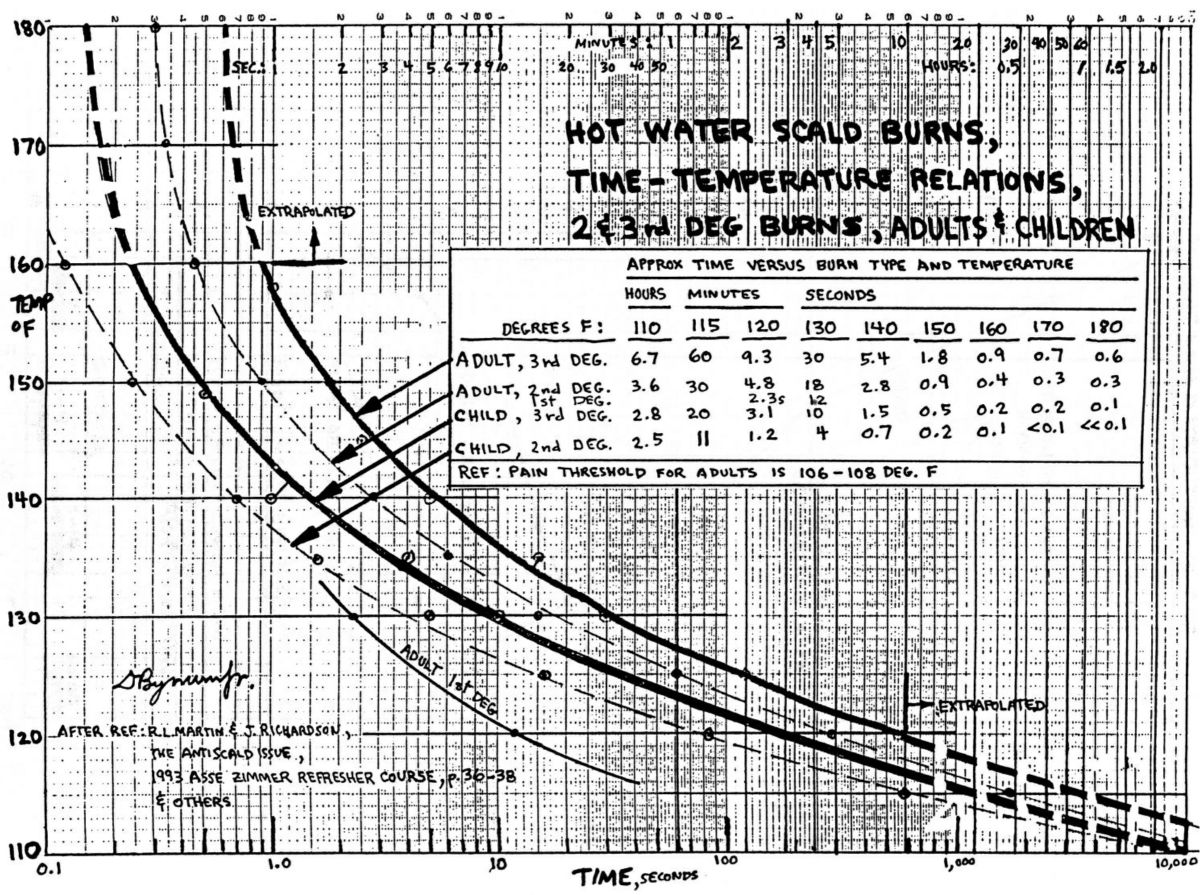
The table below extracted from the Moritz & Henriques Burn Studies shows that at 115 F it significantly increases the amount of time for a bather to get out of harm's way before a serious, irreversible, blistering 2nd degree burn injury occurs.

As you can see, 120 F only gives an adult male 4.8 minutes to get out of harm's way and before a serious burn injury occurs. Women, children & infants have thinner skin and can be burned in a much shorter time (1.2 minutes) when exposed to 120 F. Also a bathtub can be filled with 115 F water with heat loss during filling for a comfortable bath at around 102 - 105 F. Therefore, lowering the maximum allowable shower temperature to 115 will provide an increased level of safety for bathing and showering fixtures. The hot water delivery temperature to the shower valve or tub-shower valve can still be higher to control bacteria in the hot water distribution temperature and the maximum temperature limit stop is adjusted to a lower delivery temperature from the shower head or tub filler faucet.

The Moritz & Henriques burn Studies at Harvard Medical College burn study information is shown below:,

The time temperature exposure to hot water at 120 F vs 115 F water.

Temperature:	Time:	Adult/Child	Degree of Burn:
120 F	4.8 mins	Adult Male	2nd
115 F	30 mins	Adult Male	2nd
120 F	1.2 mins	Child	2nd
115 F	11 mins	Child	2nd



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is simply changing the maximum allowable temperature adjustment, It will not increase the cost of construction, however it will significantly increase health and safety in the showering and bathing settings.

P38-24

P39-24

IPC: 412.4

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Revise as follows:

412.4 Multiple (gang) showers.
Multiple (gang) showers supplied with a single, *tempered water* supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, <u>and set to deliver tempered water within 5°F (2.7 C) plus or minus of 105°F (40.5 C)</u>, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and that is installed at the point of use. <u>The integral maximum temperature limit-stop adjustment on these valves shall be field adjusted in accordance with the manufacturer's instructions upon installation, and adjusted seasonally as in-coming cold water temperatures change, and adjusted every time there is a change to the domestic hot water distribution system temperature to limit the maximum temperature flowing from the fixture outlet to no greater than 115F (46.1C).</u> ~~Where a shower head is individually controlled, shower control valves shall be rated for the flow rate of the installed shower head. Such Individually valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions to provide water at a temperature not to exceed 120°F (49°C).~~ *Access* shall be provided to an ASSE 1069 or CSA B125.3 valve.

Reason: Having a maximum temperature limit of 120 F on a gang shower with a single delivery temperature is unsafe.

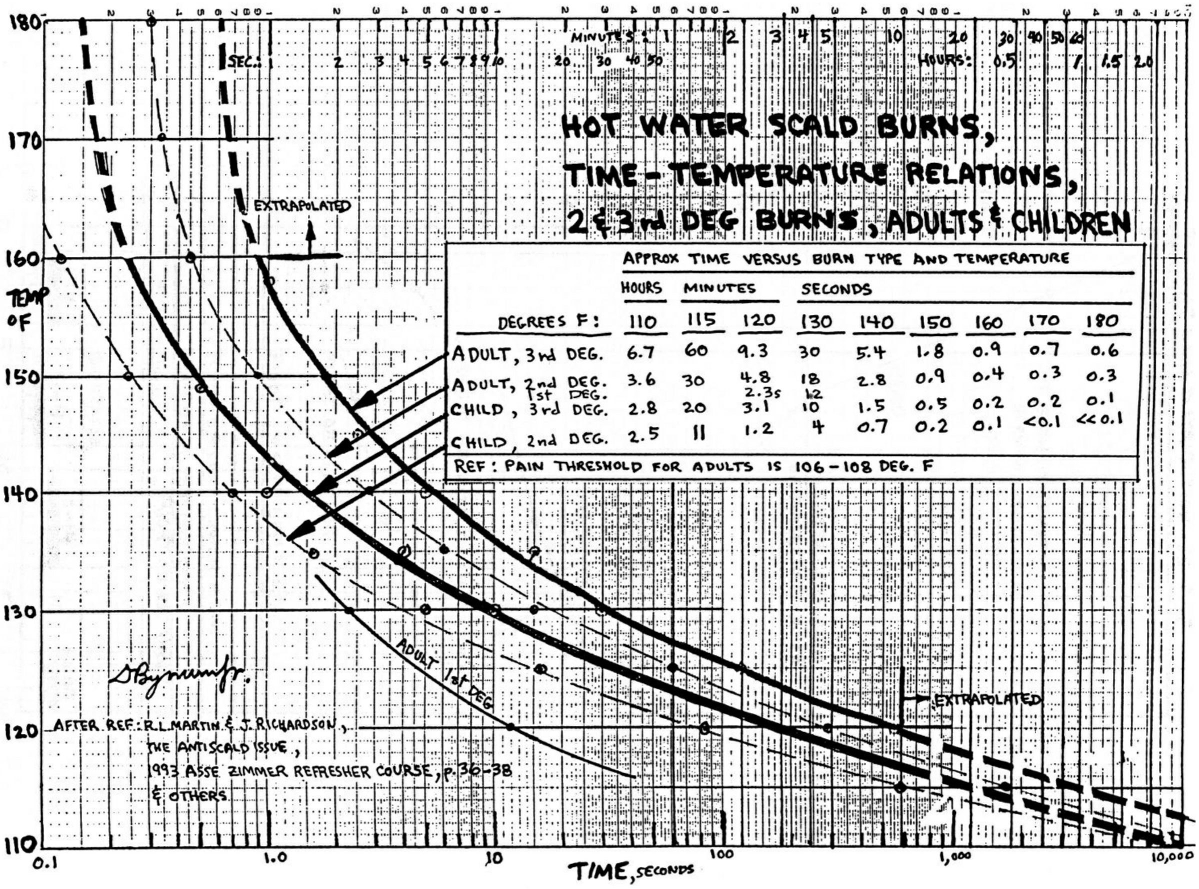
This code change simply gives a temperature setting range within a comfortable bathing temperature. Studies of bathing temperatures have shown showering temperatures generally range between 102 to 109 F. Setting the gang shower mixing valve to 105 F with a tolerance of 5 degrees above or below seems like a good and safe temperature requirement. Temperatures above 115 were painful in the Moritz & Henriques Burn Studies. This code change proposes 105 F plus or minus 5 degrees F. The second part of the code change lowers the maximum allowable shower temperature from 120 F to 115 F. The table below extracted from the Moritz & Henriques Burn Studies shows that at 115 F it significantly increases the amount of time for a bather to get out of harm's way before a serious, irreversible, blistering 2nd degree burn injury occurs.

As you can see, 120 F only gives an adult male 4.8 minutes to get out of harm's way and before a serious burn injury occurs. Women, children & infants have thinner skin and can be burned in a much shorter time (1.2 minutes) when exposed to 120 F. Also a bathtub can be filled with 115 F water with heat loss during filling for a comfortable bath at around 102 - 105 F. Therefore, lowering the maximum allowable shower temperature to 115 will provide an increased level of safety for bathing and showering fixtures.

The Moritz & Henriques burn Studies at Harvard Medical College burn study information is shown below:,

The time temperature exposure to hot water at 120 F vs 115 F water.

Temperature:	Time:	Adult/Child	Degree of Burn:
120 F	4.8 mins	Adult Male	2nd
115 F	30 mins	Adult Male	2nd
120 F	1.2 mins	Child	2nd
115 F	11 mins	Child	2nd



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change simply edits the maximum temperature set point for shower valves. This code change will save lives and reduce scald injuries. There will be an increase in plumbing system safety and a reduction in medical costs associated with treating scald injuries.

P39-24

P40-24

IPC: 412.5

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com); William Grayzar, DiClemente Siegel Design, Inc., Self (bill@dsdonline.com)

2024 International Plumbing Code

Revise as follows:

412.5 Bathtub and whirlpool bathtub valves.
Bathtubs and whirlpool bathtub valves shall have or be supplied by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or by a water heater complying with ~~ASSE 1082 or~~ ASSE 1084, except where such valves are combination tub/shower valves in accordance with Section 412.3. The water-temperature-limiting device required by this section shall be equipped with a means to limit the maximum setting of the device to 120°F (49°C), and, where adjustable, shall be field adjusted in accordance with the manufacturer's instructions to provide *hot water* at a temperature not to exceed 120°F (49°C). *Access* shall be provided to water-temperature-limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70.

Exception: *Access* shall not be required for nonadjustable water-temperature-limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70 and are integral with a fixture fitting, provided that the fixture fitting itself can be accessed for replacement.

Reason: [SHANKS]:

ASSE 1082 is designed for the following - This standard is for water heaters that control the outlet temperature to specific limits and are installed within a hot water distribution system but not at point-of-use. Being this code section is in regards to point of use the ASSE 1082 is the wrong application.

The correct application is the ASSE 1084 which is designed for the following - Water heaters covered by this standard have a cold-water inlet connection, a means of heating the water, a means of controlling the water temperature, a means of limiting the temperature to a maximum of 120 °F (48.9 °C), and have an outlet connection to connect to downstream fixture fittings. This water heater in regards to a ASSE 1082 is intended to supply tempered water at point of use in order to reduce and control the risks of scalding. This water heater as an ASSE 1082 is not intended to limit thermal shock. This water heater is not a substitute for an automatic compensative valve complying with ASSE 1016 / ASME A112.1016 / CSA B125.16.

Leaving the ASSE 1082 in this section of the code for this useage will go against other current code sections within the IPC such as 408.3 (Bidets) and 419.5 (Public Hand Washing Lavatories). Which causes not only a health and safety concern to the end user but confusion in the Plumbing Industry.

[GRAYZAR]:

ASSE Standard 1082 added in the 2021 code cycle is not suitable for a point-of-use applications. ASSE 1082 Standard does not include scald protection and is intended for steady state flow conditions.

The proposed revision is intended to remove ASSE Standard 1082 only from point-of use applications, while allowing it to remain in Chapter 6 of the code for distribution systems.

The ASSE Standard 1082 is similar to the ASSE Standard 1017 and is intended for controlling the water outlet temperature in a water distribution system and not intended for end use applications without the use of a point-of-use control valve as specified by ASSE 1016/ASME A112.1016/CSA B125.16, ASSE 1069, ASSE 1070/ ASME A112.1070/CSA B125.70, or other appropriate standard.

ASSE Standard 1082 does not include scald protection and is intended for various steady state flow conditions and has an outlet temperature range between 105ºF and 125ºF. The outlet temperature can vary as much as +/- 3ºF for flows less than 5 GPM, +/- 5ºF for flows between 5 GPM and 50 GPM, and as much a +/- 7ºF for flows above 50 GPM.

ASSE Standard 1084 added in the 2024 code cycle is the correct standard in addition to ASSE 1070/ASME A112.1070/BSA B125.70 for this application. An ASSE 1084 compliant device is intended to perform like a water heater with a ASSE 1070/ASME A112.1070/CSA B125.70 compliant water- temperature-limiting device.

ASSE Standard 1084 is intended for varying flow conditions, it is intended to include a level of scald protection consistent with ASSE 1070/ASME A112.1070/CSA B125.70, and it has an outlet temperature range between 100ºF and 110ºF with a maximum temperature of 110ºF for non-adjustable application and 120ºF for an adjustable application.

ASSE Standards 1082 and 1084 do not limit thermal shock and are not substitutes for automatic compensative valves complying with ASSE 1016/ASME A112.1016/CSA B125.16 Performance Requirements for Automatic Compensating Valves for Individual Showers and Tub/Shower Combinations.

Bibliography: [GRAYZAR]: ASSE Standard 1082-2018 - Performance Requirements for Water Heaters with Integral Temperature Control Devices For Hot Water Distribution Systems

ASSE Standard 1084-2018 - Performance Requirements for Water Heaters with Temperature Limiting Capacity

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

[SHANKS]: This proposed change will bring the current requirements for protection against hot water temperatures in the IPC 2024 Code in line with already existing Code Sections for the protection of health and safety of the public. The costs are already included in the construction of a Hot Water System currently in the Code.

[GRAYZAR] : The proposal has no cost impact it is editorial and removes the misapplied ASSE 1082 Standard, which applies hot water distribution systems, from being allowed in a point of use application.

P40-24

P41-24

IPC: 412.10

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com); William Grayzar, DiClemente Siegel Design, Inc., Self (bill@dsdonline.com)

2024 International Plumbing Code

Revise as follows:

412.10 Head shampoo sink faucets.
Head shampoo sink faucets shall be supplied with *hot water* that is limited to not more than 120°F (49°C). Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections. The means for regulating the maximum temperature shall be one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70.
2. A water heater conforming to ~~ASSE 1082 or~~ ASSE 1084.
3. A temperature-actuated, flow-reduction device conforming to ASSE 1062.

Reason: [SHANKS]:

ASSE 1082 is designed for the following - This standard is for water heaters that control the outlet temperature to specific limits and are installed within a hot water distribution system but not at point-of-use. Being this code section is in regards to point of use the ASSE 1082 is the wrong application.

The correct application is the ASSE 1084 which is designed for the following - Water heaters covered by this standard have a cold-water inlet connection, a means of heating the water, a means of controlling the water temperature, a means of limiting the temperature to a maximum of 120 °F (48.9 °C), and have an outlet connection to connect to downstream fixture fittings. This water heater in regards to a ASSE 1082 is intended to supply tempered water at point of use in order to reduce and control the risks of scalding. This water heater as an ASSE 1082 is not intended to limit thermal shock. This water heater is not a substitute for an automatic compensative valve complying with ASSE 1016 / ASME A112.1016 / CSA B125.16.

Leaving the ASSE 1082 in this section of the code for this useage will go against other current code sections within the IPC such as 408.3 (Bidets) and 419.5 (Public Hand Washing Lavatories). Which causes not only a health and safety concern to the end user but confusion in the Plumbing Industry.

[GRAYZAR]:

ASSE Standard 1082 added in the 2021 code cycle is not suitable for a point-of-use application. ASSE 1082 Standard does not include scald protection and is intended for steady state flow conditions.

The proposed revision is intended to remove ASSE Standard 1082 only from point-of use applications, while allowing it to remain in Chapter 6 of the code for distribution systems.

The ASSE Standard 1082 is similar to the ASSE Standard 1017 and is intended for controlling the water outlet temperature in a water distribution system and not intended for end use applications without the use of a point-of-use control valve as specified by ASSE 1016/ASME A112.1016/CSA B125.16, ASSE 1069, ASSE 1070/ ASME A112.1070/CSA B125.70, or other appropriate standard.

ASSE Standard 1082 does not include scald protection and is intended for various steady state flow conditions and has an outlet temperature range between 105°F and 125°F. The outlet temperature can vary as much as +/- 3°F for flows less than 5 GPM, +/- 5°F for flows between 5 GPM and 50 GPM, and as much a +/- 7°F for flows above 50 GPM.

ASSE Standard 1084 added in the 2024 code cycle is the correct standard in addition to ASSE 1070/ASME A112.1070/BSA B125.70 for this application. An ASSE 1084 compliant device is intended to perform like a water heater with a ASSE 1070/ASME A112.1070/CSA B125.70 compliant water- temperature-limiting device.

ASSE Standard 1084 is intended for varying flow conditions, it is intended to include a level of scald protection consistent with ASSE 1070/ASME A112.1070/CSA B125.70, and it has an outlet temperature range between 100ºF and 110ºF with a maximum temperature of 110ºF for non-adjustable application and 120ºF for an adjustable application.

ASSE Standards 1082 and 1084 do not limit thermal shock and are not substitutes for automatic compensative valves complying with ASSE 1016/ASME A112.1016/CSA B125.16 Performance Requirements for Automatic Compensating Valves for Individual Showers and Tub/Shower Combinations.

Bibliography: [GRAYZAR]: ASSE Standard 1082-2018 - Performance Requirements For Water Heaters With Integral Temperature Control Devices For Hot Water Distribution Systems.

ASSE Standard 1084-2018 - Performance Requirements For Water Heaters With Temperature Limiting Capacity

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

[SHANKS]: This proposed change will bring the current requirements for protection against hot water temperatures in the IPC 2024 Code in line with already existing Code Sections for the protection of health and safety of the public. The costs are already included in the construction of a Hot Water System currently in the Code.

[GRAYZAR]:

The proposal has no cost impact it is editorial and removes the misapplied ASSE 1082 Standard, which applies hot water distribution systems, from being allowed in a point of use application.

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Residential Code

Revise as follows:

TABLE P2701.1 PLUMBING FIXTURES, FAUCETS AND FIXTURE FITTINGS

Portions of table not shown remain unchanged.

MATERIAL	STANDARD
Air gap fittings for use with plumbing fixtures, appliances and appurtenances	ASME A112.1.3
Bathtub/whirlpool pressure-sealed doors	ASME A112.19.15
Diverters for faucets with hose spray, anti-syphon type, residential application	ASME A112.18.1/CSA B125.1
Enameled cast-iron plumbing fixtures	ASME A112.19.1/CSA B45.2
Floor drains	ASME A112.6.3
Framing-affixed supports for off-the-floor water closets with concealed tanks	ASME A112.6.2
Hose connection vacuum breaker	ASSE 1052
Hot water dispensers, household storage type, electrical	ASSE 1023
Household disposers	ASSE 1008
Hydraulic performance for water closets and urinals	ASME A112.19.2/CSA B45.1
Individual automatic compensating valves for individual fixture fittings	ASME A112.18.1/CSA B125.1
Individual shower control valves anti-scald	ASSE 1016/ASME A112.1016/CSA B125.16
Macerating toilet systems and related components	ASME A112.3.4/CSA B45.9
Nonvitreous ceramic plumbing fixtures	ASME A112.19.2/CSA B45.1
Plastic bathtub units	CSA B45.5/IAPMO Z124; ASME A112.19.2/CSA B45.1
Plastic lavatories	CSA B45.5/IAPMO Z124
Plastic shower receptors and shower stalls	CSA B45.5/IAPMO Z124
Plastic sinks	CSA B45.5/IAPMO Z124
Plastic water closet bowls and tanks	CSA B45.5/IAPMO Z124
Plumbing fixture fittings	ASME A112.18.1/CSA B125.1
Plumbing fixture waste fittings	ASME A112.18.2/CSA B125.2; ASTM F409
Porcelain-enameled formed steel plumbing fixtures	ASME A112.19.1/CSA B45.2
Pressurized flushing devices for plumbing fixtures	ASSE 1016/ASME 112.1016/CSA B125.16; CSA B125.3
Specification for copper sheet and strip for building construction	ASTM B370
Stainless steel plumbing fixtures	ASME A112.19.3/CSA B45.4
Suction fittings for use in whirlpool bathtub appliances	ASME A112.19.7/CSA B45.10
Temperature-actuated, flow reduction valves to individual fixture fittings	ASSE 1062
Thermoplastic accessible and replaceable plastic tube and tubular fittings	ASTM F409
Trench drains	~~ASME A112.6.3~~ ASME A112.6.8/CSA B79.8
Trim for water closet bowls, tanks and urinals	ASME A112.19.5/CSA B45.15
Vacuum breaker wall hydrant-frost-resistant, automatic-draining type	ASSE 1019
Vitreous china plumbing fixtures	ASME A112.19.2/CSA B45.1
Wall-mounted and pedestal-mounted, adjustable and pivoting lavatory and sink carrier systems	ASME A112.19.12
Water closet flush tank fill valves	ASSE 1002/ASME A112.1002/CSA B125.12; CSA B125.3
Whirlpool bathtub appliances	ASME A112.19.7/CSA B45.10

P2719.1 Floor and trench drains.

Floor drains shall comply to ASME A112.6.3. Trench drains shall comply to ASME A112.6.8/CSA B79.8. *Floor drains* shall have waste outlets not less than 2 inches (51 mm) in diameter and a removable strainer. *Floor drains* shall be constructed so that the drain can be cleaned. Access shall be provided to the drain inlet. *Floor drains* shall not be located under or have their access restricted by permanently installed appliances.

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

A112.6.8/CSA B79.8–2022 Trench Drains

Staff Analysis: A review of the standard proposed for inclusion in the code, SME A112.6.8/CSA B79.8-2022 T*rench Drains*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The ASME A112.6.3 was harmonized with CSA B79 such that the CSA B79 designation is not used. The updated standard designation will be proposed in Group B Administrative standard updates. Trench drains are now covered under ASME A112.6.8/CSA B79.3.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification as to which standard is applicable to which product. Drains were already using the ASME standards for certification.

P42-24 Part II

P43-24

IPC: 414.1, ASME Chapter 15, ASME Chapter 15 (New)

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Plumbing Code

Revise as follows:

414.1 Approval.
Sanitary floor sinks shall conform to the requirements of ASME A112.6.7/CSA B79.7.

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

~~A112.6.7—2010 (R2024)~~ ~~Sanitary Floor Sinks~~

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

A112.6.7/CSA B79.7-2022 Sanitary Floor Sinks

Staff Analysis: A review of the standard proposed for inclusion in the code, ASME A112.6.7/CSA B79.7-2022 *Sanitary Floor Sinks*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The ASME A112.6.7 was harmonized with CSA B79. The intent of this proposal is to replace the current standard with the new standard.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Products were already required to comply with ASME standard, this to clarify the ASME was harmonized with the CSA B79 standard.

P43-24

P44-24

IPC: 419.5

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

419.5 Tempered water for public hand-washing facilities.
~~*Tempered water* shall be delivered from lavatories and group wash fixtures located in *public* toilet facilities provided for customers, patrons and visitors.~~ Tempered water shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for any occupancy with primary users being children, such as elementary schools, Sunday bible schools, and child daycare facilities or for any occupancy serving primarily elderly or other vulnerable occupants, and for any lavatories and group wash fixtures located in public use toilet facilities that are provided with a single delivered temperature faucet. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.

Reason: Tempered water for public handwashing fixtures was the result of an overreach associated to trying to protect the users of bathtubs and showers from sudden changes in temperature. The protection for users of bathtubs and showers makes sense because the user is "captive" to the fixture when they use it. The same cannot be said for handwashing fixtures. This requirement was a massive overreach because the same risk level just isn't there. If a user of a handwashing fixture senses water is too hot or too cold, they can simply remove their hands from the stream of water. This proposal will still require protection for public facility users that would be most at risk, such as children and senior citizens in assisted care facilities.

Bibliography: See reason statement.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Between $200-$500 for each unit that would no longer be required to be installed.

Estimated Immediate Cost Impact Justification (methodology and variables):

$100-$200 per unit and between $100-$300 for labor depending on the local labor costs.

P44-24

P45-24

IPC: 421.4

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us)

2024 International Plumbing Code

Revise as follows:

421.4 Shower compartments. Shower compartments shall be not less than 900 square inches (0.58 m^2) in interior cross-sectional area. Shower compartments shall be not less than 30 inches (762 mm) in least dimension as measured from the finished interior dimension of the compartment, exclusive of fixture valves, showerheads, soap dishes and safety grab bars or rails. Except as required in Section 404, the minimum required area and dimension shall be measured from the finished interior dimension at a height equal to the top of the threshold and at a point tangent to its centerline and shall be continued to a height not less than 70 inches (1778 mm) above the shower drain outlet. Where curbs are installed, the curb shall be not less than 2 inches (51 mm) and not more than 9 inches (229 mm) deep when measured from the top of the curb to the top of the drain.

> **Exception:** Shower compartments having not less than 25 inches (635 mm) in minimum dimension measured from the finished interior dimension of the compartment, provided that the shower compartment has not less than 1,300 square inches (0.838 m^2) of cross-sectional area.

Reason: This added text will align with what's in the IRC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This a clarification because most showers have curbs yet there isn’t anything in the code about the height of the curb. Establishing a minimum height of a curb doesn’t change the cost of a curb installation because the cost of choosing to install the curb is already considered.

P45-24

P46-24

IPC: 423.3

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com); William Grayzar, DiClemente Siegel Design, Inc., Self (bill@dsdonline.com)

2024 International Plumbing Code

Revise as follows:

423.3 Footbaths and pedicure baths.
The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub and footbaths, shall be limited to not greater than 120ºF (49ºC) by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or by a water heater complying with ~~ASSE 1082 or~~ 1084.

Reason: [SHANKS]: ASSE 1082 is designed for the following - This standard is for water heaters that control the outlet temperature to specific limits and are installed within a hot water distribution system but not at point-of-use. Being this code section is in regards to point of use the ASSE 1082 is the wrong application.

The correct application is the ASSE 1084 which is designed for the following - Water heaters covered by this standard have a cold-water inlet connection, a means of heating the water, a means of controlling the water temperature, a means of limiting the temperature to a maximum of 120 °F (48.9 °C), and have an outlet connection to connect to downstream fixture fittings. This water heater in regards to a ASSE 1082 is intended to supply tempered water at point of use in order to reduce and control the risks of scalding. This water heater as an ASSE 1082 is not intended to limit thermal shock. This water heater is not a substitute for an automatic compensative valve complying with ASSE 1016 / ASME A112.1016 / CSA B125.16.

Leaving the ASSE 1082 in this section of the code for this useage will go against other current code sections within the IPC such as 408.3 (Bidets) and 419.5 (Public Hand Washing Lavatories). Which causes not only a health and safety concern to the end user but confusion in the Plumbing Industry.

[GRAYZAR]:

ASSE Standard 1082 added in the 2021 code cycle is not suitable for a point-of-use application. ASSE 1082 Standard does not include scald protection and is intended for steady state flow conditions.

The proposed revision is intended to remove ASSE Standard 1082 only from point-of use applications, while allowing it to remain in Chapter 6 of the code for distribution systems.

The ASSE Standard 1082 is similar to the ASSE Standard 1017 and is intended for controlling the water outlet temperature in a water distribution system and not intended for end use applications without the use of a point-of-use control valve as specified by ASSE 1016/ASME A112.1016/CSA B125.16, ASSE 1069, ASSE 1070/ ASME A112.1070/CSA B125.70, or other appropriate standard.

ASSE Standard 1082 does not include scald protection and is intended for various steady state flow conditions and has an outlet temperature range between 105°F and 125°F. The outlet temperature can vary as much as +/- 3°F for flows less than 5 GPM, +/- 5°F for flows between 5 GPM and 50 GPM, and as much a +/- 7°F for flows above 50 GPM.

ASSE Standard 1084 added in the 2024 code cycle is the correct standard in addition to ASSE 1070/ASME A112.1070/BSA B125.70 for this application. An ASSE 1084 compliant device is intended to perform like a water heater with a ASSE 1070/ASME A112.1070/CSA B125.70 compliant water- temperature-limiting device.

ASSE Standard 1084 is intended for varying flow conditions, it is intended to include a level of scald protection consistent with ASSE 1070/ASME A112.1070/CSA B125.70, and it has an outlet temperature range between 100°F and 110°F with a maximum temperature of 110°F for non-adjustable application and 120°F for an adjustable application.

ASSE Standards 1082 and 1084 do not limit thermal shock and are not substitutes for automatic compensative valves complying with ASSE 1016/ASME A112.1016/CSA B125.16 Performance Requirements for Automatic Compensating Valves for Individual Showers and Tub/Shower Combinations.

Bibliography: [GRAYZAR]: ASSE Standard 1082-2018 - Performance Requirements for Water Heaters with Integral Temperature Control Devices For Hot Water Distribution Systems.

ASSE Standard 1084-2018 - Performance Requirements for Water Heaters with Temperature Limiting Capacity

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

[SHANKS]: This proposed change will bring the current requirements for protection against hot water temperatures in the IPC 2024 Code in line with already existing Code Sections for the protection of health and safety of the public. The costs are already included in the construction of a Hot Water System currently in the Code.

[GRAYZAR]: The proposal has no cost impact it is editorial and removes the misapplied ASSE 1082 Standard, which applies hot water distribution systems, from being allowed in a point of use application.

P46-24

P47-24 Part I

IPC: 425.1.3

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

425.1.3 Dual flush water closets.
Water closets equipped with a dual flushing device shall comply with ~~ASME A112.19.14~~ ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124.

Staff Analysis: The proposed standards are currently referenced in the Code.

P47-24 Part I

P47-24 Part II

IRC: P2712.1

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Residential Code

Revise as follows:

P2712.1 Approval.
Water closets shall conform to the water consumption requirements of Section P2903.2 and shall conform to ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124. Water closets shall conform to the hydraulic performance requirements of ASME A112.19.2/CSA B45.1. Water closet tanks shall conform to ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124. Water closets that have an invisible seal and unventilated space or walls that are not thoroughly washed at each discharge shall be prohibited. Water closets that allow backflow of the contents of the bowl into the flush tank shall be prohibited. Water closets equipped with a dual flushing device shall comply with ~~ASME A112.19.14~~ ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124.

Staff Note: The proposed standards are currently referenced in the Code.

Reason: ASME A112.19.14 has been discontinued. The requirements from ASME A112.19.14 for dual flush are now covered under ASME A112.19.2/CSA B45.1 for ceramic fixtures, ASME A112.19.3/CSA B45.4 for stainless steel fixtures or CSA B45.5/IAPMO Z124 for plastic fixtures.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The requirements remained the same so no new testing is needed for toilets to be certified, this change just clarification as to what standard is applicable.

P47-24 Part II

P48-24

IPC: 425.3 (New), IAPMO Chapter 15 (New)

Proponents: Terry Burger, IAPMO Group, IAPMO Group (terry.burger@asse-plumbing.org)

2024 International Plumbing Code

Add new text as follows:

425.3 Water closet seats. Water closets shall be equipped with seats of smooth, nonabsorbent material. Seats of water closets provided for *public* or employee toilet facilities shall be of the hinged open-front type. Integral water closet seats shall be of the same material as the fixture. Water closet seats shall be sized for the water closet bowl type. Plastic water closet seats shall conform to IAPMO Z124.5

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

Z124.5 - 2013E1(R2018) Plastic toilet seats

Staff Analysis: A review of the standard proposed for inclusion in the code, IAPMO Z124.5-2023e1(R2018) *Plastic Toilet Seats* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The water closet seat standard provides the performance and material requirements which provides a means to demonstrate performance and material requirements in addition to compliance to this section of the codes

Bibliography: IAPMO Z124.5 - 2013E1(R2018) Plastic toilet seats

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Product exist in the market place already compliant to the reference standard. This change has no cost impact.

P48-24

P49-24

IPC: SECTION 202 (New), SECTION 427 (New), 427.1 (New), 427.2 (New), 427.3 (New), IAPMO Chapter 15 (New)

Proponents: Misty Guard, Regulosity LLC, MAG Industries LLC (misty.guard@regulosity.com)

2024 International Plumbing Code

Add new definition as follows:

ASSISTIVE TABLE.
A product produced, generally available, or used by or for persons with a physical, or cognitive disability intended to facilitate and support personal care or hygiene with a changing surface to support a user in a reclined or lying position. Assistive Tables can be fixed or adjustable height and have integrated plumbing fittings and fixtures.

Add new text as follows:

SECTION 427
ASSISTIVE TABLES

427.1 Approval. Assistive tables shall conform to IAPMO Z1390. Assistive tables with an integrated water closet shall conform with Section 425. Assistive tables with an integrated bidet shall conform to Section 408. Assistive tables with an integrated faucet or fixture fitting shall conform to Section 412. Assistive tables with an integrated flushing device for a water closet shall conform to Section 415. Assistive tables with an integrated lavatory shall conform to Section 419. Assistive tables with an integrated sink shall conform to Section 422.

427.2 Waste outlet connection. Assistive tables with an integrated water closet shall have a waste outlet that connects to a 4 x 4 or 4 x 3 water closet flange. A 4-inch by 3-inch (102 mm by 76 mm) closet bend shall be acceptable.

427.3 Installation. Assistive tables shall be installed in accordance with Section 405.

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

Z1390-xx Assistive Tables

Staff Analysis: A review of the standard proposed for inclusion in the code, IAPMO Z1390-xx *Assistive Tables*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Assistive tables are plumbing products that facilitate and support the personal hygiene of individuals who are physically challenged, disabled, or elderly. While the assistive table is not a new product, the products are required in new commercial buildings and substantial renovations of existing bathrooms in Arkansas, Arizona, California, New Hampshire, and Pennsylvania. Massachusetts, Michigan, Minnesota, and Wisconsin have pending legislation for these products. A technical subcommittee of manufacturers, consultants, installers, and disability experts wrote the product performance and safety standard, IAPMO Z1390 Assistive Tables. IAPMO Z1390 covers 1) product design requirements for user weight, maximum loads, heights, operation, locking safety mechanisms, mechanical wear, cleaning and disinfection, changing surface, grab rails, safety restraint systems, electrical, support structure, integrated plumbing fittings, integrated plumbing fixtures, 2) performance requirements for height, vertical movement, locking mechanisms, changing surface tests, grab bars, support structures, waste fitting connections, and body part entrapment, 3) marking and signage requirements, and 4) installation documentation.

Bibliography: IAPMO Z1390: Assistive Table

Cost Impact: Increase

Estimated Immediate Cost Impact:

This requirement will increase the cost of these products by requiring the product manufacturer to obtain testing through a testing laboratory and third-party certification. Laboratory testing and third-party certification fees for products typically range between $3,000 to $20,000. The increase in cost is offset by the benefits to public health and safety of products that conform to product safety and performance standards resulting in a reduction of harm to users.

Estimated Immediate Cost Impact Justification (methodology and variables):

This requirement will increase the cost of these products by requiring the product manufacturer to obtain testing through a testing laboratory and third-party certification. The increase in cost is offset by the benefits to public health and safety of products that conform to product safety and performance standards resulting in a reduction of harm to users.

P50-24

IPC: CHAPTER 5, SECTION 501, 501.10 (New)

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

CHAPTER 5 WATER HEATERS

SECTION 501
GENERAL

Add new text as follows:

501.10 Minimum Storage Temperature in Storage Type Water Heaters. Storage type water heaters shall have a minimum water temperature of 140 F to control the growth of Legionella bacteria and other pathogens in the storage tank.

Reason: ASHRAE 188 and ASHRAE Guideline 12 dealing with control of Legionella in Building water systems recommends a minimum hot water storage temperature to kill bacteria. This code change is intended to bring the code in line with industry standards on Legionella. **Effects of Temperature on Legionella Bacteria**

Temperature[1]	Result
Below 68F (20C)	Legionella survives, but will not grow/multiply
68 F (20C)	Legionella will double its population in 8 days
77 F (25C)	Legionella will double its population in 3 days
68 to 122 F (20-50C)	Legionella bacteria growth temperature range[3]
95 to 115 F (35-46C)	Ideal Legionella bacteria growth temperature range
Abv 122F & Bel. 131 F	Legionella bacteria survives, will not grow/multiply[2,3]
131 F (55C)	Legionella bacteria dies in 5 to 6 hours[2]
140 F (60C)	Legionella bacteria dies in 32 minutes[2]
151 F (66C)	Legionella bacteria dies in 2 minutes[2]
158 F + (70C+)	Legionella bacteria dies instantly (Disinfection temp.)[2]

Notes:

1. These temperatures are based on laboratory tests. Field conditions may vary due to differences in water quality, insulating properties of host amoeba, biofilm,

   scale and sediment.

2. Verify that the water heater is capable of heating to non-growth or disinfection temperatures.

3. The coolest point in the hot water system (Hot water return pipe) should be a couple of degrees above the highest growth temperature as a safety factor.

   (122F + 2F = 124F, many temperature gauges have a + or – 2F accuracy Locate a temperature gauge just before HW Return connects to Water Heater/Mixing

   Valve return tee.)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Raising the hot water storage temperature does not affect costs of construction as this is something that is done after construction. This proposal improves health & Safety.

P50-24

P51-24

IPC: 501.8, 501.8.1 (New), 501.8.2 (New)

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

501.8 Temperature controls.
Hot water supply systems shall be equipped with automatic temperature controls capable of adjustments from the lowest to the highest acceptable temperature settings for the intended temperature operating range.

Add new text as follows:

501.8.1 Water Heater Outlet Temperature Controls. All water heaters in hospitals, medical facilities, nursing homes, senior housing facilities, hotels and motels shall have a temperature actuated mixing valve conforming to ASSE 1017, set to maintain the hot water temperature 2 degrees above the Legionella bacteria growth temperature of 122 F at all points in the storage and distribution system.

501.8.2 Water Heater Minimum Storage Temperature.
Storage type water heaters in hospitals, medical facilities, nursing homes, senior housing facilities, hotels and motels shall have a minimum water storage temperature of 140 F to control the growth of Legionella bacteria and other pathogens in the storage tank.

Staff Analysis: The proposed standard is in the current edition of the code.

Reason: This code change is intended to add a minimum storage temperature and temperature controls for for buildings with susceptible populations for Legionnaires disease. This code change will increase the cost of construction, but it will significantly increase the safety of building occupants in these facilities.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$100 to $4,950

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of mixing valves depends on the size of the valve Mixing valves can cost anywhere between $100 to $4,950.0

The cost of a Legionella outbreak can be millions of dollars.

Estimated Life Cycle Cost Impact:

Not installing a mixing valve can leave a system susceptible to Legionella bacteria growth and one outbreak can bankrupt a company.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

To purchase a 1-1/2 inch Temperature actuated mixing valve ranges from $1,080 to $1,500

A Legionella Outbreak has cost some companies tens of millions of dollar

The idea of an outbreak of Legionnaires' Disease sends property managers and owners everywhere scurrying for cover. and News reporters and camera operators knocking on your door for a statement for the evening news.

Legionnaires disease spread through contaminated aerosolized water droplets, that when inhaled into the lungs, the bacteria flourishes in the warm, moist lining of he lungs where it multiplyas and eventually can cause pneumonia and many other complications.

According to The **Center for Disease Control and Prevention (CDC)**, between 8,000 and 18,000 people are hospitalized with Legionnaires' disease each year, and only about 20 percent of Legionnaires disease cases are reported. With the number of cases rapidly rising in the last ten years, and medical costs exceeding $360 million annually. Owners and managers of properties where outbreaks occur frequently find themselves the target of legal action by those who have contracted the disease, and the cost of an outbreak can quickly tally up to eight figures and beyond. Legionnaires disease is 100% preventable with a good system design, a water management plan to monitor and control the system to prevent conditions conducive to growth and with education.

What is the Price of Liability?

In the event of a Legionnaires' outbreak on your property, there are three main consequences that can cost you:

Expensive settlements and personal injury awards A Legionnaires' outbreak is serious business. An outbreak can affect dozens, and even hundreds, of people, with death rates between 20 and 40 percent, and many survivors facing weeks to months of hospitalization, six-figure medical bills, and permanent damage. Because of this, settlements and jury awards range from the hundreds of thousands to several million dollars.

Building closure and business interruption

On top of legal action, investigation and remediation of an outbreak usually results in a building closure, causing substantial business interruption. A 2009 outbreak at Miami's EPIC Hotel, for instance, reportedly caused daily income losses of about $200,000.

Irreparable negative publicity The damage to a companie's reputation, brand, and other intangibles may be harder to put a number on, but this damage is also often longer-lasting and less easily repaired.

P51-24

P52-24 Part I

IPC: SECTION 202 (New), 501.10 (New), ASSE Chapter 15 (New)

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Add new definition as follows:

HEAT INTERFACE UNIT. A unit including one or more double wall heat exchangers and control devices for transferring heat from a primary to a secondary system. The primary system may be a hot water heating system. The secondary system is the domestic hot water system within the dwelling or other space.

Add new text as follows:

501.10 Heat Interface Unit. Installed heat interface units shall contain a proportional control valve that is third-party certified to ASSE 1379.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1379-20xx	Proportional Flow Control Devices, with Protection from Cross Connection via Hydronic Water, for use in Potable Water Installation

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1379-20xx *Proportional Flow Control Devices, with Protection from Cross Connection via Hydronic Water, for use in Potable Water Installation*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The Heat Interface Unit helps improve water quality, water and energy efficiency, water and energy conservation, and system performance.

A Heat Interface Unit system eliminates more than 50% of the Domestic Hot Water (DHW) volume. This is accomplished by eliminating much of the hot water piping and all the recirculation line piping. Since much of the hot water piping has been eliminated with a Heat Interface Unit system there is a much higher turnover of fresh water in the domestic system. The domestic hot-water piping that remains in the building is only the in-suite piping on the other side of the Heat Interface Unit. These are short runs of smaller-diameter piping that have little volume of water and cool quickly after use to help minimize the time in the optimal-bacterial-growth temperature range.

When designed properly, a Heat Interface Unit system can realize up to 35% reduction of energy used in the building by eliminating a central DHW system with its recirculation piping and pumps, and just using the 4-pipe HVAC system to distribute hot water to the Heat Interface Units.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

P52-24 Part I

2024 International Plumbing Code

Add new definition as follows:

WATER HEATER, HEAT PUMP, AIR SOURCE. A water heating system, containing a heat pump and storage tank, where the heat pump uses ambient air as a heat source to heat water. There are two types:

1. Unitary systems where the heat pump and storage tank are a single assembly. The heat pump is generally mounted on top of the storage tank.
2. Split systems where the heat pump and storage tank are separate assemblies.

SECTION 502 INSTALLATION

Revise as follows:

502.1 General. Water heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired water heaters shall conform to the requirements of this code and the *International Mechanical Code*. Electric water heaters shall conform to the requirements of this code and provisions of NFPA 70. Gas-fired water heaters shall conform to the requirements of the *International Fuel Gas Code.* Solar thermal water heating systems shall conform to the requirements of the *International Mechanical Code* and ICC 900/SRCC 300. Air source heat pump water heaters shall be installed in accordance with Section 506.

Add new text as follows:

SECTION 506 Heat Pump Water Heaters

506.1 Air-source heat pump water heaters (HPWH). Air-source heat pump water heaters (HPWH) shall comply with Sections 506.2. through 506.5.

506.2 Obstructions and clearances. Air intakes, exhaust outlets, filters, heating elements, wiring connections, condensate drains, temperature and pressure relief valves shall not be obstructed. Clearances shall be provided for maintenance and replacement in accordance with Section 502.5.

506.3 Seismic Supports. Seismic supports shall comply with Section 502.4. Restraints shall not obstruct components specified in Section 506.2.

506.3.1 Unitary HPWH. Seismic restraints for unitary HPWHs shall be located at points within the upper one-third and lower one-third of the vertical dimensions of the storage tank, and not on the heat pump portion.

506.3.2 Split System HPWH. For split systems, the seismic restraints for the storage tank shall be in accordance with Section 506.3.1. The heat pump portion of the split system shall be installed in accordance with the manufacturer's instructions.

506.4 Condensate Drains. Condensate drain lines from air source HPWHs shall be in accordance with Section 314.2.

506.5 Ventilation. The ventilation requirements for air-source HPWH shall be in accordance with Sections 506.5.1 through 506.5.4. The minimum dimensions for the space volume where the HPWH is installed shall be 3.5 x 3.5 x 8 = 98 cubic feet.

506.5.1 Space volume method. Ventilation shall comply with the provisions Table 506.5.1.

TABLE 506.5.1 MINIMUM SPACE VOLUME FOR INSTALLING AIR-SOURCE HPW

Heat Pump Capacity (BTU/Hour)	<1,000	≥1,000 and <2,000	≥2,000 and <3,000	≥3,000 and <4,000	≥4,000 and <5,000	≥5,000 and <6,000	≥6,000 and <7,000	≥7,000 and <8,000	≥8,000 and <9,000	≥9,000 and <10,000	≥10,000 and <11,000	≥11,000 and <12,000	≥12,000 and <13,000	≥13,000 and <14,000	≥14,000 and <15,000	≥15,000 and <16,000	≥16,000 and <17,000	≥17,000 and <18,000
Space Volume (cubic feet)	175	350	525	700	875	1,050	1,225	1,400	1,575	1,750	1,925	2,100	2,275	2,450	2,625	2,800	2,975	3,150

For SI units: 1 cubic foot = 0.0283 m^3, 1000 British thermal units per hour = 0.293 kW

506.5.2 Passive ventilation method. Where the location of the HPWH is in a space smaller than required in Table 506.5.1, additional ventilation shall be provided in accordance with Table 506.5.2. Passive ventilation shall be into an adjacent space that shares the same pressure zone with the HPWH. The sum of the volume of the space where the HPWH is located and the volume in the adjacent space shall be not less than the space volume required for the capacity shown in Table 506.5.2. The net free area of the passive ventilation shall be equally distributed between high and low openings. These openings shall be in the top quarter and bottom quarter of the space where the HPWH is located.

TABLE 506.5.2 MINIMUM NET FREE AREA FOR INSTALLING AIR-SOURCE HPWH

Space Volume (cubic feet)	Heat Pump Capacity (BTU/Hour)																	
	<1,000	≥1,000 and <2,000	≥2,000 and <3,000	≥3,000 and <4,000	≥4,000 and <5,000	≥5,000 and <6,000	≥6,000 and <7,000	≥7,000 and <8,000	≥8,000 and <9,000	≥9,000 and <10,000	≥10,000 and <11,000	≥11,000 and <12,000	≥12,000 and <13,000	≥13,000 and <14,000	≥14,000 and <15,000	≥15,000 and <16,000	≥16,000 and <17,000	≥17,000 and <18,000

For SI units: 1 cubic foot = 0.0283 m3, 1000 British thermal units per hour = 0.293 kW

506.5.3 Ducted ventilation method. Where the location of the HPWH is in a space smaller than required in Table 506.5.1, and it is not possible to comply with the provisions for passive ventilation in accordance with Table 506.5.2, the HPWH shall be ducted in accordance with the manufacturer's instructions. Air intake and exhaust ducts shall come from and go to the same pressure zone. The termination of the ducts in the remote space shall be directed so that they draw from and exhaust to different parts of the pressure zone. It is permissible to install a combination of passive and ducted ventilation to meet the air flow requirements of the HPWH.

506.5.4 New construction. Ventilation shall comply with the provisions in Sections 506.5.1, 506.5.2 and 506.5.3 for the 18,000 BTU per Hour capacity column in Tables 506.5.1 and 506.5.2.

Exception: For HPWHs larger than 18,000 BTU per hour, the minimum space volume shall be not less than 0.175 cubic feet per BTU per hour as rated by the manufacturer. Net free area and ducting shall be in accordance with the manufacturer's instructions.

2024 International Residential Code

Add new definition as follows:

Water Heater, Heat Pump, Air Source.
A water heating system, containing a heat pump and storage tank, where the heat pump uses ambient air as a heat source to heat water. There are two types:

(1) Unitary systems where the heat pump and storage tank are a single assembly. The heat pump is generally mounted on top of the storage tank.

(2) Split systems where the heat pump and storage tank are separate assemblies.

CHAPTER 20 BOILERS AND WATER HEATERS

SECTION M2005 WATER HEATERS

Revise as follows:

M2005.1 General. Water heaters shall be installed in accordance with Chapter 28, the manufacturer's instructions and the requirements of this code. Water heaters installed in an *attic* shall comply with the requirements of Section M1305.1.2. Gas-fired water heaters shall comply with the requirements in Chapter 24. Domestic electric water heaters shall comply with UL 174. Oiled-fired water heaters shall comply with UL 732. Solar thermal water heating systems shall comply with Chapter 23 and ICC 900/SRCC 300. Solid fuel-fired water heaters shall comply with UL 2523. Air source heat pump water heaters shall comply with the requirements in Section P2805.

Add new text as follows:

P2805 Heat Pump Water Heaters

P2805.1 Air-source HPWHs. Air-source heat pump water heaters (HPWH) shall comply with Section P2805.2. through Section P2805.5.

P2805.2 Obstructions and clearances. Air intakes, exhaust outlets, filters, heating elements, wiring connections, condensate drains, temperature and pressure relief valves shall not be obstructed. Clearances shall be provided for maintenance and replacement in accordance with Section M1305.

P2805.3 Seismic bracing. Seismic bracing shall comply with Section P2801.8. Restraints shall not obstruct components specified in Section P2805.2.

P2805.3.1 Unitary HPWH. For unitary HPWHs seismic restraints shall be located at points within the upper one-third and lower one-third of the vertical dimensions of the storage tank, and not on the heat pump portion.

P2805.3.2 Split System HPWH. For split systems the seismic restraints for the storage tank shall be in accordance with Section

P2805.3.1. The heat pump portion of the split system shall be installed in accordance with the manufacturer's instructions.

P2805.4 Condensate drains. Condensate drain lines from air source HPWHs shall be in accordance with Section M1411.3.

P2805.5 Ventilation. The ventilation requirements for air-source HPWH shall be in accordance with Sections P2805.5.1 through P2805.5.4. The minimum dimensions for the space volume where the HPWH is installed shall be 3.5 x 3.5 x 8 = 98 cubic feet.

P2805.5.1 Space volume method. Ventilation shall comply with the provisions Table P2805.5.1.

TABLE 2805.5.1 MINIMUM SPACE VOLUME FOR INSTALLING AIR-SOURCE HPW

Heat Pump Capacity (BTU/Hour)	<1,000	≥1,000 and <2,000	≥2,000 and <3,000	≥3,000 and <4,000	≥4,000 and <5,000	≥5,000 and <6,000	≥6,000 and <7,000	≥7,000 and <8,000	≥8,000 and <9,000	≥9,000 and <10,000	≥10,000 and <11,000	≥11,000 and <12,000	≥12,000 and <13,000	≥13,000 and <14,000	≥14,000 and <15,000	≥15,000 and <16,000	≥16,000 and <17,000	≥17,000 and <18,000
Space Volume (cubic feet)	175	350	525	700	875	1,050	1,225	1,400	1,575	1,750	1,925	2,100	2,275	2,450	2,625	2,800	2,975	3,150

For SI units: 1 cubic foot = 0.0283 m^3, 1000 British thermal units per hour = 0.293 kW

P2805.5.2 Passive ventilation method. Where the location of the HPWH is in a space smaller than required in Table P2805.5.1, additional ventilation shall be provided in accordance with Table P2805.5.2. Passive ventilation shall be into an adjacent space that shares the same pressure zone with the HPWH. The sum of the volume of the space where the HPWH is located and the volume in the adjacent space shall be not less than the space volume required for the capacity shown in Table P2805.5.2. The net free area of the passive ventilation shall be equally distributed between high and low openings. These openings shall be in the top quarter and bottom quarter of the space where the HPWH is located.

<100	70	140	210	280	350	420	490	560	630	700	770	840	910	980	1050	1120	1190	1260

For SI units: 1 cubic foot = 0.0283 m3, 1000 British thermal units per hour = 0.293 kW

P2805.5.3 Ducted ventilation method. Where the location of the HPWH is in a space smaller than required in Table P2805.5.1, and it is not possible to comply with the provisions for passive ventilation in accordance with Table P2805.5.2, the HPWH shall be ducted in accordance with the manufacturer's instructions. Air intake and exhaust ducts shall come from and go to the same pressure zone. The termination of the ducts in the remote space shall be directed so that they draw from and exhaust to different parts of the pressure zone. It is permissible to install a combination of passive and ducted ventilation to meet the air flow requirements of the HPWH.

P2805.5.4 New construction. Ventilation shall comply with the provisions in Sections P2805.5.1, P2805.5.2 and P2805.5.3 for the 18,000 BTU per Hour capacity column in Tables P2805.5.1 and P2805.5.2.

Exception: For HPWHs larger than 18,000 BTU per hour, the minimum space volume shall be not less than 0.175 cubic feet per BTU per hour as rated by the manufacturer. Net free area and ducting shall be in accordance with the manufacturer's instructions.

-

Reason: The purpose of this proposal is to add an option to the plumbing code so that installers of heat pump water heaters (HPWH) have clear provisions in the chapterson Water Heaters regarding their proper installation. HPWH are water heaters, and most of the provisions regarding the installation of all water heaters apply. A key requirement that does not exist is that they need to be installed so that they operate in heat pump mode for the majority of their duty cycle.

For air source HPWH, the type of water heater discussed in this proposal, this means special attention must be paid to the air flow requirements. They need a source of "warm" air to extract energy and they need a sink for the cold air they discharge to be absorbed. The source and the sink need be matched. This can be challenging in cold climates.

To accommodate the energy exchange required by the source and the sink, the sizes of which depend on the capacity of the heat pump, there needs to be

1. A minimum volume of the space where the HPWH is installed. Energy exchange happens within that space.

2. Passive ventilation into an adjacent space if the space where the HPWH is located is not large enough. The volume of the two spaces must meet the minimum volume requirements for the HPWH's capacity. The two spaces must share a common pressure zone.

3. Ducted ventilation into an adjacent or remote space if the minimum volume or passive ventilation requirements cannot be me. The HPWH needs to be ducted to and from a location with the ability to support required energy exchange. When ducted, the remote terminals for the intake need to come from, and exhaust ducts to, the same pressure zone so that they do not adversely affect the performance of other mechanical systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

P54-24 Part II

P55-24

IPC: 502.11 (New)

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Add new text as follows:

502.11 Hot water Generators, Heat Exchangers, Pre-heaters, Solar water heaters. Hot water generators, heat exchangers, pre-heaters, and solar water heaters that utilize heat exchangers to heat or pre-heat domestic hot water shall have a temperature-actuated mixing valve complying with ASSE 1017 located downstream of any hot water generators, heat exchangers, pre-heaters, or solar water heaters to limit and control the water temperature supplied to the potable hot water distribution system to a stable, temperature. The potability of the water shall be maintained throughout the domestic hot water distribution system. Requirements for the heat source piping systems shall be in accordance with the International Mechanical Code.

Staff Analysis: The proposed standard is in the current edition of the code.

Reason: Heat exchangers used as pre-heaters or hot water generators have the ability to overheat the domestic hot water when steam or heating hot water valves stick open or when flue gasses are extremely hot. This code change assures that a temperature actuated mixing valve will mix the hot water downstream of the device to a stable and desired temperature. A specific temperature is not given, because in some applications the distribution temperature may need to be slightly above 140 F in order to keep the circulated return above a Legionella bacteria growth temperature in larger buildings with significant heat loss in the system. Having the mixing valve downstream of these heat exchangers and HW generators can control the temperature when the heat recovery or pre-heater system heats the water well beyond the desired hot water system temperature.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This will slightly increase the cost of construction, but adds a significant level of safety.

The retail cost of a 3/4-inch valves starts at $88.89 and the wholesale price is typically 40% less than retail price. The installed cost with a labor rate of $95/hr can start at $183.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will save lives for as little as $183.00 on smaller systems and up to a few thousand dollars on larger systems. The value of this safety device is cheap compared to the increase in safety. This code change is needed to provide a safe hot water distribution system. The retail cost of a 3/4-inch valves starts at $88.89 and the wholesale price is typically 40% less than retail price. The installed cost starts at about $183 for Water heaters up to 80 gallons or a maximum of gpm.

For larger systems, Bronze Thermostatic Mixing Valves 1" in size cost is about $100.00 to $300.00; Bronze Tempering Valves 3" in size cost about $2,400.00 to $3,925.00.

.

Estimated Life Cycle Cost Impact:

This cost is much less than the cost of a burn injury which can reach millions of dollars in medical costs, and affect entire families who have to help care for burn victims. The physical, emotional, phycological and ongoing medical costs can be immense. Then add any litigation costs associated with litigation. Insurance companies should support this as a safer installation and a total reduction in overall medical and liability costs.

When a facility has an unsafe hot water system (Without temperature controls to prevent overheating conditions) injuries and deaths can occur. injuries include costs for medical treatment which includes burn care, debridement to scrape off dead tissue still attached to the body, skin grafting to cover burned areas with skin from the burn victim to prevent rejection issues, Ongoing surgeries to splice in skin as the body grows, because the scar tissue does not grow or have elasticity. Additional medical costs associated with related medical conditions, psychological counseling, etc. Another cost not accounted for is the Litigation cost associated with a burn injury.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The average size of a cold water make-up valve in an institutional building is about 3 inches in size.

In my experience dealing with scald litigation, the judge and jury awards for scald cases have included costs to cover medical expenses, and ongoing medical equipment, assistance and treatments including punitive damages totaling in excess of 16 million dollars for one incident at a facility that had hot water systems that were not safely designed, controlled and maintained and caused burn injuries. According to Internet research, In Western countries and other democracies, estimates for the value of a statistical life typically range from $1 million US dollars to $10 million US Dollars; for example, the United States Federal Emergency Management Agency (FEMA) estimated the value of a statistical life at $7.5 million US Dollars in 2020.
The cost of a valve is far less expensive than the injury, pain, suffering, Medical and physical therapy expenses, and litigation expenses. Or the emotional issues from a serious burns or loss of life from a scald injury.

P55-24

P56-24

IPC: 503.3 (New)

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Add new text as follows:

503.3 Water Heaters, Heat Exchangers and Heat Recovery Device Appurtenances. Each water heater, heat exchanger, or heat recovery device serving the domestic hot water system shall have isolation valves located on the inlet and on the outlet pipe connections. The isolation valves shall be located outside of de-liming tees with 3/4-inch hose valve connections, and outside of a temperature and pressure gauge on each connection.

Reason: Water heaters, heat exchangers, and heat recovery devices need temperature and pressure gauges in order to see how the equipment is performing. For example, when heat exchangers or heat recovery devices are used to pre-heat domestic cold water that is supplied to the water heater, it is important to understand what the temperature is coming into the water heater in order to avoid sending water into the distribution system that is a higher temperature than the water heater thermostat setting.

Water heaters, heat exchangers, and heat recovery devices are susceptible to temperature and pressure changes due to the heating fluid temperature and pressure changes associated with scale and water quality.

Valved de-liming connections allow for descaling operations to take place when service is scheduled or required.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This will increase of the cost of construction initially but will save thousands of dollars in fuel costs by keeping the system running efficiently. This will reduce the emission of greenhouse gasses.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of the small valves and pressure gauges here are minimal.

Estimated Life Cycle Cost Impact:

By allowing the operators to see the pressure drop and temperature changes, they will know when the heat exchanger is fouled. De-liming the heat exchanger will allow the equipment to go back to full efficiency. If a heat exchanger fouls 10% per year because of hard water, then each additional year, the fuel required to heat the water or application will increase by 10 %. Theoretically, after 5 years the additional fuel required would be 50% more fuel required to perform the same amount of work. The compounded additional expenses on fuel bills justifies having these devices to allow the operator to see what the system is doing. If the equipment requires $1,000 in fuel per month to operate, at the end of the first year each month it will waste an extra $200 or an average of $100 per month over the first year. ($1,200 for the first year wasted energy, by the 5th year the wasted energy could be in excess of $6,000) The cost of these devices in minimal compared to the potential energy wasted and additional greenhouse gasses created.

P56-24

P57-24

IPC: 504.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

504.2 Vacuum relief valve.
Bottom fed storage water heaters and bottom fed tanks connected to water heaters shall have a vacuum relief valve installed. The vacuum relief valve shall comply with ANSI Z21.22.

Reason: This section was originally intended to protect storage tanks and storage tank type water heaters from being siphoned which could result in the tanks being dry when energized causing the elements to burn out or in the case of a gas fired water heater, it could result in the tank liner fracturing prematurely. Due to the current language in the code, this is also being applied to tankless water heaters. Tankless water heaters typically have flow switches which prove there is ample water inside the unit before they can energize, thus they are already protected from accidental damage.

Bibliography: See reason statement.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Between $160 - $480 per unit.

Estimated Immediate Cost Impact Justification (methodology and variables):

Between $60 - $180 per unit depending on markup by the contractor and $100-$300 for labor depending on the local labor rates.

P57-24

P58-24 Part I

IPC: 504.4, 504.4.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

504.4 Relief valve. Storage water heaters operating above atmospheric pressure shall be provided with an *approved*, self-closing (levered) pressure relief valve and temperature relief valve or combination thereof. The relief valve shall conform to ANSI Z21.22. The relief valve shall not be used as a means of controlling thermal expansion. Tankless instantaneous water heaters shall not be required to be provided with pressure or temperature relief valves unless required by the manufacturer's installation instructions.

504.4.1 Installation.
Storage water heaters shall have ~~S~~such valves ~~shall be~~ installed in the shell of the water heater tank. Temperature relief valves shall be located in the tank so as to be actuated by the water in the top 6 inches (152 mm) of the tank served. For installations with separate storage tanks, the *approved*, self-closing (levered) pressure relief valve and temperature relief valve or combination thereof conforming to ANSI Z21.22 valves shall be installed on both the storage water heater and storage tank. There shall not be a check valve or shutoff valve between a relief valve and the heater or tank served.

P58-24 Part I

P58-24 Part II

IRC: P2804.4

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Residential Code

Revise as follows:

P2804.4 Temperature relief valves. Temperature relief valves shall have a relief rating compatible with the temperature conditions of the *appliances* or equipment protected. The valves shall be installed such that the temperature-sensing element monitors the water within the top 6 inches (152 mm) of the tank. The valve shall be set to open at a temperature of not greater than 210°F (99°C).

> **Exception:** Tankless instantaneous water heaters shall not be required to be provided with pressure or temperature relief valves unless required by the manufacturer's installation instructions.

Reason: This proposal clarifies requirements for relief valves for tankless instantaneous water heaters. Typically, these are specified for the manufacturer only in specific installations, such as providing hot water for space heating applications.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Approximately $100 per tankless water heater installation.

Estimated Immediate Cost Impact Justification (methodology and variables):

The existing code language was not clear to all users such that temperature valves may have been required by some code officials in tankless installations, which was not the intent of the existing code. The proposal reduces costs by the elimination of the temperature relief valve ($20), the associated plumbing ($30), and the labor ($50) to install those components.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

P58-24 Part II

P59-24

IPC: 504.6

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping.
The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank where the water heater or storage tank is not elevated off of the floor, to a waste receptor, or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is installed with insert fittings. The outlet end of such tubing shall be fastened in place.

Reason: When water heaters are elevated off the floor, discharging to the pan can create splashing that will result in scalding if persons are standing near the water heater or below the water heater. This potential would violate item #6 of this section.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is for clarification only to ensure that people are not put at risk by ensuring users of the code understand the section and how it should be applied.

P59-24

P60-24

IPC: 504.6

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

2024 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping.
The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants. Where the discharge termination point is not readily visible and observable, a leak detection monitoring device with alarm notification (and not automatic shut-off), or a building management system shall be required.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is installed with insert fittings. The outlet end of such tubing shall be fastened in place.

Reason: Approval of this code change will allow design flexibility, and more importantly, provide for the allowance of leak detection technology to warn building occupants and managers of a problem with a safety device.

Current code language just requires visibility of the termination point, but if there is a significant discharge of the valve there may not be any awareness of the problem for an extended period. This can especially be a problem when a building is unoccupied and then significant flood damage can result.

This proposal does not intend to require the devices, just allow their use if the termination point is not visible. The allowance of leak detection technology makes for safer, smarter buildings.

P60-24

P61-24 Part I

IPC: 504.7, 504.7.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

504.7 Required pan.
Where a storage tank-type water heater or a hot water storage tank is installed in ~~a~~ <u>an elevated</u> location where water leakage from the tank will cause damage <u>or personal injury</u>, the tank shall be installed in a pan constructed of one of the following:

1. Galvanized steel or aluminum of not less than 0.0236 inch (0.6010 mm) in thickness.
2. Plastic not less than 0.036 inch (0.9 mm) in thickness.
3. Other *approved* materials.

A plastic pan installed beneath a gas-fired water heater shall be constructed of material having a flame spread index of 25 or less and a smoked-developed index of 450 or less when tested in accordance with ASTM E84 or UL723. Water heaters installed in pans shall comply with Section 314.2.3.2.

<u>**Exception:**In existing buildings, a pan shall not be required where one was not previously installed unless the room or space can accommodate a pan and the drain can be run to an approved place of disposal.</u>

504.7.2 Pan drain termination.
The pan drain shall extend full size and terminate over a suitably located indirect waste receptor or floor drain or extend to the exterior of the building and terminate not less than 6 inches (152 mm) and not more than 24 inches (610 mm) above the adjacent ground surface. ~~Where a pan drain was not previously installed, a pan drain shall not be required for a replacement water heater installation.~~

P61-24 Part I

P61-24 Part II

IRC: P2801.5, P2801.5.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Residential Code

Revise as follows:

P2801.5 Required pan.
Where a storage tank-type water heater or a *hot water* storage tank is installed in ~~a~~ an elevated location where water leakage from the tank will cause damage or personal injury, the tank shall be installed in a pan constructed of one of the following:

1. Galvanized steel or aluminum of not less than 0.0236 inch (0.6010 mm) in thickness.
2. Plastic not less than 0.036 inch (0.9 mm) in thickness.
3. Other *approved* materials.

A plastic pan beneath a gas-fired water heater shall be constructed of material having a *flame spread index* of 25 or less and a *smoke-developed index* of 450 or less when tested in accordance with ASTM E84 or UL 723.
EXCEPTION: In existing buildings, a pan shall not be required where one was not previously installed unless the room or space can accommodate a pan and the drain can be run to an approved place of disposal.

P2801.5.1 Pan size and drain.
The pan shall be not less than $1^1/_2$ inches (38 mm) deep and shall be of sufficient size and shape to receive dripping or condensate from the tank or water heater. The pan shall be drained by an *indirect waste pipe* of not less than $^3/_4$ inch (19 mm) diameter. Piping for safety pan drains shall be of those materials indicated in Table P2906.5.
~~Where a pan drain was not previously installed, a pan drain shall not be required for a replacement water heater installation.~~

Reason: The idea that a water heater pan will prevent damage from leaks, dripping, or condensate is nothing more than a sales pitch. Especially if you consider the pan drain is not required to be terminated to a waste receptor if there wasn't one previously installed (ref. P2801.6.1). A pan drain cannot handle a full open discharge of a 3/4-inch T&P discharge pipe. The bottom line is if we are actually trying to protect people, protect them from an actual danger, such as when the water heaters are elevated then that is what we should focus on in the code. Elevated water heaters have a significantly higher possibility of resulting in an injury when the T&P valve discharges. Regardless of how high they are elevated; the discharge can now splash up high on a person's leg is they are nearby when it happens. The risk to injury is even higher when associated to leaks or drips when the water heater is located above a ceiling.

Bibliography: In over 30 + years working in the plumbing industry, with over 14 years as a plumbing inspector, I have yet to see a situation where a leaking water heater caused a building to fail. The bigger danger exists only when the water heaters are elevated and pose a greater risk of personal injury.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Water heater pan costs range anywhere between approximately $20 to over $200 each.

Estimated Immediate Cost Impact Justification (methodology and variables):

Actual cost impact is dependent on numerous factors, such as the type of construction (new, remodel/repair), the building use group, the method chosen for installation, the type of pan, the local labor rates, and the mark-up factor the contractor uses.

P61-24 Part II

P62-24 Part I

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

504.7.1 Pan size and drain.
The pan shall be not less than 1$^{1}/_{2}$ inches (38 mm) in depth and shall be of sufficient size and shape to receive all dripping or condensate from the tank or water heater. The pan shall be drained by an indirect waste pipe having a diameter of not less than $^{3}/_{4}$ inch (19 mm) or shall be equipped with a device complying with CAN/IAPMO Z1349 to automatically shut off the water supply to the water heater upon detection of a leak.. Piping for safety pan drains shall be of those materials listed in Table 605.4.

504.7.2 Pan drain termination.
The pan drain shall extend full size and terminate over a suitably located indirect waste receptor or floor drain or extend to the exterior of the building and terminate not less than 6 inches (152 mm) and not more than 24 inches (610 mm) above the adjacent ground surface. Where a pan drain was not previously installed, a pan drain shall not be required for a replacement water heater installation where equipped with a device complying with CAN/IAPMO Z1349 to detect and automatically shut off the water supply to the water heater in the event of a leak..

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

ANSI/CAN/IAPMO Z1349-2021 Standard for Detection, Monitoring or Control of Plumbing Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/CAN.IAPMO Z1349 -2021 *Standard for Detection, Monitoring or Control of Plumbing Systems*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The pan and drainage piping are intended to relieve small leaks. Although it might be small, a leak should not occur and is the first sign of a possible pending catastrophic event with no indication to the owner of any possible problem, as it is typically out of sight. In other instances, it can be extremely onerous to provide piping to an approved location in existing construction.

These listed devices are approved as options in many jurisdictions across Texas, California and more. In come cases, they are required in lieu of a pan and/or drain. They are reliable and sense a minuscule bit of moisture (one drop) and immediately shut off the water supply to the specific appliance. There are multiple manufacturers and well over a million units have been installed. Leading water heater manufacturers, such as Rheem and AO Smith, have already incorporated this leak sensing technology into their equipment. This provision will raise the level of safety and protection for installations without integral devices.

T**he first change above** provides an option, could be a less expensive installation in some cases, raises the level of safety, has the potential to reduce injuries and save millions of dollars in water damages to structures.

T**he second change above** provides a much higher level of safety and corrects a potential safety hazard. The original provision allows for a noncompliant (unsafe) installation to be replaced and remain noncompliant in perpetuity regardless of whether it is above an occupied space or any other potential unsafe location. If a leak occurs above an occupied space, the pan may collect and have no place to drain. This new addition would now require a replacement water heater to have a pan drain or have an integral device or an approved external device to shut off the water to the heater in the event of a leak.

The code should not incentivize substandard installations and provide exceptions for noncompliant unsafe conditions that could cause damage and bodily harm just because it was already done previously.

Sample Local Jurisdiction Code Language:

Fort Worth, Texas

Exception: When a water heater retrofit or replacement occurs on a slab foundation and the line cannot be discharged to an approved location the T& P discharge line can be piped to the water heater pan provided with all of the following:

1. the water heater when water is detected inside the pan;

2. A device is installed that will sound an audible alarm when water is detected inside the pan to alert the occupants that a leak has occurred.

Frisco Texas

P2801.9 Water heaters installed in attics or with living space below: Water heaters, other than tankless, when located in an attic space or a space located above living space, shall be equipped with a WAGS, Floodstop or other approved device to automatically shut off the water supply if a water leak is detected.**Exception:** Replacement water heaters that were permitted on or before December 31, 2013, shall not be required to be equipped with an automatic Shut off device.

The following standard for the testing and certification of these devices has also beed proposed to the list of approved standards in the IRC and the IPC: **ANSI/CAN/IAPMO Z1349 Standard for Devices for Detection, Monitoring or Control of Plumbing Systems.**

This standard supports the proposals in the IRC and IPC to allow these devices as an additional option. It is an ANSI Standard

Cost Impact: Decrease

Estimated Immediate Cost Impact:

No Cost Impact. ($0)

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal only provides an additional option that could potentially reduce construction and installation costs and does not have a cost impact since it is merely an option. The provision could save construction and installation costs, not to mention prevent leaks from becoming damaging over time or even catastrophic. Since **it is only another option, and not a required provision, it should never increase the cost of construction** if the decision is made on cost alone. This provision could save construction and installation costs, not to mention prevent leaks from becoming damaging over time or even catastrophic. The proposal corrects an unsafe provision and could also potentially save tens thousands of dollars per leak incident.

IPC: 504.7.3 (New)

Proponents: Brian Kelleher, Kelleher Home Solutions, LLC, Self (bkelleher@kelleherhvac.com)

2024 International Plumbing Code

Add new text as follows:

504.7.3 Pan drain termination cap. A protection device shall be installed on the drain pan adaptor to deter pest and air exchange from passing through but still allowing water to discharge when necessary.

Attached Files

- **dyno-cap.jpg**
  https://www.cdpaccess.com/proposal/9327/28398/files/download/3923/

Reason: To deter unwanted pest and outside air from entering the home through this required 1" PVC open pipe but without compromising water to discharge when necessary. Safety and efficiency! Deter mice, snakes, scorpions, insects from entering. Prevents unconditioned outside air from entering the home environment.

Bibliography: Please see supporting documentation, including videos, and analysis at the following link:
https://www.dropbox.com/scl/fo/7admcn4t757e5xcd4ko3n/h?rlkey=o8ndpvv7k5ukrxa684n3hmpi3&dl=0 This site was created and updated on 8 January 2024.

“Performance Video 1” shows the product in place on a drain line. When the water in the pan contacts the diaphragm, it dissolves in under 5 seconds (actually about 1-3 seconds). This video uses a push on version of the device with a thin metal retaining nut previously installed on the drain line.

Performance Video 2 shows the product in place on a drain line. This video uses a push on version of the device with a larger CPVC retaining nut previously installed on the drain line. When the water in the pan contacts the diaphragm, it dissolves in under 5 seconds (actually about 1-3 seconds).

Performance Video 3 shows the product in place on a drain line. This video uses a screw on version of the device with a thin metal retaining nut previously installed on the drain line. When the water in the pan contacts the diaphragm, it dissolves in under 5 seconds (actually about 1-3 seconds).

The video “Mouse vs Dyno-Cap” video shows the ease with which a mouse can access the inside of a home via an open 1” drain line. It further shows that with the proposed product in place, the mouse is deterred from entering the house. Similar effect is expected with insects, small snakes, etc…

The video “Temperature vs Dyno Cap” shows the resistance that the proposed product has to ingress of outside air into the home. It shows temperature at the cap to be 69-F when in place, and then rapidly decreasing to below freezing in under 2 minutes when the cap is removed.

The File “Results of Temperature” is a PDF document reviewing the equipment set up and and results as seen on the “Temperature vs Dyno cap” video.

The file “Statement of pros and cons” shows supporting discussion for the cost effectiveness of the proposed product.

The File "Proposed product" contains photo of the product in 3 different potential versions.

Cost Impact: Increase

Estimated Immediate Cost Impact:

A very small cost impact of $19/water heater is expected as a one time cost for the protection product which takes less than 10 seconds to install.

Estimated Immediate Cost Impact Justification (methodology and variables):

As the inventor of the product, manufacturing cost estimates support the cost at or below $19. The product design will be available for licensing and additional manufactures may market the product for less.

P63-24

P64-24

IPC: 504.8 (New)

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Add new text as follows:

504.8 Temperature Actuated Mixing Valves. All water heaters serving facilities with domestic hot water for bathing, washing, or showering shall have a temperature actuated mixing a valve conforming to ASSE 1017.

Staff Analysis: The proposed standard are is in the current edition of the code.

Reason: It's time to require temperature controls on water heaters! Currently, there are no temperature controls on water heaters. The combination gas controls (thermostats) serving gas-fired, storage type water heaters are burner controls, and these are located near the bottom of the water heater to sense cold water coming in and to turn "on" the burner. The heating element on electric water heaters are energy controls, and they are not intended to accurately control outlet temperature in the tight temperature ranges to prevent scalding.

The water heater thermostats do not sense or control the water temperature leaving the top of a tank type water heater. Tank type heaters allow hot water temperatures leaving the top of the water heater to vary up to 30 degrees Fahrenheit (30F) from the thermostat set point temperature.

Stacking occurs when there are short, intermittent draws of hot water that draw in a little cold water to the bottom of the water heater, and this causes the burner or heating element to cycle "ON." The standards for a water heater and combination gas control valve, combined, allow a 30F rise in temperature from the level of the thermostat to the top of the water heater. A 30F rise is not safe. At 120F, it takes about 4.8 minutes to cause serious blistering burn injuries in an adult male. At 150F, an adult male can receive serious blistering burn injuries in less than one second. This is so fast, that the bather would not have time to react and get out of harm's way. Women & children have thinner skin and can be burned in less time than an adult male.

This code change to require thermostatic or temperature actuated temperature controls on water heaters is intended to protect bathers, especially children, the elderly, and handicapped persons. The inability of storage type water heaters to accurately control the outlet temperature presents a scald danger.

Because storage type water heaters do not have the ability to control the outlet temperature in ranges to avoid scalding dangers, engineers, contractors, medical personnel, and researchers have been calling for thermostatic or temperature actuated mixing valves to be installed on water heaters serving the hot water distribution system. According to researchers at Johns Hopkins University and injury lawyers that specialize in scald burns, who have researched the costs associated with burn injuries, burn injuries are very expensive to treat. Serious burn injuries have many complications—some physical, some medical, some psychological, some financial. A severely burned injury victim can end up permanently disabled and suffering from post-traumatic stress disorder (PTSD).

Burn injuries are often expensive to treat because a serious injury can cause multiple medical problems. Some of the physical injuries and medical costs that can result from burn injuries include skin damage, skin loss, and scarring and disfigurement:* Follow-up surgeries to scrape off or cut off and remove dead tissue (Debridement)

* Sepsis infection from dead tissue that rots on or in the body (Sepsis Shock)
* Contracture (Skin Tightening that limits future mobility)
* Damage to or loss of soft tissues, such as ligaments, tendons, and muscles
* Damage to bones (with severe burn injuries)
* Nerve damage
* Loss of vision

* Lung damage

* Other internal organ damage, often from medical complications.

Burn injuries often require hospital stays that are much longer than stays for non-burn injuries; the average is 8.1 days for burn victims and 4.5 days for those with non-burn injuries. Costs run much higher as well, often more than twice as high for burn-injury sufferers. The American Burn Association has stated that a burn accident survivor with 40 to 60 percent of their body burned will be in the hospital an average of 54 days, at an average cost of $780,000. If burns are more serious, costs can skyrocket. Severe burns without complications cost $1.6 million on average.

Medical Complications Increase Medical Costs of Burn Injury Victims Quickly:

* Burn injuries cause loss of skin leaving burn victims vulnerable to infections, which can add up to $120,000 in costs (occurs, on average, in 35 percent of cases).

* Skin grafts and slow healing can increase costs to $110,000 (occurs, on average, in 32 percent of cases).

* Fragile skin and skin breakdown can increase costs to $107,000 (occurs, on average, in 55 percent of cases).

* PSTD and other psychological issues can add $75,000 to hospital costs (occurs, on average, in 57 percent of cases).

* Disfigurement, scarring, and contracture can increase costs to $35,000 (occurs, on average, in 66 percent of cases).

* Serious burn injuries can require a multitude of specialists:

* Surgeons, including plastic and reconstructive surgeons

* Anesthesiologists

* Pain management specialists

* Wound-care professionals

* Various types of therapists, including physical, occupational, speech, and psychological, depending on the injuries

* Mental health professionals and social workers.

Such specialized care is not inexpensive. On top of that, the many medications—at the minimum, pain relief and antibiotics—are costly, along with specialized wound dressings, pressure bandages to help limit scarring, and blood transfusions.

Post-hospital, costs can mount if it is necessary to modify the home or the family vehicle to accommodate the new disability. Other items that can add to costs are wheelchairs or walkers, prosthetics, and orthotics. Often, specialized home health care is required.

The family of the burn victim can also suffer from financial loss after the injury, if the scald victim was the breadwinner. However, if the injury was caused by another party’s negligence or recklessness, a number of economic and non-economic damages are recoverable. “Economic damages” are things such as past and future medical bills; the cost of rehabilitation, assistive devices and prostheses; and lost wages. Typical “non-economic” damages are compensation for pain and suffering, and for mental anguish resulting from the injury. No amount of compensation will undo a serious scald burn injury.This code change should eliminate most of the scald injuries and reduce litigation and liability costs, which should also help reduce the retail cost of water heaters.

Bibliography: Related research:

“Burn injuries in the older population and understanding the common causes to influence accident prevention,” published in the journal Burns in June 2023, finds: “The main cause of burn injuries in the elderly of Yorkshire and Humber [England] was food preparation. The majority of the food preparation burn injuries were a scald burn due to the handling of hot fluids, either from a saucepan or a kettle. A prevention strategy aiming to make people aware of this finding can help reduce burn injuries in the over 65 years old age group.”

“Pediatric major burns: a monocentric retrospective review of etiology and outcomes (2008–2020),”

published in the European Journal of Plastic Surgery in April 2022, finds: “Scalds were the main mechanism of injury (70.1%) and upper extremity was the most frequent location affected (68%). The 28.6% of patients suffered some complication, but the mortality rate was low (0.7%).”

“A state-wide analysis of pediatric scald burns by tap water, 2016–2018,”

published in Burns in December 2020, finds “a significant number of scald burn injuries by tap water in children, particularly under 5 years.”

“Burn Injury,”

published in Nature Reviews, Disease Primers, in February 2020, finds, “Development of international burn registries should facilitate better understanding of burn injury aetiologies in many vulnerable populations.”

“Pediatric Burns:

A Single Institution Retrospective Review of Incidence, Etiology, and Outcomes in 2273 Burn Patients (1995–2013)” published in the Journal of Burn Care & Research in November 2016, finds “children 6 years or younger accounted for more than half of the burn-associated hospitalizations, and were more likely to be male children suffering scald burns.” Also, “Geographical analysis revealed significantly higher incidence of burns in areas with lower incomes.”

“Preventing childhood scalds within the home: Overview of systematic reviews and a systematic review of primary studies,” published in Burns in August 2015, finds, “The paucity of evidence we found highlights the need for research to investigate the effect of interventions on reducing the incidence of childhood scalds in the home, the safe handling of food and drinks, and safe kitchen and cooking practices.”

Cost Impact: Increase

- **Berkley Nat Lab WH Retail Price Database for DOE1997-1999.pdf**
  https://www.cdpaccess.com/proposal/10283/30697/documentation/147338/attachments/download/4326/

Estimated Immediate Cost Impact:

$70 - $250 Materials Plumber's cost to consumer for a thermostatic mixing valve

$120 - $240 for a plumber to install a thermostatic mixing valve on site.

Total price range to install a thermostatic nixing valve on a water heater discharge piping at a jobsite = $190 - $490

$35-$55 Materials wholesale price for manufacturer to purchase Thermostatic Mixing Valves in bulk
$7-$15 to install a thermostatic mixing valve on a factory assembly line

Total price range to install a thermostatic mixing valve on a Water heater in a factory assembly line = $42 - $70

Estimated Immediate Cost Impact Justification (methodology and variables):

Reducing burn injuries is a health & safety issue that will save hundreds of thousands of dollars in medical costs and long term care for over 17,000 tap water scald burn victims each year.
According to Researchers at John’s Hopkins University and prominent burn injury lawyers, that have researched burn injuries, and determined that costs associated with burn injuries are very expensive.

Burn Injury Treatment And Expenses: January 23, 2018 / Catastrophic Injuries.

Serious burn injuries have many complications—some physical, some medical, some psychological, some financial. A severely burned injury victim can end up permanently disabled and suffering from post-traumatic stress disorder (PTSD). If the burn injury occurred because of someone else’s negligence or recklessness, you may have an actionable lawsuit for lost income and other damages.

Between 2016 and 2018, 52,088 people in the U.S. visited emergency departments for tap water scald burns (Over 17,000 per year).

An additional 7,270 were hospitalized and 110 died at the hospital.

In total, the cost of visits added up to $29.79 million for emergency department visits and $206.69 million for hospital stays.

Among those who were hospitalized, 41% were white, 28% were Black and 17% were Hispanic. About 9% were listed as “others” and data was missing for 5%. Race data were not available for emergency department visits.

Also, Medicaid and Medicare paid for 67% of inpatient stays and 47% of emergency department visits, reflecting that scald burns disproportionally affect older adults and lower-income populations. Medicaid covers people whose income is below a certain government threshold, while Medicare covers people who are 65 and older, regardless of income. Both programs cover people who have disabilities.

“We’re all paying these costs with federal dollars, and it has a simple engineering solution,” says a researcher at John’s Hopkins University.

Burn Injuries Are Extremely Costly To Treat Burn injuries are often expensive to treat because a serious injury can cause multiple medical problems. Some of the physical injuries that can result from burn injuries include:

kin damage, skin loss, and scarring and disfigurement. (Elephant Man Syndrome)

ollow-up surgeries to scrape off or cut off and remove dead tissue (Debridement)

epsis infection from dead tissue that rots on or in the body

ontracture (skin tightening that limits future mobility)

amage to or loss of soft tissues such as ligaments, tendons, and muscles

amage to bones (with severe burn injuries)

erve damage

oss of vision

ung damage

ther internal organ damage, often from medical complications.

Burn injuries often require hospital stays that are much longer than stays for non-burn injuries; the average is 8.1 days for burn victims and 4.5 days for those with non-burn injuries. Costs run much higher as well, often more than twice as high for burn-injury sufferers. The American Burn Association has stated that a burn accident survivor with 40 to 60 percent of their body burned will be in the hospital an average of 54 days, at an average cost of $780,000. If burns are more serious, costs can skyrocket. Severe burns without complications cost $1.6 million on average.

Medical Complications Increase medical costs of burn Injury Victims Quickly:

urn injuries cause loss of skin leaving burn victims vulnerable to infections, which can add up to $120,000 in costs (occurs, on average, in 35 percent of cases).

kin grafts and slow healing can increase costs to $110,000 (occurs, on average, in 32 percent of cases).

ragile skin and skin breakdown can increase costs to $107,000 (occurs, on average, in 55 percent of cases).

STD and other psychological issues can add $75,000 to hospital costs (occurs, on average, in 57 percent of cases).

isfigurement, scarring, and contracture can increase costs to $35,000 (occurs, on average, in 66 percent of cases).

erious burn injuries can require a multitude of specialists:

urgeons, including plastic and reconstructive surgeons

nesthesiologists

ain management specialists

Vound-care professionals

arious types of therapists, including physical, occupational, speech, and psychological depending on the injuries

lental health professionals and social workers.

Such specialized care is not inexpensive. On top of that, the many medications—at the minimum, pain relief and antibiotics—are costly, along with specialized wound dressings, pressure bandages to help limit scarring, and blood transfusions.

Post-hospital, costs can mount if it is necessary to modify the home or the family vehicle to accommodate the new disability. Other items that can add to costs are wheelchairs or walkers, prosthetics, and orthotics. Often, specialized home health care is required as well.

The family of the burn victim can also suffer from financial loss after the injury, if the scald victim was the breadwinner. However, if the injury was caused by another party's negligence or recklessness, a number of economic and non-economic damages are recoverable. "economic damages" are things such as past and future medical bills; the cost of rehabilitation, assistive devices and prostheses; and lost wages. typical "non-economic" damages are compensation for pain and suffering, and for mental anguish resulting from the injury. No amount of compensation will undo a serious scald burn injury.

But facts and figures do not come close to touching the heart of the matter. The human costs—the burn victim's physical and emotional suffering, as well as the emotional pain of family members—mean that everyone suffers when a serious burn injury occurs.

Estimated Life Cycle Cost Impact:

Between 2016 and 2018, 52,088 people in the U.S. visited emergency departments for tap water scald burns (Over 17,000 per year).

An additional 7,270 were hospitalized and 110 died at the hospital.

In total, the cost of visits added up to $29.79 million for emergency department visits and $206.69 million for hospital stays.

Among those who were hospitalized, 41% were white, 28% were Black and 17% were Hispanic. About 9% were listed as "others" and data was missing for 5%. Race data were not available for emergency department visits.

Also, Medicaid and Medicare paid for 67% of inpatient stays and 47% of emergency department visits, reflecting that scald burns disproportionally affect older adults and lower-income populations. Medicaid covers people whose income is below a certain government threshold, while Medicare covers people who are 65 and older, regardless of income. Both programs cover people who have disabilities.

"We're all paying these costs with federal dollars, and it has a simple engineering solution," says a researcher at John's Hopkins University.

P64-24

P65-24

IPC: 602.2

Proponents: Kyle Thompson, Technical Director, Plumbing Manufacturers International, Plumbing Manufacturers International (kthompson@safeplumbing.org)

2024 International Plumbing Code

Revise as follows:

602.2 Potable water required.
Only potable water shall be supplied to plumbing fixtures that provide water for drinking, bathing or culinary purposes, or for the processing of food, medical or pharmaceutical products. Unless otherwise provided in this code, potable water shall be supplied to all plumbing fixtures. <u>Water closets supplied by an alternate non-potable water source for use in flushing shall also be supplied with an equal-sized potable water line that is dry until in use.</u>

Reason: The objective of this proposal is to safeguard an individual's freedom to choose between a conventional flush toilet and a smart toilet or personal hygiene device (bidet seat) for their home, ensuring that the code upholds this right.

The current code incorporates provisions for providing non-potable water indoors specifically for toilet flushing and other applications. In instances where a building is plumbed with a non-potable water supply line to the toilet, residents opting for a smart toilet or personal hygiene device, whether out of necessity or choice, must connect to the available non-potable water supply or re-pipe with a potable water supply line for proper installation of the smart toilet – often incurring prohibitive expenses. The code restricts the use of non-potable water for activities like bathing, washing with faucets, showerheads, tub spouts, etc. This same consideration should be extended to personal hygiene devices and smart toilets, crucial for many Americans due to medical conditions, or preferred for reasons of cleanliness, health, and environmental awareness.

Making an allowance in the existing code for the inclusion of these products, which adhere to all major plumbing codes and boast a longstanding presence in the market, is important for ensuring public health and safety. The U.S. smart toilet market, valued at $1.8 billion, is anticipated to surpass $3 billion within the next five years. Individuals across the United States incorporate these products into their bathrooms, with some relying on them for maintaining dignity, privacy, and self-reliance, especially those with special needs or limited mobility.

Ensuring ease of cleaning is immediately beneficial and crucial for seniors, significantly impacting their hygiene. Moreover, individuals facing colorectal issues like hemorrhoids, irritable bowel syndrome (IBS), and inflammatory bowel disease (IBD),[1.] along with pregnant women experiencing severe constipation or postpartum recovery,[2.] derive additional hygiene-related advantages from these products. They also contribute to maintaining hand hygiene, a critical factor in preventing the spread of diseases.[3.]

Beyond hygiene, many smart toilets feature health monitoring capabilities that analyze stool or urine to detect health issues such as sugar levels in diabetics. These innovations have proven especially beneficial for stroke rehabilitation[4.]. For certain individuals who cannot use toilet paper due to medical reasons, personal hygiene devices are indispensable. Additionally, these devices have demonstrated a reduction in instances of rashes, hemorrhoids, and urinary tract infections.

In essence, these products are vital for numerous individuals across the United States in preserving their health. However, the existing code could impede the installation of such products in residential bathrooms where the building is plumbed with a non-potable water supply line to the toilet.

This proposal aims to guarantee residents the freedom to choose personal hygiene devices or smart toilets for their homes. It specifies the availability of a potable water supply if builders opt to install non-potable water lines for toilet flushing. To prevent stagnant water conditions, the proposal necessitates keeping the potable water line dry until it is in use. Achieving this could involve installing a water line from the lavatory and incorporating a labeled shutoff valve at the lavatory.

Furthermore, the code already approves using personal hygiene devices that conform to ASME A112.4.2/CSA B45.16. This industry standard requires that a personal hygiene device includes backflow protection through an atmospheric vacuum breaker, air space type vacuum breaker, or air gap fitting.

Non-potable water treated to the level for use in toilet flushing that is compliant with the code, applicable laws, rules, ordinances, and NSF/ANSI 350 or IGC 324 is not equivalent to the level of safety that is dictated by federal law for potable water. Many individuals that use smart toilets and personal hygiene devices do so out of necessity due to disabilities and/or underlying health issues (e.g., arthritis, urinary tract infections, hemorrhoids, anal fissures). The quality level of water that is used with smart toilets and personal hygiene devices must be free of any pathogens, etc., that could cause infection or disease, and therefore, must be treated at a minimum in accordance with regulations for potable water.

Though it is always wise to consult a building official before tackling a new project, the codes do not require a permit to be pulled for every installation in a residential occupancy. For example, the IRC allows for the removal and reinstallation of a toilet without a permit if the installation does not involve or require the replacement or rearrangement of valves, pipes, or fixtures (Section R105.2). A personal hygiene device or smart toilet would meet this exemption as they are installed using the existing plumbing components and piping configuration.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Increase cost of $175 for rough in of potable water supply line that is dry until in use.

Estimated Immediate Cost Impact Justification (methodology and variables):

a. Rough-in of potable water line that is dry until in use:
i. Parts: shutoff valve ($40), 20 ft copper pipe ($60).
ii. Plumbing Labor: 0.5-hour labor @$150/hr ($75).
iii. Total $175

Estimated Life Cycle Cost Impact:

Savings of $775 for re piping when compared with the cost of rough in of potable supply pipe.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

a. Re-pipe for potable water supply line after construction:
i. Construction
1. Parts: Estimate Drywall $2.50/sq ft., Tile $10/sq ft.
2. Construction Labor: $100/hr.
3. Construction Subtotal: Remove and restore 20sq ft of drywall and tile. 2 hr labor plus parts (Sub Total $450).
ii. Plumbing
1. Parts: Shutoff valve ($40), 20 ft copper pipe ($60).

2. Plumbing Labor: $150/hr.

3. Plumbing Subtotal: Reframe for new plumbing, pipe and fitting installation. 2 hr labor plus parts (Sub Total: $400).

iii. Permit: $100.

iv. Total $950 for re-pipe after construction.

P65-24

P66-24

IPC: 602.2.1 (New), ASHRAE Chapter 15 (New)

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Plumbing Code

Add new text as follows:

602.2.1 Pathogen Control. Where required, water supply and distribution systems shall be designed and maintained to control Legionella and other pathogens in accordance with ASHRAE 188 and ASHRAE 514.

Add new standard(s) as follows:

ASHRAE

ASHRAE
180 Technology Parkway
Peachtree Corners, GA 30092

ASHRAE 188-2021	Legionellosis: Risk Management for Building Water Systems
ASHRAE 514-2023	Risk Management for Building Water Systems: Physical, Chemical, and Microbial Hazards

Staff Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 188-2021 *Legionellosis: Risk Management for Building Water Systems* and ASHRAE 514-2023 *Risk Management for Building Water Systems: Physical, Chemical, and Microbial Hazards,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: ASHRAE Standard 188 provides minimum legionellosis risk management requirements for the design, construction, commissioning, operation, maintenance, repair, replacement, and expansion of new and existing buildings and their associated (potable and non-potable) water systems and components.

Standard 188 has been in development for over 12 years by a cross-section of expert stakeholders. It has been supported by the CDC and was adopted as the basis for their Legionella Toolkit. It is increasingly being adopted by state and local jurisdictions, for example New York and Michigan. Additionally, the Alliance to Prevent Legionnaires' Disease endorses the use of ASHRAE Standard 188 by building owners and operators holistically to support risk management against legionella for the entire building.

ASHRAE Standard 188 gives building owners a structured approach to develop water management plans designed for their specific facility to assist with legionella prevention. Further, it takes into consideration the risks of incoming water quality that can result in building and residential water quality and bacterial issues, which is sometimes overlooked.

In contrast, ASHRAE Standard 514 is broader in scope to include chemical, physical, and microbial hazards. Thus, having both references will ensure the necessary steps are taken to maintain optimal water quality.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The cost will vary based on the specifics of the water management plan. However, the cost is associated with developing and carrying out a water management plan will be orders of magnitude less than the cost of remediation and possible litigation should there be an outbreak.

An estimated cost based on a previous project is $4,000 in upfront cost (for a consultant) and $1600 - $2600 annual cost for training and testing.

Estimated Immediate Cost Impact Justification (methodology and variables):

Consultant cost for generating water plan: $4,000 assuming 40 hours of work.

Staff training: $600 per year assuming 2 hour training session at a rate of $20/hr per person and 15 people being trained.

Testing: $1,000 - $2,000 per year assuming 20 tests/year.

P66-24

P67-24

IPC: 604.4, 604.4.1 (New), 604.4.2 (New), TABLE 604.4

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com)

2024 International Plumbing Code

Revise as follows:

604.4 Maximum flow and water consumption.
The maximum water consumption flow rates and quantities for all plumbing fixtures and fixture fittings shall be in accordance with Table 604.4.

~~**Exceptions:**~~

1. ~~Blowout design water closets having a water consumption not greater than $3^{1}/_{2}$ gallons (13 L) per flushing cycle.~~
2. ~~Vegetable sprays.~~
3. ~~Clinical sinks having a water consumption not greater than $4^{1}/_{2}$ gallons (17 L) per flushing cycle.~~
4. ~~Service sinks.~~
5. ~~Emergency showers.~~

Add new text as follows:

604.4.1 Group wash fixtures. Group wash fixtures used as public lavatories shall have a maximum water consumption flow rate in accordance with Table 604.4 based on each 16 inches of rim space.

604.4.2 Emergency fixtures. The maximum flow rates in Table 604.4 shall not apply to emergency fixtures.

Revise as follows:

TABLE 604.4 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Clinical sink	4.5 gallons per flushing cycle
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a, c]	2.0 gpm at 80 psi
~~Sink~~ Kitchen sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle
Water closet, blowout	3.5 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Shower heads shall comply with all requirements for high-efficiency showerheads in ASME A112.18.1-2020/CSA B125.1.

Reason: This proposal is an alternative approach for addressing the exceptions currently listed in Section 604.4. Clinical sink and blowout water closets have been added to the table since there are water consumption requirements. These are not exceptions.

The other change to the table is the addition of the word “kitchen” in front of sink faucet in Table 604.4. The Federal water conservation requirements are very clear in listing kitchen faucets. The use of the term “sink faucets” has led to some of the confusion regarding what sinks are regulated for water conservation.

A new subsection is proposed for determining the water consumption use for group wash fixtures used as public lavatories. Section 419.1 lists a rim space to be classified as a lavatory. However, for water consumption applications, the spacing listed is not consistent with the use of the fixture. The manufacturers have allocated the water use for each 16 inches of rim space.

The other new subsection states that emergency fixtures, showers, eyewash, or facewash, are not regulated by Table 604.4. This is consistent with the Federal requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial. If one reviews the change, they will notice that there is no additional requirements for plumbing fixtures. The text is simplified into a table format for better understanding. Hence, this has no impact on the cost of construction.

P67-24

P68-24

IPC: 604.4, 604.4.1 (New), 604.4.2 (New), 604.4.3 (New), 604.4.4 (New), TABLE 604.4

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com)

2024 International Plumbing Code

Revise as follows:

604.4 Maximum flow and water consumption.
The maximum water consumption flow rates and quantities for all plumbing fixtures and fixture fittings shall be in accordance with Table 604.4 and Section 604.4.1 through 604.4.4.

~~**Exceptions:**~~

1. ~~Blowout design water closets having a water consumption not greater than 3$^{1}/_{2}$ gallons (13 L) per flushing cycle.~~
2. ~~Vegetable sprays.~~
3. ~~Clinical sinks having a water consumption not greater than 4$^{1}/_{2}$ gallons (17 L) per flushing cycle.~~
4. ~~Service sinks.~~
5. ~~Emergency showers.~~

Add new text as follows:

604.4.1 Blowout water closets. Blowout design water closets shall have a maximum water consumption of 3-1/2 gallons (13 L) per flushing cycle.

604.4.2 Clinical Sinks. Clinical sinks shall have a maximum water consumption of 4-1/2 gallons (17 L) per flushing cycle.

604.4.3 Group wash fixtures. Group wash fixtures used as public lavatories shall have a maximum water consumption flow rate in accordance with Table 604.4 based on each 16 inches of rim space.

604.4.4 Vegetable sprays, service sinks, and emergency fixtures. The maximum flow rates in Table 604.4 shall not apply to vegetable sprays, service sinks, and emergency fixtures.

Revise as follows:

TABLE 604.4 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a, c]	2.0 gpm at 80 psi
Kitchen ~~Sink~~ sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Shower heads shall comply with all requirements for high-efficiency showerheads in ASME A112.18.1-2020/CSA B125.1.

Reason: The primary purpose of this proposal is to remove the exceptions from Section 604.4. Many of the exceptions are not exceptions, they are additional requirements. As such, the requirements belong as subsections of the main section. The fixtures that are not listed as not having applicable requirements are technically not even listed in Table 604.4. However, these fixtures were added as exceptions to clarify that the table requirements do not apply. Rather than removing these fixtures from the additional requirements, they have been combined and added as the last subsection indicating that the water consumption requirements do not apply.

For the other items, blowout water closets and clinical sinks, the water consumption requirements are included in the first two subsections. However, it should be noted that both of these fixtures could be added to Table 604.4 since there are maximum water consumption requirements for the fixtures.

The final additional subsection is for determining the water consumption use for group wash fixtures used as public lavatories. Section 419.1 lists a rim space to be classified as a lavatory. However, for water consumption applications, the spacing listed is not consistent with the use of the fixture. The manufacturers have allocated the water use for each 16 inches of rim space.

The final modification is the addition of the word “kitchen” in front of sink faucet in Table 604.4. The Federal water conservation requirements are very clear in listing kitchen faucets. The use of the term “sink faucets” has led to some confusion regarding what sinks are regulated for water conservation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial as current code requirements are being reformatted for clarity.

P69-24

IPC: TABLE 604.4

Proponents: Anthony Floyd, City of Scottsdale, City of Scottsdale (afloyd@scottsdaleaz.gov); Edward R. Osann, Natural Resources Defense Council, Natural Resources Defense Council (eosann@nrdc.org)

2024 International Plumbing Code

Revise as follows:

TABLE 604.4 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a, c]	2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	~~1.0~~0.5 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Shower heads shall comply with all requirements for high-efficiency showerheads in ASME A112.18.1-2020/CSA B125.1.

Reason: Urinals can account for a significant amount of indoor water usage in commercial and institutional buildings. A typical urinal getting 18 flushes a day over 260 weekdays will draw and discharge nearly 5,000 gallons of water per year if operating at the IPC's maximum flush volume of 1 gallon per flush. In light if this, in 2009 the US EPA WaterSense Program published a voluntary specification for flushing urinals, with a maximum flush volume of 0.5 gallons per flush while conforming with all other applicable industry standards. Manufacturers responded with scores of urinal models having a maximum flush rate of 0.5 gallons or less without sacrificing product performance.

All flushing urinals produce calcite build-up in the urinal trapway and drain pipes caused by the bonding of the mineral ions in the flush water with the sediment in urine. As such, build-up occurs in all flushing urinals from 1.0 gpf down to 0.1 gpf and is not any greater for 0.5 gpf urinals.

Based on WaterSense product listings from January 2024, there are 19 brands and 399 models of flushing urinals and 17 brands and 407 models of urinal flush valves sold separately that meet the 0.5 gpf criterion, demonstrating the commercial viability and availability of water-efficient urinals. To date, 12 states (including New York and California) and the District of Columbia have adopted requirements limiting new urinals to a maximum flush volume of 0.5 gallons or less.

The installation of urinals that conform to this proposal will save building owners on water and wastewater charges (see cost impact statement below) and help protect public water supplies by reducing unnecessary water use over the life of the building.

Bibliography: EPA WaterSense
- https://www.epa.gov/watersense/urinals

Considerations for Reduced Water Consumption Rates of Urinal Fixtures (Sloan Valve) - https://www.sloan.com/sites/default/files/2016-01/hybrid-urinal-whitepaper.pdf

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The code change proposal will decrease the cost of construction, with a likely range of cost reduction of $30 to $0 per urinal. In most cases, there is little cost difference between urinals that flush at 0.5 gpf, as proposed here, and those that flush at 1.0 gpf, the volume allowed in the IPC. Numerous examples are found where the price of 0.5 gpf units are the same or less.

Our review (below) of current pricing information reaffirms what the US EPA WaterSense program found comparing 1.0 gpf units with 0.5 gpf units in 2017, when it stated:

"Our product research has found that high-efficiency urinal fixtures and flushing devices are no more expensive than their standard (1.0 gpf) counterparts. The average price of a new high-efficiency or standard urinal fixture is about $350 and the average cost for a high-efficiency or standard pressurized flushing device (flushometer valve) is approximately $200. Because there is very little to no cost difference between high-efficiency flushing urinals and standard flushing urinals, installing high-efficiency models in new construction or as part of the natural replacement process is cost-effective with immediate payback in water cost savings."

See https://19january2017snapshot.epa.gov/www3/watersense/pubs/faq_lfu.html#two.

Estimated Immediate Cost Impact Justification (methodology and variables):

Pricing information is from the W. W. Grainger web site,

<https://www.grainger.com/category/plumbing?analytics=nav> accessed January 8, 2024, and illustrates this point.

Urinal flush valves and urinal fixtures are frequently sold separately, as well as in combination. Urinal fixture models can be found that are rated to operate at *both* 1.0 gpf and 0.5 gpf, allowing for a flush valve of either 0.5 gpf or 1.0 gpf to be affixed to the fixture. Thus, for a significant group of urinal fixtures, there is *no difference* in cost because the same fixture can perform at either flush volume, as controlled by the specific flush valve selected. Among wall-mounted washout urinals with a top spud, the least expensive fixture model carried by Grainger is the Gerber Lafayette, rated at both 1.0 gpf and 0.5 gpf, offered at $137. Other examples include American Standard Maybrook, rated at 0.1, 0.25, and 0.5 gpf, priced at $197; Sloan, rated at 0.1, 0.25, and 0.5 gpf, priced at $195.50; and Kohler Darfield, rated at both 1.0 gpf and 0.5 gpf, priced at $412. For wall-mounted urinals with back spuds, all seven of the models offered by Grainger were rated at 0.5 gpf or less.

Urinal flush valves can vary in cost based on spud and inlet dimensions and internal mechanism. But where manufactures are offering comparable products that differ only in flush volume, there is little difference in price. For American Standard piston-type manual valves with 3/4 in spud coupling and 3/4 in inlet, the 1.0 gpf model is priced at $143.21 and the 0.5 gpf model is priced at $143.83. Similarly, Toto offers a comparable piston-type valve priced at $276.42 for the 1.0 gpf model and $280.40 for the 0.5 gpf model, a difference of less than 2%. In manual diaphragm-type valves, the Zurn Aquaflush Z6003 rated at 1.0 gpf is priced at $176.21, while the same model rated at 0.5 gpf is priced at $134.12, significantly less. The Sloan Royal diaphragm-type valve with the same dimensions flushing at 1.0 gpf is priced at $253.63, while the comparable model flushing at 0.5 gpf is priced at $223.15, also significantly less. Automatic flush valves are significantly more expensive than manual valves, but again, several examples can be found of manufacturers offering valves that are similar in all dimensions and differ only in flush volume, with models rated at 1.0 gpf and 0.5 gpf being priced at nearly the same levels. For example, Zurn's Metroflush ZEM6203 electric valves are priced identically in both 1.0 gpf and 0.5 gpf models.

Estimated Life Cycle Cost Impact:

Cost savings attributable to reduced water and sewer charges to the building owner ($22 per year) over a 30-year period have a present value of approximately $430 in current dollars.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Water savings to the building owner or tenant will vary by usage, of course. But for a urinal receiving typical usage of 18 flushes per day over 260 weekdays per year (assumptions used by WaterSense in their own analysis), the savings in water and wastewater charges from flushing at 0.5 gpf rather than 1.0 gpf amount to about $22 per year per urinal, based on a national average $9.09/kgal for the quantity charge for water and wastewater service to commercial customers as of July 2022, as reported by the Water and Wastewater Rate Survey produced by the American Water Works Association, Raftelis Financial Consultants, Inc, and posted here: https://ellio.raftelis.com/Account/AWWA. Applying a 3% discount rate over 30 years, these savings have a present value of $431 per urinal, based on standard discounted cash flow analysis.

P69-24

P70-24 Part I

IPC: TABLE 604.4

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

TABLE 604.4 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Lavatory, private	~~2.2~~ 1.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a, c]	2.0 gpm at 80 psi
Sink faucet	~~2.2~~ 1.8 gpm at 60 psi[d]
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Shower heads shall comply with all requirements for high-efficiency showerheads in ASME A112.18.1-2020/CSA B125.1.

d. Kitchen faucets shall be permitted to temporarily increase the flow above the maximum rate, but not to exceed 2.2 gpm at 60 psi provided that the faucet reverts to a maximum flow rate of 1.8 gpm at 60 psi upon valve closure.

Reason: Residential Lavatory Faucets: This proposal requires a maximum flow rate of 1.2 gallon per minute (gpm) at 60 psi standard for residential lavatory faucets. These standards have been adopted in multiple states, including California, Hawaii, Oregon, Washington, Maine, and New York. There is wide technological availability—of the 12,602 lavatory faucets and aerators listed in DOE's Compliance Certification Database, 10,607 or 85% meet the 1.2 gpm standard. In their analysis to establish this standard in 2013, the California Energy Commission found no or very low incremental costs for compliant products.[1] Plumbing and sewer systems in older buildings are not expected to be negatively impacted as the standards allow for only 20% less water to flow.

Res Kitchen Faucets: This proposal requires a maximum flow rate of 1.8 gpm (with a 2.2 gpm override) at 60 psi for kitchen faucets. These standards have been adopted in multiple states including Maine, Massachusetts, New Jersey, New York and Vermont. This standard provides water savings but maintains consumer utility for pot filling allowing a 2.2 gpm override. 2.2 gpm is the same level as the current Watersense standard. There is wide technological availability—of the 11,519 kitchen faucets and aerators listed in DOE's Compliance Certification Database, 7,173 or 62% meet the 1.8 gpm standard. In plumbing systems in older buildings are not expected to be negatively impacted as the standards allow for only 18% less water to flow.

This proposal would save 5,200 gallons of water per year and result in $1,000 in cost savings over the lifetime of the faucet for a typical residence.

[8] https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_5_3
[9] https://www.eia.gov/dnav/ng/ng_pri_sum_dcu_nus_a.htm
[10] https://www.eia.gov/dnav/pet/pet_pri_wfr_dcus_nus_m.htm

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. In their analysis to establish this standard in 2013, the California Energy Commission found no or very low incremental costs for compliant products.[2]

Estimated Immediate Cost Impact Justification (methodology and variables):

The California Energy Commission report found very little price difference between higher and lower efficiency faucets and faucet accessories. The CEC reviewed the whole sale catalog of NEOPERL, a major manufacturer, and found there was no cost difference between qualifying and non-qualifying product.[2]

Estimated Life Cycle Cost Impact:

This proposal would save 5,200 gallons of water per year and result in $1,000 in cost savings over the lifetime of the faucets in a typical dwelling unit.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

To estimate the roughly $1,000 in life cycle cost savings, a conservative assumption of saving 1,140 gallons of water per year resulting in 91kWh of electricity savings and 4.6 therms/year of savings from a natural gas or oil water heater was made based on savings estimates from the appliance standards awareness program[3] and an appliance standards evaluation report for California.[4] It was assumed that a typical dwelling unit has roughly 3.5 lavatory faucets and 1 kitchen faucet.[5] Water and waste water prices were estimated at $11 per thousand gallons and the effective useful life of the faucet was estimated to be 10 years.[6] It was assumed that 48% of water heaters were natural gas, 46% were electric and 6% were fuel oil based on the 2020 Residential Energy Consumption Survey.[7]Electricity was estimated to cost $0.15/kWh[8], fuel oil was estimated at $3.06/therm[10] and natural gas was estimated at $1.42/therm[9] using annual prices from the Energy Information Administration.

P70-24 Part I

P70-24 Part II

IRC: TABLE P2903.2

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

2024 International Residential Code

Revise as follows:

TABLE P2903.2 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS [b]

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	~~2.2~~1.2 gpm at 60 psi
Shower head [a]	2.5 gpm at 80 psi
Sink faucet	~~2.2~~1.8 gpm at 60 psi[c]
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.c

a. A hand-held shower spray shall be considered to be a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Kitchen faucets shall be permitted to temporarily increase the flow above the maximum rate, but not to exceed 2.2 gpm at 60 psi provided that the faucet reverts to a maximum flow rate of 1.8 gpm at 60 psi upon valve closure.

Reason: Residential Lavatory Faucets: This proposal requires a maximum flow rate of 1.2 gallon per minute (gpm) at 60 psi standard for residential lavatory faucets. These standards have been adopted in multiple states, including California, Hawaii, Oregon, Washington, Maine, and New York. There is wide technological availability—of the 12,602 lavatory faucets and aerators listed in DOE's Compliance Certification Database, 10,607 or 85% meet the 1.2 gpm standard. In their analysis to establish this standard in 2013, the California Energy Commission found no or very low incremental costs for compliant products.[1] Plumbing and sewer systems in older buildings are not expected to be negatively impacted as the standards allow for only 20% less water to flow.

Res Kitchen Faucets: This proposal requires a maximum flow rate of 1.8 gpm (with a 2.2 gpm override) at 60 psi for kitchen faucets. These standards have been adopted in multiple states including Maine, Massachusetts, New Jersey, New York and Vermont. This standard provides water savings but maintains consumer utility for pot filling allowing a 2.2 gpm override. 2.2 gpm is the same level as the current Watersense standard. There is wide technological availability—of the 11,519 kitchen faucets and aerators listed in DOE's Compliance Certification Database, 7,173 or 62% meet the 1.8 gpm standard. In plumbing systems in older buildings are not expected to be negatively impacted as the standards allow for only 18% less water to flow.

For a typical single family home, this proposal would save 5,200 gallons of water per year and result in $1,000 in cost savings over the lifetime of the faucets.

[10] https://www.eia.gov/dnav/pet/pet_pri_wfr_dcus_nus_m.htm

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. In their analysis to establish this standard in 2013, the California Energy Commission found no or very low incremental costs for compliant products.[2]

Estimated Immediate Cost Impact Justification (methodology and variables):

The California Energy Commission report found very little price difference between higher and lower efficiency faucets and faucet accessories. The CEC reviewed the whole sale catalog of NEOPERL, a major manufacturer, and found there was no cost difference between qualifying and non-qualifying product.[2]

Estimated Life Cycle Cost Impact:

This proposal would save 5,200 gallons of water per year and result in $1,000 in cost savings over the lifetime of the faucet.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

To estimate the roughly $1,000 in life cost savings, a conservative assumption of saving 1,140 gallons of water per year resulting in 91 kWh of electricity savings and 4.6 therms/year of savings from a natural gas or oil water heater was made based on savings estimates from the appliance standards awareness program[3] and an appliance standards evaluation report for California.[4] It was assumed that a typical single family home which has roughly 3.5 lavatory faucets and 1 kitchen faucet.[5] Water and waste water prices were estimated at $11 per thousand gallons and the effective useful life of the faucet was estimated to be 10 years.[6] It was assumed that 48% of water heaters were natural gas, 46% were electric and 6% were fuel oil based on the 2020 Residential Energy Consumption Survey.[7]Electricity was estimated to cost $0.15/kWh[8], fuel oil was estimated at $3.06/therm[10] and natural gas was estimated at $1.42/therm[9] using annual prices from the Energy Information Administration.

P70-24 Part II

P71-24

IPC: TABLE 604.4

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

2024 International Plumbing Code

Revise as follows:

TABLE 604.4 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a, c]	2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	~~1.0~~ 0.125 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Shower heads shall comply with all requirements for high-efficiency showerheads in ASME A112.18.1-2020/CSA B125.1.

Reason: This proposal requires a maximum of 0.125 gallons per flush (gpf) for urinals. These standards have been adopted in multiple states including New York State, Washington and California. There is wide technological availability and very cost-effective water savings. The proposed standards are significantly more efficient than the current requirements in the 2024 International Plumbing Code. Urinal requirements provide significant additional benefit while still maintaining consumer satisfaction. There is wide technological availability—of the 166 urinals listed in DOE's Compliance Certification Database, 59 or 36% meet the 0.125 gpf standard. Since urinals only manage liquid waste and are installed almost exclusively in non-residential settings, it is not expected that plumbing challenges would be faced regarding insufficient sewage movement. For a typical office building which has roughly 6 urinals, this proposal would result in no increase in construction costs but would save approximately 14,040 gallons of water per year and result in $312 in water/sewer cost savings over the lifetime of the urinal.

Bibliography: [1] https://droughtresilience.com/wp-content/uploads/2018/08/CEC-400-2014-007-SD.pdf

[2]https://www.calmac.org/publications/Del13B_CS_Report_Appl-Stds_FINAL_2021-06-30.pdf

[3] https://www.safeplumbing.org/files/safeplumbing.org/documents/misc/7-1-19-WaterSense-2019-Report.pdf

[4] https://appliance-standards.org/sites/default/files/States%20Go%20First.pdf

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. There is no immediate cost impact.

Estimated Immediate Cost Impact Justification (methodology and variables):

In their analysis to establish this standard in 2015, the California Energy Commission found the incremental cost for urinals is zero because there is no cost premium for a compliant product.[1]

Estimated Life Cycle Cost Impact:

For a typical office building which has roughly 6 urinals, this proposal would save approximately 14,040 gallons of water per year and result in $312 in water/sewer cost savings over the lifetime of the urinal.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

To estimate the roughly $312 in lifecycle cost savings, it was assumed the urinal would save 2,340 gallons of water per year.[2] It was assumed that a typical office building has roughly 6 urinals.[3]Water and waste water prices were estimated at $11 per thousand gallons and the effective useful life of the urinal was estimated to be 12 years.[4]

P71-24

P72-24 Part I

IPC: TABLE 604.4

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

TABLE 604.4 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a, c]	2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	~~1.6~~ 1.28 gallons per flushing cycle[d]

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Shower heads shall comply with all requirements for high-efficiency showerheads in ASME A112.18.1-2020/CSA B125.1.

d. The flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.

Reason: This proposal requires a maximum of 1.28 gallons per flush (gpf). 1.28 gpf is the same level as the current Watersense standard. There is wide technological availability and very cost-effective water savings. Of the 2,215 water closets listed in DOE's Compliance Certification Database, 566 or 25% meet the 1.28 gpf standard. Plumbing systems in older buildings are not expected to be negatively impacted as the standards allow for only 20% less water to flow. While this proposal results in significant water savings, the incremental impact for a building's plumbing system is negligible. For a typical office building which has roughly 13 toilets, this proposal would not increase construction costs but could save approximately 6,300 gallons of water per year and result in $850 in water/sewer cost savings over the lifetime of the toilet.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. There is no immediate cost impact.

Estimated Immediate Cost Impact Justification (methodology and variables):

In their analysis to establish this standard in 2015, the California Energy Commission found the incremental cost for toilets is zero because there is no cost premium for a compliant product.[1]

Estimated Life Cycle Cost Impact:

For a typical office building which has roughly 13 toilets, this proposal would not increase construction costs but could save approximately 6,300 gallons of water per year and result in $850 in water/sewer cost savings over the lifetime of the toilet.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

To estimate the roughly $850 in lifecycle cost savings, we assumed the toilet would save 488 gallons of water per year.[2] It was assumed that a typical office building has roughly 13 toilets.[3]Water and waste water prices were estimated at $11 per thousand gallons and the effective useful life of the toilet was estimated to be 12 years.[4]

P72-24 Part I

P72-24 Part II

IRC: TABLE P2903.2

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

2024 International Residential Code

Revise as follows:

TABLE P2903.2 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS [b]

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	2.2 gpm at 60 psi
Shower head [a]	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	~~1.6~~ 1.28 gallons per flushing cycle[c]

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray shall be considered to be a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. The flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.

Reason: This proposal requires a maximum of 1.28 gallons per flush (gpf). 1.28 gpf is the same level as the current Watersense standard. There is wide technological availability and very cost-effective water savings. Of the 2,215 water closets listed in DOE’s Compliance Certification Database, 566 or 25% meet the 1.28 gpf standard. Plumbing systems in older buildings are not expected to be negatively impacted as the standards allow for only 20% less water to flow. While this proposal results in significant water savings, the incremental impact for a building’s plumbing system is negligible.

For a typical single family home which has roughly 2.4 toilets, this could proposal would result in no increase in incremental costs and could save approximately 861 gallons of water per year and result in $584 in lifetime water/sewer cost savings over the 25 year lifetime of the toilet.

IPC: 604.8, ASSE Chapter 15 (New)

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

604.8 Water pressure-reducing valve or regulator.
Where water pressure within a building exceeds 80 psi (552 kPa) static, an *approved* water pressure-reducing valve conforming to ASSE 1003, ASSE 1103, or CSA B356 with strainer shall be installed to reduce the pressure in the building water distribution piping to not greater than 80 psi (552 kPa) static.

> **Exception:** Service lines to sill cocks and outside hydrants, and main supply risers where pressure from the mains is reduced to 80 psi (552 kPa) or less at individual fixtures.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1103-202x Pilot operated Water Pressure Reducing Valves for Potable Water

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1103-202x *Pilot operated Water Pressure Reducing Valves for Potable Water*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: There are currently 2 types of pressure reducing valves allowed in the plumbing code. The ASSE 1003 Water Pressure Reducing Valves for Potable Water Distribution Systems, a directing acting valve in sizes ½" through 4" and the AWWA C530 Pilot Operated Control Valve. The ASSE 1103 valve is as the title states, a pilot operated valve in sizes 1-1/2" through 60". AWWA C530 valves were approved in the 2024 code cycle to provide an approved pressure reducing valve larger than 4" for systems that have larger volume requirements.

The new ASSE Standard 1103 "Pilot Operated Water Pressure Reducing Valves for Potable Water" will allow the use of pilot operated pressure control valves that are specifically intended for potable water applications. As such the standard requires compliance with NSF 61 and NSF 372.

The approval of this proposal will allow designers the flexibility to specify, and AHJs to approve, potable water pressure controllers with a valve specifically intended for use in potable water systems.

Pilot operated: https://masterbuildermercantile.com/products/zurn-wilkins-212-zw209-2-1-2-pressure-reducing-valve-pilot-controlled-lead-free

Cost Impact: Increase

Estimated Immediate Cost Impact:

Product Cost: 2½" Zurn ASSE 1003 PRV @ Zorro - $2,635 vs Pilot operated $2,089

Installation Cost: Same cost to install

Estimated Immediate Cost Impact Justification (methodology and variables):

Product Cost: 2½" Zurn ASSE 1003 PRV @ Zorro - $2,635 vs Pilot operated $2,089

Installation Cost: Same cost to install

Estimated Life Cycle Cost Impact:

Comparatively same cost for repair/maintenance kits for each, so no increase or reduction. 30year Lifetime repair cost estimated $200-$300, parts and labor.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Comparatively same cost for repair/maintenance kits for each, so no increase or reduction. 30year Lifetime repair cost estimated $200-$300, parts and labor.

P73-24 Part I

P73-24 Part II

IRC: P2903.3.2, ASSE Chapter 44 (New)

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

2024 International Residential Code

Revise as follows:

P2903.3.2 Maximum pressure.
The static water pressure shall be not greater than 80 psi (551 kPa). Where the *main* pressure exceeds 80 psi (551 kPa), an *approved* pressure-reducing valve conforming to ASSE 1003, ASSE 1103, or CSA B356 shall be installed on the domestic water branch *main* or riser at the connection to the water service pipe.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1103-202x Pilot operated Water Pressure Reducing Valves for Potable Water

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1103-202x *Pilot operated Water Pressure Reducing Valves for Potable Water*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1103-202x *Pilot operated Water Pressure Reducing Valves for Potable Water*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The addition of the new ASSE Standard 1103 Pilot Operated Water Pressure Reducing Valves for Potable Water will allow system designers another option for valve selection, particularly when sizes than 3" are required. These types of valves are capable of maintaining tighter control of the set pressure. The standard also requires their compliance with NSF 61 and NSF 372 in applications where the water is intended for human consumption.

For SI: 1 inch = 25.4 mm.

*These standards, which are referenced in appliance standards ANSI Z21.10.1 • CSA 4.1, ANSI Z21.10.3 • CSA 4.3, ANSI Z21.13 • CSA 4.9, and CSA/ANSI Z21.47 • CSA 2.3, do not specify requirements for venting of combustion gases. UL 1738 specifies requirements for pipe, fittings, and accessories intended for venting of combustion gases.

†These standards do not specify requirements for venting of combustion gases. UL 1738 specifies requirements for pipe, fittings, and accessories intended for venting of combustion gases.

TABLE 702.6 CHEMICAL WASTE DRAINAGE SYSTEM PIPE AND FITTINGS

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC)	ASTM F2618†
Borosilicate glass	ASTM C1053
High silicon iron	ASTM A518/A518M
Polyolefin	ASTM F1412, CSA B181.3
Polyvinylidene fluoride (PVDF)	ASTM F1673, CSA B181.3

†ASTM F2618 does not specify requirements for venting of combustion gases. UL 1738 specifies requirements for pipe, fittings, and accessories intended for venting of combustion gases.

Staff Analysis: The proposed change is not within the scope of the IPC.

Reason: The purpose of the proposed notes to the tables is to make users of the IPC, including tradespersons, aware that those ASTM and CSA plastic piping standards expressly indicate that they do **not** contain specific provisions for venting of combustion gases.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal only adds statements for clarity.

<u>F3536-22</u> <u>Standard Specification for PE and PP Mechanical Fittings for use on NPS 3 or Smaller Cold-water Service Polyethylene (PE) or Crosslinked Polyethylene (PEX) Pipe or Tubing</u>

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

<u>IAPMO/ANSI/CAN Z1117</u> <u>Standard for Press Connections</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F3536-22 *Standard Specification for PE and PP Mechanical Fittings for use on NPS 3 or Smaller Cold-water Service Polyethylene (PE) or Crosslinked Polyethylene (PEX) Pipe and Tubing* and IAPMO Z1117-2022 *Standard for Press Connections*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposal adds ASTM F3536 "Standard Specification for PE and PP Mechanical Fittings for use on NPS 3 or Smaller Cold-water Service Polyethylene (PE) or Crosslinked Polyethylene (PEX) Pipe or Tubing" as a recognized fitting Standard for PE water service fittings in Table 605.5. The scope of ASTM F3536 covers plastic bodied mechanical fittings for PE or PEX water service pipe. These fittings, commonly produced by Philmac, have a history of successful field use. The ASTM Standard was written to recognize and standardize the performance requirements of this design, and includes sustained pressure, hydrostatic burst, and tensile force requirements. The F3536 Standard was published in 2022 narrowly missing the deadline for addition to the current 2024 edition of IPC, and thus this Proposal seeks to add it to the Code now.

It also seeks to add IAPMO/ANSI/CAN Z1117 "Standard for Press Connections" which is a harmonized standard for press-connect fittings used across North America. It is recognized and enforced in both the United States and Canada and encompasses multiple press-connect materials such as copper, steel, and stainless steel 304 and 316.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of these standards does not increase the cost of construction. The addition of these standards allows for a wider selection of materials but does not make their use mandatory. By including these standards in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

2024 International Plumbing Code

605.15 Chlorinated polyvinyl chloride/aluminum/chlorinated polyvinyl chloride (CPVC/AL/CPVC) pipe and tubing.
Joints between CPVC/AL/CPVC plastic pipe or CPVC fittings shall comply with Sections 605.15.1 and 605.15.2.

Revise as follows:

605.15.2 Solvent cementing.
Joint surfaces shall be clean and free from moisture, and an *approved* primer shall be applied. Solvent cement, orange in color and conforming to ASTM F493, shall be applied to joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D2855. Solvent cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is *third-party certified* as conforming to ASTM F493.
2. The solvent cement used is yellow <u>or green</u> in color.
3. The solvent cement is used only for joining $^{1}/_{2}$-inch (12.7 mm) through 2-inch-diameter (51 mm) CPVC/AL/CPVC pipe and CPVC fittings.
4. The CPVC fittings are manufactured in accordance with ASTM D2846.
5. The joint is made in accordance with ASTM F3328.

Reason: Green cement was previously added to the CPVC tubing section and should also appear in the composite CPVC tubing section as an option.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Allows for an additional color for cement and would not change costs.

P78-24 Part I

2024 International Residential Code

Revise as follows:

P2906.9.1.3 CPVC/AL/CPVC pipe.
Joint surfaces shall be clean and free from moisture, and an *approved* primer shall be applied. Solvent cement, orange in color and conforming to ASTM F493, shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D2846 or ASTM F493. Solvent-cemented joints shall be installed above or below ground.

Exception: A primer shall not be required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM F493.
2. The solvent cement used is yellow <u>or green</u> in color.
3. The solvent cement is used only for joining $^1/_2$-inch (12.7 mm) through 1-inch (25 mm) diameter CPVC/AL/CPVC pipe and CPVC fittings.
4. The CPVC fittings are manufactured in accordance with ASTM D2846.

Reason: Green cement was previously added to the CPVC tubing section and should also appear in the composite CPVC tubing section as an option.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding a permitted color is not expected to change costs of construction.

P78-24 Part II

P79-24

IPC: 607.2.2.2

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Delete without substitution:

~~**607.2.2.2 Demand recirculation controls for distribution systems.**~~
~~A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a demand recirculation water system. Pumps shall have controls that comply with both of the following:~~

1. ~~The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture, or sensing the flow of hot or *tempered water* to a fixture fitting or appliance.~~
2. ~~The control shall limit the temperature of the water entering the cold water piping to 104°F (40°C).~~

Reason: The Plumbing Code has the following Language: *IPC 604.2 System Interconnection*

At the points of interconnection between the hot and cold water supply piping systems and the individual fixtures, appliances or devices, provisions shall be made to prevent flow between such piping systems.

Comment: The above language clearly requires the separation of hot and cold-water systems, and that "provisions shall be made to prevent flow between such piping systems." These provisions typically include check valves and integral check valves in faucets and fixture fittings, which prevent hot water from crossing over into the cold water piping system or cold water crossing over into the hot water piping system. When crossover occurs, hot or warm water can be flushing fixtures, scalding can occur, bacteria, amoeba and pathogens can grow in cold water pipes, and in larger apartment buildings, you could be brushing your teeth with hot or warm water because another tenant decided to install an on-demand cross-connection pump device that is designed to pump hot water into your cold water pipes. Also, the mixing of hot and cold water can create areas of the piping system where temperatures are ideal for Legionella bacteria growth. When Pressure reducing valves or check valves are installed in systems this concept will not work.

Small, demand recirculation pumps were developed to intentionally created a cross-connection, where the device pumps previously heated hot water through the cold water pipes back to the water heater instead of installing a dedicated hot water return pipe. The plumbing code should not be promoting intentional cross-connections and Jerry-rigged plumbing systems. A dedicated return piping system is already required. I support this concept for single family homes where the homeowner lives with the consequences of installing this system. However in a commercial office building or condo building installing one of these systems could force hot water into other tenants cold water piping.

The on-demand recirculation systems, were only successful in the codes because it was popular, not because of safety, because it is not safe! This code provision is not safe and violates the basic principles of plumbing, in addition to being a direct violation of the code section on prohibition of system interconnections stated in code section, 604.2. This code provision creates a conflict in the code and a health and safety issue that could be a liability when an outbreak occurs. I spoke with a few backflow prevention industry people, and they were shocked that the plumbing code would allow such a device. Most of them were not aware of the new section 607.2.2.2 Demand Recirculation Controls for Distribution Systems.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Approximately $1,850 per on-demand circulator pump

Estimated Immediate Cost Impact Justification (methodology and variables):

Recirculation Systems are already required in the plumbing system when the developed length exceeds 50 feet. The code section proposed for deletion is in conflict with other code sections which prohibit cross connections between hot and cold water systems. Hot or warm water circulated back toward the water heater in the cold water piping system, as the stricken is code section allows, the previously heated hot water will rarely reach the water heater in large cold water distribution systems because the cold water flow rate is many times higher than the circulated water flow rate, so the recirculated flow will be swept away in the cold water distribution to other fixtures. The reason given for using these devices was to save water that was previously heated from being dumped down the drain, but the previously heated hot water that is pumped into the cold water pipes will simply be swept away with the cold water current in the cold water mains and flushed out other fixtures where warm water from the water heater with dissolved metals from the water heater anode rod and bacteria growing in the warm piping system will make the cold water unsuitable for uses like brushing teeth or cooking. When the warm water is flushed from cold water fixtures, it perpetually wastes energy for the life of the building. This cost can be estimated based on the number of times a person enters a bathroom in a given day. and cycles of the circulating pump. in addition to the initial cost of multiple pumps in a building vs one central pump.
Example of excessive costs: In a conventional multi-unit apartment building or similar structure with a central domestic hot water distribution system design there will typically be one, fractional horsepower hot water return circulating pump serving the entire building. With the demand circulator pumps located in every bathroom, and kitchen of an apartment building the following is a summary of the first cost for a circulation system relying on demand circulators within the system.

If the code language proposed to be stricken remains, a building can be constructed with no central hot water circulating pump. and a reliance on demand circulators at each apartment would then be required.

Given a 10-story apartment building, with 24 apartments on every floor where each apartment has two bathrooms and a kitchen sink with a demand circulator, there would be 10 floors x 24 apartments x 3 circulators per apartment unit = 720 On-demand circulating pumps. The cost of each on-demand circulator with proximity sensors is: $450 each materials; + $190 plumbing labor; + $450 electrical power materials. + 4 hours @ 190/hr = 760 electrical labor for dedicated wiring to panel with ground-fault circuit breaker = $1,850 per on-demand circulator pump x750 pumps = $1,387,500.00 initial cost.

The cost of a dedicated recirculation line would be a fraction of the cost of everyone installing an on-demand circulator.

This is a waste of materials and energy when a single circulating pump with balancing can provide adequate circulation for a whole building.

Estimated Life Cycle Cost Impact:

Example of excessive costs: In a conventional multi-unit apartment building or similar structure with a central domestic hot water distribution system design there will typically be one, fractional horsepower hot water return circulating pump serving the entire building.

With the demand circulator pumps located in every bathroom, and kitchen of an apartment building the following is a summary of the first cost for a circulation system relying on demand circulators within the system.

If the code language proposed to be stricken remains, a building can be constructed with no central hot water circulating pump. and a reliance on demand circulators at each apartment would then be required.

Given a 10-story apartment building, with 24 apartments on every floor where each apartment has two bathrooms and a kitchen sink with a demand circulator, there would be 10 floors x 24 apartments x 3 circulators per apartment unit = 720 On-demand circulating pumps.

The cost of each on-demand circulator with proximity sensors is: $450 each materials; + $190 plumbing labor; + $450 electrical power materials. + 4 hours @ 190/hr = 760 electrical labor for dedicated wiring to panel with ground-fault circuit breaker = $1,850 per on-demand circulator pump x750 pumps = $1,387,500.00 initial cost.

The cost of a dedicated recirculation line would be a fraction of the cost of everyone installing an on-demand circulator.

This is a waste of materials and energy when a single circulating pump with balancing can provide adequate circulation for a whole building.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

In the United States the US Census bureau statistics say there are approximately 3 people per household. In a multifamily apartment or condominium building, if each person enters the bathroom 4 times a day, there will be approximately 12 circulator pump cycles per day per bathroom plus approximately 4 additional pump cycles for people walking by the proximity sensors triggering a pump cycle. If an apartment building with 720 circulating pumps run for 15 minutes every time a proximity sensor is triggered, then 750 circulating pumps would run for twenty four (24), 15-minute cycles per day vs a single pump running 12 or 24 hours a day.

The energy wasted by pre-heated water being flushed from other fixtures and the running of the circulator pumps would be massive in this 240 unit apartment building example, not to mention the long term dissatisfaction from tenants not getting clean, safe, cold water. The existing language is not safe and this method of circulation should be eliminated.

P79-24

P80-24

IPC: 607.2.3, 607.2.4 (New)

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

607.2.3 Piping for recirculation systems having temperature-actuated mixing valves.
Where a temperature-actuated mixing valve is used in a system with a hot water recirculating pump, the *hot water* or *tempered water* return line shall be routed to the cold water inlet pipe of the water heater and the cold water inlet pipe or the hot water return connection of the temperature-actuated mixing valve.

Add new text as follows:

607.2.4 Temperature Gauge at end of Hot Water Return Pipe. A temperature gauge shall be located within 10 feet before the hot water return pipe connection to the water heater.

Reason: ASHRAE 188 and ASHRAE Guideline 12 dealing with control of Legionella in Building water systems recommends having a water management program and maintaining the hot water distribution system above the maximum Legionella bacteria growth temperature of 122 F. This proposal calls for a temperature gauge at the lowest temperature location in the circulated hot water system which is the end of the hot water return pipe, just before the connection the the cold water makeup and the water heater or storage tank. Generally a minimum temperature of 122 to 124 F would need to be maintained at this location to assure that Legionella bacteria will not grow in the hot water system. This code change is intended to allow a building owner to adjust temperature controls with an ASSE 1017 valve to monitor and maintain about 124 F at a temperature gauge at the lowest temperature location in the hot water system. (The end of the Hot water recirculation system).

Effects of Temperature on Legionella Bacteria

Temperature[1]	Result
Below 68F (20C)	Legionella survives, but will not grow/multiply
68 F (20C)	Legionella will double its population in 8 days
77 F (25C)	Legionella will double its population in 3 days
68 to 122 F (20-50C)	Legionella bacteria growth temperature range[3]
95 to 115 F (35-46C)	Ideal Legionella bacteria growth temperature range
Abv 122F & Bel. 131 F	Legionella bacteria survives, will not grow/multiply[2,3]
131 F (55C)	Legionella bacteria dies in 5 to 6 hours[2]
140 F (60C)	Legionella bacteria dies in 32 minutes[2]
151 F (66C)	Legionella bacteria dies in 2 minutes[2]
158 F + (70C+)	Legionella bacteria dies instantly (Disinfection temp.)[2]

Notes:

1. These temperatures are based on laboratory tests. Field conditions may vary due to differences in water quality, insulating properties of host amoeba, biofilm,

   scale and sediment.

2. Verify that the water heater is capable of heating to non-growth or disinfection temperatures.
3. The coolest point in the hot water system (Hot water return pipe) should be a couple of degrees above the highest growth temperature as a safety factor.

   (122F + 2F = 124F, many temperature gauges have a + or – 2F accuracy Locate a temperature gauge just before HW Return connects to Water Heater/Mixing

Valve return tee.)

Cost Impact: Increase

Estimated Immediate Cost Impact:

This will cost about $10-$15 for a temperature gauge in the piping system to allow a building operator to monitor condition in the piping that are conducive to bacterial growth. This will significantly improve the safety of the building and potentially save lives.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of a temperature gauge in minimal in order for a building operator to know what is happening in the piping system.

Estimated Life Cycle Cost Impact:

Every time there is a positive test for legionella bacteria it can disrupt building operations. When there is a reported case and an outbreak, the costs can get into the hundreds of thousands of dollars in lost revenue, legal and professional fees, disinfection costs. If there are serious illnesses or deaths associated with an outbrek, the costs can rapidly get into the millions of dollars. The cost of a single temperature gauge at the lowest temperature location in the hot water system is minimal compared to what can happen it the temperature is not monitored and bacteria is allowed to growth and cause disease.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The cost of not installing a temperature gauge can quickly get into the millions if bacteria causes an outbreak of Legionnaires disease.

Revise as follows:

P2903.4.2 Backflow prevention device or check valve. Where a backflow prevention device, check valve or other device is installed on a water supply system using storage water heating equipment such that thermal expansion causes an increase in pressure, a device for controlling pressure shall be installed.<u>Where a thermal expansion tank is installed, the thermal expansion tank shall be supported to the structure with a support rated for the weight of the tank and water in the tank, or shall be floor mounted tanks.</u>

Reason: In many instances installers are relying on the water heater or storage tank or the water heater or storage tank piping to support the expansion tanks. When replacing the water heater or storage tank becomes necessary, this can be come problematic and/or dangerous for the installer when removing the existing tank. These tanks are not only an extensions of the potable water distribution systems, but they are also classified as appurtenances and should be supported in the same fashion as piping systems but independent of the piping systems.

Bibliography: See reason statement.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Between $70 - $200

Estimated Immediate Cost Impact Justification (methodology and variables):

Between $19 - $30 for a bracket designed to support the expansion tank and depending on the labor market, between $51 - $170 for the installation labor.

P81-24 Part II

P82-24

IPC: 607.3, IAPMO Chapter 15 (New)

Proponents: Terry Burger, IAPMO Group, IAPMO Group (terry.burger@asse-plumbing.org)

2024 International Plumbing Code

Revise as follows:

607.3 Thermal expansion control. Where a storage water heater is supplied with cold water that passes through a check valve, pressure reducing valve or backflow preventer, a thermal expansion control device shall be connected to the water heater cold water supply pipe at a point that is downstream of all check valves, pressure reducing valves and backflow preventers. Thermal expansion tanks shall be sized in accordance with the tank manufacturer's instructions and shall be sized such that the pressure in the water distribution system shall not exceed that required by Section 604.8. <u>Pre-pressurized water expansion tanks shall comply with IAPMO Z1088.</u>

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

<u>IAPMO Z1088-19e1</u> <u>Pre-pressurized Water Expansion Tanks</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, IAPMO Z1088-19e1 *Pre-pressurized Water Expansion Tanks*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This standard provides the minimum safety and performance requirements for pre-pressurized expansion tanks.

Bibliography: IAPMO Z1088-19e1 Pre-pressurized Water Expansion Tanks

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Products are currently listed to this standard.

P82-24

P83-24

IPC: TABLE 608.1, 608.17.1.2, ASSE Chapter 15 (New)

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

2024 International Plumbing Code

Revise as follows:

TABLE 608.1 APPLICATION OF BACKFLOW PREVENTERS

Portions of table not shown remain unchanged.

DEVICE	DEGREE OF HAZARD[a]	APPLICATION[b]	APPLICABLE STANDARDS
Backflow preventer plumbing devices:			
Antisiphon-type fill valves for gravity water closet flush tanks	High hazard	Backsiphonage only	ASSE 1002/ASME A112.1002/CSA B125.12; CSA B125.3
Backflow preventer for carbonated beverage machines	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″– $^1/_2$″	ASSE 1022
Backflow preventer for carbonated and non-carbonated beverage machines.	Low Hazard	Backpressure or backsiphonage Sizes 1/4″–1/2″	ASSE 1032
Backflow preventer with intermediate atmospheric vents	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″–$^3/_4$″	ASSE 1012; CSA B64.3
Backflow preventer with intermediate atmospheric vent and pressure-reducing valve.	Low hazard	Backpressure or backsiphonage Sizes $^1/_2$″–$^3/_4$″	ASSE 1081
Dual-check-valve-type backflow preventer	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″–2″	ASSE 1024; CSA B64.6
Hose connection backflow preventer	High or low hazard	Low head backpressure, rated working pressure, backpressure or backsiphonage Sizes $^1/_2$″–1″	ASME A112.21.3; ASSE 1052; CSA B64.2.1.1
Hose connection vacuum breaker	High or low hazard	Low head backpressure or backsiphonage Sizes $^1/_2$″, $^3/_4$″, 1″	ASME A112.21.3; ASSE 1011; CSA B64.2; CSA B64.2.1
Laboratory faucet backflow preventer	High or low hazard	Low head backpressure and backsiphonage	ASSE 1035; CSA B64.7
Pipe-applied atmospheric-type vacuum breaker	High or low hazard	Backsiphonage only Sizes $^1/_8$″–8″	ASSE 1001; CSA B64.1.1
Vacuum breaker wall hydrants, frost-resistant, automatic-draining-type	High or low hazard	Low head backpressure or backsiphonage Sizes $^3/_4$″, 1″	ASME A112.21.3; ASSE 1019; CSA B64.2.2

For SI: 1 inch = 25.4 mm.

a. Low hazard—See Pollution (Section 202).

High hazard—See Contamination (Section 202).

b. See Backpressure, low head (Section 202, Backflow).

See Backsiphonage (Section 202, Backflow).

608.17.1.2 Coffee machines and noncarbonated drink dispensers.
The water supply connection to each coffee machine and each noncarbonated beverage dispenser shall be protected against backflow by a backflow preventer conforming to ASSE 1022 or ASSE 1024, ASSE 1032, or protected by an *air gap*.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

ASSE/ANSI 1032-23	Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1032-23 *Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: ASSE/ANSI 1032-2023 *“Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers”* has been published and the title was updated to include the approval for applications that are carbonated and non-carbonated. The previous version of the standard did not include non-carbonated and was the basis for rejection in the last code cycle. ASSE technical committees reviewed the design and materials of the ASSE 1032 backflow preventors and verified that they exceed the requirements for non-carbonated applications. This title change will provide increased design flexibility and inclusion in the IPC will allow acceptance by AHJs.

Zurn 1032

https://www.grainger.com/product/454N98?gucid=N:N:PS:Paid:GGL:CSM-2295:4P7A1P:20501231&gad_source=1&gclid=EAIaIQobChMI6d_p9Z37ggMVRmJHAR1O-gkwEAQYASABEgLT8fD_BwE&gclsrc=aw.ds

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The approval of this proposal will allow designers the flexibility to specify, and AHJs to approve check valves specifically intended for use in potable water systems. Costs for the original purchase, installation and life cycle of the proposed additional valve are very similar to the currently approved check valve. These valves are small and are generally replaced versus being field repaired.

P83-24

P84-24 Part I

IPC: 608.9

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

608.9 Identification of nonpotable water systems.
Where nonpotable water distribution systems are installed, the piping conveying the nonpotable water shall be identified either by color marking, metal tags or tape in accordance with Sections 608.9.1 through 608.9.2.3.

P84-24 Part I

P84-24 Part II

IRC: P2901.2

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Residential Code

Revise as follows:

P2901.2 Identification of nonpotable water systems.
Where *nonpotable* water distribution systems are installed, the piping conveying the nonpotable water shall be identified either by color marking, metal tags or tape in accordance with Sections P2901.2.1 through P2901.2.2.3.

Reason: This section has been misinterpreted to mean that all nonpotable water system piping needed to be labeled. For example, the collection piping for greywater. This section only applies to nonpotable water distribution systems.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal only clarifies which water systems need identified so that labeling is not applied where no labeling was intended.

P84-24 Part II

P85-24

IPC: 608.12, 608.12.1 (New), ASSE Chapter 15 (New)

Proponents: Erin Coffman, Water Systems Council, Water Systems Council

2024 International Plumbing Code

608.12 Potable water tanks.
Where in contact with potable water intended for drinking water, water tanks, coatings for the inside of tanks and liners for water tanks shall conform to NSF 61. The interior surface of a potable water tank shall not be lined, painted or repaired with any material that changes the taste, odor, color or potability of the water supply when the tank is placed in, or returned to, service.

Add new text as follows:

608.12.1 Pressurized potable water tanks. Pressurized potable water tanks for well water systems shall comply with ASSE 1099/WSC-PST.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1099-2022/WSC-PST-2000/2022 Performance Requirements for Pressurized Water Storage Tanks

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE #1093-2019 (R2023) WSC Standard PAS-97(2019) (R2023) *Performance Requirements for Pitless Adapters, Pitless Units, and Well Caps* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Currently, pressurized water storage tanks for water well systems are not stringently regulated; countries and municipalities may elect to implore oversight, or they may ignore the need to qualify pressure vessels within residences. In general, pressurized water tanks are not included within the scope of in-home inspections and see very little oversight in the majority of communities. As of now, some manufacturers elect to certify their production to ASSE-1099-2022/WSC-PST-2000/2022, but it is not mandatory from a plumbing code level. It is the contention of The Water Systems Council that all pressurized water storage vessels sold to the consumer market should be qualified through certification to ASSE-1099-2022/WSC-PST-2000/2022.

ASSE-1099-2022/WSC-PST-2000/2022effectively qualifies the structural integrity of pressurized water storage vessels through the prescription of construction materials, methods of manufacture, water quality extraction testing, labeling requirements, proof testing schedules and ultimate yield strength requirements. The tanks covered under this standard are up to 120 gallons in volume and designed for a maximum working pressure up to 150 PSI. These guidelines impress upon the industry the requirements for a safe and reliable product for the consumer market.

The consumer market for these products is predominantly residential dwellings in areas without municipal water service. The vessel is installed within the home as part of the plumbed domestic well water system. Water and air are stored within the pressure bearing components of the vessel for the duration of the product lifecycle; it is imperative to the safety of the residents that the integrity of pressure containment vessel is not compromised leading to the release of stored energy. This standard lays out simple and effective guidelines to ensure the continued integrity of the vessel over years of service under all expected conditions.

It would be in the best interest of the municipalities, contractors, and consumers for the structural integrity of these vessels to be covered by the International Plumbing Code through the adoption of ASSE-1099-2022/WSC-PST-2000/2022.

Bibliography: ASSE-1099-2022/WSC-PST-2000/2022

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Existing standard, products in the marketplace currently listed to the standard. Reference the product listing: https://www.watersystemscouncil.org/resources/well-standards/ansiwsc-pst/

P85-24

P86-24 Part I

IPC: 608.15, 608.15.1 (New), 608.15.1.1 (New)

Proponents: Dennis Hart, Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA) (dennis.hart@fairfaxcounty.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

608.15 Location of backflow preventers.
Access shall be provided to backflow preventers ~~as specified by the manufacturer's instructions~~.

Add new text as follows:

608.15.1 Backflow Prevention Assemblies. Backflow prevention assemblies indicated in Table 608.1 shall be installed between 12 inches (305 mm) and 60 inches (1525 mm) above grade, floor level or service platform.

608.15.1.1 Backflow prevention devices. Access shall be provided to backflow prevention devices.

P86-24 Part I

P86-24 Part II

IRC: P2902.6, P2902.6.1 (New), P2902.6.1.2 (New)

Proponents: Dennis Hart, Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA) (dennis.hart@fairfaxcounty.gov)

2024 International Residential Code

Revise as follows:

P2902.6 Location of backflow preventers.
Access shall be provided to backflow preventers as ~~specified by the manufacturer's installation instructions~~.

Add new text as follows:

P2902.6.1 **Backflow Prevention Assemblies.** Backflow prevention assemblies indicated in Table 608.1 shall be installed between 12 inches (305 mm) and 60 inches (1525 mm) above grade, floor level or service platform.

P2902.6.1.2 **Backflow prevention devices.** Access shall be provided to backflow prevention devices.

Reason: Per the definition found in Chapter 2, "backflow preventers" include both backflow prevention assemblies, which require annual testing, and backflow prevention devices which typically do not. The current code specifies that access shall be provided to backflow prevention assemblies per the manufacturer's installation instructions, but there are some manufacturers of backflow prevention assemblies that do not provide specific requirements for access. Since the current code requires backflow prevention assemblies be installed per the manufacturer's installation instructions, and some manufacturers do not provide guidance, often there is inadequate access to inspect, test, service, repair or replace the backflow prevention assembly. This proposal provides minimum requirements to follow if the manufacturer does not provide adequate requirements for access to a backflow prevention assembly. This proposal also separates backflow prevention assemblies and backflow prevention devices and clarifies that access is required to backflow prevention devices either by the definition in Chapter 2, or by the manufacturers requirements if they are more restrictive. While a backflow prevention device may not be required to be tested annually and require less maintenance than a backflow prevention assembly, these devices still need to be accessible for repair and replacement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Access is already required for backflow preventers. This change simply provides more details to these access requirements that should not increase the cost of construction.

P86-24 Part II

P87-24

IPC: 608.17.1.1, ASSE Chapter 15 (New)

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

2024 International Plumbing Code

Revise as follows:

608.17.1.1 Carbonated beverage dispensers.
The water supply connection to each carbonated beverage dispenser shall be protected against backflow by a backflow preventer conforming to ASSE 1022, ASSE 1032, or by an *air gap*. The portion of the backflow preventer device downstream from the second check valve of the device and the piping downstream therefrom shall not be affected by carbon dioxide gas.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

ASSE/ANSI 1032-23	Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE/ANSI 1032-23 *Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: ASSE/ANSI 1032-2023 *"Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers"* has been published and the title was updated to include the approval for applications that are carbonated and non-carbonated. The previous version of the standard did not include non-carbonated and was the basis for rejection in the last code cycle. ASSE technical committees reviewed the design and materials of the ASSE 1032 backflow preventors and verified that they exceed the requirements for non-carbonated applications. This title change will provide increased design flexibility and inclusion in the IPC will allow acceptance by AHJs.

Bibliography: Links date: 11-29-2023

Zurn 1022

https://www.grainger.com/product/454N98?gucid=N:N:PS:Paid:GGL:CSM-2295:4P7A1P:20501231&gad_source=1&gclid=EAIaIQobChMI6d_p9Z37ggMVRmJHAR1O-gkwEAQYASABEgLT8fD_BwE&gclsrc=aw.ds

Zurn 1032

https://www.grainger.com/product/454N98?gucid=N:N:PS:Paid:GGL:CSM-2295:4P7A1P:20501231&gad_source=1&gclid=EAIaIQobChMI6d_p9Z37ggMVRmJHAR1O-gkwEAQYASABEgLT8fD_BwE&gclsrc=aw.ds

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The approval of this proposal will allow designers the flexibility to specify, and AHJs to approve check valves specifically intended for use in potable water systems. Costs for the original purchase, installation and life cycle of the proposed additional valve are very similar to the currently approved check valve. These valves are small and are generally replaced versus being field repaired.

P87-24

P88-24

IPC: 608.17.1.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

Revise as follows:

608.17.1.1 Carbonated beverage dispensers.
The water supply connection to each carbonated beverage dispenser shall be protected against backflow by a backflow preventer conforming to ASSE 1013, ASSE 1022 or by an *air gap*. The portion of the backflow preventer device downstream from the second check valve of the device and the piping downstream therefrom shall not be affected by carbon dioxide gas.

Staff Analysis: The proposed standard is in the current edition of the code.

Reason: Some designers could prefer to use an RPP because of their reliability over a long period of time and its testability to ensure that the device is still functioning as intended.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition to the code text provides for more choices for the designer. The code does not mandate the device selection.

P88-24

P89-24

IPC: 608.17.4.1

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com)

2024 International Plumbing Code

Revise as follows:

608.17.4.1 Additives or nonpotable source.
Where systems under continuous pressure contain chemical additives or antifreeze, or where systems are connected to a nonpotable secondary water supply, the potable water supply shall be protected against backflow by a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly conforming to ASSE 1013 or ASSE 1047. Where chemical additives or antifreeze are added to only a portion of an automatic sprinkler system or standpipe system, the reduced pressure principle backflow prevention assembly or the reduced pressure principle fire protection backflow prevention assembly shall be permitted to be located so as to isolate that portion of the system. Where systems are not under continuous pressure, the potable water supply shall be protected against backflow by an *air gap* or an atmospheric vacuum breaker conforming to ASSE 1001 or CSA B64.1.1.

Staff Analysis: The proposed standards are in the current edition of the code.

Reason: Adding the ASSE Standards Numbers to be included along with the titles of the standards will allow reference either to the name or the number of the standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not adding any requirements to the current code section.

P89-24

P90-24

IPC: TABLE 608.1, 608.17.11 (New), ASSE Chapter 15 (New)

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com)

2024 International Plumbing Code

Revise as follows:

TABLE 608.1 APPLICATION OF BACKFLOW PREVENTERS

Portions of table not shown remain unchanged.

DEVICE	DEGREE OF HAZARD[a]	APPLICATION[b]	APPLICABLE STANDARDS
Other means or methods:			
Air gap	High or low hazard	Backsiphonage or backpressure	ASME A112.1.2
Air gap fittings for use with plumbing fixtures, appliances and appurtenances	High or low hazard	Backsiphonage or backpressure	ASME A112.1.3
Barometric loop	High or low hazard	Backsiphonage only	(See Section 608.14.4)
<u>Dual check backflow preventer wall hydrants, freeze resistant</u>	<u>High or low hazard</u>	<u>Backsiphonage or Backpressure</u>	<u>ASSE 1053</u>

For SI: 1 inch = 25.4 mm.

a. Low hazard—See Pollution (Section 202).

High hazard—See Contamination (Section 202).

b. See Backpressure, low head (Section 202, Backflow).

See Backsiphonage (Section 202, Backflow).

Add new text as follows:

<u>**608.17.11**</u> <u>**Dual Check Backflow Preventer Wall Hydrants-Freeze Resistant Type**</u>**.** <u>Dual check backflow preventer wall hydrants, freeze resistant type, shall conform to ASSE 1053.Such hydrants shall not be exposed to continuous pressure conditions.</u>

-

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

<u>1053-2019(R2023)</u> <u>Performance Requirements for Dual Check Backflow Preventer Wall Hydrants-Freeze Resistant Type</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1053-2019(R2023) *Performance Requirements for Dual Check Backflow Preventer Wall Hydrants-Freeze Resistant Type*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Dual Check Backflow Preventer Wall Hydrants – Freeze Resistant Type. Dual Check Backflow Preventer Wall Hydrants – Freeze Resistant Type shall confirm to ASSE 1053. The device provides protection of the potable water supply from contamination due to backsiphonage or backpressure without damage to the device due to freezing. The device shall only be used on systems where there is low-head backpressure that does not exceed that generated by an elevated hose equal to or less than 10.0 ft (3.0 m) in height. The device shall not be subjected to more than 12 hours of continuous water pressure. The device consists of two independent checks, force-loaded or biased to a closed position, with an atmospheric vent located between the two check valves, which is force-loaded or biased to an open position, and a means for attaching a hose. They shall be installed in accordance with the manufacturer's instructions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Giving another option for the protection of the system.

P91-24

IPC: TABLE 608.1, 608.17.11 (New), ASSE Chapter 15 (New)

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com)

2024 International Plumbing Code

Revise as follows:

TABLE 608.1 APPLICATION OF BACKFLOW PREVENTERS

Portions of table not shown remain unchanged.

DEVICE	DEGREE OF HAZARD[a]	APPLICATION[b]	APPLICABLE STANDARDS
Other means or methods:			
Air gap	High or low hazard	Backsiphonage or backpressure	ASME A112.1.2
Air gap fittings for use with plumbing fixtures, appliances and appurtenances	High or low hazard	Backsiphonage or backpressure	ASME A112.1.3
Barometric loop	High or low hazard	Backsiphonage only	(See Section 608.14.4)
Freeze resistant sanitary yard hydrants	High or low hazard	Backsiphonage only	ASSE 1057

For SI: 1 inch = 25.4 mm.

a. Low hazard—See Pollution (Section 202).

   High hazard—See Contamination (Section 202).

b. See Backpressure, low head (Section 202, Backflow).

   See Backsiphonage (Section 202, Backflow).

Add new text as follows:

608.17.11 Freeze resistant sanitary yard hydrants. Freeze resistant sanitary yard hydrants shall conform to ASSE 1057. Such hydrants shall not be exposed to continuous pressure conditions.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1057-2012 Performance Requirements for Freeze Resistant Sanitary Yard Hydrants with Backflow Protection

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1057-2012 *Freeze Resistant Sanitary Yard Hydrant with Backflow Protection* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Freeze Resistant Sanitary Yard Hydrants with Backflow Protection. Freeze resistant sanitary yard hydrants with backflow prevention shall conform to ASSE 1057. Freeze Resistant Sanitary Yard Hydrants protect the potable water supply from backflow contamination and ground water contamination. Hydrants that comply with ASSE 1057 do not contain a stop and waste or weep hole feature. The standard lists five types of yard hydrants. Type 1, which provides protection with two check valves and an atmospheric vent and does not require removal of the hose to provide freeze protection; Type 2, which provides protection with two check valves and an atmospheric vent and requires removal of the hose to provide freeze protection; Type 3, which provides protection with one check valve and an atmospheric vent and does not require removal of the hose to provide freeze protection; Type 4, which provides protection with one check valve and an atmospheric vent and requires removal of the hose to provide freeze protection; and Type 5, which has an air gap or removable backflow protection device and requires removal of the backflow protection device and hose to provide freeze protection. They shall be installed in accordance with the manufacturer's instructions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adds to options for something already required.

P91-24

P92-24

IPC: 608.18.9 (New), SECTION 202 (New), ASSE Chapter 15 (New)

Proponents: Erin Coffman, Water Systems Council, Water Systems Council

2024 International Plumbing Code

Add new text as follows:

608.18.9 Pitless adapters, pitless units, and sanitary well caps. Pitless adapters, pitless units, and sanitary well caps shall comply with ASSE 1093/WSC PAS-97.

Add new definition as follows:

Pitless Adapter.
A device designed to attach to one or more openings through a well casing. to provide access to water system parts within the well.

Pitless Unit. An assembly that extends the upper end of the well casing from below the frostline to above grade. Its purpose is to prevent the entrance of contaminants or pollutants into the well water supply, to conduct water from the well, to protect the water from freezing or extremes of temperature, and to provide full access to the well and to water system parts within the well.

Sanitary Well Cap.
A device that covers and encloses the upper termination of a pitless unit or the well casing to provides protection to the top, exposed portion of the well casing.

Add new standard(s) as follows:

#1093-2019 (R2023) WSC Standard PAS-97(2019)(R2023)	Performance Requirements for Pitless Adapters, Pitless Units, and Well Caps

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE #1093-2019 (R2023) WSC Standard PAS-97(2019) (R2023) *Performance Requirements for Pitless Adapters, Pitless Units, and Well Caps* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: A common system for supplying potable water is a private water well. There are approximately 47 million people that are using private wells for water supply in the United States (US Geological Survey).

Well pits are potentially unsanitary method of providing access to lateral pipe connections below ground level on individual water systems. There is a health and safety concern for some unregulated systems because pits will cause unsanitary conditions when not properly built and are commonly contaminated from near surface sources that can drain into the pit and well.

Pitless adapter wells are common replacements for above ground well houses and well pits, improving sanitation, convenience, frost protection, and vandalism security. The ASSE 1093/WSC PAS-97 is an ANSI designated standard which guides the end user with pitless well construction and sharply eliminates the possibility of contaminated water entering the well and system, allowing these systems to be more resilient to the surroundings.

While some products for well construction such as casing are covered in the UPC/IPC codes, there is a need to also include pitless adapters, pitless units, and sanitary well caps that provide the connection to the well casing. The pitless and the well cap are the connection of the water supply to the home from the well and protect the well from contamination. These well components are also often not covered by health departments or home inspections, as inspection requirements vary by state and local jurisdiction. Many state health departments do not have jurisdiction or require water well inspections. The source of water connection to the well and casing needs to be included in the plumbing code for the millions of homes with water wells.

The standard covers pitless adapters, pitless units, and sanitary well caps that are part of a pitless well system. These components are critical to well water supply systems as they protect the system's parts and potable water supply. The addition of the provision in the proposed Section 605.17 (Connections to Private Wells) will give the end user and local jurisdictions minimum necessary requirements for safety aspects and dependable performance standards. Additionally, Section 602.4 (Approved by Authority) is needed to guide the end user to Section 605.17 for private wells where permitted).

IPC: SECTION 609, 609.1, 609.3 (New), 609.3.1 (New), 609.3

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org)

2024 International Plumbing Code

SECTION 609
HEALTH CARE PLUMBING

609.1 Scope.
This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to the requirements of this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following *occupancies* : Group I-1, Group I-2, ambulatory care facilities, medical offices, research and testing laboratories, and Group F facilities manufacturing pharmaceutical drugs and medicines.

Add new text as follows:

609.3 Water. Water shall be provided in health care facilities in accordance with Section 609.3.1 and 609.3.2.

609.3.1 Hand-washing water. Hand-washing water shall be provided to all dedicated handwashing stations. Water with a temperature not less than 45 degrees F (13 C) and not greater than 85 F degrees (32 C) or not less than 105 degrees F (40 C) to 120 degrees F (49 C), shall be delivered from dedicated hand-washing stations. Water shall be delivered through an approved water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.

Revise as follows:

~~609.3~~ 609.3.2 Hot water.
Other than at dedicated hand washing stations, *hot* ~~*Hot*~~ *water* shall be provided to supply all of the hospital fixture, kitchen and laundry requirements. Special fixtures and equipment shall have hot water supplied at a temperature specified by the manufacturer. The hot water system shall be installed in accordance with Section 607.

Staff Analysis: The proposed standard is in the current edition of the code.

Reason: The purpose of this change is to allow for maximum amount of handwashing options in a hospital setting, while considering optimal operating performance of systems. In addition to the proven effectiveness of handwashing against COVID-19, other pathogens such as Legionella are a primary concern for healthcare facilities. Water systems are constantly being optimized to In addition, use of higher water temperature increases energy consumption, and therefore having alternate options for handwashing would be beneficial from an environmental standpoint. Even if ABHR is used, it is not recommended for use when hands are heavily soiled or greasy, also per the CDC (Show Me the Science – When & How to Use Hand Sanitizer in Community Settings | Handwashing | CDC). From that article, the “CDC recommends washing hands with soap and water whenever possible because handwashing reduces the amounts of all types of germs and chemicals on hands.”

Hospital water systems do not directly reflect outside weather conditions in terms of temperature. Systems generally receive water from municipal mains at about 45 degrees minimum. To combat pathogens such as Legionella, CDC recommendations are to maintain cold water temperature at approximately 68 degrees, based on standard ASHRAE 12-2020. This is achieved by simple circulation of the water through the interior system of the hospital, where indoor air temperatures are maintained. Systems heat water, and also chilled water, to operational temperatures, but water from the cold water tap is not extreme in temperature. This dispels the notion of the “Minnesota Effect,” which was a concern in the debate and discussion during the Committee Action Hearings on this code change.

Also, during proper handwashing, use of soap accounts for most of the 20 seconds recommended for hand scrubbing. Hands are only under the water briefly at the beginning, to rinse hands, and then at the end to rinse off the soap. Based on CDC observations, found at

Frequent Questions About Hand Hygiene | Handwashing | CDC the effectiveness of the soap is not related to water temperature. Per the CDC, on the topic of use of warm water or cold water for handwashing, “[u]se your preferred water temperature – cold or warm – to wash your hands. Warm and cold water remove the same number of germs from your hands. The water helps create soap lather that removes germs from your skin when you wash your hands. Water itself does not usually kill germs; to kill germs, water would need to be hot enough to scald your hands.” Other studies suggest that cold water handwashing is actually more effective than warm water handwashing, including elimination of a number of pathogens as noted in Quantifying the Effects of Water Temperature, Soap Volume, Lather Time, and Antimicrobial Soap as Variables in the Removal of Escherichia coli ATCC 11229 from Hands (https://meridian.allenpress.com/jfp/article/80/6/1022/200017/Quantifying-the-Effects-of-Water-Temperature-Soap). In brief, “the results of this study indicate that water temperature is not a critical factor for the removal of transient microorganisms from hands.”

Regarding data surrounding Legionella testing, ASHRAE 188-2017 requires a testing program to determine growth of Legionella at cooling towers and domestic water systems. The purpose for testing is to treat the water before the pathogen grows to lethal levels. In 2017, as noted in Legionellosis Report 2017 (pa.gov), the top jurisdictions had a total of 7,458 cases of Legionella. The monumental Legionnaires Disease outbreak of 1976 at the Bellevue Stratford Hotel in Philadelphia had 182 reported cases with 29 deaths, for a 15.9% death rate. There have been more recent outbreaks in 2017 at Lenox Hill Hospital in New York, and in relation to the Flint, MI water crisis in 2019. Water testing programs are instituted throughout the united states to avoid such a catastrophic result, so systems can be properly cleaned before they reach an outbreak level.The complexities of encouraging handwashing, while mitigating pathogens such as Legionella and COVID-19, are a balance that hospitals face regularly. This change to allow cold handwashing affords another tool to successfully create the safest environment possible.

This proposal is submitted by the ICC Committee for Healthcare (CHC).
The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Bibliography: 1. Carrico AR, Spoden M, Wallston KA, Vandenbergh MP. The Environmental Cost of Misinformation: Why the Recommendation to Use Elevated Temperatures for Handwashing is Problematic. Int J Consum Stud. 2013;37(4):433-441. doi:10.1111/ijcs.12012

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an option for hospitals for water temperature and will not change the requirements for construction of the dedicated handwashing stations or the piping.

P94-24

IPC: 610.1

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Revise as follows:

610.1 General.

New potable water systems and systems or portions of systems that have been shut down for renovations shall be purged of deleterious matter and disinfected prior to utilization. The method followed shall be documented and contain, at a minimum, the factors set forth below. ~~That prescribed by the health authority or water purveyor having jurisdiction or, in the absence of a prescribed method, the procedure described in either AWWA C651 or AWWA C652, or as described in this section.~~ This requirement shall apply to all domestic water distribution systems before they are put into service. ~~“on-site” or “in-plant” fabrication of a system or to a modular portion of a system.~~

1. Remove all strainers, filters, and equipment connections. ~~The pipe system shall be flushed with clean, potable water until dirty water does not appear at the points of outlet.~~

2. Flush the piping distribution system and branches with potable water at a flow velocity of at least three (3) feet per second for a minimum of three (3) seconds. For a building with greater than 100 feet of developed length of pipe from the building water entrance to the farthest fixture, flush three minutes for each 100 feet of developed length of pipe.

~~2.~~ 3. The system or part thereof shall be filled with a water/chlorine solution containing a minimum of 10 parts per million of chlorine and not exceeding 20 parts per million of chlorine for a minimum of 10 hours and a maximum of 24 hours. Verify the maximum ppm chlorine level and contact time with the manufacturer for each pipe material on the project prior to the disinfection process. ~~The system or part thereof shall be filled with a water/chlorine solution containing not less than 50 parts per million (50 mg/L) of chlorine, and the system or part thereof shall be valved off and allowed to stand for 24 hours; or the system or part thereof shall be filled with a water/chlorine solution containing not less than 200 parts per million (200 mg/L) of chlorine and allowed to stand for 3 hours.~~

~~3.~~ 4. Following the required minimum contact ~~standing~~ time, the system shall be flushed with clean potable water until the chlorine is purged from the system.

~~4~~ 5. The procedure shall be repeated where shown by a bacteriological examination that contamination remains present in the system.

6. Document the method used in a: "Flushing, Disinfection, and Purge" report, which shall be provided to the code official and the building owner upon completion. The report shall include, at a minimum, the start and end times and the flushing time at each fixture; the ppm level; the start time of fill and the start time of post-disinfection flush; the ppm levels, contact times, and post purge time; and chlorine level post purge.

Reason: AWWA C651 and AWWA C652 standards for Disinfection of Water mains are not applicable and not easily converted for use in building piping systems. For example the smallest pipe size listed in the AWWA C651 Standard is 4-inch diameter pipe. The vast majority of plumbing pipes within buildings is of different pipe materials than identified in the water main standard. For pipes smaller than 4-inches, there is no direction for flow velocities for flushing. The chemicals and disinfection methods used in public water mains through fire hydrants are not applicable for plumbing pipes in buildings. There is no chemical compatibility information for the pipe materials used inside buildings.

Many new plumbing systems have been destroyed because the current disinfection method has a minimum chlorine level, but no maximum chlorine level. Excessive disinfection chemical concentrations and extended contact times without post disinfection purging have led to failed piping systems within a very short time after construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Flushing and disinfection is already required; this change just seeks to ensure that it is done correctly.

For SI: 1 inch = 25.4 mm.

TABLE P3002.1(2) UNDERGROUND BUILDING DRAINAGE AND VENT PIPE

PIPE	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D2661; ASTM F628; ASTM F1488; CSA B181.1
Cast-iron pipe	ASTM A74; ASTM A888; CISPI 301
Copper or copper-alloy tubing (Type K, L, M or DWV)	ASTM B75/B75M; ASTM B88; ASTM B251; ASTM B306
Polyethylene (PE) plastic pipe (SDR-PR)	ASTM F714
Polyolefin pipe	ASTM F714; ASTM F1412; ASTM F3371; CSA B181.3
Polyvinyl chloride (PVC) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D2665; ASTM F891; ASTM F1488; ASTM F1760; CSA B181.2
Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D. and a solid, cellular core or composite wall	ASTM D2949; ASTM F1488
Stainless steel drainage systems, Type 316L	ASME A112.3.1

For SI: 1 inch = 25.4 mm.

TABLE P3002.2 BUILDING SEWER PIPE

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D2661; ASTM F628; ASTM F1488
Acrylonitrile butadiene styrene (ABS) plastic pipe in sewer and drain diameters, including SDR 42 (PS 20), PS35, SDR 35 (PS 45), PS50, PS100, PS140, SDR 23.5 (PS 150) and PS200; with a solid, cellular core or composite wall	ASTM D2751; ASTM F1488
Polyvinyl chloride (PVC) plastic pipe in sewer and drain diameters, including PS 25, SDR 41 (PS 28), PS 35, SDR 35 (PS 46), PS 50, PS 100, SDR 26 (PS 115), PS140 and PS 200; with a solid, cellular core or composite wall	ASTM D3034; ASTM F891; ASTM F1488; CSA B182.2; CSA B182.4
Cast-iron pipe	ASTM A74; ASTM A888; CISPI 301
Concrete pipe	ASTM C14; ASTM C76; CSA A257.1; CSA A257.2
Copper or copper-alloy tubing (Type K or L)	ASTM B75/B75M; ASTM B88; ASTM B251/B251M
Polyethylene (PE) plastic pipe (SDR-PR)	ASTM F714
Polyolefin pipe	ASTM F1412; ASTM F3371; CSA B181.3
Polyvinyl chloride (PVC) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with solid, cellular core or composite wall	ASTM D2665; ASTM D2949; ASTM D3034; ASTM F1412; ASTM F1760; CSA B182.2; CSA B182.4

MATERIAL	STANDARD
Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D. and a solid, cellular core or composite wall	ASTM D2949, ASTM F1488
Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1
Vitrified clay pipe	ASTM C425; ASTM C700

For SI: 1 inch = 25.4 mm.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F1760-16(2020) *Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content*

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F1760-16(2020) *Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: ASTM F1760 is ***Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content***, last updated in 2020. It is a piping material included in IPC APPENDIX AG, as well as the UPC and NSPC codes.

Bibliography: ASTM F1760***, Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content***

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Adding the standard ASTM F1760 ***Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content*** is not expected to alter costs of construction, it only offers another optional material which could offer minor reductions in costs depending on market pricing vs. current options ($0-$100).

Estimated Immediate Cost Impact Justification (methodology and variables):

Adding the standard ASTM F1760 ***Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content*** is not expected to alter costs of construction, it only offers another optional material which could offer minor reductions in costs depending on market pricing vs. current options ($0-$100).

Estimated Life Cycle Cost Impact:

Adding the standard ASTM F1760 ***Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content*** is not expected to alter costs post construction ($0-$1).

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Adding the standard ASTM F1760 ***Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content*** is not expected to alter costs post-construction ($0-$1).

Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D. and a solid, cellular core or composite wall	ASTM D2949; ASTM F1488
Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
Stainless steel drainage systems, Type 316L	ASME A112.3.1

For SI: 1 inch = 25.4 mm.

TABLE 702.4 PIPE FITTINGS

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters	ASME A112.4.4; ASTM D2661; ASTM F628; CSA B181.1
Acrylonitrile butadiene styrene (ABS) plastic pipe in sewer and drain diameters	ASTM D2751
Cast iron	ASME B16.4; ASME B16.12; ASTM A74; ASTM A888; CISPI 301
Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29
<u>Chlorinated polyvinylchloride (CPVC), Schedule 80</u>	<u>ASTM F439, CSA B181.2</u>
Glass	ASTM C1053
Gray iron and ductile iron	AWWA C110/A21.10
Polyethylene	ASTM D2683
Polyolefin	ASTM F1412; ASTM F3371; CSA B181.3
Polyvinyl chloride (PVC) plastic in IPS diameters	ASME A112.4.4; ASTM D2665; ASTM F1866
Polyvinyl chloride (PVC) plastic pipe in sewer and drain diameters	ASTM D3034
Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D.	ASTM D2949
Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1
Steel	ASME B16.9; ASME B16.11; ASME B16.28
Vitrified clay	ASTM C700

For SI: 1 inch = 25.4 mm.

Staff Analysis: The proposed standards are in the current edition of the code.

Reason: CPVC is a widely used and accepted piping material and adding it to Tables 702.1, 702.2, and 702.3 will give users of the IPC a broader choice of materials.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal adds a piping material, thus giving users more options to choose from, without any cost impact because of the new alternative.

Polyvinyl chloride (PVC) plastic in IPS diameters	ASME A112.4.4; ASTM D2665; ASTM F1866
Polyvinyl chloride (PVC) plastic pipe in sewer and drain diameters	ASTM D3034
Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D.	ASTM D2949
Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1
Steel	ASME B16.9; ASME B16.11; ASME B16.28
Vitrified clay	ASTM C700

For SI: 1 inch = 25.4 mm.

Staff Analysis: The proposed standards are in the current edition of the code.

Reason: PP is a widely used and accepted piping material and adding it to Tables 702.1, 702.2, and 702.3 will give users of the IPC a broader choice of materials.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal adds a piping material, thus giving users more options to choose from, without any cost impact because of the new alternative.

P98-24

P99-24 Part I

IPC: 702.2, ASTM Chapter 15 (New)

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov); Brian Conner, Charlotte Pipe and Foundry (bconner@charlottepipe.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

702.2 Underground building sanitary drainage and vent pipe.
Underground building sanitary drainage and vent pipe shall conform to one of the standards listed in Table 702.2. Thermoplastic pipe and fittings shall be installed in accordance with ASTM D2321.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

D2321-20	Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM D2321-20 *Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications*,with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P99-24 Part I

P99-24 Part II

IRC: P3002.1, P3002.2, ASTM Chapter 44 (New)

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov); Brian Conner, Charlotte Pipe and Foundry (bconner@charlottepipe.com)

2024 International Residential Code

Revise as follows:

P3002.1 Piping within buildings.
Drain, waste and vent (DWV) piping in *buildings* shall be as indicated in Tables P3002.1(1) and P3002.1(2) except that galvanized wrought-iron or galvanized steel pipe shall not be used underground and shall be maintained not less than 6 inches (152 mm) above ground. Allowance shall be made for the thermal expansion and contraction of plastic piping. Thermoplastic pipe and fittings shall be installed in accordance with ASTM D 2321.

P3002.2 Building sewer.
Building sewer piping shall be as indicated in Table P3002.2 Forced main sewer piping shall conform to one of the standards for ABS plastic pipe, copper or copper-alloy tubing, PVC plastic pipe or pressure-rated pipe indicated in Table P3002.2. Thermoplastic pipe and fittings shall be installed in accordance with ASTM D 2321.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

D2321-20	Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM D2321-20 *Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Every manufacturer of thermoplastic pipe has in their instruction a reference to the ASTM D 2321 standard for underground installations. The problem is that there is nothing in the code that also references this important standard except section 303.2. Inspectors do not necessarily have the time to read through every manufacturer's installation instructions during an inspection, however, if the installation standard was referenced in the code then the jurisdiction would be responsible for providing access to the standard for verification purposes.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will make it easier to ensure installation are in compliance with the manufacturer's requirements and should not technically have any impact on the cost of construction if the installers were following these requirements as they should have been.

P99-24 Part II

P100-24 Part I

IPC: TABLE 308.5, 308.5, 702.7, 705.9, 705.9.1, 705.9.2, 705.16.5

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

TABLE 308.5 HANGER SPACING

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Acrylonitrile butadiene styrene (ABS) pipe	4	10[b]
Aluminum tubing	10	15
Cast-iron pipe	5[a]	15
Chlorinated polyvinyl chloride (CPVC) pipe and tubing, 1 inch and smaller	3	10[b]
Chlorinated polyvinyl chloride (CPVC) pipe and tubing, 1 $^1/_4$ inches and larger	4	10[b]
Copper or copper-alloy pipe	12	10
Copper or copper-alloy tubing, 1 $^1/_4$-inch diameter and smaller	6	10
Copper or copper-alloy tubing, 1 $^1/_2$-inch diameter and larger	10	10
Cross-linked polyethylene (PEX) pipe, 1 inch and smaller	2.67 (32 inches)	10[b]
Cross-linked polyethylene (PEX) pipe, 1 $^1/_4$ inches and larger	4	10[b]
Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pipe	2.67 (32 inches)	4
~~Lead pipe~~	~~Continuous~~	~~4~~
Polyethylene/aluminum/polyethylene (PE-AL-PE) pipe	2.67 (32 inches)	4
Polyethylene of raised temperature (PE-RT) pipe, 1 inch and smaller	2.67 (32 inches)	10[b]
Polyethylene of raised temperature (PE-RT) pipe, 1 $^1/_4$ inches and larger	4	10[b]
Polypropylene (PP) pipe or tubing, 1 inch and smaller	2.67 (32 inches)	10[b]
Polypropylene (PP) pipe or tubing, 1 $^1/_4$ inches and larger	4	10[b]
Polyvinyl chloride (PVC) pipe	4	10[b]
Stainless steel drainage systems	10	10[b]
Steel pipe	12	15

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.

b. For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe.

308.5 Interval of support.
Pipe shall be supported in accordance with Table 308.5.

Exception: The interval of support for piping systems designed to provide for expansion/contraction shall conform to the engineered design in accordance with Section 316.1.

Delete without substitution:

~~**702.7 Lead bends and traps.**~~
~~The wall thickness of lead bends and traps shall be not less than $^1/_8$ inch (3.2 mm).~~

~~**705.9 Lead.**~~
~~Joints between lead pipe or fittings shall comply with Sections 705.9.1 and 705.9.2.~~

~~**705.9.1 Burned.**~~

~~Burned joints shall be uniformly fused together into one continuous piece. The thickness of the joint shall be not less than the thickness of the lead being joined. The filler metal shall be of the same material as the pipe.~~

~~**705.9.2 Wiped.**~~

~~Joints shall be fully wiped, with an exposed surface on each side of the joint not less than $^3/_4$ inch (19.1 mm). The joint shall be not less than $^3/_8$ inch (9.5 mm) thick at the thickest point.~~

~~**705.16.5 Lead pipe to other piping material.**~~

~~Joints between lead pipe and other piping material shall be made by a wiped joint to a caulking ferrule, soldering nipple or bushing or shall be made with an *approved* adapter fitting.~~

Reason: If we are finally removing lead pipe from use in old service lines, it should be also be removed from the plumbing code, as it does not serve the code to continue suggesting it's usage. It's just historical lingering text at this point.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

Not using a material no one is using seems cost neutral.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Proposal removes a rarely used material from the support table, so no cost impact or minor decrease because other materials would be cheaper than lead pipe ($0-$10) is estimated. I don't think we could install lead pipe anymore.

Estimated Immediate Cost Impact Justification (methodology and variables):

Proposal removes a rarely used material from the support table, so no cost impact or minor decrease because other materials would be cheaper than lead pipe ($0-$10) is estimated. I don't think we could install lead pipe anymore.

Estimated Life Cycle Cost Impact:

Not expected to have a cost impact over life of building or project ($0-$1).

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Not expected to have a cost impact over life of building or project ($0-$1).

P100-24 Part I

P100-24 Part II

IRC: P3003.8, P3003.8.1, P3003.8.2, P3003.13.5

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com)

2024 International Residential Code

Delete without substitution:

~~P3003.8 Lead~~.
~~Joints between lead pipe or fittings shall comply with Sections P3003.8.1 and P3003.8.2.~~

~~P3003.8.1 Burned.~~ ~~Burned joints shall be uniformly fused together into one continuous piece. The thickness of the joint shall be not less than the thickness of the lead being joined. The filler metal shall be of the same material as the pipe.~~

~~P3003.8.2 Wiped.~~ ~~Joints shall be fully wiped, with an exposed surface on each side of the joint not less than $^3/_4$ inch (19 mm). The joint shall be not less than $^3/_8$ inch (9.5 mm) thick at the thickest point.~~

~~P3003.13.5 Lead pipe to other piping material.~~ ~~Joints between lead pipe and other piping material shall be made by a wiped joint to a caulking ferrule, soldering nipple, or bushing or shall be made with an *approved* adapter fitting.~~

Reason: It's time to remove lead piping not just from service lines, but the residential code as well.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Proposal removes a rarely used material from the support table, so no cost impact or minor decrease because other materials would be cheaper than lead pipe ($0-$10) is estimated. I don't think we could install lead pipe anymore.

Estimated Immediate Cost Impact Justification (methodology and variables):

Proposal removes a rarely used material from the support table, so no cost impact or minor decrease because other materials would be cheaper than lead pipe ($0-$10) is estimated. I don't think we could install lead pipe anymore.

Estimated Life Cycle Cost Impact:

None expected over the life of the building or project ($0-$1)

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None expected over the life of the building or project ($0-$1)

2024 International Mechanical Code

Revise as follows:

TABLE 305.4 PIPING SUPPORT SPACING[a]

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
ABS pipe	4	10[c]
Aluminum pipe and tubing	10	15
Cast-iron pipe[b]	5	15
Copper or copper-alloy pipe	12	10
Copper or copper-alloy tubing	8	10
CPVC pipe or tubing, 1 inch and smaller	3	10[c]
CPVC pipe or tubing, $1^1/_4$-inches and larger	4	10[c]
~~Lead pipe~~	~~Continuous~~	~~4~~
PE-RT 1 inch and smaller	$2^2/_3$ (32 inches)	10[c]
PE-RT $1^1/_4$ inches and larger	4	10[c]
PEX tubing 1 inch and smaller	$2^2/_3$ (32 inches)	10[c]
PEX tubing $1^1/_4$ inches and larger	4	10[c]
Polypropylene (PP) pipe or tubing, 1 inch and smaller	$2^2/_3$ (32 inches)	10[c]
Polypropylene (PP) pipe or tubing, $1^1/_4$ inches and larger	4	10[c]
PVC pipe	4	10[c]
Steel pipe	12	15
Steel tubing	8	10

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. See Section 301.18.

b. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.

c. Mid-story guide.

Reason: This proposal would remove lead pipe from the Mechanical code piping support table. It is rarely used and we are removing it from other applications.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Proposal removes a rarely used material from the support table, so no cost impact or minor decrease because other materials would be cheaper than lead pipe ($0-$10) is estimated, as no increase in cost seems probably.

Estimated Immediate Cost Impact Justification (methodology and variables):

Proposal removes a rarely used material from the support table, so no cost impact or minor decrease because other materials would be cheaper than lead pipe ($0-$10) is estimated.

Estimated Life Cycle Cost Impact:

Proposal removes a rarely used material from the support table, so no cost impact ($0-$10) during life of building.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Proposal removes a rarely used material from the support table, so no cost impact ($0-$10) during life of building

P101-24 Part I

IPC: 708.1.11.2, ASME Chapter 15, ASME Chapter 15 (New)

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

708.1.11.2 Floor cleanout assemblies.
Where it is necessary to protect a cleanout plug from the loads of vehicular traffic, cleanout assemblies in accordance with ASME ~~A112.36.2M~~ ASME A112.36.2/CSA B79.2 shall be installed.

ASME

ASME
ASME
Two Park Avenue
New York, NY 10016-5990

~~A112.36.2M—1991 (R2022)~~ ~~Cleanouts~~

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

A112.36.2/CSA B79.2-2022 Cleanouts

Staff Analysis: A review of the standard proposed for inclusion in the code, ASME A112.36.2/CSA B79.2-2022 *Cleanouts*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P101-24 Part I

P101-24 Part II

IRC: P3005.2.10.3, ASME Chapter 44, ASME Chapter 44 (New)

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Residential Code

Revise as follows:

P3005.2.10.3 Floor cleanout assemblies.
Where it is necessary to protect a cleanout plug from the loads of vehicular traffic, cleanout assemblies in accordance with ~~ASME A112.36.2M~~ ASME A112.36.2/CSA B79.2 shall be installed.

ASME

ASME
ASME
Two Park Avenue
New York, NY 10016-5990

~~A112.36.2M—1991 (R2022)~~ ~~Cleanouts~~

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

A112.36.2/CSA B79.2 Cleanouts

Staff Analysis: A review of the standard proposed for inclusion in the code, ASME A112.36.2/CSA B79.2-2022 *Cleanouts*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The ASME A112.36.2 was harmonized with CSA B79. The intent of this proposal is to replace the current standard with the new standard.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The ASME standard was harmonized with the CSA standard, no additional requirements were added, clarification change.

P101-24 Part II

P102-24

IPC: TABLE 709.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

TABLE 709.1 DRAINAGE FIXTURE UNITS FOR FIXTURES AND GROUPS

FIXTURE TYPE	DRAINAGE FIXTURE UNIT VALUE AS LOAD FACTORS	MINIMUM SIZE OF TRAP (inches)
Automatic clothes washers, commercial[a, g]	3	2
Automatic clothes washers, residential[g]	2	2
Bathroom group as defined in Section 202 (1.6 gpf water closet)[f]	5	—
Bathroom group as defined in Section 202 (water closet flushing greater than 1.6 gpf)[f]	6	—
Bathtub[b] (with or without overhead shower or whirlpool attachments)	2	1 1/2
Bidet	1	1 1/4
Combination sink and tray	2	1 1/2
Dental lavatory	1	1 1/4
Dental unit or cuspidor	1	1 1/4
Dishwashing machine[c], domestic	2	1 1/2
Drinking fountain	~~1/2~~ 0	1 1/4
Emergency floor drain	0	2
Floor drains[h]	2[h]	2
Floor sinks	Note h	2
Kitchen sink, domestic	2	1 1/2
Kitchen sink, domestic with food waste disposer, dishwasher or both	2	1 1/2
Laundry tray (1 or 2 compartments)	2	1 1/2
Lavatory	1	1 1/4
Shower (based on the total flow rate through showerheads and body sprays)Flow rate:5.7 gpm or lessGreater than 5.7 gpm to 12.3 gpmGreater than 12.3 gpm to 25.8 gpmGreater than 25.8 gpm to 55.6 gpm	2 3 5 6	1 1/2 2 3 4
Service sink	2	1 1/2
Sink	2	1 1/2
Urinal	4	Note d
Urinal, 1 gallon per flush or less	2[e]	Note d
Urinal, nonwater supplied	1/2	Note d
Wash sink (circular or multiple) each set of faucets	2	1 1/2
Water closet, flushometer tank, public or private	4[e]	Note d
Water closet, private (1.6 gpf)	3[e]	Note d
Water closet, private (flushing greater than 1.6 gpf)	4[e]	Note d
Water closet, public (1.6 gpf)	4[e]	Note d
Water closet, public (flushing greater than 1.6 gpf)	6[e]	Note d

For SI: 1 inch = 25.4 mm, 1 gallon = 3.785 L, gpf = gallon per flushing cycle, 1 gallon per minute (gpm) = 3.785 L/m.

a. For traps larger than 3 inches, use Table 709.2.

b. A showerhead over a bathtub or whirlpool bathtub attachment does not increase the drainage fixture unit value.

c. See Sections 709.2 through 709.4.1 for methods of computing unit value of fixtures not listed in this table or for rating of devices with intermittent flows.

d. Trap size shall be consistent with the fixture outlet size.

e. For the purpose of computing loads on building drains and sewers, water closets and urinals shall not be rated at a lower drainage fixture unit unless the lower values are confirmed by testing.

f. For fixtures added to a bathroom group, add the dfu value of those additional fixtures to the bathroom group fixture count.

g. See Section 406.2 for sizing requirements for fixture drain, branch drain and drainage stack for an automatic clothes washer standpipe.

h. See Sections 709.4 and 709.4.1.

Reason: A DFU value is not necessary for a drinking fountain. Approximately 90% of the water discharged at a drinking fountain leaves with the user and is not discharged down the drain. Any residual amount of water that does make it down the drain can easily be accommodated by any drainage system.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal would result in no additional materials or labor as the proposal only clarifies a drainage value in the table.

P102-24

P103-24

IPC: TABLE 710.1(2), 710.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

TABLE 710.1(2) ~~HORIZONTAL FIXTURE BRANCHES AND~~ STACKSAND CONNECTIONS TO STACKS[a]

DIAMETER OF PIPE (inches)	MAXIMUM NUMBER OF DRAINAGE FIXTURE UNITS (dfu)			
	Total for ~~horizontal~~fixture drain or fixture branch connection	Stacks[b]		
		Total discharge into one branch interval	Total for stack of three branch intervals or less	Total for stack greater than three branch intervals
1 1/2	3	2	4	8
2	6	6	10	24
2 1/2	12	9	20	42
3	20	20	48	72
4	160	90	240	500
5	360	200	540	1,100
6	620	350	960	1,900
8	1,400	600	2,200	3,600
10	2,500	1,000	3,800	5,600
12	3,900	1,500	6,000	8,400
15	7,000	Note c	Note c	Note c

For SI: 1 inch = 25.4 mm.

a. Does not include branches of the building drain. Refer to Table 710.1(1).

b. Stacks shall be sized based on the total accumulated connected load at each story or branch interval. As the total accumulated connected load decreases, stacks are permitted to be reduced in size. Stack diameters shall not be reduced to less than one-half of the diameter of the largest stack size required.

c. Sizing load based on design criteria.

710.1 Maximum fixture unit load.
The maximum number of *drainage fixture units* ~~connected~~ discharging to a given size of *building sewer*, *building drain* or horizontal *branch* of the *building drain* shall be determined using Table 710.1(1). The maximum number of *drainage fixture units* ~~connected~~ discharging to a given size of ~~horizontal~~ fixture drain or fixture *branch connection* ~~or~~ to a vertical soil or waste *stack* shall be determined using Table 710.1(2).

Reason: The current code language is often confusing to users. The first charging statement in 710.1 refers people to table 710.1 for sizing horizontal branches of building drains. The second sentence refers the user to 710.1(2) for sizing "horizontal branches or vertical soil or waste stacks". Since the column in table 710.1(2) is labeled " Total for horizontal branch", users are often confusing this to mean all horizontal branches when in fact the intent is for sizing connections to the stack. In order to eliminate further confusion, it is also being suggested to change the phrases "connected to a given size of" to " discharging to a given size of", reserving connected for the connections to stacks.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There would be absolutely no cost impact as this proposal is just for clarification purposes. The reason statement explains.

P103-24

P104-24 Part I

IPC: 714.3, 714.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

714.3 ~~Location~~ Installation.
Backwater valves shall be installed so that *access* is provided to the working parts.

714.1 Sewage backflow. Where plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the public *sewer,* such fixtures shall be protected by a backwater valve installed in the *building drain*, or horizontal *branch* serving such fixtures. ~~Plumbing fixtures installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not discharge through a backwater valve.~~The backwater valve shall be of the normally open type.

~~**Exception:** In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not be prohibited from discharging through a backwater valve.~~**Exception:** Normally closed backwater valve installations for *existing buildings* shall not be prohibited.Normally closed backwater valves shall be provided with a venting method in accordance with one of the methods in Chapter 9 upstream of the backwater valve.

P104-24 Part I

P104-24 Part II

IRC: P3008.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Residential Code

Revise as follows:

P3008.2 Allowable installations. Where plumbing fixtures are installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public sewer~~, and~~ a backwater valve ~~is~~ shall be installed in the *building drain* or *horizontal branch* serving such fixtures. ~~, the~~ The backwater valve shall be of the normally open type.

> **Exception:** Normally closed backwater valve installations for *existing buildings* shall not be prohibited.Normally closed backwater valves shall be provided with a venting method in accordance with one of the methods in Chapter 9 upstream of the backwater valve.

Reason: The title of the section was improper to begin with, "Location", the entire section was referencing installation requirements. The remainder of the proposal is focused on the fact that most floor drains are installed as part of a combination waste and vent system, however, since most backwater valves are manufactured as normally closed backwater valves, this interrupts the pathway for venting in a combination waste and vent system. Additionally, a normally closed backwater valve poses a resistance to flow until a certain amount of flow is present to force the valve open. This results in slowing the flow below the desired flow rate and impedes the ability of the waste flow to scour the pipe as it flows. A normally open backwater valve will avoid both of these associated complications from backwater valves. Additionally, allowing normally closed backwater valves to be installed to serve an entire existing building results in restricting the ability of the sewer systems to use building DWV system to assist in providing a venting pathway to atmosphere. This results in less pathways and increased positive and/or negative pressures within the sewer network and ultimately can negatively impact the DWV system of surrounding buildings.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal doesn't create any additional requirements and should technically result in lower overall maintenance costs.

P104-24 Part II

P105-24

IPC: 715.2, CSA Chapter 15 (New)

Proponents: Abraham MURRA, Abraham Murra Consulting, Jets Vacuum AS, Norway

2024 International Plumbing Code

Revise as follows:

715.2 System design.
Vacuum drainage systems shall be designed in accordance with the vacuum drainage system manufacturer's instructions. The system layout, including piping layout, tank assemblies, vacuum pump assembly and other components necessary for proper function of the system shall be in accordance with <u>CSA B45.13/IAPMO Z1700 and with </u>the manufacturer's instructions. Plans, specifications and other data for such systems shall be submitted to the code official for review and approval prior to installation.

Add new standard(s) as follows:

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland, OH 44131-5516

<u>CSA B45.13:19/IAPMO Z1700-2019</u>	<u>Vacuum waste-collection systems</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, CSA B45.13:19/IAPMO Z1700-2019 *Vacuum waste-collection systems*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Adding a reference to CSA B45.13/IAPMO Z1700 —a consensus standard that specifies requirements for materials, construction, performance testing, and markings— in the system design section of the IPC will standardize vacuum waste-collection systems. Mandating that such systems comply only with the manufacturer's instructions allows installation of substandard systems that do not benefit users or regulators.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding CSA B45.13/IAPMO Z1700 as a referenced standard to the IPC should not have a cost impact as major manufacturers of vacuum waste-collection systems are already listed to the standard.

P105-24

P106-24

IPC: 717.1, ASSE Chapter 15 (New)

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Revise as follows:

717.1 General.
This section shall govern the relining of existing *building sewers* and building drainage piping. Required Inspections shall be conducted by a ANSI/ASSE/IAPMO Series 28000 qualified inspector.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

ANSI/ASSE/IAPMO Series 28000-Standard 28001-xx	Professional Qualifications Standard for Inspectors of CIPP (Cured-in-Place-Pipe) Rehabilitation of Building Sewer and Drain, Waste and Vent Piping Systems (DRAFT)

Reason: The new ANSI/ASSE/IAPMO Series 2800 standard assures that the inspector and inspection of piping using CIPP is done appropriately. Unfortunately, many inspectors are not knowledgeable concerning CIPP rehabilitation, and the necessary requirements demanded for proper installation and inspection. This requirement is necessary and needed in the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proper inspection is not only a cost built into the code but necessary to protect it's users ultimate health and safety.

P106-24

P107-24

IPC: 717.1

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Revise as follows:

717.1 General.
This section shall govern the relining of existing *building sewers* and building drainage system piping.

Reason: The title and scope of both Secton 717 and 718 are for Building sewers and Building drains. Building drains can include sanitary and storm water. A more inclusive and proper scope for both 717 and 718 would be to use Drainage System piping instead of drainage piping which are both defined in Section 3 of the code. This would eliminate confusion and recognize all piping covered under the requirements of these Sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Just as my reason states: This code change simply clarifies current requirements in the code and would add no additional cost to installation and technology currently used in Section 717.

P107-24

P108-24

IPC: 717.2

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.2 Applicability.

The relining of existing *building sewers* and building drainage piping shall be limited to gravity drainage piping 2"~~4~~ inches (~~102~~50 mm) in diameter and larger. The relined piping shall be of the same nominal size as the existing piping.

Attached Files

- **TECH BRIEF - NuDrain Flow Analysis - 20201117 Rev Lvl 1.1.pdf**
  https://www.cdpaccess.com/proposal/10434/30667/files/download/4388/

Reason: CIPP in building drains is routinely used in sizes down to 2". The scope of ASTM F1216-22 governs the usage of CIPP down to 2".

Documentation is provided that shows the ability to routinely preserve flow capacity while increasing scouring velocities in sizes down to 2", with typical CIPP thicknesses. It is recognized that the DFU design capacity requires preservation. The nominal pipe size is not altered.

The provided flow analysis chart does not take into consideration the inherent conservatism of DFU design being based upon data from cast iron pipe collected in the 1930s. As far as actually maintaining the original design DFUs, all CIPP relined pipes should be compared to iron pipe flows as the basis of their original DFU design capacity. What is apparent, is that CIPP does not negatively alter nominal sizing nor DFU capacity at typical installed thicknesses. Scouring velocity also greatly improves, further helping to correct for minor flow issues in the existing piping.

Bibliography: ASTM F1216-22 Scope

"1.1 This practice describes the procedures for the reconstruction of pipelines and conduits (**2 in.** to 108 in. diameter) by the installation of a resin-impregnated, flexible tube which is inverted into the existing conduit by use of a hydrostatic head or air pressure."

NuFlow Flow Analysis Chart to be attached.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal merely expands the applicable size range down to 2" with the same comparative cost impacts as are typical of relining / rehabilitation for repair or replacement with Cured-in-Place Pipe (CIPP) versus exhume and replace with other piping materials, as already otherwise approved for use within Sections 717 and 718 of the Code.

This proposal to expand the size range down to 2” creates no significant cost impact alteration as compared to the considerations behind the existing code inclusion of CIPP.

P108-24

P109-24

IPC: 717.4

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.4 Permitting.
<u>For replacement work, a reviewed permit shall be required. Prior to permit issuance, t</u>he code official shall review and evaluate the preinstallation recorded video camera survey to determine if the piping system is able to be relined in accordance with the proposed lining system manufacturer's installation requirements, and applicable referenced standards. <u>Replacement work shall include applications where the pipe is broken or missing and where the cured-in-place-pipe is replacing the structural function of the existing pipe. For repair work, review and evaluation of the preinstallation recorded video camera survey shall not be required prior to permit issuance. Repair work does not require removal or replacement of the piping systems and shall include relining to stop joint leakage, restoration of design flow, or to protect from internal corrosion of the existing, otherwise code compliant piping. Prior to permit issuance, the code official shall review and approve construction documents as per Section 105.5.1.</u>

Reason: Current language effectively requires pre-installation review & evaluation to issue permits for all Cured-in-Place Pipe (CIPP) projects, whereas Section 105.2 currently exempts "plumbing" work unless "it becomes necessary to remove and replace with new material." Many "repair" applications with CIPP would otherwise be deemed exempt from permitting by the language of Section 105.2, as CIPP is widely used to "repair" leaks and to more permanently clear stoppages in conjunction with cleaning of scaling and tuberculation.

We do concur with the value of routine permitting with CIPP work. We propose, however, that AHJs have the option of not having to conduct a mandatory "review and evaluation" of pre-CCTV video prior to issuing permits for basic "repair" work, so as to ease the burden on local AHJs when dealing with lower risk "repair" applications of CIPP. We propose that a distinction be made for mandatory "review and evaluation" prior to issuing permits for plumbing "replacement" applications of CIPP, where the CIPP is intended to function as the new structural "replacement" pipe.

This proposal strikes a closer balance to the general permitting practices for other plumbing pipe materials within the IPC as governed by Section 105.2. The local AHJ can then use discretion with their preferred permitting process for CIPP according to their experience and comfort level.

The applications of concern necessitating mandatory preinstallation "review and evaluation" of pre-CCTV video for code officials to ensure that the code requirements will continue to be met, all pertain to "replacement" applications of CIPP. The "repair" applications as defined within this proposal are inherently less likely to alter the code approved design compliance of the completed CIPP "repair." Regardless, post-installation inspection and review for permit closing will verify the as-built code compliance of the CIPP.

We feel that this proposal will significantly reduce the burden on AHJ staff while still providing proper code compliance oversight with the usage of CIPP.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As proposed, permits will still be required for CIPP projects, so there is no permitting cost difference to the cost of construction.

However, the time cost to AHJ staff will be significantly reduced versus mandatory review of pre-installation CCTV video prior to permitting for all (even lower risk "repair") CIPP applications.

AHJs will still have the local authority to require a "reviewed" permit should they so desire. The proposed language simply permits AHJs to issue non-reviewed permits and verify compliance at permit closing for applications where CIPP is being used for a "repair" [that would otherwise be completely non-permitted as per the requirements of IPC Section 105.2] with the option to place trust in the professionalism of the licensed plumber while still verifying code compliance with review and inspection during permit closure. This brings section 717.4 more in line with the permitting practices for all other code approved plumbing pipe products, while still providing for greater oversight through "required" permitting even for "repair" work that does not involve "removal and replacement."

P110-24

IPC: 717.5

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.5 Prohibited applications.
Where review of the preinstallation recorded video camera survey reveals that piping systems are not installed correctly or defects exist , that will not be corrected by relining, then relining shall not be permitted without correction of such defects prior to cured-in place-pipe relining. ~~The defective portions of piping shall be exposed and repaired with pipe and fittings in accordance with this code. Defects include, but are not limited to, backgrade or insufficient slope, complete pipe wall deterioration or complete separations such as from tree root invasion or improper support.~~

Reason: The deleted language is erroneous regarding the capabilities and limitations of CIPP and confusingly complicated. The revised opening language more appropriately covers the guidance required by AHJs to make informed decisions on when to prohibit the use of CIPP.

There seems to be the erroneous assumption that CIPP is only ever a "repair" option and not capable of being a "replacement" option. The industry consensus standards and their design equations (as found in the design appendix of ASTM F1216) provide for the use of CIPP as a structural replacement as well as a performance repair system.

The installation of CIPP as a "repair" in conjunction with the preparation of the existing pipe for relining can readily correct defects such as flow disruption by scaling or tuberculation (which can be mistaken for backgrade or insufficient slope) prior to cleaning. Although CIPP cannot correct significant line and grade issues, the improved flow characteristics (including the increased scouring velocity) frequently rectifies any sedimentation issues associated with minor bellies in piping. Properly designed in compliance with the IPC, CIPP does NOT reduce the nominal sizing, the original design flow capacity, or the original design DFU count.

CIPP can also reliably eliminate leakage and root penetration from failed joint seals and even function as "replacement" piping for missing sections of buried piping. CIPP can structurally "replace" pipe sections with "channel rot" and can also structurally "replace" pipes with missing pipe sections; there are also reliable methods to fill voids around the pipe wall while restoring the proper flow line for code compliance. Soil voiding in such smaller diameter CIPP applications is expected to fully reconsolidate within 2 to 3 years to restore proper soil support, with the CIPP structurally spanning the void in the interim.

Where existing pipe defects are capable of being corrected through pipe "replacement" with CIPP, there should be no reason to disallow a reviewed permit installation of certified and listed CIPP systems by a responsible, licensed contractor. The 2024 code language is unnecessarily restrictive.

Bibliography: The ASTM F1216 design appendix provides an industry consensus design approach for use of CIPP as a structural replacement for piping.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The clarifications are in regard to proper applicability for use as either "repair" or "replacement."

P110-24

P111-24

IPC: 717.6, ASTM Chapter 15 (New)

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.6 Relining materials.
The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. Cured-in-place-pipe reline materials shall comply with ASTM F1216, ASTM F1743, ASTM F2561, ASTM F2599 or ASTM F3541. Fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216-22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F1743-22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured-in-Place Thermosetting Resin Pipe (CIPP)
F2599-22	Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Liner
F3541-22	Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Staff Analysis: A review of the standards proposed for inclusion in the code, ASTM F1216-22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube*, ASTM F1743-22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured-in-Place Thermosetting Resin Pipe (CIPP)* and ASTM F2599-22 *Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Liner1,* ASTM F3541-22 *Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)1,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

The proposed standard ASTM F2561 is in the current edition of the code.

Attached Files

- **Value Engineering Considerations.pdf**
  https://www.cdpaccess.com/proposal/10453/30661/files/download/4716/
- **Example Project Cost Analysis Documentation (2).docx**
  https://www.cdpaccess.com/proposal/10453/30661/files/download/4715/

Reason: The scope of Section 717 with its detailed guidance is clearly intended to include usage with Cured-in-Place Pipe (CIPP) reline materials. The Fold & Form PVC reline materials standards (ASTM F1871 & ASTM F1504) have never had a product certified and listed by ICC-ES and have exceptionally minimal usage in Building Sewer applications only.

This section needs to include the ASTM standards to which ICC-ES is actively certifying and listing CIPP systems to provide more thorough guidance to AHJs; currently, products are certified and listed to ASTM F1216-22 (with ICC required mandatory language) for inversion and ASTM F1743-22 (expected mandatory language revision in 2024 -- currently balloting) for pull-in-place CIPP.

We also propose that the recently passed standard of ASTM F3541-22 be included within this section. ASTM F3541 is for segmental relining by CIPP and closely reflects the actual installation practices utilized within Building Sewer and Building Drain applications. ASTM F3541 includes by reference the same performance property requirements of ASTM F1743 to which ICC-ES currently certifies CIPP systems.

We are also recommending the inclusion of ASTM F2599 (segmental CIPP lining by inversion with patented gaskets) and ASTM F2561 (utility sewer lateral to utility main connection CIPP lining with patented gaskets) that are currently included in the otherwise redundant (same title scope) Section 718. Note that no CIPP systems has ever been certified and listed for use to these standards. Any products applicable to ASTM F2599 or ASTM F2561 will also comply with the same performance property requirements of ASTM F1216 to which ICC-ES already certifies CIPP systems. As such, the inclusion of these proprietary standards is a bit redundant.

Bibliography: F1216-22 Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube

ASTM F1743-24 (expected) [F1743-22] Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured-in-Place Thermosetting Resin Pipe (CIPP)

ASTM F2561-20 Standard Practice for Rehabilitation of a Sewer Service Lateral and Its Connection to the Main Using a One Piece Main and Lateral Cured-in-Place Liner

ASTM F2599-22 Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Liner

ASTM F3541-22 Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal only requests referencing standards of materials already otherwise governed by this Code section (thereby is editorial in nature or a clarification), and as such there is no new cost impact.

The addition of existing and newly referenced standards into Section 717 provides no significant cost impact alteration as compared to the existing costs impacts behind the existing code inclusion.

For those interested, we will further expound upon the comparative cost impacts between relining / rehabilitation with Cured-in-Place Pipe (CIPP) versus exhumation and replacement with other piping materials.

The unit costs of CIPP "materials" are typically about the same as other code approved piping alternatives. But depending upon the project scope and site conditions, the unit costs of CIPP "as constructed" are HIGHLY variable as compared to the alternative of exhuming existing piping and replacing with other code approved piping alternatives (refer to the attached project cost analysis documentation).

CIPP "project costs" are significantly driven by the site conditions (and the ancillary "costs" of facility operational disruption tend to also weigh into choosing relining / rehabilitation versus exhumation & replacement) rather than the piping materials cost differences. Hence, a more direct cost comparison to other piping materials' costs is not truly relevant or particularly useful.

So, we will explore how site conditions and operational disruptions create relevant “cost impacts” deserving of thoughtful consideration.

SITE CONDITIONS: Where surface structure restoration costs are exceptionally high, avoidance of such site restoration costs through the remote installation of CIPP (with limited site disruption) can provide significant project cost savings as compared to exhuming the existing piping and replacing with alternative code approved piping materials. The "ancillary" surface structure restoration costs associated with piping exhumation, removal, and replacement is frequently the primary driver of project cost differentials.

Exhumation and replacement can often negatively impact load bearing components of a structure resulting in exceptionally high restoration costs that can be avoided by pipe relining / rehabilitation with CIPP.

Relining / rehabilitation with CIPP can also greatly reduce site safety risks associated with exhumation and prospectively confined space entry. Exhumation and replacement can have environmental and health impacts such as disruption of encapsulated asbestos, lead paint or other hazardous materials, requiring high remediation and disposal costs, as well as subjecting workers and facility occupants to unnecessary risks. Relining / rehabilitation with CIPP can be leveraged to avoid such risks and costs.

Where surface structure restoration and/or remediation costs and risks are high, the higher materials, specialty labor, and equipment costs associated with CIPP installation are generally absorbed and frequently exceeded, resulting in the potential for significant cost savings with CIPP.

OPERATIONAL DISRUPTION & BROADER SOCIAL COSTS: In addition to direct construction costs and risks, the indirect costs and risks of operational disruption often weigh into any project "cost" comparison between a relining / rehabilitation installation with CIPP versus exhumation and replacement with other piping materials.

With facilities such as hospitals, jails, court houses, schools, etc. (even the Pentagon & White House on multiple occasions), the "social costs" of operational disruption from exhumation and replacement are frequently deemed to be entirely unacceptable. Relining / rehabilitation with CIPP can reduce the "social costs" to a more acceptable level.

Schools with emergency piping issues do not have the facility capacity and cannot afford the “social costs” to the community that would be caused by unscheduled shutting down of classrooms for extensive exhumation and replacement of piping during the school year. Jails and other government facilities often have security and operational concerns that are alleviated through remote pipe relining / rehabilitation with CIPP versus direct secure zone entry and disruption that is required for exhumation and replacement.

P111-24

P112-24

IPC: 717.6

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.6 Relining materials.
The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. ~~Fold and form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.~~

Reason: No products have ever been certified and listed by ICC-ES to ASTM F1504 or ASTM F1871. There has been very limited to practically no usage of such Fold & Form PVC products for Building Sewer relining and without Section 303 compliance they should not be used.

Removing Fold & Form PVC standards from Section 717 clarifies the intent of Section 717 as having primary applicability to the widely used Cured-in-Place Pipe (CIPP) systems.

If and when Fold & Form PVC products seek Section 303 compliance through certification & listing, it can be proposed for a new section more relevant to Fold & Form capabilities and limitations.

Bibliography: ASTM F1504-21e1 Standard Specification for Folded Poly(Vinyl Chloride) (PVC) Pipe for Existing Sewer and Conduit Rehabilitation

ASTM F1871-20
Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no increase or decrease in cost impact as no products compliant with the standards proposed to be removed have ever been certified and listed for use, and therefore, are not code compliant for usage anyway.

The products compliant with ASTM F1504 and ASTM F1871 (Fold & Form PVC pipe) require "direct" access through an access chamber or excavation at both ends of the existing piping, whereas the more commonly used CIPP relining methods only require "remote" access at one end of the existing piping; as a result, the Fold & Form PVC relining methods tend to be significantly higher cost than the CIPP relining methods, contributing to the exceedingly rare (almost non-existent) usage of Fold & Form PVC relining in building sewer applications. This is further attested to by the complete lack of products ever ICC-ES certified to either ASTM F1504 or ASTM F1871 for proper code compliant permitted usage.

P112-24

P113-24

IPC: 717.6, 717.7 (New), 717.8 (New), ASTM Chapter 15 (New)

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Revise as follows:

717.6 Relining materials.
The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section 303.~~Fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.~~

Add new text as follows:

717.7 Fold in form. Sectional repair using fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.

717.8 Cured-in-Place-Pipe. Sectional repair using push or pull in place cure-in-place pipe (CIPP) shall be in compliance with ASTM F3541 using gaskets in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration. Sectional repair using inversion cure-in-place pipe (CIPP)shall be in compliance with ASTMF1216 or ASTM F2599 using gaskets in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration. Main and lateral cured-in-place rehabilitation of building sewer and sewer service lateral pipe and their connections to the main sewer pipe shall be in accordance with ASTM F2561 using gaskets in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216-22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F3541-22	Standard Practice for Sectional Repair of Existing Gravity Fow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-in-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F1216-22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube1,2* and ASTM F3541-22 *Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)1,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: ASTM F3541 is the preferred method of rehabilitation using CIPP technology inside the building parameter and ASTM F1216 is referenced for requirements in all other CIPP standards in Section 718. adding more clarification regarding Hydrophilic gaskets and rings is consistent with the requirements in Section 718 currently and is an health and safety issue.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

there is no material cost added to this code as the standards referenced are currently referenced in the code and the standards reference each other in most cases such as ASTM F1216 and ASTM F3541. ASTM F3240, and the required use of hydrophilic gaskets, is in Section 718 where the minimal cost is already recognized by the code.

P113-24

P114-24

IPC: 717.6, 717.7 (New)

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

717.6 Relining materials.
The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. Fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.

Add new text as follows:

717.7 Cured-in-place-pipe. Sectional cured-in-place pipe rehabilitation of building sewer piping and sewer service lateral piping shall be in accordance with ASTM F2599. Main and lateral cure-in-place pipe rehabilitation of building sewer and sewer service lateral pipe and their connections to the main sewer pipe shall be in accordance with ASTM F2561. Hydrophilic rings or gaskets in cure-in-place rehabilitation of building sewer piping and sewer service laterals shall be in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.

Staff Analysis: The proposed standards are in the current edition of the code.

Reason: This code change simply moves Section 718 into Section 717. Both Sections cover the rehabilitation of building sewers and building drains.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply moves existing requirements in Section 718 into Section 717 and thus cost allowance is already in code.

P114-24

P115-24

IPC: 717.10 (New), 717.10

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Add new text as follows:

717.10 Pressure Testing. The rehabilitated piping system shall be tested in accordance with Section 312.

Revise as follows:

~~717.10~~ 717.11 Approval.
Upon verification of compliance with the requirements of Sections 717.1 through ~~717.9~~ 717.10, the code official shall approve the installation.

Reason: All sanitary drainage systems must be pressure tested in accordance with Section 312 as is noted in Section 701.6 and 716.8 in Chapter 7. It also needs to be clarified in Section 717 and 718 that this is necessary.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Pressure testing is required in multiple Sections of the code currently and the cost allowance is already recognized.

P115-24

P116-24

IPC: SECTION 202 (New), 718.1, ASTM Chapter 15 (New)

Proponents: Joanne Carroll, Subtegic Group Inc., Subtegic Group Inc (jcarroll@subtegic.com)

2024 International Plumbing Code

Add new definition as follows:

CURED-IN-PLACE PIPE (CIPP). A system consisting of a flexible textile tube saturated with a thermosetting resin used to rehabilitate existing pipe in-place by insertion and cure within an existing pipe.

Revise as follows:

718.1 Cured-in-place pipe (CIPP).
The cured-in-place pipe (CIPP) materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. ~~Sectional cure-in-place~~ CIPP rehabilitation of building drain and *building sewer* piping ~~and *sewer* service lateral piping~~ shall be installed in accordance with ASTM F1216, ASTM F3541, or F2599. ~~Main and lateral cure-in-place~~ CIPP rehabilitation of a *building sewer* ~~and *sewer* service lateral pipe~~ and ~~their~~ its connection~~s~~ to the main *sewer* pipe shall be installed in accordance with ASTM F2561. Seamless molded ~~H~~ hydrophilic ~~rings or~~ gaskets in ~~cure-in-place~~ CIPP rehabilitation of ~~*building sewer* piping and *sewer* service~~ lateral~~s~~ pipelines shall be installed in accordance with ASTM F3240 ~~to ensure water tightness and elimination of ground water penetration~~.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216 - 2022	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F3541 - 2022	Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F1216-2022 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube* and ASTM F3541-2022 *Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: As is the case with all plumbing-related pipe, materials, fittings and fixtures, in order to ensure quality and appropriateness for the intended use, CIPP lining materials must be manufactured in accordance with an industry standard.

The addition of CIPP installation standards ASTM F1216 and ASTM F3541 cover the requirements for the installation of CIPP when using the inversion or pushed or pulled-in place installation methods.

Reference to ASTM F2561 is made to clearly describe the scope of F2561 as appropriate for the reference to installation of CIPP for the rehabilitation of a building sewer and its connection to the main. Reference to ASTM F3240 is clarified to the scope of ASTM F3240 that is specific to covering the requirements for the installation of seamless molded hydrophilic gaskets in the CIPP rehabilitation of main and lateral pipelines.

Bibliography: Scope from ASTM F2561 - "*1.1 This practice covers requirements and test methods for the reconstruction of a sewer service lateral pipe having an inner diameter of 3 to 12 in. (7.6 to 30.5 cm) and its connection to the main pipe having an inner diameter of 6 to 24 in. (15.2 to 61.0 cm) and up the lateral a maximum of 150 ft (46 m) without excavation.*"

Scope from ASTM F3240 - "*1.1 This practice covers the requirements for the installation of seamless molded hydrophilic gaskets (SMHG) in cured-inplace pipe (CIPP) rehabilitation of main and lateral pipelines.*"

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal adds industry standards and provides clarity for the application of CIPP already included in the code.

P116-24

P117-24 Part I

IPC: 718.1, ASTM Chapter 15 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

718.1 Cure-in-place.
~~Sectional~~ ~~c~~Cure-in-place rehabilitation of *building sewer* piping and *sewer* service lateral piping shall be in accordance with ASTM F1216, ASTM F1743, ASTM F2561, or ASTM F2599. ~~Main and lateral cure-in-place rehabilitation of *building sewer* and *sewer* service lateral pipe and their connections to the main *sewer* pipe shall be in accordance with ASTM F2561.~~ Hydrophilic rings or gaskets in cure-in-place rehabilitation of *building sewer* piping and *sewer* service laterals shall be in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
ASTM F1743 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured in-Place Thermosetting Resin Pipe (CIPP)

Staff Analysis: The proposed standard ASTM F2561 is in the current edition of the code.
A review of the standard proposed for inclusion in the code, ASM F1216 - 22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube* and ASTM F1743 - 22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured in-Place Thermosetting Resin Pipe (CIPP)*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Cure-in-place pipe lining is a commonly used method of rehabilitating existing sewer piping and laterals. The 2021 International Plumbing Code added this new Section 718, but left off several important ASTM reference standards that are necessary to allow different methods of cure-in-place lining to be used properly. This proposal adds two additional reference standards as noted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is simply adding options for methods of rehabilitating existing sewers and laterals by cured-in-place lining. Owners and designers may chose to rehabilitate sewers via this method, and then chose which standards are most appropriate for their project. Therefore, nothing new is being mandated by this change; the change only provides more options.

P117-24 Part I

P117-24 Part II

IRC: P3012.1 (New), ASTM Chapter 44 (New)

Proponents: Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Brian Tollisen, NYS Department of State, NYS Department of State (brian.tollisen@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov); Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov)

2024 International Residential Code

Add new text as follows:

P3012.1 Cure-in-place. Cure-in-place rehabilitation of building sewer piping and sewer service lateral piping shall be in accordance with ASTM F1216, ASTM F1743, ASTM F2561, or ASTM F2599. Hydrophilic rings or gaskets in cure-in-place rehabilitation of building sewer piping and sewer service laterals shall be in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F1216 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F1743 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured in-Place Thermosetting Resin Pipe (CIPP)
F2599-22	Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Line
F3240-19 (2023)	Standard Practice for Installation of Seamless Molded Hydrophilic Gaskets (SMHG) for Long-Term Watertightness of Cured-in-Place Rehabilitation of Main and Lateral Pipelines

Staff Analysis: The proposed standard ASTM F2561 is in the current edition of the code.

A review of the standards proposed for inclusion in the code,

ASTM F1216 - 22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube*

ASTM F1743 - 22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured in-Place Thermosetting Resin Pipe (CIPP)*

ASTM F2599-22 *Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Line*

ASTM F3240-19 (2023) *Standard Practice for Installation of Seamless Molded Hydrophilic Gaskets (SMHG) for Long-Term Watertightness of Cured-in-Place Rehabilitation of Main and Lateral Pipelines Standard Practice for Rehabilitation of a Sewer Service Lateral and Its Connection to the Main Using a One Piece Main and Lateral Cured-in-Place Liner*,with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Cure-in-place pipe lining is a commonly used method of rehabilitating existing sewer piping and laterals. The 2021 International Plumbing Code added a new Section 718 to the IPC, but nothing was added for the Residential Provisions and 718 left off several important ASTM reference standards that are necessary to allow different methods of cure-in-place lining to be used properly. This proposal pulls in the language from the IPC and adds two additional reference standards as noted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is simply adding options for methods of rehabilitating existing sewers and laterals by cured-in-place lining. Owners and designers may chose to rehabilitate sewers via this method, and then chose which standards are most appropriate for their project. Therefore, nothing new is being mandated by this change; the change only provides more options.

P117-24 Part II

P118-24

IPC: SECTION 718, 718.1

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Delete without substitution:

~~SECTION 718~~
~~REHABILITATION OF BUILDING SEWERS AND BUILDING DRAINS~~

~~**718.1 Cure-in-place.**~~
~~Sectional cure-in-place rehabilitation of *building sewer* piping and *sewer* service lateral piping shall be in accordance with ASTM F2599. Main and lateral cure-in-place rehabilitation of *building sewer* and *sewer* service lateral pipe and their connections to the main *sewer* pipe shall be in accordance with ASTM F2561. Hydrophilic rings or gaskets in cure-in-place rehabilitation of *building sewer* piping and *sewer* service laterals shall be in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.~~

Reason: Section 718 is redundant with Section 717, having the exact same scope. The CIPP standards referenced are suggested to be added to the more comprehensive Section 717 in a separate proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Consolidating the redundant Section 718 with Section 717.

The elimination of the "redundant" section 718 through consolidation with Section 717 (which inappropriately has the exact same scope of application as per their section titles), does not inherently alter the code inclusive availability of any methods or materials and therefore does NOT affect the cost of construction. All IPC compliant, listed and certified Cured-in-Place Pipe (CIPP) materials, including those governed by the ASTM standards currently referenced within Section 718, are also capable of compliance with the "same" scope of application defined more completely within Section 717.

All CIPP systems are currently ICC-ES certified and listed to ASTM F1216 or ASTM F1743; the ASTM standards referenced within Section 718 also rely upon certification to the performance requirements of ASTM F1216, as referenced from within those ASTM standards. No CIPP products have ever been certified and listed to ASTM F2561, ASTM F2599, or ASTM F3240 (a gasket standard, not a CIPP standard).

As the proposal to eliminate Section 718 does not eliminate the availability or code approved usage of any CIPP materials or methods (which ALL still have the ability to comply with Section 717), the proposal is "editorial in nature or a clarification" (removing an inherent redundancy within the Code) and therefore has no impact on the cost of construction. Section 717 has greater depth of guidance to AHJs regarding the proper usage of ALL pipe relining systems, including CIPP, and the CIPP standards listed within Section 718 likewise need to be governed by the same depth of guidance for use as is provided within Section 717. Furthermore, in the separate proposal, 10453, the ASTM CIPP standards (ASTM F2561 and ASTM F2599) found within Section 718 are among the CIPP industry standards proposed for more appropriate inclusion into Section 717, instead of the redundant Section 718 that is proposed for removal.This proposal has no intention to eliminate (nor effect of eliminating) the option of using ANY currently code approved CIPP materials or methods of construction, and therefore has NO cost impact; this proposal merely consolidates redundant sections of the Code.For those interested, we will further expound upon the comparative cost impacts between relining / rehabilitation with Cured-in-Place Pipe (CIPP) versus exhumation and replacement with other piping materials.

The unit costs of CIPP "materials" are typically about the same as other code approved piping alternatives. But depending upon the project scope and site conditions, the unit costs of CIPP "as constructed" are HIGHLY variable as compared to the alternative of exhuming existing piping and replacing with other code approved piping alternatives (refer to the attached project cost analysis documentation).

CIPP "project costs" are significantly driven by the site conditions (and the ancillary "costs" of facility operational disruption tend to also weigh into choosing relining / rehabilitation versus exhumation & replacement) rather than the piping materials cost differences. Hence, a more direct cost comparison to other piping materials' costs is not truly relevant or particularly useful.

So, we will explore how site conditions and operational disruptions create relevant "cost impacts" deserving of thoughtful consideration.

SITE CONDITIONS: Where surface structure restoration costs are exceptionally high, avoidance of such site restoration costs through the remote installation of CIPP (with limited site disruption) can provide significant project cost savings as compared to exhuming the existing piping and replacing with alternative code approved piping materials. The "ancillary" surface structure restoration costs associated with piping exhumation, removal, and replacement is frequently the primary driver of project cost differentials.

Exhumation and replacement can often negatively impact load bearing components of a structure resulting in exceptionally high restoration costs that can be avoided by pipe relining / rehabilitation with CIPP.

Relining / rehabilitation with CIPP can also greatly reduce site safety risks associated with exhumation and prospectively confined space entry. Exhumation and replacement can have environmental and health impacts such as disruption of encapsulated asbestos, lead paint or other hazardous materials, requiring high remediation and disposal costs, as well as subjecting workers and facility occupants to unnecessary risks. Relining / rehabilitation with CIPP can be leveraged to avoid such risks and costs.

Where surface structure restoration and/or remediation costs and risks are high, the higher materials, specialty labor, and equipment costs associated with CIPP installation are generally absorbed and frequently exceeded, resulting in the potential for significant cost savings with CIPP.

OPERATIONAL DISRUPTION & BROADER SOCIAL COSTS: In addition to direct construction costs and risks, the indirect costs and risks of operational disruption often weigh into any project "cost" comparison between a relining / rehabilitation installation with CIPP versus exhumation and replacement with other piping materials.

With facilities such as hospitals, jails, court houses, schools, etc. (even the Pentagon & White House on multiple occasions), the "social costs" of operational disruption from exhumation and replacement are frequently deemed to be entirely unacceptable. Relining / rehabilitation with CIPP can reduce the "social costs" to a more acceptable level.

Schools with emergency piping issues do not have the facility capacity and cannot afford the "social costs" to the community that would be caused by unscheduled shutting down of classrooms for extensive exhumation and replacement of piping during the school year. Jails and other government facilities often have security and operational concerns that are alleviated through remote pipe relining / rehabilitation with CIPP versus direct secure zone entry and disruption that is required for exhumation and replacement.

P118-24

P119-24

IPC: 802.1.5

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

802.1.5 Nonpotable clear-water waste.
Where devices and equipment such as process tanks, filters, drips, and boilers, plumbing appliances, or other mechanical equipment discharge nonpotable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air break or an air gap to an approved waste receptor.

Reason: This section has only referenced process tanks, boilers, filters and drips, condensate is a non-potable clearwater waste that is often generated at mechanical equipment such as furnaces and air conditioners, as well as condensing water heaters and tankless water heaters. This proposal will include a wider range of nonpotable clear water waste and address how to dispose of it.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is for clarification only and does not impart any additional requirements.

P119-24

P120-24

IPC: SECTION 202 (New), 802.1.9 (New)

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Add new definition as follows:

DUMP SINK

.

A sink provided in food service operations for the sole purpose of dumping leftover liquids from drinking containers, these sinks can be stand-alone fixtures or in combination with a 3-compartment sink.

Add new text as follows:

802.1.9 Dump sinks. When dump sinks are required, they shall discharge directly or indirectly through an air gap or air break to the drainage system.

Reason: Public health agencies are requiring these fixtures in an effort to keep food service operation staff from dumping leftover liquids/beverages into food preparation sinks where they could cause a potential contamination issue. This proposal is intended to provide direction for how these fixtures should be viewed and how they will be permitted to discharge to the drainage systems.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These sinks are already being required by public health agencies so there would be no additional costs.

P120-24

P121-24

IPC: 802.4, 802.4.3

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

802.4 Waste receptors.
For other than hub drains that receive only clear-water waste and standpipes, a removable strainer or basket shall cover the outlet of waste receptors. Waste receptors shall not be installed in concealed spaces. Waste receptors shall not be installed in plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors. *Ready access* shall be provided to waste receptors.

Exception: *Access* shall be provided for automatic clothes washer standpipe drains for rodding.

802.4.3 Standpipes.
Standpipes shall be individually trapped. Standpipes shall extend not less than 18 inches (457 mm) but not greater than 42 inches (1067 mm) above the trap weir. ~~*Access* shall be provided to standpipes and drains for rodding.~~

Reason: It is imperative that indirect waste receptors are provided with 'Ready Access" since they receive indirect waste discharge. Without the clear view of the waste receptor, a backup in the drainage system can result in damage due to the concealed location of the waste receptor. The portion of this section which previously indicated standpipes shall be provided with "Access" allows for all standpipes to be concealed in some fashion. Allowing for "Access" to be provided specifically for automatic clothes washer standpipe makes sense due to the fact there is a minimum and maximum height the standpipe is permitted to extend above the trap which results in many of these being concealed by the automatic clothes washers. However, if only providing "Access" is permitted for all types of standpipes, it results in standpipes located under counters behind cabinet doors where they will not be observable to the occupants.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not positively or negatively impact costs, it just clarifies which waste receptors are required to be provided with "Ready Access" and which ones are required to be provided with "Access".

P121-24

P122-24

IPC: 903.1.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

903.1.2 Roof used for recreational or assembly purposes.
Where a roof is to be used as a promenade, restaurant, bar, or sunbathing deck, as an observation deck, or for similar purposes, open vent pipes, including side wall vent terminations, shall terminate not less than 7 feet (2134 mm) above the roof.

Reason: In many cases side wall vent terminals have not been considered in the application of this section. Many code users have improperly assumed this section only applied to thru roof vent terminations. This has led to situations where fumes/vapors from a side wall vent terminal located below an occupiable room area are drawn up or otherwise entering the occupiable roof area. The language should be made more clear that this includes side wall vents as an air contamination source.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The requirement is already in the code, this proposal just clarifies to users that side wall vent terminations should be included in the implementation of this section.

P122-24

P123-24

IPC: 903.1.2

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

903.1.2 Roof used for recreational or assembly purposes. Where a roof is to be used as a promenade, restaurant, bar, or sunbathing deck, as an observation deck, or for similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof. <u>As an alternative, open vent pipes shall terminate to a stack type air admittance valve conforming to ASSE 1050. Such air admittance valves shall be installed in accordance with the manufacturer's instructions and fitted with a with a UV-rated cover.</u>

Staff Analysis: The proposed standards are in the current edition of the code.

Attached Files

- **Studor Engineered Products Manual - 10th Edition (1).pdf**
  https://www.cdpaccess.com/proposal/9704/30403/files/download/4658/
- **Cost Impact Calculations - Rooftop Stack AAV.pdf**
  https://www.cdpaccess.com/proposal/9704/30403/files/download/4657/

Reason: Stack type AAVs have been used for decades for rooftop promenades, restaurants, bars, sunbathing decks, or observation decks to eliminate sewer gas odors on the rooftop environment.

Bibliography: Studor Engineered Products Manual - 10th Edition

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost of installing a stack-type air admittance valve to a rooftop application is approximately $450 less than adding at least seven (7) feet of pipe and securing it to the roof with guy wires.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

P123-24

P124-24

IPC: 904.2, 904.2.1 (New), 904.2.2 (New)

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

904.2 ~~Stack vents and vent stacks~~ ~~Vent stack required.~~ ~~A vent *stack* shall be required for every drainage *stack* that has five *branch intervals* or more.~~ Stack vents and vent stacks shall be provided in accordance with section 904.2.1 and 904.2.2, and shall be sized in accordance with Section 906.1.

Exception: Drainage *stacks* installed in accordance with Section 913 and Section 917.

Add new text as follows:

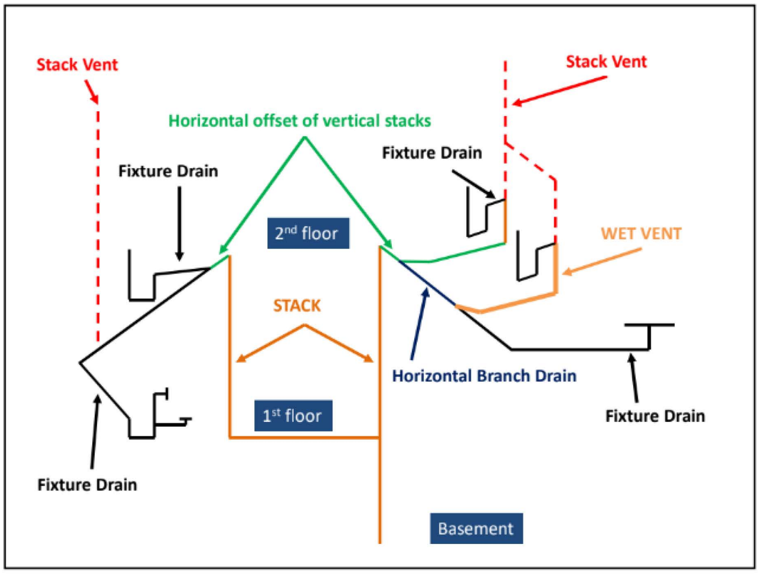
904.2.1 Stack vent required. Each soil or waste stack shall be provided with a stack vent at the interconnection between the stack and the uppermost drainage connection to the stack.

904.2.2 Vent stack required. A vent *stack* shall be required for every drainage *stack* that has five *branch intervals* or more.

Exception: Drainage *stacks* installed in accordance with Section 913.

Reason: Though technically the definition of a stack vent ensures a soil or waste stack has a stack vent, clarification is need as to where it should be applied. Many installation have been installed where the stack is simply terminated to a 90 degree fitting to a horizontal pipe which connects to a bathroom group or other fixtures, however, this wide interpretation can lead to installers providing piping configurations that leave fixture traps unprotected.

Consider a vertical stack that originated in the basement of a 2-story home with a master bath on the second story with a water closet, 2 lavatories, a show and a whirlpool tub. A 2 inch branch is installed below the first floor and extends 12 feet before turning vertically to the 2nd floor where the shower and whirlpool are to be connected. The drain travels through 1 full story which by definition makes it a "stack". The stack connects to a 90 degree fitting and turns horizontally. The shower is connected via a wye fitting and the drain extends another 2 feet where a vertical vent is connected. From there it extends to the whirlpool. Many would look at this and consider it a circuit vent or a version of a wet vent, however, that is just not the case. This configuration did not create a horizontal branch drain because the stack did not have a stack vent applied at the interconnection of the horizontal drain and the stack. The vent connection applied is actually the stack vent which is upstream of the shower drain leaving the trap unprotected. When water is discharge from the 80 gallon whirlpool, the flow of the water blocks the venting pathway for the shower trap and when the waste eater reaches the stack and begin to fall, the negative pressure generated within the piping system results in positive pressure from the atmosphere pushing the shower trap seal around , siphoning the trap, until the positive pressure can enter the system to balance out the negative pressure. See attached isometric.



Bibliography: See reason statement

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal technically should have no impact on cost and is entirely for clarification purposes only, see reason statement.

P124-24

P125-24 Part I

IPC: 905.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

905.2 Grade. Horizontal ~~Vent~~ vent and *branch vent* pipes shall be installed level, or sloped ~~so graded and connected as~~ to drain back to the drainage pipe by gravity.

P125-24 Part I

P125-24 Part II

IRC: P3104.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Residential Code

Revise as follows:

P3104.2 Grade. Horizontal ~~Vent~~ vent and branch vent pipes shall installed level, or be ~~graded~~ sloped~~, connected and supported to allow moisture and condensate~~ to drain back to the ~~soil or waste~~ drainage pipe by gravity.

Reason: The intent of this section is to ensure vent systems are installed in a manner that does not result in a situation where condensate can collect in sufficient quantities which would result in a blockage of a vent. A vent pipe that is run level could not retain enough water to cause this to occur, at best, a residual amount of water could be left behind on the invert of the pipe due to surface tension. This residual water would never be enough to block or substantially restrict the emission or admission of air for balancing the system.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds no additional requirements for an installation, but rather provides more options for compliance.

P125-24 Part II

P126-24

IPC: 906.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

906.2 Vents other than stack vents or vent stacks. The diameter of individual vents, *branch vents*, circuit vents and relief vents shall be not less than one-half the ~~required diameter of the drain served~~ diameter of the largest rough-in drain to be served**.** The required size of the drain shall be determined in accordance with Table 710.1(2). Vent pipes shall be not less than $1^1/_4$ inches (32 mm) in diameter. Vents exceeding 40 feet (12 192 mm) in *developed length* shall be increased by one nominal pipe size for the entire *developed length* of the vent pipe. Relief vents for soil and waste *stacks* in buildings having more than 10 *branch intervals* shall be sized in accordance with Section 908.2.

Reason: There exists a contradiction in the current code text between section 906.2 and section 905.6. One requires the vent to be sized based on the required size of the drain served while the other requires the vent to be sized based on the rough-in size of the drain served. Leaving section 906.2 as is also can create compliance issue in the future. Jurisdictions typically are only required to keep records for 2 to 4 years for construction documents. If a building was designed with pipe sizes one size larger than "required" in an effort to allow for future expansion, the installed vent will be undersized once the DFU value added reaches the point where the larger size pipe is required. In such a design, the additional DFU load added may not happen within 2 to 4 years, maybe it happens 10 years down the road and no one involved has the records or remembers the vent was sized based on the "required size" of the drain served. A best practice here is to always require the vent to be sized based on the installed size of the drain.

905.6 Vent for future fixtures.

Where the drainage piping has been roughed-in for future fixtures, a rough-in connection for a vent shall be installed. The vent size shall be not less than one-half the diameter of the rough-in drain to be served. The vent rough-in shall connect to the vent system, or shall be vented by other means as provided for in this chapter. The connection shall be identified to indicate that it is a vent.

Bibliography: See reason statement.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The increased cost will be minimal as it will only require the vents to be sized appropriately for the given size of the largest drainage pipe served. Based on retail prices a conservative estimate for the increase is a range of approximately $4 - $20 per 10 foot length of pipe.

Estimated Immediate Cost Impact Justification (methodology and variables):

The increased cost will be minimal as it will only require the vents to be sized appropriately for the given size of the largest drainage pipe served. The overall impact would be determined by the length of the associated vent and the mark -up in material cost by the contractor. As an example, Lowe's lists the price of 10 ft. sections of PVC pipe as follows:

1-1/2 inch - $11.37

2 inch - $15.78

3 inch - $29.47

4 inch - $48.31

P126-24

P127-24

IPC: 907.1, ASSE Chapter 15 (New)

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

907.1 Vent for horizontal offset of drainage stack.
Horizontal offsets of drainage *stacks* shall be vented where five or more *branch intervals* are located above the offset. The offset shall be vented by venting the upper section of the drainage *stack* and the lower section of the drainage *stack*, or in single stack drainage systems, a positive pressure reduction device conforming to ASSE 1030 shall be installed in accordance with the manufacturer's instructions.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016	Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The current language does not address single stack drainage systems where positive pressure reduction devices conforming to ASSE 1030 are used to protect the trap seals from positive pressure transients in the drainage system.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: Decrease

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

P129-24

P130-24

IPC: 908.1, ASSE Chapter 15 (New)

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

908.1 Where required.
Soil and waste *stacks* in buildings having more than 10 *branch intervals* shall be provided with a relief vent at each tenth interval installed, beginning with the top floor.When a single stack drainage system is installed utilizing a combination of air admittance valves and positive pressure reduction devices (PPRDs), a PPRD shall be permitted to serve as a relief vent for the stack when the PPRDs are located no greater than six (6) branch intervals apart, and installed in accordance with the manufacturer's instructions.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016	Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The current code language does not address relief vents for single stack drainage systems. Positive pressure reduction devices conforming to ASSE 1030 installed in accordance with the manufacturer's instructions provide relief from positive pressure transients in waste stacks.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

P130-24

P131-24

IPC: 915.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

915.1 Type of fixtures.
A *combination waste and vent system* shall not serve fixtures other than floor drains,<u>hub drains, </u>sinks, lavatories and drinking fountains. *Combination waste and vent systems* shall not receive the discharge from a clinical sink.

Reason: In most cases, hub drains receive identical waste discharge as what is received by sinks, floor drains, lavatories and drinking fountains. It is reasonable to expect that these traps will be protected as well as the traps associated to the other listed fixtures for this type of venting method if designed and installed in the same manner.

Bibliography: See reason statement.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Assuming an individual or common venting method was previously chosen to vent the hub drain, under the current code requirement, and as per this proposal it would be permitted to be vented using a combination waste and vent system, the decrease in cost would be dependent on the total distance a vent would be required to be installed otherwise.

Expected immediate saving would range between $172.74 - $246.62 for every 20 feet of vent pipe that would no longer be required to be installed.

Estimated Immediate Cost Impact Justification (methodology and variables):

Allowing for hub drains to be vented as part of a combination waste and vent system would result in lowering the cost of construction compared to some of the other venting options available such as individual vents and common vents.

The overall impact would be determined by the length of the associated vent and the mark -up in material cost by the contractor.

As an example, Lowe's lists the price of 10 ft. sections of PVC pipe as follows:
1-1/2 inch - $11.37
2 inch - $15.78
3 inch - $29.47
4 inch - $48.31
If we assume a labor rate of $150/hr., and 20 feet of pipe with 1 hour of installation time, the overall savings would be as follows per pipe size:

1-1/2 inch - $22.74 - Labor - $150 - Total $172.74
2 inch - $36.51 - Labor - $150 - Total $186.51
3 inch - $58.94 - Labor - $150 - Total $208.94
4 inch - $96.62 - Labor - $150 - Total $246.62

P131-24

P132-24

IPC: 915.2.3

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

915.2.3 Connection.
The *combination waste and vent system* shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain that serves vented fixtures located on the same floorlevel that are not isolated by a normally closed backwater valve. *Combination waste and vent systems* connecting to *building drains* receiving only the discharge from one or more *stacks* shall be provided with a dry vent. The vent connection to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the *flood level rim* of the highest fixture being vented before offsetting horizontally.

Reason: Fixtures that are vented using the combination waste and vent method can be totally separated from the venting pathway if a normally closed backwater valve has been installed on the fixture drain or fixture branch. placing a dry vent upstream of the normally closed backwater valve, or installing a normally open backwater valve will prevent this condition from occurring.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Any cost impact would be the responsibility of the design professional designing the project. The code does not dictate how to design a system in order to avoid cost impacts. This proposal just ensures whichever pathway the designer chooses that the fixtures or traps connected will be appropriately protected by a compliant venting method.

P132-24

P133-24

IPC: 915.2.5

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

915.2.5 Fixture branch or drain.
The *fixture branch* or *fixture drain* shall connect to the combination waste and vent within a distance specified in Table 909.1. The combination waste and vent pipe shall be considered to be the vent for the fixture. <u>Each fixture drain shall connect horizontally to the combination waste and vent system.</u>

Reason: Combination waste and vent systems rely on the upper half of the pipe remaining empty in order to provide a pathway for venting. If fixtures are permitted to connect vertically, the venting pathway can/will be interrupted by the discharge. This problem was addressed in the circuit venting method, however, it has never been addressed in the combination waste and vent method.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is for clarification only and aimed at keeping venting methodology consistent with methodology in circuit venting.

P133-24

P134-24

IPC: 918.1, ASSE Chapter 15 (New)

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com); Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Revise as follows:

918.1 General.
Vent systems utilizing air admittance valves shall comply with this section. Stack-type air admittance valves shall conform to ASSE 1050. Individual and branch-type air admittance valves shall conform to ASSE 1051. Positive pressure reduction devices used in systems with air admittance valves shall conform to ASSE 1030.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016	Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposed change adds a reference to positive pressure reduction devices and the affiliated standard.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

- **Studor Engineered Products Manual - 10th Edition.pdf**
  https://www.cdpaccess.com/proposal/9350/30427/documentation/145718/attachments/download/4294/

Justification for no cost impact:

The proposal is simply adding a statement that the device must meet a standard but does not mandate that the device be installed. There is no requirement for the device and therefore there is no cost impact.

P134-24

P135-24

IPC: 918.3.1, ASSE Chapter 15 (New)

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

918.3.1 Horizontal branches.
Individual and branch-type air admittance valves shall vent only fixtures that are on the same floor level and connect to a *horizontal branch drain*. Where the horizontal *branch* is located more than four *branch intervals* from the top of the *stack*, the horizontal *branch* shall be provided with a relief vent that shall connect to a vent *stack*,~~or~~ stack *vent*, ~~or~~ extend outdoors to the open air, or a positive pressure reduction device (PPRD) installed in accordance with the manufacturer's instructions. The relief vent or PPRD shall connect to the *horizontal branch drain* between the *stack* and the most downstream *fixture drain* connected to the *horizontal branch drain*. The relief vent shall be sized in accordance with Section 906.2 and installed in accordance with Section 905. The relief vent shall be permitted to serve as the vent for other fixtures.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016	Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Attached Files

- **Cost Impact Calculations - PPRD.pdf**
  https://www.cdpaccess.com/proposal/9716/30434/files/download/4673/

Reason: This code change is to address ASSE 1030 - Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems. This new standard for a venting method that relieves positive pressures in the drainage system. These devices are specifically designed to work in concert with air admittance valves in all building types including high rise buildings where positive pressures can develop in drainage systems.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

P135-24

P136-24

IPC: 918.3.2, ASSE Chapter 15 (New)

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

918.3.2 Stack.
Stack-type air admittance valves shall be ~~prohibited from serving~~ permitted to serve as the vent terminal for vent *stacks* or *stack vents* ~~that serve drainage *stacks* having more than six *branch intervals*~~where the stack has a positive pressure reduction device that is designed to relieve positive pressures in the stack and conforms to ASSE 1030. Air admittance valves and positive pressure reduction devices shall be installed in accordance with the manufacturer's design and installation manual..

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016	Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: With the recent development of a standard for positive pressure reduction devices, there is no reason to limit stack type air admittance valves to a maximum of six branch intervals. This code change addresses this new technology.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is just a clarification that stack type AAVs are allowed to be installed in buildings over six stories in height when installed with positive pressure reduction devices.

P136-24

IPC: 918.7

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

918.7 Vent required.
Within each plumbing system, to relieve positive pressure from surcharging public sewers, not less than one stack vent or vent stack shall extend outdoors to the open air.

Reason: This proposed code language clarifies the reason why one stack vent or vent stack is extended outdoors to the open air.

Bibliography: Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost increase or decrease, this language is just to clarify the need for a vent to open air.

P138-24 Part I

P138-24 Part II

IRC: P3114.7

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Residential Code

Revise as follows:

P3114.7 Vent required. Within each plumbing system, to relieve positive pressure from surcharging public sewers, not less than one stack vent or a vent stack shall extend outdoors to the open air.

Reason: This proposed code language clarifies the reason why one stack vent or vent stack is extended outdoors to the open air.

Bibliography: Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost increase or decrease, this language is just to clarify the need for a vent to open air.

P138-24 Part II

P139-24 Part I

IPC: 918.8

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

918.8 Prohibited installations.
Air admittance valves shall not be installed in nonneutralized special waste systems as described in Chapter 8 except where such valves are in compliance with ASSE 1049, are constructed of materials *approved* in accordance with Section 702.5, and are tested for chemical resistance in accordance with ASTM F1412. Air admittance valves shall not be located in spaces utilized as supply or return air plenums. Air admittance valves shall not be used to vent sumps or tanks except where the vent system for the sump or tank has been designed by an engineer, or where the valve is installed in accordance with the manufacturer's engineered instructions. Air admittance valves shall not be installed on outdoor vent terminals for the sole purpose of reducing clearances to gravity air intakes or mechanical air intakes.

Reason: Manufacturers have engineered solutions for sumps or tank installations.

Bibliography: Studor Engineered Products Manual - 10th Edition

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost of a venting a sump pump with an AAV in an existing building should be about $600 less than the cost of venting a sump pump conventionally.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

P139-24 Part I

P139-24 Part II

IRC: P3114.8

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Residential Code

Revise as follows:

P3114.8 Prohibited installations.
Air admittance valves shall not be used to vent sumps or tanks except where the vent system for the sump or tank has been designed by an engineer, or where the valve is installed in accordance with the manufacturer's instructions. *Air admittance valves* shall not be installed on outdoor vent terminals for the sole purpose of reducing clearances to gravity or mechanical air intakes.

Reason: Manufacturers have engineered solutions for sumps or tank installations.

P141-24

IPC: 918.9 (New), ASSE Chapter 15 (New)

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Add new text as follows:

918.9 Positive Pressure Reduction Devices. Vent systems utilizing positive pressure reduction devices shall comply with this section. Positive pressure reduction devices shall conform to ASSE 1030.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016	Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Attached Files

- **Cost Impact Calculations - PPRD.pdf**
  https://www.cdpaccess.com/proposal/9724/30473/files/download/4686/

Reason: This is adding language regarding the use of positive pressure reduction devices and a requirement to comply with the new industry standard for these devices.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

P141-24

P142-24

IPC: 1002.4.1, 1002.4.1.6 (New)

Proponents: Jim Williams, JK Plastics, JK Plastics (jimwilliams@jk-plastics.com)

2024 International Plumbing Code

Revise as follows:

1002.4.1 Trap seal protection.
Trap seals of *emergency floor drain* traps, ~~and~~ trap seals subject to evaporation and trap seals subjected to water discharged at high rates of velocity via an ejector type pump shall be protected by one of the methods in Sections 1002.4.1.1 through ~~1002.4.1.5~~ 1002.4.1.6.

Add new text as follows:

1002.4.1.6 Check Valve type trap seal protection device- Automatic clothes washer standpipe trap..
A check valve type trap seal protection device shall protect the automatic clothes washer standpipe trap seal from evaporation or water discharged at high rates of velocity. The protection device shall consist of a one-way valve designed to only allow air to enter the plumbing drainage system (air admittance valve) and an elastomeric sealing gasket to seal the automatic clothes washer's discharge hose. Such protective devices shall conform with Sections 406.2 & 802.4.3. Air admittance valves shall conform to ASSE 1050 or ASSE 1051. The devices shall be installed in accordance with the manufacture's requirements.

Staff Analysis: The proposed standard is in the current edition of the code.

Reason: The trap protecting the standpipe of an automatic clothes washer is the only trap in a dwelling which is not fed by gravity. This is a unique situation where not only is the trap of an automatic clothes washer routinely subjected to evaporation, but also to large volumes of water discharged at high rates of velocity from an ejector pump which forces the protective water seal out of the trap and creates a "dry-trap" allowing dangerous sewer gases to enter the dwelling. While the emergency floor drain trap seal is protected by a barrier-type protection device, there is no protection device for the automatic clothes washer standpipe trap seal. This check-valve type protection device will provide the necessary protection to the automatic clothes washer standpipe trap seal.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The estimated immediate cost impact would be approximately $89.95 completely installed (cost of device $39.95 + labor $50.00).

Estimated Immediate Cost Impact Justification (methodology and variables):

The minimal increase of less than $100 in construction cost would be greatly outweighed by the benefits to public health and safety.

Estimated Life Cycle Cost Impact:

The estimated life cycle cost impact would be $0.00.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

There would be no additional future cost impact. Once the device is installed there would be no maintenance required or need for replacement.

P142-24

P143-24

IPC: SECTION 202 (New), CHAPTER 10, SECTION 1003, 1003.1, 1003.2, 1003.3.8, 1003.9, 1003.3, 1003.3.1, 1003.3.2, 1003.3.3, 1003.3.4, 1003.3.5, 1003.3.5.1, TABLE 1003.3.5.1, 1003.3.5.2, 1003.3.6, 1003.3.7, 1003.3.7 (New), 1003.3.7.1 (New), 1003.3.7.2 (New), 1003.3.7.3 (New), 1003.3.7.4 (New), 1003.3.7.5 (New), 1003.3.7.5.1 (New), 1003.3.7.5.2 (New), 1003.3.7.6 (New), 1003.3.7.7 (New), 1003.3.8 (New), Table 1003.3.8 (New), 1003.3.9 (New), 1003.3.10 (New), 1003.3.10.1 (New), 1003.3.10.2 (New), 1003.3.10.2.1 (New), 1003.3.10.2.1.1. Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Add new definition as follows:

Calculated peak flow rate. Maximum possible grease laden waste discharge into a fats, oils, and grease interceptor expressed in gallons per minute (GPM).

Designed Service Interval. The amount of time the design professional has designated as the maximum time between grease interceptor services for a specific design. This time can be in days, weeks, months, or events, but shall not exceed 90 days between services.

Fast food/quick service restaurant. Any food service operation that serves food primarily with disposable containers and flatware and discharges non-domestic wastewater.

Full service restaurant. Any food service operation that serves food on plates or serving trays that requires washing, with or without flatware that requires washing and discharges non-domestic wastewater.

Nondomestic Wastewater.
Not regular sewage due to volume or character of water. Can contain substances like industrial chemicals, pesticides, rags, paints, excessive oil and grease. Permit and pretreatment may be required before this type of wastewater discharges into the sanitary drainage system.

Peak flow rate. All potential grease laden waste discharge into a fats, oils, and grease interceptor expressed in gallons per minute (GPM).

CHAPTER 10 TRAPS, INTERCEPTORS AND SEPARATORS

SECTION 1003
INTERCEPTORS AND SEPARATORS

Revise as follows:

1003.1 Where required.
Interceptors and separators shall be provided to prevent the discharge of oil, grease, sand and other substances harmful or hazardous to the *public sewer*, the private sewage system or the sewage treatment plant or processes.

> **Exception:** A grease interceptor or an automatic grease removal device shall not be required for individual dwelling units or any *private* living quarters.

1003.2 Approval.
The size, type and location of each interceptor and of each separator shall be designed and installed in accordance with the manufacturer's instructions and the requirements of this section based on the anticipated conditions of use. Wastes that do not require treatment or separation shall not be discharged into any interceptor or separator.

Revise as follows:

~~1003.3.8~~ 1003.2.1 Direct connection.
The discharge piping from ~~a grease~~ interceptors shall be directly connected to the sanitary drainage system.

~~1003.9~~ 1003.2.2 Venting of interceptors and separators.
Interceptors and separators shall be designed so as not to become air bound. Interceptors and separators shall be vented in accordance with one of the methods in Chapter 9.

1003.3 Grease interceptors.
Grease interceptors shall comply with the requirements of Sections 1003.3.1 through 1003.3~~.8~~.11.2.2.

1003.3.1 Grease interceptors and automatic grease removal devices required.
A grease interceptor or automatic grease removal device shall be required to receive the drainage from fixtures and equipment with grease-laden waste located in food preparation areas, such as in restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers without prerinse sinks. Grease interceptors and automatic grease removal devices shall receive waste only from fixtures and equipment that allow fats, oils or grease to be discharged. Where lack of space or other constraints prevent the installation or replacement of a grease interceptor, one or more grease interceptors shall be permitted to be installed on or above the floor and upstream of an existing grease interceptor.

1003.3.2 Food waste disposers restriction.
A food waste disposer shall not discharge to a grease interceptor.

1003.3.3 Additives to grease interceptors.
Dispensing systems that dispense interceptor performance additives to grease interceptors shall not be installed except where such systems dispense microbes for the enhancement of aerobic bioremediation of grease and other organic material, or for inhibiting growth of pathogenic organisms by anaerobic methods. Such microbial dispensing systems shall be installed only where the grease interceptor manufacturer's instructions allow such systems and the systems conform to ASME A112.14.6. Systems that discharge emulsifiers, chemicals or enzymes to grease interceptors shall be prohibited.

Revise as follows:

~~1003.3.4 Grease interceptors and automatic grease removal devices not required~~.
~~A grease interceptor or an automatic grease removal device shall not be required for individual dwelling units or any *private* living quarters.~~

1003.3.4~~1003.3.5~~ Hydromechanical grease interceptors, fats, oils and greases disposal systems and automatic grease removal devices.
Hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be sized in accordance with ASME A112.14.3, ASME A112.14.4, ASME A112.14.6, CSA B481.3 or PDI G101. Hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be designed and tested in accordance with ASME A112.14.3, ASME A112.14.4, CSA B481.1, PDI G101 or PDI G102. Hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be installed in accordance with the manufacturer's instructions. Where manufacturer's instructions are not provided, hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be installed in compliance with ASME A112.14.3, ASME A112.14.4, ASME A112.14.6, CSA B481.3 or PDI G101.

~~1003.3.5.1~~ 1003.3.4.1 Hydromechanical ~~Grease~~ grease interceptor and grease removal device retention capacity.
Hydromechanical ~~Grease~~ grease interceptors and automatic grease removal devices shall ~~have~~ be certified for the grease retention capacity indicated in Table ~~1003.3.5.1~~ 1003.3.4.1, or more, for the flow-through rates indicated in Table 1003.3.4.1.

TABLE ~~1003.3.5.1~~ 1003.3.4.1 RETENTION CAPACITY OF HYDROMECHANICAL GREASE INTERCEPTORS[a], AND AUTOMATIC GREASE REMOVAL DEVICES

15	30
18	36
20	40
25	50
35	70
50	100
75	150
100	200

For SI: 1 gallon per minute = 3.785 L/m, 1 pound = 0.454 kg.

a. For total flow-through ratings greater than 100 (gpm), double the flow-through rating to determine the grease retention capacity (pounds).

~~1003.3.5.2~~ 1003.3.4.2 Rate of flow controls.
Hydromechanical ~~Grease~~ grease interceptors and grease removal devices shall be equipped with devices to control the rate of water flow so that the water flow does not exceed the rated flow. ~~The~~ External flow-control devices shall be vented and terminate not less than 6 inches (152 mm) above the flood rim level or be installed in accordance with the manufacturer's instructions.

~~1003.3.6~~1003.3.5 Automatic grease removal devices.
Where automatic grease removal devices are installed, such devices shall be located downstream of each fixture or multiple fixtures in accordance with the manufacturer's instructions. The automatic grease removal device shall be sized to pretreat the measured or calculated flows for all connected fixtures or equipment. *Ready access* shall be provided for inspection and maintenance.

~~1003.3.7~~ 1003.3.6 Gravity grease interceptors and gravity grease interceptors with fats, oils, and greases disposal systems.
The required capacity of gravity grease interceptors and gravity grease interceptors with fats, oils, and greases disposal systems shall be determined by multiplying the peak drain flow into the interceptor in gallons per minute by a retention time of 30 minutes. Gravity grease interceptors shall be designed and tested in accordance with IAPMO/ANSI Z1001. Gravity grease interceptors with fats, oils, and greases disposal systems shall be designed and tested in accordance with ASME A112.14.6 and IAPMO/ANSI Z1001. Gravity grease interceptors and gravity grease interceptors with fats, oils, and greases disposal systems shall be installed in accordance with manufacturer's instructions. Where manufacturer's instructions are not provided, gravity grease interceptors and gravity grease interceptors with fats, oils, and greases disposal systems shall be installed in compliance with ASME A112.14.6 and IAPMO/ANSI Z1001.

Add new text as follows:

1003.3.7 Meals served per day. Meals served per day shall be calculated based on the occupancy type and service type in accordance with section 1003.3.7.1 through section 1003.3.7.7

1003.3.7.1 Convenience Store. Convenience store meals per day shall be calculated at 1000 meals per day.

1003.3.7.2 Hotel breakfast bars. Hotel breakfast bar meals per day shall be calculated multiplying total guest rooms times 2.

1003.3.7.3 Carryout only pizza shops. Carryout only pizza shop meals per day shall be assumed to be 250 meals per day.

1003.3.7.4 Nursing homes, school cafeterias, adult daycare facilities, child daycare facilities and similar occupancies. Nursing homes, school cafeterias, adult daycare facilities, child daycare facilities and similar occupancy meals per day shall be calculated using total allowable occupancy times the number of meal services per day. Meals services can be any combination of the following, breakfast, lunch, or dinner.

1003.3.7.5 Restaurants. Restaurant meals per day shall be calculated in accordance with 1003.3.7.5.1 or 1003.3.7.5.2

1003.3.7.5.1 Fast food/quick service restaurants. Fastfood/quick service restaurant meals per day shall be calculated as 40 meals times total service hours per day.

1003.3.7.5.2 Full service restaurants. Full service restaurant meals per day shall be calculated as 50 meals times total service hours per day.

1003.3.7.6 Event spaces. Event spaces, such as but not limited to, banquet halls, fraternal organizations, churches, and golf/country clubs shall have meals calculated based on the maximum anticipated number of events per year. Meals per event shall be calculated as 1 meal per allowable occupant. This total anticipated meals per year shall then be used to establish a service interval correlating the storage capacity of the fats, oils and grease interceptor with the number of events per year. Capacity should be selected so that the service interval stays within a 3-month maximum interval.

1003.3.7.7 Ballparks, arenas, and stadiums. Ballpark, arena, and stadium shall have meals calculated based on the maximum anticipated number of events per year. Meals per event shall be calculated by multiplying total allowable occupancy times 2. This total anticipated meals per event shall then be used to establish a service interval correlating the rentetion capacity of the fats, oils and grease interceptor with the number of events per year. Capacity shall be selected so that the service interval stays within a 3-month maximum interval.

Exception: Where there are multiple food service operations within the ballpark, arena, or stadium, the meals per event can be divided by the total number of food service operations when each food service operation is provided with a dedicated fats, oils, and grease interceptor. Each dedicated interceptor retention capacity shall be selected so that the service interval stays within a 3-month maximum interval.

1003.3.8 Grease discharge per meal. Fats, oils, and grease discharge per meal shall be referenced from Table 1003.3.8 based on the occupancy type and service type.

Table 1003.3.8 Fats, oils, and grease discharge per meal values

Restaurant Type	Grease Production Values	Examples
Low grease producer	0.005 lbs(2.268 g)/meal (no flatware)	Elementary cafeteria, grocery meat department, hotel breakfast bar, deli/sub shop, sushi, carryout pizza
	0.0065 lbs(2.268 g)/meal (with flatware)	
Medium grease producer	0.025 lbs(2.268 g)/meal (no flatware)	Cafe, coffee shop, Convenience store, Greek cuisine, Indian cuisine, Japanese cuisine, Korean cuisine, Vietnamese cuisine
	0.0325 lbs(2.268 g)/meal (with flatware)	
High grease producer	0.035 lbs(2.268 g)/meal (no flatware)	Full-fare family, fast-food hamburger, hamburger bar and grill, German cuisine, Italian cuisine, fast-food Mexican cuisine
	0.0455 lbs(2.268 g)/meal (with flatware)	
Very high grease producer	0.058 lbs(2.268 g)/meal (no flatware)	Full-fare BBQ, fast-food fried chicken, full-fare Mexican cuisine, steak and seafood restaurants, Chinese cuisine, Hawaiian cuisine
	0.075 lbs(2.268 g)/meal (with flatware)	

1003.3.9 Designed Service Interval. The designed service interval for fats, oils, and grease interceptors shall be established by the designer and shall be included in the design.The designed service interval for fats, oils, and grease interceptors shall be within 90 days between intervals. The designed service interval shall be within the interceptor storage capacity for the connected food service operation or event space.

> **Exception:** The designed service interval for concrete interceptors shall be within 30 days.

1003.3.10 Flow rates. Flow rates for hydromechanical interceptors and automatic grease removal devices shall be calculated as indicated in section 1003.3.10.1, flow rates for gravity interceptors shall be calculated as indicated in section 1003.3.10.2.

1003.3.10.1 Peak flow rate. The peak flow rate shall include all fixtures listed in section 1003.3.1 that discharge fats, oils, and grease laden waste to a hydromechanical interceptor or an automatic grease removal device. Total discharge shall be expressed in gallons per minute (GPM).

1003.3.10.2 Calculated peak flow rate. Calculated peak flow rate shall shall be calculated using equation 10-01, and shall include all fixtures listed in section 1003.3.1 that discharge fats, oils, and grease laden waste to a gravity interceptor, this can include pre-rinse sinks with or without food waste disposals.

(Equation 10-01) TD/60=CPFR

where: TD = Total possible discharge for 1 hour for all fixtures discharging fats, oils, and grease to the interceptor.
60 = minutes in one hour

CPFR = Calculated Peak Flow Rate in Gallon per Minute (GPM)

1003.3.10.2.1 Sinks. Calculated peak flow rate shall be the maximum discharge expressed in gallons per minute (GPM) that could occur based on fill time for the number of fixture vessel and sizes (total gallons), faucet discharge in GPM, plus a drain down period of 1 minute for sinks unless the manufacturer has a published drain down time period. Sink volume shall be calculated in gallons in accordance with section 1003.3.10.2.1.1.

> **Exception:** For gravity interceptors, pre-rinse sink discharge shall be calculated using faucet GPM x 60. For hydromechanical interceptor and automatic grease removal devices, the pre-rinse sink faucet discharge shall be added to the single cycle discharge of all fixtures connected to the interceptor.

1003.3.10.2.1.1. Sink Volume. Each sink vessel volume shall be calculated using equation10-2. For multiple vessel sinks, the volume for each vessel shall be added together to establish the total volume for the sink.

> **Exception:** The volume of each vessel of a food utensil, dishes, pots and pans sink shall be calculated using equation 10-3. The volume for each vessel shall be added together to establish the total volume for the sink.

(10-2) ((L x W x D)/1728) x 7.47

where:

L = Length in inches
W = Width in inches

D = Depth in inches

1728 converts cubic inches into cubic feet

7.47 gallons per cubic foot.

(10-3) (((L x W x D)/1728) x.75[a]) x 7.47.

where:
L = Length in inches

W = Width in inches

D = Depth in inches

1728 converts cubic inches into cubic feet

7.47 gallons per cubic foot.

a. Food utensil, dishes, pots, and pans sinks are assumed to have 1/4 the volume taken up by dirty utensils, dishes, pots, and pans.

1003.3.10.2.2 Dishwashers. Calculated peak flow rate for dishwasher shall be based on the number of possible cycles per hour and gallons per cycle converted to GPM.

(10-4) C x G = GPH

where:
C = cycles or racks possible per hour

G = gallons per cycles

GPH = Gallons per Hour

1003.3.10.2.3 Other waste receptors. Other types of fats, oils, and grease waste receptors discharge shall be calculated using equation 10-5.

(10-5) G x C = GPH

where:
G = gallons per cycle

C = cycles per hour

GPH = gallon per hour

1003.3.11 Grease interceptor sizing. Grease interceptors shall be sized in accordance with 1003.3.11.1, or 1003.3.11.2.

1003.3.11.1 Gravity grease interceptor sizing. Gravity grease interceptors shall be sized as follows:

1. Required volume to allow separation to occur shall be established by multiplying the calculated peak flow rate in GPM by 30 minutes retention time.
2. Anticipated pounds of fats, oils, and grease discharge per day/event shall be established by multiplying meals per day/event by the appropriate fats, oils, and grease discharge per meal value in table 1003.3.8.

   Exception: For event spaces, areas, ballparks, and stadiums, the anticipated pounds of fats, oils, and grease discharge per day/event shall be established by multiplying meals per event by 0.075 lbs.
3. The designed service interval in days shall be multiplied by the anticipated pounds of fats, oils and grease discharge per day.

   Exception: For event spaces, areas, ballparks, and stadiums, the designed service interval shall be established using the number of events that can occur between intervals, but in no case shall exceed 90 days.
4. The anticipated pounds of fats, oils and grease discharge per designed service interval shall be converted to gallons using equation 10-6.

5. The anticipated gallons of fats, oils and grease discharge shall be added to the required volume established in step 1 to establish the minimum total volume of the gravity interceptor.

(10-6) P/6.4=Gwhere: P = Pounds of anticipated fats, oils, and grease discharge for the designed service interval.

6.4 = Average weight of fats, oils, and grease in pounds per gallon.

G = Converted pounds of anticipated fats, oils, and grease discharge to gallons of anticipated fats, oils, and grease discharge.

1003.3.11.2 Hydromechanical interceptor and automatic grease removal device sizing. Hydromechanical interceptors shall be sized in accordance with section 1003.3.10.2.1 and automatic grease removal devices shall be sized in accordance with section 1003.3.10.2.2.

1003.3.11.2.1 Hydromechanical interceptor sizing. Hydromechanical interceptors shall be sized as follows:

1. Anticipated pounds of fats, oils, and grease discharge per day shall be established by multiplying meals per day by the appropriate fats, oils, and grease discharge per meal value in table 1003.3.8.

   Exception: For event spaces, areas, ballparks, and stadiums, the anticipated pounds of fats, oils, and grease discharge per day shall be established by multiplying meals per event by 0.075 lbs.

2. The designed service interval in days shall be multiplied by the anticipated pounds of fats, oils and grease discharge per day/event.

   Exception: For event spaces, arenas, ballparks, and stadiums, the designed service interval shall be established using the number of events that can occur between intervals, but in no case shall exceed 90 days.

3. A hydromechanical interceptor shall be selected with a flow rate that can accommodate the peak flow rate established in 1003.3.9 with a 1 minute drain down period and enough retention capacity to accommodate the anticipated pounds of fats, oils, and grease discharge for the design service interval established in step 2.

   Exception: A 2 minute drain down may be used provided the retention capacity and flow rate can be accommodated by the interceptor.

1003.3.11.2.2 Automatic grease removal device sizing. Automatic grease removal devices shall be sized as follows:

1. Anticipated pounds of fats, oils, and grease discharge per day/event shall be established by multiplying meals per day/event by the appropriate fats, oils, and grease discharge per meal value in table 1003.3.8.

   Exception: For event spaces, areas, ballparks, and stadiums, the anticipated pounds of fats, oils, and grease discharge per day/event shall be established by multiplying meals per event by 0.075 lbs.

2. The designed service interval shall be established as a number of services per day and hours between services.

   Exception: For event spaces, arenas, ballparks, and stadiums, the designed service interval shall be at the completion of each event.

3. The anticipated pounds of fats, oils, and grease discharge per day/event shall be divided by the number of service intervals per day/event.

   Exception: Event spaces, arenas, ballparks, and stadiums.

4. The anticipated fats, oils, and grease discharge established in step 3 shall be used to establish the minimum storage capacity of the automatic grease removal device.

   Exception: For event spaces, arenas, ballparks, and stadiums, the anticipated fats, oils, and grease discharge per event shall be used to establish the minimum storage capacity for the automatic grease removal device.

Revise as follows:

~~1003.10~~ 1003.9 Access and maintenance of interceptors and separators.
Access shall be provided to each interceptor and separator for service and maintenance. Interceptors and separators shall be maintained by periodic removal of accumulated grease, scum, oil, or other floating substances and solids deposited in the interceptor or separator.

Attached Files

- **SIZING FOG WASTE INTERCEPTORS.docx.pdf**
  https://www.cdpaccess.com/proposal/9947/30659/files/download/4556/

Reason: The current section for sizing interceptors includes only part of the data needed to properly size an interceptor. Data collect via the "2011 Brown Grease Supply Study" resulted in the ability to identify the amount of fats, oils, and grease discharged per meal at various types of Food Service Operations (FSOs). Other data points, such as service hours, flow rate design and design service intervals are also needed. This proposal includes these necessary data points, as well as table 8-3 from ASPE Plumbing Design Manual which was developed in conjunction with the 2011 Brown Grease Supply Study.

Other changes to this section included in this proposal include re-organization of some of the sections, including moving section 1003.3.4 "Grease interceptor and automatic grease removal devices not required" to an exception in listing in section 1003.3.1 "Grease interceptor and automatic grease removal devices required." As well as moving sections 1003.3.8 "Direct connection" and 1003.9 "Venting of interceptors" into sub-sections of 1003.2 "Approval" as these sections should apply to all interceptors as part of an approval.

Please reference the attached file for the Bibliography which includes background on the additions and sizing methodology included in this proposal.

Bibliography: See attached file.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is to provide a prescriptive method for sizing fats, oils, and grease interceptors. Sizing is already required, however, it does not include enough information and provides no direction. The overall effect of this proposal would technically result in lowering the cost of construction, especially for gravity interceptors, as well as the potential to decrease maintenance costs depending of the designed service interval selected.

P143-24

P144-24

IPC: 1003.2, 1003.3.1, 1003.3.5, 1003.9, 1003.10

Proponents: Max Weiss, Plumbing and Drainage Institute, PDI (mweiss@pdionline.org)

2024 International Plumbing Code

Revise as follows:

1003.2 Approval.
The size, type and location of each interceptor and of each separator shall be designed and installed in accordance with the manufacturer's instructions and the requirements of this section based on the anticipated conditions of use and rate of peak discharge as calculated in accordance with ASME A112.14.3; ASME A112.14.4; CSA B 481.1 or PDI G101. Wastes that do not require treatment or separation shall not be discharged into any interceptor or separator.

1003.3.1 Grease interceptors and automatic grease removal devices required.
A grease interceptor or automatic grease removal device shall be required to receive the drainage from fixtures and equipment with grease-laden waste located in food preparation areas, such as in restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers without prerinse sinks. Grease interceptors and automatic grease removal devices shall receive waste ~~only~~ from fixtures and equipment that allow fats, oils or grease to be discharged. Where lack of space or other constraints prevent the installation or replacement of a single grease interceptor, one or more grease interceptors shall be permitted to be installed on or ~~above~~ in the floor. ~~and upstream of an existing grease interceptor~~.

1003.3.5 Hydromechanical grease interceptors, fats, oils and greases disposal systems and automatic grease removal devices.
Hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be sized in accordance with ASME A112.14.3, ASME A112.14.4, ASME A112.14.6, CSA B481.3 or PDI G101. Hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be designed and ~~tested~~ certified in accordance with ASME A112.14.3, ASME A112.14.4, CSA B481.1, PDI G101 or PDI G102. Hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be installed in accordance with the manufacturer's instructions. Where manufacturer's instructions are not provided, hydromechanical grease interceptors; fats, oils, and greases disposal systems and automatic grease removal devices shall be installed in compliance with ASME A112.14.3, ASME A112.14.4, ASME A112.14.6, CSA B481.3 or PDI G101.

1003.9 Venting of interceptors and separators.
Interceptors and separators shall be designed so as not to become air bound. Interceptors and separators shall be trapped and vented in accordance with one of the methods in Chapter 9.

1003.10 Access and maintenance of interceptors and separators.
Access shall be provided to each interceptor and separator for service and maintenance. Interceptors and separators shall be maintained by periodic removal of accumulated grease, scum, oil, or other floating substances and solids deposited in the interceptor or separator.
Interceptors shall be serviced prior to: contents reaching a pH of five (5); accumulations greater in depth than twenty-five percent (25%) of the wetted depth of the interceptor or thirty (30) days, whichever condition first occurs.

Reason: Clarification is necessary to ensure empirical hydraulic sizing, service, and application of grease interceptors.

Printed in the United States of America
IWAP ISBN: 978-1-84339-526-3/1-84339-526-6

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed code changes do not add materials; only clarify methodologies.

P144-24

P145-24

IPC: 1003.3.1

Proponents: Eric Thompson, Schier Products, Schier Products

2024 International Plumbing Code

Revise as follows:

1003.3.1 Grease interceptors and automatic grease removal devices required.
A grease interceptor or automatic grease removal device shall be required to receive the drainage from fixtures and equipment with grease-laden waste located in food preparation areas, such as in restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers ~~without prerinse sinks~~. Grease interceptors and automatic grease removal devices shall receive waste only from fixtures and equipment that allow fats, oils or grease to be discharged. Where lack of space or other constraints prevent the installation or replacement of a grease interceptor, one or more grease interceptors shall be permitted to be installed on or above the floor and upstream of an existing grease interceptor.

Reason: All fixtures and equipment that allow fats, oils or grease should be connected to the interceptor, regardless of the upstream fixtures.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Fixtures that connect do not impact the cost of the change. Dishwashers and pre-rinse sinks, if present, are already a part of the system so there is no additional cost to construction.

P145-24

P146-24

IPC: 1003.3.2

Proponents: Eric Thompson, Schier Products, Schier Products

2024 International Plumbing Code

Revise as follows:

1003.3.2 Food waste disposers restriction.
A food waste disposer shall not discharge to a grease interceptor.

> **Exception:** Food waste disposers shall be permitted to discharge to grease interceptors or solids interceptors that are designed to receive the discharge of food waste.

Reason: Larger grease interceptors have solids capability to allow for additional food waste. Solids interceptors are designed to handle food waste when installed before a grease interceptor and can handle the discharge of food waste disposers.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Grease interceptors are already a part of the project so there would be no additional cost impact in construction. Solids interceptors could be installed additionally which could add cost, however they would not be required per the change.

P146-24

P147-24

IPC: 1003.3.5.1, TABLE 1003.3.5.1

Proponents: Eric Thompson, Schier Products, Schier Products

2024 International Plumbing Code

Revise as follows:

1003.3.5.1 Grease interceptor capacity.
Grease interceptors shall have the minimum grease retention capacity indicated in Table 1003.3.5.1 for the flow-through rates indicated.

TABLE 1003.3.5.1 CAPACITY OF GREASE INTERCEPTORS[a]

TOTAL FLOW-THROUGH RATING (gpm)	GREASE RETENTION CAPACITY (pounds)
4	8
6	12
7	14
9	18
10	20
12	24
14	28
15	30
18	36
20	40
25	50
35	70
50	100
75	150
100	200

For SI: 1 gallon per minute = 3.785 L/m, 1 pound = 0.454 kg.

a. For total flow-through ratings greater than 100 (gpm), double the flow-through rating to determine the grease retention capacity (pounds).

Reason: ASME A112.14.3, one of the standards for grease interceptors, allows for interceptors to be tested beyond the minimum capacity. The table implies that only interceptors certified to that grease capacity would be allowed under the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Grease interceptors are tested to ASME A112.14.3 to a minimum grease capacity requirement. This change clarifies that there is a minimum and allows for interceptors that are certified beyond the capacities as shown in the table. There is no impact as interceptors will hold more than the minimum requirement, manufacturers choose to continue the test to maximum capacity at their own expense.

P147-24

P148-24

IPC: 1003.4, 1003.4.2, 1003.4.2.1, 1003.4.2.2, IAPMO Chapter 15 (New)

Proponents: Andrew Heck, Striem, Manufacturer (andrew.heck@striemco.com)

2024 International Plumbing Code

Revise as follows:

1003.4 Oil separators required. ~~At repair garages where floor or trench drains are provided, car washing facilities, factories where oily and flammable liquid wastes are produced and hydraulic elevator pits, oil separators shall be installed into which oil-bearing, grease-bearing or flammable wastes shall be discharged before emptying into the building drainage system or other point of disposal.~~The following facilities shall require an oil separator before discharging into the sanitary sewer system:

1. Automobile service or repair garages.
2. Facilities where automobiles are washed.
3. Vehicle parking areas not intended for storm drainage.
4. Manufacturing, storage, maintenance, repair, or testing process facilities that have oily, flammable, or both types of wastes.
5. Liquid waste that is pumped or drained from hydraulic elevator pits.

~~**Exception:** An oil separator is not required in hydraulic elevator pits where an approved alarm system is installed. Such alarm systems shall not terminate the operation of pumps utilized to maintain emergency operation of the elevator by firefighters.~~

1003.4.2 Oil separator ~~design~~ compliance.
Oil separators shall comply with IAPMO IGC 183 or IAPMO IGC 325 ~~be listed and labeled, or designed in accordance with Sections 1003.4.2.1 and 1003.4.2.2.~~.

1003.4.2.1 General design requirements.
The oil separator shall be provided with gastight covers that shall be readily accessible. The vapor compartment in the oil separator shall be independently vented to atmosphere, and the outlet opening shall contain a water seal.
~~Oil separators shall have a depth of not less than 2 feet (610 mm) below the invert of the discharge drain. The outlet opening of the separator shall have not less than an 18-inch (457 mm) water seal.~~

1003.4.2.2 ~~Garages and service stations~~ Oil separator sizing.
The size of an oil separator shall be based on one of the following methods.

1. Where automobiles are serviced, greased, repaired or washed or where gasoline is dispensed, oil separators shall have a capacity of not less than 6 cubic feet (0.168 m^3) for the first 100 square feet (9.3 m^2) of area to be drained, plus 1 cubic foot (0.028 m^3) for each additional 100 square feet (9.3 m^2) of area to be drained into the separator. ~~Parking garages in which servicing, repairing or washing is not conducted, and in which gasoline is not dispensed, shall not require a separator. Areas of commercial garages utilized only for storage of automobiles are not required to be drained through a separator.~~
2. Where not more than three motor vehicles are stored, interceptors shall have a minimum capacity of 6 cubic feet (0.168m^3), and 1 cubic foot (0.028 m^3) of capacity shall be added for each vehicle up to 10 vehicles. For greater than 10 vehicles, an additional 0.15 cu. ft (0.004 m^3) per vehicle shall be added to the interceptor's total capacity.
3. A method approved by the code official.

~~Where automobiles are serviced, greased, repaired or washed or where gasoline is dispensed, oil separators shall have a capacity of not less than 6 cubic feet (0.168 m³) for the first 100 square feet (9.3 m²) of area to be drained, plus 1 cubic foot (0.028 m³) for each additional 100 square feet (9.3 m²) of area to be drained into the separator. Parking garages in which servicing, repairing or washing is not conducted, and in which gasoline is not dispensed, shall not require a separator. Areas of commercial garages utilized only for storage of automobiles are not required to be drained through a separator.~~

Add new standard(s) as follows:

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

IAPMO

<u>IGC 183:2016</u> <u>Oil/Water Separators and Coalescing Plate Separators</u>

<u>IGC 325:2023</u> <u>High Efficiency Oil/Water Separators Performance</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, IGC 183:2016 *Oil/Water Separators and Coalescing Plate Separators* and IGC 325:2023 *High Efficiency Oil/Water Separators Performance*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: 10003.4 - Created a numbered list format as it is more legible and comprehensible. Elaborated on existing applications. Added more application types to cover all bases for oil separators. Included parking and storage facilities since they are very popular. Parking garages, and specifically sizing an oil separator for them, is to be discussed in 1003.4.2.2. Removed the exception for hydraulic elevator pits.

Substantiation against an approved alarm system:

1. A standard (and approved) sump pump connected to an oil separator always guarantees a dry elevator pit. One could argue that the introduction of a duplex pump system (or similar) that pumps oil and water separately guarantees a dry pit. However, that introduces more points of potential mechanical failure.

2.The elevator will never be shut down due to accumulated liquid in the pit. This is especially relevant for firefighter emergency operations during an emergency.

3. Any oil that is removed the pit can be pumped to an accessible location for proper maintenance and monitoring. Any oily waste accumulating in an elevator pit poses health, safety, and maintenance risks.

Reason 1003.4.2 - Simplifying this section by providing two standards that are specific to oil separators. IGC 183 is a *design-based* standard and IGC 325 is a *performance-based* standard. Both of these standards are very robust in their requirements, and should supersede the minimal language referenced in the subsequent sections.

Reason 1003.4.2.1 - Removed the language regarding minimum depth below the discharge drain and water seal. This is language that is not typically enforced and doesn't carry any specific logic to be present. Replaced with universally accepted design guidelines for oil separators: sealed and gastight cover, trap on the outlet, independent vent.

Reason 1003.4.2.2 - Changed the section title to better align with the section content: sizing options for oil separators. Broke this section down into (3) bullet point options for simplicity.

The first is the (unedited) square footage sizing methodology for service/maintenance applications.

The second is a sizing methodology for covered parking-only facilities as described in section 1003.4. Again, these are a popular application and are often required by municipalities and local water authorities. Similar to the square footage sizing, provided is a minimum baseline formula. In sum: 1-3 vehicles = 6 cubic feet of capacity required. Then you add (1) additional cu. ft. per vehicles up to 10 vehicles. Above 10 vehicles, add .15 additional cu. ft. per vehicle. The logic behind .15 additional cubic feet is due to the average vehicle holding between 4-6 quarts of oil, which translates to roughly .15 cu. ft.

- Further, unlike the square footage sizing methodology for service/maintenance applications, parking facilities generally produce little to no flow from a constant source. This sizing guide allows the designer/owner to select a unit that is more appropriately sized than it would be otherwise by using square footage sizing. For example: at roughly 180 square feet per stall, a 200 stall covered garage area would require a minimum of 36,000 square feet of drainage area. Using square footage sizing, that would require the oil interceptor to have a minimum gallon capacity of 2,730 gallons. Using the proposed methodology, the minimum would be 310 gallons.

The third method is any method deemed appropriate by the AHJ.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes are meant for clarity and simplification. They also do not limit competition for oil separator manufacturers. For example, all oil separator manufacturers have the opportunity to design to the standards outlined in 1003.4.2.

Note: Proposed changes to sections 1003.4 and 1003.4.2.2 would require added scope/cost of an oil separator for covered parking facilities. Currently, the IPC does not require oil separators for parking garages. However, they are still common and regularly enforced. We've addressed mitigating the cost impact by detailing the sizing methodology as outlined in 1003.4.2.2. To summarize: Sizing is more conducive to smaller tanks. Smaller tanks = less install and maintenance cost.

P148-24

P149-24

IPC: 1003.4.2, UL Chapter 15 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Plumbing Code

Revise as follows:

1003.4.2 Oil separator design.
Oil separators shall be listed and labeled <u>in accordance with UL 2215,</u> or designed in accordance with Sections 1003.4.2.1 and 1003.4.2.2.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

<u>2215-19</u> <u>Outline of Investigation for Oil/Water Separators</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 2215-9 *Outline of Investigation for Oil/Water Separators*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposal identifies UL 2215 as the standard requirements used for third party certification (listed and labeled) oil/water separators. These requirements cover stationary gravity or pump fed aboveground and underground, atmospheric type oil/water separator systems intended to remove oil, having a specific gravity of 0.83 – 0.94 at 15°C (59°F), suspended in water from rainwater runoff or normal washdown of streets, highways, and parking lots at an inlet rate not exceeding the marked maximum influent concentration and flow rate. These requirements cover gravity or pump fed oil/water separator systems having capacities of 60 to 50,000 gallons (227 – 189,270 L) total. There are 17 manufacturers who have products certified in accordance with UL 2215.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is providing clarification as to which standard applies to listed oil/water separators, there is no substantive change as these are already required by the code to be listed.

P149-24

P150-24

IPC: 1102.4 (New)

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Add new text as follows:

1102.5 Relining Storm Drainage. The relining and rehabilitation of storm drainage systems using cured-in-place pipe (CIPP) shall be in accordance with ASTM F2599.

Staff Analysis: The proposed standard is in the current edition of the code.

Reason: Storm drainage is certainly a candidate for rehabilitation by CIPP and it should be added to Chapter 11.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost allowance is already recognized by fact that the standard is already referenced in the code and technology is currently being used in drainage systems.

P150-24

P151-24

IPC: 1102.6, ASME Chapter 15, ASME Chapter 15 (New)

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Plumbing Code

Revise as follows:

1102.6 Roof drains.
Roof drains shall conform to ASME A112.3.1 or ASME A112.6.4<u>/CSA B79.4</u>. Roof drains, other than siphonic roof drains, shall be tested and rated in accordance with ASME A112.6.4<u>/CSA B79.4</u> or ASPE/IAPMO Z1034.

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

~~A112.6.4—2003 (R2020)~~ ~~Roof, Deck, and Balcony Drains~~

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

<u>A112.6.4/CSA B79.4 -2022</u> <u>Roof, Deck, and Balcony Drains</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, ASME A112.6.4/CSA B79.4-2022 *Roof, Deck, and Balcony Drains*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The ASME A112.6.3 was harmonized with CSA B79 standard. The intent of this proposal is to replace the current standard with the new standard.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification to call out the new harmonized satndard, no addtional requirements.

2024 International Plumbing Code

Revise as follows:

1106.2 Size of storm drain piping.
~~Vertical and horizontal *storm drain* piping shall be sized based on the flow rate through the roof drain. The flow rate, as calculated in accordance with Section 1106.2.1, shall be checked against the roof drain manufacturer's published flow rate for the specific roof drain model and size to verify that the selected roof drain will handle the anticipated flow. The flow rate in *storm drain* piping shall not exceed that specified in Table 1106.2.~~ The size of storm drain piping shall be in accordance with Sections 1106.2.1 through 1106.2.4.

1106.2.1 ~~Rainfall rate conversion method~~ Maximum storm water demand.
~~The rainfall rate falling on a roof surface shall be converted to a gallon per minute (L/m) flow rate in accordance with Equation 11-1.~~

$$GPM = R \times A \times 0.0104$$ **~~(Equation 11-1)~~**

~~where:~~
~~*R* = Rainfall intensity in inches (mm) per hour.~~
~~*A* = Roof area in square feet (m²).~~

The volumetric flow rate of storm drainage shall be the sum of the connected roof drain(s). The total connected load shall be used as the basis for pipe sizing, assuming all roof drains are at full capacity simultaneously.

Delete without substitution:

~~TABLE 1106.2 STORM DRAIN PIPE SIZING~~

PIPE SIZE (inches)	CAPACITY (gpm)				
	VERTICAL DRAIN	SLOPE OF HORIZONTAL DRAIN			
		$^1/_{16}$ inch per foot	$^1/_8$ inch per foot	$^1/_4$ inch per foot	$^1/_2$ inch per foot
2	34	15	22	31	44
3	87	39	55	79	111
4	180	81	115	163	231
5	311	117	165	234	331
6	538	243	344	487	689
8	1,117	505	714	1,010	1,429
10	2,050	927	1,311	1,855	2,623
12	3,272	1,480	2,093	2,960	4,187
15	5,543	2,508	3,546	5,016	7,093

~~For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 gallon per minute = 3.785 L/m.~~

Add new text as follows:

1106.2.2 Sizing. Storm drain pipe sizing shall be sized in accordance with one of the following:

1. Pipe sizing tables or equations in accordance with Section 1106.2.3 and 1106.2.4
2. The sizing tables included in a listed piping system's manufacturer's installation instructions
3. Engineering methods.

1106.2.3 **Sizing tables and equations.** This section applies to horizontal drainage systems using building gravity. Where the drainage system material is known, Tables 1106.2.3(1), 1106.2.3(2) and 1106.2.3(3) shall be used to size drainage piping.
Where Equation 11-1 is used to determine the expected flow rate seen at a roof drain, or building drain.

Where Equations 11-2, 11-3 and 11-4 are used to size drainage piping based on the drainage pipe material used.

1. The rainfall rate falling on a roof surface shall be converted to a gallon per minute (L/m) flow rate in accordance with Equation 11-1, The Rational Method. $Q = C \times R \times A \times 0.0104$ (Equation 11-1)
   Where: C = Discharge Coefficient, *the roughness of the roof's surface.* Use 1.0 unless permitted by the local authority to factor in roof roughness for primary storm drainage. Secondary drainage shall use 1.0 in all cases.
   Q = Flow rate in gallons per minute (L/m)
   R= Rainfall intensity in inches (mm) per hour.
   A = Projected roof area in square feet (m^2)
2. The flow rates for horizontal sloped drains shall be calculated by use of the Flow Rate Equation and the Manning Equation based on full flow for pipe diameters of a given material, or coefficient of roughness.

   The Flow Rate Equation, Equation 11-2
   $Q = A \times V$ (Equation 11-2)

   Where: Q = Flow rate in gallons per minute (L/m)
   A = Cross-sectional area of the full flow
   V = Velocity of flow, feet per second (L/s)

   The Manning Equation, Equation 11-3
   $V = (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-3)
   Where: V = Velocity of flow, feet per second (m/s)
   k = unit conversion factor, 1.486 in English units
   n = roughness (Manning) coefficient
   R = hydraulic radius of pipe, ft (m); for full flow pipe, use radius of the pipe
   S = slope of pressure gradient

   The modified Flow Rate Equation, Equation 11-4
   $Q = A \times (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-4)

Reason: If a building using cast iron storm drain pipe built from the model 2015, 2018, 2021 or 2024 codes were to have roof issues in the future; there is risk to the ICC because of faulty information in sizing storm drains. This proposal aims to fix that so engineers can follow a more complete model code.

As engineers, we have an ethical contract to not impose a hazard onto the occupants of the buildings we design. In its current form, the storm piping code imposes a hazard onto the occupants of the buildings we design. If we follow the current storm drain sizing criteria in 1106 and cast iron pipe is used, then the pipes would undersized between 20-50%, pending the size and slope of the installed pipe. Undersizing roof drain pipes increasing the possibility of the primary drains being overloaded and water ponding on the roof greater than the assumptions made by the structural engineer. The printed Tables in the 2015, 2018, 2021 and 2024 codes are assuming PVC pipe. The printed Tables in the IPC 2012 and earlier editions assumed aged cast iron. We must change this code immediately for the safety of the public and for the engineer's awareness in sizing pipes for a proper working system. This proposed change is a large overhaul from prior storm drainage sections, a code and commentary could be provided, but I didn't submit the context for that here. The layout and wording used was mimicked from the International Fuel Gas Code for gas pipe sizing (section 402), with obvious differences, so that the ICC reads similarly.

Use of roughness coefficients for tall/thick green roofs is viable, which is why mention of the complete Rational Method is shared. It would be fantastic if plumbing engineers use the same formulas as our Civil friends. It is true, storm piping within a building would have gravitational influence to drain faster if there is ponding at the roof drain, but this level of complexity does not appear warranted.

The manipulation of units can be seen/tested in the excels attached. PDFs are also included. I trusted the Manning's Roughness Coefficients from engineering toolbox, and have included them as a reference. The aged cast iron value for "n" was reverse engineered from the legacy storm tables. See documents "Manning Formula_proving code is based on Manning.pdf" and "Storm Rationale Method_04-Storm Drainage Calc.pdf" to see how accurate use of Manning Equation is to the legacy storm tables, so 0.0152 was proposed for the 2027 code to give homage to all storm tables of the last 20 years. PDFs and excel justifying the proposed tables are attached to answer questions about how the numbers were generated, and the excel can be used to see how the proposed Equations can be used should a less common pipe material be used.

Bibliography: For pipe roughness coefficients:

https://www.engineeringtoolbox.com/mannings-roughness-d_799.html

The layout and wording used was mimicked from the International Fuel Gas Code for gas pipe sizing (section 402), with obvious differences

The Rational Method and Manning Equation were sourced from my college fluid dynamics book. But they are readily available formulae that need not be sourced, right? I can provide more information as needed.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$20 / foot of storm pipe.

Estimated Immediate Cost Impact Justification (methodology and variables):

The potential cost increase would only be for cast iron (metal) pipe. The current code edition reflects pipe sizes for PVC/plastic pipe, and those values in the charts remain the same.

The cost was calculated on a cost per linear foot of pipe basis.

I found list prices from a leading cast iron foundry showing costs for 10-foot sections of no hub cast iron pipes. Note that from the reasoning section, PVC pipes can carry ~20% more water when compared to the same size cast iron pipes because of a smoother interior. Here are the costs for convenience on how the number above was guesstimated:

- 2" x 10' pipe --> $174

- 3" x 10' --> $240

- 4" x 10' --> $312

- 5" x 10' --> $449

- 6" x 10' --> $536

- 8" x 10' --> $834

- 10" x 10' --> $1,417

- 12" x 10' --> $2,059

- 15" x 10' --> $3,010

Note that the proposed code change will not require a certain material to be used, but with the differentiation of sizes between PVC and cast iron, more engineers may opt to use PVC pipe as a cost savings measure. To which, this cost impact analysis would be useless as pipe material change adds a certain degree of complexity. If the engineer uses PVC in all storm drain systems, then there would not be a cost impact.

Estimated Life Cycle Cost Impact:

no change

P152-24

P153-24

IPC: 1107.1, ASME Chapter 15, ASME Chapter 15 (New)

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Plumbing Code

Revise as follows:

1107.1 General.
Siphonic roof drains and drainage systems shall be designed in accordance with ASME A112.6.9<u>/CSA B79.9</u> and ASPE 45.

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

~~A112.6.9 - 2005 (R2024)~~ ~~Siphonic Roof Drains~~

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

<u>A112.6.9/CSA B79.9-2022</u> <u>Siphonic Roof Drains</u>

Staff Analysis: A review of the standard proposed for inclusion in the code, ASME A112.6.9/CSA B79.9 *Siphonic Roof Drains*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The ASME A112.6.9 standard was harmonized with B79 standard. The intent of this proposal is to replace the current standard with the new standard.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification to call out the new harmonized standard, no additional requirements

P153-24

P154-24

IPC: 1302.2.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

Revise as follows:

1302.2.1 Prohibited sources.
Wastewater containing urine or fecal matter shall not be diverted to on-site nonpotable water reuse systems and shall discharge to the sanitary drainage system of the building or premises in accordance with Chapter 7. ~~Reverse osmosis system reject water,~~ Water ~~water~~ softener discharge water, kitchen sink wastewater, dishwasher wastewater and wastewater discharged from wet-hood scrubbers shall not be collected for reuse in an on-site nonpotable water reuse system.

Reason: Reverse osmosis reject water is a wastewater that has high total dissolved solids (TDS) and other contaminates that were already in the source water. This water can be safely used in graywater systems as such systems will have treatment protocols applied before being used for another purpose. There is no need to eliminate this water from use onsite nonpotable water systems.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The choice to use reverse osmosis reject water is the responsibility of the designer. The code does not mandate the use of reverse osmosis reject water

P154-24

P155-24

IPC: 1302.6.1

Proponents: Kyle Thompson, Technical Director, Plumbing Manufacturers International (kthompson@safeplumbing.org)

2024 International Plumbing Code

Revise as follows:

1302.6.1 Graywater used for fixture flushing.
Graywater used for flushing water closets and urinals shall be disinfected and treated by an on-site water reuse treatment system complying with NSF 350. <u>Water closets supplied by an on-site water reuse treatment system for use in flushing shall also be supplied with an equal-sized potable water line that is dry until in use.</u>

Reason: The objective of this proposal is to safeguard an individual's freedom to choose between a conventional flush toilet and a smart toilet or personal hygiene device (bidet seat) for their home, ensuring that the code upholds this right.

The current code incorporates provisions for providing non-potable water indoors specifically for toilet flushing and other applications. In instances where a building is plumbed with a non-potable water supply line to the toilet, residents opting for a smart toilet or personal hygiene device, whether out of necessity or choice, must connect to the available non-potable water supply or re-pipe with a potable water supply line for proper installation of the smart toilet – often incurring prohibitive expenses. The code restricts the use of non-potable water for activities like bathing, washing with faucets, showerheads, tub spouts, etc. This same consideration should be extended to personal hygiene devices and smart toilets, crucial for many Americans due to medical conditions, or preferred for reasons of cleanliness, health, and environmental awareness.

Making an allowance in the existing code for the inclusion of these products, which adhere to all major plumbing codes and boast a longstanding presence in the market, is important for ensuring public health and safety. The U.S. smart toilet market, valued at $1.8 billion, is anticipated to surpass $3 billion within the next five years. Individuals across the United States incorporate these products into their bathrooms, with some relying on them for maintaining dignity, privacy, and self-reliance, especially those with special needs or limited mobility.

Ensuring ease of cleaning is immediately beneficial and crucial for seniors, significantly impacting their hygiene. Moreover, individuals facing colorectal issues like hemorrhoids, irritable bowel syndrome (IBS), and inflammatory bowel disease (IBD),[1.] along with pregnant women experiencing severe constipation or postpartum recovery,[2.] derive additional hygiene-related advantages from these products. They also contribute to maintaining hand hygiene, a critical factor in preventing the spread of diseases.[3.]

Beyond hygiene, many smart toilets feature health monitoring capabilities that analyze stool or urine to detect health issues such as sugar levels in diabetics. These innovations have proven especially beneficial for stroke rehabilitation[4.]. For certain individuals who cannot use toilet paper due to medical reasons, personal hygiene devices are indispensable. Additionally, these devices have demonstrated a reduction in instances of rashes, hemorrhoids, and urinary tract infections.

In essence, these products are vital for numerous individuals across the United States in preserving their health. However, the existing code could impede the installation of such products in residential bathrooms where the building is plumbed with a non-potable water supply line to the toilet.

This proposal aims to guarantee residents the freedom to choose personal hygiene devices or smart toilets for their homes. It specifies the availability of a potable water supply if builders opt to install non-potable water lines for toilet flushing. To prevent stagnant water conditions, the proposal necessitates keeping the potable water line dry until it is in use. Achieving this could involve installing a water line from the lavatory and incorporating a labeled shutoff valve at the lavatory.

Furthermore, the code already approves using personal hygiene devices that conform to ASME A112.4.2/CSA B45.16. This industry standard requires that a personal hygiene device includes backflow protection through an atmospheric vacuum breaker, air space type vacuum breaker, or air gap fitting.

Non-potable water treated to the level for use in toilet flushing that is compliant with the code, applicable laws, rules, ordinances, and NSF/ANSI 350 or IGC 324 is not equivalent to the level of safety that is dictated by federal law for potable water. Many individuals that use smart toilets and personal hygiene devices do so out of necessity due to disabilities and/or underlying health issues (e.g., arthritis, urinary tract infections, hemorrhoids, anal fissures). The quality level of water that is used with smart toilets and personal hygiene devices must be free of any pathogens, etc., that could cause infection or disease, and therefore, must be treated at a minimum in accordance with regulations for potable water.

Though it is always wise to consult a building official before tackling a new project, the codes do not require a permit to be pulled for every installation in a residential occupancy. For example, the IRC allows for the removal and reinstallation of a toilet without a permit if the installation does not involve or require the replacement or rearrangement of valves, pipes, or fixtures (Section R105.2). A personal hygiene device or smart toilet would meet this exemption as they are installed using the existing plumbing components and piping configuration.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Increase cost of $175 for rough in of potable water supply line that is dry until in use.

Estimated Immediate Cost Impact Justification (methodology and variables):

a. Rough-in of potable water line that is dry until in use:
i. Parts: shutoff valve ($40), 20 ft copper pipe ($60).
ii. Plumbing Labor: 0.5-hour labor @$150/hr ($75).
iii. Total $175

Estimated Life Cycle Cost Impact:

Savings of $775 for re piping when compared with the cost of rough in of potable supply pipe.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

a. Re-pipe for potable water supply line after construction:
i. Construction
1. Parts: Estimate Drywall $2.50/sq ft., Tile $10/sq ft.
2. Construction Labor: $100/hr.
3. Construction Subtotal: Remove and restore 20sq ft of drywall and tile. 2 hr labor plus parts (Sub Total $450).
ii. Plumbing
1. Parts: Shutoff valve ($40), 20 ft copper pipe ($60).
2. Plumbing Labor: $150/hr.
3. Plumbing Subtotal: Reframe for new plumbing, pipe and fitting installation. 2 hr labor plus parts (Sub Total: $400).
iii. Permit: $100.

iv. Total $950 for re-pipe after construction.

IPC: 1303.10, IAPMO Chapter 15 (New)

Proponents: Terry Burger, IAPMO Group, IAPMO Group (terry.burger@asse-plumbing.org)

2024 International Plumbing Code

Revise as follows:

1303.10 Storage tanks.
Storage tanks utilized in nonpotable rainwater collection and conveyance systems shall comply with Sections 1301.9 and 1303.10.1 through 1303.10.3~~.~~, or comply with IAPMO Z1002

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

Z1002 -2020	Rainwater Harvesting Tanks

Staff Analysis: A review of the standard proposed for inclusion in the code, IAPMO Z1002-2020 Sta*ndard for Rainwater Harvesting Tanks,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: There is a standard which cover these products. This change provides reference to an equivalent standard.

Bibliography: IAPMO Z1002 -2020 Rainwater Harvesting Tanks

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Products already exist in the market which are compliant to the referenced standard.

2024 International Plumbing Code

SECTION 202
GENERAL DEFINITIONS

Add new definition as follows:

BLACKWATER. Wastewater that contains urine or fecal matter.

BLACKWATER CONTRIBUTION (BWC). The fraction equal to the quantity of blackwater divided by the sum of the quantities of raw and treated blackwater plus surface water, groundwater, and water from approved potable water systems.

LOG REDUCTION VALUE (LRV). The measure of the ability of a treatment process to remove or inactivate microorganisms such as bacteria, protozoa and viruses. LRV is the logarithm base 10 of the ratio of the levels of a pathogenic organism or other contaminant before and after treatment.

POTABLE REUSE. The practice of treating wastewater and utilizing it for potable applications.

REUSE WATER. Wastewater or rainwater treated to a level of quality suitable for reuse.

WASTEWATER. The water generated after use of freshwater, raw water, drinking water, or saline water in a deliberate application or process.

WATER REUSE SYSTEM. A system for the treatment, storage, distribution, and reuse of water including, but not limited to, wastewater and captured rainwater.

Revise as follows:

CHAPTER 13 ~~NONPOTABLE~~ WATER REUSE SYSTEMS

1301.1 General.
The provisions of Chapter 13 shall govern the materials, design, construction and installation of systems for the ~~collection~~ treatment, storage, ~~treatment~~ and distribution of ~~nonpotable~~ reuse water. ~~For nonpotable rainwater systems, the~~ The provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution ~~of nonpotable water~~. The application of water reuse systems shall comply with all applicable laws, rules, and ordinances of the jurisdiction. ~~The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the jurisdiction~~.

1301.2 ~~Water~~ Reuse water quality.
~~Nonpotable~~ Reuse water ~~for each end use application~~ quality shall meet the minimum ~~water quality~~ requirements as specified in Tables

1301.2(1), 1301.2(2), 1301.2(3), and as established for the intended application by ~~the~~ all applicable laws, rules and ordinances ~~applicable in~~of the jurisdiction. Where ~~nonpotable~~ water from ~~different~~multiple sources is combined ~~in a system~~, the system shall comply with the most stringent of the requirements of this code that are applicable to such sources.

Add new text as follows:

TABLE 1301.2(1) REQUIRED WATER QUALITY FOR REUSE APPLICATIONS

Use Category	Application	Exposure[a]
Direct Potable Reuse	Direct Potable Reuse	DC
Indirect Potable Reuse (Treatment Follows Reuse Application)	Aquifer Recharge - Direct Injection	IC
	Aquifer Recharge - Surface Application	IC
	Aquifer Storage and Recovery	IC
	Rapid Infiltration Basins	IC
	Infiltration/Percolation Lagoons	IC
	Raw Water Augmentation	IC
	Saltwater Intrusion Barrier	IC
	Surface Water Augmentation to a Supply Source	IC
Irrigation of Food Crops for Human Consumption (Spray/Drip)	Food crop with processing that destroys pathogens (Restricted Access)	LC
	Orchards and Vineyards	AC/LC
	Water contacts edible portion of food crop (Includes Root Crops)	AC
	Water doesn't contact edible portion of food crop (Restricted Access)	IC
Irrigation of Crops Not for Human Consumption (Spray/Drip)	Christmas Tree Farms	AC/LC
	Hemp Crops	AC/LC
	Fiber crops	AC/LC
	Fodder /Feed Crop/ Forage Crops	AC/LC
	Ornamental nursery stock	AC/LC

	Stack Scrubbing	LC
	Stream Flow Augmentation	LC
	Street, Sidewalk, Parking Lot Cleaning (Restricted Access)	LC
	Street, Sidewalk, Parking Lot Cleaning (Unrestricted Access)	AC
	Vehicle and equipment Washing	AC
	Wastewater Treatment (Process Uses)	LC
	Window Washing	AC

a. Where two Exposures and two Tiers are cited, the first refers to spray irrigation and the second refers to drip irrigation (or other subsurface irrigation).

b. Where the equipment manufacturer or the jurisdiction requires a level of free residual disinfectant that exceeds the requirement of the quality Tier indicated, such excess shall be provided.

DC (Quality Tier 4) = Direct Public Contact/Consumption Intended

AC (Quality Tier 3) = Aerosolization, or Accidental/Limited

Consumption Possible

IC (Quality Tier 2) = Indirect Public Consumption Intended or Possible

LC (Quality Tier 1) = Limited Contact / No Consumption Intended

TABLE 1301.2(2) WATER QUALITY FOR TIERS OF REUSE

Quality Tier	Minimun Design Water Quality
4	United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards (40 CFR 141), plus 18/15/15 Log Removal of Enteric Viruses, Giardia, and Cryptosporidium
3	Compliant with all applicable laws, rules, ordinances and NSF 350
2	Compliant with all applicable laws, rules, ordinances, and end use fixture / equipment manufacturer requirements

1	Compliant with all applicable laws, rules, ordinances, and end use fixture / equipment manufacturer requirements

TABLE 1301.2(3) LOG REDUCTION (LRV) CREDITS APPLICALBLE TO DPR BASED ON SOURCE WATER

Source Water	Maximum LRV Credits for DPR
Blackwater	0/0/0
Blackwater blended with groundwater [a]	LRV credit [b] = negative log of BWC
Blackwater blended with surface water [a]	LRV credit [b] = negative log of BWC
Blackwater blended with groundwater and surface water [a]	LRV credit [b] = negative log of BWC
Graywater	Case by case basis
Stormwater	Case by case basis
Rainwater	Case by case basis
Industrial Water	Case by case basis
Process Water	Case by case basis

a. Groundwater and surface waters must be either an untreated source of drinking water approved by the jurisdiction or a treated drinking water approved by the jurisdiction.

b. LRV credit for all source waters containing blackwater shall not exceed 2.0.

Delete without substitution:

~~1301.2.1 Residual disinfectants~~.

~~Where chlorine is used for disinfection, the nonpotable water shall contain not more than 4 ppm (4 mg/L) of chloramines or free chlorine when tested in accordance with ASTM D1253. Where ozone is used for disinfection, the nonpotable water shall not contain gas bubbles having elevated levels of ozone at the point of use.~~

~~Exception:~~ ~~Reclaimed water sources shall not be required to comply with these requirements.~~

~~1301.2.2 Filtration required~~.

~~Nonpotable water utilized for water closet and urinal flushing applications shall be filtered by a 100-micron (0.1 mm) or finer filter.~~

~~Exception:~~ ~~Reclaimed water sources shall not be required to comply with these requirements.~~

Revise as follows:

1301.3 Signage required.

~~Nonpotable~~ Where nonpotable water is supplied to outlets such as hose connections, hydrants, open-ended pipes and faucets, each outlet shall be identified at the point of use ~~for each outlet~~ with signage that reads as follows: "~~Nonpotable water is utilized for [application name].~~ CAUTION: NONPOTABLE WATER – DO NOT DRINK." The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and in colors in contrast to the background on which they are applied. In addition to the required ~~wordage~~ text, the pictograph shown in Figure 1301.3 shall appear on the signage required by this section.

1301.4 Permits.

Permits shall be required for the construction, installation, operation, alteration and repair of ~~nonpotable~~ water reuse systems. Construction documents, engineering calculations, diagrams, operations and maintenence manuals,and other such data pertaining to the ~~nonpotable~~ water reuse systems shall be submitted with each permit application.

1301.5 Potable water connections.

Where a potable system is connected to a nonpotable water system, the potable water supply shall be protected against backflow in accordance with Section 608.

Revise as follows:

1301.6 Components and materials.
Piping, plumbing components and materials used in ~~collection and~~ conveyance and distibution systems shall be of material approved ~~by the manufacturer~~ for the intended application.

1301.7 Insect and vermin control.
The system shall be protected to prevent the entrance of insects and vermin into process tanks and equipment, storage tanks and piping systems. Screen materials shall be compatible with contacting system components and shall not accelerate the corrosion of system components.

1301.8 Freeze protection.
Where ~~sustained~~ freezing temperatures occur, provisions shall be made to keep storage tanks, process tanks and equipment and the related piping from freezing.

1301.9 ~~Nonpotable water storage~~ Water tanks.
~~Nonpotable w~~Water storage and process tanks shall comply with Sections 1301.9.1 through 1301.9.10.

1301.9.1 Location. Any storage tank, process tank and equipment
or portion thereof that is above grade shall be protected from direct exposure to sunlight by one of the following methods:

1. Tank construction using opaque, UV-resistant materials such as heavily tinted plastic, fiberglass, lined metal, concrete, ~~wood,~~ or painted to prevent algae growth.
2. Specially constructed sun barriers.
3. Installation in garages, crawl spaces or sheds.

1301.9.2 Materials.
~~Where collected on-site,~~ Prior to treatment for reuse, water shall be collected in an *approved* tank constructed of durable, nonabsorbent and corrosion-resistant materials. The ~~storage~~ tank shall be constructed of materials compatible with ~~any~~ all disinfection systems used to treat water upstream of the tank and with ~~any~~all systems used to maintain water quality in the tank. ~~Wooden storage tanks that are not equipped with a makeup water source shall be provided with a flexible liner.~~

1301.9.3 Foundation and supports.
~~Storage~~ All tanks shall be supported on a firm base capable of withstanding the weight of the ~~storage~~ tank when filled to capacity. ~~Storage t~~Tanks shall be supported in accordance with the *International Building Code*.

1301.9.3.1 Ballast.
Where the soil can become saturated, an underground ~~storage~~ tank shall be ballasted, or otherwise secured, to ~~prevent the tank from floating out of the ground~~ resist buoyant forces when empty. The combined weight of the empty tank and hold-down ballast shall ~~meet or~~ exceed the buoyancy force ~~of~~ applied to the tank. Where the installation requires a foundation, the foundation shall be flat and shall be designed to resist the maximum buoyant forces when the tank is empty, and to support the weight of the ~~storage~~ tank when full, consistent with the bearing capability of adjacent soil.

1301.9.3.2 Structural support.
Where installed below grade, ~~storage~~ tank installations shall be designed to withstand earth and surface structural loads without damage and with minimal deformation when empty or filled with water.

1301.9.4 Makeup water.

Where an uninterrupted supply is required for the intended application, ~~potable or reclaimed water shall be provided as a~~an additional source of makeup water shall be provided for the storage tank. ~~The~~ All makeup water suppl~~y~~ies shall be protected against backflow in accordance with Section 608. A *full-open valve* located on the makeup water supply lines to the storage tank ~~shall be provided~~. ~~Inlets to~~ Flow into the storage tank shall be controlled by fill valves or other automatic supply valves installed to prevent the tank from overflowing and to prevent the water level from dropping below a predetermined point. ~~Where makeup water is provided,~~ ~~t~~The water level shall not be permitted to drop below the ~~source water inlet or the~~ intake of any ~~attached~~ pump supplying makeup water.

1301.9.5 Overflow.
~~The storage~~ ~~t~~Tanks shall be equipped with an overflow pipe having a diameter not less than that shown in Table ~~606.5.4~~ 606.5(4). The overflow pipe shall be protected from insects ~~or~~ and vermin and shall discharge in a manner consistent with all applicable laws, rules, and ordinances of the jurisdiction for storm water runoff requirements of the jurisdiction. The overflow pipe shall discharge at a sufficient distance from the tank to avoid damaging the tank foundation or the adjacent property. Drainage from overflow pipes shall be directed to prevent freezing on roof walkways, and on sidewalks, pavement, and other accessways subject to vehicular or pedestrian traffic. The overflow drain shall not be equipped with a shutoff valve. A cleanout shall be provided on each overflow pipe in accordance with Section 708.

1301.9.6 Access. Not less than one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other *approved* method of securing access. Below-grade ~~storage~~ tanks, located outside of the building, shall be provided with ~~a manhole~~ an access opening either not less than 24 inches (610 mm) square or with an inside diameter not less than 24 inches (610 mm). ~~Manholes~~ Access opening shall extend not less than 4 inches (102 mm) above ground ~~or~~ and shall be designed to prevent water infiltration. ~~Finished~~ The finished grade shall be sloped away from the ~~manhole~~ maintenance hole to divert surface water. ~~Manhole~~ Access opening covers shall be secured to prevent unauthorized access. Service ports in ~~manhole~~ access opening covers shall be not less than 8 inches (203 mm) in diameter and shall be not less than 4 inches (102 mm) above the finished grade level. The service port shall be secured to prevent unauthorized access. Access locations to confined spaces shall be labeled "CONFINED SPACE."

> **Exception:** ~~Treated-water storage~~ ~~t~~Tanks that are less than 800 gallons (3028 L) in volume and installed below grade shall not be required to be equipped with a manhole an access opening provided that the tank has a service port of not less than 8 inches (203 mm) in diameter.

1301.9.7 Venting.
~~Storage t~~Tanks that receive flow by gravity shall be provided with a vent sized in accordance with Chapter 9 and based on the aggregate diameter of all tank influent pipes. The reservoir vent shall not be connected to sanitary drainage system vents. Vents shall be protected from contamination by means of an *approved* cap or U-bend installed with the opening directed downward. Vent outlets shall extend not less than 4 inches (102 mm) above grade or as necessary to prevent surface water from entering the ~~storage~~ tank. Vent openings shall be protected against the entrance of vermin and insects in accordance with the requirements of Section 1301.7.

1301.9.8 Draining of tanks.
Tanks shall be provided with a means of emptying the contents for the purpose of service or cleaning. Tanks shall be drained by using a pump or by a drain located at the lowest point in the tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table ~~606.5.7~~ 606.5(7). Not less than one cleanout shall be provided on each drain pipe in accordance with Section 708.

Revise as follows:

1301.9.9 Marking and signage.
Each nonpotable water ~~storage~~ tank shall be labeled with its rated volumetric capacity. The contents of ~~storage~~ tanks shall be identified with the words "CAUTION: NONPOTABLE WATER – DO NOT DRINK." Where an opening is provided that could allow the entry of personnel, the opening shall be marked with the words, "DANGER – CONFINED SPACE." Markings shall be indelibly printed on the tank or on a tag or sign constructed of corrosion-resistant waterproof material that is mounted on the tank. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.

1301.9.10 ~~Storage~~ ~~t~~Tank tests.

~~Storage~~ Pressurized tanks shall be be certified in accordance with Section 303.4. Tanks that receive flow by gravity shall tested in accordance with the following:~~Storage t~~Tanks shall be filled with water to the overflow line prior to and during inspection. Seams and joints shall be left exposed and the tank shall remain watertight without leakage for a period of 24 hours.

1. After 24 hours, supplemental water shall be introduced for a period of 15 minutes to verify proper drainage of the overflow system and that there are no leaks.
2. The tank drain shall be observed for proper operation.
3. The makeup water system shall be observed for proper operation and successful automatic shutoff of the system at the refill threshold shall be verified.

1301.10 System abandonment.
If the owner of an on-site ~~nonpotable~~ water reuse system or ~~rainwater collection and conveyance system~~ components thereof, elects to cease use of, or fails to properly maintain such system, the system shall be abandoned and shall comply with ~~the following:~~ Sections 1301.10.1 through 1301.10.3.

1. ~~All system piping connecting to a utility-provided water system shall be removed or disabled.~~
2. ~~The distribution piping system shall be replaced with an *approved* potable water supply piping system. Where an existing potable pipe system is already in place, the fixtures shall be connected to the existing system.~~
3. ~~The storage tank shall be secured from accidental access by sealing or locking tank inlets and access points, or filling with sand or equivalent.~~

Add new text as follows:

1301.10.1 Utility-Connected Piping. All system piping connecting to a utility-provided water system shall be removed or disabled.

1301.10.2 Distribution Piping. The distribution piping system shall be removed or replaced with an approved potable water supply piping system. Where an existing potable pipe system is already in place, the fixtures shall be connected to the existing system.

1301.10.3 Tanks. Tanks shall be removed, or secured from accidental access by sealing or locking tank inlets and access points, or filling with sand or equivalent.

Revise as follows:

1301.11 Trenching requirements for nonpotable water piping.
Nonpotable water ~~collection and~~ distribution ~~piping and reclaimed water~~ piping shall be separated from the *building sewer* and potable water piping underground by 5 feet (1524 mm) of undisturbed or compacted earth. Nonpotable water ~~collection and~~ distribution piping shall not be located in, under or above cesspools, septic tanks, septic tank drainage fields or seepage pits. Buried nonpotable water piping shall comply with the requirements of Section 306.

Exceptions:

1. The required separation distance shall not apply where the bottom of the nonpotable water pipe within 5 feet (1524 mm) of the *sewer* is not less than 12 inches (305 mm) above the top of the highest point of the *sewer* and the pipe materials conform to Table 702.3.
2. The required separation distance shall not apply where the bottom of the potable water service pipe within 5 feet (1524 mm) of the nonpotable water pipe is not less than 12 inches (305 mm) above the top of the highest point of the nonpotable water pipe and the pipe materials comply with the requirements of Table 605.4.
3. Nonpotable water pipe is permitted to be located in the same trench with a *building sewer*, provided that such *sewer* is constructed of materials that comply with the requirements of Table 702.2.

4. The required separation distance shall not apply where a nonpotable water pipe crosses a *sewer* pipe, provided that the pipe is sleeved to not less than 5 feet (1524 mm) horizontally from the *sewer* pipe centerline on both sides of such crossing, with pipe materials that comply with Table 702.2.
5. The required separation distance shall not apply where a potable water service pipe crosses a nonpotable water pipe, provided that the potable water service pipe is sleeved for a distance of not less than 5 feet (1524 mm) horizontally from the centerline of the nonpotable pipe on both sides of such crossing, with pipe materials that comply with Table 702.2.
6. Irrigation piping located outside of a building and downstream of the backflow preventer is not required to meet the trenching requirements where nonpotable water is used for outdoor applications.

1301.12 Outdoor outlet access.
Sill cocks, hose bibbs, wall hydrants, yard hydrants and other outdoor outlets supplied by nonpotable water shall be located in a locked vault or shall be operable only by means of a removable key and marked in accordance with Section 1301.3.

Add new text as follows:

1301.13 Operations and monitoring. The design, installation, and continued operation of water reuse systems shall be in accordance with an approved operating and monitoring program. The program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code.*

Revise as follows:

SECTION 1302
~~ON-SITE NONPOTABLE~~ WATER REUSE SYSTEMS

1302.1 General.
The provisions of ASTM E2635 and Section 1302 shall govern the construction, installation, alteration and repair of water reuse systems. ~~on-site nonpotable water reuse systems for the collection, storage, treatment and distribution of on-site sources of nonpotable water as permitted by the jurisdiction water reuse systems.~~.

1302.2 Graywater ~~S~~sources. ~~On-site nonpotable water~~ Graywater reuse systems shall collect waste discharge from only the following sources: bathtubs, showers, lavatories, clothes washers ~~and laundry trays~~ , laundry trays, condensate, and other domestic wastewaters that are not expected to contain urine, fecal matter, grease, or food wastes. ~~Where *approved* and as appropriate for the intended application, water from other nonpotable sources shall be collected for reuse by on-site nonpotable water reuse systems.~~.

1302.3 ~~1302.2.1 Prohibited~~ Blackwater sources.
~~Wastewater containing urine or fecal matter~~ Blackwater shall ~~not~~ be ~~diverted to on-site nonpotable water reuse systems and shall discharge~~ discharged to the sanitary drainage system ~~of the building or premises~~ in accordance with Chapter 7~~. Reverse osmosis system reject water, water softener discharge water, kitchen sink wastewater, dishwasher wastewater and wastewater discharged from wet-hood scrubbers shall not be collected for reuse in an on-site nonpotable water~~or to an approved on-site blackwater reuse system.

Add new text as follows:

1302.4 Other sources.. Other sources including, but not limited to, condensate, reverse osmosis system reject water, water softener discharge water, and wastewater discharged from wet-hood scrubbers shall also be considered for use in a water reuse system.

Revise as follows:

1302.5 ~~1302.3~~ Traps.
Traps serving fixtures and devices discharging ~~wastewater to on-site nonpotable~~ water to water reuse systems shall comply with Section 1002.4.

Delete without substitution:

~~**1302.4 Collection pipe**~~**.**

~~On-site nonpotable water reuse systems shall utilize drainage piping *approved* for use in plumbing drainage systems to collect and convey untreated water for reuse. Vent piping *approved* for use in plumbing venting systems shall be utilized for vents in the graywater system. Collection and vent piping materials shall comply with Section 702.~~

~~**1302.4.1 Installation**~~**.**

~~Collection piping conveying untreated water for reuse shall be installed in accordance with Section 704.~~

~~**1302.4.2 Joints**~~**.**

~~Collection piping conveying untreated water for reuse shall utilize joints *approved* for use with the distribution piping and appropriate for the intended applications as specified in Section 705.~~

~~**1302.4.3 Size**~~**.**

~~Collection piping conveying untreated water for reuse shall be sized in accordance with drainage sizing requirements specified in Section 710.~~

Revise as follows:

1302.6 ~~**1302.4.4**~~ **Pipe marking.**

Additional marking of collection piping conveying untreated water for reuse shall not be required beyond that required for sanitary drainage, waste and vent piping by Chapter 7.

1302.7 ~~**1302.5 Filtration**~~ **Treatment.**

~~Untreated w~~Water collected for reuse shall be ~~filtered as required for the intended end use. Filters shall be provided with *access* for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.~~treated to meet the quality standards required in Tables 1301.2(1) and 1301.2(2).

Add new text as follows:

1302.8 Treatment systems.. Treatment systems shall be installed to allow access for inspection and maintenance. All treatment equipment shall utilize pressure gauges, level sensors, intensity meters, or other approved methods to indicate when servicing or replacement is required. All treatment equipment shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.

Revise as follows:

1302.9 ~~**1302.6 Disinfection and treatment**~~ **Tanks.** ~~Where the intended application for nonpotable water collected on-site for reuse requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use. Nonpotable water collected on-site containing untreated graywater shall be retained in collection reservoirs for not longer than 24 hours.~~ Nopotable tanks utilized in water reuse systems shall comply with Sections 1301.9, 1302.8.1 and 1302.8.2.

Delete without substitution:

~~**1302.6.1 Graywater used for fixture flushing**~~**.**

~~Graywater used for flushing water closets and urinals shall be disinfected and treated by an on-site water reuse treatment system~~

~~complying with NSF 350.~~

~~**1302.7 Storage tanks.**~~
~~Storage tanks utilized in on-site nonpotable water reuse systems shall comply with Sections 1301.9, 1302.7.1 and 1302.7.2.~~

Revise as follows:

1302.9.1 ~~1302.7.1~~ Location.
~~Storage t~~Tanks shall be located with a minimum horizontal distance between various elements as indicated in Table ~~1302.7.1~~ 1302.7(1).

1302.9.2 ~~1302.7.2~~ Outlets.
Outlets shall be located not less than 4 inches (102 mm) above the bottom of the ~~storage~~ tank and shall not skim water from the surface.

1302.10 ~~1302.8~~ Valves.
Valves shall be ~~supplied~~ installed on ~~on-site nonpotable~~ the collection of the water reuse systems in accordance with Sections 1302.~~8~~ 9 .1 and 1302.~~8~~ 9.2.

1302.10.1 ~~1302.8.1~~ Bypass valve.
One three-way diverter valve listed and labeled to NSF 50 or other *approved* device shall be installed on collection piping upstream of each storage tank, ~~or drain field,~~ as applicable, to divert untreated on-site reuse sources to the sanitary *sewer* or approved receiving tank to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections. Bypass valves shall be marked to indicate the direction of flow~~, connection and storage tank or drainfield connection~~. Bypass valves shall be provided with *access* that allows for removal. Two shutoff valves shall not be installed to serve as a bypass valve.

1302.10.2 ~~1302.8.2~~ Backwater valve.
One or more backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be installed in accordance with Section 714.

1302.11 ~~1302.9~~ Pumping and control system.
Mechanical equipment including pumps, valves and ~~filters~~ treatment units shall have *access* ~~and be removable~~ in order to ~~perform~~ to replace, repair, ~~maintenance~~ maintain and clean~~ing~~. The minimum flow rate and flow pressure delivered by the pumping system shall be appropriate for the application and in accordance with Section 604.

1302.12 ~~1302.10~~ Water pressure-reducing valve or regulator.
Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the ~~nonpotable~~ water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section 604.8.

1302.13 ~~1302.11~~ Distribution piping.
Distribution piping utilized in ~~on-site nonpotable~~ water reuse systems shall comply with Sections ~~1302.11.1~~ 1302.12.1 through ~~1302.11.3~~ 1302.12.3.

Exception: Irrigation piping located outside of the building and downstream of a backflow preventer.

~~1302.11.1~~ 1302.13.1 Materials, joints and connections.
Distribution piping shall conform to the standards and requirements specified in Section 605.

~~1302.11.2~~ 1302.13.2 Design.
~~On-site nonpotable w~~Water reuse distribution piping systems shall be designed and sized in accordance with Section 604 for the intended application.

~~1302.11.3~~ 1302.13.3 Labeling and marking.
~~On-site n~~Nonpotable water distribution piping labeling and marking shall comply with Section 608.9.

1302.14 ~~1302.12~~ Tests and inspections.
Tests and inspections shall be witnessed by the designer and performed in accordance with Sections 1302.12 14.1 through 1302.12 14 .6.

1302.14.1 ~~1302.12.1~~ Collection pipe and vent test.
Drain, waste and vent piping used for on-site water reuse systems shall be tested in accordance with Section 312.

1302.14.2 ~~1302.12.2~~ ~~Storage t~~Tank tests.
~~Storage t~~Tanks shall be tested in accordance with Section 1301.9.10.

1302.14.3 ~~1302.12.3~~ Water supply system test.
The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section 312.6.

1302.14.4 ~~1302.12.4~~ Inspection and testing of backflow prevention assemblies.
The testing of backflow preventers and backwater valves shall be conducted in accordance with Section 312.11.

1302.14.5 ~~1302.12.5~~ Inspection of vermin and insect protection.
Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the ~~storage~~ tank and piping systems in accordance with Section 1301.7.

1302.14.6 ~~1302.12.6~~ Initial ~~W~~water quality test.
The quality of the water for the intended application shall be verified at the point of use in accordance with ~~the requirements~~ all applicable laws, rules, and ordinances of the jurisdiction.

Add new text as follows:

1302.14.7 Operational water quality testing.. The quality of the water for the intended application(s) shall be verified at the point of use in accordance with all applicable laws, rules, ordinances of the jurisdiction, and in accordance with the operation and maintenance manual, and where required, the operating permit.

Revise as follows:

1302.15 ~~1302.13~~ Operation and maintenance manuals. Operation and maintenance materials shall be supplied with nonpotable on-site water reuse systems in accordance with Sections 1302.13.1 through 1302.13.4~~.~~ and the maintenance program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code.*

1302.15.1 ~~1302.13.1~~ Manual.
A detailed operations and maintenance manual shall be supplied in hardcopy form with all systems.

1302.15.2 ~~1302.13.2~~ Schematics.
The manual shall include a detailed system schematic, and the locations and a list of all system components, including manufacturer and model number.

1302.15.3 ~~1302.13.3~~ Maintenance procedures.
The manual shall provide a schedule and procedures for all system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.

1302.15.4 ~~1302.13.4~~ Operations procedures.
The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the

system.

Add new text as follows:

Add new standard(s) as follows:

. 40 CFR 141 United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards

Staff Analysis: A review of the standard proposed for inclusion in the code, DOE 40 CFR 141 *United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

2024 International Residential Code

SECTION R202 DEFINITIONS

Add new definition as follows:

BLACKWATER

. Wastewater that contains urine or fecal matter.

BLACKWATER CONTRIBUTION (BWC)

.

The fraction equal to the quantity of blackwater divided by the sum of the quantities of raw and treated blackwater plus surface water, groundwater, and water from approved potable water systems.

LOG REDUCTION VALUE (LRV).

The measure of the ability of a treatment process to remove or inactivate microorganisms such as bacteria, protozoa and viruses. LRV is the logarithm base 10 of the ratio of the levels of a pathogenic organism or other contaminant before and after treatment.

POTABLE REUSE

. The practice of treating *wastewater* and utilizing it for potable applications.

REUSE WATER

. Wastewater or rainwater treated to a level of quality suitable for reuse.

WASTEWATER

.
The water generated after use of freshwater, raw water, drinking water, or saline water in a deliberate application or process.

WATER REUSE SYSTEM

.
A system for the treatment, storage, distribution, and reuse of water including, but not limited to, wastewater and captured rainwater.

Delete without substitution:

~~SECTION P2910~~
~~NONPOTABLE WATER SYSTEMS~~

~~**P2910.1 Scope.** The provisions of this section shall govern the materials, design, construction and installation of systems for the collection, storage, treatment and distribution of nonpotable water. The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the *jurisdiction*.~~

~~**P2910.2 Water quality.** Nonpotable water for each end use application shall meet the minimum water quality requirements as established for the intended application by the laws, rules and ordinances applicable in the *jurisdiction*. Where nonpotable water from different sources is combined in a system, the system shall comply with the most stringent requirements of this code applicable to such sources.~~

~~**P2910.2.1 Residual disinfectants.** Where chlorine is used for disinfection, the nonpotable water shall contain not more than 4 ppm (4 mg/L) of chloramines or free chlorine. Where ozone is used for disinfection, the nonpotable water shall not contain gas bubbles having elevated levels of ozone at the point of use.~~

~~**Exception:** Reclaimed water sources shall not be required to comply with the requirements of this section.~~

~~**P2910.2.2 Filtration required.** Nonpotable water utilized for water closet and urinal flushing applications shall be filtered by a 100 micron or finer filter.~~

~~**Exception:** Reclaimed water sources shall not be required to comply with the requirements of this section.~~

~~**P2910.3 Signage required.**~~
~~Nonpotable water outlets such as hose connections, open-ended pipes and faucets shall be identified at the point of use for each outlet with signage that reads, "Nonpotable water is utilized for [application name]. CAUTION: NONPOTABLE WATER. DO NOT DRINK." The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant, waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inches (12.7 mm) in height and in colors contrasting the background on which they are applied. In addition to the required wordage, the pictograph shown in Figure P2910.3 shall appear on the signage required by this section.~~

~~FIGURE P2910.3 PICTOGRAPH—DO NOT DRINK~~

~~**P2910.4 Permits.**~~
~~*Permits* shall be required for the construction, installation, *alteration* and *repair* of nonpotable water systems. *Construction documents*, engineering calculations, diagrams and other such data pertaining to the nonpotable water system shall be submitted with each *permit* application.~~

~~**P2910.5 Potable water connections.**~~
~~Where a potable system is connected to a nonpotable water system, the potable water supply shall be protected against backflow in accordance with Section P2902.~~

~~**P2910.6 Approved components and materials.** Piping, plumbing components and materials used in collection and conveyance systems shall be manufactured of material *approved* for the intended application and compatible with any disinfection and treatment systems used.~~

~~**P2910.7 Insect and vermin control.** The system shall be protected to prevent the entrance of insects and vermin into storage tanks and piping systems. Screen materials shall be compatible with contacting system components and shall not accelerate the corrosion of system components.~~

~~**P2910.8 Freeze protection.** Where sustained freezing temperatures occur, provisions shall be made to keep storage tanks and the related piping from freezing.~~

~~**P2910.9 Nonpotable water storage tanks.**~~
~~Nonpotable water storage tanks shall comply with Sections P2910.9.1 through P2910.9.11.~~

~~**P2910.9.1 Sizing.** The holding capacity of the storage tank shall be sized in accordance with the anticipated demand.~~

~~**P2910.9.2 Location.** Storage tanks shall be installed above or below grade. Above-grade storage tanks shall be protected from direct sunlight and shall be constructed using opaque, UV-resistant materials such as, but not limited to, heavily tinted plastic, lined metal, concrete and wood; or painted to prevent algae growth; or shall have specially constructed sun barriers including, but not limited to, installation in garages, *crawl spaces* or sheds. Storage tanks and their manholes shall not be located directly under any soil piping, waste piping or any source of contamination.~~

~~**P2910.9.3 Materials.** Where collected on site, water shall be collected in an *approved* tank constructed of durable, nonabsorbent and corrosion-resistant materials. The storage tank shall be constructed of materials compatible with any disinfection systems used to treat water upstream of the tank and with any systems used to maintain water quality within the tank. Wooden storage tanks that are not equipped with a makeup water source shall be provided with a flexible liner.~~

~~**P2910.9.4 Foundation and supports.** Storage tanks shall be supported on a firm base capable of withstanding the weight of the storage tank when filled to capacity. Storage tanks shall be supported in accordance with this code.~~

~~**P2910.9.4.1 Ballast.** Where the soil can become saturated, an underground storage tank shall be ballasted or otherwise secured to prevent the tank from floating out of the ground when empty. The combined weight of the tank and hold-down ballast shall meet or exceed the buoyancy force of the tank. Where the installation requires a foundation, the foundation shall be flat and shall be designed to support the storage tank weight when full, consistent with the bearing capability of adjacent soil.~~

~~**P2910.9.4.2 Structural support.** Where installed below grade, storage tank installations shall be designed to withstand earth and surface structural loads without damage and with minimal deformation when empty or filled with water.~~

~~**P2910.9.5 Makeup water.**~~

~~Where an uninterrupted nonpotable water supply is required for the intended application, potable or reclaimed water shall be provided as a source of makeup water for the storage tank. The makeup water supply shall be protected against backflow by means of an *air gap* not less than 4 inches (102 mm) above the overflow or an *approved* backflow device in accordance with Section P2902. A *full-open valve* located on the makeup water supply line to the storage tank shall be provided. Inlets to the storage tank shall be controlled by fill valves or other automatic supply valves installed to prevent the tank from overflowing and to prevent the water level from dropping below a predetermined point. Where makeup water is provided, the water level shall be prohibited from dropping below the source water inlet or the intake of any attached pump.~~

~~**P2910.9.5.1 Inlet control valve alarm.**~~

~~Makeup water systems shall be fitted with a warning mechanism that alerts the user to a failure of the inlet control valve to close correctly. The alarm shall activate before the water within the storage tank begins to discharge into the overflow system.~~

~~**P2910.9.6 Overflow.**~~

~~The storage tank shall be equipped with an overflow pipe having a diameter not less than that shown in Table P2910.9.6. The overflow outlet shall discharge at a point not less than 6 inches (152 mm) above the roof or roof drain; floor or *floor drain*; or over an open water-supplied fixture. The overflow outlet shall be covered with a corrosion-resistant screen of not less than 16 by 20 mesh per inch (630 by 787 mesh per m) and by $^1/_4$-inch (6.4 mm) hardware cloth or shall terminate in a horizontal angle seat check valve. Drainage from overflow pipes shall be directed to prevent freezing on roof walks. The overflow drain shall not be equipped with a shutoff valve. Not less than one cleanout shall be provided on each overflow pipe in accordance with Section P3005.2.~~

~~**TABLE P2910.9.6 SIZE OF DRAIN PIPES FOR WATER TANKS**~~

TANK CAPACITY (gallons)	DRAIN PIPE (inches)
Up to 750	1
751 to 1,500	1$^1/_2$
1,501 to 3,000	2
3,001 to 5,000	2$^1/_2$
5,001 to 7,500	3
Over 7,500	4

~~For SI: 1 gallon = 3.875 liters, 1 inch = 25.4 mm.~~

~~**P2910.9.7 Access.**~~

~~Not less than one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other *approved* method of securing access. Below-grade storage tanks, located outside of the *building*, shall be provided with a manhole either not less than 24 inches (610 mm) square or with an inside diameter not less than 24 inches (610 mm). Manholes shall extend not less than 4 inches (102 mm) above ground or shall be designed to prevent water infiltration. Finished grade shall be sloped away from the manhole to divert surface water. Manhole covers shall be secured to prevent unauthorized access. Service ports in manhole covers shall be not less than 8 inches (203 mm) in diameter and shall be not less than 4 inches (102 mm)~~

~~above the finished grade level. The service port shall be secured to prevent unauthorized access.~~

> ~~**Exception:** Storage tanks under 800 gallons (3028 L) in volume installed below grade shall not be required to be equipped with a manhole, but shall have a service port not less than 8 inches (203 mm) in diameter.~~

~~P2910.9.8 Venting~~.
~~Storage tanks shall be provided with a vent sized in accordance with Chapter 31 and based on the aggregate diameter of all tank influent pipes. The reservoir vent shall not be connected to sanitary drainage system vents. Vents shall be protected from contamination by means of an *approved* cap or a U-bend installed with the opening directed downward. Vent outlets shall extend not less than 4 inches (102 mm) above grade, or as necessary to prevent surface water from entering the storage tank. Vent openings shall be protected against the entrance of vermin and insects in accordance with the requirements of Section P2910.7.~~

~~SECTION P2911~~
~~ON-SITE NONPOTABLE WATER REUSE SYSTEMS~~

~~P2910.9.9 Drain~~.
~~A drain shall be located at the lowest point of the storage tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table P2910.9.6. Not less than one cleanout shall be provided on each drain pipe in accordance with Section P3005.2.~~

~~P2910.10 Marking and signage~~.
~~Each nonpotable water storage tank shall be *labeled* with its rated capacity. The contents of storage tanks shall be identified with the words, "CAUTION: NONPOTABLE WATER. DO NOT DRINK." Where an opening is provided that could allow the entry of personnel, the opening shall be marked with the words, "DANGER—CONFINED SPACE." Markings shall be indelibly printed on the tank, or on a tag or sign constructed of corrosion-resistant waterproof material that is mounted on the tank. The letters of the words shall be not less than 0.5 inches (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.~~

~~P2910.11 Storage tank tests~~.
~~Storage tanks shall be tested in accordance with the following:~~

1. ~~Storage tanks shall be filled with water to the overflow line prior to and during inspection. Seams and joints shall be left exposed and the tank shall remain watertight without leakage for a period of 24 hours.~~
2. ~~After 24 hours, supplemental water shall be introduced for a period of 15 minutes to verify proper drainage of the overflow system and leaks do not exist.~~
3. ~~Following a successful test of the overflow, the water level in the tank shall be reduced to a level that is 2 inches (51 mm) below the makeup water trigger point by using the tank drain. The tank drain shall be observed for proper operation. The makeup water system shall be observed for proper operation, and successful automatic shutoff of the system at the refill threshold shall be verified. Water shall not be drained from the overflow at any time during the refill test.~~

~~P2910.12 System abandonment.~~ ~~If the *owner* of an on-site nonpotable water reuse system or rainwater collection and conveyance system elects to cease use of or fails to properly maintain such system, the system shall be abandoned and shall comply with the following:~~

1. ~~System piping connecting to a utility-provided water system shall be removed or disabled.~~
2. ~~The distribution piping system shall be replaced with an *approved* potable water supply piping system. Where an existing potable water pipe system is already in place, the fixtures shall be connected to the existing system.~~

3. ~~The storage tank shall be secured from accidental access by sealing or locking tank inlets and access points, or filled with sand or equivalent.~~

~~**P2910.13 Separation requirements for nonpotable water piping**~~**.**
~~Nonpotable water collection and distribution piping and reclaimed water piping shall be separated from the *building sewer* and potable water piping underground by 5 feet (1524 mm) of undisturbed or compacted earth. Nonpotable water collection and distribution piping shall not be located in, under or above cesspools, septic tanks, septic tank drainage fields or seepage pits. Buried nonpotable water piping shall comply with the requirements of Section P2604.~~

~~**Exceptions:**~~

1. ~~The required separation distance shall not apply where the bottom of the nonpotable water pipe within 5 feet (1524 mm) of the sewer is not less than 12 inches (305 mm) above the top of the highest point of the sewer and the pipe materials conforms to Table P3002.2.~~
2. ~~The required separation distance shall not apply where the bottom of the potable water service pipe within 5 feet (1524 mm) of the nonpotable water pipe is not less than 12 inches (305 mm) above the top of the highest point of the nonpotable water pipe and the pipe materials comply with the requirements of Table P2906.5.~~
3. ~~The required separation distance shall not apply where a nonpotable water pipe is located in the same trench with a *building sewer* that is constructed of materials that comply with the requirements of Table P3002.2.~~
4. ~~The required separation distance shall not apply where a nonpotable water pipe crosses a sewer pipe provided that the nonpotable water pipe is sleeved to not less than 5 feet (1524 mm) horizontally from the sewer pipe centerline on both sides of such crossing, with pipe materials that comply with Table P3002.2.~~
5. ~~The required separation distance shall not apply where a potable water service pipe crosses a nonpotable water pipe, provided that the potable water service pipe is sleeved for a distance of not less than 5 feet (1524 mm) horizontally from the centerline of the nonpotable pipe on both sides of such crossing, with pipe materials that comply with Table P3002.2.~~
6. ~~The required separation distance shall not apply to irrigation piping located outside of a building and downstream of the backflow preventer where nonpotable water is used for outdoor applications.~~

~~**P2910.14 Outdoor outlet access**~~**.**
~~Sillcocks, hose bibbs, wall hydrants, yard hydrants and other outdoor outlets supplied by nonpotable water shall be located in a locked vault or shall be operable only by means of a removable key.~~

~~**P2911.1 General.**~~ ~~The provisions of this section shall govern the construction, installation, *alteration* and *repair* of *on-site nonpotable water reuse systems* for the collection, storage, treatment and distribution of on-site sources of nonpotable water as permitted by the *jurisdiction*.~~

~~**P2911.2 Sources**~~**.** ~~*On-site nonpotable water reuse systems* shall collect waste discharge only from the following sources: bathtubs, showers, lavatories, clothes washers and laundry trays. Water from other *approved* nonpotable sources including swimming pool backwash operations, air conditioner condensate, rainwater, foundation drain water, fluid cooler discharge water and fire pump test water shall be permitted to be collected for reuse by *on-site nonpotable water reuse systems*, as *approved* by the *building official* and as appropriate for the intended application.~~

~~**P2911.2.1 Prohibited sources.**~~ ~~Reverse osmosis system reject water, water softener backwash water, *kitchen* sink wastewater, dishwasher wastewater and wastewater containing urine or fecal matter shall not be collected for reuse within an on-site nonpotable water reuse system.~~

~~**P2911.3 Traps**~~**.**
~~Traps serving fixtures and devices discharging wastewater to *on-site nonpotable water reuse systems* shall comply with the Section~~

~~P3201.2.~~

~~P2911.4 Collection pipe~~.

~~*On-site nonpotable water reuse systems* shall utilize drainage piping *approved* for use within plumbing drainage systems to collect and convey untreated water for reuse. Vent piping *approved* for use within plumbing venting systems shall be utilized for vents within the *graywater* system. Collection and vent piping materials shall comply with Section P3002.~~

~~P2911.4.1 Installation~~.

~~Collection piping conveying untreated water for reuse shall be installed in accordance with Section P3005.~~

~~P2911.4.2 Joints~~.

~~Collection piping conveying untreated water for reuse shall utilize joints *approved* for use with the distribution piping and appropriate for the intended applications as specified in Section P3002.~~

~~P2911.4.3 Size~~.

~~Collection piping conveying untreated water for reuse shall be sized in accordance with drainage sizing requirements specified in Section P3005.4.~~

~~P2911.4.4 Marking~~.

~~Additional marking of collection piping conveying untreated water for reuse shall not be required beyond that required for sanitary drainage, waste and vent piping by Chapter 30.~~

~~P2911.5 Filtration~~. ~~Untreated water collected for reuse shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.~~

~~P2911.6 Disinfection~~.

~~Nonpotable water collected on site for reuse shall be disinfected, treated or both to provide the quality of water needed for the intended end-use application. Where the intended end-use application does not have requirements for the quality of water, disinfection and treatment of water collected on site for reuse shall not be required. Nonpotable water collected on site containing untreated *graywater* shall be retained in collection reservoirs for not more than 24 hours.~~

~~P2911.6.1 Graywater used for fixture flushing~~.

~~*Graywater* used for flushing water closets and urinals shall be disinfected and treated by an on-site water reuse treatment system complying with NSF 350.~~

~~P2911.7 Storage tanks~~.

~~Storage tanks utilized in *on-site nonpotable water reuse systems* shall comply with Section P2910.9 and Sections P2911.7.1 through P2911.7.3.~~

~~P2911.7.1 Location~~.

~~Storage tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P2911.7.1.~~

~~**TABLE P2911.7.1 LOCATION OF NONPOTABLE WATER REUSE STORAGE TANKS**~~

ELEMENT	MINIMUM HORIZONTAL DISTANCE FROM STORAGE TANK (feet)
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Public water main	10
Seepage pits	5
Septic tanks	5
Streams and lakes	50
Water service	5
Water wells	50

~~For SI: 1 foot = 304.8 mm.~~

~~**P2911.7.2 Inlets.** Storage tank inlets shall be designed to introduce water into the tank with minimum turbulence, and shall be located and designed to avoid agitating the contents of the storage tank.~~

~~**P2911.7.3 Outlets.** Outlets shall be located not less than 4 inches (102 mm) above the bottom of the storage tank, and shall not skim water from the surface.~~

~~**P2911.8 Valves.**~~

~~Valves shall be supplied on *on-site nonpotable water reuse systems* in accordance with Sections P2911.8.1 and P2911.8.2.~~

~~**P2911.8.1 Bypass valve.**~~

~~One three-way diverter valve certified to NSF 50 or other *approved* device shall be installed on collection piping upstream of each storage tank, or drainfield, as applicable, to divert untreated on-site reuse sources to the sanitary sewer to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections. Bypass valves shall be *labeled* to indicate the direction of flow, connection and storage tank or drainfield connection. Bypass valves shall be installed in accessible locations. Two shutoff valves shall not be installed to serve as a bypass valve.~~

~~**P2911.8.2 Backwater valve.**~~

~~Backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be in accordance with Section P3008.~~

~~**P2911.9 Pumping and control system.**~~

~~Mechanical equipment including pumps, valves and filters shall be accessible and removable in order to perform *repair*, maintenance and cleaning. The minimum flow rate and *flow pressure* delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.~~

~~**P2911.10 Water pressure-reducing valve or regulator.**~~

~~Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the nonpotable water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.~~

~~**P2911.11 Distribution pipe.**~~

~~Distribution piping utilized in *on-site nonpotable water reuse systems* shall comply with Sections P2911.11.1 through P2911.11.3.~~

~~**Exception:** Irrigation piping located outside of the *building* and downstream of a backflow preventer.~~

~~P2911.11.1 Materials, joints and connections~~.

~~Distribution piping shall conform to the standards and requirements specified in Section P2906 for nonpotable water.~~

P2911.11.2 Design.

On-site nonpotable water reuse distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.

Delete without substitution:

~~P2911.11.3 Marking~~.

~~On-site nonpotable water distribution piping labeling and marking shall comply with Section P2901.2.~~

~~P2911.12 Tests and inspections~~.

~~Tests and inspections shall be performed in accordance with Sections P2911.12.1 through P2911.12.6.~~

~~P2911.12.1 Collection pipe and vent test~~.

~~Drain, waste and vent piping used for on-site water reuse systems shall be tested in accordance with Section P2503.~~

~~P2911.12.2 Storage tank test~~.

~~Storage tanks shall be tested in accordance with Section P2910.11.~~

~~P2911.12.3 Water supply system test~~.

~~The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.~~

~~P2911.12.4 Inspection and testing of backflow prevention assemblies~~.

~~The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.~~

~~P2911.12.5 Inspection of vermin and insect protection~~.

~~Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the storage tank and piping systems in accordance with Section P2910.7.~~

~~P2911.12.6 Water quality test~~.

~~The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the *jurisdiction*.~~

~~P2911.13 Operation and maintenance manuals~~.

~~Operation and maintenance materials shall be supplied with nonpotable on-site water reuse systems in accordance with Sections P2911.13.1 through P2911.13.4.~~

~~**P2911.13.1 Manual.** A detailed operations and maintenance manual shall be supplied in hard-copy form for each system.~~

~~**P2911.13.2 Schematics.** The manual shall include a detailed system schematic, the location of system components and a list of system components that includes the manufacturers and model numbers of the components.~~

~~**P2911.13.3 Maintenance procedures.** The manual shall provide a schedule and procedures for system components requiring periodic maintenance. Consumable parts including filters shall be noted along with part numbers.~~

~~**P2911.13.4 Operations procedures.** The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the system.~~

~~SECTION P2912~~
~~NONPOTABLE RAINWATER COLLECTION AND DISTRIBUTION SYSTEMS~~

~~**P2912.1 General.**~~

~~The provisions of this section shall govern the construction, installation, *alteration* and *repair* of rainwater collection and conveyance systems for the collection, storage, treatment and distribution of rainwater for nonpotable applications. For nonpotable rainwater systems, the provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution of nonpotable water. The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the *jurisdiction*.~~

~~**P2912.2 Collection surface.** Rainwater shall be collected only from above-ground impervious roofing surfaces constructed from *approved* materials. Collection of water from vehicular parking or pedestrian walkway surfaces shall be prohibited except where the water is used exclusively for landscape irrigation. Overflow and bleed-off pipes from roof-mounted *appliances* including, but not limited to, evaporative coolers, water heaters and solar water heaters shall not discharge onto rainwater collection surfaces.~~

~~**P2912.3 Debris excluders.** Downspouts and leaders shall be connected to a roof washer and shall be equipped with a debris excluder or equivalent device to prevent the contamination of collected rainwater with leaves, sticks, pine needles and similar material. Debris excluders and equivalent devices shall be self-cleaning.~~

~~**P2912.4 Roof washer.** An amount of rainwater shall be diverted at the beginning of each rain event, and not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize storage tank water contamination. The roof washer shall not rely on manually operated valves or devices and shall operate automatically. Diverted rainwater shall not be drained to the roof surface and shall be discharged in a manner consistent with the stormwater runoff requirements of the *jurisdiction*. Roof washers shall be accessible for maintenance and service.~~

~~**P2912.5 Roof gutters and downspouts.**~~

~~Gutters and downspouts shall be constructed of materials that are compatible with the collection surface and the rainwater quality for the desired end use. Joints shall be watertight.~~

~~**P2912.5.1 Slope.** Roof gutters, leaders and rainwater collection piping shall slope continuously toward collection inlets and shall be free of leaks. Gutters and downspouts shall have a slope of not less than $^1/_8$ inch per foot (10.4 mm/m) along their entire length. Gutters and downspouts shall be installed so that water does not pool at any point.~~

~~**P2912.5.2 Cleanouts.** Cleanouts shall be provided in the water conveyance system to allow *access to* filters, flushes, pipes and downspouts.~~

~~**P2912.6 Drainage.** Water drained from the roof washer or debris excluder shall not be drained to the sanitary sewer. Such water shall be diverted from the storage tank and shall discharge to a location that will not cause erosion or damage to property. Roof washers and~~

~~debris excluders shall be provided with an automatic means of self-draining between rain events and shall not drain onto roof surfaces.~~

~~P2912.7 Collection pipe~~.
~~Rainwater collection and conveyance systems shall utilize drainage piping *approved* for use within plumbing drainage systems to collect and convey captured rainwater. Vent piping *approved* for use within plumbing venting systems shall be utilized for vents within the rainwater system. Collection and vent piping materials shall comply with Section P3002.~~

~~P2912.7.4 Marking~~.
~~Additional marking of collection piping conveying captured rainwater for reuse shall not be required beyond that required for sanitary drainage, waste, and vent piping by Chapter 30.~~

~~P2912.7.2 Joints~~.
~~Collection piping conveying captured rainwater shall utilize joints *approved* for use with the distribution piping and appropriate for the intended applications as specified in Section P3003.~~

~~P2912.7.3 Size~~.
~~Collection piping conveying captured rainwater shall be sized in accordance with drainage sizing requirements specified in Section P3005.4.~~

~~P2912.7.1 Installation~~.
~~Collection piping conveying captured rainwater shall be installed in accordance with Section P3005.3.~~

~~P2912.8 Filtration~~. ~~Collected rainwater shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.~~

~~P2912.9 Disinfection~~. ~~Where the intended application for rainwater requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use.~~

~~P2912.10 Storage tanks~~.
~~Storage tanks utilized in nonpotable rainwater collection and conveyance systems shall comply with Section P2910.9 and Sections P2912.10.1 through P2912.10.3.~~

~~P2912.10.1 Location~~.
~~Storage tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P2912.10.1.~~

~~TABLE P2912.10.1 LOCATION OF RAINWATER STORAGE TANKS~~

ELEMENT	MINIMUM HORIZONTAL DISTANCE FROM STORAGE TANK (feet)
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Seepage pits	5
Septic tanks	5

~~For SI: 1 foot = 304.8 mm~~

~~P2912.10.2 Inlets~~. ~~Storage tank inlets shall be designed to introduce collected rainwater into the tank with minimum turbulence, and shall be located and designed to avoid agitating the contents of the storage tank.~~

~~P2912.10.3 Outlets~~. ~~Outlets shall be located not less than 4 inches (102 mm) above the bottom of the storage tank and shall not skim water from the surface.~~

~~P2912.11 Valves~~.
~~Valves shall be supplied on rainwater collection and conveyance systems in accordance with Sections P2912.11.1 and P2912.11.2.~~

~~P2912.11.1 Influent diversion~~.
~~A means shall be provided to divert storage tank influent to allow for maintenance and repair of the storage tank system.~~

~~P2912.11.2 Backwater valve~~.
~~Backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be in accordance with Section P3008.~~

~~P2912.12 Pumping and control system~~.
~~Mechanical equipment including pumps, valves and filters shall be easily accessible and removable in order to perform repair, maintenance and cleaning. The minimum flow rate and~~ ~~*flow pressure*~~ ~~delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.~~

~~P2912.13 Water pressure-reducing valve or regulator~~.
~~Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the rainwater distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.~~

~~P2912.14 Distribution pipe~~.
~~Distribution piping utilized in rainwater collection and conveyance systems shall comply with Sections P2912.14.1 through P2912.14.3.~~

> **~~Exception:~~** ~~Irrigation piping located outside of the~~ ~~*building*~~ ~~and downstream of a backflow preventer.~~

~~P2912.14.1 Materials, joints and connections~~.
~~Distribution piping shall conform to the standards and requirements specified in Section P2906 for nonpotable water.~~

~~P2912.14.2 Design~~.
~~Distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.~~

~~P2912.14.3 Labeling and marking~~.
~~Nonpotable rainwater distribution piping labeling and marking shall comply with Section P2901.2.~~

~~P2912.15 Tests and inspections~~.

~~Tests and inspections shall be performed in accordance with Sections P2912.15.1 through P2912.15.8.~~

~~P2912.15.1 Roof gutter inspection and test.~~
~~Roof gutters shall be inspected to verify that the installation and slope is in accordance with Section P2912.5.1. Gutters shall be tested by pouring not less than 1 gallon of water (3.8 L) into the end of the gutter opposite the collection point. The gutter being tested shall not leak and shall not retain standing water.~~

~~P2912.15.2 Roofwasher test.~~
~~Roofwashers shall be tested by introducing water into the gutters. Proper diversion of the first quantity of water in accordance with the requirements of Section P2912.4 shall be verified.~~

~~P2912.15.3 Collection pipe and vent test.~~
~~Drain, waste and vent piping used for rainwater collection and conveyance systems shall be tested in accordance with Section P2503.~~

~~P2912.15.4 Storage tank test.~~
~~Storage tanks shall be tested in accordance with Section P2910.11.~~

~~P2912.15.5 Water supply system test.~~
~~The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.~~

~~P2912.15.6 Inspection and testing of backflow prevention assemblies.~~
~~The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.~~

~~P2912.15.7 Inspection of vermin and insect protection.~~
~~Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the storage tank and piping systems in accordance with Section P2910.7.~~

~~P2912.15.8 Water quality test.~~
~~The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the *jurisdiction*.~~

~~P2912.16 Operation and maintenance manuals.~~
~~Operation and maintenance manuals shall be supplied with rainwater collection and conveyance systems in accordance with Sections P2912.16.1 through P2912.16.4.~~

~~P2912.16.1 Manual.~~ ~~A detailed operations and maintenance manual shall be supplied in hard-copy form for each system.~~

~~P2912.16.2 Schematics.~~ ~~The manual shall include a detailed system schematic, the location of system components and a list of system components that includes the manufacturers and model numbers of the components.~~

~~P2912.16.3 Maintenance procedures.~~ ~~The manual shall provide a maintenance schedule and procedures for system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.~~

~~P2912.16.4 Operations procedures~~.

~~The manual shall include system startup and shutdown procedures, and detailed operating procedures.~~

~~SECTION P2913~~
~~RECLAIMED WATER SYSTEMS~~

~~P2913.1 General~~.

~~The provisions of this section shall govern the construction, installation, *alteration* and *repair* of systems supplying nonpotable reclaimed water.~~

~~P2913.2 Water pressure-reducing valve or regulator~~.

~~Where the reclaimed water pressure supplied to the *building* exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the reclaimed water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2~~

~~P2913.3 Reclaimed water systems~~.

~~The design of the reclaimed water systems shall conform to accepted engineering practice.~~

~~P2913.3.1 Distribution pipe~~.

~~Distribution piping shall comply with Sections P2913.3.1.1 through P2913.3.1.3.~~

> **~~Exception:~~** ~~Irrigation piping located outside of the *building* and downstream of a backflow preventer.~~

~~P2913.3.1.1 Materials, joints and connections~~.

~~Distribution piping conveying reclaimed water shall conform to standards and requirements specified in Section P2906 for nonpotable water.~~

~~P2913.3.1.2 Design~~.

~~Distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.~~

~~P2913.3.1.3 Labeling and marking~~.

~~Nonpotable rainwater distribution piping labeling and marking shall comply with Section P2901.2.~~

~~P2913.4 Tests and inspections~~.

~~Tests and inspections shall be performed in accordance with Sections P2913.4.1 and P2913.4.2.~~

~~P2913.4.1 Water supply system test.~~

~~The testing of makeup water supply piping and reclaimed water distribution piping shall be conducted in accordance with Section P2503.7.~~

~~P2913.4.2 Inspection and testing of backflow prevention assemblies~~.

~~The testing of backflow preventers shall be conducted in accordance with Section P2503.8.~~

Add new text as follows:

CHAPTER 34 WATER REUSE SYSTEMS

SECTION 3401 GENERAL

P3401.1 General. The provisions of this chapter shall govern the materials, design, construction, and installation of systems for the treatment, storage, and distribution of *reuse water*. The provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment, and distribution. The application of water reuse systems shall comply with all applicable laws, rules, and ordinances of the jurisdiction.

P3401.2 Reuse water quality. Reuse water quality shall meet the minimum requirements as specified in Tables P3401.2(1), P3401.2(2), P3401.2(3), and as established for the intended application by all applicable laws, rules, and ordinances of the jurisdiction. Where water from multiple sources is combined, the system shall comply with the most stringent of the requirements of this code that are applicable to such sources.

TABLE P3401.2(1) REQUIRED WATER QUALITY FOR REUSE APPLICATIONS

Use Category	Application	Exposure[a]	Quality Tier[b]
Direct Potable Reuse	Direct Potable Reuse	DC	4
Indirect Potable Reuse (Treatment Follows Reuse Application)	Aquifer Recharge - Direct Injection	IC	2
	Aquifer Recharge - Surface Application	IC	2
	Aquifer Storage and Recovery	IC	2
	Rapid Infiltration Basins	IC	2
	Infiltration/Percolation Lagoons	IC	2
	Raw Water Augmentation	IC	2
	Saltwater Intrusion Barrier	IC	2
	Surface Water Augmentation to a Supply Source	IC	2
Irrigation of Food Crops for Human Consumption (Spray/Drip)	Food crop w/ processing that destroys pathogens (Restricted Access)	LC	1
	Orchards and Vineyards	AC/LC	4/1
	Water contacts edible portion of food crop (Includes Root Crops)	AC	4
	Water doesn't contact edible portion of food crop (Restricted Access)	IC	2
Irrigation of Crops Not for Human Consumption (Spray/Drip)	Christmas Tree Farms	AC/LC	3/1
	Hemp Crops	AC/LC	3/1
	Fiber crops	AC/LC	3/1
	Fodder /Feed Crop/ Forage Crops	AC/LC	3/1
	Ornamental nursery stock	AC/LC	3/1
	Silviculture / Tree Farms	AC/LC	3/1
	Sod/Turf Crops	AC/LC	3/1
	Tobacco	AC/LC	3/1
Landscape Irrigation (Spray/Drip)	Athletic Fields	AC/LC	3/1
	Cemeteries	AC/LC	3/1
	College and University Campuses	AC/LC	3/1
	Commercial Campuses	AC/LC	3/1
	Golf Courses (Restricted Access)	LC	1
	Golf Courses (Unrestricted Access)	AC/LC	3/1
	Highway/Freeway Medians/ Roadside Vegetation	AC/LC	3/1
	Open Access Land Irrigation	AC/LC	3/1
	Pasture for Milk Producing Animals (Restricted Access)	LC	1
	Pasture for Non-Milk Producing Animals (Restricted Access)	LC	1
	Parks	AC/LC	3/1
	Playgrounds	AC/LC	3/1

	Residential Irrigation	AC/LC	3/1
	Landscape Irrigation (Restricted Access)	LC	1
	Urban Landscaping	AC/LC	3/1
	Schoolyards	AC/LC	3/1
Water Features	Decorative Fountains	AC	3
	Landscape Impoundments (With Fountain(s))	AC	3
	Landscape Impoundments (Without Fountain(s))	LC	1
	Ponds and Lagoons	LC	1
	Recreational Impoundments (Restricted Access)	LC	1
	Recreational Impoundments (Unrestricted Access)	AC	3
	Reservoir Augmentation (Recreational)	AC	3
	Wetland Creation	LC	1
	Wetland Discharge / Application	LC	1
Life Safety	Fire Fighting Via Plane	AC	3
	Fire Hydrant Water Supply	AC	3
	Fire Protection systems	AC	3
	Non Structural Fire Fighting	AC	3
	Structural Fire Fighting	AC	3
Construction	Concrete and Cement mixing	LC	1
	Dust Control	LC	1
	Equipment Operation (Ex. Cooling Power Equipment)	LC	1
	Material Washing and Sieving	LC	1
	Soil Compaction and Consolidation	LC	1
Process Water	Agricultural Cleaning (Animal Washing & Animal Pens)	AC	3
	Aquaculture	LC	1
	Boiler Feed	LC	1
	Building Washing	AC	3
	Chemical Mixing (Herbicides, Pesticides, Fertilizers)	LC	1
	Commercial Car Washes	AC	3
	Commercial Laundries	AC	3
	Cooling Power Equipment	LC	1
	Cooling systems with aerosolization	AC	3
	Cooling systems with no aerosolization	LC	1
	Dust Control (Roads and Streets)	LC	1
	Flushing Sanitary Sewers	LC	1
	Flushing Toilets and Urinals	AC	3
	Bidets and personal hygiene devices	DC	4
	Frost Protection	LC	1
	Gas Pipeline Testing	LC	1
	Hydro Seeding	AC	3
	Impoundments at Fish Hatcheries	LC	1
	Industrial Oil and Gas Operations	LC	1
	Industrial Process Water (No Possibility of Human Contact)	LC	1
Process Water	Industrial Process Water (Possibility of Human Contact or Evaporative)	AC	3
	Industrial Washwater applications	AC	3
	Livestock Drinking Water (Milk Producing)	AC	3
	Livestock Drinking Water (Non-Milk Producing)	AC	3
	Parts Cleaning	LC	1
	Pool Water Makeup	AC	3
	Pressure Washing	AC	3
	Priming Drainage Traps	LC	1
	Road Milling	LC	1
	Ship Ballasting	LC	1
	Snow Making (Commercial / Recreational Use)	AC	3
	Snow Making (Storage)	AC	3
	Stack Scrubbing	AC	3
	Stream Flow Augmentation	LC	1
	Street, Sidewalk, Parking Lot Cleaning (Restricted Access)	LC	1
	Street, Sidewalk, Parking Lot Cleaning (Unrestricted Access)	AC	3
	Vehicle and equipment Washing	AC	3
	Wastewater Treatment (Process Uses)	LC	1
	Window Washing	AC	3

TABLE P3401.2(3) LOG REDUCTION (LRV) CREDITS APPLICABLE TO DPR BASED ON SOURCE WATER

Source Water	Maximum LRV Credits for DPR
Blackwater	0/0/0

Blackwater blended with ground water [a]	*LRV* credit [b] = negative log of *BWC*
Blackwater blended with surface water [a]	LRV credit [b] = negative log of BWC
Blackwater blended with groundwater and surface water [a]	*LRV* credit [b] = negative log of *BWC*
Graywater	Case by case basis
Stormwater	Case by case basis
Rainwater	Case by case basis
Industrial Water	Case by case basis
Process water	Case by case basis

a. Groundwater and surface waters must be either an untreated source of drinking water approved by the jurisdiction or a treated drinking water approved by the jurisdiction.

b. LRV credit for all source waters containing blackwater shall not exceed 2.0.

TABLE P3401.2.2(2) WATER QUALITY FOR TIERS OF REUSE

Quality Tier	Minimum Design Water Quality
4	United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards (40 CFR 141), plus 18/15/15 Log Removal of Enteric Viruses, Giardia, and Cryptosporidium
3	Compliant with all applicable laws, rules, ordinances, and NSF/ANSI 350
2	Compliant with all applicable laws, rules, ordinances, and end use fixture / equipment manufacturer requirements
1	Compliant with all applicable laws, rules, ordinances, and end use fixture / equipment manufacturer requirements

P3401.3 Signage required. Where nonpotable water is supplied to outlets such as hose connections, hydrants, open-ended pipes and faucets each outlet shall be identified at the point of use with signage that reads as follows: “CAUTION: NONPOTABLE WATER – DO NOT DRINK.” The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and in colors in contrast to the background on which they are applied. In addition to the required text, the pictograph shown in Figure P3401.3 shall appear on the signage required by this section.

FIGURE P3401.3 PICTOGRAPH—DO NOT DRINK

P3401.4 Permits. Permits shall be required for the construction, installation, operation, alteration and repair of water reuse systems. Construction documents, engineering calculations, diagrams, operation and maintenance manuals, and other such data pertaining to the water reuse system shall be submitted with each permit application.

P3401.5 Potable water connections. Where a potable system is connected to a nonpotable water system, the potable water supply shall be protected against backflow in accordance with Section P2902.

P3401.6 Components and materials. Piping, plumbing components, and materials used in conveyance and distribution systems shall be of material *approved* for the intended application.

P3401.7 Insect and vermin control. The system shall be protected to prevent the entrance of insects and vermin into process tanks and equipment, storage tanks and piping systems. Screen materials shall be compatible with contacting system components and shall not accelerate the corrosion of system components.

P3401.8 Freeze protection. Where freezing temperatures occur, provisions shall be made to keep storage tanks, process tanks and equipment, and the related piping from freezing.

P3401.9 Water tanks. Water storage and process tanks shall comply with Sections P3401.9.1 through P3401.9.10.

P3401.9.1 Location. Any storage tank, process tank and equipment, or portion thereof that is above grade shall be protected from direct exposure to sunlight by one of the following methods:

1. Tank construction using opaque, UV-resistant materials such as heavily tinted plastic, fiberglass, lined metal, concrete, or painted to prevent algae growth.
2. Specially constructed sun barriers.
3. Installation in garages, crawl spaces or sheds.

P3401.9.2 Materials. Prior to treatment for reuse, water shall be collected in an *approved* tank constructed of durable, nonabsorbent and corrosion-resistant materials. The tank shall be constructed of materials compatible with all disinfection systems used to treat water upstream of the tank and with all systems used to maintain water quality in the tank.

P3401.9.3 Foundation and supports.. All tanks shall be supported on a firm base capable of withstanding the weight of the tank when filled to capacity. Tanks shall be supported in accordance with the *International Building Code*.

P3401.9.3.1 Ballast. Where the soil can become saturated, an underground tank shall be ballasted, or otherwise secured, to resist buoyant forces when empty. The combined weight of the empty tank and hold-down ballast shall exceed the buoyancy force applied to the tank. Where the installation requires a foundation, the foundation shall be flat and shall be designed to resist the maximum buoyant forces when the tank is empty, and to support the weight of the tank when full, consistent with the bearing capability of adjacent soil.

P3401.9.3.2 Structural support. Where installed below grade, tank installations shall be designed to withstand earth and surface structural loads without damage and with minimal deformation when empty or filled with water.

P3401.9.4 Makeup water. Where an uninterrupted supply is required for the intended application, an additional source of makeup water shall be provided for the storage tank. All makeup water supplies shall be protected against backflow in accordance with Section P2902. A *full-open valve* located on the makeup water supply lines to the storage tank shall be provided. Flow into the storage tank shall be controlled by fill valves or other automatic supply valves installed to prevent the tank from overflowing and to prevent the water level from dropping below a predetermined point. The water level shall not be permitted to drop below the intake of any pump supplying makeup water.

P3401.9.5 Overflow. Tanks shall be equipped with an overflow pipe having a diameter not less than that shown in Table P3401.9.5. The overflow pipe shall be protected from insects and vermin and shall discharge in a manner consistent with all applicable laws, rules, and ordinances of the jurisdiction for storm water runoff requirements. The overflow pipe shall discharge at a sufficient distance from the tank to avoid damaging the tank foundation or the adjacent property. Drainage from overflow pipes shall be directed to prevent freezing on roof walkways, and on sidewalks, pavement, and other accessways subject to vehicular or pedestrian traffic. The overflow drain shall not be equipped with a shutoff valve. A cleanout shall be provided on each overflow pipe in accordance with Section P3005.2.

TABLE P3401.9.5 SIZE OF DRAIN PIPES FOR WATER TANKS

TANK CAPACITY (gallons)	DRAIN PIPE (inches)
Up to 750	1
751 to 1,500	1 1/2
1,501 to 3,000	2
3,001 to 3,000	2 1/2
5,001 to 7,500	3
Over 7,500	4

For SI: 1 gallon = 3.875 liters, 1 inch = 25.4 mm.

P3401.9.6 Access. Not less than one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other *approved* method of securing access. Below-grade tanks, located outside of the building, shall be provided with an access opening either not less than 24 inches (610 mm) square or with an inside diameter not less than 24 inches (610 mm). An access opening shall extend not less than 4 inches (102 mm) above ground and shall be designed to prevent water infiltration. The finished grade shall be sloped away from the maintenance hole to divert surface water. Access opening covers shall be secured to prevent unauthorized access. Service ports in an access opening shall be not less than 8 inches (203 mm) in diameter and shall be not less than 4 inches (102 mm) above the finished grade level. The service port shall be secured to prevent unauthorized access. Access locations to confined spaces shall be labeled “CONFINED SPACE.”

Exception: Tanks that are less than 800 gallons (3028 L) in volume and installed below grade shall not be required to be equipped with an access opening provided that the tank has a service port of not less than 8 inches (203mm) in diameter.

P3401.9.7 Venting. Tanks that receive flow by gravity shall be provided with a vent sized in accordance with Chapter 31 and based on the aggregate diameter of all tank influent pipes. The reservoir vent shall not be connected to sanitary drainage system vents. Vents shall be protected from contamination by means of an approved cap or U-bend installed with the opening directed downward. Vent outlets shall extend not less than 4 inches (102 mm) above grade or as necessary to prevent surface water from entering the tank. Vent openings shall be protected against the entrance of vermin and insects in accordance with the requirements of Section P3401.7.

P3401.9.8 Draining of tanks. Tanks shall be provided with a means of emptying the contents for the purpose of service or cleaning. Tanks shall be drained by using a pump or by a drain located at the lowest point in the tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table P3401.9.5.Not less than one cleanout shall be provided on each drain pipe in accordance with Section P3005.2.

P3401.9.9 Marking and signage. Each nonpotable water tank shall be labeled with its rated volumetric capacity. The contents of tanks shall be identified with the words “CAUTION: NONPOTABLE WATER – DO NOT DRINK.” Where an opening is provided that could allow the entry of personnel, the opening shall be marked with the words, “DANGER – CONFINED SPACE.” Markings shall be indelibly printed on the tank or on a tag or sign constructed of corrosion-resistant waterproof material that is mounted on the tank. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied

P3401.9.10 Tank tests. Pressurized tanks shall be certified in accordance with Section P2609.4. Tanks that receive flow by gravity shall be tested in accordance with the following:
Tanks shall be filled with water to the overflow line prior to and during inspection. Seams and joints shall be left exposed and the tank shall remain watertight without leakage for a period of 24 hours.

1. After 24 hours, supplemental water shall be introduced for a period of 15 minutes to verify proper drainage of the overflow system and that there are no leaks.
2. The tank drain shall be observed for proper operation.
3. The makeup water system shall be observed for proper operation, and successful automatic shutoff of the system at the refill threshold shall be verified.

P3401.10 System abandonment. If the owner of an on-site *water reuse system* or components thereof elects to cease use of, or fails to properly maintain such system, the system shall be abandoned and shall comply with Sections P3401.10.1 through P3401.10.3.

P3401.10.1 Utility-connected piping. All system piping connecting to a utility-provided water system shall be removed or disabled.

P3401.10.2 Distribution piping. The distribution piping system shall be removed or replaced with an approved potable water supply piping system. Where an existing potable pipe system is already in place, the fixtures shall be connected to the existing system.

P3401.10.3 Tanks. Tank(s) shall be removed, or secured from accidental access by sealing or locking tank inlets and access points, or filling with sand or equivalent.

P3401.11 Trenching requirements for nonpotable water piping. Nonpotable water distribution piping shall be separated from the *building sewer* and potable water piping underground by 5 feet (1524 mm) of undisturbed or compacted earth. Nonpotable water distribution piping shall not be located in, under or above cesspools, septic tanks, septic tank drainage fields or seepage pits. Buried nonpotable water piping shall comply with the requirements of Section P2604.

Exceptions:

1. The required separation distance shall not apply where the bottom of the nonpotable water pipe within 5 feet (1524 mm) of the sewer is not less than 12 inches (305 mm) above the top of the highest point of the *sewer* and the pipe materials conform to Table P3002.2.
2. The required separation distance shall not apply where the bottom of the potable water service pipe within 5 feet (1524 mm) of the nonpotable water pipe is not less than 12 inches (305 mm) above the top of the highest point of the nonpotable water pipe and the pipe materials comply with the requirements of Table P2906.5
3. Nonpotable water pipe is permitted to be located in the same trench as a *building sewer*, provided that such sewer is constructed of materials that comply with the requirements of Table P3002.1(2).
4. The required separation distance shall not apply where a nonpotable water pipe crosses a sewer pipe, provided that the pipe is sleeved to not less than 5 feet (1524 mm) horizontally from the sewer pipe centerline on both sides of such crossing, with pipe materials that comply with Table P3002.1(2).
5. The required separation distance shall not apply where a potable water service pipe crosses a nonpotable water pipe, provided that the potable water service pipe is sleeved for a distance of not less than 5 feet (1524 mm) horizontally from the centerline of the nonpotable pipe on both sides of such crossing, with pipe materials that comply with Table P3002.1(2).
6. Irrigation piping located outside of a building and downstream of the backflow preventer is not required to meet the trenching requirements where nonpotable water is used for outdoor applications.

P3401.12 Outdoor outlet access. Sillcocks, hose bibbs, wall hydrants, yard hydrants and other outdoor outlets supplied by nonpotable water shall be located in a locked vault or shall be operable only by means of a removable key and marked in accordance with Section P3401.3.

P3401.13 Operation and Monitoring. The design, installation and continued operation of water reuse systems shall be in accordance with an approved operating and monitoring program. The program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code*.

SECTION P3402
GRAYWATER AND BLACKWATER REUSE

P3402.1 General. The provisions of ASTM E2635 and Section P3402 shall govern the construction, installation, alteration and repair of water reuse systems.

3402.2 Graywater sources. Graywater reuse systems shall collect waste discharge from only the following sources: bathtubs, showers, lavatories, clothes washers, laundry trays, condensate and other domestic wastewaters that are not expected to contain urine, fecal matter, grease or food wastes.

P3402.3 Blackwater sources. Blackwater shall be discharged to the sanitary drainage system in accordance with Chapter 30 or to an approved on-site blackwater reuse system.

P3402.4 Other sources. Other sources including, but not limited to, condensate, reverse osmosis system reject water and water softener discharge water shall also be considered for use in a water reuse system.

P3402.5 Traps. Traps serving fixtures and devices discharging water to water reuse systems shall comply with Section P3201.2.

P3402.6 Pipe marking. Additional marking of collection piping conveying untreated water for reuse shall not be required beyond that required for sanitary drainage, waste and vent piping by Chapter 30.

P3402.7 Treatment. Water collected for reuse shall be treated to meet the quality standards required in Tables P3401.2(1) and P3401.2(2).

P3402.8 Treatment systems. Treatment systems shall be installed to allowaccess for inspection and maintenance. All treatment equipment shall utilize pressure gauges, level sensors, intensity meters or other approved methods to indicate when servicing or replacement is required. All treatment equipment shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.

P3402.9 Tanks. Nonpotabletanksutilized in water reuse systems shall comply with Sections P3401.9, P3402.9.1 and P3402.9.2.

P3402.9.1 Location. Tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P3402.9.1.

TABLE P3402.9.1 LOCATION OF NONPOTABLE WATER REUSE TANKS

ELEMENT	MINIMUM HORIZONTAL DISTANCE FROM TANK (feet)
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Public water main	10
Seepage pits	5
Septic tanks	5
Streams and lakes	50
Water service	5
Water wells	50

1 foot = 304.8 mm.

P3402.9.2 Outlets. Outlets shall be located not less than 4 inches (102 mm) above the bottom of the tank and shall not skim water from the surface.

P3402.10 Valves. Valves shall be installed on the collection piping of the *water reuse system*s in accordance with Sections P3402.10.1 and P3402.10.2.

P3402.10.1 Bypass valve. One three-way diverter valve listed and labeled to NSF 50 or other *approved* device shall be installed on collection piping upstream of each storage tank, as applicable, to divert untreated on-site reuse sources to the sanitary sewer or approved receiving tank to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections. Bypass valves shall be marked to indicate the direction of flow. Bypass valves shall be provided with access that allows for removal. Two shutoff valves shall not be installed to serve as a bypass valve.

P3402.10.2 Backwater valve. One or more backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be installed in accordance with Section P3008.

P3402.11 Pumping and control system. Mechanical equipment including pumps, valves, and treatment units shall have *access* in order to replace, repair, maintain and clean. The minimum flow rate and flow pressure delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.

P3402.12 Water pressure-reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P3402.13 Distribution piping. Distribution piping utilized in water reuse systems shall comply with Sections P3402.13.1 through P3402.13.3.

Exception: Irrigation piping located outside of the building and downstream of a backflow preventer.

P3402.13.1 Materials, joints and connections. Distribution piping shall conform to the standards and requirements specified in Section P2906.

P3402.13.2 Design. Water reuse distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.

P3402.13.3 Labeling and marking. Nonpotable water distribution piping labeling and marking shall comply with Section P2901.2.

P3402.14 Tests and Inspections. Tests and inspections shall be witnessed by the designer and performed in accordance with Sections P3402.14.1 through P3402.14.7.

P3402.14.1 Collection pipe and vent test. Drain, waste and vent piping used for on-site water reuse systems shall be tested in accordance with Section P2503.5.

P3402.14.2 Tank test. Tanks shall be tested in accordance with Section P3401.9.10.

P3402.14.3 Water supply system test. The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.

P3402.14.4 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.

P3402.14.5 Inspection of vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the tank and piping systems in accordance with Section P3401.7.

P3402.14.6 Initial water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with all applicable laws, rules and ordinances of the jurisdiction.

P3402.14.7 Operational water quality testing. The quality of the water for the intended application(s) shall be verified at the point of use in accordance with all applicable laws, rules, ordinances of the jurisdiction, and in accordance with the operation and maintenance manual, and where required, the operating permit.

P3402.15 Operation and maintenance manuals. Operation and maintenance materials shall be supplied with ~~nonpotable on-site~~*water reuse system*s in accordance with Sections P3402.15.1 through P3402.15.4 and the maintenance program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code*.

P3402.15.1 Manual. A detailed operations and maintenance manual shall be supplied in hardcopy form with all systems.

P3402.15.2 Schematics. The manual shall include a detailed system schematic, and the locations and a list of all system components, including manufacturer and model number.

P3402.15.3 Maintenance procedures. The manual shall provide a schedule and procedures for all system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.

P3402.15.4 Operations procedures. The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the system.

SECTION 3403
NONPOTABLE RAINWATER COLLECTION SYSTEMS

P3403.1 General. The provisions of this section shall govern the construction, installation, alteration and repair of rainwater collection and conveyance systems for the collection, storage, treatment and distribution of rainwater for nonpotable applications. For nonpotable rainwater systems, the provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution of nonpotable water. The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the jurisdiction.

P3403.2 Collection surface. Rainwater shall be collected only from above-ground impervious roofing surfaces constructed from approved materials. Collection of water from vehicular parking or pedestrian walkway surfaces shall be prohibited except where the water is used exclusively for landscape irrigation. Overflow and bleed-off pipes from roof-mounted appliances including, but not limited to, evaporative coolers, water heaters and solar water heaters shall not discharge onto rainwater collection surfaces.

P3403.3 Debris excluders. Downspouts and leaders shall be connected to a roof washer and shall be equipped with a debris excluder or equivalent device to prevent the contamination of collected rainwater with leaves, sticks, pine needles and similar material. Debris excluders and equivalent devices shall be self-cleaning.

P3403.4 Roof washer. An amount of rainwater shall be diverted at the beginning of each rain event, and not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize storage tank water contamination. The roof washer shall not rely on manually operated valves or devices, and shall operate automatically. Diverted rainwater shall not be drained to the roof surface, and shall be discharged in a manner consistent with the stormwater runoff requirements of the jurisdiction. Roof washers shall be accessible for maintenance and service.

P3403.5 Roof gutters and downspouts . Gutters and downspouts shall be constructed of materials that are compatible with the collection surface and the rainwater quality for the desired end use. Joints shall be watertight.

P3403.5.1 Slope. Roof gutters, leaders and rainwater collection piping shall slope continuously toward collection inlets and shall be free of leaks. Gutters and downspouts shall have a slope of not less than $^{1}/_{8}$ inch per foot (10.4 mm/m) along their entire length. Gutters and downspouts shall be installed so that water does not pool at any point.

P3403.5.2 Cleanouts. Cleanouts shall be provided in the water conveyance system to allow access to filters, flushes, pipes and downspout

P3403.6 Drainage. Water drained from the roof washer or debris excluder shall not be drained to the sanitary sewer. Such water shall be diverted from the storage tank and shall discharge to a location that will not cause erosion or damage to property. Roof washers and debris excluders shall be provided with an automatic means of self-draining between rain events and shall not drain onto roof surfaces.

P3403.7 Collection pipe. Rainwater collection and conveyance systems shall utilize drainage piping approved for use within plumbing drainage systems to collect and convey captured rainwater. Vent piping approved for use within plumbing venting systems shall be utilized for vents within the rainwater system. Collection and vent piping materials shall comply with Section P3002.

P3403.7.1 Installation. Collection piping conveying captured rainwater shall be installed in accordance with Section P3005.3.

P3403.7.2 Joints. Collection piping conveying captured rainwater shall utilize joints approved for use with the distribution piping and appropriate for the intended applications as specified in Section P3003.

P3403.7.3 Size. Collection piping conveying captured rainwater shall be sized in accordance with drainage-sizing requirements specified in Section P3005.4

P3403.7.4 Marking. Additional marking of collection piping conveying captured rainwater for reuse shall not be required beyond that required for sanitary drainage, waste, and vent piping by Chapter 30.

P3403.8 Filtration. Collected rainwater shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gauge or other approved method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.

P3403.9 Disinfection. Where the intended application for rainwater requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use.

P3403.10 Storage tanks. Storage tanks utilized in nonpotable rainwater collection and conveyance systems shall comply with Section P3401.9 and Sections P3403.10.1 through P3403.10.3.

P3403.10.1 Location. Storage tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P3403.10.1.

TABLE P3403.10.1 LOCATION OF RAINWATER STORAGE TANKS

ELEMENT	MINIMUM HORIZONTAL DISTANCE (feet)
Critical root zone	2
Lot line adjoining private lots	5
Seepage pits	5
Septic tanks	5

For SI: 1 foot = 304.8 mm

P3403.10.2 Inlets. Storage tank inlets shall be designed to introduce collected rainwater into the tank with minimum turbulence, and shall be located and designed to avoid agitating the contents of the storage tank.

P3403.10.3 Outlets. Outlets shall be located not less than 4 inches (102 mm) above the bottom of the storage tank and shall not skim water from the surface.

P3403.11 Valves. Valves shall be supplied on rainwater collection and conveyance systems in accordance with Sections P3403.11.1 and P3403.11.2.

P3403.11.1 Influent diversion. A means shall be provided to divert storage tank influent to allow for maintenance and repair of the storage tank system.

P3403.11.2 **Backwater valve.** Backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be in accordance with Section P3008.

P3403.12 **Pumping and control system..** Mechanical equipment including pumps, valves and filters shall be easily accessible and removable in order to perform repair, maintenance and cleaning. The minimum flow rate and flow pressure delivered by the pumping system shall appropriate for the application and in accordance with Section P2903.

P3403.13 **Water pressure-reducing valve or regulator.** Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the rainwater distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P3403.14 **Distribution pipe.** Distribution piping utilized in rainwater collection and conveyance systems shall comply with Sections P3403.14.1 through P3403.14.3.

> **Exception:** Irrigation piping located outside of the building and downstream of a backflow preventerrigation piping located outside of the building and downstream of a backflow preventer.

-

P3403.14.1 **Materials, joints and connections.** Distribution piping shall conform to the standards and requirementsspecified in Section P2906 for nonpotable water.

P3403.14.2 **Design.** Distribution piping systems shall be designed and sized in accordance with the Section P2903 for the intended application.

P3403.14.3 **Labeling and marking.** Nonpotable rainwater distribution piping labeling and marking shall comply with Section P2901.2.

P3403.15 **Tests and inspections.** Tests and inspections shall be performed in accordance with Sections P3403.15.1 through P3403.15.8.

P3403.15.1 **Roof gutter inspection and test.** Roof gutters shall be inspected to verify that the installation and slope is in accordance with Section P3403.5.1. Gutters shall be tested by pouring not less than 1 gallon of water (3.8 L) into the end of the gutter opposite the collection point. The gutter being tested shall not leak and shall not retain standing water.

P3403.15.2 **Roofwasher test..** Roofwashers shall be tested by introducing water into the gutters. Proper diversion of the first quantity of water in accordance with the requirements of Section P3403.4 shall be verified.

P3403.15.3 **Collection pipe and vent test.** Drain, waste and vent piping used for rainwater collection and conveyance systems shall be tested in accordance with Section P2503.5.

P3403.15.4 **Storage tank test .** Storage tanks shall be tested in accordance with the Section P3401.9.10.

P3403.15.5 **Water supply system test.** The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.

P3403.15.6 **Inspection and testing of backflow prevention assemblies.** The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.

P3403.15.7 **Inspection of vermin and insect protection.** Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the storage tank and piping systems in accordance with Section P3401.7.

P3403.15.8 Water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the jurisdiction.

>P3403.16 Operation and maintenance manuals.. Operation and maintenance manuals shall be supplied with rainwater collection and conveyance systems in accordance with Sections P3403.16.1 through P3403.16.4.

P3403.16.1 Manual.. A detailed operations and maintenance manual shall be supplied in hard-copy form for each system.

P3403.16.2 Schematics. The manual shall include a detailed system schematic, the location of system components and a list of system components that includes the manufacturers and model numbers of the components.

P3403.16.3 Maintenance procedures. The manual shall provide a maintenance schedule and procedures for system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.

P3403.16.4 Operations procedures. The manual shall include system startup and shutdown procedures, and detailed operating procedures.

SECTION P3404
RECLAIMED WATER SYSTEMS

P3404.1 General. The provisions of this section shall govern the construction, installation, alteration and repair of systems supplying nonpotable reclaimed water.

P3404.2 Water pressure-reducing valve or regulator. Where the reclaimed water pressure supplied to the building exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the reclaimed water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P3404.3 Reclaimed water systems. The design of the reclaimed water systems shall conform to accepted engineering practice.

P3404.3.1 Distribution pipe. Distribution piping shall comply with Sections P3404.3.1.1 through P3404.3.1.3.

Exception: Irrigation piping located outside of the building and downstream of a backflow preventer.

P3404.3.1.1 Materials, joints and connections. . Distribution piping conveying reclaimed water shall conform to standards and requirements specified in Section P2906 for nonpotable water.

P3404.3.1.2 Design. Distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.

P3404.3.1.3 Labeling and marking. Nonpotable rainwater distribution piping labeling and marking shall comply with Section P3401.3.

P3404.4 Tests and inspections.. Tests and inspections shall be performed in accordance with Sections P3404.4.1 and P3404.4.2.

P3404.4.1 Water supply system test. The testing of makeup water supply piping and reclaimed water distribution piping shall be conducted in accordance with Section P2503.7.

P3404.4.2 Inspection and testing of backflow prevention assemblies. . The testing of backflow preventers shall be conducted in accor dance with Section P2503.8.

Add new standard(s) as follows:

. 40 CFR 141 United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards

Staff Analysis: A review of the standard proposed for inclusion in the code, DOE 40 CFR 141 *United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: A version of this proposal was presented in 2020 and rejected. Feedback from the PMGCAC has been considered and addressed herein as follows:

The definitions of graywater, wastewater, and blackwater are unclear.

It is unclear how a code official would enforce odor controls.

Odors are addressed in this proposal by reference to 40 CFR 141, NSF 350, and required compliance with all applicable laws, rules, and ordinances. Furthermore, The designer is required to address odor control in the operation and monitoring program, if the code official has any concerns.

Wastewater reuse should be governed locally, not in ICC code.

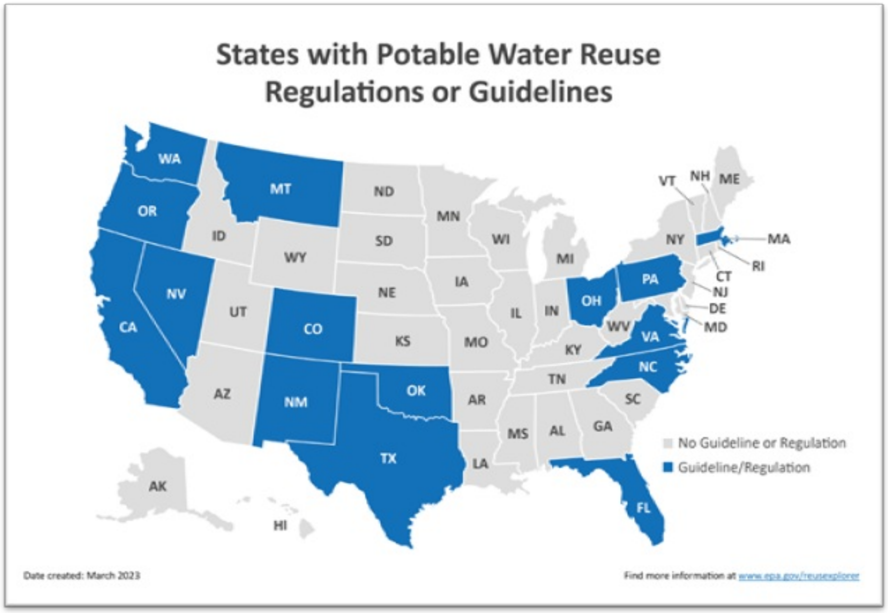
More detail is needed on blackwater reuse and related quality.

This proposal includes rigorous quality standards based on current science and focused on public safety.

Water reuse options should be expanded in the plumbing code not only because of the moral imperative to improve water efficiency and reduce consumption of valuable potable water for nonpotable purposes, but also because current technologies safely enable such practices. For example, by treating and reusing its own wastewater, a commercial office building can offset 100% of its toilet and urinal flushing demand, which can represent up to 70% of its total indoor potable water demands. In San Francisco, the San Francisco Public Utilities Commission headquarters building treats wastewater onsite for toilet and urinal flushing, reducing the use of potable water within the building by approximately 50%. In Sydney, Australia at 1 Bligh Street, a commercial high rise tower is offsetting 100% of the building's nonpotable water demands by reusing wastewater. In Portland, Oregon the Hassalo on Eighth eco-district, a cluster of residential, commercial, and mixed-use buildings is collecting its wastewater and reusing it for toilet flushing and irrigation. This system saves up to 7 million gallons of potable water per year. In New York City, the Solaire Building has successfully operated an onsite blackwater reuse system for two decades to meet the building's toilet flushing, cooling tower makeup, and irrigation demands. Similar to San Francisco, New York City has several buildings treating blackwater onsite for non-potable end uses. These are just a few examples of successfully operating nonpotable reuse systems with long histories.

Today, focus has shifted to Indirect Potable Reuse (IPR) and Direct Potable Reuse (DPR). IPR is when treated wastewater is supplied to a raw drinking water source such as an aquifer or reservoir. The naturally blended water is then withdrawn for treatment in a drinking water treatment facility prior to public consumption. DPR eliminates the environmental buffer and provides treated wastewater directly for public consumption.

According to the EPA, treated wastewater can be used for potable consumption in California, Colorado, Connecticut, Delaware, Florida, Massachusetts, Montana, Nevada, New Mexico, North Carolina, Oklahoma, Oregon, Pennsylvania, Texas, Virginia, and Washington. Some of these states also permit DPR. Still other states are in the process of developing DPR regulations, including Arizona where the practice is currently labeled "Advanced Water Purification" (AWP) instead of DPR.



ADEQ
Arizona Department of Environmental Quality
azdeq.gov

FACT SHEET

Publication Number: FS-23-03

What Is Advanced Water Purification?

Advanced Water Purification (AWP) is an innovative set of water treatment processes that purifies recycled water into safe drinking without the need for an environmental buffer, such as a river or lake. The purified water is then blended with other sources of water, such as groundwater or surface water, and distributed as drinking water to consumers. AWP can help increase the availability of water in areas with water scarcity and reduce the dependence on limited sources of water.

Consumer → Wastewater Treatment → Advanced Water Treatment

Key Facts About AWP

- AWP involves using proven technologies such as UltraViolet (UV) light, Reverse Osmosis (RO), ozone and biofiltration to purify water to meet or exceed state and federal drinking water standards.
- The treatment process effectively targets pathogens and harmful chemical contaminants.
- AWP is safe and effective in providing high-quality drinking water. Studies have shown that the purified water is of comparable or better quality than conventional drinking water sources.

What Is ADEQ Doing And Why?

Just like water conservation, water recycling and other sustainable water management practices, AWP is a part of Arizona's long-term strategy to ensure a safe and adequate drinking water supply sufficient to support Arizona's existing and future population.

ADEQ is working on a rule to establish a permitting process for collecting and treating wastewater to meet protective standards so that it may be used as a drinking water source.

What Are The Benefits Of AWP?

AWP is a valuable strategy for managing water resources, offering numerous benefits:

- Increased Water Quality
- Drought Resilience & Water Security
- Improved Public Health
- Reduced Environmental Impact
- Energy Efficiency
- Sustainability

Learn more about what ADEQ is doing to help utilities provide AWP as a viable drinking water source for Arizona communities and how you can get involved:

Health & Safety. Standards such as NSF 350 exist to guide the implementation of onsite treatment and reuse systems. Water quality standards are also evolving as public health regulators and utilities from across the country are adopting a health risk-based approach that applies to water sources including blackwater, graywater, and rainwater. This health risk- framework focuses on the removal of pathogens and ongoing monitoring to ensure water is treated appropriately based on the end use. Public health and safety is paramount. States including California and Washington are proceeding with establishing health risk-based frameworks for the treatment of onsite blackwater.

The quality defined for the sole Tier 4 application (DPR) is by necessity not only based on common drinking water quality standards (USEPA), but also on the recognition that additional biological barriers are appropriate, given the source water's origin. Extensive studies have been conducted in the past few decades to determine the level of treatment required to ensure public health and safety.

Log removals of Enteric Viruses, Giardia, and Cryptosporidium (18/15/15, respectively) are based on the National Water Research Institute's "DPR Criteria Expert Panel: Preliminary Findings and Recommendations", Fountain Valley, California, June 23, 2023

These log reductions, mean that enteric viruses are reduced by 99.9999999999999999% (18 nines), that giardia and cryptosporidium oocysts are each reduced by 99.9999999999999% (15 nines)

Engineering process design is expected to be based on treatment technique log removal values (LRVs), as published by generally accepted industry leaders and institutions (e.g., United States Environmental Protection Agency, Water Environment & Research Foundation, World Health Organization, etc.). Treatment verification is expected to be demonstrated by periodic challenge tests, as described by generally accepted industry leaders and institutions (see above). Due to the rapid evolution and variety of treatment techniques and challenge test protocols, neither are further specified herein although they may be in the future. Additionally, periodic challenge testing may not be required where treatment process surrogates are monitored to ensure ongoing performance within a credited window. At this time, flexibility is needed to promote water conservation and to empower decision makers.

This proposal does not seek to specifically define water quality requirements for Tier 1 and 2 applications. It is recognized that such standards may be highly dependent on source water quality,and should remain flexible to empower decision makers.

Public health and safety are further assured by requiring competent management of all water reuse systems. Section 1302.14 specifies Management Model 4 or Management Model 5 of USEPA's Management Guidelines for Decentralized Wastewater Management (EPA 832-B-03-001, March 2003)

The Five Management Models

- **Management Model 1 - "Homeowner Awareness"** specifies appropriate program elements and activities where treatment systems are owned and operated by individual property owners in areas of low environmental sensitivity. This program is adequate where treatment technologies are limited to conventional systems that require little owner attention. To help ensure that timely maintenance is performed, the regulatory authority mails maintenance reminders to owners at appropriate intervals.
- **Management Model 2 - "Maintenance Contracts"** specifies program elements and activities where more complex designs are employed to enhance the capacity of conventional systems to accept and treat wastewater. Because of treatment complexity, contracts with qualified technicians are needed to ensure proper and timely maintenance.
- **Management Model 3 - "Operating Permits"** specifies program elements and activities where sustained performance of treatment systems is critical to protect public health and water quality. Limited-term operating permits are issued to the owner and are renewable for another term if the owner demonstrates that the system is in compliance with the terms and conditions of the permit. Performance-based designs may be incorporated into programs with management controls at this level.
- **Management Model 4 - "Responsible Management Entity (RME) Operation and Maintenance"** specifies program elements and activities where frequent and highly reliable operation and maintenance of decentralized systems is required to ensure water resource protection in sensitive environments. Under this model, the operating permit is issued to an RME instead of the property owner to provide the needed assurance that the appropriate maintenance is performed.
- **Management Model 5 - "RME Ownership"** specifies that program elements and activities for treatment systems are owned, operated, and maintained by the RME, which removes the property owner from responsibility for the system. This program is analogous to central sewerage and provides the greatest assurance of system performance in the most sensitive of environments.

SAMPLE LRV CREDIT CALCULATION REGARDING IPC TABLE 1301.2(3) and IRC Table P3401.2(3):

10,000 gpd of Blackwater

70,000 gpd of groundwater

20,000 gpd of surface water

BWC = 10,000 / (10,000 + 70,000 + 20,000)

BWC = 0.10

LRV Credit = -log (BWC)

LRV Credit = -log (0.10)

LRV Credit = 1.0

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC) PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal to expand implementation of onsite wastewater reuse will not increase the cost of construction. The proposal is allowing for onsite wastewater reuse systems as an option, but not mandating installation. Buildings that choose to install a system would experience increased construction costs to install tanks, treatment, and distribution piping. However, buildings can also realize cost savings on water and sewer bills by reusing wastewater onsite. As a result, the building would consume less potable water and send less wastewater to the sewer.

An analysis was conducted to evaluate the amount of wastewater that could be treated and reused onsite in proposed mixed-use development in San Francisco. Using the water utility's rate schedule to estimate the financial savings, the analysis showed installing an onsite wastewater reuse system could result in savings of about $50,000 annually based on reduced potable consumption alone. As the cost of potable water increases, so would such savings.

P157-24 Part II

P158-24

IPC: TABLE 1403.2, 1403.2

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com)

2024 International Plumbing Code

Revise as follows:

TABLE 1403.2 DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F405
Polyvinyl chloride (PVC) plastic pipe	ASTM D2729; CSA B182.1
Polyvinyl chloride (PVC) plastic pipe with a 3.5-inch O.D. and solid cellular core or composite wall	ASTM F1488

For SI: 1 inch = 25.4 mm.

1403.2 Distribution piping.
Distribution piping shall be not less than 3 inches (76 mm) in diameter. Materials shall comply with Table 1403.2. The top of the distribution pipe shall be not less than 8 inches (203 mm) below the original surface. The slope of the distribution pipes shall be not less than 2 inches (51 mm) and not greater than 4 inches (102 mm) per 100 feet (30 480 mm).

Reason: Standard CSA B182.1, which is already in the IPC, contains section 5.1.2 for perforated pipe.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Adding CSA B182.1 as an optional type of perforated pipe would not alter the costs of construction, but could offer slightly less expense on a project, depending on the local pipe market costs ($0-$100).

Estimated Immediate Cost Impact Justification (methodology and variables):

Adding CSA B182.1 as an optional type of perforated pipe would not alter the costs of construction, but could offer slightly less expense on a project, depending on the local pipe market costs ($0-$100) compared with current options.

Estimated Life Cycle Cost Impact:

None expected over the life of the project ($0).

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None expected over the life of the project ($0).

~~APPENDIX B RECOMMENDED PERMIT FEE SCHEDULE~~

~~SECTION B101~~
~~MECHANICAL WORK, OTHER THAN GAS PIPING SYSTEMS~~

~~**B101.1 Initial fee.** For issuing each permit $___.~~

~~**B101.2 Additional fees.** Where applicable, additional fees shall be in accordance with Sections B101.2.1 through B101.2.3.~~

~~**B101.2.1 Mechanical systems.** Fee for inspecting heating, ventilating, ductwork, air-conditioning, exhaust, venting, *combustion air*, pressure vessel, solar, fuel oil and *refrigeration systems* and *appliance* installations shall be $___ for the first $1,000.00, or fraction thereof, of valuation of the installation plus $___ for each additional $1,000.00 or fraction thereof.~~

~~**B101.2.3 Boilers.** Fee for inspecting boilers (based upon Btu input):~~

~~**B101.2.2 Repairs, alterations and additions.** Fee for inspecting repairs, *alterations* and additions to an existing system shall be $___ plus $___ for each $1,000.00 or fraction thereof.~~

~~**B102.1 General.** If it becomes necessary to make a reinspection of a heating, ventilation, air-conditioning or *refrigeration system*, or boiler installation, the installer of such *equipment* shall pay a reinspection fee of $___.~~

~~**B103.1 General.** When preliminary inspection is requested for purposes of permitting temporary operation of a heating, ventilating, refrigeration, or air-conditioning system, or portion thereof, a fee of $___ shall be paid by the contractor requesting such preliminary inspection. If the system is not *approved* for temporary operation on the first preliminary inspection, the usual reinspection fee shall be charged for each subsequent preliminary inspection for such purpose.~~

~~**B104.1 General.**~~
~~In all *buildings*, except one- and two-family *dwellings*, where self-contained air-conditioning units of less than 2 tons (7.034 kW) are to be installed, the fee charged shall be that for the total cost of all units combined (see Section B101.2.1 for rate).~~

~~SECTION B104~~
~~SELF-CONTAINED UNITS LESS THAN 2 TONS~~

~~SECTION B103~~
~~TEMPORARY OPERATION INSPECTION FEE~~

~~SECTION B102~~

~~FEE FOR REINSPECTION~~

Reason: There were two different proposals to address consistency in the Fees section (ADM 27-19 and ADM 33-19) – the end result was coordination between the 2021 codes for – IBC, IFC, IEBC, IMC, IPC, IPMC, IFGC, ISPSC, IWUIC and IZC. ADM 27-19 removed fees schedules from being inserted at the time of adoption into the IMC, IPC, IPMC, IFGC and ISPSC. If the jurisdiction is on a code for 3 to 6 years, this would prohibit them from adjusting their fees. Adoption of an appendix with fees (IRC) or to be filled in by the jurisdiction (IMC and IPC) would have the same effect. These appendices should be deleted.The BCAC will be submitting a proposal in Group B for IRC Appendix AB (Previously AL) Permit Fees.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is essentially editorial because the intent of ADM27-19 was to remove the fee schedules in the codes that had such schedules.

P159-24 Part II

P160-24 Part I

IPC: APPENDIX E, TABLE E103.3(3)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

APPENDIX E SIZING OF WATER PIPING SYSTEM

Revise as follows:

TABLE E103.3(3) TABLE FOR ESTIMATING DEMAND

SUPPLY SYSTEMS PREDOMINANTLY FOR FLUSH TANKS			SUPPLY SYSTEMS PREDOMINANTLY FOR FLUSHOMETER VALVES

1,250	239.0	31.94952	1,250	239.0	31.94952
1,500	269.0	35.95992	1,500	269.0	35.95992
1,750	297.0	39.70296	1,750	297.0	39.70296
2,000	325.0	43.446	2,000	325.0	43.446
2,500	380.0	50.7984	2,500	380.0	50.7984
3,000	433.0	57.88344	3,000	433.0	57.88344
4,000	525.0	70.182	4,000	525.0	70.182
5,000	593.0	79.27224	5,000	593.0	79.27224

For SI: 1 inch = 25.4 mm, 1 gallon per minute = 3.785 L/m, 1 cubic foot per minute = 0.28 m^3 per minute.

Reason: This is an editorial change. The conversion from gallons per minute to cubic feet per minute for these two rows has been incorrect for many editions of the code. Most users of this table utilize the “gallon per minute” values, it is best to avoid confusion by having the conversion displayed correctly.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a simple cleanup of incorrect values in table.

2024 International Plumbing Code

Add new text as follows:

APPENDIX G URINE DIVERSION SYSTEMS

SECTION G101
GENERAL

G101.1 Scope. This appendix shall govern the materials, design, installation, maintenance and inspection of urine diversion systems, and shall govern the disposal or treatment of *diverted urine* and the output of *urine derived products*.

G101.2 Urine diversion fixture units. Each urine diversion fixture shall be rated as one drainage fixture unit.

G101.3 Tests. The *urine diversion* system shall be tested in accordance with Section 312.

G101.4 Maintenance responsibility. The required maintenance and inspection of *urine diversion* systems shall be the responsibility of the property owner, unless otherwise required by the *code official.*

G101.5 Operation. *Urine diversion* systems shall be operated and maintained in a safe and sanitary condition in accordance with the Section G101.6.

G101.6 Operation and maintenance manual. An operation and maintenance manual shall be provided in hardcopy form and shall be transferred to the new owner or tenant upon transfer of property or tenancy. The manual shall include the following items:

1. Storage capacity for urine, flush water and additives.
2. Design loading of the system and expected inputs.
3. Expected schedule of additives.
4. Sources or provider of necessary additives. Source may be on-site.
5. Comprehensive maintenance schedule, including a pipe cleaning schedule.
6. Cleaning agents and instructions for each.
7. Instructions for all maintenance tasks.
8. If container transfer is used, container transfer plan and container cleaning instructions.

9. Disposal or beneficial use plan containing all of the following, as applicable:
   9.1. Removal schedule and service provider.
   9.2. Instructions for diversion to sewer or private sewage disposal system.
   9.3. Treatment plan and treatment system operations.
   9.4. Plan for licensing, certification, or labeling of *urine derived products.*
   9.5. Land application following a *nutrient management plan.*

G102
DEFINITIONS

G102.1 Scope. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 for general definitions.

Add new definition as follows:

DIVERTED URINE. Urine that is collected separately from fecal matter.

NUTRIENT MANAGEMENT PLAN. A *nutrient management plan* outlines the quantity, timing, locations, methods and other aspects of applying plant nutrients and soil amendments to the land in order to prevent or minimize environmental impacts while maximizing horticultural benefits.

TREATED URINE. *Diverted urine* that has been treated for beneficial use.

URINE DERIVED PRODUCT. A product that is derived from urine, such as an agricultural amendment, fertilizer, or diesel exhaust fluid.

URINE DIVERSION. Collection of *diverted urine* that occurs at the fixture.

URINE DIVERTING WATER CLOSET. A fixture connected to a plumbing system that separates fecal matter and urine into separate piping. (also urine diverting flush toilet)

Add new text as follows:

SECTION G103
MATERIALS

G103.1 General. Material used for *urine diversion* shall be corrosion resistant, such as stainless steel or durable polymers. Concrete piping is prohibited.

G103.2 Identification. All *urine diversion* piping shall be identified.

G103.3 Screening. Where screening is required to prevent the unintentional entry of insects and vermin, screening shall have openings with a maximum size of 3/32 inches (2.5mm). Screening shall be made of materials compatible with the system components in contact with screen materials. Screen materials shall not generate galvanic corrosion of system components.

SECTION G104
DESIGN OF URINE DIVERSION SYSTEM

G104.1 Pipe sizing. Pipe sizes shall be in accordance with the Table 710.1(1) or shall be *approved.*

G104.2 **Change of direction.** Changes in direction of *urine diversion* piping shall be made by a long-sweep 90-degree fitting or other approved fittings of equivalent sweep.

G104.3 **Traps.** Fixtures discharging into *urine diversion* piping shall be trapped in accordance with Section 1002.

G104.4 **Slope of horizontal piping.** *Urine diversion* piping shall be installed at a slope conforming to the fixture manufacturer's guidelines and of not less than ¼-inch per foot (20 mm per meter), or 2 percent toward the point of storage or disposal.

G104.5 **Cleanouts.** A cleanout shall be provided at the upper terminal of each drain line, every 50 feet (15 m), and at any aggregate horizontal change of direction exceeding 135 degrees.

G104.6 **Venting.** *Urine diverting water closets* shall be vented in accordance with Chapter 9. *Urine diverting* commodes shall be vented to a composting toilet system vent in compliance with the International Private Sewage Disposal Code.

> **Exception:** Where the *code official* determines urine storage tank venting or air admittance valves are sufficient to vent fixtures, venting of fixtures shall not be required.

G104.7 **Discharge.** A *urine diversion* system shall be directed to a storage tank or discharged to an approved *sanitary drainage system*.

SECTION G105
URINE STORAGE TANKS

G105.1 **Volume.** Total urine tank storage volume shall be in accordance with Equation G-1. Where treatment by retention in accordance with Section G106.1 is specified, days in use for collection (D) shall be at least 365.

V = (C + (N x (U + F) x O)) x D (Equation G-1)

where:

V = total tank volume
C= water used per fixture per day for cleaning
C = (c + w + t)/7
c = water used per cleaning
w = cleanings per week
t = total urine diversion fixtures

N = number of users

U = urine per person per day (0.4 gallons, 1.5L)

F = flush water per day
F = f x e

f = water volume per flush
e = visits to toilet per day (5.9)

O = occupant fraction

D = days in use for collection

G105.2 Venting. Urine storage tanks shall be vented as required for pressure equalization. When required, vents shall be installed on urine storage tanks and shall extend from the top of the tank. Dedicated urine storage tank vents extending to the outdoors shall terminate no less than 12 inches (300 mm) above grade. The vent terminal shall be directed downward and screened to prevent entry of insects and vermin. Storage tank vents shall be permitted to connect to the plumbing venting system at least 6 inches (150 mm) above the flood level rim of the highest fixture.

G105.2.1 Vent size. Pressure equalization vents that prevent nitrogen loss through the use of restrictions, or of piping or tubing that is less than the minimum pipe diameter required in the plumbing code, shall be *approved*.

G105.3 Traps. Urine storage tanks shall prevent odors and nitrogen loss from the tank inlet by means of a P-trap, mechanical trap, submerged inlet piping, or other *approved* means. Submerged inlet piping shall remain submerged during use and after pumpout.

Exception: Tanks of 5.5 gallons (20 L) or less with connection to a fixture with active venting.

G105.4 Overflow. Where urine storage tank overflows are installed, they shall be connected to the *sanitary drainage system*.

G105.5 Backwater valve. When connected to a public sewer system or private sewage disposal system and where subject to *backflow*, storage tank overflows shall be provided with a *backwater valve* or check valve at the point of connection to the *sanitary drainage system*. The *backwater valve* shall be *accessible* for inspections and maintenance.

G105.6 Water level monitoring and warning. Urine storage tanks shall be provided with a water level monitoring device connected to an alarm system. The alarm system shall provide a visual and auditory warning signal when 80 percent volume is reached.

Exception: Tanks meeting one of the following requirements:

1. Where tank volume does not exceed 5.5 gallons (20 L) and the tank is located within the toilet room, a visible indicator of tank volume shall be provided.
2. Where the tank has no direct connection to urine diversion piping, is filled manually, and has a visible indicator of tank volume.

G105.7 Construction. Urine storage tanks shall be constructed of corrosion resistant materials such as stainless steel or durable polymers.

G105.8 Above grade. Where subject to freezing conditions, above grade storage tanks and associated piping shall be provided with an *approved* means of freeze protection, or fitted with high level alarms that are suitable for detecting a high level condition in the presence of ice.

G105.9 Below grade. Urine storage tanks installed below grade shall be structurally designed to withstand all anticipated earth or other loads. Tank covers shall be capable of supporting an earth load of not less than 300 pounds per square foot (lb/ft^2) (1500 kg/m^2) when the tank is designed for underground installation. Below grade urine tanks installed underground shall be provided with manholes. The manhole opening shall have a diameter of at least 20 inches (500 mm) and located at least 4 inches (100 mm) above the surrounding grade. The surrounding grade shall be sloped away from the manhole. Underground tanks shall be ballasted, anchored, or otherwise secured, to prevent the tank from floating out of the ground when empty. The combined hold-down capacity of the tank and hold down system shall meet or exceed the buoyancy force of the tank.

G105.10 Marking. Where openings are provided to allow a person to enter the tank, the openings shall be marked with the following words: "DANGER—CONFINED SPACE." The letters shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.

G105.11 Openings. All openings shall be covered and secured to prevent tampering. Openings shall be screened or covered to prevent insect and vermin entry and be protected against unauthorized human entry.

G105.12 Transfer. Where urine is transferred between tanks, cleaning of tanks and provisions for limiting user exposure shall be according to the operation and maintenance manual.

SECTION G106
TREATMENT, DISPOSAL AND BENEFICIAL USE

G106.1 Approved treatment methods.

1. Retention of diverted urine without addition for six months before usage. Two or more holding tanks shall be required for retention.
2. Heat sanitization with one of the following methods:
   2.1. Heat treatment for not less than 15 seconds and not greater than 30 minutes at a temperature calculated using Equation G-2.

   $$D = 131{,}700{,}000/10^{0.14T} \quad \text{(Equation G-2)}$$

   where:
   D = treatment duration (days)

   T = temperature (degrees Celsius)

   2.2. Heat treatment for not less than 30 minutes at a temperature of at least 122°F (50°C) for a period calculated using Equation G-3.

   $$D = 50{,}070{,}000/10^{0.14T} \quad \text{(Equation G-3)}$$

   where:
   D = treatment duration (days)

   T = temperature (degrees Celsius)

3. Other *approved* method.

G106.2 Disposal and beneficial use. *Urine diversion* systems shall have a plan for disposal or shall have a plan for beneficial use with one of the following methods. The plan shall be recorded in the operation and maintenance manual.

1. **Disposal.** Urine shall be removed by one of the following methods:
   1.1. An *approved* service provider.

   1.2. Discharge to a public sewer system or *private* sewage disposal system.

   1.3. Discharge to a nonliquid treatment system in compliance with the International Private Sewage Disposal Code.

2. **Urine derived products.** Urine shall be processed into u*rine derived products* for commercial product licensing, certification, and labeling as required by the authority having jurisdiction.
3. **Land application.** Treated urine complying with Section 105 shall be land applied following an *approved nutrient management plan* if required by the authority having jurisdiction.

Reason: Urine diversion captures urine at toilet room fixtures and directs it to collection tanks, enabling the conversion of what is currently a polluting waste into a resource for agricultural or other uses. Urine diversion has been extensively employed and researched for more than 40 years, largely in an international development context, and is now being deployed as a nutrient recovery technology at building and municipal scales. Clear code guidance is needed to enable consistent and strict public health protections, provide reliable and maintainable plumbing, and encourage proper growth of an emerging industry. This proposed appendix has the following features:

- Contains clear and enforceable standards.
- Mandates documentation on all aspects of system operation and maintenance.
- Ensures urine sanitization through onsite treatment or professional disposal.

- Controls onsite land application through nutrient management requirements.

Urine diversion has emerged as a leading technology for nutrient recovery, because 70-80% of the nitrogen and 50-65% of the phosphorus in residential wastewater come from urine alone. To meet nutrient discharge limits (without which algae blooms and other environmental harm can occur in public waterways), wastewater treatment plants must remove extremely dilute nutrients from wastewater streams using processes that are capital and energy intensive and generate potent greenhouse gasses.[1] Although nutrient recovery is a major goal of current wastewater treatment, only 11% of nitrogen and 21% of phosphorus are recovered from wastewater in the US.[2] Urine diversion has the potential to cut the energy demands and greenhouse gas emissions of water treatment by approximately a third to a half.[3]

The cost of nutrient removal from wastewater is increasingly constraining sewer districts, thereby limiting development.[4] To increase the supply of housing without increasing nutrient discharges, many cities are exploring urine diversion. For example, in 2020, the OCAPI program, a collaboration between Toulouse and Paris water authorities, installed urine diversion in a 1000-person district of Paris, France to pilot municipal-scale urine diversion and protect the Seine River.[5] In the US, the PAE Building in Portland, Oregon has a urine diversion system licensed by the Oregon Departments of Environmental Quality and Agriculture to produce commercial fertilizer directly from diverted urine.[6] The University of Michigan Department of Civil & Environmental Engineering was recently invited by the New York Department of Environmental Protection to evaluate if adding urine diversion to new buildings in New York City could enable development in an area whose treatment plant is at capacity.[7]

This proposed appendix to the IPC is based on the Recode Model Code, which incorporates the latest urine diversion research and practice from around the globe. The Recode Model Code was created in 2015 through a consensus process with a national team of U.S. experts, and was incorporated into IAPMO's 2017 Water Efficiency and Sanitation Standard (WE Stand), which was revised in 2020 and 2023. The latest Recode Model Code incorporates refinements from the WE Stand process, as well as insights derived from international codes, such as the Dutch ISSO NTR 3216 standard.

This Urine Diversion Systems proposal was created in parallel with a Composting Toilet Systems proposal for the International Private Sewage Disposal Code, which adds the Recode Model Code's clear design, installation, and inspection guidance for composting toilet systems. Notes:

- Urine pump-out pipes slope backward toward the storage tank. Pump-out to be performed using vacuum suction, using gasketed cam-lock connection between pump-out pipe and service provider's collection hose. Fitting on pump-out pipe to be capped with gasketed cam-lock connector after pump-out.
- Storage tanks sized to exceed 14 day storage capacity.
- A high-level alarm will report when storage tanks are at 75% capacity. In configurations with multiple connected tanks, the float alarm will be on the tank that receives urine from the urine collection plumbing.
- All horizontal pipe runs between fixture and storage tank: ½" : 12" slope
- Rigid pipe sch. 40 ABS or PVC unless noted
- Cleanouts or sweep fittings at corners or where appropriate
- Relative pipe elevations shown in the schematic will be recognized in installation
- Pipe connections to tank are made using bulkhead fittings or manufacturer-installed fittings.

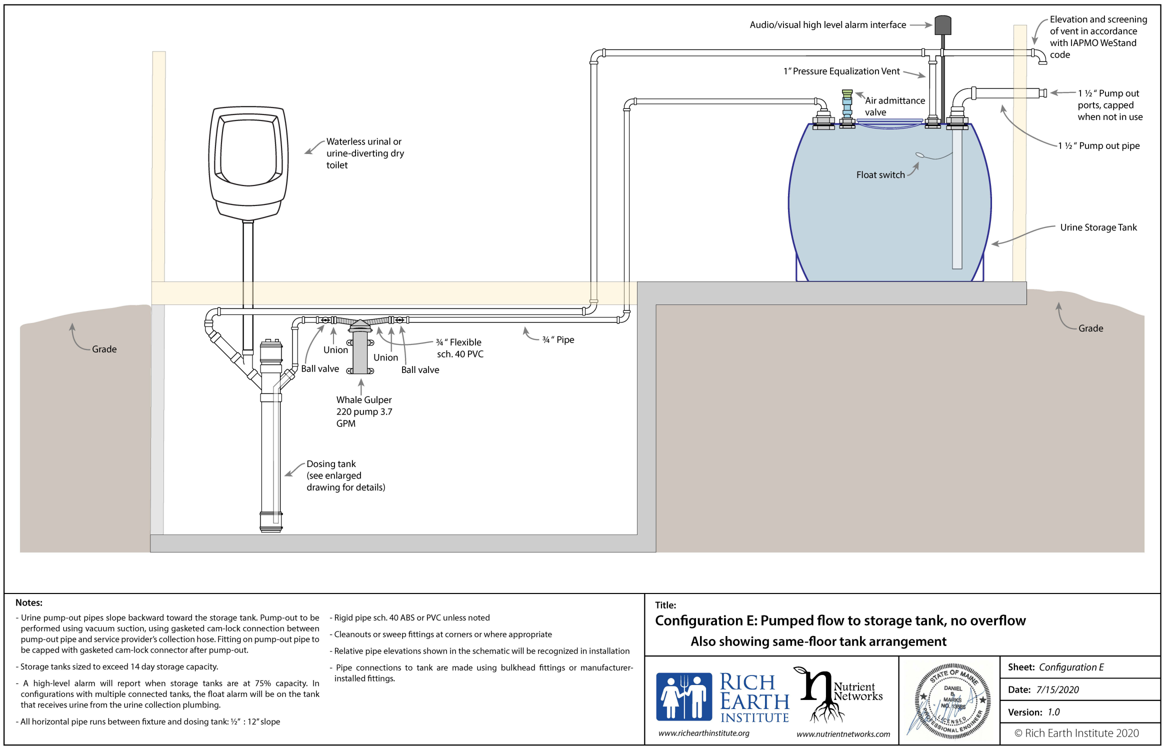
Sheet: *Configuration D (indoor)*

Date: *3/14/2022*

Version: *1.0*



Bibliography: G104.4 Slope of horizontal piping:

Per the requirements of K.3.4 *NTR 3216*, ISSO 2023. An ideal slope may be higher than 2 percent; "at least 2% (ideally 3%)," per Section 3.1 of the *Urine Diversion System with LAUFEN Save! WC Installation Guide* Version No. 01, LAUFEN, 2022.

G105.1 Volume:

Equation based on the volume calculator of Appendix K, *NTR 3216*, ISSO 2023.

Quantity of urine based on 550L per year, a number widely used in European guidance, including von Münch and Winker's *Technology Review of Urine Diversion Components,* Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) GmbH 2011. Originally from Jönsson et. al *Composition of Urine, Faeces, Greywater, and Biowaste for Utilisation in the URWARE Model*, Mistra Programme for Urban Water, 2006.

G106.1 Approved treatment methods:

Method 1, retention, per Table 5.3, *Guidelines for the Safe Use of Wastewater, Excreta and Greywater: Volume 1: Policy and Regulatory Aspects*, WHO, 2006.

Method 2, heat sanitization, per *Technical Support Document for Reduction of Pathogens and Vector Attraction in Sewage Sludge,* EPA, 1992 (EPA 822/R-93-004).

Cost Impact: Increase

Estimated Immediate Cost Impact:

Utilization of this appendix will increase the cost of initial construction by requiring additional system components and labor. In new construction, urine diversion system materials are estimated to cost an additional $940.00 per water closet, with system installation requiring an additional 8 hours of labor, for an estimated labor cost of $400.00 per installation. Jurisdictions may also require additional permitting fees, estimated to be $270.

Estimated Immediate Cost Impact Justification (methodology and variables):

Costs are estimated based on the latest (2023) cost of residential installation of a single water closet system by the Rich Earth Institute's staff in Vermont, USA. Only tank, piping, fittings, and float alarm are included in material fees, as the price of a urine diverting water closet is estimated to be equivalent to a standard water closet. While systems with multiple water closets may see lower costs per water closet due to shared tanks, piping, and float alarm, such savings are not included in the estimate. Please see Attached file Rich-Earth-UD-Options.pdf for schematic diagrams of typical installations.

Tank (including shipping): $670
Water closet: $300
Pipe and fittings: $120
Float alarm: $150
Labor (8 hours @ $50/hour): $400
Permit filing fee: $270
Wastewater design fee: $400
SUBTOTAL: $2310

Add new text as follows:

APPENDIX G Calculation and Labeling of the Water Use Performance of One- and Two-Family Dwellings

SECTION G101 GENERAL

G101.1 Purpose. The provisions of this appendix establish a uniform methodology for evaluating, rating and labeling the water use performance of one and two-family dwellings.

G101.2 Scope. This appendix shall provide a uniform methodology for evaluating, rating and labeling the indoor and outdoor water use performance of one- and two-family dwellings. Such evaluations, rating and labeling shall be in accordance with this appendix and RESNET/ICC-850.

SECTION G201 DEFINITIONS

G201.1 Definitions. The following terms and acronyms have specific meanings as used in this Appendix. In the event that definitions given here differ from definitions given elsewhere, the definitions given here shall govern.

Add new definition as follows:

APPROVED RATING PROVIDER.
An approved entity responsible for the certification of home water efficiency raters working under its auspices and who is responsible for the quality assurance of such Certified Raters and for the quality assurance of water efficiency ratings produced by such home water efficiency raters.

APPROVED SOFTWARE RATING TOOL.
A computerized procedure that is approved for the purpose of conducting home water efficiency ratings and calculating the annual water

consumption, annual water costs and a Water Rating Index for a home.

AUTOMATIC IRRIGATION SYSTEM.
An irrigation system that is initiated by a clock timer, irrigation controller, or other method that does not require human intervention to initiate an irrigation event.

BEDROOM.
A room or space 70 square feet of floor area or greater, with egress window and closet, used or intended to be used for sleeping. A “den,” “library,” “home office” with a closet, egress window, and 70 square feet of floor area or greater or other similar rooms shall count as a Bedroom, but living rooms and foyers shall not.

IRRIGATED AREA.
The portion of a lot that receives supplemental water for irrigation.

LOT SIZE.
The area of a single parcel of land on which the Rated Home is located.

OTHER WATER USE.
Water use associated with leaks, minor draws, and other end uses not specified in the Reference Home or Rated Home.

OUTDOOR WATER USE.
Water use that occurs outside of the exterior walls of a dwelling unit.

RATED HOME.
The specific real property that is evaluated using the water use performance rating procedures specified by this Appendix.

REFERENCE HOME.
A hypothetical home configured in accordance with the specifications set forth in Section G301.3 of this code and the basis of comparison for the purpose of calculating the Water Rating Index of a Rated Home.

RESIDENTIAL IRRIGATION CAPACITY INDEX (RICI).
The intensity with which an automatic irrigation system applies water calculated in accordance with Section G301.6.3.

WATER RATING INDEX (WRI).
An integer representing the relative water use of a Rated Home as compared with the water use of the Reference Home and where an Index value of 100 represents the water use of the Reference Home and each integer reduction represents a one percent improvement in water use efficiency.

Add new text as follows:

SECTION G301
HOME WATER RATING CALCULATION PROCEDURE

G301.1 Determining the Water Rating Index. The Water Rating Index (WRI) shall be determined in accordance with Sections G301.2 through G301.6. The Reference Home shall be configured in accordance with Sections G301.3 and G301.4, and the Rated Home shall be configured in accordance with Section G301.5 and G301.6 .

G301.2 Calculating the Water Rating Index. . A Water Rating Index shall be calculated as follows:

$$WRI = \frac{\text{indoor and outdoor daily water use for the Rated Home}}{\text{indoor and outdoor daily water use for the Reference Home}} \times 100$$ **Equation G301.2-1**

G301.3 Determining the Daily Indoor Water Use for the Reference Home. The indoor daily water use for the Reference Home shall be calculated as follows:
refingpd = refFgpd + refWgpd + refDWgpd + refCWgpd +

refTgpd + refSofgpd + refOther

(Equation G301.3-1)

Where:

refFgpd = daily fixture water use for the Reference Home

refWgpd = daily water use wasted from hot water outlets for the Reference Home

refDWgpd = daily dishwasher water use for the Reference Home

refCWgpd = daily clothes washer water use for the Reference Home

refTgpd = daily toilet water use for the Reference Home

refSofgpd = daily water softener water use for the Reference Home

refOther = daily total other/unidentified water use for the Reference Home

G301.3.1 Determining Daily Reference Home Fixture Water Use. Reference Home daily fixture water use shall be calculated as follows:
refFgpd = 14.6 + 10 × *Nbr* **(Equation G301.3.1-1)**

Where:

Nbr = number of bedrooms in the Rated Home

G301.3.2 Determining Daily Reference Home Hot Water Waste. Reference Home daily hot water waste shall be calculated as follows:
refWgpd = 9.8 × *Nbr*0.43 **(Equation G301.3.2-1)**

Where:

Nbr = number of bedrooms

G301.3.3 Determining Daily Reference Home Dishwasher Water Use. Reference Home dishwasher water use shall be calculated as follows:
refDWgpd = $\frac{(88.4 + 34.9 \times Nbr) \times 8.16}{365}$

(Equation G301.3.3-1)

Which simplifies to:

$refWgpd = 1.97 + 0.7802 \times Nbr$

Where:

Nbr = number of bedrooms

$(88.4 + 34.9 \times Nbr)$ = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey

8.16 = gallons per cycle from the DOE Technical Support Document from the NAECA standard in effect in 2006

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

G301.3.4 **Determining Daily Reference Home Clothes Washer Water Use.** Reference Home daily clothes washer water use shall be calculated as follows:

$refCWgpd = \frac{(3.0 \times 11.4 \times ACY)}{365}$ **(Equation G301.3.4-1)**

Where:

3.0 = reference washer capacity ($CAPw$) in ft3

11.4 = reference integrated water factor (IWF) in (gal/cyc) per ft3

ACY = Adjusted Cycles per Year = $(164 + 46.5 \times Nbr)$

Nbr = number of bedrooms

G301.3.5 **Determining Daily Reference Home Toilet Water Use.** Reference Home daily toilet water use shall be calculated as follows:

$refTgpd = refFPO \times refGPF \times Occ$ **(Equation G301.3.5-1)**

Where:

$RefFPO$ = the Reference Home flushes per person per day = 5.05

$RefGPF$ = the Reference Home gallons per flush for toilets = 1.6

Occ = the number of occupants = $1.09 + 0.54 \times Nbr$

Nbr = number of bedrooms

G301.3.6 **Determining Daily Reference Home Water Softener Use.** Where the Rated Home has a water softener and the water hardness at the Rated Home location is greater than or equal to 180 milligrams/liter, the Reference Home water softener daily water use shall be calculated as follows:

$refSofgpd = \frac{\text{grains of hardness}}{\text{gallon of water}}$ × sum of indoor water uses in the

Reference Home × $\frac{\text{5 gallons used}}{\text{1,000 grains removed}}$ **(Equation G301.3.6-1)**

Where the Rated Home does not meet these conditions, the *refSofgpd* = 0.

G301.3.7 Determining Daily Reference Home Other Water Use. Reference Home daily other water use shall be determined as follows:

refOther = 5.93 × *Nbr* **(Equation G301.3.7-1)**

Where:

Nbr = the number of bedrooms in the Rated Home

G301.4 Determining the Reference Home Outdoor Water Use. The reference home outdoor annual water use (in thousands of gallons per year) shall be calculated using the following two equations:

If the rated home has a netET of less than 12 inches/year OR the rated home has an automatic irrigation system, use Equation G301.4-1.

$\left[\frac{Exp(A)}{1+Exp(A)}\right]$ × 1.18086 × [2.0341 × *netET*0.7154 × *Ref_Irr_Area*0.6227 + 0.5756 × *ind_Pool* × *netET]*

(Equation G301.4-1)

If the rated home has a netET of greater than 12 inches/year AND the rated home does NOT have an automatic irrigation system, use Equation G301.4-2.

[$\left[\frac{Exp(B)}{1+Exp(B)}\right]$ × 1.22257 × [1.4233 + 0.6311 × *netET* + 0.9376 × *Ref_Irr_Area*]]+ *ref_Pool*(Equation G301.4-2)

Either equation shall be constrained as follows:

IF

Rat_Irr_Area < *Ref_Irr_Area*

THEN

Ref_Out = Equation G301.4-1 or G301.4-2

$\frac{\text{Equation 1 (Using Rat\_Irr\_Area and ind\_Pool = 0)}}{\text{Equation 1 (with Ref\_Irr\_Area and ind\_Pool = 0)}}$

AND

Outdoor Reference Home Annual Water

Use shall never be lower than Equation G301.4-2

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × *netET* × (*Irr_Area*/1,000)]

Ref_Irr_Area = the size of the irrigated area in the Reference Home, calculated in accordance with Section G301.4.1

Rat_Irr_Area = the size of the irrigated area in the Rated Home

NetET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool in the Rated Home

ref_Pool = Equation G301.4-1 (using *ind_Pool* = 1) – Equation G301.4-1 (using *ind_Pool* = 0)

G301.4.1 Determining Outdoor Daily Water Use for the Reference Home. Reference Home daily outdoor water use shall be determined by multiplying the result of either Equation G301.4-1 or Equation G301.4-2, as appropriate, by 1,000 and dividing the product by 365.

G301.4.2 Determining Irrigated Area for the Reference Home. Reference Home Irrigated Area shall be calculated as follows:
Where the lot size of the Rated Home is less than 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:

Ref_Irr_Area = *Lot_Area* × (0.002479 × *Lot_Area*0.6157) **(**Equation G301.4.2-1)

Where the Lot Size of the Rated Home is greater than or equal to 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:

Ref_Irr_Area = *Lot_Area* × 0.577 **(Equation G301.4.2-2)**

Where:

Ref_Irr_Area = the size of the landscape that receives supplemental water in the Reference Home

Lot_Area = the size of the lot on which the Rated Home is being constructed

G301.5 Determining Daily Indoor Water Use of the Rated Home. The daily Indoor Water Use of the Rated Home shall be calculated as follows:
Indoorgpd = *Showergpd* + *KitchFgpd* + *LavFgpd* + *Wastegpd* + *CWgpd* + *DWgpd* + *Toiletsgpd* + *Softgpd* + *Other* + *EPgpd* **(Equation G301.5-1)**

Where:

Showergpd = daily shower water use for the Rated Home

KitchFgpd = daily kitchen faucet water use for the Rated Home

LavFgpd = daily lavatory water use for the Rated Home

Wastegpd = daily water use wasted for the Rated Home

CWgpd = daily clothes washer water use for the Rated Home

DWgpd = daily dishwasher water use for the Rated Home

Toiletsgpd = daily toilet water use for the Rated Home

Softgpd = daily water softener water use for the Rated Home

Othergpd = daily other/unidentified water use for the Rated Home

EPgpd = daily excess pressure adjustment

G301.5.1 Determining Daily Shower Water Use for the Rated Home. Rated Home daily shower water use shall be calculated as follows:

Showergpd = *FixtureTot* × *showerpc* × *SHeff* **(Equation G301.5.1-1)**

Where:*FixtureTot* = determined in accordance with ANSI/RESNET/ICC 301, Addendum A = $\frac{adjFmix}{Fmix} \times refFgpd$

Shower_pc = percent of fixture water use consumed by showers = 54%

SHeff = the ratio of the average rated flow rate of showerheads to the reference home flow rate $= \frac{\text{average flow rate of showerheads in the Rated Hame}}{2.5}$

G301.5.2 Determining Daily Kitchen Faucet Water Use for the Rated Home. Rated Home daily kitchen faucet water use shall be calculated as follows:
KitchFgpd = *FixtureTot* × *faucetpc* × *KitchFeff* × *kitch* **(Equation 301.5.2-1)**

Where:

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301 Addendum A =

$\frac{adjFmix}{Fmix}$ × *refFgpd*

faucetpc = percent of fixture water use consumed by faucets = 46%

KitchFeff = the ratio of the average rated flow rate of kitchen faucets to the Reference Home flow rate

$= \frac{\text{average flow rate of kitchen faucets in the Rated Hame}}{2.2}$

Kitch = the percentage of faucet use that is attributed to kitchen faucets = 69%

G301.5.3 Determining Daily Lavatory Faucet Water Use for the Rated Home. Rated Home daily lavatory faucet use shall be calculated as follows:*LavFgpd* = FixtureTot × faucetpc × LavFeff × Lav (Equation G301.5.3-1)
Where:

Lav = the percentage of faucet use that is attributed to lavatory faucets= 31%

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301 Addendum A =

$\frac{adjFmix}{Fmix}$ × *refFgpd*

faucet pc = percent of fixture water use consumed by faucets = 46%

LavFeff = the ratio of the average rated flow rate of lavatory faucets to the Water Rating Reference Home flow rate = 1 for standard faucets and 0.95 for high-efficiency faucets

G301.5.4 Determining Daily Hot Water Waste for the Rated Home. Rated Home daily hot water waste shall be calculated as follows: *Wastegpd* = *Feff* × (*oWgpd* + *sWgpd* × *WDeff*) **(Equation G301.5.4-1)**

Where:

Feff = fixture efficiency of showerheads, kitchen faucets, and lavatory faucets weighted by contribution to total fixture use = daily standard operating condition hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

sWgpd = daily structural hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

WDeff = distribution system water use effectiveness from Table 4.2.2.5.2.11(3) of ANSI/RESNET/ICC 301 Addendum A

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

G301.5.5 Determining Daily Clothes Washer Water Use for the Rated Home. Rated Home daily clothes washer water use shall be calculated as follows:

$$CW_{gpd} = \frac{CAPw \times IWF \times ACY}{365}$$

(Equation G301.5.5-1)

Where:

CAPw = washer capacity in cubic feet = the manufacturer's data or the CEC database or the EPA Energy Star® website

IWF = Integrated Water Factor from manufacturer's data [(gal/cyc)/ft3]

ACY = Adjusted cycles per year

Determining ACY:

ACY = (164 + 46.5 × *Nbr*)

$$\times \frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)}$$

Where:*CAPw* = the capacity of the clothes washer in ft3

(164 + 46.5 × *Nbr*) = standard cycles per year based on 2005 Residential Energy Consumption Survey data

$\frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)}$ = best fit regression equation to adjust the standard cycles per year to account for occupancy and size of clothes washer; based on 2005 Residential Energy Consumption Survey data

G301.5.6 Determining Daily Dishwasher Water Use for the Rated Home. Rated Home daily dishwasher water use shall be calculated as follows:
DWgpd = [(88.4 + 34.9 × *Nbr*) × (12/*dWcap*) × gal/cycle/365 **(Equation G301.5.6-1)**

Where:

Nbr = number of bedrooms in the Rated Home

DWcap = capacity of the dishwasher in the Rated Home (in place settings) as included in the manufacturer's data (88.4 + 34.9 × *Nbr*) = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey gal/cycle can be entered either directly or as listed on:

a. The ENERGY STAR product finder database.
b. The California Energy Commission (CEC) Modernized Appliance Efficiency Database.
c. The Department of Energy (DOE) Compliance Certification Management System (CCMS).

OR gal/cycle can be calculated from the Energy Guide label as follows (developed using the equations from 10 CFR 430, Subpart B, Appendix C and values on the Energy Guide label) to isolate the energy used by the appliance from the energy used in water heating):
gal/cycle = h2o_kWh × elec_h2o

h2o_kWh = LER-Appl_kWh

LER = Labeled Energy Rating in kWh per year per the dishwasher Energy Guide label

Appl_kWh = dishwasher appliance annual electric energy use = (GHWC × gas_h2o/$_therm-LER × $_kWh × elec_h2o/per_kWh) / ($_kWh × gas_h2o/$_therm-elec_h2o)

Where:

$_kWh = the cost of one kWh per the dishwasher Energy Guide label

$_therm = the cost of one therm per the dishwasher Energy Guide label

GHWC = Gas Hot Water Cost per the dishwasher Energy Guide label

elec_h2o = gallons of hot water use per cycle per unit of annual electricity use in gal × y/kWh × cyc = 1/(80 × 0.0024 × 208) = 0.02504

gas_h2o = gallons of hot water use per cycle per unit of annual gas use in gal × y/therm × cyc = 1/(80 × 8.2/0.75 × 208/100,000) = 0.5497

80 = the average hot water heater temperature rise per 10 CFR 430, Subpart B, Appendix C

0.0024 = specific heat of water in kWh/gal × F per 10 CFR 430, Subpart B, Appendix C

8.2 = specific heat of water in Btu/gal × F per 10 CFR 430, Subpart B, Appendix C

0.75 = recovery efficiency of gas hot water heater per 10 CFR 430, Subpart B, Appendix C

208 = cycles per year

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

G301.5.7 Determining Daily Toilet Water Use for the Rated Home. Rated Home daily toilet water use shall be calculated as follows:

$Toiletgpd = refFPO \times gpf \times Occ$

Where:

RefFPO = the reference flushes per person per day = 5.05

gpf = the average gallons per flush of all toilets installed in the Rated Home; for tank-type dual-flush toilets, use the effective flush volume per flush based on EPA Water Sense specification for Tank-Type Toilets

Occ = the number of predicted occupants in the Rated Home = 1.09 + 0.54 × *Nbr*

Nbr = the number of bedrooms in the Rated Home

G301.5.8 Determining Daily Water Softener Water Use for the Rated Home. Rated Home daily water softener water use shall be calculated as follows:

$Softgpd = \frac{\text{grains of hardness}}{\text{gallon of water}}$ × [sum of softened water

uses in the Rated Home] × [gallons used per 1,000 grains of hardness]

(Equation G301.5.8-1)

Where:

softened water = water conditioned by a water softener

G301.5.9 Determining Daily Other Water Use for the Rated Home. Rated Home daily other water use shall be calculated as follows: $Othergpd = 5.93 \times Nbr$ **(Equation G301.5.9-1)**

Where:

Nbr = the number of bedrooms in the rated home

G301.5.10 Determining Daily Excess Pressure Adjustment Water Use for the Rated Home. Where a Rated Home does not have a pressure-reducing valve or pressure tank, additional water use attributed to excess water pressure shall be calculated as follows: $EPgpd = \text{MAX}\{[(Showergpd + (0.5 \times (LavFgpd + KitchFgpd + Othergpd))) \times 0.006 \times (PR - 90)], 0\}$ **(Equation G301.5.10-1)**

Where:

PR = static water pressure (in psi) measured at the indoor fixture outlet on the lowest floor and (if more than one) closest to the water service entry to the house

Shower and lavatory faucets controlled by integral or accessory pressure-compensating devices shall be permitted to be excluded from this equation.

G301.6 Determining Outdoor Water Use for the Rated Home. The Rated Home outdoor water use shall be calculated as follows: Where the Rated Home has an automatic irrigation system, outdoor water use shall be calculated as follows:

$\left[\frac{Exp(A)}{1 + Exp(A)}\right] \times 1.18086 \times [2.0341 \times netET0.7154 \times Rat\_Irr\_Area0.6227 + 0.5756 \times ind\_Pool \times netET]$ **(Equation G301.6-1)** Where the Rated Home does not have an automatic irrigation system, outdoor water use shall be calculated as follows:

$[\left[\frac{Exp(B)}{1 + Exp(B)}\right] \times 1.22257 \times [1.4233 + 0.6311 \times netET + 0.9376 \times Rat\_Irr\_Area]] + Pool\_use$ **(Equation G301.6-2)**

The outdoor water use for the Rated Home shall never be less than the result of the following calculation:

$\left[\frac{Exp(B)}{1+Exp(B)}\right]$ × 1.22257 × [1.4233 + 0.6311 × *netET* + 0.9376 × *Rat_Irr_Area*] **(Equation G301.6-3)**

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Rat_Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × netET * (*Rat_Irr_Area*/1,000)]

Rat_Irr_Area = the size of the landscape that might receive supplemental water in the Rated Home

NetET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool

Pool_use = Equation G301.6-1 (using *ind_Pool* = 1) – Equation G301.6-1 (using *ind_Pool* = 0)

G301.6.1 Determining Outdoor Daily Water Use for the Rated Home. Rated Home daily outdoor water use shall be determined by multiplying the result of either Equation G301.6-1 or Equation G301.6-2, as appropriate, as such result may be further modified pursuant to Sections G301.6.1 through G301.6.4, by 1,000 and dividing the product by 365.

G301.6.2 Weather-based Controllers. Sensor- and weather- based irrigation controllers that are certified by the US EPA WaterSense program shall decrease the portion of predicted Rated Home outdoor water use associated with irrigation (less the water use associated with pools) by 15% in homes that have automatic irrigation system.

G301.6.3 Commissioning of an Automatic Irrigation System. In Rated Homes with an automatic irrigation system, where documentation is provided, the water use associated with irrigation shall be decreased by 5% where a certified professional, as identified by a WaterSense labeled certification, has inspected the irrigation system according to the protocols identified in ASABE S626 and verified as follows:

1. Average distribution uniformity of at least 65% on turf areas.
2. Sprinklers are operating at the manufacturer's recommended water pressure +/- 10%.
3. The system operates without leaks
4. The system prevents runoff and overspray from leaving the property (checked during the audit).
5. Two seasonal water schedules (initial grow-in period and established landscape) are posted at the controller.

G301.6.4 Residential Irrigation Capacity Index (RICI). In a Rated Home with an automatic irrigation system, where documentation is provided, a RICI shall be calculated as follows:

$RICI_{rat} = \frac{\text{sum of flow (gpm) of all irrigation valves}}{\text{square feet irrigated area}} \times 1{,}000$ **(Equation G301.6.4-1)**

G301.6.4.1 Applying RICI. A Rated Home, where documentation for a RICI is provided, may adjust the volume of water use associated with irrigation (less the water use associated with pools) in the outdoor water use of the Rated Home by 10% for every point from a baseline RICI (RICI_ref) of 5.

G301.6.5 Applying Adjustments to the Outdoor Water Use of Rated Homes. Because the Water Rating Index model includes a number of percent adjustments for the outdoor water use of the Rated Home, the order of application becomes important. The correct order in which to apply these adjustments is as indicated in Table G301.6.5.

TABLE G301.6.5 APPLYING ADJUSTMENTS TO OUTDOOR WATER USE OF THE RATED HOME

STEP	SECTION	DETERMINED BY
1	G301.6.2 —Weather-based Controllers	Shall be determined by the presence or absence of a smart controller in the installed portion of the landscape.
2	G301.6.3 — Commissioning of an Automatic Irrigation System	Shall be determined by the presence or absence of commissioning in the installed portion of the landscape.
3	CI301.6.4 —Residential Irrigation Capacity Index (RICI)	Shall be calculated in accordance with Section G301.6.4 and adjusted in partially finished landscapes to be calculated as: $RICI\_rat = \frac{\text{sum of flow (gpm) of all irrigation valves } + (0.005 \times \text{predicted } Back\_irr)}{\text{square feet irrigated area}} \times 1{,}000$ (Predicted *Back_irr* is defined in Section G401.5 .)

SECTION G401
MINIMUM RATED FEATURES

G401.1 N/A MINIMUM RATED FEATURES TABLE. The estimated annual indoor and outdoor water use shall be determined using the minimum rated features set forth in Table G401.1.

TABLE G401.1 MINIMUM RATED FEATURES

Building Element	Minimum Rated Feature
Toilet	Flush volume for each toilet as measured on-site or from manufacturer's data.
Shower/Bath	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Bathroom Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Kitchen Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Clothes Washer	Washer capacity (cubic feet) from manufacturer's data or the CEC Appliance Efficiency Database or the EPA ENERGY STAR website for all clothes washers located within the Rated Home.
Dishwasher	Capacity of the dishwasher (in place settings) as included in the manufacturer's data, labeled energy factor (cycles/kWh) for all dishwashers located within the Rated Home.
Water Softener	Gallons of water used per 1,000 grains of hardness removed.
Hot Water Distribution	Insulation *R*-value of pipe insulation, type of recirculation system, length of pipe.
Outdoor Water Use	Irrigation system type (automatic or manual), lot size, irrigated area (square feet).
Pool/Spa	Indicate presence or absence of a pool or spa.
Service Water Pressure	Service pressure of water being supplied to the home, as established by the setting of an installed pressure-reducing valve OR the setting of an installed pressure tank OR written documentation from the water supplier that service pressure to the site is 90 psi OR an on-site static pressure test.

G401.2 Data Sources. Data required for the calculation of indoor and outdoor daily water use in the Rated and Reference Homes shall be determined by the location of the Rated Home and using data as set forth in Sections G401.2.1 and G401.2.2.

G401.2.1 Net Evapotranspiration. Data for net evapotranspiration shall be determined for the location of the Rated Home using the World Water and Climate Atlas.

G401.2.2 Hardness of Water. Data for the hardness of water shall be determined by the location of the Rated Home and one of the following:

1. US Geological Survey Concentrations of Hardness as Calcium Carbonate Map.
2. Data provided by the local water supplier.
3. A hardness test of water collected in the home using an EPA-approved method for determination of hardness.

G401.3 Default Values. Values that are not available in accordance with Table G401.1 or are absent from the home at the time of the rating shall use default values in accordance with Table G401.3. Values for building elements that are not specified in Table G401.3 are required for a rating to be issued.

TABLE G401.3 DEFAULT VALUES

Building Element	Default
Water Softeners	Can be entered as 0 if they are absent from a Rated Home. If they are present and no documentation is available, they may be assumed to use 5 gallons/1,000 grains removed for cation water softeners if information is unavailable.
Clothes Washer	Same as Reference Home.
Dishwasher	Determined by ANSI/RESNET/ICC 301. A Rated Home without either a dishwasher or an undercounter cavity for placement of a dishwasher shall be assigned a Daily Dishwasher Water Use of 0.
Hot Water Distribution	Determined by ANSI/RESNET/ICC 301 Addendum A.
Outdoor Water Use	Must be done in accordance with Section G301.4.

G401.4 Incomplete Outdoor Area. To receive a rating, a home must (at a minimum) have the front yard landscape completed. Homes that do not have landscaping completed in the back yard shall be determined in accordance with Section G301.6 with the portion of landscaping that is done determining the presence or absence of an automatic irrigation system. The following steps shall be followed in determining irrigated area in this instance:
Rater must determine a line between the front and back area (*Front_area* + *Back_area* must = *Total_available_area*)

Lot_Area – Pad Footprint = *Total_available_area*

(Back_area/*Total_available_area*) × *Ref_Irr_Area* = *Predicted Back_irr*

Irr_Area = *Predicted Back_irr* + *Front_irr*

Where:

Pad Footprint = the portion of the lot area covered by the dwelling unit and any attached or detached garage

Total_available_area = the portion of the lot excluding the pad of the house that is available for landscaping or other design features (hardscape, softscape, etc.)

Front_area = the area (ft2) of the total available area that is located primarily in front of the house

Back_area = the area (ft2) of the total available area that is located primarily behind the house

Front_irr = the area located primarily in front of the house that receives supplemental water for irrigation at the time of the rating

Predicted Back_irr = the portion of the area located primarily behind the house that can be predicted to receive supplemental water for irrigation in the future

SECTION G501
CERTIFICATION AND LABELING

G501.1 STANDARD FOR CERTIFICATION AND LABELING. This section establishes minimum uniform standards for certifying and labeling home water use performance using the Water Rating Index. These include minimum requirements of the home water use rating process, standard methods for estimating water use, minimum reporting requirements, and specification of the types of ratings that are performed in accordance with this code.

G501.2 Rating Requirements. .

G501.2.1 General. The rating for a home shall be determined in accordance with Sections G501.2.1.1 through G501.2.1. 2 .

G501.2.1.1 EXISTING HOMES. For an existing home, required data shall be collected on-site.

G501.2.1.1.1 NEW HOMES. For a new, to-be-built home, the procedures of Section G401 shall be used to collect required data.

G501.2.1.2 ESTIMATED ANNUAL WATER CONSUMPTION. The collected data shall be used to estimate the annual water consumption for indoor and outdoor water use for both the Rated Home and the Reference Home as specified by Section G301.

G501.2.2 Cost Savings Estimates. Where determined, cost savings estimates for water and wastewater (sanitary sewer) service for the Rated Home shall be calculated in accordance with Sections G501.2.2.1 through G501.2.2.1.3 .

G501.2.2.1 Water Cost Savings.

501.2.2.1.1 Water Prices. Water cost savings for homes receiving potable water service from a water supplier shall be based on the schedule of rates and charges adopted by the water supplier serving the Rated Home.

G501.2.2.1.2 Relevant Rates and Charges. Water cost savings shall be calculated from the volumetric portion of the schedule of rates and charges, sometimes referred to as the commodity charge. Fixed or flat charges that do not vary with the volume of water delivered to the home, sometimes referred to as the meter charge or service charge, shall not contribute to the cost savings estimate.

G501.2.2.1.3 Water Cost Savings Calculations. .

G501.2.2.1.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a water billing period by dividing the annual indoor volume by the number of bills per year generated by the water supplier (e.g., for monthly billing divide by 12 and for quarterly billing divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

G501.2.2.1.3.2 Determine Outdoor Water Use for a Billing Period. Convert the total annual volume of outdoor water use in the Reference Home to an increment of outdoor use during a water billing period using one of two methods, based on prevailing practice at the location of the Rated Home.

G501.2.2.1.3.2.1 Peak Season Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during the irrigation season (e.g., for a 6-month irrigation season with monthly billing, divide by 6; for a 6-month irrigation season with quarterly billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

G501.2.2.1.3.2.1.2 Year-Round Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during a full year (e.g., for monthly billing, divide by 12 and for quarterly billing, divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

G501.2.2.1.3.3 Combine Indoor and Outdoor Water Use Charges. For each billing period in a year, calculate the billed water volume by combining the average billed indoor volume with any average billed outdoor volume applicable to such billing period. Note that where peak season irrigation has been calculated, the billed water volume for the billing period outside of the irrigation season will consist entirely of the average billed indoor volume. Apply the volumetric portion of the rate schedule to the billed volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual water volume charge of the Reference Home.

G501.2.2.1.3.4 Determine Water Use Cost for the Rated Home. Repeat the process described in Sections G501.2.2.1.3 through G501.2.2.1.3.3 for the Rated Home to calculate the annual water volume charge of the Rated Home.

G501.2.2.1.3.5 Total Estimated Water Cost Savings. Estimated water cost savings shall be the difference between the estimated annual water volume charge of the Reference Home and the estimated annual water volume charge of the Rated Home.

G501.2.2.2 Sanitary Sewer Service Cost Saving. .

G501.2.2.2.1 Sewer Service Prices. Sanitary sewer service cost savings for homes with a permanent connection to sanitary collection and treatment works shall be based on the schedule of rates and charges adopted by the sanitary sewer service provider serving the Rated Home. Note that collection and treatment of sanitary discharges may be performed by separate entities, and that billing to the Rated Home by such entities may be combined or separate.

G501.2.2.2.2 Relevant Rates and Charges. Sanitary sewer service cost savings shall be calculated from the volumetric portion of the schedule of rates and charges. Fixed or flat charges that do not vary with the volume of water delivered to the home shall not contribute to the cost savings estimate.

G501.2.2.2.3 Sewer Cost Savings Calculations. .

G501.2.2.2.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a sewer billing period by dividing the annual indoor volume by the number of bills per year generated by the sewer service provider (e.g., for monthly billing, divide by 12 and for semi-annual billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

G501.2.2.2.3.2 Annual Sewer Volume Charge for the Reference Home. Apply the volumetric portion of the sewer rate schedule to the average billed indoor volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual sewer volume charge of the Reference Home.

G501.2.2.2.4 Determine Annual Sewer charge for the Rated Home. Repeat the process described in Section CI501.2.2.2.3 for the

Rated Home to calculate the annual sewer volume charge of the Rated Home.

G501.2.2.2.5 Estimated Sewer Cost Savings. Estimated sewer cost savings shall be the difference between the estimated annual sewer volume charge of the Reference Home and the estimated annual sewer volume charge of the Rated Home.

G501.2.2.2.6 Combined Presentation of Cost Savings. Estimated water cost savings and estimated sewer cost savings may be presented as a total estimated cost savings when designated as "water and sewer" savings.

G501.2.2.3 Other Cost Savings. Performance attributes of the Rated Home may influence other types of charges, depending on the fee structure in the jurisdiction of the Rated Home. While less common, these savings may be significant. Any determinations for cost savings associated with the following charges shall be submitted for individual review and approval by the body providing quality assurance for the rating service provider of the Rated Home.

1. Water service connection charges, also known as tap fees.
2. Sanitary sewer service connection charges, also known as capacity charges.
3. Stormwater fees.

G501.2.3 Reports. All reports generated by an Approved Software Rating Tool shall, at a minimum, contain the information specified by Sections G501.2.3.1 through G501.2.3.6

G501.2.3.1 Location. The property location, including city, state, zip code and either the street address or the Community Name and Plan Name for the Rating.

G501.2.3.2 Name of rater. The name of the certified rater conducting the Rating.

G501.2.3 Name of provider. The name of the Approved Rating Provider under whose auspices the rater is certified.

G501.2.3.4 DATE. The date the Rating was conducted.

G501.2.3.5 TOOL NAME AND VERSION. The name and version number of the Approved Software Rating Tool used to determine the Rating.

G501.2.3.6 DISCLOSURE. The following statement in not less than 10-point font: "The Home Water Rating Standard Disclosure for this home is available from the Rating Provider." At a minimum, this statement shall also include the Rating Provider's mailing address and phone number.

G501.2.4 Rating Types. There shall be three Rating Types in accordance with Sections G501.2.4.1 through G501.2.4.3.

G501.2.4.1 Confirmed Rating. A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections G501.2.4.1.1 through G501.2.4.1.3.

G501.2.4.1.1 Field verified. All Minimum Rated Features of the Rated Home shall be field-verified through inspection and testing in accordance with Section G401.

G501.2.4.1.2 Entry into tool. All field-verified Minimum Rated Features of the Rated Home shall be entered into the Approved Software Rating Tool that generates the home water rating. The home water rating shall report the Water Rating Index that comports with these inputs.

G501.2.4.1.3 Quality Assurance. Confirmed Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

G501.2.4.2 Sampled Ratings. A Rating Type that encompasses a set of dwellings and is conducted in accordance with Sections G501.2.4.2.1 through G501.2.4.2.3.

G501.2.4.2.1 Set of rated homes. For the set of Rated Homes, all Minimum Rated Features shall be field verified through inspection and testing of a single home in the set, or distributed across multiple homes in the set, in accordance with the requirements equivalent to Section 600 of the Mortgage Industry National Home Energy Rating Systems Standard.

G501.2.4.2.2 Worst case analysis. The threshold specifications from the Worst-Case Analysis for the Minimum Rated Features of the set of Rated Homes shall be entered into the Approved Software Rating Tool that generates the home water use rating. The home water use rating shall report the Water Rating Index that comports with these inputs.

G501.2.4.2.3 QUALITY ASSURANCE. Sampled Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

G501.2.4.3 Projected Ratings. A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections G501.2.4.3.1 through G501.2.4.3.3.

G501.2.4.3.1 Minimum rated features. All Minimum Rated Features of the Rated Home shall be determined from architectural drawings, threshold specifications, and the planned location for a new home or from a site audit and threshold specifications for an existing home that is to be improved.

G501.2.4.3.2 Unknown values. Unknown values shall be determined in accordance with Section G401.3.

G501.2.4.3.3 Text required. The Projected Rating Report shall contain the following text in not less than 14-point font at the top of the first page of the report: "Projected Rating Based on Plans—Field Confirmation Required."

G501.3 Innovative Design Requests. .

G501.3.1 Petition. Water Rating providers can petition for adjustment to the Water Rating Index for a Rated Home with features or technologies not addressed by Approved Software Rating Tools or this Standard. Innovative Design Requests (IDRs) shall be submitted to an Approved IDR authority and shall include, at a minimum, the following:

G501.3.1.1 Features required. A Rating generated from an Approved Software Rating Tool for the Rated Home without feature(s) that cannot be modeled in the software tool.

G501.3.1.2 Features not included. Written description of feature(s) not included in the Rating generated from software.

G501.3.1.3 Manufacturer's specifications. Manufacturer's technical and/or performance specifications for feature(s) not included in the Rating generated from the Approved Software Rating Tool.

G501.3.1.4 Estimated water use impact. Calculations or simulation results estimating the water use impact of feature(s) not included in the Rating generated from an Approved Software Rating Tool and documentation to support the calculation methodology and/or describe the modeling approach used.

G501.3.1.5 Estimated adjustment. Estimated adjustment to the Water Rating Index. Calculations shall follow the procedures of Sections G301.1 and G301.2.

G501.3.2 Approval. IDRs shall be approved on a case by case basis. The Approved IDR review authority shall accept or reject the IDR as submitted, or request additional information. The Approved IDR review authority shall assign a unique identifier to each IDR and maintain a database of IDRs. If the IDR is approved, the Water Rating provider is authorized to issue a supplemental report that adjusts the Water Rating Index, as approved.

SECTION G601
REFERENCE STANDARD

G601.1 General. See Table G601.1 for standards that are referenced in various section of this appendix. Standards are listed by the standard identification with the effective date, the standard title, and the section or sections of this appendix that reference this standard.

TABLE G601.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ANSI/RESNET/ICC-301-2022	Standard for the Calculation and Labeling of the Energy Performance of Dwelling and Sleeping Units using an Energy Rating Index.	
RESNET/ICC-850-2020	Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index	
ANSI/ASABE S626 SEP2016 (R2020)	Landscape Irrigation System Uniformity and Application Rate Testing	
--	CEC appliance database	
--	EPA Energy Star Website	
--	ENERGY STAR product finder database	
--	California Energy Commission (CEC) Modernized Appliance Efficiency Database	
--	Department of Energy (DOE) Compliance Certification Management System (CCMS).	
--	EPA Water Sense specification for Tank-Type Toilets	
--	US Geological Survey Concentrations of Hardness as Calcium Carbonate Map	
--	Mortgage Industry National Home Energy Rating Systems Standard.	

Staff Analysis: A review of the standards proposed for inclusion in the code,
ANSI/RESNET/ICC-301-2022 *Standard for the Calculation and Labeling of the Energy Performance of Dwelling and Sleeping Units using an Energy Rating Index.*
RESNET/ICC-850-2020 *Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index*
ANSI/ASABE S626 SEP2016 (R2020) *Landscape Irrigation System Uniformity and Application Rate Testing*
CEC appliance database
EPA Energy Star Website
ENERGY STAR product finder database
California Energy Commission (CEC) Modernized Appliance Efficiency Database
Department of Energy (DOE) Compliance Certification Management System (CCMS).
EPA Water Sense specification for Tank-Type Toilets
US Geological Survey Concentrations of Hardness as Calcium Carbonate Map
Mortgage Industry National Home Energy Rating Systems Standard.
, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: In response to water resources becoming increasingly strained throughout the country and water prices rising fast due to aging infrastructure and water utility rate structures, ANSI/RESNET/ICC 850-2020 was developed to provide a consistent, uniform methodology for evaluating, quantifying, and labeling the water use performance of one- and two-family dwellings and to serve as the basis for RESNET's residential water efficiency rating system (known as $HERS_{H2O}$®).

Drought, new development and aging water infrastructure can all put a strain on local water resources. In some instances this has caused local officials to put a moratorium on new permits for fear the water utility could not meet the increased demand, as described in a New York Times article. ANSI/RESNET/ICC 850 provides a much-needed resource for states, municipalities and builders to not only evaluate a home's water efficiency but to estimate their annual water use. This estimate of annual water use can serve as an important tool for anticipating the water needs of new development.

For user convenience and to provide a resource for builders to measure the water efficiency of the homes they build, ANSI/RESNET/ICC 850 should be added in its entirety as a new appendix in both the International Plumbing Code and International Residential Code since both are adopted for use in residential construction.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Bibliography: RESNET's Water Efficiency Rating System HERS$_{H2O}$® - https://www.resnet.us/about/hersh2o/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed language is being recommended for inclusion into the code(s) as a voluntary appendix.

Add new text as follows:

APPENDIX CI Calculation and Labeling of the Water Use Performance of One- and Two-Family Dwellings

SECTION CI101
GENERAL

CI101.1 Purpose. The provisions of this appendix establish a uniform methodology for evaluating, rating and labeling the water use performance of one and two-family dwellings.

CI101.2 Scope. This appendix shall provide a uniform methodology for evaluating, rating and labeling the indoor and outdoor water use performance of one- and two-family dwellings. Such evaluations, rating and labeling shall be in accordance with this appendix and RESNET/ICC-850.

Add new definition as follows:

CI201
DEFINITIONS

Add new text as follows:

CI201.1 Definitions. The following terms and acronyms have specific meanings as used in this Appendix. In the event that definitions given here differ from definitions given elsewhere, the definitions given here shall govern.

Add new definition as follows:

Approved Rating Provider.
An approved entity responsible for the certification of home water efficiency raters working under its auspices and who is responsible for the quality assurance of such Certified Raters and for the quality assurance of water efficiency ratings produced by such home water

efficiency raters.

Approved Software Rating Tool.
A computerized procedure that is approved for the purpose of conducting home water efficiency ratings and calculating the annual water consumption, annual water costs and a Water Rating Index for a home.

Automatic Irrigation System.
An irrigation system that is initiated by a clock timer, irrigation controller, or other method that does not require human intervention to initiate an irrigation event.

Bedroom.
A room or space 70 square feet of floor area or greater, with egress window and closet, used or intended to be used for sleeping. A “den,” “library,” “home office” with a closet, egress window, and 70 square feet of floor area or greater or other similar rooms shall count as a Bedroom, but living rooms and foyers shall not.

Irrigated Area.
The portion of a lot that receives supplemental water for irrigation.

Lot Size.
The area of a single parcel of land on which the Rated Home is located.

Other Water Use.
Water use associated with leaks, minor draws, and other end uses not specified in the Reference Home or Rated Home.

Outdoor Water Use. Water use that occurs outside of the exterior walls of a dwelling unit.

Rated Home.
The specific real property that is evaluated using the water use performance rating procedures specified by this Appendix.

Reference Home. A hypothetical home configured in accordance with the specifications set forth in Section CI301.3of this code andthe basis of comparison for the purpose of calculating the Water Rating Index of a Rated Home.

Residential Irrigation Capacity Index (RICI). The intensity with which an automatic irrigation system applies water calculated in accordance with Section **CI301.6.3.**

Water Rating Index (WRI). An integer representing the relative water use of a Rated Home as compared with the water use of the Reference Home and where an Index value of 100 represents the water use of the Reference Home and each integer reduction represents a one percent improvement in water use efficiency.

Add new text as follows:

SECTION CI301
HOME WATER RATING CALCULATION PROCEDURES

CI301.1 Determining the Water Rating Index. The Water Rating Index (WRI) shall be determined in accordance with Sections CI301.2 through CI301.6. The Reference Home shall be configured in accordance with Sections CI301.3 and CI301.4, and the Rated Home shall be configured in accordance with Section CI301.5 and CI301.6 .

CI301.2 Determining the Daily Indoor Water Use for the Reference Home. The indoor daily water use for the Reference Home shall be calculated as follows:

$$WRI = \frac{\text{indoor and outdoor daily water use for the Rated Home}}{\text{indoor and outdoor daily water use for the Reference Home}} \times 100$$

(Equation CI301.2-1)

CI301.3 Determining the Daily Indoor Water Use for the Reference Home.. The indoor daily water use for the Reference Home shall be calculated as follows:

refingpd = refFgpd + refWgpd + refDWgpd + refCWgpd +refTgpd + refSofgpd + refOther(Equation CI301.3-1)

where: $refF_{gpd}$ = daily fixture water use for the Reference Home

refWgpd = daily water use wasted from hot water outlets for the Reference Home

refDWgpd = daily dishwasher water use for the Reference Home

refCWgpd = daily clothes washer water use for the Reference Home

refTgpd = daily toilet water use for the Reference Home

refSofgpd = daily water softener water use for the Reference Home

refOther = daily total other/unidentified water use for the Reference Home

CI301.3.1 Determining Daily Reference Home Fixture Water Use. Reference Home daily fixture water use shall be calculated as follows:

$refFgpd = 14.6 + 10 \times Nbr$ **(Equation CI301.3.1-1)**

where:

Nbr = number of bedrooms in the Rated Home

CI301.3.2 Determining Daily Reference Home Hot Water Waste. Reference Home daily hot water waste shall be calculated as follows:

$refWgpd = 9.8 \times Nbr^{0.43}$ **(Equation CI301.3.2-1)**

where:

Nbr = number of bedrooms

CI301.3.3 Determining Daily Reference Home Dishwasher Water Use. Reference Home dishwasher water use shall be calculated as follows:

$$refDWgpd = \frac{(88.4 + 34.9 \times Nbr) \times 8.16}{365}$$ **(Equation CI301.3.3-1)**

Which simplifies to:

$refWgpd = 1.97 + 0.7802 \times Nbr$

Where:

Nbr = number of bedrooms

($88.4 + 34.9 \times Nbr$) = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey

8.16 = gallons per cycle from the DOE Technical Support Document from the NAECA standard in effect in 2006

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

CI301.3.4 Determining Daily Reference Home Clothes Washer Water Use. Reference Home daily clothes washer water use shall be calculated as follows:

$$refCWgpd = \frac{(3.0 \times 11.4 \times ACY)}{365}$$ **(Equation CI301.3.4-1)**

Where:

3.0 = reference washer capacity (*CAPw*) in ft3

11.4 = reference integrated water factor (IWF) in (gal/cyc) per ft3

ACY = Adjusted Cycles per Year = (164 + 46.5 × *Nbr*)

Nbr = number of bedrooms

CI301.3.5 Determining Daily Reference Home Toilet Water Use.

refTgpd= *refFPO* × *refGPF* × *Occ* **(Equation CI301.3.5-1)**

where:

refFPO = the Reference Home flushes per person per day = 5.05

refGPF = the Reference Home gallons per flush for toilets = 1.6

Occ = the number of occupants = 1.09 + 0.54 ×*Nbr*

Nbr = number of bedrooms

CI301.3.6 Determining Daily Reference Home Water Softener Use.. Where the Rated Home has a water softener and the water hardness at the Rated Home location is greater than or equal to 180 milligrams/liter, the Reference Home water softener daily water use shall be calculated as follows:

$$refSofgpd = \frac{\text{grains of hardness}}{\text{gallon of water}} \times \text{sum of indoor water uses in the Reference Home} \times \frac{\text{5 gallons used}}{\text{1,000 grains removed}}$$

Where the Rated Home does not meet these conditions, the *refSofgpd* = 0. **(Equation CI301.3.6-1)**

CI301.3.7 Determining Daily Reference Home Other Water Use. . Reference Home daily other water use shall be determined as follows:

refOther = 5.93 × *Nbr* **(Equation CI301.3.7-1)**

where:

Nbr = the number of bedrooms in the Rated Home

CI301.4 Determining the Reference Home Outdoor Water Use. The reference home outdoor annual water use (in thousands of gallons per year) shall be calculated using the following two equations:

If the rated home has a netET of less than 12 inches/year OR the rated home has an automatic irrigation system, use Equation **CI301.4-1**.

(Equation CI301.4-1)

$$\left[\frac{Exp(A)}{1 + Exp(A)}\right] \times 1.18086 \times [2.0341 \times netET0.7154 \times Ref\_Irr\_Area0.6227 + 0.5756 \times ind\_Pool \times netET]$$

If the rated home has a netET of greater than 12 inches/year AND the rated home does NOT have an automatic irrigation system, use

Equation CI301.4-2. $\left[\dfrac{Exp(B)}{1+Exp(B)}\right]$ × 1.22257 × [1.4233 + 0.6311 × *netET* +

0.9376 × *Ref_Irr_Area*]]+ *ref_Pool* (Equation **CI301.4-2**)*Either equation shall be constrained as follows:*

IF

Rat_Irr_Area < *Ref_Irr_Area* ***THEN*** *Ref_Out* = Equation **CI301.4-1** or **CI301.4-2**

$$\frac{\text{Equation 1 (Using Rat\_Irr\_Area and ind\_Pool = 0)}}{\text{Equation 1 (with Ref\_Irr\_Area and ind\_Pool = 0)}}$$ (Equation **CI301.4-3**)

AND

Outdoor Reference Home Annual Water
Use shall never be lower than Equation **CI301.4-2**

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × *netET* × (*Irr_Area*/1,000)]

Ref_Irr_Area = the size of the irrigated area in the Reference Home, calculated in accordance with Section **CI301.4.1**

Rat_Irr_Area = the size of the irrigated area in the Rated Home

netET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool in the Rated Home

ref_Pool = Equation **CI301.4-1** (using *ind_Pool* = 1) – Equation **CI301.4-1** (using *ind_Pool* = 0)

-

CI301.4.1 Determining Outdoor Daily Water Use for the Reference Home. . Reference Home daily outdoor water use shall be determined by multiplying the result of either Equation **CI301.4-1** or Equation **CI301.4-2**, as appropriate, by 1,000 and dividing the product by 365.

CI301.4.2 Determining Irrigated Area for the Reference Home. Reference Home Irrigated Area shall be calculated as follows: Where the lot size of the Rated Home is less than 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:

Ref_Irr_Area = *Lot_Area* × (0.002479 × *Lot_Area*0.6157) **(Equation CI301.4.2-1)**

wherethe Lot Size of the Rated Home is greater than or equal to 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:

Ref_Irr_Area = *Lot_Area* × 0.577Equation **CI301.4.2-2**)

Where:

Ref_Irr_Area = the size of the landscape that receives supplemental water in the Reference Home

Lot_Area = the size of the lot on which the Rated Home is being constructed

CI301.5 Determining Daily Indoor Water Use of the Rated Home.. The daily Indoor Water Use of the Rated Home shall be calculated as follows:

$$Indoorgpd = Showergpd + KitchFgpd + LavFgpd + Wastegpd + CWgpd + DWgpd + Toiletsgpd + Softgpd + Other + EPgpd$$

where: **(Equation CI301.5-1)**

Where:

Showergpd = daily shower water use for the Rated Home

KitchFgpd = daily kitchen faucet water use for the Rated Home

LavFgpd = daily lavatory water use for the Rated Home

Wastegpd = daily water use wasted for the Rated Home

CWgpd = daily clothes washer water use for the Rated Home

DWgpd = daily dishwasher water use for the Rated Home

Toiletsgpd = daily toilet water use for the Rated Home

Softgpd = daily water softener water use for the Rated Home

Othergpd = daily other/unidentified water use for the Rated Home

EPgpd = daily excess pressure adjustment

CI301.5.1 Determining Daily Shower Water Use for the Rated Home. Rated Home daily shower water use shall be calculated as follows:

$$Showergpd = FixtureTot \times showerpc \times SHeff$$ **(Equation CI301.5.1-1)**

where:

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301, Addendum A =

$$\frac{adjFmix}{Fmix} \times refFgpd$$

Shower_pc = percent of fixture water use consumed by showers = 54%

SHeff = the ratio of the average rated flow rate of showerheads to the reference home flow rate

$$= \frac{\text{average flow rate of showerheads in the Rated Hame}}{2.5}$$

CI301.5.2 Determining Daily Kitchen Faucet Water Use for the Rated Home. Rated Home daily kitchen faucet water use shall be calculated as follows:

$$KitchFgpd = FixtureTot \times faucetpc \times KitchFeff \times kitch$$ **(Equation CI301.5.2-1**

where:

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301 Addendum A = $\frac{adjFmix}{Fmix}$ × *refFgpdfaucetpc*

= percent of fixture water use consumed by faucets = 46%

KitchFeff = the ratio of the average rated flow rate of kitchen faucets to the Reference Home flow rate

average flow rate of kitchen faucets in rated home

2.2

Kitch = the percentage of faucet use that is attributed to kitchen faucets = 69%

-

CI301.5.3 **Determining Daily Lavatory Faucet Water Use for the Rated Home. .** Rated Home daily lavatory faucet use shall be calculated as follows:

LavFgpd = FixtureTot × faucetpc × LavFeff × Lav **(Equation CI301.5.3-1)**

where:

Lav = the percentage of faucet use that is attributed to lavatory faucets= 31%*FixtureTot* = determined in accordance with ANSI/RESNET/ICC 301 Addendum A =

$\frac{adjFmix}{Fmix}$ x *refFgpdfaucet_pc* = percent of fixture water use consumed by faucets = 46%

LavFeff = the ratio of the average rated flow rate of lavatory faucets to the Water Rating Reference Home flow rate = 1 for standard faucets and 0.95 for high-efficiency faucets

-

CI301.5.4 **Determining Daily Hot Water Waste for the Rated Home.** Rated Home daily hot water waste shall be calculated as follows:

Wastegpd = *Feff* × (*oWgpd* + *sWgpd* × *WDeff*) **(Equation CI301.5.4-1)**

where:

Feff = fixture efficiency of showerheads, kitchen faucets, and lavatory faucets weighted by contribution to total fixture use (by volume)

oWgpd = daily standard operating condition hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

sWgpd = daily structural hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

WDeff = distribution system water use effectiveness from Table 4.2.2.5.2.11(3) of ANSI/RESNET/ICC 301 Addendum A

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

CI301.5.5 **Determining Daily Clothes Washer Water Use for the Rated Home.** Rated Home daily clothes washer water use shall be calculated as follows:

(Equation CI301.5.5-1)

$$CW_{gpd} = \frac{CAPw \times IWF \times ACY}{365}$$

where:

CAPw = washer capacity in cubic feet = the manufacturer's data or the CEC database or the EPA Energy Star® website

IWF = Integrated Water Factor from manufacturer's data [(gal/cyc)/ft3]

ACY = Adjusted cycles per year

Determining ACY:

ACY = (164 + 46.5 × *Nbr*)

$$\times \frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)} =$$

best fit regression equation to adjust the standard cycles per year to account for occupancy and size of clothes washer; based on 2005 Residential Energy Consumption Survey data

Where:

CAPw = the capacity of the clothes washer in ft3(164 + 46.5 × *Nbr*) = standard cycles per year based on 2005 Residential Energy Consumption Survey data

$$\frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)}$$

CI301.5.6 Determining Daily Dishwasher Water Use for the Rated Home. . Rated Home daily dishwasher water use shall be calculated as follows:

DWgpd = [(88.4 + 34.9 × *Nbr*) × (12/*dWcap*) × gal/cycle/365 **(Equation CI301.5.6-1)**

where:

Nbr = number of bedrooms in the Rated Home

dWcap = capacity of the dishwasher in the Rated Home (in place settings) as included in the manufacturer's data (88.4 + 34.9 × *Nbr*) = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey gal/cycle can be entered either directly or as listed on:

a. The ENERGY STAR product finder database.

b. The California Energy Commission (CEC) Modernized Appliance Efficiency Database.

c. The Department of Energy (DOE) Compliance Certification Management System (CCMS).

OR gal/cycle can be calculated from the Energy Guide label as follows (developed using the equations from 10 CFR 430, Subpart B, Appendix C and values on the Energy Guide label) to isolate the energy used by the appliance from the energy used in water heating):gal/cycle = h2o_kWh × elec_h2o

h2o_kWh = LER-Appl_kWh

LER = Labeled Energy Rating in kWh per year per the dishwasher Energy Guide label

Appl_kWh = dishwasher appliance annual electric energy use = (GHWC × gas_h2o/$_therm-LER × $_kWh × elec_h2o/per_kWh) / ($_kWh × gas_h2o/$_therm-elec_h2o)

-
Where:

-
$_kWh = the cost of one kWh per the dishwasher Energy Guide label

$_therm = the cost of one therm per the dishwasher Energy Guide label

GHWC = Gas Hot Water Cost per the dishwasher Energy Guide label

elec_h2o = gallons of hot water use per cycle per unit of annual electricity use in gal × y/kWh × cyc = 1/(80 × 0.0024 × 208) = 0.02504gas_h2o = gallons of hot water use per cycle per unit of annual gas use in gal × y/therm × cyc = 1/(80 × 8.2/0.75 × 208/100,000) = 0.5497

80 = the average hot water heater temperature rise per 10 CFR 430, Subpart B, Appendix C

0.0024 = specific heat of water in kWh/gal × F per 10 CFR 430, Subpart B, Appendix C

8.2 = specific heat of water in Btu/gal × F per 10 CFR 430, Subpart B, Appendix C

0.75 = recovery efficiency of gas hot water heater per 10 CFR 430, Subpart B, Appendix C

208 = cycles per year

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

-

CI301.5.7 Determining Daily Toilet Water Use for the Rated Home. Rated Home daily toilet water use shall be calculated as follows:
Toiletgpd = refFPO × gpf × Occ

Where:

refFPO = the reference flushes per person per day = 5.05

gpf = the average gallons per flush of all toilets installed in the Rated Home; for tank-type dual-flush toilets, use the effective flush volume per flush based on EPA Water Sense specification for Tank-Type Toilets

Occ = the number of predicted occupants in the Rated Home = 1.09 + 0.54 × *Nbr*

Nbr = the number of bedrooms in the Rated Home

-

CI301.5.8 **Determining Daily Water Softener Water Use for the Rated Home.** .

Rated Home daily water softener water use shall be calculated as follows:*Softgpd* = $\frac{\text{grains of hardness}}{\text{gallon of water}}$ × [sum of softened water uses in the Rated Home] × [gallons used per 1,000 grains of hardness]

where: **(Equation CI301.5.8-1)**

softened water = water conditioned by a water softener

CI301.5.9 **Determining Daily Other Water Use for the Rated Home.** . Rated Home daily other water use shall be calculated as follows:

Othergpd = 5.93 × *Nbr* **(Equation CI301.5.9-1)**

where:

Where:

Nbr = the number of bedrooms in the rated home

CI301.5.10 **Determining Daily Excess Pressure Adjustment Water Use for the Rated Home.**. Where a Rated Home does not have a pressure-reducing valve or pressure tank, additional water use attributed to excess water pressure shall be calculated as follows:

EPgpd = MAX {[(*Showergpd* + (0.5 × (*LavFgpd* + *KitchFgpd* + *Othergpd*))) × 0.006 × (*PR* – 90)],0} **(Equation CI301.5.10-1)**

where:

Where:

PR = static water pressure (in psi) measured at the indoor fixture outlet on the lowest floor and (if more than one) closest to the water service entry to the house

Shower and lavatory faucets controlled by integral or accessory pressure-compensating devices shall be permitted to be excluded from this equation.

CI301.6 **Determining Outdoor Water Use for the Rated Home.** The Rated Home outdoor water use shall be calculated as follows: Where the Rated Home has an automatic irrigation system, outdoor water use shall be calculated as follows:

(Equation CI301.6-1)

$\left[\frac{Exp(A)}{1 + Exp(A)}\right]$ × 1.18086 × [2.0341 × netET0.7154 × *Rat_Irr_Area*0.6227 + 0.5756 × *ind_Pool* × *netET*]

Where the Rated Home does not have an automatic irrigation system, outdoor water use shall be calculated as follows: $\left[\frac{Exp(B)}{1 + Exp(B)}\right]$ × 1.22257 × [1.4233 + 0.6311 × *netET* + 0.9376 × *Rat_Irr_Area*]] + *Pool_use*

(Equation **CI301.6-2**)

The outdoor water use for the Rated Home shall never be less than the result of the following calculation:

$\left[\frac{Exp(B)}{1 + Exp(B)}\right]$ × 1.22257 × [1.4233 + 0.6311 × *netET* + 0.9376 × *Rat_Irr_Area*]

(Equation **CI301.6-3**)

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Rat_Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × netET * (*Rat_Irr_Area*/1,000)]

Rat_Irr_Area = the size of the landscape that might receive supplemental water in the Rated Home

netET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool

Pool_use = Equation **CI301.6-1** (using *ind_Pool* = 1) – Equation **CI301.6-1** (using *ind_Pool* = 0)

-

CI301.6.1 Determining Outdoor Daily Water Use for the Rated Home. Rated Home daily outdoor water use shall be determined by multiplying the result of either Equation CI301.6-1 or Equation CI301.6-2 as appropriate, as such result may be further modified pursuant to Sections CI301.6.1 through CI301.6.4 , by 1,000 and dividing the product by 365.

CI301.6.2 Weather-based Controllers. . Sensor- and weather- based irrigation controllers that are certified by the US EPA WaterSense program shall decrease the portion of predicted Rated Home outdoor water use associated with irrigation, less the water use associated with pools, by 15% in homes that have automatic irrigation system.

CI301.6.3 Commissioning of an Automatic Irrigation System. In Rated Homes with an automatic irrigation system, where documentation is provided, the water use associated with irrigation shall be decreased by 5% where a certified professional, as identified by a WaterSense labeled certification, has inspected the irrigation system according to the protocols identified in ASABE S626 and verified as follows:

1. Average distribution uniformity of at least 65% on turf areas.
2. Sprinklers are operating at the manufacturer's recommended water pressure +/- 10%.
3. The system operates without leaks
4. The system prevents runoff and overspray from leaving the property (checked during the audit).
5. Two seasonal water schedules (initial grow-in period and established landscape) are posted at the controller.

CI301.6.4 Residential Irrigation Capacity Index (RICI). In a Rated Home with an automatic irrigation system, where documentation is provided, a RICI shall be calculated as follows:

-

(Equation CI301.6.4-1

$$RICI_{rat} = \frac{\text{sum of flow (gpm) of all irrigation valves}}{\text{square feet irrigated area}} \times 1{,}000$$

CI301.6.4.1 Applying RICI. . A Rated Home, where documentation for a RICI is provided, may adjust the volume of water use associated with irrigation (less the water use associated with pools) in the outdoor water use of the Rated Home by 10% for every point from a baseline RICI (RICI_ref) of 5.

CI301.6.5 Applying Adjustments to the Outdoor Water Use of Rated Homes. . Because the Water Rating Index model includes a number of percent adjustments for the outdoor water use of the Rated Home, the order of application becomes important. The correct order in which to apply these adjustments is as indicated in Table **CI301.6.5.**

TABLE CI301.6.5 APPLYING ADJUSTMENTS TO OUTDOOR WATER USE OF THE RATED HOME

STEP	SECTION	DETERMINED BY
1	**CI301.6.2** —Weather-based Controllers	Shall be determined by the presence or absence of a smart controller in the installed portion of the landscape.
2	**CI301.6.3** — Commissioning of an Automatic Irrigation System	Shall be determined by the presence or absence of commissioning in the installed portion of the landscape.
3	**CI301.6.4**—Residential Irrigation Capacity Index (RICI)	Shall be calculated in accordance with Section **CI301.6.4** and adjusted in partially finished landscapes to be calculated as: *RICI_rat* $= \frac{\text{sum of flow (gpm) of all irrigation valves } + (0.005 \times \text{predicted } Back\_irr)}{\text{square feet irrigated area}} \times 1{,}000$ (Predicted *Back_irr* is defined in Section **CI401.5**)

SECTION CI401
MINIMUM RATED FEATURES

CI401.1 MINIMUM RATED FEATURES TABLE. The estimated annual indoor and outdoor water use shall be determined using the minimum rated features set forth in Table **CI401.1**

TABLE CI401.1 MINIMUM RATED FEATURES

Building Element	Minimum Rated Feature
Toilet	Flush volume for each toilet as measured on-site or from manufacturer’s data.
Shower/Bath	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Bathroom Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Kitchen Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Clothes Washer	Washer capacity (cubic feet) from manufacturer’s data or the CEC Appliance Efficiency Database or the EPA ENERGY STAR website for all clothes washers located within the Rated Home.
Dishwasher	Capacity of the dishwasher (in place settings) as included in the manufacturer’s data, labeled energy factor (cycles/kWh) for all dishwashers located within the Rated Home.
Water Softener	Gallons of water used per 1,000 grains of hardness removed.
Hot Water Distribution	Insulation *R*-value of pipe insulation, type of recirculation system, length of pipe.
Outdoor Water Use	Irrigation system type (automatic or manual), lot size, irrigated area (square feet).
Pool/Spa	Indicate presence or absence of a pool or spa.
Service Water Pressure	Service pressure of water being supplied to the home, as established by the setting of an installed pressure-reducing valve OR the setting of an installed pressure tank OR written documentation from the water supplier that service pressure to the site is 90 psi OR an on-site static pressure test.

CI401.2 Data Sources. Data required for the calculation of indoor and outdoor daily water use in the Rated and Reference Homes shall be determined by the location of the Rated Home and using data as set forth in Sections **CI401.2**.1 and **CI401.2**.2.

CI401.2.1 Net Evapotranspiration. Data for net evapotranspiration shall be determined for the location of the Rated Home using the World Water and Climate Atlas.

CI401.2.2 Hardness of Water. Data for the hardness of water shall be determined by the location of the Rated Home and one of the following:

1. US Geological Survey Concentrations of Hardness as Calcium Carbonate Map.
2. Data provided by the local water supplier.

3. A hardness test of water collected in the home using an EPA-approved method for determination of hardness.

CI401.3 Default Values. Values that are not available in accordance with Table CI401.1 5.0 or are absent from the home at the time of the rating shall use default values in accordance with Table **CI401.3** . Values for building elements that are not specified in Table **CI401.3** are required for a rating to be issued.

TABLE CI401.3 DEFAULT VALUES

Building Element	Default
Water Softeners	Can be entered as 0 if they are absent from a Rated Home. If they are present and no documentation is available, they may be assumed to use 5 gallons/1,000 grains removed for cation water softeners if information is unavailable.
Clothes Washer	Same as Reference Home.
Dishwasher	Determined by ANSI/RESNET/ICC 301. A Rated Home without either a dishwasher or an undercounter cavity for placement of a dishwasher shall be assigned a Daily Dishwasher Water Use of 0.
Hot Water Distribution	Determined by ANSI/RESNET/ICC 301 Addendum A.
Outdoor Water Use	Must be done in accordance with Section CI301.4

CI401.4 Incomplete Outdoor Area. To receive a rating, a home must (at a minimum) have the front yard landscape completed. Homes that do not have landscaping completed in the back yard shall be determined in accordance with Section **CI301.6** with the portion of landscaping that is done determining the presence or absence of an automatic irrigation system. The following steps shall be followed in determining irrigated area in this instance:

Rater must determine a line between the front and back area (*Front_area* + *Back_area* must = *Total_available_area*)

Lot_Area – Pad Footprint = *Total_available_area*

(Back_area/*Total_available_area*) × *Ref_Irr_Area* = *Predicted Back_irr*

Irr_Area = *Predicted Back_irr* + *Front_irr*

Where:

Pad Footprint = the portion of the lot area covered by the dwelling unit and any attached or detached garage

Total_available_area = the portion of the lot excluding the pad of the house that is available for landscaping or other design features (hardscape, softscape, etc.)

Front_area = the area (ft2) of the total available area that is located primarily in front of the house

Back_area = the area (ft2) of the total available area that is located primarily behind the house

Front_irr = the area located primarily in front of the house that receives supplemental water for irrigation at the time of the rating

Predicted Back_irr = the portion of the area located primarily behind the house that can be predicted to receive supplemental water for irrigation in the future

CI501
CERTIFICATION AND LABELING

CI501.1 STANDARD FOR CERTIFICATION AND LABELING. This section establishes minimum uniform standards for certifying and labeling home water use performance using the Water Rating Index. These include minimum requirements of the home water use rating process, standard methods for estimating water use, minimum reporting requirements, and specification of the types of ratings that are performed in accordance with this code.

CI501.2 Rating Requirements. .

CI501.2.1 General. The rating for a home shall be determined in accordance with Sections CI501.2.1.1through CI501.2.1. 2.

CI501.2.1.1 EXISTING HOMES. For an existing home, required data shall be collected on-site.

CI501.2.1.1.1 NEW HOMES. For a new, to-be-built home, the procedures of Section CI401 shall be used to collect required data.

CI501.2.1.2 ESTIMATED ANNUAL WATER CONSUMPTION. The collected data shall be used to estimate the annual water consumption for indoor and outdoor water use for both the Rated Home and the Reference Home as specified by Section CI301

CI501.2.2 Cost Savings Estimates. Where determined, cost savings estimates for water and wastewater (sanitary sewer) service for the Rated Home shall be calculated in accordance with Sections CI501.2.2.1 through CI501.2.2.1.3

CI501.2.2.1 Water Cost Savings. .

CI501.2.2.1.1 Water Prices. Water cost savings for homes receiving potable water service from a water supplier shall be based on the schedule of rates and charges adopted by the water supplier serving the Rated Home.

CI501.2.2.1.2 Relevant Rates and Charges. Water cost savings shall be calculated from the volumetric portion of the schedule of rates and charges, sometimes referred to as the commodity charge. Fixed or flat charges that do not vary with the volume of water delivered to the home, sometimes referred to as the meter charge or service charge, shall not contribute to the cost savings estimate.

CI501.2.2.1.3 Water Cost Savings Calculations. .

CI501.2.2.1.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a water billing period by dividing the annual indoor volume by the number of bills per year generated by the water supplier (e.g., for monthly billing divide by 12 and for quarterly billing divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

CI501.2.2.1.3.2 Determine Outdoor Water Use for a Billing Period. Convert the total annual volume of outdoor water use in the Reference Home to an increment of outdoor use during a water billing period using one of two methods, based on prevailing practice at the location of the Rated Home.

CI501.2.2.1.3.2.1 Peak Season Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during the irrigation season (e.g., for a 6-month irrigation season with monthly billing, divide by 6; for a 6-month irrigation season with quarterly billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

CI501.2.2.1.3.2.1.2 Year-Round Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during a full year (e.g., for monthly billing, divide by 12 and for quarterly billing, divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

CI501.2.2.1.3.3 Combine Indoor and Outdoor Water Use Charges. For each billing period in a year, calculate the billed water volume by combining the average billed indoor volume with any average billed outdoor volume applicable to such billing period. Note that where peak season irrigation has been calculated, the billed water volume for the billing period outside of the irrigation season will consist entirely of the average billed indoor volume. Apply the volumetric portion of the rate schedule to the billed volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual water volume charge of the Reference Home.

CI501.2.2.1.3.4 Determine Water Use Cost for the Rated Home. Repeat the process described in Sections CI501.2.2.1.3 through CI501.2.2.1.3.3 for the Rated Home to calculate the annual water volume charge of the Rated Home.

CI501.2.2.1.3.5 Total Estimated Water Cost Savings. Estimated water cost savings shall be the difference between the estimated annual water volume charge of the Reference Home and the estimated annual water volume charge of the Rated Home.

CI501.2.2.2 Sanitary Sewer Service Cost Savings. .

CI501.2.2.2.1 Sewer Service Prices. Sanitary sewer service cost savings for homes with a permanent connection to sanitary collection and treatment works shall be based on the schedule of rates and charges adopted by the sanitary sewer service provider serving the Rated Home. Note that collection and treatment of sanitary discharges may be performed by separate entities, and that billing to the Rated Home by such entities may be combined or separate.

CI501.2.2.2.2 Relevant Rates and Charges. Sanitary sewer service cost savings shall be calculated from the volumetric portion of the schedule of rates and charges. Fixed or flat charges that do not vary with the volume of water delivered to the home shall not contribute to the cost savings estimate.

CI501.2.2.2.3 Sewer Cost Savings Calculations. .

CI501.2.2.2.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a sewer billing period by dividing the annual indoor volume by the number of bills per year generated by the sewer service provider (e.g., for monthly billing, divide by 12 and for semi-annual billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

CI501.2.2.2.3.2 Annual Sewer Volume Charge for the Reference Home. Apply the volumetric portion of the sewer rate schedule to the average billed indoor volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual sewer volume charge of the Reference Home.

CI501.2.2.2.4 Determine Annual Sewer charge for the Rated Home. . Repeat the process described in Section CI501.2.2.2.3 for the Rated Home to calculate the annual sewer volume charge of the Rated Home.

CI501.2.2.2.5 Estimated Sewer Cost Savings. . Estimated sewer cost savings shall be the difference between the estimated annual sewer volume charge of the Reference Home and the estimated annual sewer volume charge of the Rated Home.

CI501.2.2.2.6 Combined Presentation of Cost Savings. . Estimated water cost savings and estimated sewer cost savings may be presented as a total estimated cost savings when designated as “water and sewer” savings.

CI501.2.2.3 Other Cost Savings. Performance attributes of the Rated Home may influence other types of charges, depending on the fee structure in the jurisdiction of the Rated Home. While less common, these savings may be significant. Any determinations for cost savings associated with the following charges shall be submitted for individual review and approval by the body providing quality assurance for the rating service provider of the Rated Home.

1. Water service connection charges, also known as tap fees.
2. Sanitary sewer service connection charges, also known as capacity charges.
3. Stormwater fees.

CI501.2.3 Reports. All reports generated by an Approved Software Rating Tool shall, at a minimum, contain the information specified by Sections CI501.2.3.1 through CI501.2.3.6.

CI501.2.3.1 LOCATION. The property location, including city, state, zip code and either the street address or the Community Name and Plan Name for the Rating.

CI501.2.3.2 NAME OF RATER. The name of the certified rater conducting the Rating.

CI501.2.3.2 NAME OF Provider. The name of the Approved Rating Provider under whose auspices the rater is certified.

CI501.2.3.4 DATE. The date the Rating was conducted.

CI501.2.3.5 TOOL NAME AND VERSION. The name and version number of the Approved Software Rating Tool used to determine the Rating.

CI501.2.3.6 DISCLOSURE. The following statement in not less than 10-point font: “The Home Water Rating Standard Disclosure for this home is available from the Rating Provider.” At a minimum, this statement shall also include the Rating Provider’s mailing address and phone number.

CI501.2.4 Rating Types. . There shall be three Rating Types in accordance with Sections CI501.2.4.1through CI501.2.4.3.

CI501.2.4.1 Confirmed Rating. . A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections CI501.2.4.1.1 through CI501.2.4.1.3 .

CI501.2.4.1.1 Field verified. All Minimum Rated Features of the Rated Home shall be field-verified through inspection and testing in accordance with Section CI401 .

CI501.2.4.1.2 Entry into tool. All field-verified Minimum Rated Features of the Rated Home shall be entered into the Approved Software Rating Tool that generates the home water rating. The home water rating shall report the Water Rating Index that comports with these inputs.

CI501.2.4.1.3 Quality Assurance. Confirmed Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

CI501.2.4.2 Sampled Ratings. . A Rating Type that encompasses a set of dwellings and is conducted in accordance with Sections CI501.2.4.2.1 through CI501.2.4.2.3.

CI501.2.4.2.1 Set of rated homes. For the set of Rated Homes, all Minimum Rated Features shall be field verified through inspection and testing of a single home in the set, or distributed across multiple homes in the set, in accordance with the requirements equivalent to Section 600 of the Mortgage Industry National Home Energy Rating Systems Standard.

CI501.2.4.2.2 Worst case analysis. The threshold specifications from the Worst-Case Analysis for the Minimum Rated Features of the set of Rated Homes shall be entered into the Approved Software Rating Tool that generates the home water use rating. The home water use rating shall report the Water Rating Index that comports with these inputs.

CI501.2.4.2.3 QUALITY ASSURANCE. Sampled Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

CI501.2.4.3 Projected Ratings. . A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections CI501.2.4.3.1 through CI501.2.4.3.3 .

CI501.2.4.3.1 Minimum rated features. All Minimum Rated Features of the Rated Home shall be determined from architectural drawings, threshold specifications, and the planned location for a new home or from a site audit and threshold specifications for an existing home that is to be improved.

CI501.2.4.3.2 Unknown values. Unknown values shall be determined in accordance with Section CI401.3 5.2.

CI501.2.4.3.3 Text required. The Projected Rating Report shall contain the following text in not less than 14-point font at the top of the first page of the report: "Projected Rating Based on Plans—Field Confirmation Required."

CI501.3 Innovative Design Requests. .

CI501.3.1 Petition. Water Rating providers can petition for adjustment to the Water Rating Index for a Rated Home with features or technologies not addressed by Approved Software Rating Tools or this Standard. Innovative Design Requests (IDRs) shall be submitted to an Approved IDR authority and shall include, at a minimum, the following:

CI501.3.1.1 Features required. A Rating generated from an Approved Software Rating Tool for the Rated Home without feature(s) that cannot be modeled in the software tool.

CI501.3.1.2 Features not included. Written description of feature(s) not included in the Rating generated from software.

CI501.3.1.3 Manufacturer's specifications. Manufacturer's technical and/or performance specifications for feature(s) not included in the Rating generated from the Approved Software Rating Tool.

CI501.3.1.4 Estimated water use impact. Calculations or simulation results estimating the water use impact of feature(s) not included in the Rating generated from an Approved Software Rating Tool and documentation to support the calculation methodology and/or describe the modeling approach used.

CI501.3.1.5 Estimated adjustment. Estimated adjustment to the Water Rating Index. Calculations shall follow the procedures of Sections CI301.1 and CI301.2 .

CI501.3.2 Approval.. IDRs shall be approved on a case by case basis. The Approved IDR review authority shall accept or reject the IDR as submitted, or request additional information. The Approved IDR review authority shall assign a unique identifier to each IDR and maintain a database of IDRs. If the IDR is approved, the Water Rating provider is authorized to issue a supplemental report that adjusts the Water Rating Index, as approved.

CI601
REFERENCE STANDARDS

CI601.1 General. See Table CI601.1 for standards that are referenced in various section of this appendix. Standards are listed by the standard identification with the effective date, the standard title, and the section or sections of this appendix that reference this standard.

TABLE CI601.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ANSI/RESNET/ICC-301-2022	Standard for the Calculation and Labeling of the Energy Performance of Dwelling and Sleeping Units using an Energy Rating Index.	

RESNET/ICC-850-2020	Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index	
ANSI/ASABE S626 SEP2016 (R2020)	Landscape Irrigation System Uniformity and Application Rate Testing	
--	CEC appliance database	
--	EPA Energy Star Website	
--	ENERGY STAR product finder database	
--	California Energy Commission (CEC) Modernized Appliance Efficiency Database	
--	Department of Energy (DOE) Compliance Certification Management System (CCMS).

--	US Geological Survey Concentrations of Hardness as Calcium Carbonate Map	
--	Mortgage Industry National Home Energy Rating Systems Standard.	

Staff Analysis: A review of the standards proposed for inclusion in the code,

ANSI/RESNET/ICC-301-2022 *Standard for the Calculation and Labeling of the Energy Performance of Dwelling and Sleeping Units using an Energy Rating Index.*

RESNET/ICC-850-2020 *Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index*

ANSI/ASABE S626 SEP2016 (R2020) *Landscape Irrigation System Uniformity and Application Rate Testing*

CEC appliance database

EPA Energy Star Website

ENERGY STAR product finder database

California Energy Commission (CEC) Modernized Appliance Efficiency Database

Department of Energy (DOE) Compliance Certification Management System (CCMS).

EPA Water Sense specification for Tank-Type Toilets

US Geological Survey Concentrations of Hardness as Calcium Carbonate Map

Mortgage Industry National Home Energy Rating Systems Standard.

, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: In response to water resources becoming increasingly strained throughout the country and water prices rising fast due to aging infrastructure and water utility rate structures, ANSI/RESNET/ICC 850-2020 was developed to provide a consistent, uniform methodology for evaluating, quantifying, and labeling the water use performance of one- and two-family dwellings and to serve as the basis for RESNET's residential water efficiency rating system (known as $HERS_{H2O}$®).

Drought, new development and aging water infrastructure can all put a strain on local water resources. In some instances this has caused local officials to put a moratorium on new permits for fear the water utility could not meet the increased demand, as described in a New York Times article. ANSI/RESNET/ICC 850 provides a much-needed resource for states, municipalities and builders to not only evaluate a home's water efficiency but to estimate their annual water use. This estimate of annual water use can serve as an important tool for anticipating the water needs of new development.

For user convenience and to provide a resource for builders to measure the water efficiency of the homes they build, ANSI/RESNET/ICC 850 should be added in its entirety as a new appendix in both the International Plumbing Code and International Residential Code since both are adopted for use in residential construction.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC) PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Bibliography: RESNET's Water Efficiency Rating System HERS$_{H2O}$® - https://www.resnet.us/about/hersh2o/

Cost Impact: Increase

Estimated Immediate Cost Impact:

$50 to $300 per home

Estimated Immediate Cost Impact Justification (methodology and variables):

This cost comes from a small survey of what third party home rating firms currently charge for completing the water efficiency rating for various sizes of typical homes. Larger homes may cost more than small homes and builders with more homes may receive volume discounts. The costs also vary based on geographic location of the home rating companies.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Add new text as follows:

APPENDIX G NONSEWERED SANITATION SYSTEMS

SECTION G101 GENERAL

G101.1 Applicability. The provisions of this chapter shall apply to the installation of nonsewered sanitation systems.

G101.2 System requirements.
Nonsewered sanitation systems shall comply with ANSI/CAN/IAPMO/ISO 30500.

SECTION G102 DEFINITIONS

G102.1 General. For purposes of this chapter, the following definitions shall apply:

CONDITIONED SPACE. An area, room, or space normally occupied and being heated or cooled for human habitation by any equipment.

NONSEWERED SANITATION SYSTEM. A prefabricated integrated sewage treatment unit that is not connected to a public sewer or private sewage disposal system.

SECTION G103 INSTALLATION

G103.1 General.
The installation of nonsewered sanitation systems shall be in accordance with the manufacturer's installation instructions and with Sections G103.2 through G103.7.

G103.2 Operating conditions.
A nonsewered sanitation system in either a conditioned or unconditioned space shall be installed where the ambient temperature, ambient humidity and altitude (*atmospheric pressure*) are in accordance with the manufacturer's installation instructions or product listing.

G103.3 Clearances for servicing and maintenance.
A nonsewered sanitation system shall be located to permit access and sufficient clearance for service and maintenance. Unless otherwise specified by the manufacturer's installation instructions, not less than 30 inches (762 mm) in depth, width and height of working space shall be provided at any access panel.

G103.4 Backflow prevention.

A domestic water supply connection to a nonsewered sanitation system shall be protected in accordance with Section 608 of this code.

G103.5 Effluent storage. Any container or vessel for the storage of effluent discharged from a nonsewered sanitation system and not integral to such system shall be installed in accordance with Section 1301.9.

G103.6 Systems employing combustion. A nonsewered sanitation system employing combustion shall comply with the *International Mechanical Code* .

G103.7 Connection to plumbing system not required. A nonsewered sanitation system is not required to be connected to the sanitary drainage system of the *building* or premises.

SECTION G104 MANUAL REQUIRED

G104.1 Operation and maintenance manual. Nonsewered sanitation systems shall have an operation and maintenance manual provided by the manufacturer.

SECTION G105 SYSTEM OUTPUT

G105.1 General. The use or disposal of all substances exiting the nonsewered sanitation system shall be determined by the authority having jurisdiction.

G106 REFERENCE STANDARDS

G106.1 General. See Table G106.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, the standard title and the section or sections of this appendix that reference the standard.

TABLE G106.1 REFERENCE STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ANSI/CAN/IAPMO/ISO 30500-2019	*Non-sewered sanitation systems — Prefabricated integrated treatment units — General safety and performance requirements for design and testing*	G101.2

Staff Analysis: A review of the standard proposed for inclusion in the code, CAN/IAPMO/ISO 30500:2019 *Non-Sewered Sanitation Systems-Prefabricated Integrated Treatment Units-General Safety and performance Requirements for Design and Testing*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposal covers the essential considerations that a building official must assess when a nonsewered sanitation system (NSSS) as defined herein is installed in a building. **It is identical to language adopted as Appendix CG in the 2024 IRC.** Because the early entries of NSSSs into the marketplace are likely to be multi-user systems for installation in multifamily and commercial buildings covered by the IPC, this proposal will be useful to adopting jurisdictions.

Designed for operation without a sewer connection and, in many cases, without a dedicated water supply, NSSSs are anticipated to meet critical public health needs in areas with limited water and wastewater infrastructure, water supply constraints, and/or unfavorable soils for traditional on-site disposal methods. In the U.S., over 20% of the population relies on an on-site wastewater system. And even today, a portion of our population does not have access to fully functioning sanitation, largely due to lack of affordable infrastructure or to challenging site conditions. In 2011, the Bill & Melinda Gates Foundation launched the "Reinvent the Toilet Challenge" to bring new technology to bear to achieve sustainable sanitation solutions. The target is a factory-built device that provides complete and effective treatment of human sanitary waste, unconnected to any sewer or drainage network and with minimal inputs of energy and water. Eight teams received Foundation support to develop prototypes for lab testing, field trials, and commercialization. Among these initial devices, three broad pathways for treatment technology have emerged -- electro-chemical, biological, and combustion -- and in some cases, combinations of these in the same device. Manufacturers have been involved in these efforts, and LIXIL (owner of the American Standard brand) and other companies are working to develop compliant systems for both domestic and international installations. It is the general preference of manufacturers to design and market systems that are compliant with published codes and standards, rather than one-off compliance reviews by individual jurisdictions.To facilitate commercialization of hi-tech toilets and their acceptance by state and national regulatory bodies, an ISO standard was adopted in 2018 to establish the key performance attributes of NSSSs. Standard 30500, *Non-sewered sanitation systems - Prefabricated integrated treatment units - General safety and performance requirements for design and testing*, sets performance requirements for solid and liquid outputs, odor, noise, air emissions, materials, safety, marking, and ergonomics, together with relevant test procedures for measuring the attainment of these requirements. This ISO standard was adopted in identical form as a U.S. and Canadian national standard in 2019, designated as ANSI/CAN/IAPMO/ISO 30500:2019.This proposal addresses the considerations that must be taken into account by building officials regarding the placement and installation of NSSSs in buildings. The proposal would permit (but not require) the installation of a NSSS listed to the ISO standard, and provide an exception to the general requirement in the IPC that sanitation devices be connected to the building drainage system. Certain key protections, such as backflow prevention, proper ventilation of combustion-based units, and proper siting of storage tanks (if any) external to the unit are each specified in the proposal. Considerations of the use and disposal of outputs of the system are specifically referred to an AHJ, which most likely will be a health department.

Criteria for the functioning of the unit for its intended purpose are established by the ISO standard and do not need to be repeated in plumbing code language. It should be noted that the ISO standard was developed by an international group of scientists, engineers, and regulators to assure the highest levels of treatment would apply to all outputs (air, water, and solids) from the device. The performance-based standards allow a variety of technologies to be applied, so long as key metrics are achieved. The microbiological reduction requirements for solid and liquid waste are based on the quantitative microbial risk assessment (QMRA) method recognized by the World Health Organization for this purpose. The requirements of the standard mimic the highest quality standards imposed by regulatory agencies on waste-derived materials destined for reuse. The standard's test procedures are rigorous (both lab and field tests are required), and the proposal allows only NSSSs listed to the standard to be approved for installation under this appendix.

With "Reinvented Toilets" meeting the 30500 standard now on the cusp of commercialization, the arrival of such toilets at job sites across the country can reasonably be expected by the time this code update is published and adopted by states and localities, e.g., 2028. Clear code language will accelerate the availability of safe sanitation for people who lack it today. While much is still unknown about the cost, maintenance, and reliability of NSSSs, or even the business model for their installation and servicing, forward-looking communities and jurisdictions with acute sanitation needs or water supply constraints will want to be prepared for the safe installation and use of this promising new technology as it enters the market. **Section 311 of the 2024 IPC already allows ISO 30500-compliant systems to be used for toilets for construction workers.** This proposal lays out the necessary groundwork for code officials to inspect and approve their installation within buildings, set out in an appendix available for voluntary adoption by state and local code bodies.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0. This voluntary appendix sets basic requirements for the installation of NSSSs in buildings, but as with the IPSDC, it does not *require* their installation in *any* building. A project developer will only incur the costs of an NSSS if he/she elects to do so.

Estimated Immediate Cost Impact Justification (methodology and variables):

A nonsewered sanitation system (NSSS) can be expected to cost more than a traditional flush toilet. However, NSSSs may be more cost competitive in applications that would otherwise require a traditional on-site treatment system, i.e., septic tank and drain field, and may become the system of choice where soil conditions or space constraints preclude the traditional approach. Section 1101 of the 2024 IPSDC requires residential on-site treatment systems to comply with *either* NSF 40 *or* ISO 30500, allowing the project applicant to make the choice based on price and other relevant factors.

Nonsewered sanitation systems (NSSSs) have yet to enter the US market, so reliable cost data is not available for analysis. But it is reasonable to assume that the cost of purchasing and installing a sanitation system providing complete on-site treatment of human waste will be more than the cost of a conventional toilet discharging to a sanitary sewer. At a meeting of the ISO Project Committee 305's working group in South Africa in June 2023, a European NSSS developer stated plans to bring a household-scale NSSS to market for $1,000 by early 2025, but there is no way to evaluate this claim in advance of market entry.

TENTATIVE ORDER OF DISCUSSION
2021 PROPOSED CHANGES TO THE
INTERNATIONAL PLUMBING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some P code change proposals may not be included on this list, as they are being heard by another committee.

2024 International Private Sewage Disposal Code

CHAPTER 2 DEFINITIONS

SECTION 202
GENERAL DEFINITIONS

Add new definition as follows:

COMMODE. A fixture without connection to a *sanitary drainage system* used for collecting, containing, or transporting excreta to a *compost processor*. (also dry toilet, urine diverting dry toilet, vacuum flush toilet, foam flush toilet).

COMPOST ADDITIVES. Any material such as sawdust, wood shavings, and other compostable material added to maintain operational conditions within the *composting toilet system*.

COMPOSTING TOILET SYSTEM. A system designed to safely collect and process *excreta* and *compost additives* into *humus* through aerobic decomposition.

COMPOST PROCESSOR. The site of aerobic decomposition transforming *excreta* and *compost additives* into *humus*.

DIVERTED URINE. Urine that is collected separately from fecal matter.

EXCRETA. Includes but is not limited to urine, feces, menses, and other human body emissions, as well as toilet paper and biodegradable cleaning products.

HUMUS. The biologically decomposed, soil-like output of the compost processor.

LEACHATE. Liquid drained from a compost processor.

SECONDARY COMPOSTING. Additional retention and continued decomposition of humus removed from compost processors in order to meet the required retention time.

URINE DIVERSION. Collection of *diverted urine* that occurs at the fixture.

URINE DIVERTING COMMODE. A commode that separates urine from other *excreta* and directs urine to a *urine diversion* system that is in accordance with the International Plumbing Code.

Revise as follows:

CHAPTER 13 ~~NONLIQUID SATURATED TREATMENT SYSTEMS~~ COMPOSTING TOILET SYSTEMS

SECTION 1301
GENERAL

Revise as follows:

1301.1 Scope.
The provisions of this chapter shall govern ~~nonliquid saturated treament systems~~ *composting toilet systems*.

1301.2 ~~Nonliquid saturated treatment systems~~ Maintenance responsibility.
~~The regulations for materials, design, construction and performance shall comply with NSF 41.~~The required maintenance and inspection of *composting toilet systems* shall be the responsibility of the property owner, unless otherwise required by the code official.

Add new text as follows:

1301.3 Operation. *Composting toilet systems* shall be operated and maintained in a safe and sanitary condition in accordance with the Section 1301.4.

1301.4 Operation and maintenance manual. An operation and maintenance manual shall be supplied in hardcopy with all systems. The manual shall be transferred to the new owner or tenant upon transfer of property or tenancy. The manual shall include the following items:

1. Schedule for addition of necessary *compost additives*.
2. Source or provider of necessary *compost additives*. Source may be on-site.
3. Schedule for all regular maintenance tasks.
4. Instructions for all regular maintenance tasks.
5. Expected input of and capacity for *excreta* and *compost additives* to compost toilet system specifying loading of *commode*(s) and *compost processor*(s).
6. Treatment period and expected schedule for removing *humus* from *composting processors* and *secondary composting*, where used.
7. Plan for container transfer and cleaning where transfer is used.
8. Plan for on-site disposal of *humus* or professional removal.
9. Plan for managing *leachate*.
10. For *composting toilet systems* not tested to NSF 41, a plan for microbial testing in accordance with Section 1302.5.2.

1301.5 Approved systems. Composting toilets and *composting toilet systems* shall comply with NSF 41 or shall be in accordance with Section 1302.

SECTION 1302
COMPOSTING TOILET SYSTEM DESIGN

1302.1 Approval. *Composting toilet systems* complying with this section shall be permitted for residential, commercial, and institutional applications.

1302.2 System records. The property owner is responsible for retaining test result records in accordance with the Section 1302.5.2 and making such records available to the *code official* upon request. Upon transfer of property or tenancy, all test records shall be transferred to the owner or tenant, and *humus* shall be re-tested after its first treatment period and a record retained by the property owner.

1302.3 System materials and components. All components expected to contact *excreta* or *leachate* shall be constructed of corrosion-resistant material such as stainless steel or durable polymers. Concrete in contact with *excreta* or *leachate* shall meet requirements of Section 1302.3.3.

1302.3.1 Pipes and fixtures. Pipe, pipe fittings, traps, fixtures, material, and devices used in *composting toilet systems* that are expected to contact *leachate* or *diverted urine* shall be listed by an approved agency or a third-party certification agency in accordance with Section 505 or the International Plumbing Code, unless otherwise approved by the *code official*. Products and materials shall be identified.

1302.3.2 Screening. Where screening is required to prevent the unintentional entry of insects and vermin, screening shall have openings with a maximum size of 3/32 inch (2.5mm). Screening shall be made of materials compatible with the system components in contact with screen materials. Screen materials shall not generate galvanic corrosion of system components.

1302.3.3 Concrete construction. Concrete construction shall be reinforced, watertight, and able to withstand loading in compliance with Section 1302.3.3. Where drainage is required, the *compost processor* floor shall be sloped not less than ¼-inch per foot (20mm per meter), or 2 percent. The flange of each sub-drain shall be set level.

1302.3.4 Commodes. *Commodes* shall be designed to support users of a weight not less than 300 pounds (136 kg). *Commodes* shall transport *excreta* into the *compost processor* or contain *excreta* for transfer as designed and in accordance with the operation and maintenance manual.

1302.3.4.1 Urine diversion. *Urine diversion* piping shall be connected to a *urine diversion* system in accordance with the International Plumbing Code.

1302.4 Compost processors. *Compost processors* shall maintain unsaturated aerobic composting conditions within the compost mass through the drainage, absorption or desiccation of *leachate*; and aeration of the *compost processor*.

1302.4.1 Openings. All openings shall be covered and secured to prevent tampering. Openings shall be screened or covered to prevent insect and vermin infiltration and be protected against unauthorized human entry.

1302.4.2 Transfer. Where unfinished *excreta* or *diverted urine* is transferred between *compost processors* or from *commode* to *compost processor*, transfer and cleaning of containers and provisions for limiting user exposure shall be in accordance with the operation and maintenance manual.

1302.4.3 Watertightness. *Compost processors* shall be constructed of watertight material in accordance with Section 1302.3.

1302.4.4 Insects and vermin. *Compost processors* shall be protected to prevent the unintentional entry of insects and vermin. No unsecured opening other than vents, drainage, or *commode* may exceed 1/2 inch (12.7 mm) in the least dimension.

1302.4.5 Sizing. *Compost processors* shall be sized to accommodate the maximum daily adult usage as specified by the manufacturer's or designer's published ratings. *Compost processors* shall be sized to hold at least 10 gallons (38L) of material per person per year while allowing for the removal of the *humus*.

1302.4.6 Treatment period. The *compost processor* or processors shall be sized to compost *excreta* for a treatment period with a minimum of one year of biologically active conditions. Biologically active conditions shall be maintained at or above a daily average of 42°F (6°C).

Exception: Systems with shorter treatment periods shall be permitted where either:

1. *Humus* from the compost processor has been tested in accordance with Section 1302.5.2 and transferred to *secondary composting* in accordance with Section 1302.4.7.
2. *Humus* is removed off site for processing or disposal at an approved facility.

1302.4.7 Secondary composting. *Humus* transferred to *secondary composting* shall first be tested in accordance with Section 1302.5.2. *Secondary composting* shall be labeled and protected from human contact in a well maintained compost bin or other facility designated for the exclusive purpose of containing *humus* removed from the *compost processor*. Contact with precipitation and surface waters shall be prohibited.

1302.4.8 Venting. Negative pressure between the *commode* and *compost processor* shall be provided where the *compost processor* is connected directly to the *commode* without a trap.

1302.4.9 Vent terminals. Vent stacks shall terminate to the exterior of the building in compliance with the requirements of the International Plumbing Code.

1302.4.10 Leachate. *Leachate* shall be collected for removal or recirculation within the *compost processor*, evaporated or drained to an approved sanitary drainage system or other location approved by the *code official*.

1302.4.11 Leachate storage tanks. *Leachate* storage tanks shall be constructed of corrosion resistant materials.

1302.4.11.1 Venting. *Leachate* storage tanks shall be vented as required for pressure equalization. When required, vents shall be installed on leachate storage tanks and shall extend from the top of the tank. Storage tank vents shall be permitted to connect to the plumbing venting system at least 6 inches (150mm) above the flood level rim of the highest fixture. Vents extending to the outdoors shall terminate no less than 12 inches (300mm) above grade. The vent terminal shall be directed downward and covered screening to prevent the unintentional entry of insects and vermin.

1302.4.11.2 Vent size. Pressure equalization vents that prevent nitrogen loss by the use of restrictions, or of piping or tubing that is less than the minimum pipe diameter required by Section 1302.3.1, shall be approved by the *code official.*

1302.4.11.3 Overflow. Where storage tank overflows are installed, they shall be connected to the sanitary drainage system.

1302.4.11.4 Backwater prevention. Storage tank overflows shall be provided with a backwater valve or check valve at any point of connection to a sanitary drainage system or *private sewage disposal system* subject to backflow. The backwater valve shall be accessible for inspections and maintenance.

1302.4.11.5 Above grade. Where subject to freezing conditions, storage tanks shall be provided with an adequate means of freeze protection. Above grade leachate storage tank shall be provided with a high-water sensing device and alarm system. The alarm shall report when 80 percent volume is reached.

1302.4.11.6 Below grade. *Leachate* storage tanks installed below grade shall be structurally designed to withstand all anticipated earth or other loads. Tank covers shall be capable of supporting an earth load of not less than 300 pounds per square foot (lb/ft2) (150 kg/m2) when the tank is designed for underground installation. Below grade *leachate* tanks installed underground shall be provided with manholes. The manhole opening shall be at least 20 inches (500 mm) in diameter and located at least 4 inches (100 mm) above the surrounding grade. The surrounding grade shall be sloped away from the manhole. Underground tanks shall be ballasted, anchored, or otherwise secured, to prevent the tank from floating out of the ground when empty. The combined hold-down capacity of the tank and hold down system shall meet or exceed the buoyancy force of the tank. Below grade *leachate* storage tank shall be provided with a high-water sensing device and alarm system.

1302.4.11.7 Marking. Where openings are provided to allow a person to enter the tank, the opening shall be marked with the following words: “DANGER—CONFINED SPACE.” The letters shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.

1302.5 Testing. Prior to permit issuance, *composting toilet systems* shall be tested for watertightness in accordance with Section 1302.5.1. Humus from the first treatment period shall be tested after the first treatment period in accordance with Section 1302.5.2.

1302.5.1 Compost processors. *Compost processors* shall be tested for watertightness by filling the system to the maximum designed liquid storage capacity of the unit for a duration of 24 hours.

1302.5.2 Humus. The owner or owner's agent of the *composting toilet system* shall verify compliance with the operation and maintenance manual after the first treatment period and before removal of *humus* from the *compost processor*. A sample of the *humus* from the first treatment period shall be submitted to a certified laboratory. Where multiple *compost processors* are used, the *humus* sample shall be removed from the last *compost processor*. The sample shall be tested in accordance with NSF 41. *Humus* shall not have a moisture content exceeding 75 percent by weight, and the most probable number (MPN) fecal coliform assay shall not exceed 200 MPN per gram (dry weight basis).

1302.5.3 Testing following repairs and alterations. If the *code official* determines that new tests are required following repairs or alterations, tests shall be conducted at the owner's expense and in accordance with Section 1302.5.

1302.6 Humus removal. *Humus* shall be removed in accordance with the operation and maintenance manual. *Humus* from the *compost processor* shall be permitted to be used around ornamental shrubs, flowers, trees, or fruit trees and shall be mixed with soil or mulch and covered with at least 3 inches (76mm) of cover material. Depositing *humus* from any *composting toilet system* around any edible vegetable or vegetation shall be prohibited.

Reason: This proposal offers two paths to composting toilet system approval: either following NSF 41 (as currently provided for in Chapter 13), or with a system inspected and tested to requirements or standards that are as strict or stricter than NSF 41 (through this proposal's new provisions). Integration of the provisions of this proposal into the IPSDC will promote time-tested, safe practices by placing clear requirements for each system component directly into the code. Under the path added by this proposal, each system installation is verified for watertightness, mandated to have a 1-year treatment period to ensure pathogen destruction, tested for proper operation, and required to document and preserve operation and maintenance information. System features that NSF 41 leaves to individual manufacturers or jurisdictions, including venting, screening for insects and vermin, leachate management, and disposal of the outputs of compost processors away from human contact, are subject to clear and enforceable requirements under this proposal.

This proposal is intended to promote the growth of a domestic component supply industry for composting toilet systems that will enable the design of systems appropriate to the scale of the installation. Because NSF 41 treats composting toilet systems as manufactured products rather than systems assembled from a variety of components, the size of composting chambers is limited. For instance, the Bullitt Center in Seattle required multiple Phoenix composting chambers, and load balancing the various chambers created maintenance headaches that were pivotal to removal of the composting toilet system.[1] Under the requirements of this proposal, larger composting chambers could be assembled on-site and tested for watertightness and treatment efficacy, potentially simplifying system design and long-term maintenance. Such site-built composting chambers have become a common feature of large-scale projects in the Netherlands and elsewhere.[2]

Urine diversion can improve the function and reduce the labor and compost additives needed to control odor in a composting toilet system. The use of urine diversion with composting toilets was a core recommendation of the Bullitt Center team. Urine diversion is connected by this proposal's Section 1302.3.4.1 to the IPC and through a parallel Urine Diversion Systems proposal for the IPC. The language in this proposal is based on the Recode Model Code, which incorporates the latest best practices from around the globe. The Recode Model Code was created in 2015 through a consensus process with a national team of U.S. experts, and was incorporated into IAPMO'S 2017 Water Efficiency and Sanitation Standard (WE Stand), which was revised in 2020 and 2023. The latest Recode Model Code incorporates refinements from the WE Stand process and lessons learned by designers and installers in the interim.

Additionally, a change in the title of Chapter 13 is proposed from "Non-Liquid Saturated Treatment Systems" because that term is not standard in either the industry or its literature, and appears only in NSF 41. The proposed title "Composting Toilet Systems" emphasizes the entire system, rather than a single product, and is a common term used in industry literature and by NSF 41 tested manufacturers such as 'Sun Mar' and 'Advanced Composting Systems'.

(1) *The Bullitt Center Composting Toilet System A White Paper on Lessons Learned*, Bullit Foundation, Seattle, WA, 2021.

(2) Lansing, J. *Designing for Source Separation – the Key to a Regenerative Building*. Rich Earth Summit, Brattleboro, VT, 2023.

Bibliography: 1302.4.6 Treatment period.

One year is approximately twice as long as the survival time of *Ascaris* (Roundworm) eggs under active composting, per Table 6-2 of Biosolids Applied to Land. *Ascaris* are used as an indicator species for long-lived and hard-shelled pathogens.

National Research Council. 2002. *Biosolids Applied to Land*. Washington, DC: The National Academies Press. https://doi.org/10.17226/10426

1302.5.2 Humus.

Bacteriological testing requirements are per NSF 41.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

- **CT-equipment-cost.pdf**
  https://www.cdpaccess.com/proposal/10314/30802/documentation/147968/attachments/download/4627/

Justification for no cost impact:

Composting toilet systems tested to NSF 41 and those not tested to NSF 41 are comparably priced for similar feature sets and capacities. Under this proposal, systems not tested to NSF 41 will also require a fecal coliform test, which will add $30-60 to those systems; however, the equipment costs will remain comparable.

Composting toilet systems designed for full-time residential use by one to six users and with the most basic dry commode are available in sufficient variety to compare equipment prices of NSF 41 tested systems and those not tested to NSF 41. For NSF 41 tested systems meeting the above criteria, market prices range from $639 to $7700. Systems meeting the same criteria that are not tested to NSF 41 range in price from $1280 to $4745. Please see the attached table for equipment prices as of January 2024.

For engineered systems built on-site and meeting similar criteria, Nutrient Networks estimates system costs of $400 to $6000 before installation.

PSD1-24

PSD2-24

IPSDC: 1101.2, NSF Chapter 14 (New)

Proponents: Jeremy Brown, NSF International, NSF International (brown@nsf.org)

2024 International Private Sewage Disposal Code

Revise as follows:

1101.2 Residential wastewater treatment systems.
The regulations for materials, design, construction and performance shall comply with NSF 40 or IAPMO/ISO 30500. Where nitrogen reduction is required, the materials, design, construction and performance shall comply with NSF 245 or IAPMO/ISO 30500.

Add new standard(s) as follows:

NSF

NSF International
789 N. Dixboro Road
Ann Arbor, MI 48105

245-2023	Residential Wastewater Treatment Systems - Nitrogen Reduction

Staff Analysis: A review of the standard proposed for inclusion in the code, NSF 245-2023 *Residential Wastewater Treatment Systems - Nitrogen Reduction*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Nitrogen reduction is required by some AHJ's when treating effluent water quality requirements. Excess nitrogen can cause surface water algae blooms. This code change does not require nitrogen reduction in all installations, but does provide requirements when nitrogen reduction is required. NSF/ANSI 245 is the American National Standard for Nitrogen reduction. There are at least 12 states that require NSF/ANSI 245 in there regulations. There are 179 systems and 17 manufacturers listed by NSF to NSF/ANSI 245. A copy of NSF/ANSI 245 may be obtained for free by emailing brown@nsf.org.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

First, this proposal does not require nitrogen reduction. Where authorities do require nitrogen reduction, it references the ISO and American National Standards. As the majority of products on the market already have certification, this code change is not expected to add additional cost.

TENTATIVE ORDER OF DISCUSSION
2024 PROPOSED CHANGES TO THE
INTERNATIONAL RESIDENTIAL CODE – MECHANICAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some RM code change proposals may not be included on this list, as they are being heard by another committee.

IRC: M1305.1.2, M1305.1.2.2 (New)

Proponents: David Crawford Bixby, Air Conditioning Contractors of America (ACCA), ACCA (david.bixby@acca.org)

2024 International Residential Code

M1305.1.2 Appliances in attics.
Attics containing *appliances* shall be provided with an opening and a clear and unobstructed passageway large enough to allow removal of the largest *appliance*, but not less than 30 inches (762 mm) high and 22 inches (559 mm) wide and not more than 20 feet (6096 mm) long measured along the centerline of the passageway from the opening to the *appliance*. The passageway shall have continuous solid flooring in accordance with Chapter 5 not less than 24 inches (610 mm) wide. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present along all sides of the *appliance* where access is required. The clear access opening dimensions shall be not less than of 20 inches by 30 inches (508 mm by 762 mm), and large enough to allow removal of the largest *appliance*.

Exceptions:

1. The passageway and level service space are not required where the *appliance* can be serviced and removed through the required opening.
2. Where the passageway is unobstructed and not less than 6 feet (1829 mm) high and 22 inches (559 mm) wide for its entire length, the passageway shall be not more than 50 feet (15 250 mm) long.

Add new text as follows:

M1305.1.2.2 Permanent service access.. For new construction, a permanent means of access without the use of a portable ladder shall be provided in order to comply with M1305.1. Such means shall include the use of either pulldown stairs or other permanent steps acceptable to the code official.

Exception: Existing construction.

Reason: Section M1305.1.2 provides specifications for the size of the minimum clear and unobstructed opening and passageway to allow removal of the largest appliance. However, the need for a safe and secure energy efficient access is not specified and should be added for the safety of personnel and consumers. For consumers, replacement of HVAC filters is recommended maintenance and access to the attic should be as safe as possible. ACCA believes that there is an urgent need for new homes to be constructed to take care of future service, repair, replacement and overall general safety for all including the homeowner, contractors, insurance representatives, regular structural pest control inspections, especially first responders and anyone else who may need to access to this part of the home in the future. The exception limits the proposal to new construction only. ACCA is not suggesting that existing homes anywhere in the country change their access to a stair/ladder access when they change their heating and cooling equipment or any other items in their attics. The proposal is similar to an amendment to the Georgia building code that became effective January 1, 2020.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The code change proposal **will increase** the cost of construction. It is estimated that attic stairs/ladders may add $250-$350 to a new home cost, but the savings in safety over time is significantly overcome and justified.

Estimated Immediate Cost Impact Justification (methodology and variables):

A range of costs was determined based on surveying available pull-down attic stairs that are widely available in the marketplace.

RM2-24

IRC: M1401.1, ASHRAE Chapter 44 (New)

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Residential Code

Revise as follows:

M1401.1 Installation.
Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's instructions and the requirements of this code. Heating and cooling equipment using a refrigeration system shall also be installed in accordance with ASHRAE 15.2.

Add new standard(s) as follows:

ASHRAE

ASHRAE
180 Technology Parkway
Peachtree Corners, GA 30092

15.2-2022 Safety Standard for Refrigeration Systems in Residential Applications

Staff Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 15.2-2022 *Safety Standard for Refrigeration Systems in Residential Application*s, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This code change proposal adds the reference to ASHRAE 15.2, the installation standard for residential air conditioning. This code change closes the hole that was created in the Code when ASHRAE 15 split its scope between standards 15 and 15.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes will have no impact on the cost of construction. The equipment design of residential systems is covered by the product design standard, UL 60335-2-40. Additionally, installation instructions will be found in the installation manuals provided by the Original Equipment Manufacturers (OEMs). However, the reference to ASHRAE 15.2 is necessary, as it is now the required application standard for residential systems serving a single dwelling or sleeping unit.

RM2-24

RM3-24

IRC: M1401.3

Proponents: David Crawford Bixby, Air Conditioning Contractors of America (ACCA), ACCA (david.bixby@acca.org)

2024 International Residential Code

Revise as follows:

M1401.3 Equipment and appliance sizing.
Heating and cooling *equipment* and *appliances* shall be sized in accordance with ACCA Manual S ~~or other *approved* sizing methodologies~~ based on building loads calculated in accordance with ACCA Manual J ~~or other *approved* heating and cooling calculation methodologies~~.

~~**Exception:** Heating and cooling *equipment* and *appliance* sizing shall not be limited to the capacities determined in accordance with ACCA Manual S where either of the following conditions applies:~~

1. ~~The specified *equipment* or *appliance* utilizes multistage technology or variable refrigerant flow technology and the loads calculated in accordance with the *approved* heating and cooling calculation methodology are within the range of the manufacturer's published capacities for that *equipment* or *appliance*.~~
2. ~~The specified *equipment* or *appliance* manufacturer's published capacities cannot satisfy both the total and sensible heat gains calculated in accordance with the *approved* heating and cooling calculation methodology and the next larger standard size unit is specified.~~

Reason: The existing exceptions are no longer needed because the Normative Sections of the new edition of ACCA Manual S - 2023, *Residential Equipment Selection*, now address sizing equipment having multi-stage and VRF technologies. In addition, Manual S now requires the equipment OEM performance data to be used to calculate the capacities required to satisfy the total, latent, and sensible loads. The 2023 edition of ACCA Manual S is approved by ANSI and its updated reference appears in the 2024 edition of the IRC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impacts since ACCA Manuals J and S are ANSI standards and are widely used by the industry.

RM3-24

RM4-24

IRC: M1411.1

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Daikin U.S. (jbengineer@aol.com)

2024 International Residential Code

Revise as follows:

M1411.1 Approved refrigerants.
Refrigerants used in direct refrigerating systems shall conform to the applicable provisions of ANSI/ASHRAE 34. Refrigerants shall comply with the U.S. EPA regulations for low global warming potential.

Reason: A new Federal requirement will stipulate that residential refrigeration systems must use a low global warming potential of 700 or less after January 1, 2025. This change will add the requirement to the code for any new systems. US EPA will allow existing systems using a higher global warming potential refrigerant to be repaired, hence, the change only identifies new systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is informative in identifying Federal requirements for the use of refrigerants. U.S. EPA regulates the use of refrigerants under the SNAP regulations. Hence, there is no impact on the cost of construction.

RM4-24

RM5-24

IRC: SECTION 202, M1413.1, CHAPTER 15, SECTION M1502, M1502.3, SECTION M1504, M1504.3, M1602.1

Proponents: Mike Moore, Stator LLC, Broan-NuTone (mmoore@statorllc.com)

2024 International Residential Code

[MP] LIVING SPACE. Space within a *dwelling unit* utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes. For the definition applicable in Chapter 11, see Section N1101.6. For the definition applicable in Chapter 24, see Section G2403.

Revise as follows:

M1413.1 General.
Evaporative cooling *equipment* and *appliances* shall comply with UL 1995 or UL/CSA 60335-2-40, and shall be installed:

1. In accordance with the manufacturer's instructions.
2. On level platforms in accordance with Section M1305.1.3.1.
3. So that openings in exterior walls are flashed in accordance with Section R703.4.
4. So as to protect the potable water supply in accordance with Section P2902.
5. So that outdoor air intake opening locations are in accordance with Section R325.4.1.

CHAPTER 15 EXHAUST AND VENTILATION SYSTEMS

SECTION M1502
CLOTHES DRYER EXHAUST

Revise as follows:

M1502.3 Duct termination.
Exhaust ducts shall terminate on the outside of the *building*. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into *buildings*, including openings in ventilated soffits. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Exhaust air shall not be directed onto walkways.

SECTION M1504
VENTILATION SUPPLY DUCTS, LIVING SPACE EXHAUST DUCTS~~,~~ AND LIVING SPACE EXHAUST TERMINATIONS ~~OPENINGS~~

M1504.3 Location of ~~E~~exhaust terminations serving living spaces~~openings~~.
Exhaust air shall not be directed onto walkways. ~~Air exhaust openings shall terminate~~ Exhaust terminations serving dwelling-unit toilet rooms, bathrooms, kitchens, and other dwelling unit living spaces shall be located as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from gravity outdoor air intake openings, operable windows and doors except where the exhaust opening is located not less than 1 foot (305 mm) above the gravity air intake opening, operable windows and doors.

3. Not less than 10 feet (3048 mm) from mechanical <u>outdoor</u> air intake openings except where either of the following apply:
   3.1. The exhaust <u>termination</u>~~opening~~ is located not less than 3 feet (914 mm) above the air intake opening.
   3.2. The exhaust <u>termination</u>~~opening~~ is part of a factory-built intake/exhaust combination termination fitting installed in accordance with the fan manufacturer's instructions, and the exhaust air is drawn from a *living space*.
4. ~~In accordance with Sections R303.5.2 and R303.6.~~

<u>M1505.4 Exhaust termination protection.</u> <u>Exhaust terminations</u> serving dwelling-unit toilet rooms, bathrooms, kitchens, and other dwelling unit living spaces <u>shall be protected with corrosion-resistant screens, louvers, or grilles having an opening size of not less than 1/4 inch (6 mm) and a maximum opening size of 1/2 inch (13 mm), in any dimension. Exhaust terminations shall be protected against local weather conditions.</u>

M1602.1 Outdoor air <u>intake</u> openings.
Outdoor <u>air</u> intake openings shall be located in accordance with Section R~~325.4.1~~<u>303.5.1</u>. Opening protection shall be in accordance with Section R~~325.5~~<u>303.6</u>.

Reason: In the 2009/2010 cycle, Section M1504.3 was formed through proposal RM12-09/10 based on the rationale that outdoor air intake openings should be addressed in Chapter 3 and that exhaust terminations should be addressed elsewhere. After multiple cycles, the language has become muddled, and modifications are needed to clarify the intent. This proposal does the following:

1. Uses the term "outdoor air intake opening" where referenced in Chapters 14, 15, and 16, consistent with the language in R303.5.1.

2. Uses consistent terminology when referring to "exhaust terminations," "clothes dryer exhaust duct terminations," and "vent and chimney terminations."

3. Moves the R303.5.2 prohibition for directing exhaust onto walkways to Sections M1504.3 and M1502.3, which address exhaust termination locations for exhaust air from living spaces and exhaust air from clothes dryers, respectively. Note that Table G2427.8 (503.8) already prohibits appliance vent terminations from being located above public walkways.

4. Moves the R303.6 requirements for exhaust termination protection to Section M1504.4, as this only applies to exhaust terminations that serve dwelling-unit toilet rooms, bathrooms, kitchens, and other dwelling-unit living spaces.

5. Modifies the titles for various sections to align with the material contained in those sections.

To coordinate these modifications with Sections R303.5 and R303.6 of the IRC, a companion proposal is planned for the Group B hearings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of existing requirements.

RM5-24

RM6-24

IRC: M1505.4.1

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

2024 International Residential Code

Revise as follows:

M1505.4.1 System design.
The whole-house ventilation system shall comply with one of the following:

1. In Climate Zones 0 through 5, the whole-house ventilation system shall consist of one or more supply or exhaust fans, or a combination of such, and associated ducts and controls. *Local exhaust* or supply fans are permitted to serve as such a system. Outdoor air ducts connected to the return side of an air handler shall be considered as providing supply *ventilation*.
2. In Climate Zones 6, 7 and 8, the whole-house ventilation system shall be a *balanced ventilation system* in compliance with Section N1103.6.

Reason: This proposal is intended to align the ventilation requirements in Section 1505.4 with the ventilation requirements in Section N1103.6. Public draft #2 of the 2024 IECC requires the use of an energy recovery ventilator or heat recovery ventilator in Climate Zones 6 through 8 which are both balanced ventilation systems.

Section 1505.4 of the 2024 IRC explicitly allows the use of supply-only, exhaust-only or balanced ventilation systems. This proposal is intended to clarify that supply-only and exhaust-only ventilation systems are only allowed in Climate Zones 0 through 5 and balanced ventilation systems are required in Climate Zones 6, 7, and 8.

Bibliography: THE INTERNATIONAL RESIDENTAIL CODE-CHAPTER 11 ENERGY EFFICIENCY PUBLIC COMMENT DRAFT #2
https://www.iccsafe.org/wp-content/uploads/PCD2-IRC-CHAP-11.pdf

REPI-93-21 https://energy.cdpaccess.com/proposal/443/1236/preview/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no increased costs for this proposal, as it is simply a coordination proposal. Increased costs due to the ERV/HRV requirements have been addressed as part of the development process of the IECC-R.

RM6-24

RM7-24

IRC: M1601.1.1

Proponents: Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov)

2024 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems.
Above-ground *duct systems*shall conform to the following:

1. *Equipment*connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards .*
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.
7. ~~Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:~~ <u>*Building* framing cavities shall not be used as ducts or plenums.</u>
   ~~7.1. These cavities or spaces shall not be used as a plenum for supply air.~~
   ~~7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~
   ~~7.3. Stud wall cavities shall not convey air from more than one floor level.~~
   ~~7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.~~
   ~~7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~
   ~~7.6. Building cavities used as plenums shall be sealed.~~
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Reason: Section N1103.3.7 (R403.3.7 in the IECCC) states that *building* framing cavities shall not be used as ducts or plenums. However, section M1601.1.1 provides provisions for using joist framing cavities as return air plenums, which contradicts section N1103.3.7. This change would align M1601.1.1 with N1103.3.7, prohibiting the use of framing cavities as plenums.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Sections M1601.1.1 and N1103.3.7 are contradictory on the subject of joist cavities used as return air plenums. Section 102.1 states that, in the event of such a conflict, the more restrictive provision shall apply. In this case, section 1103.3.7 is the more restrictive provision, and as such, is the provision which should govern. This proposed change merely clarifies section M1601.1.1 so that there is no confusion for users who may or may not notice the contradiction.

RM8-24

IRC: M1601.1.1

Proponents: Austin Rivera, Centrotherm Exo Systems, Centrotherm Exo Systems

2024 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems.
Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards .*
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   7.1. These cavities or spaces shall not be used as a plenum for supply air.
   7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   7.3. Stud wall cavities shall not convey air from more than one floor level.
   7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.
   7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
   7.6. Building cavities used as plenums shall be sealed.
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.
9. Factory-made ducts that are constructed of *combustible materials*, that are part of a duct system carrying only *ventilation air* and that are contained entirely within a *dwelling unit*, shall not be required to comply with items 2. and 6.

Reason: The proposed addition (Sentence 9) to this proposal aims to permit the use of combustible ducts in residential construction for mechanical ventilation systems, aligning with the National Canadian Building Code's verbatim wording. The specific allowance for combustible ducts is confined to ventilation air and is mandated to be fully contained within a single dwelling. These limitations serve to prevent the penetration of rated fire walls by the ducts and their connection to heating systems. Such constraints introduce an additional layer of safety to the system, aligning with the original code's intent under the newly specified circumstances.

Furthermore, this proposal points out that NFPA 90B concurs with the mentioned restrictions, as evidenced by the citations from the National Canadian Building Code and NFPA in the bibliography.

As ASHRAE 62.1/2 advocates for more rigorous ventilation standards, the standard practice is shifting towards fully dedicated mechanical ventilation systems, independent of heating/cooling systems. However, adhering to UL181 standards for all materials in constructing these dedicated systems may render the process economically impractical. Therefore, permitting the use of combustible duct materials for dedicated ventilation systems could substantially reduce construction costs for both contractors and homeowners. In addition to reduction of direct construction costs, the air tightness of fully sealed plastic ventilation systems increases appliance efficiency leading to decreased cost of ownership over the life of the system. It is infeasible to fully seal traditional tin ducts.

Given the multitude of benefits, the minimal associated risks that are effectively mitigated, and the longstanding integration of similar language in other codes and standards, it is recommended that these proposed changes be incorporated into the International Residential Code (IRC). This adjustment would not only enhance cost-effectiveness in construction but also align with evolving industry practices and standards.

Bibliography:

1. National Canadian Building Code, Volume I - 3.6.5.1, Sentence 3
2. National Canadian Building Code, Volume II - 9.33.6.2, Sentence 5
3. NFPA 90B, Section 4.1.1.1.2
4. Leprince, V., Lightfoot, M., & de Jong, J. (n.d.). *Impact of ductwork leakage on the fan energy use and sound production of central mechanical ventilation units in houses*.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The estimated saving would be approximately $2,000-3,000 per installation.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost savings were calculated by designing 2 mechanical ventilation systems, one using combustible plastic duct (Centrotherm Air Excellent system) and the other using traditional tin duct and materials. The two systems were identical (dimensions, flow rates, etc) except for the material used.

Estimated Life Cycle Cost Impact:

The air tightness of fully sealed plastic ventilation systems increases appliance efficiency leading to decreased cost of ownership over the life of the system.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Leprince, V., Lightfoot, M., & de Jong, J. (n.d.). *Impact of ductwork leakage on the fan energy use and sound production of central mechanical ventilation units in houses*.

RM8-24

RM9-24

IRC: M1601.1.1, ACCA Chapter 44 (New)

Proponents: David Crawford Bixby, Air Conditioning Contractors of America (ACCA), ACCA (david.bixby@acca.org)

2024 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems.
Above-ground *duct systems*shall conform to the following:

1. *Equipment*connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards .*
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   7.1. These cavities or spaces shall not be used as a plenum for supply air.
   7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   7.3. Stud wall cavities shall not convey air from more than one floor level.
   7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.
   7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
   7.6. Building cavities used as plenums shall be sealed.
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.
9. Zoned duct systems shall be designed and installed in accordance with ACCA Manual Zr and the manufacturer's instructions or by other approved methods.

Add new standard(s) as follows:

ACCA

Air Conditioning Contractors of America
1330 Braddock Place, Suite 350
Alexandria, VA 22314

ANSI/ACCA 11 Manual Zr-2018 Residential Zoning Systems

Staff Analysis: New Standard

Reason: Although M1601.1 *Duct design* references ACCA *Manual D* for duct design, currently there is no coverage in the residential code to address the design of zoned duct systems, such as what to do with bypass air when one or more dampers are closed. ACCA Manual Zr provides procedures for designing zoned comfort systems for single family detached homes, duplex and triplex homes, row houses, town houses, and large multi-family structures that are compatible with ACCA Manual J procedures for residential load calculations. In addition, use of Manual Zr will avoid the potential for an improperly designed zoned duct system to adversely impact the safe operation and durability of the heating/cooling equipment. For code officials, Manual Zr has three Normative sections written in code language to determine clear compliance. Manual Zr is also a consensus-based ANSI standard. A separate proposal shown below is to add ANSI/ACCA 11 Manual Zr - 2018 as an IRC referenced standard under Chapter 44. A copy of the standard has been submitted to ICC staff for committee review due to the file size.

Bibliography: ANSI/ACCA 11 Manual Zr - 2018, *Residential Zoning Systems*

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The use of ANSI/ACCA Manual Zr - 2018 is current industry practice, and the standard is based on zone damper OEM's installation instructions.

RM9-24

RM10-24

IRC: M1905 (New), M1905.1 (New), M1905.2 (New), UL Chapter 44 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Add new text as follows:

M1905
CLOTHES DRYERS

M1905.1 General. Electric residential clothes dryers, including heat pump and condensing-type dryers, shall be *listed* and *labeled* in accordance with UL 2158, and installed in accordance with the manufacturer's instructions.

M1905.2 Exhaust required. Clothes dryers shall be exhausted in accordance with Section M1502.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

2158-21	Electric Clothes Dryers

Staff Analysis: The proposed standard is in the current edition of the IMC.

Reason: Requirements for clothes dryers need to be included in the IRC. This is necessary to align with the exhaust system requirements in Section 1502, which provides exceptions for certain types of listed and labeled clothes dryers. This does not require the clothes dryers to be installed when the building is constructed. This is in the same format of what is currently in Section 913 of the IMC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Listing of electrical appliances is already required by IRC M3404.3. This proposal clarifies the listing standard. It also provides pointers to existing code for exhaust requirements. The existing requirements in M1502 already reference these listings.

TENTATIVE ORDER OF DISCUSSION
2024 PROPOSED CHANGES TO THE
INTERNATIONAL RESIDENTIAL CODE – PLUMBING

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some RP code change proposals may not be included on this list, as they are being heard by another committee.

IRC: P2904.1.1

Proponents: Jeffrey M Hugo, CBO, NFSA, National Fire Sprinkler Association (hugo@nfsa.org)

2024 International Residential Code

Revise as follows:

P2904.1.1 Required sprinkler locations.
Sprinklers shall be installed to protect all areas of a *dwelling unit*.

Exceptions:

1. *Attics*, *crawl spaces* and normally unoccupied concealed spaces that do not contain fuel-fired *appliances* do not require sprinklers. In *attics*, *crawl spaces* and normally unoccupied concealed spaces that contain fuel-fired appliances ~~equipment, a~~ one quick response intermediate temperature sprinkler shall be installed above the appliance ~~equipment~~; however, additional sprinklers shall not be required in the remainder of the space.
2. Clothes *closets*, linen *closets* and pantries not exceeding 24 square feet (2.2 m^2) in area~~, with the smallest dimension not greater than 3 feet (915 mm) and~~ having wall and ceiling surfaces of *gypsum board*.
3. Bathrooms not more than 55 square feet (5.1 m^2) in area.
4. Garages; carports; exterior porches; unheated entry areas, such as mud rooms, that are adjacent to an exterior door; and similar areas.

Reason: This proposal for the residential sprinkler criteria in the IRC, Section P2904, correlates with the 2022 edition of NFPA 13D. While both documents are considered equivalent, having the correlation benefits designers and code officials using the IRC alone.

As currently written, this section uses the defined terms “equipment” and “appliance.” This change uses the term “appliance” and replaces any reference to “equipment.” NFPA 13D allows one quick response sprinkler installed to protect the area where the fuel fired appliance is and allows the remainder of the space to remain unprotected. Removing the smallest dimension in the closet correlates to NFPA 13D. Small closets, up to 24 sq ft are exempt from sprinklers.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Source: Actual estimates

Residential pendent sprinklers cost ranges from approximately $18-$40 apiece

Quick response pendent sprinklers cost ranges from approximately $13-$20 apiece

Estimated Immediate Cost Impact Justification (methodology and variables):

Analogous methodology using actual current material costs to create a range of cost. This proposal decreases the cost of construction by offering a quick response sprinkler in lieu of a residential sprinkler with similar characteristics, such as activation time. Residential sprinklers do cost more because they are listed for the residential fire load. Quick response sprinklers cost less and can control the residential fire load near the fuel fired appliance.

RP1-24

RP2-24

IRC: P2904.2.4.2

Proponents: Jeffrey M Hugo, CBO, NFSA, National Fire Sprinkler Association (hugo@nfsa.org)

2024 International Residential Code

Revise as follows:

P2904.2.4.2 Obstructions to coverage.
Sprinkler discharge shall not be blocked by obstructions unless additional sprinklers are installed to protect the obstructed area. Additional sprinklers shall not be required where the sprinkler separation from obstructions complies with either the minimum distance indicated in Figure P2904.2.4.2 or the minimum distances specified in the sprinkler manufacturer's instructions where the manufacturer's instructions permit a lesser distance. Additional sprinklers shall not be required where obstructions caused by architectural features produce not more than an aggregate of 15 square feet (1.4 m 2) of dry floor area per sprinkler.

Reason: This proposal for the residential sprinkler criteria in the IRC, P2904 correlates with the 2022 edition of NFPA 13D. While both documents are considered equivalent, having the correlation benefits designers and code officials using the IRC.

NFPA 13D permits shadow areas per sprinkler, in Section 8.2.5.7, "Shadow areas shall be permitted in the protection area of a sprinkler as long as the cumulative dry areas do not exceed 15 ft2 (1.4 m 2) per sprinkler." This concept is permitted to address when certain architectural features can impact the sprinkler spray pattern. This change to the IRC does not supersede the obstruction rules. Sprinklers have to meet the obstruction rules first, then allow for the shadowed areas.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Source: Actual estimates

Residential pendent sprinklers cost ranges from approximately $18-$40 apiece

Estimated Immediate Cost Impact Justification (methodology and variables):

Analogous methodology using actual current material cost estimates to create a range of cost. This proposal lowers construction costs by a potential reduction to the number of sprinkler(s) in a compartment.

RP2-24

RP3-24

IRC: P3103.1.2, P3103.1.4

Proponents: Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov)

2024 International Residential Code

Revise as follows:

P3103.1.2 Roof used for recreational or assembly purposes.
~~Where a roof is to be used for assembly, as a promenade, observation deck or sunbathing deck, or for similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.~~ Where a roof is to be used as a promenade, restaurant, bar, or sunbathing deck, as an observation deck, or for similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.

P3103.1.4 Sidewall vent terminal. Vent terminals extending through the wall shall terminate not less than 10 feet (3048 mm) from ~~a~~ the *lot line* and ~~not less than~~ 10 feet (3048 mm) above the highest adjacent grade ~~elevation~~ within 10 feet (3048 mm) ~~in any direction~~ horizontally of the vent terminal. V~~ent pipes shall not terminate under the overhang of a structure where the overhang includes soffit vents. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening and that does not reduce the open area of the vent pipe.~~
Vent terminals shall not terminate under the overhang of a structure with soffit vents. Sidewall vent terminals shall be protected to prevent birds and rodents from entering or blocking the vent opening.

Reason: The language in sections 3103.1.2 and 3103.1.4 (IRC) do not match sections 903.1.2 and 903.1.4 of the IPC. This proposed change edits the IRC provisions to match the ones found in the IPC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change merely edits the provision language to match the IPC. The code requirements are not changed, merely edited into a more clear format.

RP3-24

RP4-24

IRC: P2903.4, P2903.4.1, P2903.4.2

Proponents: Dennis Hart, Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA) (dennis.hart@fairfaxcounty.gov)

2024 International Residential Code

Revise as follows:

P2903.4 Thermal expansion control.
~~A means for controlling increased pressure caused by thermal expansion shall be installed where required in accordance with Sections P2903.4.1 and P2903.4.2~~Where a storage water heater is supplied with cold water that passes through a check valve, pressure reducing valve or backflow preventer, a thermal expansion control device shall be connected to the water heater cold water supply pipe at a point that is downstream of all check valves, pressure reducing valves and backflow preventers. Thermal expansion tanks shall be sized in accordance with the tank manufacturer's instructions and shall be sized such that the pressure in the water distribution system shall not exceed that required by Section P2903.3.2.

Delete without substitution:

~~**P2903.4.1 Pressure-reducing valve.** For water service system sizes up to and including 2 inches (51 mm), a device for controlling pressure shall be installed where, because of thermal expansion, the pressure on the downstream side of a pressure-reducing valve exceeds the pressure-reducing valve setting.~~

~~**P2903.4.2 Backflow prevention device or check valve.** Where a backflow prevention device, check valve or other device is installed on a water supply system using storage water heating equipment such that thermal expansion causes an increase in pressure, a device for controlling pressure shall be installed.~~

Reason: This proposal brings in line language from the IPC to the IRC for thermal expansion controls. Thermal expansion in water piping does not know the difference between whether the piping is located in a commercial building or a one- or two-family dwelling, and there is no logical reason that the language should be different when requirements are the same. This proposal also clears up any confusion on whether thermal expansion controls are required on a non-storage type water heater. This change does not change current code requirements and brings language forward from the IPC to the IRC for correlation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are already requirements for thermal expansion controls in the code. This clarification does not add conditions that would require additional thermal expansion controls.

RP4-24

RP5-24

IRC: P2903.4

Proponents: Dennis Hart, Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA) (dennis.hart@fairfaxcounty.gov)

2024 International Residential Code

Revise as follows:

P2903.4 Thermal expansion control.
<u>Where a storage water heater is supplied,</u> a means for controlling increased pressure caused by thermal expansion shall be installed where required in accordance with Sections P2903.4.1 and P2903.4.2.

Reason: This proposal clarifies that thermal expansion controls are not required on a non-storage type tank water heater. Tankless water heater manufacturers typically do not require thermal expansion controls unless installed in conjunction with a storage tank. If a tankless water heater manufacturer requires thermal expansion controls per the manufacturer's installation instructions, then the requirement to install thermal expansion controls will apply per R102.4.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are already requirements for thermal expansion controls in the code. This clarification does not add conditions that would require additional thermal expansion controls.

RP5-24

RP6-24

IRC: P2904.1

Proponents: Dennis Hart, Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and Virginia Building and Code Officials Association (VBCOA) (dennis.hart@fairfaxcounty.gov)

2024 International Residential Code

Revise as follows:

P2904.1 General.
The design and installation of automatic sprinkler systems shall be in accordance with NFPA 13D or Section P2904, which shall be considered to be equivalent to NFPA 13D. Partial automatic sprinkler systems shall be permitted to be installed only in buildings not required to be equipped with an automatic sprinkler system. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose automatic sprinkler system shall provide domestic water to both fire sprinklers and plumbing fixtures. A stand-alone automatic sprinkler system shall be separate and independent from the water distribution system and shall comply with P2902.5.4. A backflow preventer shall not be required to separate an automatic sprinkler system from the water distribution system, provided that the sprinkler system complies with all of the following:

1. The system complies with NFPA 13D for a multipurpose piping sprinkler system, a passive purge sprinkler system or Section P2904.
2. The piping material complies with Section P2906.
3. The system does not contain antifreeze.
4. The system does not have a fire department connection.

Reason: NFPA 13D has several design options for a residential sprinkler system. There are multipurpose systems, passive purge systems and standalone systems. When a standalone sprinkler system is installed, it is required to be separate and independent from the water distribution system. This is achieved by having a branch off the water distribution piping after it enters the dwelling that only serves the NFPA 13D standalone sprinkler system. The other branch on the water distribution system will serve as the potable water for the dwelling. Backflow protection on these NFPA 13D standalone systems is necessary because of concerns with life safety. Stagnation can occur in the piping of a standalone sprinkler system, which leads to an increased risk of bacterial growth, mold growth and leaching of metals. Multipurpose sprinkler systems and passive purge sprinkler systems allow the flow through of water; therefore, the issue of stagnation is not present. This proposal ensures that backflow is required to be installed on these systems if installed, ensuring a backflow event will not occur.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 to $800

Estimated Immediate Cost Impact Justification (methodology and variables):

This code change proposal would increase the cost of construction when the designer chooses to install an NFPA 13D standalone system. If the designer chooses to install either a multipurpose or a passive purge NFPA 13D sprinkler system, or comply with Section 2904, then there would be no added costs.
a standalone 13D sprinkler system, in order for a backflow event to be prevented, backflow protection is necessary. Additional costs would be for the purchase and installation of the backflow preventer, and the cost of the annual inspections/maintenance of the testable device.

Costs for an ASSE 1015, Double Check Valve Assembly is listed at $469 (see the link below). Including labor, the overall initial cost for installation would be approximately $800.

Double Check Valve Assembly | Gateway Supply Co., Inc

RP7-24

IRC: TABLE P2903.2

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

2024 International Residential Code

Revise as follows:

TABLE P2903.2 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS [b]

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	2.2 gpm at 60 psi
Shower head [a]	~~2.5~~2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray shall be considered to be a shower head. Where a shower compartment is served by multiple shower heads, the concurrent discharge of all shower heads controlled by a single valve shall not exceed the maximum flow rate.

b. Consumption tolerances shall be determined from referenced standards.

Reason: This proposal requires a maximum flow-rate of 2.0 gpm at 80 psi standard for showerheads in residential homes. This requirement is consistent with a similar requirement in the 2024 International Plumbing Code. More stringent standards have been adopted in multiple states including Maine, Hawaii, Washington, Oregon, New York and California. There is wide technological availability and very cost-effective water and energy savings for hot water usage. There is wide technological availability—of the 17,275 showerheads listed in DOE's Compliance Certification Database, 14,146 or 82% meet the 2.0 gpm standard. Plumbing systems in older buildings are not expected to be negatively impacted as the standards allow for only 20% less water to flow (for a 5 minute shower, that would mean 8 gallons of water with a compliant showerhead versus 10 gallons of water for a non-compliant showerhead). For a typical single family home which has roughly 2.2 showerheads, this proposal would save approximately 5,100 gallons of water per year and result in $1,170 in utility cost savings over the 10 year life of the fixture. While this has significant energy and water savings, the incremental impact for a building's plumbing system is negligible.

[8] https://www.eia.gov/dnav/pet/pet_pri_wfr_dcus_nus_m.htm

Cost Impact: Decrease

Estimated Immediate Cost Impact:

In their analysis to establish this standard in 2015, the California Energy Commission found the incremental cost for showerheads is zero because there is no cost premium for a compliant product.[1]

Estimated Immediate Cost Impact Justification (methodology and variables):

In their analysis to establish this standard in 2015, the California Energy Commission found the incremental cost for showerheads is zero because there is no cost premium for a compliant product.[1]

Estimated Life Cycle Cost Impact:

For a typical single family home which has roughly 2.2 showerheads, this proposal would save approximately 5,100 gallons of water per year and result in $1,170 in utility cost savings over the 10 year life of the fixture.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

To estimate the roughly $1,170 in life cycle cost savings, we assumed one showerhead would save 2,247 gallons of water per year resulting in 261 kWh of electricity savings and 13.4 therms/year of savings from a natural gas or oil water heater was made based on savings estimates from the appliance standards awareness program.[2] It was assumed that a typical single family home has roughly 2.2 showerheads.[3] Water and waste water prices were estimated at $11 per thousand gallons and the effective useful life of the showerhead was estimated to be 10 years.[4] It was assumed that 48% of water heaters were natural gas, 46% were electric and 6% were fuel oil based on the 2020 Residential Energy Consumption Survey.[5]Electricity was estimated to cost $0.15/kWh[6], natural gas was estimated at $1.42/therm[7] fuel oil was estimated at $3.06/therm[8] using average annual residential utility prices from the Energy Information Administration.

RP7-24

RP8-24

IRC: P2905.3

Proponents: Anthony Floyd, City of Scotsdale, City of Scottsdale (afloyd@scottsdaleaz.gov)

2024 International Residential Code

Revise as follows:

P2905.3 Hot water supply to fixtures.
The *developed length* of *hot water* piping, from the source of the *hot water* to the fixtures that require *hot water*, shall not exceed ~~100 feet (30 480 mm)~~50 feet (15 240 mm) Water heaters and recirculating system piping shall be considered to be sources of hot water.

Reason: This change reduces the length of hot water supply line from the source of hot water to the fixtures unless part of a hot water recirculation system. The 50-foot limit is replicated from IPC Section 607.2. Hot water supply lines greater than 50 feet waste water (proportional to pipe size) while occupants wait for hot water to reach fixtures for bathing, washing and culinary purposes. Even though hot water supply lines are insulated, the hot water remaining in the lines between demand periods cools down. Limiting the length and consequent volume of heated water in the supply lines reduce the amount of wasted water and occupant waiting time.

Bibliography: WaterSense Guide for Efficient Hot Water Delivery Systems -https://www.epa.gov/sites/default/files/2017-01/documents/ws-homes-hot-water-distribution-guide.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

A hot water pump will be required where the hot water supply line exceeds 50 feet between the water heater and furthest fixture. The immediate cost of a recirculation pump range from $100 to $400 depending on size and control features.

Estimated Immediate Cost Impact Justification (methodology and variables):

Variables include length of hot water supply line between the water heater and the furthest fixture. Approximately 10 to 15 percent of the energy use associated with a hot water delivery system is wasted in distribution losses. The average home wastes more than 3,650 gallons of water per year waiting for hot water to arrive at the point of use. Annual energy and water savings will offset the upfront cost within 5 years.

RP8-24

RP9-24

IRC: P2903.4.3 (New)

Proponents: Joseph Summers, Mashantucket Pequot Tribal Nation, Building Code Enforcement

2024 International Residential Code

Add new text as follows:

P2903.4.3 **Thermal expansion tanks.** A thermal expansion tank shall be supported in accordance with the manufacturer's instructions. Thermal expansion tanks shall not be supported by the piping that connects to such tanks.

Reason: This is to provide consistency with the IPC and to emphasize that piping shall not be used to support thermal expansion tanks. The supporting of expansion tanks by means of the piping has resulted in pipe breaks and leaks as the fittings are not designed for the stresses exerted on.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is using the same language that is in the IPC and reinforces the manufacturer's requirements for the proper installation and support of the tank(s). Piping and fittings are not intended to support equipment.

RP9-24

RP10-24

IRC: TABLE P2906.6

Proponents: Christopher Adam Smith, Viega, LLC, Codes and Standards Manager for Viega, LLC

2024 International Residential Code

Revise as follows:

TABLE P2906.6 PIPE FITTINGS

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic	ASTM D2468
Cast iron	ASME B16.4
Chlorinated polyvinyl chloride (CPVC) plastic	ASSE 1061; ASTM D2846; ASTM F437; ASTM F438; ASTM F439; CSA B137.6
Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.26; ASME B16.51; ASSE 1061; ASTM F3226
Cross-linked polyethylene/aluminum/high-density polyethylene (PEX-AL-HDPE)	ASTM F1986
Fittings for cross-linked polyethylene (PEX) plastic tubing	ASSE 1061; ASTM F877; ASTM F1807; ASTM F1960; ASTM F2080; ASTM F2098; ASTM F2159; ASTM F2434; ASTM F2735; ASTM F3347; ASTM F3348; CSA B137.5
Gray iron and ductile iron	AWWA C110/A21.10; AWWA C153/A21.53
Malleable iron	ASME B16.3
Insert fittings for polyethylene/aluminum/polyethylene (PE-AL-PE) and cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX)	ASTM F1281; ASTM F1282; ASTM F1974; CSA B137.9; CSA B137.10
Polyethylene (PE) plastic	ASTM D2609; CSA B137.1
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASSE 1061; ASTM D2683; ASTM D3261; ASTM F1055; ASTM F1807; ASTM F2098; ASTM F2159; ASTM F2735; ASTM F2769; ASTM F3347; ASTM F3348; CSA B137.18
Polypropylene (PP) plastic pipe or tubing	ASTM F2389; CSA B137.11
Polyvinyl chloride (PVC) plastic	ASTM D2464; ASTM D2466; ASTM D2467; CSA B137.2; CSA B137.3
Stainless steel (Type 304/304L) pipe	ASTM A312; ASTM A778
Stainless steel (Type 316/316L) pipe	ASTM A312; ASTM A778
Steel	ASME B16.9; ASME B16.11; ASME B16.28

Staff Analysis: The proposed standards are in the current edition of the code.

Reason: The addition of ASTM F3347 "Standard Specification for Metal Press Insert Fittings with Factory Assembled Stainless Steel Press Sleeve for SDR9 Cross-linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing" and ASTM F3348 "Standard Specification for Plastic Press Insert Fittings with Factory Assembled Stainless Steel Press Sleeve for SDR9 Cross-linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing" are industry standards for PEX and PE-RT barbed fittings currently used in the International Plumbing Code and International Mechanical Code. The addition of these standards will keep the material tables aligned between the IRC and the other ICC codes, as well as keep the IRC up to date with the most relevant material standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this standard does not increase the cost of construction. The addition of this standard allows for a wider selection of materials but does not make their use mandatory. By including this standard in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

RP10-24

RP11-24

IRC: TABLE P2903.10.4

Proponents: Christopher Adam Smith, Viega, LLC, Codes and Standards Manager for Viega, LLC

2024 International Residential Code

Revise as follows:

TABLE P2903.10.4 VALVES

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic	ASME A112.4.14, ASME A112.18.1/CSA B125.1, ASTM F1970, CSA B125.3, MSS SP-122
Copper or copper alloy	ASME A112.4.14, ASME A112.18.1/CSA B125.1, ASME B16.34, CSA B125.3, IAPMO/ANSI Z1157; MSS SP-67, MSS SP-80, MSS SP-110, MSS SP-139
Gray and ductile iron	ASTM A126, AWWA C500, AWWA C504, AWWA C507, MSS SP-42, MSS SP-67, MSS SP-70, MSS SP-71, MSS SP-72, MSS SP-78
Cross-linked polyethylene (PEX) plastic	ASME A112.4.14, ASME A112.18.1/CSA B125.1, CSA B125.3, IAPMO/ANSI Z1157; NSF 359
Polypropylene (PP) plastic	ASME A112.4.14, ASTM F2389
Polyvinyl chloride (PVC) plastic	ASME A112.4.14, ASTM F1970, MSS SP-122

Staff Analysis: A review of the standard proposed for inclusion in the code, IAPMO/ANSI Z1157-2014e1(R2019) *Ball Valves*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposal adds IAPMO/ANSI Z1157 "Ball Valves" to the IRC. This Standard covers ball valves in sizes NPS-⅛ to NPS-4, with minimum rated working pressures of 860 kPa (125 psi) at 23°C (73°F), intended for use in water supply and distribution systems and specifies requirements for materials, physical characteristics, performance, testing and markings, and it is already used in the IPC. The addition of this standard will keep the material tables aligned between the IRC and the IPC, as well as keep the IRC up to date with the mast relevant materials standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this standard does not increase the cost of construction. The addition of this standard allows for a wider selection of materials but does not make their use mandatory. By including this standard in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

RP11-24

RP12-24

IRC: SECTION 202, M2002.4, P2503.6, P2706.2, SECTION P2709, P2709.1, P2709.2, P2709.4, P2902.3.1, TABLE P3004.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Residential Code

Revise as follows:

[MP] AIR BREAK (DRAINAGE SYSTEM). An arrangement where a discharge pipe from a fixture, *appliance* or device drains indirectly into a waste receptor below the *flood-level rim* of the waste receptor and above the trap seal.

[MP] AIR GAP, DRAINAGE SYSTEM. The unobstructed vertical distance through free atmosphere between the outlet of a waste pipe and the *flood-level rim* of the fixture or waste receptor into which it is discharging.

[MP] FLOOD-LEVEL RIM. The edge of the waste receptor or fixture from which water overflows.

[MP] INDIRECT WASTE PIPE. A waste pipe that discharges into the drainage system through an *air gap* into a trap, fixture or waste receptor.

M2002.4 Pressure relief valve.
Boilers shall be equipped with pressure relief valves with minimum rated capacities for the *equipment* served. Pressure relief valves shall be set at the maximum rating of the boiler.

Revise as follows:

P2503.6 Shower liner test.
Where shower floors ~~and receptors~~ are made watertight by the application of materials required by Section P2709.2, the completed liner installation shall be tested. The pipe from the shower drain shall be plugged watertight for the test. The shower floor ~~and receptor~~ area shall be filled with potable water to a depth of not less than 2 inches (51 mm) measured at the threshold. Where a threshold of not less than 2 inches (51 mm) in height does not exist, a temporary threshold shall be constructed to retain the test water in the lined shower floor ~~or receptor~~ area to a level not less than 2 inches (51 mm) in depth measured at the threshold. The water shall be retained for a test period of not less than 15 minutes and there shall not be evidence of leakage.

P2706.2 Prohibited waste receptors. Plumbing fixtures that are used for washing or bathing shall not be used to receive the discharge of indirect waste piping.

Exceptions:

1. A *kitchen* sink trap is acceptable for use as a waste receptor for a dishwasher.
2. A laundry tray is acceptable for use as a waste receptor for a clothes washing machine.

SECTION P2709
SHOWER ~~RECEPTORS~~CONSTRUCTION

P2709.1 Construction.
Where a shower ~~receptor~~ has a finished curb threshold, ~~it~~ the shower depth shall be not less than 1 inch (25.4 mm) ~~below~~ at the sides and back ~~of~~ the ~~receptor~~ below the curb threshold. The curb shall be not less than 2 inches (51 mm) and not more than 9 inches (229 mm) deep when measured from the top of the curb to the top of the drain. The finished floor shall slope uniformly toward the drain not less than $^{1}/_{4}$ unit vertical in 12 units horizontal (2-percent slope) nor more than $^{1}/_{2}$ unit vertical per 12 units horizontal (4-percent slope) and *floor drains* shall be flanged to provide a watertight joint in the floor.

P2709.2 Lining required.
The adjoining walls and floor framing enclosing on-site built-up shower ~~receptors~~ shall be lined with one of the following materials:

1. Sheet lead.
2. Sheet copper.
3. Plastic liner material that complies with ASTM D4068 or ASTM D4551.
4. Hot-mopping in accordance with Section P2709.2.3.
5. Sheet-applied load-bearing, bonded waterproof membranes that comply with ANSI A118.10.

The lining material shall extend not less than 2 inches (51 mm) beyond or around the rough jambs and not less than 2 inches (51 mm) above finished thresholds. Sheet-applied load bearing, bonded waterproof membranes shall be applied in accordance with the manufacturer's instructions.

P2709.4 ~~Receptor~~Shower drains.

An *approved* flanged drain shall be installed with shower subpans or linings. The flange shall be placed flush with the subbase and be equipped with a clamping ring or other device to make a watertight connection between the lining and the drain. The flange shall have weep holes into the drain.

P2902.3.1 Air gaps.

Air gaps shall comply with ASME A112.1.2 and *air gap* fittings shall comply with ASME A112.1.3. An *air gap* shall be measured vertically from the lowest end of a water outlet to the *flood level rim* of the fixture or waste receptor into which the water outlets discharge~~s to the floor~~. The required *air gap* shall be not less than twice the diameter of the effective opening of the outlet and not less than the values specified in Table P2902.3.1.

TABLE P3004.1 DRAINAGE FIXTURE UNIT (d.f.u.) VALUES FOR VARIOUS PLUMBING FIXTURES

TYPE OF FIXTURE OR GROUP OF FIXTURES	DRAINAGE FIXTURE UNIT VALUE (d.f.u.) [a]
Bar sink	1
Bathtub (with or without a shower head or whirlpool attachments)	2
Bidet	1
Clothes washer standpipe	2
Dishwasher	2
Floor drain [b]	0
Kitchen sink	2
Lavatory	1
Laundry tub	2
Shower stall	2
Water closet (1.6 gallons per flush)	3
Water closet (greater than 1.6 gallons per flush)	4
Full-bath group with bathtub (with 1.6-gallons-per-flush water closet, and with or without shower head and/or whirlpool attachment on the bathtub or shower stall)	5
Full-bath group with bathtub (water closet greater than 1.6 gallonsper flush, and with or without shower head and/or whirlpool attachment on the bathtub or shower stall)	6
Half-bath group (1.6-gallons-per-flush water closet plus lavatory)	4
Half-bath group (water closet greater than 1.6 gallonsper flush plus lavatory)	5
Kitchen group (dishwasher and sink with or without food-waste disposer)	2
Laundry group (clothes washer standpipe and laundry tub)	3
Multiple-bath groups[c]: 1.5 baths 2 baths 2.5 baths 3 baths 3.5 baths	 7 8 9 10 11

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m.

a. For a continuous or semicontinuous flow into a drainage system, such as from a pump or similar device, 1.5 fixture units shall be allowed per gpm of flow. For a fixture not listed, use the highest d.f.u. value for a similar listed fixture.

b. A floor drain itself does not add hydraulic load. Where used as a waste receptor, the fixture unit value of the fixture discharging into the waste receptor shall be applicable.

c. Add 2 d.f.u. for each additional full bath.

Reason: This definition of "RECEPTOR" is already covered by the definition of a "Waste Receptor", which provide clear direction on what is considered an appropriate waste receptor for indirect wastes.

[MP] WASTE RECEPTOR. A floor sink, standpipe, hub drain or a floor drain that receives the discharge of one or more indirect waste pipes.

The intent of this proposal is to remove the defined term "RECEPTOR"

Bibliography: This definition is redundant and already covered under the definition of a waste receptor which in fact provides greater clarification as to what fixtures can be classified as waste receptors.

"WASTE RECEPTOR. A device for receiving the discharge of a waste pipe or pipes and discharges them by gravity into the sanitary drainage system. Waste receptors include, but are not limited to, floor drains, floor sinks, trench drains, hub drains, standpipes, mop basins, service sinks, and laundry trays."

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not impact cost of construction, it is entirely for clarification since the definition of a waste receptor already exists. Refer to reason statement.

RP12-24

RP13-24

IRC: P2904.2

Proponents: Jeffrey M Hugo, CBO, NFSA, National Fire Sprinkler Association (hugo@nfsa.org)

2024 International Residential Code

Revise as follows:

P2904.2 Sprinklers.
Sprinklers shall be new *listed* residential sprinkler. Sprinklers ~~and~~ shall be installed in accordance with the sprinkler manufacturer's instructions.

Exceptions:

1. High temperature quick response sprinklers shall be permitted to be installed in sauna and steam rooms.
2. Quick response sprinklers shall be permitted to be installed in mechanical rooms.

Reason: This proposal for the residential sprinkler criteria in the IRC, P2904 correlates with the 2022 edition of NFPA 13D. While both documents are considered equivalent, having the correlation benefits designers and code officials using the IRC.

Residential sprinklers are limited to 225°F which are too low for saunas and steam rooms located in the dwelling unit. These rooms are required to be sprinklered. This change allows a quick response sprinkler (operating with the same response thermal index (RTI) range as a residential sprinkler) in the high temperature range of 250-300°F to protect these rooms.

The quick response sprinkler is permitted to protect the mechanical room. This is an option that reduces the installation cost as quick response sprinklers are generally less in cost than the residential sprinkler. Quick response sprinklers and residential sprinklers are both in the fast response RTI range.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Source: Actual estimates

Quick response pendent, high temperature sprinklers cost ranges from approximately $11-$17 apiece

Quick response pendent sprinklers cost ranges from approximately $11-$20 apiece

Estimated Immediate Cost Impact Justification (methodology and variables):

Analogous methodology using actual material cost estimates to create a range of cost. Listed residential sprinklers cannot be used in high temperature areas, so NFPA 13D allows a listed quick response sprinkler in lieu of residential sprinklers in these specific areas.

TENTATIVE ORDER OF DISCUSSION 2024 PROPOSED CHANGES TO THE INTERNATIONAL SWIMMING POOL AND SPA CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some SP code change proposals may not be included on this list, as they are being heard by another committee.

ISPSC: SECTION 202, 202, 202 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Swimming Pool and Spa Code

Delete without substitution:

~~**EXERCISE SPA (Also known as a swim spa).** Variants of a spa in which the design and construction includes specific features and equipment to produce a water flow intended to allow recreational physical activity including, but not limited to, swimming in place. Exercise spas can include peripheral jetted seats intended for water therapy, heater, circulation and filtration system, or can be a separate distinct portion of a combination spa/exercise spa and can have separate controls. These spas are of a design and size such that they have an unobstructed volume of water large enough to allow the 99th Percentile Man as specified in APSP 16 to swim or exercise in place.~~

Revise as follows:

SPA. A structure or product intended for the immersion of persons in temperature-controlled water for the purpose of relaxing, exercise, therapy or treatment; designed and manufactured to be connected to a circulation system; ~~circulated in a closed system,~~ and not intended to be drained and filled with each use..This term includes, but is not limited to, exercise spas, hot tubs, permanent spas and portable electric spas. ~~A spa usually includes a filter, an electric, solar or gas heater, a pump or pumps, and a control, and can include other equipment, such as lights, blowers, and water-sanitizing equipment.~~

Delete without substitution:

~~**Nonself-contained spa.** A factory-built *spa* in which the water heating and circulating equipment is not an integral part of the product. Nonself-contained spas may employ separate components such as an individual filter, pump, heater and controls, or they can employ assembled combinations of various components.~~

~~**Permanent residential spa.** A spa, intended for use that is accessory to a *residential* setting and available to the household and its guests and where the water heating and water-circulating equipment is not an integral part of the product. The spa is intended as a permanent plumbing fixture and not intended to be moved.~~

~~**Portable residential spa.** A spa intended for use that is accessory to a *residential* setting and available to the household and its guests and where it is either self-contained or nonself-contained.~~

~~**Public spa.** A spa other than a permanent *residential* spa or portable *residential* spa that is intended to be used for bathing and is operated by an owner, licensee or concessionaire, regardless of whether a fee is charged for use.~~

~~**Self-contained spa.** A factory-built spa in which all control, water-heating and water-circulating equipment is an integral part of the product. Self-contained spas may be permanently wired or cord connected.~~

POOL. See "*Public swimming pool*" and "*Residential swimming pool*."

PUBLIC SWIMMING POOL (Public Pool). A pool, other than a *residential* pool, that is intended to be used for swimming or bathing and is operated by an owner, lessee, operator, licensee or concessionaire, regardless of whether a fee is charged for use. Public pools shall be further classified and defined as follows:

Class A competition pool. A pool intended for use for accredited competitive aquatic events such as Federation Internationale De Natation (FINA), USA Swimming, USA Diving, USA Synchronized Swimming, USA Water Polo, National Collegiate Athletic Association (NCAA), or the National Federation of State High School Associations (NFHS).

Class B public pool. A pool intended for public recreational use that is not identified in the other classifications of public pools.

Revise as follows:

Class C semi-public pool. A pool operated solely for and in conjunction with lodgings such as hotels, motels, apartments, ~~or~~ condominiums or property owner associations or multi-family-owned pools used by more than three owner families..

Class D-1 wave action pool. A pool designed to simulate breaking or cyclic waves for purposes of general play or surfing.

Class D-2 activity pool. A pool designed for casual water play ranging from simple splashing activity to the use of attractions placed in the pool for recreation.

Class D-3 catch pool. A body of water located at the termination of a manufactured waterslide attraction. The body of water is provided for the purpose of terminating the slide action and providing a means for exit to a deck or walkway area.

Class D-4 leisure river. A manufactured stream of water of near-constant depth in which the water is moved by pumps or other means of propulsion to provide a river-like flow that transports bathers over a defined path that may include water features and play devices.

Class D-5 vortex pool. A circular pool equipped with a method of transporting water in the pool for the purpose of propelling riders at speeds dictated by the velocity of the moving stream of water.

Revise as follows:

Class D-6 interactive water play features ~~attraction~~.
Any indoor or outdoor installation that includes sprayed, jetted, or other water sources contacting bathers and not incorporating standing or captured water as part of the bather activity area. These aquatic venues are also known as splash pads, spray pads, and wet decks.
~~A manufactured water play device or a combination of water-based play devices in which water flow volumes, pressures or patterns can be varied by the bather without negatively influencing the hydraulic conditions for other connected devices. These attractions incorporate devices or activities such as slides, climbing and crawling structures, visual effects, user-actuated mechanical devices and other elements of bather-driven and bather-controlled play.~~

Class E physical therapy pool.. A ~~P~~pools used for ~~instruction, play or~~ physical therapy and with temperatures above 86°F (30°C).

Class F wading pools. ~~Class F pools are wading pools and are covered within the scope of this code as set forth in Section 405.~~A pool with an independent circulation system and physically separated from the main pool with a water depth 18 inches or less.
~~Public pools are either a diving or nondiving type. Diving types of public pools are classified into types as an indication of the suitability of a pool for use with diving equipment.~~

Type O. A nondiving public pool.

Types VI–IX. Public pools suitable for the installation of diving equipment by type.

AQUATIC RECREATION FACILITY. A facility that is designed for free-form aquatic play and recreation. The facilities may include, but are not limited to, wave or surf action pools, leisure rivers, sand bottom pools, vortex pools, activity pools, inner tube rides, body slides and interactive play attractions.

AQUATIC VENUE. A constructed structure or modified natural structure containing water and intended for recreational or therapeutic use. Exposure to water in these structures may occur by contact, ingestion or aerosolization. Examples include swimming pools, wave pools, lazy rivers, surf pools, spas, hot tubs, therapy pools, spray pads, waterpark pools and other interactive water venues.

Revise as follows:

ELEVATED SWIMMING POOL OR PERMANENT SPA. Any permanently installed pool, spa, cold plunge, catch basin, overflow trough, including any connected water feature, or body of water water feature, that is over a habitable, occupiable or unoccupied space that is (1) inside a thermal envelope, (2) outside a thermal envelope, or (3) a combination of inside and outside the thermal envelope.

EXISTING SWIMMING POOL OR PERMANENT SPA. A pool or spa constructed prior to the date of adoption of this code, or one for which a legal building permit has been issued.

Delete without substitution:

~~**INTERACTIVE WATER PLAY FEATURES.**~~ ~~Any indoor or outdoor structure designed to allow for public recreational activities with~~

~~recirculated, filtered, and treated water that includes sprayed, jetted or other water sources contacting bathers and not incorporating standing or captured water as part of the bather activity area. These installations are also known as splash pads, spray pads, and wet decks.~~

ONGROUND STORABLE POOL. A pool that can be disassembled for storage or transport. This includes portable pools with flexible or nonrigid walls that achieve their structural integrity by means of uniform shape, a support frame or a combination thereof, and that can be disassembled for storage or relocation.

PERIMETER FLOW POOL. A pool where the water surface is lifted and flows over the perimeter of the pool into a surrounding *gutter* that delivers water to the circulation pump.

RESIDENTIAL SWIMMING POOL (Residential Pool). A pool intended for use that is accessory to a *residential* setting and available only to the household and its guests. Other pools shall be considered to be public pools for purposes of this code.

Type O. A nondiving *residential* pool.

Types I–V. *Residential* pools suitable for the installation of diving equipment by type.

SPRAY POOL. A pool or basin occupied by construction features that spray water in various arrays for the purpose of wetting the persons playing in the spray streams.

Add new definition as follows:

Exercise Spa (Also known as a swim spa). .
A variant of a spa in which the design and construction includes specific features and equipment to produce a water flow intended to allow recreational physical activity including, but not limited to, swimming in place. Exercise spas can include peripheral jetted seats intended for water therapy, heater, circulation and filtration system, or can be a separate distinct portion of a combination spa and can have separate controls. These spas are of a design and size such that they have an unobstructed volume and depth of water to allow the 99th Percentile Man as specified in APSP 16 to swim or exercise in place. An exercise spa is also known as a swim spa.

202 SWIMMING POOL. Any structure or product intended for swimming, bathing or wading; designed and manufactured to be connected to a circulation system; installed aboveground, inground, onground, or partially aboveground; and not intended to be drained and filled with each use. See “Public swimming pool” and “Residential swimming pool.”

Delete without substitution:

~~**ACTIVITY POOL.** A pool designed primarily for play activity that uses constructed features and devices including lily pad walks, flotation devices, small slide features, and similar attractions.~~

Reason: This proposal is based on a need for alignment across the I-codes with the larger definitions of “swimming pool” and “spa” and then referring to the ISPSC for the more detailed definitions. Proposals for other I-codes to follow the ISPSC “swimming pool” and “spa” definitions is expected. The other edits to ISPSC existing definitions are being made for consistency with industry terms, ANSI standards and other regulations. Duplicate terminology is also being removed. These are all meant as editorial changes to provide clarity for the user; there are no substantive changes intended.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

A clarification for the use of these definitions in other I-codes The revised definitions do not change the technical requirements of the code and therefore there isn’t any change to the cost of complying with the code.

SP1-24

SP2-24

ISPSC: SECTION 202

Proponents: Ronald Clements, Chesterfield County, VA, Chesterfield County, VA (clementsro@chesterfield.gov)

2024 International Swimming Pool and Spa Code

Revise as follows:

SWIMOUT. An underwater seat area that is placed completely outside of the diving envelope of the pool. ~~Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool.~~

Reason: The sentence proposed for deletion from the definition goes beyond defining the term, it is stating when used in the deep end the swimout can be used as a means of egress. That statement is a code requirement/allowance, it is not a definition. Section 411.1.3 is the code section addressing egress from deep ends and that section already lists swimouts as an approved deep end means of egress. Definitions should not go beyond defining the term.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool." is proposed to be deleted because it is not a definition, it is a code requirement that has been repeated from the code requirement in Section 411.1.3. Section 411.1.3, provided below for comparison, states that in the deep area of pools means of entry and exit can be by swimouts as provided in list item #6; therefore, removal of a copy from code section 411.1.3 #6 from the definition of swimout in chapter 2 is editorial. It is editorial because removal of the sentence from the definition does not change how the term is defined, nor the code requirement that uses the term with regards to entry and exits from deep ends of pools.

SWIMOUT.

An underwater seat area that is placed completely outside of the diving envelope of the pool. Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool.

411.1.3 Deep area.

The means of entry and exit in the deep area of pools shall consist of one of the following:

1. Steps/stairs.
2. Ladders.
3. Grab rails with recessed treads.
4. Ramps.
5. Beach entries.
6. Swimouts.
7. Other designs that provide the minimum utility as specified in this code.

SP2-24

SP3-24

ISPSC: SECTION 202, SECTION 202 (New), SECTION 303, 303.1, 303.1.2 (New), TABLE 303.1.2 (New), 303.1.3 (New), 303.1.1, 303.1.2, 303.1.3, 303.2, 303.3, DOE (New)

Proponents: Maureen Guttman, Senior Fellow, Energy Solutions, California Investor-Owned Utilities

2024 International Swimming Pool and Spa Code

SECTION 202 DEFINITIONS

Add new definition as follows:

SITE-RECOVERED ENERGY. Waste energy recovered at the building site that is used to offset consumption of purchased energy supplies.

SOLAR THERMAL WATER HEATER. An assembly of components designed to heat water through the conversion of incident solar radiation at the building site.

SECTION 303 ENERGY

Revise as follows:

303.1 Energy consumption of pools and permanent spas. The energy consumption of pools and permanent spas shall be controlled by the requirements in Sections 303.1.1 through ~~303.1.3~~ 303.1.4 and with Section 317.

Add new text as follows:

303.1.1 Primary heating systems. The primary pool or spa heating system shall be one of the following:

1. A *solar thermal water heater* with a solar collector surface area equivalent to at least 65 percent of the pool or spa surface area.
2. A heat pump pool heater.
3. Systems that do not use *solar thermal water heaters* or heat pump pool heaters as their primary heat source shall derive no less than 60 percent of annual heating energy from *on-site renewable energy* or *site-recovered energy*.

Exceptions:

1. *Residential* pools and *residential* spas.
2. Portable electric spas.
3. A pool or spa heated only by a *solar thermal water heater*.

303.1.2 Pool heater efficiency. Pool heaters shall meet the minimum efficiency requirements of Table 303.1.2 when tested in accordance with the test procedure listed in DOE 10 CFR 430.23(p) and Appendix P to Subpart B of Part 430.

TABLE 303.1.2 POOL HEATER MINIMUM EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	MINIMUM EFFICIENCY

Heat Pump Pool Heater	4.0 COP rated at 50° F db 44.2° F wb outdoor air 80.0° F entering water
Gas-Fired Pool Heater	*Before 5/31/2028* *Integrated Thermal Efficiency not less than the following:* *600 (PE)/(PE + 1,619)* *where PE is the active electrical power, in Btu/h* *After 5/31/2028* *82% Et* *Before 5/31/2028* *84(QIN + 491)/(QIN + 2,536)* *where QIN is the input capacity, in Btu/h* *After 5/31/2028*

303.1.3 Heater controls. Heater controls and ignition pilots shall comply with Section 303.1.3.1 through Section 303.1.3.3.

Revise as follows:

~~303.1.1~~ 303.1.3.1 ~~Heaters~~ Electric switches. The electric power to heaters shall be controlled by an on-off switch with ready access that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. ~~Gas-fired heaters shall not be equipped with continuously burning ignition pilots.~~

~~303.1.2~~ 303.1.3.2 Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for heaters and pump motors. Heaters and pump motors that have built-in time switches shall be in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- or waste-heat recovery pool heating systems.

~~303.1.1~~ 303.1.3.3 ~~Heaters~~ Ignition pilots. ~~The electric power to heaters shall be controlled by an on-off switch with ready access that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater.~~ Gas-fired heaters shall not be equipped with continuously burning ignition pilots.

~~303.1.3~~ 303.1.4 Covers. Outdoor heated pools and outdoor permanent spas shall be provided with a vapor-retardant cover or other *approved* vapor-retardant means in accordance with Section 104.9.1.

Exception: Where more than 75 percent of the energy for heating, computed over an operating season of not fewer than 3 calendar months, is from a heat pump or an on-site renewable energy system, covers or other vapor-retardant means shall not be required.

303.2 Portable spas. The energy consumption of electric-powered portable spas shall be controlled by the requirements of APSP 14.

303.3 Residential pools and permanent residential spas. The energy consumption of *residential* swimming pools and permanent *residential* spas shall be controlled in accordance with the requirements of APSP 15.

Add new standard(s) as follows:

DOE 10 CFR Part 430. Energy Conservation Program for Consumer Products: Test Procedures and Certification and Enforcement

Requirement for Plumbing Products; and Certification and Enforcement Requirements for Residential Appliances; Final Rule; Pool heaters

Staff Analysis: A review of the standard proposed for inclusion in the code, DOE 10CFR Part 430 *Energy Conservation Program for Consumer Products: Test Procedures and Certification and Enforcement Requirement for Plumbing Products; and Certification and Enforcement Requirements for Residential Appliances; Final Rule; Pool heaters*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposal, based on pool heater requirements proposed for California's 2025 energy code, requires that the primary heating system for pools and spas is either a solar thermal water heater, a heat pump pool heater or a heating system that derives no less than 60 percent of its annual heating energy from either on-site renewable energy or site-recovered energy. Natural gas or electric back-up heating systems are allowed in all cases. The proposal also includes mandatory minimum efficiency standards for pool heaters established by the U.S. Department of Energy.

The purpose of this proposal is to save energy and reduce carbon emissions from new swimming pool and spa heaters. According to CBECS 2018, the majority of pool and spa heaters installed today to heat indoor commercial pools are powered with natural gas (71%) which ties building owners to unpredictable utility costs caused by price swings in the natural gas market.

Solar thermal heating systems are cost effective alternatives to conventional gas-fired pool heaters which result in reduced energy use and lower monthly utility costs. Solar swimming pool and spa heating systems are one of the simplest and least expensive forms of solar thermal technology. The most common and least expensive type of solar swimming pool and spa heating systems are unglazed solar collectors which are made of a black plastic material that absorbs the sun's energy, converting it into heat which is then transferred to the water in the pool. Unglazed solar collectors are popular for swimming pools because they are easy to install, require little to no maintenance, and result in significantly lower monthly utility bills.

While a solar thermal heater with a backup gas-fired pool heater is more expensive than installing just a gas-fired pool heater (incremental costs are around $5,250 for a 20,000 gallon capacity pool), the reduction in monthly utility costs results in very short payback periods. A recent California CASE Study found that installing a solar pool and spa heating system with gas-fired back-up reduces natural gas use by 64 therms/year for residential pools and 45,000 therms/year for an Olympic sized pool. The same CASE study found that the reduction in natural gas use over 30 years resulted in a reduction in utility bills for solar pool and spa heating systems that were two to six times higher than the incremental cost for installing the system. The Department of Energy similarly states that the payback period for a solar pool and spa heating system alone is on the order of 1 to 7 years.

Not only do solar thermal water heaters result in reduced utility bills, but they can also reduce carbon emissions. The California CASE Study found that this requirement would reduce greenhouse gas emissions in California by approximately 37,000 metric tons of CO_2e per year. Given that commercial pools in California make up roughly 20% of the commercial pool market in the U.S., this proposal, if adopted nationwide, could result in a reduction of roughly 190,000 metric tons of CO_2e per year which is equivalent to taking 42,000 cars off the road.

As an alternative to installing a solar thermal heating system, this proposal allows for the installation of heat pump pool heaters or pool heaters which derive at least 60 percent of their annual heating energy from either on-site renewable energy or site-recovered energy. The California CASE study found that heat pump pool heaters save more energy and are more cost effective than solar thermal heating systems. This proposal exempts residential pools and spas and portable electric spas.

California Energy Codes and Standards. *Codes and Standards Enhancement (CASE) Initiative 2025 California Energy Code: Swimming Pool Heating*. Revised October 2023. https://title24stakeholders.com/wp-content/uploads/2023/10/Revised-2025-T24-Final-CASE-Report_-NR-Swimming-Pool-Spa-Heating-1.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

The California CASE study found that installing a solar thermal water heaters in addition to a gas-fired pool heating system in nonresidential pools resulted in total 30-year incremental installation and maintenance costs of $18,786. The California CASE study found that heat pump pool heaters in addition to a gas-fired pool heating system result in $17,416 in incremental installation and maintenance costs over 30 years.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimated immediate incremental cost assumed that the owner installed a solar thermal water heater or a heat pump pool heater as the primary system and a gas heater as back-up. The incremental cost therefore is the full installed cost of solar thermal water heater or heat pump pool heater. The cost of the solar collectors was estimated from a database of installation cost values from the California Solar Initiative Commercial Pool Solar Thermal Rebate program. The database contains over 1,100 commercial pool solar thermal projects with data on the collector size and total project cost.

Estimated Life Cycle Cost Impact:

Over 30 years, the CASE study found that solar thermal water heaters saved between $38,000 to $150,000 for non-residential pools yielding a benefit to cost ratio between 2.0 to 6.6 depending on the Climate Zone. If one includes the immediate and maintenance costs for the solar thermal water heaters, total life cycle cost savings over 30 years are between $19,214 and $131,214 depending on the Climate Zone.

Over 30 years, the CASE study found that heat pump pool heaters saved between $40,697 to $202,301 for consumers yielding a benefit to cost ratio between 2.3 to 11.6 depending on the Climate Zone. If one includes the immediate and maintenance costs for the solar thermal water heaters, total life cycle cost savings over 30 years are between $23,281 and $184,885 depending on the Climate Zone.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The methodology and variables for the life cycle cost impact calculation are descripted in the CASE study.

SP3-24

SP4-24

ISPSC: 303.1.2

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com); Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org)

2024 International Swimming Pool and Spa Code

Revise as follows:

303.1.2 Time switches. Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for heaters and pump motors. Heaters and pump motors that have built-in time switches shall be in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate ~~solar~~ on-site renewable energy or waste-heat recovery pool heating systems.

Reason: This proposal is being made to align with a change made in the 2024 IECC, Residential and 2024 IRC, Chapter 11. Section 303 Energy of the ISPSC is also in the IECC and Ch 11 of the IRC, so it is important to have them all align.

This change was done in the IECC to allow for more than just solar as an on-site renewable energy option to operate a pump, as other on-site renewable energy options may exist that would then fall under the exception to the time switch requirements. This change aligns with verbiage used in the IECC, but also aligns with the verbiage used in the exception to section 303.1.3 of the ISPSC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It simply aligns the ISPSC code provisions with that of the IECC, for consistency and to ensure there is no confusion.

SP4-24

SP5-24

ISPSC: 305.1, 305.4

Proponents: Dan Lenz, All Seasons Dist., Inc., Midwest Chapter of the PHTA (dan@aspools.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

305.1 General. The provisions of this section shall apply to the design of barriers for restricting entry into areas having pools and spas. Where spas or hot tubs are equipped with a lockable *safety cover* complying with ASTM F1346 ~~and swimming pools are equipped with a powered *safety cover* that complies with ASTM F1346~~, the areas where those spas~~,~~ or hot tubs ~~or pools~~ are located shall not be required to comply with Sections 305.2 through 305.7.

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the barrier and where doors, gates or windows provide direct access to the pool or spa through that wall, one of the following shall be required:

1. Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor, doors and gates shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and labeled as a water hazard entrance alarm in accordance with UL 2017.
2. In dwellings not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located at not less than 54 inches (1372 mm) above the finished floor.
3. In dwellings that are required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
4. In structures other than dwellings, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1220 mm) above the finished floor.
5. A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the ~~pools and~~ spas.
6. An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

Reason: Section 305.1 provides that pools with a powered safety cover that complies with ASTM F1346, the areas where those pools are located do not need to comply with Sections 305.2 through 305.7, removing all other barrier requirements.

Cover manufacturer's guidelines contain provisions whereby the cover is required to be left open given certain circumstances, including when the pool water is not balanced to industry standards, or when certain treatments, such as high concentrations of chlorine are introduced. When these events occur, and no other barriers exist, a significant safety hazard is created that can cause injury or death. As one example, Latham, a leading powered safety cover manufacturer posts on its website at https://www.lathampool.com/blog/maintain/automatic-pool-cover-maintenance-checklist/ that 'You may think you need to leave your pool closed permanently during the winter months when it's not in use, but weather permitting, it's important to open your cover once per week. When you do so, ***open the cover all the way for several hours*** in order to allow excessive chemicals to dissipate/evaporate.' The CDC recommends that if a pool encouters a fecal accident involving diarrhea, and the pool water contains cyanuric acid (Which most pool water does), that the pool water should be hyperchlorinated by raising the free chlorine level to 20 ppm for 28 hours (https://www.cdc.gov/healthywater/swimming/pdf/fecal-incident-response-guidelines.pdf). Latham's recommended safe chlorine level for a powered safety cover is 1.0 ppm (https://www.lathampool.com/blog/maintain/how-to-keep-pool-chemicals-from-damaging-your-automatic-safety-cover/), and that 'It is important to note that pool chemical damage is not covered under Latham's warranty. Chemical levels are the responsibility of the homeowner. Latham is not responsible for damage to any part of the pool that is caused by chemical imbalance.'

Additionally, representatives of the pool and spa industry with knowledge of construction and service know that these covers are often not covering the pool or are in some other state of disrepair, are closed but covered in water, or by other means creating a potential drowning hazard.

Bibliography: Dan Lenz is a 37 year pool industry veteran who is a PHTA Certified Building Professional, PHTA Certified Service Professional, past President and current Vice President of the Midwest chapter of the PHTA, Vice Chair of the PHTA Builder's Council, a member of the PHTA Education Committee and PHTA Service Council. He is a PHTA instructor who teaches industry certification courses including CPO, CMS, CST, CHTT and legacy CBP. Dan is also a pool industry consultant, called on routinely to speak to investors interested in the pool industry. He is employed as Vice President of All Seasons Dist., Inc out of Orland Park, IL, where his oversight includes their service and construction divisions, both of which are honored in the industry as one of the Top 50 Builders as well as one of the Top 50 Service Companies in the country.

.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost of installing conventional barriers, such as 4ft. high fencing with self-closing, self-latching gates, is less than the cost of installing a powered safety cover, and in an example of an 18' x 36' inground pool, can save consumers anywhere from $7,750 to $15,500.

Estimated Immediate Cost Impact Justification (methodology and variables):

A powered safety cover installed on an 18' x 36' inground pool will cost a consumer $14,000 to $20,000 (Materials) and $1000 to $5000 for labor to install it.

Variables for cover materials include the pool's shape, pool construction type (Vinyl, fiberglass, or gunite), installation method (Are the tracks on top of the deck vs. concealed, is the mechanism on top of the deck vs. concealed, is the recessed mechanism lid designed to be walked on), recessed mechanism lid type, fabric color, control type, type of lid for the recessed mechanism (Aluminum vs. stone or brick), and is the motor hydraulic vs. electric.

Variables for cover labor include installation method, such as whether the tracks are on top of the deck vs. concealed; whether the mechanism on top of the deck vs. concealed; the length and source of the electrical and/or hydraulic feed; whether the mechanism lid is aluminum, stone, built to be walked on or not; as well as the distance that required drainage for the recessed mechanism must be run.

As opposed to a powered safety cover, a 4 ft. high, ornamental aluminum fence that is 188 ft. long (Which would surround the same 18' x 36' inground pool with 10' of space all around the pool from the pool edge to the fence), with two 4 ft. high, 3 ft. wide gates that include self-closing, self-latching hardware, would cost a consumer $6500 to $8000 (Materials) and $750 to $1500 for labor to install it.

Variables for fence materials include color and fence design detail.

Variable for fence labor include differences in quantity of fence posts and whether those posts are surface deck mounted vs. inground.

Powered safety covers have a cost to consumers that starts at $10,000 and quickly rises to as much as $25,000. As a PHTA Certified Building Professional, 37 year industry veteran, Vice President of the Midwest chapter of the PHTA, Vice Chair of the PHTA Builder's Council, member of the PHTA Education Committee and Service Council, PHTA CPO Instructor, Industry Consultant and Vice President of All Seasons Dist., Inc out of Orland Park, IL, where I oversee our pool construction division, I am fully knowledgeable of these costs.

Latham, an industry leader in vinyl and fiberglass pool manufacturing, as well as a powered safety cover manufacturer, indicates a similar powered safety cover cost range between $10,000 to $20,000 on their website at https://www.lathampool.com/plan-your-pool/inground-pool/automatic-pool-cover-price-guide/ .

A pool fence, as identified by Angi.com at https://www.angi.com/articles/pool-fence-cost.htm , costs between $15.00 and $25.00 per linear foot. Pools and their surrounding areas vary, but they indicate that "For $6000 you can easily have 300 linear feet of fencing installed, more than enough to surround even the larger residential inground pools."

SP5-24

SP6-24

ISPSC: 305.1.2 (New)

Proponents: Daniel Stonkus, Pool & Spa Enclosures, LLC. (dan@sunrooms-enclosures.com)

2024 International Swimming Pool and Spa Code

Add new text as follows:

305.1.2 Retractable Pool Enclosures. Where pools, spas or hot tubs are equipped with a manual lockable retractable enclosure complying with ASTM F1346, the areas where those pools, spas or hot tubs are located shall not be required to comply with Sections 305.2 through 305.7.

Staff Analysis: The proposed standard is in the current edition of the code.

Reason: Pool Enclosures offer security equal to, or beyond existing approved barriers while also providing the pool owner with other benefits(reduced chemicals, reduced debris, increased swimming season, reduced heating costs, etc.). This proposal is intended to make available an alternate method meeting the barrier requirements in section 305.

Please reference these additional insights to support the consideration of our proposal:

1. Manual safety covers are currently listed as an appropriate minimum construction standard for spas and hot tubs. I assume this is the case due to the ease at which a manual cover can secure a smaller area such as a spa or hot tub. If a manual cover can also secure a pool with the same ease, that should be acceptable as a minimum construction standard.
2. Due to the variety of designs, there are varying levels of difficulty in which a manual cover can secure a pool. We don't feel it's appropriate to classify all manual safety covers the same way. For example, enclosures can be produced with self-Locking sections. No guess work as someone simply manually slides the segment that will stop and lock down securing our manual cover in place whereby, securing the pool from unwanted entry. For refence, please see this video which shows how easy it can be to open or secure the pool. https://www.youtube.com/watch?v=hR8mnP6N818
3. There is no perfect solution to securing a pool. Motorized safety covers can be left open, motors can fail, or the fabric can rip. Fences can be left open. We believe that the risk of leaving a retractable pool enclosure open is comparable to the other currently acceptable barriers.
4. We are open to collaborating to further refine the language and specifications in our proposal. This will help ensure that the inclusion of retractable pool enclosures in Section 305 aligns with the overarching goal of enhancing pool safety standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides an alternate method to meet the barrier requirements. It does not impose a mandatory cost increase or decrease. Retractable pool enclosures are installed for a host of benefits beyond pool safety (reduced chemicals, reduced debris, increased swimming season, reduced heating costs, etc.). This proposal may be considered a cost reduction since another form of barrier would no longer be required.

SP6-24

SP7-24

ISPSC: 305.2.1

Proponents: Peter Zvingilas, State of Connecticut, SECTBO

2024 International Swimming Pool and Spa Code

Revise as follows:

305.2.1 Barrier height and clearances. Barrier heights and clearances shall be in accordance with all of the following:

1. The top of the barrier shall be not less than 48 inches (1219 mm) above grade where measured on the side of the barrier that faces away from the pool or spa. Such height shall exist around the entire perimeter of the barrier and for a distance of 3 feet (914 mm) measured horizontally from the outside of the required barrier.
2. The vertical clearance between grade and the bottom of the barrier shall not exceed 2 inches (51 mm) for grade surfaces that are not solid, such as grass or gravel, where measured on the side of the barrier that faces away from the pool or spa.
3. The vertical clearance between a surface below the barrier to a solid surface, such as concrete, and the bottom of the required barrier shall not exceed 4 inches (102 mm) where measured on the side of the required barrier that faces away from the pool or spa.
4. Where the top of the pool or spa structure is above grade, the barrier shall be installed on grade or shall be mounted on top of the pool or spa structure. Where the barrier is mounted on the top of the pool or spa, the vertical clearance between the top of the pool or spa and the bottom of the barrier shall not exceed 4 inches (102 mm).
5. The barrier shall be a minimum of 3 feet (914mm) from the property line.

Reason: A property owner applies to install a pool with a code compliant barrier that is located along the property line. When applying for this permit, the neighbor has no fence on his property, while the project is undertaken the neighbor installs a fence on their adjoining property line to not see the pool owner's fence. (no building permit required) Final inspection comes along after both install their respective fences and shows a non-compliant fence now. Who has to move their respective fence for compliance?

Bibliography:

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal will not change the cost for a pool barrier. It just fixes the location adjacent to property lines.

ISPSC: 305.3, 305..3.1 (New), 305.3.1, 305.3.2, 305.3.3, 305.3.4, 305.4, 305.3.2.1 (New), 305.3.2.2 (New), 305.3.2.3 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Swimming Pool and Spa Code

Revise as follows:

305.3 Doors and gates. Doors, ~~and~~ gates and windows in barriers shall comply with the requirements of Section~~s~~ 305.3.1 or 305.3.2. ~~through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access doors and gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device. Doors and gates shall not swing over stairs.~~

Add new text as follows:

305..3.1 Doors and gates in barriers. Where a door or gate is not in a wall of a dwelling or structure, doors and gates in barriers shall comply with the requirements of Sections 305.3.1.1 through 305.3.1.4 and shall be equipped to accommodate a locking device. Pedestrian access doors and gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device. Doors and gates shall not swing over stairs.

Revise as follows:

~~**305.3.1**~~ 305.3.1.1 **Utility or service doors and gates.** Doors and gates not intended for pedestrian use, such as utility or service doors and gates, shall remain locked when not in use.

~~**305.3.2**~~ 305.3.1.2 **Double or multiple doors and gates.** Double doors and gates or multiple doors and gates shall have not fewer than one leaf secured in place and the adjacent leaf shall be secured with a self-latching device.

~~**305.3.3**~~ 305.3.1.3 **Latch release.** For doors and gates in barriers, the door and gate latch release mechanisms shall be in accordance with the following:

1. Where door and gate latch release mechanisms are accessed from the outside of the barrier and are not of the self-locking type, such mechanism shall be located above the finished floor or ground surface in accordance with the following:
   1.1. At public pools and spas, not less than 52 inches (1219 mm) and not greater than 54 inches (1372 mm).

   1.2. At *residential* pools and spas, not less than 54 inches (1372 mm).

2. Where door and gate latch release mechanisms are of the self-locking type such as where the lock is operated by means of a key, an electronic opener or the entry of a combination into an integral combination lock, the lock operation control and the latch release mechanism shall be located above the finished floor or ground surface in accordance with the following:
   2.1. At public pools and spas, not less than 34 inches and not greater than 48 inches (1219 mm).

   2.2. At *residential* pools and spas, at not greater than 54 inches (1372 mm).

3. At private pools, where the only latch release mechanism of a self-latching device for a gate is located on the pool and spa side of the barrier, the release mechanism shall be located at a point that is at least 3 inches (76 mm) below the top of the gate.

~~**305.3.4**~~ 305.3.1.4 **Barriers adjacent to latch release mechanisms.** Where a latch release mechanism is located on the inside of a barrier, openings in the door, gate and barrier within 18 inches (457 mm) of the latch shall not be greater than $^1/_2$ inch (12.7 mm) in any dimension.

~~**305.4**~~ 305.3.2 **Structure wall as a barrier.** Where a wall of a dwelling or structure serves as part of the barrier and where doors, gates or windows provide direct access to the pool or spa through that wall, each door, gate, or window in such barriers shall comply with the requirements of Section 305.3.2.1 or 305.3.2.2.~~one of the following shall be required:~~

1. ~~Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor, doors and gates shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and labeled as a water hazard entrance alarm in accordance with UL 2017.~~

2. ~~In dwellings not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located at not less than 54 inches (1372 mm) above the finished floor.~~

3. ~~In dwellings that are required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.~~

4. ~~In structures other than dwellings, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1220 mm) above the finished floor.~~

5. ~~A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.~~

6. ~~An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.~~

Add new text as follows:

305.3.2.1 Doors and gates. Where doors or gates provide direct access to the pool or spa, each door or gate shall comply with one of the following:

1. The doors or gate shall comply with the requirements of Sections 305.3.1.
2. The door or gate shall have an alarm that complies with Section 305.3.2.3.
3. A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.
4. An *approved* means of protection shall be provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1, 2 or 3.

305.3.2.2 Operable windows. Where one or more operable windows provides direct access to the pool or spa, each operable window with a sill height of less than 48 inches shall comply with one of the following:

1. The window shall have an alarm that complies with Section 305.3.2.3.
2. A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.
3. An *approved* means of protection shall be provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

305.3.2.3 Alarms. Doors, gates, and operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor shall have an alarm that produces an audible warning when the door, gate, window, or its screen is opened. The alarm shall be *listed* and labeled as a water hazard entrance alarm in accordance with UL 2017.

1. In dwellings not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located at not less than 54 inches (1372 mm) above the finished floor.
2. In dwellings that are required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
3. In structures other than dwellings, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1220 mm) above the finished floor.

Staff Analysis: The proposed standards are in the current edition of the code.

Reason: Sections 305.3 and 305.4 were modified in the 2021 edition of the ISPSC to address accessibility considerations. (See proposal SP8-18 which was approved as submitted.) The latch release provisions under Section 305.3.3 were expanded, and Items 2, 3 and 4 under Section 305.4 were separated out from Item 1 to differentiate between the requirements for dwellings and other structures.

Some fixes were identified to improve these sections. This change reorganizes Sections 305.3 and 305.4 into one section encompassing all openings in barriers. And it reorganizes the section dealing with openings in a structural used as a barrier (previously 305.4).

Section-by-section substantiation:

Section 305.3: The title was changed to include doors, gates, AND windows to support the reorganization. Each opening must comply with either of the new subsections.

Section 305.3.1: This is the existing 305.3, and no substantive changes to the requirements were made. A scoping statement was added to limit the section to barriers that are not part of a structure. The language was taken from the existing 305.4 and changed to the negative.

Section 305.3.2: This is the existing 305.4, and it was reorganized and updated. The issue that made a simple fix impossible was the fact that the charging paragraph ended with “one of the following shall be required.” This meant that only one of the items that followed could be applied to the entire situation. The language was changed in this proposal to allow each opening to be considered individually and comply with any of the provisions that follow.

Section 305.3.2.1: Doors and gates are now treated separately from windows for flexibility of compliance. Each opening should be considered individually to determine compliance.

Item 1: This requirement was implied, but not stated, in existing Section 305.4, Item 6, which pointed to “self-closing doors with self-latching devices” as an approved means of protection. This was required in existing Section 305.3, and it is logical that doors and gates complying with the requirements for doors and gates <u>in barriers</u> are acceptable for doors and gates <u>in barriers that are part of a structure</u>.

Item 2: This item points to the alarm requirements found in the existing section 305.4. It was repeated for operable windows below.

Items 3 and 4: These were copied from existing section 305.4 Items 5 and 6 (shown deleted) and are repeated for operable windows below.

Section 305.3.2.2: This is the complementary section for windows, similar to the section for doors and gates above. The option of providing operable windows with a sill height of 48 inches or more was not clearly stated in the existing language, but it was implied by requiring an alarm for operable windows with a sill height of less than 48 inches. It is provided in the charging statement for the sake of completeness.

Item 1: This item points to the alarm requirements found in the existing section 305.4.

Items 2 and 3: These are copied from existing section 305.4 Items 5 and 6 (shown deleted) and are repeated for operable windows below.

Section 305.3.2.3: This was moved to a separate section to be referenced by Section 305.3.2.1 Item 2 as well as Section 305.3.2.2 Item 2 above. The text was modified to editorially move doors and gates before operable windows and its qualifying language. The intent was to make it clear that the sill height limitation only applies to operable windows. The word “each” was added to clarify that each opening is treated individually.

Before the 2018 proposal, existing Items 2, 3 and 4 were part of the same paragraph with the charging language and should have been kept subordinate to it. These items were renumbered as Items 1, 2 and 3 to restore that subordination.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Provides clarification to make it easier to understand the current requirements for doors gates windows and alarms. Makes it easier to navigate for the code user. The technical requirements are the same as the current code so there are not any changes that would impact the costs to comply.

F2208-08(2019) Standard Safety Specification for Residential Pool Alarms

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F2208-08(2019) S*tandard Safety Specification for Residential Pool Alarms*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Attached Files

- **ISPSC CamerEye Submission Final.docx**
  https://www.cdpaccess.com/proposal/9785/28931/files/download/4072/

Reason: It has been many years since Section 304 of the International Swimming Pool & Spa Code (hereinafter referred to as the "ISPSC") has been officially revisited and/or revised. Since that time the technology behind pool alarms and their many varieties have seen remarkable advances. Advances that have produced products that, if used, will substantially improve the safety of aquatics environments and, in particular, pools and spas. The ISPSC should reflect those advances as it has in the past when revision have been made from the 2012 to 2015 to 2018 versions. For example, alarms have been improved dramatically by infrared detection, Artificial Intelligence technology, and visual and imagery data. These technologies are readily available and used in the marketplace today. In fact, many pool/spa builders and contractors (and pool owners themselves) prefer the advanced and better designed alarms compared to just traditional window and door alarms commonly used. The new alarms not only serve safety better, but some can be permanently affixed to the home and are out of sight, so pool and spa owners are not tempted (due to aesthetics) to remove the alarms after inspection and approval by code officials. These new and generally accepted devices and technologies make for a more robust pursuit of the universally accepted "layers of protection" that work together to prevent downing, especially for children.

Bibliography: n/a

Cost Impact: Increase

Estimated Immediate Cost Impact:

Cost impact depends on the safety device selected to provide the additional layer of protection. The range is from $50 to approximately $700.

Estimated Immediate Cost Impact Justification (methodology and variables):

Dependent on the safety device selected to comply. See above.

Estimated Life Cycle Cost Impact:

This is a one time cost. There are no apparent, material additional costs.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

SP10-24

ISPSC: 305.4, ASTM Chapter 11 (New)

Proponents: Ed Trevisani, Idc Services, Manager (edtrev3@gmail.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the barrier and where doors, gates or windows provide direct access to the pool or spa through that wall, one of the following shall be required:

1. ~~Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor, doors and gates shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and labeled as a water hazard entrance alarm in accordance with UL 2017.~~All doors and windows providing direct access from the home to the pool shall be equipped with an exit alarm complying with UL 2017 that has a minimum sound pressure rating of 85 dBA at 10 feet (3048 mm). Any deactivation switch shall be located at least 54 inches (1372 mm) above the threshold of the access. Separate alarms are not required for each door or window if sensors wired to a central alarm sound when contact is broken at any opening.
2. In dwellings not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located at not less than 54 inches (1372 mm) above the finished floor.
3. In dwellings that are required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
4. In structures other than dwellings, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1220 mm) above the finished floor.
5. A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.
6. An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.
7. A swimming pool alarm that, when placed in a pool, sounds an alarm upon detection of an accidental or unauthorized entrance into the water. Such pool alarm shall be listed and labeled to ASTM F2208, which includes surface motion, pressure, sonar, laser, and infrared alarms. For purposes of this item, the term swimming pool alarm shall not include any swimming protection alarm device designed for individual use, such as an alarm attached to a child that sounds when the child exceeds a certain distance or becomes submerged in water.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor, P.O. Box C700
West Conshohocken, PA 19428-2959

F2208-08(2019) ***Standard Safety Specification for Residential Pool Alarms***

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F2208-08(2019) S*tandard Safety Specification for Residential Pool Alarms*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Current standards for Audible alarms for pools do not work and are missing today's technological advancements! Many states in the us have changed code language; added options and/or eliminated Part of the code due to its inefficiency in protecting human life.

We simply propose a change in language that promotes better safety practices beyond specifically "listed" devices.

Regardless of approved device pool code can't stop human error! Pool Safety starts with combating Human error.

In our 25 years of construction experience we have found that 90% of homeowners remove the approved audible alarms after inspections are completed.

Bibliography: According to a survey conducted by the Consumer Product Safety Commission (CPSC), pool alarms are an effective way to prevent drowning incidents. The survey found that pool alarms were the second most effective safety measure after pool fencing [1].

There are two types of pool alarms: audible alarms and monitored alarms. Audible alarms emit a loud sound when triggered, while monitored alarms send a notification to a remote monitoring center or a smartphone app [2].

Audible alarms are generally less expensive than monitored alarms and can be installed by homeowners themselves. However, they may produce false alarms due to wind, rain, or other environmental factors. Monitored alarms, on the other hand, are more reliable and can be customized to suit individual needs. They are also more expensive and require professional installation [12].

It's important to note that pool alarms are not a substitute for adult supervision. They are an additional layer of protection that can help prevent accidents. It's recommended to use multiple safety measures, such as pool fencing, pool covers, and pool alarms, to ensure maximum safety [1].

R4501.17.1.9

Where a wall of a dwelling serves as part of the barrier, one of the following shall apply:

1. 1.All doors and windows providing direct access from the home to the pool shall be equipped with an exit alarm complying with UL 2017 that has a minimum sound pressure rating of 85 dBA at 10 feet (3048 mm). Any deactivation switch shall be located at least 54 inches (1372 mm) above the threshold of the access. Separate alarms are not required for each door or window if sensors wired to a central alarm sound when contact is broken at any opening.

   Exceptions:

   1. a.Screened or protected windows having a bottom sill height of 48 inches (1219 mm) or more measured from the interior finished floor at the pool access level.
   2. b.Windows facing the pool on floor above the first story.
   3. c.Screened or protected pass-through kitchen windows 42 inches (1067 mm) or higher with a counter beneath.
2. 2.All doors providing direct access from the home to the pool must be equipped with a self-closing, self-latching device with positive mechanical latching/locking installed a minimum of 54 inches (1372 mm) above the threshold, which is approved by the authority having jurisdiction.
3. 3.A swimming pool alarm that, when placed in a pool, sounds an alarm upon detection of an accidental or unauthorized entrance into the water. Such pool alarm must meet and be independently certified to ASTM Standard F2208, titled "Standard Safety Specification for Residential Pool Alarms," which includes surface motion, pressure, sonar, laser, and infrared alarms. For purposes of this paragraph, the term "swimming pool alarm" does not include any swimming protection alarm device designed for individual use, such as an alarm attached to a child that sounds when the child exceeds a certain distance or becomes submerged in water.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Monitored alarms are an option to the current alarm options in the code. Options have no cost impact as the the choice of which option to use if up the builder or designer of the pool.

SP10-24

SP11-24

ISPSC: 305.4

Proponents: David Renn, PE, SE, City and County of Denver, Colorado Chapter Code Development Committee (david.renn@denvergov.org)

2024 International Swimming Pool and Spa Code

Revise as follows:

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the barrier and where doors, gates or windows provide direct access to the pool or spa through that wall, one of the following 3 items shall be provided~~required~~:

1. Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor, doors and gates shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and labeled as a water hazard entrance alarm in accordance with UL 2017.
   - 1.1. ~~2~~ In dwellings not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located at not less than 54 inches (1372 mm) above the finished floor.
   - 1.2. ~~3~~ In dwellings that are required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
   - 1.3. ~~4~~ In structures other than dwellings, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1220 mm) above the finished floor.

2 ~~5.~~ A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.

3 ~~6.~~ An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

Reason: In the 2021 ISPSC, Section 305.4 was revised from including 3 items to including 6 items, and the charging language requires compliance with any of these 6 items. However, Items 2, 3 and 4 were previously part of Item 1 and were never intended to be separate items since they just give height requirements of the alarm deactivation switch for various conditions - the alarm itself is Item 1. This proposal clarifies that one of 3 items must be provided, and the height requirements are changed to 1.1, 1.2 and 1.3 so they are part of Item 1.

Note that the last item references a means of protection that is not less than that of Items 1 or 2 - this wasn't changed in the 2021 revision and, therefore, didn't correspond to the new numbering with 6 items - this proposal leaves this item as is since reference to Item 1 or 2 is now correct.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is editorial as it just brings back the previous numbering system with 3 items as intended.

SP11-24

SP12-24

ISPSC: 307.1.2, 307.1.2.1, ASTM Chapter 11 (New)

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

307.1.2 Colors and finishes. For other than *residential* pools and *residential* spas, the colors, patterns, or finishes of the pool and spa interiors shall not obscure objects or surfaces within the pool or spa. The ~~interior finish coating~~ floors and walls <u>of the interior finish</u> shall be white or light–colored.

307.1.2.1 ~~Munsell gray scale~~ <u>Testing</u>. ~~Finishes shall be not less than 8.0 on the Munsell gray scale~~ <u>The interior finish shall have a dry lightness value of 80.0 CIE L* Value (8.0 Munsell Grey Scale) or greater, and a wet Luminous Reflectance Value (CIE Y value) of 50.0 or greater, as determined by test results provided by the manufacturer utilizing the testing methods and procedures of ASTM D 4086, ASTM E 1477, or ASTM E 1347.</u>

Exceptions: The following shall not be required to comply with this section:

1. Competitive lane markings.
2. Floors of dedicated competitive diving wells.
3. Step or bench edge markings.
4. Pools shallower than 24 inches (609.6 mm).
5. Water line tiles.
6. Wave and surf pool depth change indicator tiles.
7. Depth change indicator tiles where a rope and float line is provided.
8. Features such as rock formations, as *approved*.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor, P.O. Box C700
West Conshohocken, PA 19428-2959

<u>E1347-06(2020)</u>	<u>Standard Test Method for Color and Color-Difference Measurement by Tristimulus Colorimetry</u>
<u>E1477-98a(2022)</u>	<u>Standard Test Method for Luminous Reflectance Factor of Acoustical Materials by Use of Integrating-Sphere Reflectometers</u>
<u>D4086-18</u>	<u>Standard Practice for Visual Evaluation of Metamerism</u>

Staff Analysis: A review of the standards proposed for inclusion in the code,
ASTM E1347-06(2020) *Standard Test Method for Color and Color-Difference Measurement by Tristimulus Colorimetry*
ASTM E1477-98a(2022) *Standard Test Method for Luminous Reflectance Factor of Acoustical Materials by Use of Integrating-Sphere Reflectometers*
ASTM D4086-18 *Standard Practice for Visual Evaluation of Metamerism*
, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The 'Munsell Grey Scale Test' (Dry Lightness Value) is only adequate for Health Department Engineer's (or AHJ's) to compare submitted samples, or to make an initial 'go/'no go' (pass/fail) assessment. To understand the actual coloration of the interior finish requires the sample to be wetted prior to testing, in order to mimic the real-world underwater environment.

All cementitious interior finishes for swimming pools get darker (shade) when wetted. Some finishes are worse than others. Therefore, the only way to properly ‘approve’ an interior finish is to test dry and wet.

The dry test can be used by the AHJ as an initial pass/pass/failure, and the wet test can be used by the AHJ to determine bather safety based on the ability of a lifeguard to effectively see a bather in distress, and on other prevailing conditions present for each swimming pool.

The Florida Building Code adopted similar proposed language on January 1, 2018. Most manufacturers/producers have followed suit and provide this testing for all finishes that have the potential to be submitted for usage in public pools.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$450-500 per finish to provide wet testing.

Estimated Immediate Cost Impact Justification (methodology and variables):

The Manufacturer/Producer of interior finishes for swimming pools will have a one-time cost for testing each interior finish that they deem to be white, or light colored enough to have the potential for usage in public pools.

Manufacturers are already required to test the dry lightness. The additional cost would be for the wet light reflectance test which gives the AHJ a true and realistic way of determining the coloration of the finish once underwater.

Currently, this one-time outside laboratory testing is about $450-$500 per finish. The interior swimming pool finish does not need to be re-tested unless a significant change is made to any component or proportion of the mix design of that interior finish.

Estimated Life Cycle Cost Impact:

None.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

SP12-24

SP13-24

ISPSC: SECTION 202, 307.2.1.1

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com); Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org)

2024 International Swimming Pool and Spa Code

Revise as follows:

AQUATIC RECREATION FACILITY. A facility that is designed for free-form aquatic play and recreation. The facilities may include, but are not limited to, wave ~~or surf~~ action pools, leisure rivers, ~~sand bottom pools,~~ vortex pools, activity pools,catch pools ~~inner tube rides, body slides~~ and interactivewater play features ~~attractions~~.

307.2.1.1 ~~Beach~~ Sand bottom pools. Clean sand or similar material, where used underwater in a ~~beach~~ pool environment, shall be used over an impervious surface. The sand area shall be designed and controlled so that the circulation system, maintenance, safety, sanitation, and operation of the pool are not adversely affected.

Reason: This proposal aligns the "Aquatic Recreation Facility" definition with the classifications and wording used in the Class D pools. It removes pool types that are not listed within the Class D pools and also adds a Class D pool type, catch pools, that is not currently listed within the definition. These changes do not limit other aspects that could be included in an "Aquatic Recreation Facility" designed for free-form aquatic play and recreation, but ensure the examples listed fall within defined Class D categories that currently exist in the ISPSC definitions.

The proposal also more accurately titles Section 307.2.1.1 to reflect that this section is addressing pools that use sand or similar material under the water of a pool. Whereas beach pools could also be beach entry/zero entry pools that do not necessarily have sand or similar material being used under the water. This will make it clear to the code user that if a pool is utilizing a sand bottom, it must meet the requirements within this subsection.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not intending to make any technical changes, but simply clarify a current definition and subsection for consistency and in order to provide clarity to the code user.

SP13-24

SP14-24

ISPSC: 307.2.2

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

307.2.2 Materials and structural design. Pools and spas shall conform to one or more of the standards indicated in Table 307.2.2. The structural design of pools and spas shall be in accordance with the *International Building Code* or the *International Residential Code*, as applicable in accordance with Section 102.7.1 of this code.

> ~~**Exception:** Pools and spas constructed with reinforced concrete or reinforced shotcrete with a minimum compressive strength of 2,500 pounds per square inch (175.8 kg/cm^2) as designed by a design professional and approved shall be permitted.~~

Reason: This proposal removes the 2,500 minimum psi compressive strength exception in 307.2.2 in favor of strength calculated by following American Concrete Institute (ACI) 318.

This change will place the burden of calculating and justifying minimum compressive strength of a concrete pool shell in the hands of the Licensed Design Professional or Engineer and the AHJ and their interpretations of the requirements of ACI 318. This interpretation may vary depending on location, type of structure (structurally watertight vessel), and placement environment severity (constant water contact having chlorides, sulfates, potentially low pH and/or low alkalinity).

ACI 318 is authoritative for the engineering of structural reinforced concrete or shotcrete used for the water-containment portion of a swimming pool as spa. The swimming pool structure should be engineered to resist the anticipated stresses, deflection, and load factors that can occur when filling and draining the pool with water, and include other anticipated regional concerns, such as expansive soils and freeze/thaw, per ACI 318.

The current ISPSC exception allows 2,500 psi minimum compressive strength, but in ACI 318 2,500 psi is the starting point for calculations for all structures. The ACI 318 requires that the durability section must also considered, and the engineer address the placement environment severity (mentioned above) as part of the engineering.The American Shotcrete Association has several Shotcrete for Swimming Pool Position Papers stipulating 4,000 psi minimum compressive strength:

Bibliography: Position papers referenced at Resources - American Shotcrete Association

1. American Shotcrete Association, ASA Pool and Recreational Shotcrete Committee, Position Statement #1, "Compressive (Strength) Values of Pool Shotcrete."
2. American Shotcrete Association, ASA Pool and Recreational Shotcrete Committee, Position Statement #2, "Definitions of Key Shotcrete Terminology."
3. American Shotcrete Association, ASA Pool and Recreational Shotcrete Committee, Position Statement #3, "Sustainability of Shotcrete in the Pool Industry."
4. American Shotcrete Association, ASA Pool and Recreational Shotcrete Committee, Position Statement #4, "Watertight Shotcrete for Swimming Pools."
5. American Shotcrete Association, ASA Pool and Recreational Shotcrete Committee, Position Statement #5, "Monolithic Shotcrete for Swimming Pools (No Cold Joints)."
6. American Shotcrete Association, ASA Pool and Recreational Shotcrete Committee, Position Statement #6, "Forming and Substrates in Pool Shotcrete."

Cost Impact: Increase

Estimated Immediate Cost Impact:

$350 - $650 per pool depending on size of pool and area of country.

Estimated Immediate Cost Impact Justification (methodology and variables):

To achieve the structural strength required per ACI 318would require the additional of 1-one extra bag of Portland cement be added for every square yard of concrete/shotcrete placed.

Approximate increase to an average swimming pool costing $30,000-$50,000, depending on the region of the country, would be approximately $350 - $650 for additional required cement as above.

The above assumes an average-sized 450 square foot pool.

Estimated Life Cycle Cost Impact:

None. Possible decrease for some pools from lower chance of structural failure.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None.

2024 International Swimming Pool and Spa Code

Revise as follows:

307.2.2 Materials and structural design. Materials shall be in accordance with Section 307.2.2.1. Structural design shall be in accordance with Section 307.2.2.2.~~Pools and spas shall conform to one or more of the standards indicated in Table 307.2.2. The structural design of pools and spas shall be in accordance with the *International Building Code* or the *International Residential Code*, as applicable in accordance with Section 102.7.1 of this code.~~

> **Exception:** Pools and spas constructed with reinforced concrete or reinforced shotcrete with a minimum compressive strength of 2,500 pounds per square inch (175.8 kg/cm^2) as designed by a design professional and approved shall be permitted.

Add new text as follows:

307.2.2.1 Materials. Pools and spas shall conform to one or more of the standards indicated in Table 307.2.2.1.

Revise as follows:

TABLE ~~307.2.2~~ 307.2.2.1 RESERVOIRS AND SHELLS

MATERIAL	STANDARD
Fiberglass reinforced plastic	IAPMO Z124.7
Plastic	IAPMO Z124.7
Reinforced concrete	ACI 318
Reinforced shotcrete	ACI 318
Stainless steel (Types 316, 316L, 304, 304L)	ASTM A240
Tile	ANSI A108/A118/A136.1
Vinyl	ASTM D1593

Add new text as follows:

307.2.2.2 Structural Design. The structural design of pools and spas shall be in accordance with the International Building Code or the International Residential Code, as applicable in accordance with Section 102.7.1 of this code.

307.2.2.2.1 Angle of repose. Trenching and excavations associated with pools and spas installed parallel to footings and walls shall not extend into the bearing plane of a footing or wall. The upper boundary of the bearing plane shall be defined as a line that extends downward, at an angle of 45 degrees (0.79 rad) from horizontal, from the outside bottom edge of the footing or wall.

> **Exception:** This section shall not apply where approved underpinning or other methods designed by an engineer are used to protect the foundation system of the pool, spa, and adjacent structures.

Reason: Currently the ISPSC does not address the angle of repose from a foundation. This code section is needed to ensure that when excavation associated with pools and spas occur those excavations do not adversely affect any adjacent structure or walls.

With some developers choosing to use smaller lot sizes and a nationwide effort to increase density, we are seeing more dwellings and public areas where pools are installed in a manner that adversely affects the structures in the immediate vicinity of the excavation sites for pools and spas. This code section is needed to protect the adjacent structures and walls. Furthermore, this requirement can be found in the IPC for trenches and will align with existing requirements.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

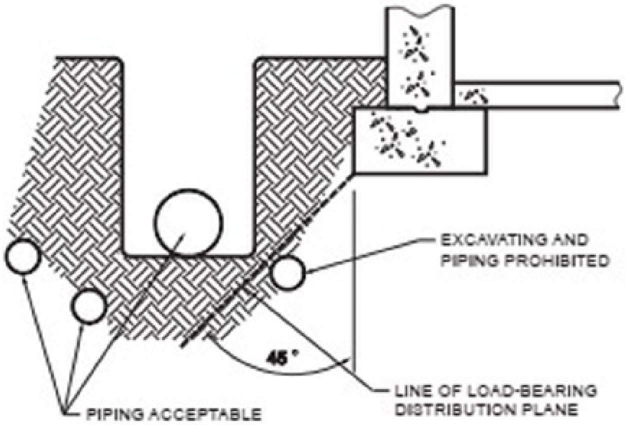
PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Bibliography:

IPC: 307.5 Protection of footings.

Trenching installed parallel to footings and walls shall not extend into the bearing plane of a footing or wall. The upper boundary of the bearing plane is a line that extends downward, at an angle of 45 degrees (0.79 rad) from horizontal, from the outside bottom edge of the footing or wall.

IPC Commentary: A footing requires a minimum load-bearing area to distribute the weight of the building. This load-bearing distribution plane extends downward at approximately a 45-degree (0.79 rad) angle from the base of the footing. Water, building drainage and building sewer piping must not be installed below this load-bearing plane. Excavation for the installation of pipe below the plane could affect the load capacity of the footing or cause the excavation to collapse (see Commentary Figure 307.5).



Commentary Figure 307.5
EXCAVATION IN RELATION TO FOOTING

Cost Impact: Increase

Estimated Immediate Cost Impact:

For a 30 foot pool wall, about $900.

Estimated Immediate Cost Impact Justification (methodology and variables):

Generally about $25-30 per foot of wall for more reinforcing steel, concrete and added labor.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

2024 International Swimming Pool and Spa Code

Revise as follows:

TABLE 312.4 CIRCULATION SYSTEM PIPE MATERIAL STANDARD

MATERIAL	STANDARD
~~Acrylonitrile butadiene styrene (ABS) plastic pipe~~	~~ASTM D1527~~
Chlorinated polyvinyl chloride (CPVC) plastic pipe and tubing	ASTM D2846; CSA B137.6
Copper or copper-alloy tubing	ASTM B88; ASTM B447
Polyvinyl chloride (PVC) hose	ASTM D1785; ASTM D2241; ASTM D2672; CSA B137.3
Polyvinyl chloride (PVC) plastic pipe	ASTM D1785; CSA B137.3
Stainless steel pipe, Types 304, 304L, 316, 316L	ASTM A312

TABLE 312.4.1 CIRCULATION SYSTEM FITTINGS

MATERIAL	STANDARD
~~Acrylonitrile butadiene styrene (ABS) plastic pipe~~	~~ASTM D1527~~
Chlorinated polyvinyl chloride (CPVC) plastic pipe and tubing	ASTM D2846; ASTM F437;ASTM F438; ASTM F439; CSA B137.6
Copper or copper-alloy tubing	ASME B16.15
Polyvinyl chloride (PVC) plastic pipe	ASTM D2464; ASTM D2466; ASTM D2467; CSA B137.2; CSA B137.3
Stainless steel pipe, Types 304, 304L, 316, 316L	ASTM A182; ASTM A403

Reason: ASTM D1527 has been withdrawn by ASTM and there is no substitute standard to guide installation.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$1-2,000

Estimated Immediate Cost Impact Justification (methodology and variables):

Total cost of residential pool piping is approximately $7,500 to $10,000. ABS piping tends to be more expensive than PVC piping, so that cost could be as high as $12,000 for an average residential pool. Removing the more expensive option results in the estimated average savings.

All of these costs can increase dramatically in a typical public pool installation due to the greater average size of the projects.

Estimated Life Cycle Cost Impact:

None.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

ISPSC: SECTION 202 (New), SECTION 202, 316.4.1

Proponents: Gregory Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Add new definition as follows:

FREEBOARD. The vertical distance between the operating level of the pool and the level where the water would spill beyond the pool or onto the deck. For a pool with a vanishing edge, or where the coping is lower than the design pool water level, the freeboard would be zero.

Revise as follows:

SURGE CAPACITY. The storage volume in a surge tank, *gutter,* and plumbing lines that is available during operation of the pool to temporarily hold water that has been displaced from the pool by bathers, without diverting that water to waste. Water held in surge capacity shall not be in motion due to gravity, rather, only by the pumps.

316.4.1 Surge capacity. Where perimeter surface skimming systems are used, they shall be connected to a circulation system with a system surge capacity of not less than ~~1~~ 0.5 gallon for each square foot (~~40.7~~ 20.4 liters per square meter) of water surface, unless there is 2 inches (51 mm) or more of freeboard around the entirety of the pool perimeter. The capacity of the perimeter overflow system and related piping is permitted to be considered as a portion of the surge capacity.

Reason: The purpose of surge capacity is poorly understood. The idea of surge capacity is to allow the pool to fill up with people and empty out without having to divert the displaced water to waste.

1. Surge capacity should not be required on pools with adequate freeboard, because they will not dump water to waste during a high bather load event. Some pools, such as vanishing edge pools or tension edge pools, would not have adequate freeboards, for example.
2. Areas that only ever have water in motion (such as gutter pipes and gutter trenches) should not count as surge capacity, because these areas typically cannot fill up with water. For example, consider a vanishing edge pool with no main drain that has a section of sloping gutter pipe above the catch basin static water level. This pipe does not get fuller when more people come into the pool. Its fullness depends on the flow rate and pipe slope only.
3. Experience shows many areas have adopted this requirement, but few enforce it, and those that do are not consistent in how they apply it. The requirement of one gallon per square foot converts to a height of about 1.75 inches of water over the pool. Surge capacity is intended to prevent water from going to waste every time a group of bathers enters the pool. Therefore, in a typical open gutter pool, with freeboard behind the gutter dropouts, water is never diverted to waste due to high bather load, and surge capacity is not needed. All that happens in that case is the water over the gutter lip temporarily grows, and this is benign.

The current definition of surge capacity expects the excess water to go to places it will not actually go, because gutter pipes typically run partially full of flowing water down a slope. The volume held in a gutter pipe is a function of the gutter flow rate, and it does not change when some volume is displaced.

Surge capacity should be more narrowly defined, and it should only be required where freeboard is low. This proposal addresses that and adds a definition for "freeboard".

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Difficult to estimate due to the differences in pool sizes and tank costs between projects.

Surge tanks range in price from $150-$10,000

Assuming a larger residential pool able to use a smaller surge tank under the proposal, the average decrease would likely be $1,000 to $2,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

Listed prices of surge tanks, cost of installation would be unaffected by the tank size.

Estimated Life Cycle Cost Impact:

None.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None.

SP17-24

SP18-24

ISPSC: 317.2, TABLE 317.2(1), TABLE 317.2(2), CSA Chapter 11 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Swimming Pool and Spa Code

Revise as follows:

317.2 Certification. Heaters ~~and hot water storage tanks~~ shall be *listed* and *labeled* in accordance with the applicable standard indicated in Table 317.2(1). ~~Hot water~~ H~~h~~eating systems and components shall comply with the applicable standard indicated in Table 317.2(2).

TABLE 317.2(1) ~~WATER HEATERS~~ POOL AND SPA HEATERS

DEVICE	STANDARD
Electric ~~water heater~~ pool and spa heaters	UL 1261, UL 1563 or CSA C22.2 No. 218.1
Gas-fired ~~water heater~~ pool and spa heaters	ANSI Z21.56/CSA 4.7a
Heat exchanger	AHRI 400
Heat pump ~~water heater~~ pool and spa heaters	AHRI 1160 and one of the following: ~~CSA C22.2 No. 236, UL 1995, or~~ UL~~/CSA~~ 60335-2-40 or CSA C22.2 No.60335-2-40

TABLE 317.2(2) ~~WATER~~ POOL AND SPA HEATING SYSTEMS AND COMPONENTS

SYSTEM	STANDARD
Solar ~~water heater~~ pool and spa heating system	ICC/APSP 902/SRCC 400

Add new standard(s) as follows:

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland, OH 44131-5516

CSA 22.2 NO. 60335-2-40:22 Household and similar electrical appliances — Safety — Part 2-40: Particular requirements for electrical heat pumps, air-conditioners and dehumidifiers (Binational standard UL 60335-2-40)

Staff Analysis: A review of the standard proposed for inclusion in the code, CSA CSA C22.2 No.60335-2-40 *Household and similar electrical appliances — Safety — Part 2-40: Particular requirements for electrical heat pumps, air-conditioners and dehumidifiers (Binational standard UL 60335-2-40)*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: "Water heater" is not defined in the ISPSC, but it is a defined term in the IMC/IPC. The referenced devices are more accurately referred to as "Pool and Spa Heaters" as witnessed by the titles of the referenced standards. Removed the reference to storage tanks because none of the referenced standards apply to storage tanks other than solar system, where they are a component as already included in Table 316.2(2). Updated standard reference for heat pump pool and spa heaters to remove standards which will be sunsetted by publication date of 2027 ISPSC.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC) PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply clarifies existing requirements. There is no technical change and therefore there are no changes to labor and materials that would impact the cost of construction.

2024 International Swimming Pool and Spa Code

SECTION 202
DEFINITIONS

Add new definition as follows:

<u>CHEMICAL STORAGE SPACE</u>. <u>A room dedicated for storing pool or spa chemicals.</u>

Revise as follows:

EQUIPMENT ROOM. A space intended for the operation of pool <u>or spa</u> pumps, filters, heaters, and controllers. This space is not intended for the storage of hazardous pool or spa chemicals.

SECTION 325
EQUIPMENT ROOMS

Revise as follows:

325.1 General. The provisions of this section apply to public pools and spas and aquatic recreation facilities.

<u>**Exception:** Equipment rooms for other purposes and equipment not serving the pool, spa or aquatic recreation facility shall be in accordance with the *International Mechanical Code.*</u>

Delete and substitute as follows:

~~**325.2 Requirements.** The equipment area or room floor shall be of concrete or other suitable material having a smooth slip-resistant finish and have positive drainage, including a sump drain pump, if necessary. Floors shall have a slope toward the floor drain or sump drain pump adequate to prevent standing water at all times. The opening to the equipment room or area shall be designed to provide access for all anticipated equipment. At least one hose bibb with backflow preventer shall be located in the equipment room or allow for access within an adequate distance of the equipment room so that a hose can service the entire room.~~

<u>325.2</u> <u>Floor Requirements</u>. <u>The floor of the equipment room shall be of concrete or other nonabsorbent material having a smooth slip-resistant finish. The floor shall have positive drainage with a slope toward the floor drain or sump drain pump to prevent standing water.</u>

~~**325.7.2 Indoor aquatic facility access.** Where a door or doors are installed in a wall between an equipment room and an indoor aquatic facility, the floor of the equipment room shall slope back into the equipment room in such a way as to prevent any equipment room spills from running under the door into the indoor aquatic facility. This requirement shall be accomplished by one of the following:~~

1. ~~A floor all of which is at least 4 inches (102 mm) below the level of the nearest part of the indoor aquatic facility floor.~~
2. ~~A continuous dike not less than 4 inches (102 mm) high located entirely within the equipment room, which will prevent spills from reaching the indoor aquatic facility floor.~~

325.2.1 Indoor aquatic facility equipment room floor requirements. Where doors are installed in a wall between an equipment room and an indoor aquatic facility, the floor of the equipment room shall slope back into the equipment room to prevent any equipment room spills from entering the indoor aquatic facility. This requirement shall be accomplished by one of the following:

1. A floor all of which is at least 4 inches (102 mm) below the level of the nearest part of the indoor aquatic facility floor.
2. A continuous dike not less than 4 inches (102 mm) high located entirely within the equipment room, which will prevent spills from reaching the indoor aquatic facility floor.
3. Installation of floor drains.

Add new text as follows:

325.3 Hose bibbs. A minimum of one hose bibb with backflow preventer shall be installed in the equipment room or within 25 feet of the equipment room door opening so that a hose can service the entire room.

Revise as follows:

325.4 ~~325.3~~ Construction tolerances. The size of the equipment room ~~or area~~ shall provide working space to perform routine operations and equipment service. Equipment rooms ~~also intended~~ which include ~~for~~ storage, shall have ~~adequate~~ the required space provided for such storage, without reducing the working spaces. ~~Equipment rooms or areas shall be lighted to provide 30 foot-candles (323 lux) of illumination at floor level.~~ The opening to the equipment room shall be large enough in size to provide access for all equipment.

Add new text as follows:

325.5 Lighting. Equipment rooms shall be lighted to provide 30 foot-candles (323 lux) of illumination at floor level.

Revise as follows:

325.6 ~~325.4~~ Electrical. All electrical wiring shall be installed in accordance with NFPA 70.

325.7 ~~325.5~~ Ventilation. Equipment room ventilation shall address all of the following:

1. Combustion requirements.
2. Heat dissipation from equipment.
3. Humidity from surge or balance tanks.
4. Ventilation to the outside.
5. Air quality.

325.8 ~~325.6~~ Markings. All piping in the equipment room shall be permanently identified by its use and the pool or spa it serves. Identification shall be provided for all of the following:

1. Main drains and skimmer lines.
2. Filtered water.
3. Make-up water
4. Chlorine (or disinfection) feeds.
5. Acid (or pH) feeds.
6. Compressed air lines.
7. *Gutter* lines.
8. Chemical sample piping.

9. Pool heating lines.

All piping shall be marked with directional arrows as necessary to determine flow direction and all valves shall be clearly identified ~~by number~~ with a brass tag, plastic laminate tag or permanently affixed alternative. Valves shall be identified and described as to their function and referenced in the operating instruction manual.

325.9 ~~325.7~~ Separation from chemical storage spaces. ~~Combustion~~ Fuel-fired equipment, air-handling equipment, and electrical equipment shall not ~~be exposed to air contaminated with corrosive chemical fumes or vapors. Spaces containing combustion equipment, air-handling equipment or electrical equipment and spaces~~ share~~ing~~ air distribution with chemical storage spaces.~~containing such equipment shall not be used as chemical storage spaces at the same time unless the equipment is listed and labeled for use in that atmosphere.~~. ~~Spaces containing combustion equipment, air-handling equipment, or electrical equipment and spaces sharing air distribution with spaces containing such equipment shall be isolated from chemical storage space air.~~

Delete without substitution:

~~**325.9.1 Signage.** In addition to the signs on all chemical storage areas, a sign shall be posted on the exterior of the entry door stating "DANGER - GASEOUS OXIDIZER — OZONE" in lettering not less than 4 inches (102 mm) high.~~

Revise as follows:

325.9.1 ~~325.7.1~~ Doors and openings. A door or opening ~~doors~~ shall not be installed in a wall between such equipment rooms and an interior chemical storage space. There shall be no ducts, grilles, pass-throughs, or other openings connecting such equipment rooms to chemical storage spaces~~, except as permitted by the *International Fire Code*~~.
~~Spaces containing combustion equipment, air-handling equipment, or electrical equipment and spaces sharing air distribution with spaces containing such equipment shall be isolated from indoor aquatic facility air unless the equipment is listed for the atmosphere. There shall be no ducts, grilles, pass-throughs, or other openings connecting such spaces to an indoor aquatic facility.~~

~~Ducts that connect the indoor aquatic facility to the duct connections of air handlers shall not be construed as connecting the air-handler space to the indoor aquatic facility unless HVAC equipment is rated for indoor aquatic facility atmosphere and serves only that indoor aquatic facility.~~

~~Where building construction leaves any openings or gaps between floors and walls, or between walls and other walls, or between walls and ceilings, such gaps shall be permanently sealed against air leakage.~~

325.9.2 ~~325.7.2.1~~ Automatic closer and lock. A door between an equipment room and an indoor aquatic facility shall be equipped with an automatic closer and automatic lock~~. The door, frame, and automatic closer shall be installed so as to ensure that the door~~ that closes the door completely and latches without human assistance.The automatic lock shall require a key or combination to open from the indoor aquatic facility side. The lock shall be designed and installed to be opened by one hand from the inside of the room under all circumstances, without the use of a key or tool.~~Such doors shall be equipped with permanent signage warning against unauthorized entry. All sides of such doors shall be equipped with a gasket. The gasket shall be installed to prevent the passage of air, fumes, or vapors when the door is closed.~~

Add new text as follows:

325.9.2.1 Signage. A door between an equipment room and an indoor aquatic facility shall be equipped with permanent signage warning against unauthorized entry.

325.8.2.2 Gaskets. All sides of doors between an equipment room and an indoor aquatic facility shall be equipped with a gasket to prevent the passage of air, fumes, or vapors when the door is closed.

SECTION 326
CHEMICAL STORAGE SPACE

326.1 General. The provisions of this section apply to public pools and spas and aquatic recreation facilities.

Revise as follows:

326.2 ~~325.8~~ Chemical storage space. At least one space dedicated to chemical storage space shall be provided to allow safe storage of pool and spa chemicals. In all chemical storage spaces, an emergency eyewash station shall be provided. The construction of a chemical storage space shall ~~take into account foreseeable hazards and~~ protect the stored materials against tampering, wildfires, unintended exposure to water and the transfer of fumes into any interior space of a building intended for occupation. ~~Any walls, floors, doors, ceilings, and other building surfaces of an interior chemical storage space shall join each other tightly.~~
~~If chemicals are to be stored outdoors, they shall be stored in a well-ventilated protective area with an installed barrier to prevent unauthorized access. Exterior chemical storage spaces not joined to a wall of a building shall be completely enclosed by fencing that is at least 6 feet high (1829 mm). Fencing shall be equipped with a self-closing and self-latching gate having a permanent locking device.~~

Add new text as follows:

326.2.1 Interior chemical storage space. Any walls, floors, doors, ceilings, and other building surfaces of an interior chemical storage space shall be sealed. There shall be no transfer grille, pass-through grille, louver, or other device or opening that will allow air movement from the chemical storage space into any other interior space of a building.

326.2.2 Outdoor chemical storage space. Where chemicals are to be stored outdoors, they shall be stored in a ventilated protective area with an installed barrier to prevent unauthorized access. Exterior chemical storage spaces not joined to a wall of a building shall be completely enclosed by fencing that is at least 6 feet high (1829 mm). Fencing shall be equipped with a self-closing and self-latching gate having a permanent locking device.

Revise as follows:

326.3 ~~325.8.1 Chemical storage space doors~~ Doors and openings. All doors opening into chemical storage spaces shall be equipped with permanent signage having all of the following:

1. A warning against unauthorized entry.
2. Statement of the ~~expected~~ hazards.
3. Statement of the location of the associated safety data sheet forms.
4. Product chemical hazard NFPA chart.

~~Where a single door is the only means of egress from a chemical storage space, the door shall be equipped with an emergency-egress device. Where a chemical storage space door must open to an interior space, spill containment shall be provided to prevent spilled chemicals from leaving the chemical storage space and the door shall not open to a space containing combustion equipment, air-handling equipment, or electrical equipment.~~

Add new text as follows:

326.3.1 Emergency-egress. Where a single door is the only means of egress from a chemical storage space, the door shall be equipped with an emergency-egress device.

326.3.2 Spill containment. Where a chemical storage space door opens to an interior space, spill containment shall be provided to prevent spilled chemicals from leaving the chemical storage space.

Revise as follows:

326.3.3 ~~325.8.1.1~~ Interior opening doors. Where a chemical storage space door ~~must~~ opens to an interior space, such door shall ~~have~~ meet all of the following requirements:

1. Constructed of corrosion-resistant materials.

2. Equipped with a corrosion-resistant, automatic lock to prevent unauthorized entry.
   2.1. Such lock shall require a key or combination to open from the outside into the chemical storage space.
   2.2. Such lock shall be designed and installed as to be capable of being opened by one hand from the inside of the chemical storage space without the use of a key or tool.
3. Supported on corrosion-resistant hinges, tracks, or other supports.
4. Equipped with ~~suitable~~ gaskets or seals on the top and all sides to ~~minimize~~ prevent air leakage between the door and the door frame.
5. Equipped with a floor or threshold seal to ~~minimize~~ prevent air leakage between the door and the floor or threshold.
6. Equipped with an automatic door closer that will completely close the door and latch without assistance ~~and against the specified difference in air pressure~~.
7. Equipped with a limit switch and an alarm that will sound if the door remains open for more than 30 minutes. The alarm shall have a minimum output level of 85 dbA at 10 feet (2028 mm).

326.4 32~~5.8.2~~ Interior chemical storage spaces~~s~~ ventilation. ~~There shall be no transfer grille, pass-through grille, louver, or other device or opening that will allow air movement from the chemical storage space into any other interior space of a building intended for occupancy or into another chemical storage space.~~
Interior chemical storage spaces that share any building surface with any other interior space shall be equipped with a ventilation system that operates continuously and ensures that all air movement is from all other interior space and toward the chemical storage space.

Interior chemical storage spaces that share an electrical conduit system with any other interior space shall be equipped with a ventilation system that operates continuously and ensures that all air movement is from all other interior spaces and toward the chemical storage space. This pressure difference shall be maintained by a continuously operated exhaust system used for no other purpose than to remove air from that one chemical storage space.

~~Where more than one chemical storage space is present, a separate exhaust system shall be provided for each chemical storage space. The exhaust airflow rate shall be the amount specified in the *International Mechanical Code*. The function of this exhaust system shall be monitored continuously by an audible differential-pressure alarm system that shall sound if the specified differential air pressure is not maintained for a period of 30 minutes. This alarm shall have a minimum output level of 85 dbA at 10 feet (3048 mm) and shall require manual reset to silence it.~~

Add new text as follows:

326.4.1 Multiple exhaust systems. Where more than one chemical storage space exists, a separate exhaust system shall be installed for each space. An audible differential-pressure alarm system that sounds if the specified differential air pressure is not maintained for a period of 30 minutes shall be provided for each chemical storage space. The alarm shall have a minimum output level of 85 dbA at 10 feet (3048 mm) and shall require manual reset. The exhaust airflow rate shall be the amount specified in the International Mechanical Code.

Delete and substitute as follows:

~~**325.8.2.1 Air ducts in interior chemical storage spaces.** No duct shall allow air movement from the chemical storage space into any other interior space of a building intended for occupation or into any other chemical storage space.~~
~~Air ducts shall not enter or pass through an interior chemical storage space unless it is a corrosion-resistant duct used for no other purpose than to exhaust air from the chemical storage space. This corrosion-resistant duct must exhaust to the exterior and must end at a point on the exterior of the building, at least 20 feet (6096 mm) from any air intake for breathing air, cooling air, or combustion air.~~

~~A duct used for no other purpose than to supply makeup air to the chemical storage area shall be acceptable. This makeup air supply duct must end at a point on the exterior of the building, at least 20 feet (6096 mm) from any air intake for breathing air, cooling air, or combustion air.~~

~~Any other ducts specifically allowable by the *International Mechanical Code* where such ducts are corrosion resistant and free of joints to the extent feasible shall be acceptable.~~

326.4.2 Air ducts in interior chemical storage spaces. Air ducts shall not enter or pass through an interior chemical storage space.

Exceptions:

1. A corrosion-resistant duct used for no other purpose than to exhaust air from the chemical storage space. The corrosion-resistant duct shall exhaust to the exterior and shall terminate at a point on the exterior of the building, at least 20 feet (6096 mm) from any air intake or combustion air intake.
2. A duct used to supply makeup air to the chemical storage area shall be acceptable.

Revise as follows:

326.5 ~~325.8.2.2~~ Pipes and tubes in interior chemical storage spaces. Piping, tubes, drain bodies, grates, and attachment and restraint devices shall be corrosion resistant including floor drain bodies and grates. All wall penetrations shall be sealed airtight. Sealing materials shall be compatible with the wall assembly and the chemical environment present. Pipes and tubes shall not enter or pass through an interior chemical storage space.

Exceptions:

1. As required to service devices integral to the function of the chemical storage space, such as pumps, vessels, controls, freeze protection, and safety devices.
2. As required to allow for automatic fire suppression.
3. As required for drainage.

~~Piping, tubes, drain bodies, grates, and attachment and restraint devices shall be corrosion resistant and rated for the chemical environment(s) present, including floor drain bodies and grates. All wall penetrations shall be sealed air tight and commensurate with the rating of the wall assembly. Sealing materials shall be compatible with the wall assembly and the chemical environment(s) present.~~

326.6 ~~325.8.2.3~~ ~~Combustion~~ Fuel-fired equipment in interior chemical storage. No ~~combustion device or~~ fuel-fired appliance shall be installed in a chemical storage space, or in any other place where it will be exposed to the air from a chemical storage space.

~~**Exceptions:** A combustion device or appliance that meets all of the following requirements shall be acceptable:~~

1. ~~The device or appliance is required for one or more processes integral to the function of the room, such as space heat.~~
2. ~~The device is listed for such use.~~
3. ~~The device as installed is *approved*.~~

326.7 ~~325.10~~ Gaseous chlorination space. Use of compressed chlorine gas shall be prohibited for new construction and after substantial *alteration* to existing facilities.

326.8 ~~326.11~~ Windows. Windows shall comply with Sections 326.8.1 and 326.8.2.~~Where windows are installed in an interior wall, ceiling, or door of a chemical storage space, such windows shall have the following components:~~

1. ~~Tempered or plasticized glass.~~
2. ~~A corrosion-resistant frame.~~
3. ~~Incapable of being opened or operated.~~

~~Where windows are installed in an exterior wall or ceiling, such windows shall:~~

1. ~~Be mounted in a corrosion-resistant frame.~~
2. ~~Be protected by a roof, eave, or permanent awning as to minimize the entry of rain or snow in the event of window breakage.~~

Add new text as follows:

326.8.1 Interior windows. Where windows are installed in an interior wall, ceiling, or door of a chemical storage space, such windows shall have the following components:

1. Tempered or plasticized glass.
2. A corrosion-resistant frame.
3. Incapable of being opened or operated.

326.8.2 Exterior windows. Where windows are installed in an exterior wall or ceiling, such windows shall:

1. Be mounted in a corrosion-resistant frame.
2. Be protected by a roof, eave, or permanent awning as to minimize the entry of rain or snow in the event of window breakage.

Revise as follows:

326.9 ~~326.12~~ Sealing and blocking materials. Materials used for sealing and blocking openings in an interior chemical storage space shall:

1. Minimize the leakage of air, vapors, or fumes from the chemical storage space.
2. Be compatible for use in the environment.
3. Be commensurate with the fire rating assembly in which they are installed.

Add new text as follows:

SECTION 327
OZONE EQUIPMENT ROOMS

327.1 General. The provisions of this section apply to public pools and spas and aquatic recreation facilities.

Revise as follows:

327.2 ~~325.9~~ Ozone equipment rooms. An ozone equipment room shall not be used for storage of chemicals, solvents, or any combustible materials, other than those required for the operation of the recirculation and ozone-generating equipment.Where an equipment room includes ozone equipment, the equipment room shall meet the requirements of Sections 327.2.1 through 327.2.4. ~~Rooms that are designed to include ozone equipment shall be equipped with an emergency ventilation system capable of 6 air changes per hour. The exhaust intake shall be located 6 inches (152 mm) from the floor, on the opposite side of the room from the make-up air intake.~~

~~The emergency ventilation system shall be so arranged as to run on command of an ozone-leak alarm or on command of a manual switch. The manual emergency ventilation switch shall be located outside the room and near the door to the ozone room.~~
~~Ozone rooms which are below grade shall be equipped with force-draft ventilation capable of 6 changes per hour. The exhaust intake shall be located 6 inches (152 mm) from the floor, on the opposite side of the room from the make-up air intake. Such ventilation shall be so arranged as to:~~

1. ~~Run automatically concurrent with the ozone equipment and for at least a time allowing for 15 air changes after the ozone equipment is stopped.~~
2. ~~Run on activation of the ozone detection and alarm system.~~
3. ~~Run on command of a manual switch.~~

~~The manual ventilation switch shall be located outside the room and near the door to the ozone room.~~

Add new text as follows:

327.2.1 Emergency mechanical ventilation. Ozone equipment rooms shall be equipped with an emergency mechanical ventilation system capable of 6 air changes per hour. An exhaust intake shall be located 6 inches (152 mm) from the floor, on the opposite side of the room from the make-up air intake. The emergency mechanical ventilation system shall be installed to run on command of an ozone-leak alarm or manual switch. Where a manual switch is installed, the manual switch shall be located outside the door to the ozone equipment room.

327.2.2 Ozone rooms below grade. Ozone rooms below grade shall be equipped with mechanical ventilation capable of 6 changes per hour. The exhaust intake shall be located 6 inches (152 mm) from the floor, on the opposite side of the room from the make-up air intake. The mechanical ventilation shall be installed to meet all the following requirements:

1. Run automatically concurrent with the ozone equipment and for a minimum 15 air changes after the ozone equipment is stopped.
2. Run on activation of the ozone detection and alarm system.
3. Run on command of a manual switch located outside the door to the ozone equipment room.

327.2.3 Signage. A sign shall be posted on the exterior of an ozone equipment room entry door stating "DANGER - GASEOUS OXIDIZER -- OZONE" in lettering not less than 4 inches (102 mm) high.

Revise as follows:

327.2.4 ~~325.9.2~~ Ozone detection and Alarm ~~alarm~~ system. ~~Rooms containing ozone-generation equipment shall be equipped with an audible and visible ozone detection and alarm system.~~
~~The alarm system shall consist of both an audible alarm capable of producing at least 85 decibels at a 10-foot (3048 mm) distance and a visible alarm consisting of a flashing light mounted in plain view of the entrance to the ozone equipment room.~~

~~The ozone sensor shall be located at a height of 18-24 inches (457-610 mm) above floor level. The ozone sensor shall be capable of measuring ozone in the range of 0-2 ppm.The alarm system shall activate when the ozone concentration equals or exceeds 0.1 ppm in the room. Activation of the alarm system shall shut off the ozone-generating equipment and turn on the emergency ventilation system.~~An ozone detection and alarm system shall be installed in accordance with all of the following

1. Activate when the ozone concentration equals or exceeds 0.1 ppm in the ozone equipment room.
2. Shut off the ozone-generating equipment and turn on the emergency mechanical ventilation system.
3. Provide an audible alarm producing a minimum 85 decibels at a 10-foot (3048 mm) distance.
4. Provide a visible alarm consisting of a flashing light mounted in plain view of the entrance to the ozone equipment room.
5. Provide an ozone sensor that can measure ozone in the range of 0-2 ppm and located at a height of 18-24 inches (457-610 mm) above floor level.

Reason: The proposal is intended to clean-up the current ISPSC language to provide clarity of what is required and remove language that is duplicative or that does not provide specific requirements. Further, the proposal separates the current section into two separate sections, one for equipment rooms and one for chemical storage spaces. It also provides for more subsections to add clarity and moves same subject requirements to be together in one place.

This proposal does not make any technical changes. It simply makes the current requirements clearer for the code user and removes any language that is not a requirement that the code user can follow or enforced.For better understanding of the results of those changes shown in this proposal, the following "clean" code text is provided:

SECTION 202

DEFINITIONS

CHEMICAL STORAGE SPACE.

A room dedicated for storing pool or spa chemicals.

EQUIPMENT ROOM. A space intended for the operation of pool or spa pumps, filters, heaters, and controllers. This space is not intended for the storage of hazardous pool or spa chemicals.

SECTION 325

EQUIPMENT ROOMS

325.1 General. The provisions of this section apply to public pools and spas and aquatic recreation facilities.

Exception: Equipment rooms for other purposes and equipment not serving the pool, spa or aquatic recreation facility shall be in accordance with the *International Mechanical Code.*

325.2 Floor Requirements. The floor of the equipment room shall be of concrete or other nonabsorbent material having a smooth slip-resistant finish. The floor shall have positive drainage with a slope toward the floor drain or sump drain pump to prevent standing water.

325.2.1 Indoor Aquatic Facility Equipment Room Floor Requirements. Where a door is installed in a wall between an equipment room and an indoor aquatic facility, the floor of the equipment room shall slope back into the equipment room to prevent any equipment room spills from entering the indoor aquatic facility. This requirement shall be accomplished by one of the following:

1. A floor at least 4 inches (102 mm) below the level of the nearest part of the indoor aquatic facility floor.
2. A continuous dike not less than 4 inches (102 mm) high located entirely within the equipment room.
3. Installation of floor drains.

325.3 Hose bibbs. A minimum of one hose bibb with backflow preventer shall be installed in the equipment room or within 25 feet of the equipment room door opening so that a hose can service the entire room.

325.4 Construction tolerances. The size of the equipment room shall provide working space to perform routine operations and equipment service. Equipment rooms which include storage, shall have the required space provided for such storage, without reducing the working spaces. The opening to the equipment room shall be large enough in size to provide access for all equipment.

325.5 Lighting. Equipment rooms shall be illuminated to provide 30 foot-candles (323 lux) of illumination at floor level.

325.6 Electrical. All electrical wiring shall be installed in accordance with NFPA 70.

325.7 Ventilation. Equipment room ventilation shall address all of the following:

1. Combustion requirements.
2. Heat dissipation from equipment.
3. Humidity from surge or balance tanks.
4. Ventilation to the outside.
5. Air quality.

325.8 Markings. All piping in the equipment room shall be permanently identified by its use and the pool or spa it serves. Identification shall be provided for all of the following:

1. Main drains and skimmer lines.
2. Filtered water.
3. Make-up water
4. Chlorine (or disinfection) feeds.
5. Acid (or pH) feeds.
6. Compressed air lines.
7. Gutter lines.

8. Chemical sample piping.

9. Pool heating lines.

All piping shall be marked with directional arrows to determine flow direction and all valves shall be clearly identified with a brass tag, plastic laminate tag or permanently affixed alternative. Valves shall be identified and described as to their function and referenced in the operating instruction manual.

325.9 Separation from chemical storage spaces. Fuel-fired equipment, air-handling equipment, and electrical equipment shall not share air distribution with chemical storage spaces.

325.9.1 Doors and openings. A door or opening ~~doors~~ shall not be installed in a wall between such equipment rooms and an interior chemical storage space. There shall be no ducts, grilles, pass-throughs, or other openings connecting such equipment rooms to chemical storage spaces.

325.9.2 Automatic closer and lock. A door between an equipment room and an indoor aquatic facility shall be equipped with an automatic closer and automatic lock that closes the door completely and latches without human assistance. The automatic lock shall require a key or combination to open from the indoor aquatic facility side. The lock shall be designed and installed to be opened by one hand from the inside of the room under all circumstances, without the use of a key or tool.

325.9.2.1 Signage. A door between an equipment room and an indoor aquatic facility shall be equipped with permanent signage warning against unauthorized entry.

325.9.2.2 Gaskets. All sides of doors between an equipment room and an indoor aquatic facility shall be equipped with a gasket to prevent the passage of air, fumes, or vapors when the door is closed.

SECTION 326

CHEMICAL STORAGE SPACE

326.1 General. The provisions of this section apply to public pools and spas and aquatic recreation facilities.

326.2 Chemical storage space. At least one space dedicated to chemical storage space shall be provided to allow safe storage of pool and spa chemicals. In all chemical storage spaces, an emergency eyewash station shall be provided. The construction of a chemical storage space shall protect the stored materials against tampering, wildfires, unintended exposure to water and the transfer of fumes into any interior space of a building intended for occupation.

326.2.1 Interior chemical storage space. Any walls, floors, doors, ceilings, and other building surfaces of an interior chemical storage space shall be sealed. There shall be no transfer grille, pass-through grille, louver, or other device or opening that will allow air movement from the chemical storage space into any other interior space of a building.

326.2.2 Outdoor chemical storage space. Where chemicals are to be stored outdoors, they shall be stored in a ventilated protective area with an installed barrier to prevent unauthorized access. Exterior chemical storage spaces not joined to a wall of a building shall be completely enclosed by fencing that is at least 6 feet high (1829 mm). Fencing shall be equipped with a self-closing and self-latching gate having a permanent locking device.

326.3 Doors and openings. All doors opening into chemical storage spaces shall be equipped with permanent signage having all ~~of~~ the following:

1. A warning against unauthorized entry.

2. Statement of the hazards.

3. Statement of the location of the associated safety data sheet forms.

4. Product chemical hazard NFPA chart.

326.3.1 Emergency-egress. Where a single door is the only means of egress from a chemical storage space, the door shall be equipped with an emergency-egress device.

326.3.2 Spill containment. Where a chemical storage space door opens to an interior space, spill containment shall be provided to prevent spilled chemicals from leaving the chemical storage space.

326.3.3 Interior opening doors. Where a chemical storage space door opens to an interior space, such door shall meet all of the following requirements:

1. Constructed of corrosion-resistant materials.

2. Equipped with a corrosion-resistant, automatic lock to prevent unauthorized entry.

2.1. Such lock shall require a key or combination to open from the outside into the chemical storage space.

2.2. Such lock shall be designed and installed as to be capable of being opened by one hand from the inside of the chemical storage space without the use of a key or tool.

3. Supported on corrosion-resistant hinges, tracks, or other supports.

4. Equipped with gaskets or seals on the top and all sides to prevent air leakage between the door and the door frame.

5. Equipped with a floor or threshold seal to prevent air leakage between the door and the floor or threshold.

6. Equipped with an automatic door closer that will completely close the door and latch without assistance.

7. Equipped with a limit switch and an alarm that will sound if the door remains open for more than 30 minutes. The alarm shall have a minimum output level of 85 dbA at 10 feet (2028 mm).

326.4 Interior chemical storage space~~s~~ ventilation. Interior chemical storage spaces that share any building surface with any other interior space shall be equipped with a ventilation system that operates continuously and ensures that all air movement is from all other interior space and toward the chemical storage space. Interior chemical storage spaces that share an electrical conduit system with any other interior space shall be equipped with a ventilation system that operates continuously and ensures that all air movement is from all other interior spaces and toward the chemical storage space. This pressure difference shall be maintained by a continuously operated exhaust system used for no other purpose than to remove air from that one chemical storage space.

326.4.1 Multiple exhaust systems. Where more than one chemical storage space exists, a separate exhaust system shall be installed for each space. An audible differential-pressure alarm system that sounds if the specified differential air pressure is not maintained for a period of 30 minutes shall be provided for each chemical storage space. The alarm shall have a minimum output level of 85 dbA at 10 feet (3048 mm) and shall require manual reset. The exhaust airflow rate shall be the amount specified in the International Mechanical Code.

326.4.2 Air ducts in interior chemical storage spaces. Air ducts shall not enter or pass through an interior chemical storage space.

Exceptions:

1. A corrosion-resistant duct used for no other purpose than to exhaust air from the chemical storage space. The corrosion-resistant duct shall exhaust to the exterior and shall terminate at a point on the exterior of the building, at least 20 feet (6096 mm) from any air intake or combustion air intake.

2. A duct used to supply makeup air to the chemical storage area shall be acceptable.

326.5 Pipes and tubes in interior chemical storage spaces. Piping, tubes, drain bodies, grates, and attachment and restraint devices shall be corrosion resistant, including floor drain bodies and grates. All wall penetrations shall be sealed airtight. Sealing materials shall be compatible with the wall assembly and the chemical environment present. Pipes and tubes shall not enter or pass through an interior chemical storage space.

Exceptions:

1. As required to service devices integral to the function of the chemical storage space, such as pumps, vessels, controls, freeze protection, and safety devices.

2. As required to allow for automatic fire suppression.

3. As required for drainage.

326.6 Fuel-fired equipment in interior chemical storage. No fuel-fired appliance shall be installed in a chemical storage space, or in any other place where it will be exposed to the air from a chemical storage space.

326.7 Gaseous chlorination space. Use of compressed chlorine gas shall be prohibited for new construction and after substantial alteration to existing facilities.

326.8 Windows. Windows shall comply with Sections 326.8.1 and 326.8.2.

326.8.1 Interior windows. Where windows are installed in an interior wall, ceiling, or door of a chemical storage space, such windows shall have the following components:

1. Tempered or plasticized glass.

2. A corrosion-resistant frame.

3. Incapable of being opened or operated.

326.8.2 Exterior windows. Where windows are installed in an exterior wall or ceiling, such windows shall:

1. Be mounted in a corrosion-resistant frame.

2. Be protected by a roof, eave, or permanent awning as to minimize the entry of rain or snow in the event of window breakage.

326.9 Sealing and blocking materials. Materials used for sealing and blocking openings in an interior chemical storage space shall:

1. Minimize the leakage of air, vapors, or fumes from the chemical storage space.

2. Be compatible for use in the environment.

3. Be commensurate with the fire rating assembly in which they are installed.

SECTION 327

OZONE EQUIPMENT ROOMS

327.1 General. The provisions of this section apply to public pools and spas and aquatic recreation facilities.

327.2 Ozone equipment rooms. An ozone equipment room shall not be used for storage of chemicals, solvents, or any combustible materials, other than those required for the operation of the recirculation and ozone-generating equipment. Where an equipment room includes ozone equipment, the equipment room shall meet the requirements of Sections 327.2.1 through 327.2.4.

327.2.1 Emergency mechanical ventilation. Ozone equipment rooms shall be equipped with an emergency mechanical ventilation system capable of 6 air changes per hour. An exhaust intake shall be located 6 inches (152 mm) from the floor, on the opposite side of the room from the make-up air intake. The emergency mechanical ventilation system shall be installed to run on command of an ozone-leak alarm or manual switch. Where a manual switch is installed, the manual switch shall be located outside the door to the ozone equipment room.

327.2.2 Ozone rooms below grade. Ozone rooms below grade shall be equipped with mechanical ventilation capable of 6 changes per hour. The exhaust intake shall be located 6 inches (152 mm) from the floor, on the opposite side of the room from the make-up air intake. The mechanical ventilation shall be installed to meet all the following requirements:

1. Run automatically concurrent with the ozone equipment and for a minimum 15 air changes after the ozone equipment is stopped.

2. Run on activation of the ozone detection and alarm system.

3. Run on command of a manual switch located outside the door to the ozone equipment room.

327.2.3 Signage. A sign shall be posted on the exterior of an ozone equipment room entry door stating “DANGER - GASEOUS OXIDIZER -- OZONE” in lettering not less than 4 inches (102 mm) high.

327.2.4 Ozone detection and alarm system. An ozone detection and alarm system shall be installed in accordance with all of the following:

1. Activate when the ozone concentration equals or exceeds 0.1 ppm in the ozone equipment room.

2. Shut off the ozone-generating equipment and turn on the emergency mechanical ventilation system.

3. Provide an audible alarm producing a minimum 85 decibels at a 10-foot (3048 mm) distance.

4. Provide a visible alarm consisting of a flashing light mounted in plain view of the entrance to the ozone equipment room.

5. Provide an ozone sensor that can measure ozone in the range of 0-2 ppm and located at a height of 18-24 inches (457-610 mm) above floor level.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a reorganization of existing code text. No new technical requirements are being added and thus there is not a impact to labor or material to comply with the code.

SP19-24

SP20-24

ISPSC: 325.5, ACCA (New)

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

325.5 Ventilation. Equipment room ventilation shall comply with ANSI/ACCA 10 Manual SPS and address all of the following:

1. Combustion requirements.
2. Heat dissipation from equipment.
3. Humidity from surge or balance tanks.
4. Ventilation to the outside.
5. Air quality.

Add new standard(s) as follows:

ACCA

Air Conditioning Contractors of America
2800 Shirlington Road, Suite 300
Arlington, VA 22206

ANSI/ACCA 10 Manual SPS--2017	HVAC Design for Swimming Pools and Spas

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/ACCA 10 Manual SPS--2017 *HVAC Design for Swimming Pools and Spas*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Section 325.5 currently states items that shall be addressed by equipment room ventilation but provides no requirements to inspect or operate an equipment room.

This proposal requires compliance with ANSI/ACCA 10 Manual SPS, which provides HVAC Design for Swimming Pools and Spas that should be applied to equipment room ventilation, clarifying the expected performance of these systems that provide ventilation to these areas.

The cited standard is then added to Chapter 11 of the ISPSC. The ACCA 10 is also cited in the IMC.

Bibliography: Air Conditioning Contractors of America (ACCA), *Manual SPS HVAC Design for Swimming Pools and Spas* [ANSI/ACCA 10 Manual SPS - 2010 (RA 2017)]

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These requirements are already in place for pool rooms and spaces, including the equipment room. ACCA manual 10 is already referenced as a requirement through International Mechanical Code Section 403.2.1 Recirculation of air. This proposal simply clarifies for code users that this is the standard to comply with in order to meet the requirements in 325.5 of the ISPSC.

SP20-24

SP21-24

ISPSC: SECTION 326

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

SECTION 326
INDOOR AIR QUALITY <u>AND MECHANICAL VENTILATION</u>

Reason: This title change is needed to bring the title of section 326 in line with the referenced code and standard. Section 326 references the International Mechanical Code and ASHRAE 62.1 Standard, which address ventilation systems used to achieve indoor air quality. The minor change in title will help users understand that the focus is on that aspect of achieving indoor air quality.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is a title change only. It creates no additional requirements for construction.

SP21-24

SP22-24

ISPSC: SECTION 326, 326.1, ACCA (New)

Proponents: David Crawford Bixby, Air Conditioning Contractors of America (ACCA), ACCA (david.bixby@acca.org)

2024 International Swimming Pool and Spa Code

SECTION 326
INDOOR AIR QUALITY

Revise as follows:

326.1 General. Indoor public pool and spa air-handling system design, construction, and installation shall comply with the requirements of the *International Mechanical Code* or ASHRAE 62.1. The design of ventilation systems serving indoor aquatic facilities shall comply with ACCA 10 Manual SPS.

Add new text as follows:

Add new standard(s) as follows:

ACCA **10 Manual SPS-2010 (RA 2017).** HVAC Design for Swimming Pools and Spas

Staff Analysis: A review of the standard proposed for inclusion in the code, ACCA 10 Manual SPS-2010 (RA 2017) *HVAC Design for Swimming Pools and Spas*
, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: Paragraph 403.2.1, *Recirculation of air*, in the 2021 IMC, contains Item 2 which references ANSI/ACCA Manual SPS for design and installation of dehumidification systems. Manual SPS should also be referenced by the ISPSC in terms of maintaining IAQ for enclosed pools and hot tubs. The mechanical system must be designed to continuously control the dew point temperature of space air, then measures are taken to control space temperature. If this is not accomplished, moisture can cause visible and concealed condensation, wet sagging ceilings, wet framing, wet structural surfaces, wet insulation, visible or concealed mold and mildew, corroded or discolored fixtures and finishes, rust, or masonry. Manual SPS is also a consensus-based ANSI approved standard.

Bibliography: ANSI/ACCA 10 Manual SPS – 2010 (RA 2017), *HVAC Design for Swimming Pools and Spas*

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Due to this standard already being specified and referenced in the 2021 IMC for pool ventilation and dehumidification, this proposal represents a clarification or correlation between the ISPSC and the current IMC.

SP22-24

SP23-24

ISPSC: SECTION 327 (New), 327.1 (New), PHTA Chapter 11 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Swimming Pool and Spa Code

Add new text as follows:

SECTION 327
OPERATIONS AND MAINTENANCE

327.1 Public pool and spa operation and maintenance. Public pools, public spas and aquatic recreation facilities shall be operated and maintained in accordance with PHTA/ICC-2.

Add new standard(s) as follows:

PHTA

Pool and Hot Tub Alliance
2111 Eisenhower Avenue, Suite 500
Alexandria, VA 22314

ANSI/PHTA/ICC-2-2023 Public pool and spa operations and maintenance

Staff Analysis: A review of the standard proposed for inclusion in the code, PHTA/ICC ANSI/PHTA/ICC-2-2023 *Public pool and spa operations and maintenance*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This proposal seeks to incorporate the *ANSI/PHTA/ICC-2 2023 Standard for Public Pool and Spa Operations and Maintenance* into the International Swimming Pool and Spa Code to ensure maintenance and operations requirements and guidance exist for public pools, public spas and aquatic recreation facilities. Seeing that these types of aquatic venues are governed under Chapters 4, 5, and 6, it makes sense to put the requirement under Chapter 3, General Compliance, so it can apply to all three types.

The standard can be access at the following web address: https://issuu.com/thephta/docs/phta-icc-2_2023_standard_04-03-23_digital_pdf-prot

The PHTA-2 is intended to cover public/commercial aquatic venues operation and maintenance, as a resource for jurisdictions seeking guidance on this topic. This Standard can then be used by state and local authorities as a health and safety document for the operation and maintenance of all types of public aquatic venues. Industry partners such as commercial pool and spa service companies, water park operators and public pool operators will then be required to use this Standard as the benchmark for the minimum standards to operate and maintain public aquatic venues. In many states building and health officials regulate public pools and spas together, by adding this Standard into the ISPSC, we are providing one code that covers design, construction, operation and maintenance. This will make it easier for the building and health officials by having all requirements in one place. Further, public health officials can adopt this Standard through adoption of the ISPSC when adopting the Code by reference in their rule or ordinance.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It doesn’t affect the cost of construction as operation and maintenance occur after the construction permit is closed out. This might increase operational cost as the standard clarifies the minimum proper operation and maintenance which is always part of the pool ownership to provide for safe water conditions.

SP23-24

SP24-24

ISPSC: 409.4, 409.4.1 (New), 409.4.1, 409.4.2, 409.4.3

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

409.4 Lifesaving equipment. Public pool Classes A, B, and C shall be provided with lifesaving equipment in accordance with Sections 409.4.1 through 409.4.~~3~~4. Such lifesaving equipment shall be visually conspicuous and conveniently located at all times.

Add new text as follows:

409.4.1 Rope and Float. Where a pool has a water depth ranging from less than 5 feet (1524 mm) to greater than 5 feet (1524 mm), a rope and float line shall be located a minimum of 1 foot (304 mm.) horizontally from the 5-foot (1524 mm) depth location, toward the shallow end of the pool. The rope and float line shall be securely fastened to wall anchors made of corrosion- resistant material and shall be recessed or have no projection that would constitute a hazard when the line is removed. The line shall have size and strength to support the load of a user using it as a handhold.

Revise as follows:

409.4.2 ~~409.4.1 Accessory~~ Reaching pole. A ~~swimming pool accessory~~ reaching pole not less than 12 feet (3658 mm) in fixed length and including ~~a body hook~~ shepherd's crook securely attached shall be provided.

409.4.3 ~~409.4.2~~ Throwing rope. A throwing rope attached to a ring buoy or similar flotation device shall be provided. The rope shall be not less than $^{1}/_{4}$ inch (6.4 mm) in diameter and shall have a length of not less than $1^{1}/_{2}$ times the maximum width of the pool or 50 feet (15 240 mm), whichever is less. A ring buoy shall have an outside diameter of not less than 15 inches (381 mm).

409.4.4 ~~409.4.3~~ Emergency response units. Pools covered by this chapter shall be provided with first aid equipment, including a first aid kit. First aid equipment and kits shall be located to allow access.

Reason: There is no requirement in the 2024 ISPSC Chapter 4 for Rope and Float for public pools. Rope and Float is included in Aquatic Facilities Chapter 6 as a safety marking at the 5' to over 5' water depth and at the first slope change. It should be included in this chapter as well.

A provision for removable rope and float and a requirement that anchors not pose a projection into the pool is necessary to provide safety for when a pool is also used for other activities.

The sections have been renumbered to accommodate the addition. To further clarify intent and purpose of the accessory pole the description for fixed length and the recommended name of the hook were added.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$1-1,500 for rope and float, fixed length shepherd's hook, and installation.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost for a rope and float assembly ($1-100) and shepherd's hook ($1-500) plus estimated cost for installation.

Estimated Life Cycle Cost Impact:

No life cycle cost impact.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

No life cycle cost impact.

SP24-24

SP25-24

ISPSC: 411.1, 411.1.2, 411.1.2.1 (New), 411.1.3

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

411.1 Entry and exit. All public pools shall have a primary means of entry and exit in all shallow areas where the water depth exceeds 24 in. (61.0 cm) at the shallowest point. The means of entry and exit shall be located on the shallow side of any first slope change. A secondary means of entry and exit shall be provided in the deep area of the pool where the water depth exceeds 5 ft (152.4 cm). ~~Pools shall have not less than two means of entry and exit that are located so as to serve both ends of a pool.~~ Pool lifts, transfer walls and transfer systems that provide for pool entry and exit by persons with physical disabilities in accordance with Section 307.1.5 shall not be counted as the means of entry or exit that is required by this section.

411.1.2 Shallow area primary entry and exit. A primary means of entry and exit shall be provided in shallow areas of pools and shall consist of pool stairs, a ramp or a beach entry.

Add new text as follows:

411.1.2.1 Shallow area secondary entry and exit. The secondary means of entry and exit shall consist of any method prescribed in Section 411.1.3.

> **Exception:** A secondary entry and exit shall not be required for shallow only pools when the water surface area is less than 1176 square feet.

Revise as follows:

411.1.3 Deep area secondary entry and exit. The secondary means of entry and exit in the deep area of pools shall consist of one of the following:

1. Steps/stairs.
2. Ladders.
3. Grab rails with recessed treads.
4. Ramps.
5. Beach entries.
6. Swimouts.
7. Other designs that provide the minimum utility as specified in this code.

Reason: This code change is needed to address shallow only pools entry and exiting requirements. The hazard associated with secondary entering and exiting of a deep area are not any different than if the pool is designed as a shallow only pool with no deep area exceeding 5 foot in depth for public pools. The exception further allows for small public pools to only have one means of entry and exit. The 1176 square feet of water surface area equates to an occupancy load of 49. This is being proposed to align secondary exits with other occupancy classification in the IBC for when a second means of egress is required.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$200-500 per pool for smaller pools (described below) only. No change in cost for pools larger than those described below.

Estimated Immediate Cost Impact Justification (methodology and variables):

This code proposal will decrease construction cost for pools that have a water surface area equal or greater than 1176 square feet or an occupancy load of 49 or less by removing the requirement for a second means of entry and exit.

Cost is for one in ground pool ladder + the estimated cost of installation.

Estimated Life Cycle Cost Impact:

None.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This proposal will have no effect on costs after first (construction) cost.

SP25-24

SP26-24

ISPSC: 504.2

Proponents: Gregory Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

504.2 Timer. The operation of the hydrotherapy jets shall be limited by a cycle timer having a maximum setting of 15~~10~~ minutes. The cycle timer shall be located not less than 5 feet (1524 mm) away, adjacent to, and within sight of the spa.

Reason: Ten-minute spa timers are largely unavailable on the market. Change in required timer type is needed to accommodate construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal makes no substantive change in the requirement to have a timer in a public spa, it merely changes the type of timer that is acceptable.

The former requirement was unable to be met with timers existing on the market. This is a clarification of the existing requirement that accommodates spa construction.

SP26-24

SP27-24

ISPSC: 604.2, TABLE 604.2

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com); Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org)

2024 International Swimming Pool and Spa Code

Revise as follows:

604.2 Turnover. Circulation system equipment shall be designed to turn over 100 percent of the nominal pool water volume in the amount of time specified in Table 604.2. Where Class D pools exist in combination with Class A through Class F pools, each element in the pool shall have the turnover time specified in Table 604.2 or elsewhere in this code as if the element functioned as a freestanding pool of that class. The system shall be designed to give the required turnover time based on the manufacturer's recommended maximum pressure and flow of the filter in ~~clean~~dirty media condition.

TABLE 604.2 TURNOVER TIME

CLASS OF POOL	MAXIMUM TURNOVER TIME[a] (hours)
D-1	~~2~~3
D-2 with less than 24 inches water depth	1
D-2 with 24 inches or greater water depth	2
D-3 with every flume ending in a runout, or less than 24 inches average water depth	1
D-3 with 24 to 48 inches average water depth	2
D-3 with greater than 48 inches average water depth	3
D-4	~~2~~3
D-5	1
D-6	1

For SI: 1 inch = 25.4 mm.

a. Pools with a sand bottom require a 1-hour turnover time.

Reason: The code currently combines Class D uses such as slides, lazy rivers and wade pool activities with Class A-C uses, such as diving and lap swimming. The recirculation rate requirement becomes very punitive. The proposal provides clarification that where Class D pools exist in combination with other Class pools, each element in the pool shall be required to have the turnover time specified in Table 604.2 or elsewhere in the code as if that one element was freestanding.

Further, the current turnover time for lazy rivers, wave pools, and waterslide catch pools is too fast. In Florida, where lazy rivers and wave pools are prevalent, it has been 3 hours, without any issues or complaints. Florida has also separated D-3 waterslide catch pools based on water depth at the catch pool where the flume/slide ends, providing different turnover times based on that depth. For example, the FlyTime Slide from SplashTacular, and similar products from other manufacturers, is intended to drop the rider into deep water that is approximately the same dimensions as a diving well. It is therefore punitive and unnecessary to require a 1 hour turnover for an entire diving well volume simply because a slide has been installed next to it.

Therefore, the proposal provides for three categories of D-3 pools based on water depth, with the appropriate turnover based on that depth. It also updates the turnover table to lessen the turnover rate of lazy rivers and wave pools to match Florida requirements.

Bibliography: Sections 454.1.9.2.6.1, 454.1.9.4.3, and 454.1.9.5.3 of the 8th edition Florida Building Code: https://codes.iccsafe.org/content/FLBC2023P1/chapter-4-special-detailed-requirements-based-on-occupancy-and-use#FLBC2023P1_Ch04_Sec454.1

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Based on the change in turnover times and allowance for a Class D pools to have a turnover time based on that exact element alone, the proposal will result in some Class D pools having a longer turnover time than currently required. Longer turnover times then allow for smaller piping, circulation pumps and filters, which typically cost less than their larger counterparts.

The exact decrease in cost will vary project to project, but could range between $0 and $60,000. A very small Lazy River or Plunge Pool may utilize negligible savings, but a larger feature will realize proportionally more.

Estimated Immediate Cost Impact Justification (methodology and variables):

The methodology to calculate the estimated cost impact is as follows:

On a recent leisure river project built in compliance with the ISPSC, the filtration turnover rate had to be 1250 gpm. This was a medium sized river, approximately 650' long. This code change would allow the flow rate to be reduced to 833 gpm. The filter pipes would be able to be reduced from 10" to 8". The savings from the reduction would depend on local construction conditions and the length of the pipe.

The filters pipes are reduced from 10", which costs about $9,000 per 100', to 8", which costs about $7,000 per 100'. The reduction is $2,000 per 100'. If we assume that the mechanical room is 200' away, and there is a suction run and a discharge run, that would require 400' of pipe and the savings would be $2,000 * (400' / 100') = $8,000.

The pump is reduced from a 40HP pump that costs about $17,000 to 25 HP pump that costs about $12,000. This reduction is about $5,000.

The filter is reduced from an approximate 50" diameter regenerative media tank that costs about $131,000 to an approximate 40" diameter regenerative media tank that costs about $106.000. This reduction is about $25,000.

The savings for this example project, using the variables of the pipe, pump and filter, would be about ($8,000 + $5,000 + $25,000) = $38,000. These numbers may vary by region and by vendor selected. Larger project than this are developed and their savings would be proportionally larger.

SP27-24

SP28-24

ISPSC: TABLE 604.2

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com); Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org)

2024 International Swimming Pool and Spa Code

Revise as follows:

TABLE 604.2 TURNOVER TIME

CLASS OF POOL	MAXIMUM TURNOVER TIME[a] (hours)
D-1	2
D-2 with less than 24 inches water depth	1
D-2 with 24 inches or greater water depth	2
D-3	1
D-4	2
D-5	1
D-6	~~1~~0.5

For SI: 1 inch = 25.4 mm.

a. Pools with a sand bottom require a 1-hour turnover time.

Reason: This code proposal decreases the turnover time for D-6 pools (interactive play features, also known as splash pads) to match both the Model Aquatic Health Code and the Florida Code, both of which require a more stringent turnover time of 0.5 hours instead of 1 hour. This is needed due to the typical young age of those using these types of features, requiring greater disinfection.

Bibliography: Section 454.1.9.8.6.1 of the 8th edition Florida Code and 4.7.1.10 of the 2023 Model Aquatic Health Code.

https://codes.iccsafe.org/content/FLBC2023P1/chapter-4-special-detailed-requirements-based-on-occupancy-and-use#FLBC2023P1_Ch04_Sec454.1

https://www.cdc.gov/mahc/pdf/2023-MAHC-508.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

For a typical interactive water feature (D-6 pool) that uses a 5,000 gallon system, the increased size of the pump, filter, and pipes that would be required to comply with the change in turnover time would increase costs by approximately $4,650.

Estimated Immediate Cost Impact Justification (methodology and variables):

Most interactive water features (D - 6 pools) have tanks that are between 3,000 and 5,000 gallons in capacity. For a 5,000 - gallon system, the minimum flow rate increases from 5,000 gallons/1 hour (83 gallons per minute) to 5,000 gallons/0.5 hour (167 gallons per minute).

The pumps used to accommodate this increased flow rate are likely to be mass-produced plastic pumps, and the designer would likely double the flow rate by adding a second pump. Pumps this size currently cost about $1500 each.

The filters are also likely to be mass-produced plastic cartridge or sand filters, and the flow of 167 gpm is a bit too large for one of these, so the designer would likely specify a second filter as well. These cartridge filters also cost about $1500 currently.

The suction pipe for the single pump with a 1-hour-turnover was likely a 3" pipe, and the discharge pipe was likely a 2.5" pipe. We estimate that the cost to trench, assemble, and commission 4" pipe is $2,600 per 100', the corresponding cost for 2.5" pipe is $1400. Estimating that the pipe run from the mechanical room to the tank is 50' long, a second 3" suction pipe to serve the second pump costs ($2,100 * 50'/100') = $1050. Then the 2.5" discharge back to the tank becomes a 4" discharge serving both pumps, and that cost increase is ($2600 - $1400) * (50'/100') = $600. Therefore, the total cost estimate for pipe upgrades is $1050 + $600 = $1650.

In this scenario with the design assumptions given, the code change would cost $1500 (pump) +$1500 (filter) + $1650 (pipes) = $4,650.

SP28-24

SP29-24

ISPSC: 604.2.2, APSP Chapter 11 (New)

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

604.2.2 Reduced ~~circulation~~flow rate. ~~The circulation rate~~ The aquatic recreation facility shall be permitted to ~~be~~ reduce~~d~~ the flow rate ~~during periods that the pool is closed for use~~ when not open to bathers and provided ~~that acceptable water clarity conditions are met prior to reopening the pool for public use.~~the water quality is maintained and documented in accordance with APSP-11. Water quality shall be tested and documented prior to opening the aquatic venue to bathers. The reduced ~~circulation~~ flow rate shall not be zero~~.~~ unless approved.

APSP

Alexandria, VA 22314

ANSI/APSP/ICC 11--2019 American National Standard for Water Quality in Public Pools and Spas

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/APSP/ICC 11--2019 *American National Standard for Water Quality in Public Pools and Spas*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: This change aligns the term "flow rate" which is used in PHTA–2, APSP-11, and the Model Aquatic Health Code (MAHC).

The sanitation and pH guidelines incorporated by reference clarify required operation. These requirements for water quality are required by reference in other sections of the ISPSC and do not change the cost of operation.

Bibliography: ANSI/APSP/ICC-11 American National Standard for Water Quality in Public Pools and Spas

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is a language change and clarification to ensure similar terminology ("flow rate" as opposed to "circulation rate") is used in all referenced PHTA standards and the Model Aquatic Health Code.

SP29-24

SP30-24

ISPSC: SECTION 202, 202, SECTION 202 (New), TABLE 604.2, SECTION 613 (New), 613.1 (New), 613.1.1 (New), 613.1.2 (New), ASTM Chapter 11 (New)

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com); Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org)

2024 International Swimming Pool and Spa Code

PUBLIC SWIMMING POOL (Public Pool). A pool, other than a *residential* pool, that is intended to be used for swimming or bathing and is operated by an owner, lessee, operator, licensee or concessionaire, regardless of whether a fee is charged for use. Public pools shall be further classified and defined as follows:

Class A competition pool. A pool intended for use for accredited competitive aquatic events such as Federation Internationale De Natation (FINA), USA Swimming, USA Diving, USA Synchronized Swimming, USA Water Polo, National Collegiate Athletic Association (NCAA), or the National Federation of State High School Associations (NFHS).

Class B public pool. A pool intended for public recreational use that is not identified in the other classifications of public pools.

Class C semi-public pool. A pool operated solely for and in conjunction with lodgings such as hotels, motels, apartments or condominiums.

Revise as follows:

Class D-1 wave action pool. A pool designed to simulate breaking or cyclic waves for purposes of general play ~~or surfing~~.
<u>It does not include a *surf venue*, *surf basin* or *stationary wave system*.</u>

Class D-2 activity pool. A pool designed for casual water play ranging from simple splashing activity to the use of attractions placed in the pool for recreation.

Class D-3 catch pool. A body of water located at the termination of a manufactured waterslide attraction. The body of water is provided for the purpose of terminating the slide action and providing a means for exit to a deck or walkway area.

Class D-4 leisure river. A manufactured stream of water of near-constant depth in which the water is moved by pumps or other means of propulsion to provide a river-like flow that transports bathers over a defined path that may include water features and play devices.

Class D-5 vortex pool. A circular pool equipped with a method of transporting water in the pool for the purpose of propelling riders at speeds dictated by the velocity of the moving stream of water.

Class D-6 interactive play attraction. A manufactured water play device or a combination of water-based play devices in which water flow volumes, pressures or patterns can be varied by the bather without negatively influencing the hydraulic conditions for other connected devices. These attractions incorporate devices or activities such as slides, climbing and crawling structures, visual effects, user-actuated mechanical devices and other elements of bather-driven and bather-controlled play.

Class E. Pools used for instruction, play or therapy and with temperatures above 86°F (30°C).

Class F. Class F pools are wading pools and are covered within the scope of this code as set forth in Section 405.
Public pools are either a diving or nondiving type. Diving types of public pools are classified into types as an indication of the suitability of a pool for use with diving equipment.

Type O. A nondiving public pool.

Types VI–IX. Public pools suitable for the installation of diving equipment by type.

Add new definition as follows:

<u>**STATIONARY WAVE SYSTEMS.** A system that delivers a constantly flowing sheet of water nominally up to 24 in. thick travelling over a</u>

form allowing for patron interaction with a perpetual wave.

SURF BASIN.
Mechanical devices to generate moving waves with suitable characteristics for surfing and can provide multiple different wave profiles suitable to any level of surfing.

SURF VENUE.
A facility designed to accommodate a large body of water dedicated only to surfing on a surfboard or other similar surfing or wave-riding device, with bathymetry, shape, and design that can use a variety of different mechanisms to generate ocean like surfable waves that shoal and break progressively towards shallow water.

Revise as follows:

TABLE 604.2 TURNOVER TIME

CLASS OF POOL	MAXIMUM TURNOVER TIME[a] (hours)
D-1[b]	2
D-2 with less than 24 inches water depth	1
D-2 with 24 inches or greater water depth	2
D-3	1
D-4	2
D-5	1
D-6	1

For SI: 1 inch = 25.4 mm.

a. Pools with a sand bottom require a 1-hour turnover time.

b. Surf venues, surf basins, and stationary wave systems in compliance with Section 613 are not considered D-1 pools.

Add new text as follows:

SECTION 613
SURF VENUES, SURF BASINS, AND STATIONARY WAVE SYSTEMS

613.1 Surf venues. Surf venues shall comply with Section 613.1.1 or 613.1.2.

613.1.1 SURF basins. Surf basins shall comply with ASTM wk75193.

613.1.2 Stationary wave systems. Stationary wave systems shall comply with ASTM F3133.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor, P.O. Box C700
West Conshohocken, PA 19428-2959

F3133–21 Standard Practice for Classification, Design, Manufacture, Construction, Maintenance, and Operation of Stationary Wave Systems

wk75193-xx Standard Practice for Classification, Design, Manufacture, Construction, Maintenance, and Operation of Controlled Surf(ing) Basins

Staff Analysis: A review of the standards proposed for inclusion in the code, ASTM F3133–21 S*tandard Practice for Classification, Design, Manufacture, Construction, Maintenance, and Operation of Stationary Wave Systems* and ASTM wk75193-xx *Standard Practice for Classification, Design, Manufacture, Construction, Maintenance, and Operation of Controlled Surf(ing) Basins*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: The ISPSC currently addresses surf pools within Class D-1 wave action pools; however, these are two different types of pools/systems/venues. This proposal clarifies that a D-1 wave action pool is not a surf pool by striking that current wording and at the same time adding a sentence to clarify that a surf venue, surf basin or stationary wave system is not a D-1 wave action pool.

The proposal then provides new definitions to define a surf venue, surf basin and stationary wave system. These are the terms associated with this rapidly growing facet of the aquatic industry. The surf venue and surf basin definitions are based on industry code and standard work that is currently being worked on. Whereas the stationary wave system definition is based on an approved ASTM standard.

This proposal moves to Chapter 6 to clarify in Table 604.2 that D-1 turnover requirements do not apply to surf venues, surf basins and stationary wave systems that comply with the newly proposed Section 613. This is to ensure D-1 wave pool turnover requirements are not erroneously applied to these surfing areas and systems.

The new section 613 being proposed then requires that surf venues comply with either two subsections. One subsection requires surf basins to comply with the draft ASTM standard currently being developed and the other subsection requires stationary wave systems to comply with the 2021 edition of the ASTM F3133 Standard for such systems.

This proposal is needed to both ensure these increasingly popular surfing venues and devices are a) not confused with wave action pools and their associated requirements and b) to ensure there are appropriate requirements for surf venues, basins and stationary wave system devices to protect those who utilize them. Simply put, unique surfing venues are currently not appropriately captured in the ISPSC. This proposal is a first step in doing so, recognizing that additional design guidelines will need to be added in the future.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The decrease in cost can range from $40,000 to $2,000,000 per project due to the greater allowance in turnover time by clarifying these products are not wave pools.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost estimate range considers the filtration cost comparing the filter system required for a 2-hour D-1 wave pool turnover rate to a 6 hour turnover rate.

2024 International Swimming Pool and Spa Code

CHAPTER 7 ONGROUND STORABLE RESIDENTIAL SWIMMING POOLS

SECTION 701 GENERAL

Revise as follows:

701.1 Scope. ~~This chapter describes certain criteria for the d~~Design, manufacturing, and testing of *onground storable pools* intended for *residential* use, shall comply with this chapter. ~~This includes portable pools with flexible or nonrigid side walls that achieve their structural integrity by means of uniform shape, support frame or a combination thereof, and that can be disassembled for storage or relocation. This chapter includes what has been commonly referred to in past standards or codes as onground or above-ground pools.~~

Delete without substitution:

~~**701.1.1 Permanent inground residential swimming pool.** This chapter does not apply to permanent inground *residential* pools, as defined in Chapter 8.~~

~~**701.2 General.** In addition to the requirements of this chapter, onground storable *residential* swimming pools shall comply with the requirements of Chapter 3.~~

~~**701.3 Floor slopes.** Floor slopes shall be uniform and in accordance with Sections 701.3.1 through 701.3.4.~~

~~**701.3.1 Shallow end.** The slope of the floor from the shallow end wall towards the deep area shall not exceed 1 unit vertical in 7 units horizontal (14-percent slope) to the point of the first slope change.~~

~~**701.3.2 Transition.** The slope of the floor from the point of the first slope change towards the deepest point shall not exceed 1 unit vertical in 3 units horizontal (33-percent slope).~~

~~**701.3.3 Adjacent.** The slope adjacent to the shallow area shall not exceed 1 unit vertical in 3 units horizontal (33-percent slope) and the slope adjacent to the side walls shall not exceed 1 unit vertical in 1 unit horizontal (100-percent slope).~~

~~**701.3.4 Change point.** The point of the first slope change shall be defined as the point at which the shallow area slope exceeds 1 unit vertical in 7 units horizontal (14-percent slope) and is not less than 6 feet (1889 mm) from the shallow end wall of the pool.~~

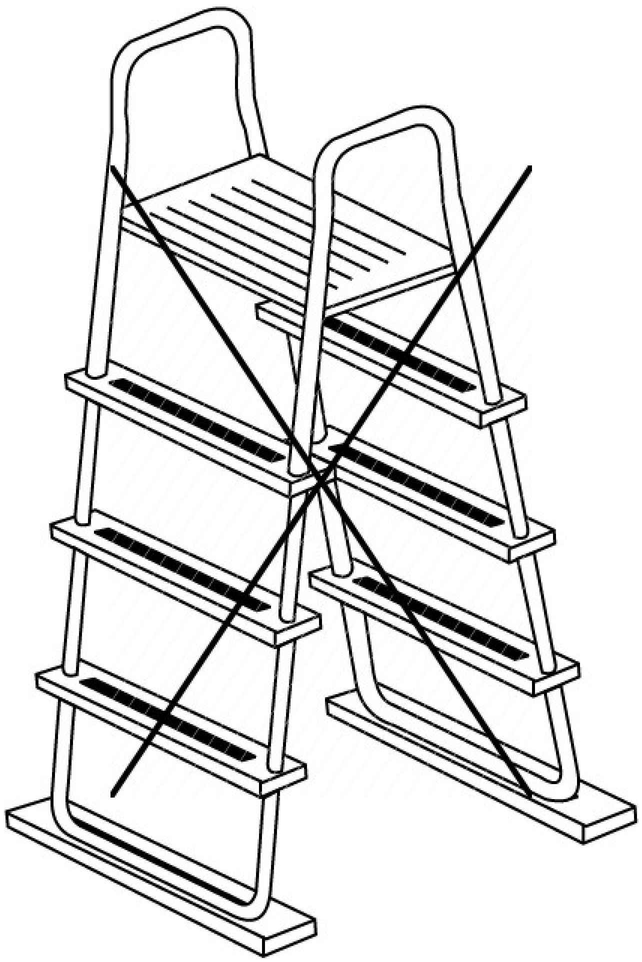
SECTION 702 LADDERS AND STAIRS

Revise as follows:

702.1 Ladders and stairs. Pools shall have a means of entry and exit consisting of not less than one ladder or a ladder and staircase combination. <u>All ladders or staircase means of entry shall meet the ladder and staircase requirements of APSP-4.</u>

Delete without substitution:

~~**702.2 Type A and Type B ladders.** Type A, double access, and Type B, limited access, A-frame ladders shall comply with Sections 702.2.1 through 702.2.7. See Figure 702.2.~~



~~**FIGURE 702.2 TYPICAL A-FRAME LADDER, TYPES A AND B**~~

~~**702.2.1 Barrier required.** Ladders in the pool shall have a physical barrier to prevent children from swimming through the riser openings or behind the ladder.~~

~~**Exception:** Barriers for ladders shall not be required where the ladder manufacturer provides a certification statement that the ladder complies with the ladder entrapment test requirements of APSP 4.~~

~~**702.2.2 Platform.** Where an A-frame ladder has a platform between the handrails, the platform shall have a width of not less than 12 inches (305 mm) and a length of not less than 12 inches (305 mm). The platform shall be at or above the highest ladder tread. The walking surface of the platform shall be slip resistant.~~

~~**702.2.3 Handrails or handholds.** A-frame ladders shall have two handrails or handholds that serve all treads. The height of the handrails and handholds shall be not less than 20 inches (508 mm) above the platform or uppermost tread, whichever is higher.~~

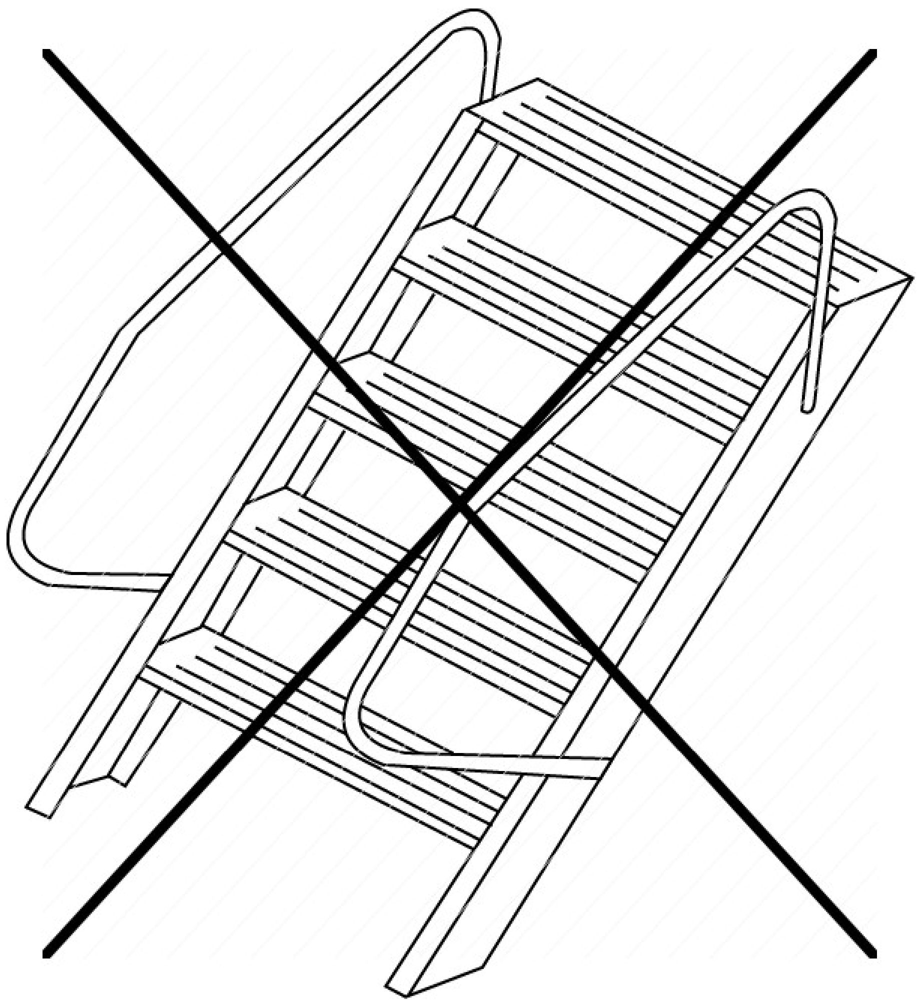
~~**702.2.4 Diameter.** The outside diameter of handrails and handholds shall be not less than 1 inch (25 mm) and not greater than 1.9 inches (48 mm).~~

~~**702.2.5 Clear distance.** The clear distance between ladder handrails shall be not less than a space of 12 inches (305 mm).~~

~~**702.2.6 Treads.** Ladder treads shall have a horizontal uniform depth of not less than 2 inches (51 mm).~~

~~**702.2.7 Riser height.** Risers, other than the bottom riser, shall be of uniform height that is not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The bottom riser height shall be not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The vertical distance from the platform or top of the pool structure to the uppermost tread shall be the same as the uniform riser heights.~~

~~**702.3 Type C staircase ladders (ground to deck).** Type C staircase ladders shall comply with Sections 702.3.1 through 702.3.6. See Figure 702.3.~~



~~**FIGURE 702.3 TYPICAL STAIRCASE LADDER, TYPE C**~~

~~**702.3.1 Handrails or handholds.** Staircase ladders shall have not less than two handrails or handholds that serve all treads. The height of the handrails and handholds shall be not less than 20 inches (508 mm) above the platform or uppermost tread, whichever is higher.~~

~~**702.3.2 Diameter.** The outside diameter of handrails and handholds shall be not less than 1 inch (25 mm) and not greater than 1.9 inches (48 mm).~~

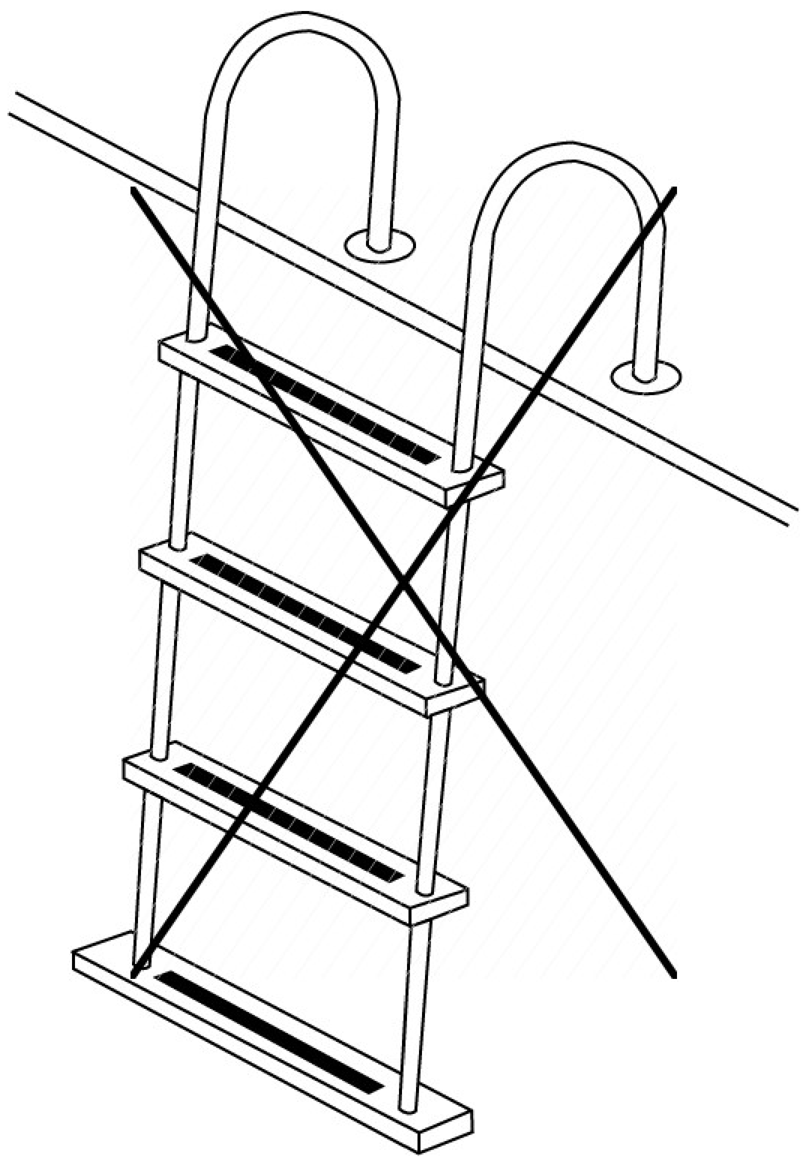
~~**702.3.3 Treads.** Ladder treads shall have a horizontal uniform depth of not less than 4 inches (102 mm).~~

~~**702.3.4 Riser height.** Risers, other than the bottom riser, shall be of uniform height that is not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The bottom riser height shall be not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The vertical distance from the platform or top of the pool structure to the uppermost tread shall be the same as the uniform riser heights.~~

~~**702.3.5 Top step.** The top step of a staircase ladder shall be flush with the deck or 7 inches (178 mm) to 12 inches (305 mm) below the deck level.~~

~~**702.3.6 Width.** Steps shall have a minimum unobstructed width of 19 inches (483 mm) between the side rails.~~

~~**702.4 Type D in-pool ladders.** Type D in-pool ladders shall be in accordance with Sections 702.4.1 through 702.4.7. See Figure 702.4.~~



~~**FIGURE 702.4 TYPICAL IN-POOL LADDER, TYPE D**~~

~~**702.4.1 Clearance.** There shall be a clearance of not less than 3 inches (76 mm) and not greater than 6 inches (152 mm) between the pool wall and the ladder.~~

~~**702.4.2 Handrails or handholds.** Ladders shall be equipped with two handrails or handholds that extend above the platform or deck not less than 20 inches (508 mm).~~

~~**702.4.3 Clear distance.** The clear distance between ladder handrails shall be not less than 12 inches (305 mm).~~

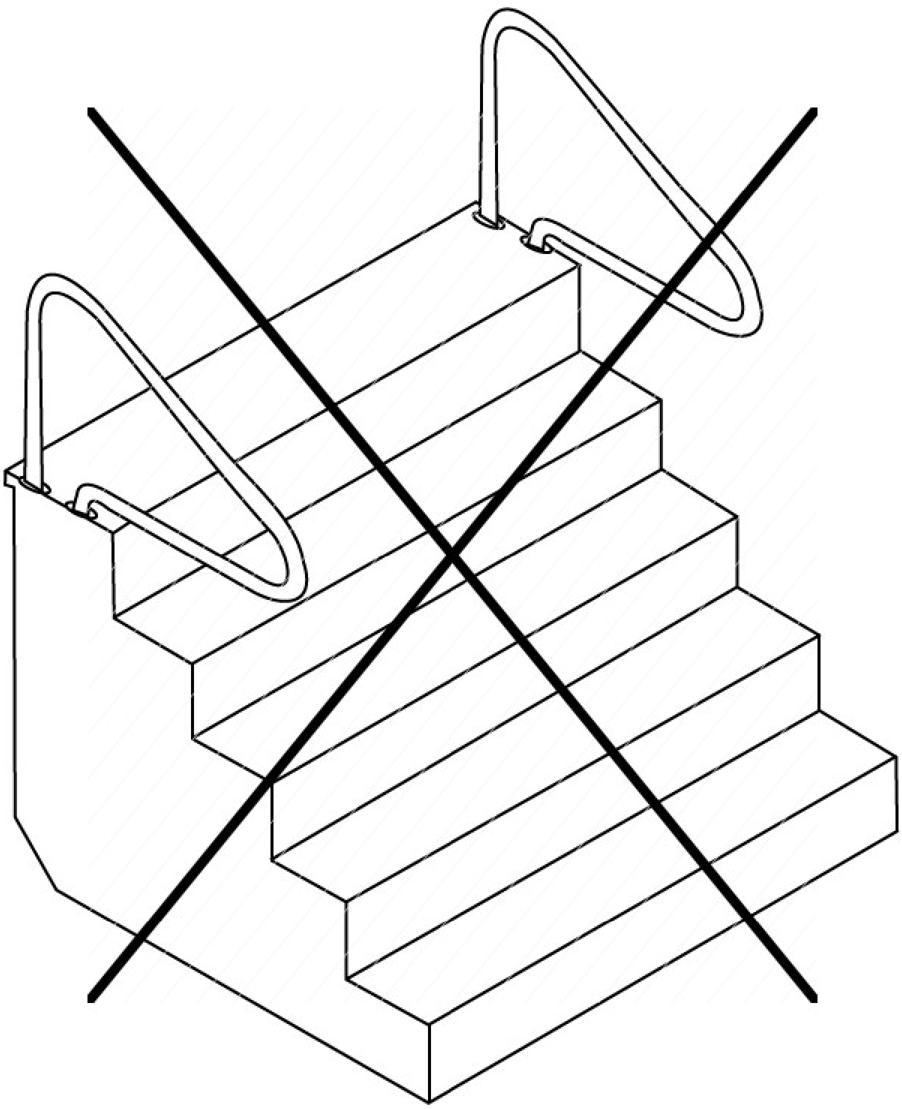
~~**702.4.4 Diameter.** The outside diameter of handrails and handholds shall be not less than 1 inch (25 mm) and not greater than 1.9 inches (48 mm).~~

~~**702.4.5 Riser height.** Risers, other than the bottom riser, shall be of uniform height that is not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The bottom riser height shall be not less than 7 inches (178 mm) and not greater than 12 inches (305 mm).~~

~~**702.4.6 Top tread.** The vertical distance from the pool coping, deck, or step surface to the uppermost tread shall be not less than 7 inches (178 mm) and not greater than 12 inches (305 mm) and uniform with other riser heights.~~

~~**702.4.7 Tread depth.** Ladder treads shall have a horizontal uniform depth of not less than 2 inches (51 mm).~~

~~**702.5 Type E protruding in-pool stairs.** Type E protruding in-pool stairs shall be in accordance with Sections 702.5.1 through 702.5.7. See Figure 702.5.~~



~~**FIGURE 702.5 TYPICAL IN-POOL STAIRCASE TYPES, E AND F**~~

~~**702.5.1 Barrier required.** In-pool stairs shall have a physical barrier to prevent children from swimming through the riser openings or behind the in-pool stairs.~~

~~**702.5.2 Handrails or handholds.** In-pool stairs shall be equipped with not less than one handrail or handhold that serves all treads with a height of not less than 20 inches (508 mm) above the platform or uppermost tread, whichever is higher.~~

~~**702.5.3 Removable handrails.** Where handrails are removable, they shall be installed such that they cannot be removed without the use of tools.~~

~~**702.5.4 Leading edge distance.** The leading edge of handrails shall be 18 inches (457 mm) ± 3 inches (± 76 mm), horizontally from the vertical plane of the bottom riser.~~

~~**702.5.5 Diameter.** The outside diameter of handrails and handholds shall be not less than 1 inch (25 mm) and not greater than 1.9 inches (48 mm).~~

~~**702.5.6 Tread width and depth.** Treads shall have an unobstructed horizontal depth of not less than 10 inches (254 mm) and an unobstructed surface area of not less than 240 square inches (0.15 m^2).~~

~~**702.5.7 Uniform riser height.** Risers, other than the bottom riser, shall be of uniform height that is not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The bottom riser height shall be not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The vertical distance from the pool coping, deck or step surface to the uppermost tread of the stairs shall be the same as the uniform riser heights.~~

~~**702.6 Type F recessed in-pool stairs.** Type F recessed in-pool stairs shall be in accordance with Sections 702.6.1 through 702.6.7. See Figure 702.5.~~

~~**702.6.1 Barrier required.** In-pool stairs shall have a physical barrier to prevent children from swimming through the riser openings or behind the in-pool stairs.~~

~~**702.6.2 Handrails or handholds.** In-pool stairs shall be equipped with not less than one handrail or handhold that serves all treads with a height of not less than 20 inches (508 mm) above the platform or uppermost tread, whichever is higher.~~

~~**702.6.3 Removable handrails.** Where handrails are removable, they shall be installed such that they cannot be removed without the use of tools.~~

~~**702.6.4 Leading edge distance.** The leading edge of handrails shall be 18 inches (457 mm) ± 3 inches (± 76 mm), horizontally from the vertical plane of the bottom riser.~~

~~**702.6.5 Diameter.** The outside diameter of handrails and handholds shall be not less than 1 inch (25 mm) and not greater than 1.9 inches (48 mm).~~

~~**702.6.6 Tread width and depth.** Treads shall have an unobstructed horizontal depth of not less than 10 inches (254 mm) at all points and an unobstructed surface area of not less than 240 square inches (0.15 m^2).~~

~~**702.6.7 Uniform riser height.** Risers, other than the bottom riser, shall be of uniform height that is not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The bottom riser height shall be not less than 7 inches (178 mm) and not greater than 12 inches (305 mm). The vertical distance from the pool coping, deck or step surface to the uppermost tread of the stairs shall be the same as the uniform riser heights.~~

SECTION 705
SAFETY SIGNS

705.1. Signs to be installed prior to final inspection. Safety signage such as "NO DIVING" signs and other safe use instruction signs that are provided by the pool and ladder manufacturer shall be posted in accordance with the manufacturer's instructions prior to final inspection.

Revise as follows:

705.2 Safety signs for ladders. Safety signage for ladders shall be in accordance with ~~Sections 705.2.1 through 705.2.3.2~~ the requirements in APSP-4.

Delete without substitution:

~~**705.2.1 A-frame ladders.** Safety signage for A-frame ladders shall be in accordance with Sections 705.2.1.1 through 705.2.1.4.1. The words on the signage shall be readable by persons standing in the pool and standing outside of the pool as applicable for the required location of each sign.~~

~~**705.2.1.1 No diving warning.** A-frame ladders shall have the following words posted on the in-pool side of the ladder and on the pool entry side of the ladder: "NO DIVING." The location of the words shall be above the elevation of the design water level of the pool.~~

~~**705.2.1.2 Entrapment warning.** A-frame ladders shall have the following words posted on the pool side of the ladder: "TO PREVENT ENTRAPMENT OR DROWNING DO NOT SWIM THROUGH, BEHIND, OR AROUND LADDER."~~

~~**705.2.1.3 Type A, A-frame ladders.** Type A double access A-frame ladders shall have the following words posted on the ladder: "REMOVE AND SECURE LADDER WHEN POOL IS NOT OCCUPIED."~~

~~**705.2.1.4 Type B, A-frame ladders.** Type B limited access A-frame ladders shall have the following words posted on the ladder: "SECURE LADDER WHEN POOL IS NOT OCCUPIED."~~

~~**705.2.1.4.1 Swing-up or slide-up secured ladders.** Type B limited access A-frame ladders that utilize swing-up or slide-up sections for limiting access to the pool shall have the following words posted on the ladder as applicable for the type of securing method:~~

1. ~~"WHEN POOL IS NOT OCCUPIED, SWING UP AND SECURE."~~
2. ~~"WHEN POOL IS NOT OCCUPIED, LIFT OFF."~~
3. ~~"WHEN POOL IS NOT OCCUPIED, SLIDE UP AND SECURE."~~

~~**705.2.2 Type C staircase ladders.** Type C staircase ladders that swing up to limit access to the pool or that are removed to limit access to the pool shall have the following words posted on the ladder: "WHEN NOT IN USE SWING UP AND SECURE OR REMOVE."~~

~~**705.2.3 Type D in-pool ladder.** Safety signage for Type D in-pool ladders shall be in accordance with Sections 705.2.3.1 and 705.2.3.2. The words on the signage shall be readable by persons standing in the pool or standing outside the pool as applicable for the required location of each sign.~~

~~**705.2.3.1 No diving warning.** Type D in-pool ladders shall have the following words posted on the in-pool side of the ladder and on the pool entry side of the ladder: "NO DIVING." The location of the words shall be above the elevation of the design water level of the pool.~~

~~**705.2.3.2 Entrapment warning.** Type D in-pool ladders shall have the following words posted on the ladder: "WARNING: TO PREVENT ENTRAPMENT OR DROWNING, DO NOT SWIM THROUGH, BEHIND, OR AROUND LADDER."~~

Revise as follows:

CHAPTER 8 PERMANENT ~~INGROUND~~ RESIDENTIAL SWIMMING POOLS

SECTION 801

GENERAL

Revise as follows:

801.1 Scope. ~~The provisions of this chapter shall govern permanent inground *residential* swimming pools.~~ Design, construction, installation, alteration, repair, and operation of p~~P~~ermanent ~~inground~~ *residential* swimming pools, which ~~shall~~ include pools that are inground, partially aboveground, or entirely aboveground ~~grade~~, shall comply with this chapter. ~~This chapter does not cover pools that are specifically manufactured for above-ground use and that are capable of being disassembled and stored. This chapter covers new construction, modification and repair of inground *residential* swimming pools.~~

Delete without substitution:

~~**801.2 General.** Permanent inground *residential* pools shall comply with the requirements of Chapter 3.~~

SECTION 802
DESIGN

Revise as follows:

802.1 Materials of components and accessories. The materials of components and accessories used for permanent ~~inground~~ *residential* swimming pools shall be suitable for the environment in which they are installed. The materials shall be capable of fulfilling the design, installation and the intended use requirements in the *International Residential Code*.

Add new text as follows:

802.3 Identification. Permanent *residential* swimming pools with a vinyl liner shall have the manufacturer's name and the liner identification number affixed to the liner.

Revise as follows:

TABLE 803.1 DESIGN WATERLINE CONSTRUCTION TOLERANCE

SURFACE	TOLERANCE
Waterline on tiled surface	± $^1/_4$ inch
Waterline on surfaces other than a tiled surface	± $^1/_2$ inch
Waterline on aboveground manufactured pool kit	±1 inch

805.1 General. Walls in the shallow area and deep area of the pool shall have a wall-to-floor transition point that is not less than 33 inches (838 mm) below the *design waterline*. Above the transition point, the walls shall be within 11 degrees (0.19 rad) of vertical.

Exception: The slope adjacent to the side walls shall not exceed 1 unit vertical in 1 unit horizontal (100 percent slope) where specified by the manufacturer for permanent aboveground pools.

809.2 Entry and exit. Pools shall have a means of entry and exit in all shallow areas where the design water depth of the shallow area at the shallowest point exceeds 24 inches (610 mm). Entries and exits shall consist of one or a combination of the following: steps, stairs, ladders, treads, ramps, beach entries, underwater seats, benches, swimouts and other *approved* designs. The means of entry and exit shall be located on the shallow side of the first slope change.

Add new text as follows:

809.2.1 Ladders and Stairs. Partially and entirely aboveground permanent non-diving pools shall meet the ladder and staircase requirements, and associated safety signage, in accordance with APSP-4.

809.10 Decks. Partially and entirely aboveground permanent non-diving pools shall meet the decking requirements in Section 703.

Staff Analysis: The proposed standards are in the current edition of the code.

Reason: The intent of this proposal is to reorganize aspects of Chapters 7 and 8 in order to provide needed clarity. Chapter 7 is titled "Onground storable residential swimming pools" and requirements within should only be relative to these specific types of pools, and only include items not addressed or that must differ from Chapter 3 General requirements. Whereas all types of permanent pools, including partially or entirely aboveground pools should be covered in Chapter 8 where permanent residential pools reside. This proposal also provides changes to eliminate duplicative provisions.

Specifically, this proposal provides the following:

- Updates scoping for both Chapters to align with what is covered within each Chapter and to align with the larger scoping proposal being addressed across all I-codes for consistency in formatting.
- Removes floor slope requirements in Chapter 7 that do not apply to onground storable pools (and is already provided within Chapter 8 where such requirements are applicable).
- Deletes the majority of Sections 702 and 705, and requires that stairs and ladders meet the requirements laid out in APSP-4, including relevant safety signage for the specific type of ladder or stairs used.
- Adds a new subsection to Chapter 8 to ensure vinyl liners used in permanent pools have the appropriate identification affixed to the liner.
- Adds a waterline tolerance for permanent aboveground manufactured pool kits to Table 803.1.
- Adds an exception under Section 805 needed for certain permanent aboveground pools.
- Adds a requirement in Section 809 for permanent aboveground non-diving pools installing ladders or stairs to follow the requirements as specified in APSP-4, including relevant safety signage.
- Adds a requirement in Section 809 for permanent aboveground non-diving pools to also follow the decking requirements in Section 703, as these types of pools may also use the types of decking laid out in Chapter 7. These requirements are not in Chapter 3 decking becuase they do not apply to all types of pools and spas.

With regard to now referring to the ANSI/APSP/ICC-4 Standard for Aboveground/Onground Residential Swimming Pools, the reasoning behind this change was these non-diving permanent aboveground or storable onground residential pools provide for pre-fabricated ladder or stair components. Other components within the ISPSC that have a standard they must follow simply reference said standard. For example, suction outlet fitting assemblies are required to comply with ANSI/APSP/ICC-16, pool and hot tub covers are required to comply with ASTM F1346, etc. Further, in one subsection of Section 702 we already refer the user to APSP-4; therefore, it makes more sense to have them go to APSP-4 for all its ladder and stair requirements. This then allows for Sections 702 and 705 to be reduced to simply requiring compliance with APSP-4. Then in Chapter 8, for permanent aboveground nondiving pools who utilize these same ladders and steps, a similar subsection is added directing the user to APSP-4 for compliance. Finally, by removing the language, this change ensures that if any changes are made to the APSP-4 requirements, the ISPSC will not be inconsistent.

This proposal is not intended to add any new requirements, but simply clarify existing requirements by properly organizing them in the appropriate chapters and sections of ISPSC and deleting duplicative language or language that comes from a standard that instead can be referenced for compliance.

Bibliography: ANSI/APSP/ICC-4 2012 (R2022) American National Standard for Aboveground/Onground Residential Swimming Pools

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal does not change any current requirements; rather, it simply reorganizes sections to make the code clearer as to what requirements are for certain types of pools. The requirement to follow APSP-4 does not affect the cost as this standard was already required within the ISPSC.

SP31-24

SP32-24

ISPSC: 811.1

Proponents: Gregory Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

811.1 ~~Rope and float~~ Slope change identification. ~~In pools where the point of first slope break occurs, a rope and float assembly shall be installed across the width of the pool. The rope assembly shall be located not less than 1 foot (305 mm) and not greater than 2 feet (610 mm) towards the shallow side of the slope break. Rope anchoring devices shall be permanently attached to the pool wall, coping or deck. Rope ends shall attach to the rope anchor devices so that the rope ends can be disconnected from the rope anchor device.~~ The point at which the shallow area changes slope to the deep area in the pool shall be identified in an approved manner.

Reason: Most pool builders do not install safety ropes and floats on residential pools with a continuous 1:7 slope or more. The transition increase of a deep end slope less than the accepted shallow end slope does necessitate an approved manner for marking the transition but that is not necessarily rope and float, which is uncommon in residential pools. Deep ends are also becoming uncommon in new residential pools.

An approved and commonly used method for depth transition may be floor or other marking used.

The slope change transition is noted in section 807 of the ISPSC.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$1-500

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of not installing rope and float anchors in pools with deep ends would be minimal -- the cost of not buying rope and float equipment or paying for installation of anchors. The cost of other forms of marking would be included in the cost of coating or tiles already part of the total cost of a pool.

Estimated Life Cycle Cost Impact:

None

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None

2024 International Swimming Pool and Spa Code

Revise as follows:

901.2 General. Permanent *residential* spas and permanent *residential* exercise spas shall comply with Chapter 5 except that Sections 504 ~~504.1, 504.1.1~~ and 508 ~~508.1~~ shall not apply. Such spas shall comply with the requirements of Chapter 3.

Reason: During the 2018 Group A code development hearings, John Kelly, representing himself submitted SP39-18. This proposal added in a much-needed timer for Commercial Spas and Exercise Spas. However, this created an unintended consequence, now making the timers required on residential and commercial. This proposal will now exempt all residential spas and exercise spas from section 504 and 508 in its entirety. By exempting out all of section 504 and not just the subsections, it cleans up the code section providing clarity. Furthermore, with there no longer being section 509 in the ISPSC removing that exemption is also needed for clarity. Section 509 on safety features was moved to section 508 in the 2021 ISPSC. This was due to approval of SP19-18. In The 2024 ISPSC section 319.2 was relocated to 320.2. This renumbering was the result of the approval of SP24-21. The updated 2024 ISPSC section 320.2 makes it clear that these only apply to Public Pools and Spa, therefore no exception is needed in chapter 9 for section 320.2. By including all of section 508 we will return the code to the original intent for exempting out the safety requirements for public spas and exercise spas.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

About $200 per spa.

Estimated Immediate Cost Impact Justification (methodology and variables):

About 2 hours labor at $80 per hours plus $40 for wiring, timer and mounting hardware.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

SP33-24

2024 GROUP A – PROPOSED CHANGES TO THE INTERNATIONAL FIRE CODE

FIRE CODE COMMITTEE

Greg Rogers, **MS, CFO, FM, MIFireE,** *Chair*
Rep: International Association of Fire Chiefs
Deputy Chief
International Association of Fire Chiefs
Veradale, WA

Dwayne Garriss, CFI, *Vice Chair*
Rep: National Association of State Fire Marshals
President

TENTATIVE ORDER OF DISCUSSION
2024 PROPOSED CHANGES TO THE
INTERNATIONAL FIRE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some F code change proposals may not be included on this list, as they are being heard by another committee.

IWUIC: 301.2, 401.2, 401.3, 501.2, 501.3, 601.2

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Delete without substitution:

~~**301.2 Objective.** The objective of this chapter is to provide simple baseline criteria for determining *wildland-urban interface areas*.~~

~~**401.2 Objective.** The objective of this chapter is to establish the minimum requirements for emergency vehicle access and water supply for buildings and structures located in the *wildland-urban interface areas*.~~

Revise as follows:

~~401.3~~401.2 General safety precautions.
General safety precautions shall be in accordance with this chapter. ~~See also Appendix A.~~

Delete without substitution:

~~**501.2 Objective.**~~
~~The objective of this chapter is to establish minimum standards to locate, design and construct buildings and structures or portions thereof for the protection of life and property, to resist damage from wildfires, and to mitigate building and structure fires from spreading to wildland fuels. The minimum standards set forth in this chapter vary with the critical *fire weather*, slope and fuel type to provide increased protection, above the requirements set forth in the *International Building Code*, from the various levels of hazards.~~

Revise as follows:

~~501.3~~501.2 Fire-resistance-rated construction.
Where this code requires 1-hour *fire-resistance-rated construction*, the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263.

Exceptions:

1. The fire-resistance rating of building elements, components or assemblies based on the prescriptive designs prescribed in Section 721 of the International Building Code.
2. The fire-resistance rating of building elements, components or assemblies based on the calculation procedures in accordance with Section 722 of the International Building Code.

Delete without substitution:

~~**601.2 Objective.** The objective of this chapter is to establish minimum requirements to mitigate the risk to life and property from wildland fire exposures, exposures from adjacent structures and to prevent structure fires spreading to wildland fuels.~~

Reason: The intent of this proposal is to move/incorporate the "Objectives" to the notes at the top of each chapter. The items there describe how the chapter should apply and do not really have any substantive requirements, thus are better in the note sections. This is a companion to the Scope rewrite, and these were identified as unrelated to the enforceable requirements of the code.

There are two sections that would need to be renumbered. Section 401.2 also has an issue in that it says "See appendix A" but Appendix A only applies if adopted by a jurisdiction, and thus is inappropriate to include in the text of the code given that the appendix isn't mandatory.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This simply moves language from the body of the code to the notes, and has no regulatory effect.

WUIC1-24

WUIC2-24

IWUIC: [A] 106.3, SECTION 202, SECTION 202 (New), 402.2.2, SECTION 503, 503.1, TABLE 503.1, SECTION 504, 504.1, 504.3, 504.5, SECTION 505, 505.1, 505.5, SECTION 506, 506.1, 507.1, 602.1, G101.3.5

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 106.3 Site plan.
In addition to the requirements for plans in the *International Building Code*, site plans shall include topography, width and percent of grade of access roads, landscape and vegetation details, locations of structures or building envelopes, existing or proposed overhead utilities, occupancy classification of buildings, ~~types of ignition-resistant construction~~ *WUI construction class* of buildings, structures and their appendages, roof classification of buildings and site water supply systems. The *code official* is authorized to waive or modify the requirement for a site plan where the application for permit is for alteration or repair or where otherwise warranted.

~~**IGNITION-RESISTANT CONSTRUCTION, CLASS 1.**~~ ~~A schedule of additional requirements for construction in *wildland-urban interface areas* based on extreme fire hazard.~~

~~**IGNITION-RESISTANT CONSTRUCTION, CLASS 2.**~~ ~~A schedule of additional requirements for construction in *wildland-urban interface areas* based on high fire hazard.~~

~~**IGNITION-RESISTANT CONSTRUCTION, CLASS 3.**~~ ~~A schedule of additional requirements for construction in *wildland-urban interface areas* based on moderate fire hazard.~~

Add new definition as follows:

WUI CONSTRUCTION CLASS. One of three sets of additional requirements for construction in wildland-urban interface areas, classified as either Class 1 WUI construction, Class 2 WUI construction, or Class 3 WUI construction.

Revise as follows:

402.2.2 Water supply.
Individual structures hereafter constructed or relocated into or within *wildland-urban interface areas* shall be provided with a conforming water supply in accordance with Section 404.

Exceptions:

1. Structures constructed to meet the requirements for the ~~class of ignition-resistant construction~~ *WUI construction class* specified in Table 503.1 for a nonconforming water supply.
2. Buildings containing only private garages, carports, sheds and agricultural buildings with a floor area of not more than 600 square feet (56 m^2).

SECTION 503
~~IGNITION-RESISTANT~~ CONSTRUCTION AND MATERIAL

503.1 General.
Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 ~~or~~ and Class 3~~, ignition-resistant construction~~ *WUI construction classes* shall be in accordance with Sections 504, 505 and 506, respectively. Materials required to be ~~ignition-resistant materials~~ *ignition-resistant building materials* shall comply with the requirements of Section 503.2.

TABLE 503.1 ~~IGNITION-RESISTANT~~ WUI CONSTRUCTION CLASSES[a]

DEFENSIBLE SPACE[c]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply[b]		Water Supply[b]		Water Supply[b]	
	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]
Nonconforming	~~IR~~ Class 2	~~IR~~ Class 1	~~IR~~ Class 1	~~IR~~ Class 1 N.C.	~~IR~~ Class 1 N.C.	Not Permitted
Conforming	~~IR~~ Class 3	~~IR~~ Class 2	~~IR~~ Class 2	~~IR~~ Class 1	~~IR~~ Class 1	~~IR~~ Class 1 N.C.
1.5 × Conforming	Not Required	~~IR~~ Class 3	~~IR~~ Class 3	~~IR~~ Class 2	~~IR~~ Class 2	~~IR~~ Class 1

a. Access shall be in accordance with Section 403.

b. Subdivisions shall have a conforming water supply in accordance with Section 402.1.

~~IR~~ Class 1 = ~~Ignition-resistant~~ construction in accordance with Section 504.

~~IR~~ Class 2 = ~~Ignition-resistant~~ construction in accordance with Section 505.

~~IR~~ Class 3 = ~~Ignition-resistant~~ construction in accordance with Section 506.

N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.

c. Conformance based on Section 603.

d. Conformance based on Section 404.

e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

SECTION 504
CLASS 1 ~~IGNITION-RESISTANT~~ WUI CONSTRUCTION

504.1 General.

~~Class 1 ignition-resistant construction~~ Class 1 WUI construction shall be in accordance with Sections 504.2 through 504.11.

504.3 Protection of eaves.

Eaves and soffits shall be protected on the exposed underside by ~~ignition-resistant materials~~ *ignition-resistant building materials* or by materials *approved* for not less than 1-hour *fire-resistance-rated construction*, 2-inch (51 mm) nominal dimension lumber, or 1-inch (25 mm) nominal fire-retardant-treated lumber or $^3/_4$-inch (19.1 mm) nominal fire-retardant-treated plywood, identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code. Fascias are required and shall be protected on the backside by ~~ignition-resistant materials~~ *ignition-resistant building materials* or by materials *approved* for not less than 1-hour *fire-resistance-rated construction* or 2-inch (51 mm) nominal dimension lumber.

504.5 Exterior walls.

Exterior walls of buildings or structures shall be constructed with one of the following methods:

1. Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.
2. *Approved noncombustible* materials.
3. Heavy timber or *log wall construction*.
4. Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.
5. ~~Ignition-resistant materials~~ *Ignition-resistant building materials* complying with Section 503.2 on the exterior side.

Such material shall extend from the top of the foundation to the underside of the roof sheathing.

SECTION 505
CLASS 2 ~~IGNITION-RESISTANT~~ WUI CONSTRUCTION

505.1 General.
~~Class 2 ignition-resistant construction~~ Class 2 WUI construction shall be in accordance with Sections 505.2 through 505.11.

505.5 Exterior walls.
Exterior walls of buildings or structures shall be constructed with one of the following methods:

1. Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.
2. *Approved noncombustible* materials.
3. *Heavy timber* or *log wall construction*.
4. Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.
5. ~~Ignition-resistant materials~~ *Ignition-resistant building materials* on the exterior side.

Such material shall extend from the top of the foundation to the underside of the roof sheathing.

SECTION 506
CLASS 3 ~~IGNITION-RESISTANT~~ WUI CONSTRUCTION

506.1 General.
~~Class 3 ignition-resistant construction~~ Class 3 WUI construction shall be in accordance with Sections 506.2 through 506.4.

507.1 General.
The *roof covering* on buildings or structures in existence prior to the adoption of this code that are replaced or have 25 percent or more replaced in a 12-month period shall be replaced with a *roof covering* required for new construction based on the ~~type of ignition-resistant construction~~ *WUI construction class* specified in accordance with Section 503.

602.1 General.
An *approved* automatic sprinkler system shall be installed in all occupancies in new buildings required to meet the requirements for ~~Class 1 ignition-resistant construction~~ Class 1 WUI construction in Chapter 5. The installation of the automatic sprinkler systems shall be in accordance with nationally recognized standards.

G101.3.5 Shelter in place.
Developments in the wildland-urban interface may be designed to allow occupants to “Shelter in place.” Use of this design alternative should include ~~ignition-resistant construction~~ Class 1, Class 2 or Class 3 *WUI construction class* in accordance with Chapter 5, access, water supply, automatic sprinkler systems, provisions for and maintenance of *defensible space*, and a *Fire Protection Plan*.
A *Fire Protection Plan* describes ways to minimize the fire problems created by a specific project or development. The purpose for the *Fire Protection Plan* is to reduce the burden and impact of the project or development on the community’s fire protection delivery system. The plan may utilize components of land use, building construction, vegetation management and other design techniques and technologies. It should include specific mitigation measures consistent with the unique problems resulting from the location, topography, geology, flammable vegetation and climate of the proposed site. The plan shall be consistent with this code, and approved by the fire *code official*. The cost of preparation and review is to be borne by the project or development proponent.

Reason: This proposal cleans up terminology used in the IWUIC regarding materials and construction classes. Current language in the IWUIC does not use consistent terminology throughout and some of the terms currently used are not defined. The undefined term "ignition-resistant construction" implies that such construction must be composed of *ignition-resistant building materials*, which is not necessarily the case. To address this, the undefined term "ignition-resistant construction" is replaced by the new term *WUI construction class*, for which a definition is proposed. Also, instances of the undefined term "ignition-resistant material" are consistently replaced with the defined term *ignition-resistant building material*. The intent of this proposal is to eliminate these specific instances of confusing language, improve consistency of terminology and ensure that terminology regarding materials and *WUI construction classes* is defined, where appropriate.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal replaces undefined terms with defined terms, to improve consistency and clarity without changing code requirements.

WUIC2-24

WUIC3-24

IWUIC: 403.4

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

403.4 Marking of roads. *Approved* signs or other *approved* notices shall be provided ~~and maintained for access roads and *driveways* to identify such roads and prohibit the obstruction thereof~~ to identify access roads. Approved signs shall be provided to prohibit the obstruction of access roads and driveways serving more than one building or structure. Required signs and notices shall be maintained and legible.

Reason: This proposal is intended to clarify this section, and indicate that it is not required to provide signs at driveways.

This current section contains several requirements in one sentence:

1. Signs identifying access roads and driveways
2. Signs to prohibit obstruction of access roads and driveways
3. Maintenance of signs.

This proposal splits the components apart and modifies it so that:

1. Signs are required to identify access roads. Signs identifying driveways are not required.
2. Signs are required to prohibit obstruction of access roads. Such signs are not required for driveways unless they serve more than one building or structure.
3. The required signs and notices must be legible and maintained.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal will reduce the cost by eliminating the requirements for signs on driveways, and "NO OBSTRUCTION" signs on driveways serving individual structures. The cost per project is estimated to be $100.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost is based on the purchase of an average of two 4 x 4 redwood posts, paint and labor.

WUIC3-24

WUIC4-24

IWUIC: 404.5

Proponents: Pierson Stoecklein, Frontline Wildfire Defense

2024 International Wildland Urban Interface Code

Revise as follows:

404.5 Adequate water supply.
Adequate water supply shall be determined for purposes of initial attack, ember control and flame front control as follows:

1. One- and two-family dwellings. The required water supply for one- and two-family dwellings having a *fire flow calculation area* that does not exceed 3,600 square feet (334 m^2) shall be 1,000 gallons per minute (63.1 L/s) for a minimum duration of 30 minutes. The required water supply for one- and two-family dwellings having a *fire flow calculation area* in excess of 3,600 square feet (334 m^2) shall be 1,500 gallons per minute (95 L/s) for a minimum duration of 30 minutes.

   Exception: A reduction in required flow rate of 50 percent, as *approved* by the *code official*, is allowed where the building is provided with an *approved* automatic sprinkler system, or an approved exterior wildfire sprinkler system, or both.

2. Buildings other than one- and two-family dwellings. The water supply required for buildings other than one- and two-family dwellings shall be as *approved* by the *code official* but shall be not less than 1,500 gallons per minute (95 L/s) for a duration of 2 hours.

   Exception: A reduction in required flow rate of up to 75 percent, as *approved* by the *code official*, is allowed where the building is provided with an *approved* automatic sprinkler system, or an approved exterior wildfire sprinkler system, or both. The resulting water supply shall not be less than 1,500 gallons per minute (94.6 L/s).

Reason: This modification facilitates (but does not require) the potential installation of a exterior wildfire sprinkler system while ensuring that water supply is addressed. It would subject each exterior system to the same water supply and flow rate requirements applicable to interior sprinkler systems without making any changes to existing precedent.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

WUIC4-24

WUIC5-24

IWUIC: 502.2

Proponents: Pierson Stoecklein, Frontline Wildfire Defense

2024 International Wildland Urban Interface Code

Revise as follows:

502.2 Fire hazard severity reduction.
The fire hazard severity identified in Table 502.1 is allowed to be reduced by implementing a vegetation management plan in accordance with Appendix B or by installing an approved exterior wildfire sprinkler system.

Reason: This proposal would allow (but not require) a code official to reduce the fire hazard severity where an approved exterior wildfire sprinkler system is installed. This simply means that, where an exterior sprinkler system is capable of providing the same or greater benefits relative to a vegetation management plan, the sprinkler system would warrant the same consideration with regard to reducing the fire hazard severity.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

WUIC5-24

WUIC6-24

IWUIC: 503.1

Proponents: Pierson Stoecklein, Frontline Wildfire Defense

2024 International Wildland Urban Interface Code

Revise as follows:

503.1 General.
Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required to be ignition-resistant materials shall comply with the requirements of Section 503.2.

> **Exception:**Where a building or structure constructed in the nonconforming defensible space category is provided with an approved exterior wildfire sprinkler system, the defensible space shall be deemed conforming and construction shall be in accordance with the requirements applicable to the conforming defensible space category.

Reason: An exterior wildfire sprinkler system significantly increases the effectiveness of the defensible space and warrants this modification.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

WUIC6-24

WUIC7-24

IWUIC: SECTION 602, 602.1, 602.2 (New), 602.3 (New), 602.3.1 (New), 602.3.2 (New), 602.4 (New), 602.4.1 (New), 602.4.2 (New), 602.4.3 (New), 602.4.4 (New), 602.4.5 (New), 602.4.6 (New)

Proponents: Pierson Stoecklein, Frontline Wildfire Defense

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 602
~~AUTOMATIC~~FIRE SPRINKLER SYSTEMS

602.1 General.
An *approved* automatic sprinkler system shall be installed in all occupancies in new buildings required to meet the requirements for Class 1 ignition-resistant construction in Chapter 5. The installation of the automatic sprinkler systems shall be in accordance with nationally recognized standards. Where permitted by the fire code official, an exterior wildfire sprinkler system shall be installed permanently in accordance with Sections 602.2 through 602.4.

Add new text as follows:

602.2 Exterior wildfire sprinkler system coverage. Where approved by the code official, an exterior wildfire sprinkler system shall provide coverage of the entire defensible space required per Table 603.2, as well as any exterior horizontal or vertical surface that is less than 67.5 degrees in angle and is within the perimeter of the defensible space.

602.3 Water supply. Where connected to a public water supply, an exterior wildfire sprinkler system shall include a mechanism, in a conspicuously marked location, accessible to the fire service, which allows immediate manual termination of system operation. Where approved by the code official, alternative sources of water supply, including fire department connections, shall be permitted to supply water to an exterior wildfire sprinkler system. The code official shall be authorized to require an exterior wildfire sprinkler system to utilize a specified percentage of biodegradable, Class A firefighting foam in order to reduce the amount of water consumed by the system.

602.3.1 Duration. An approved exterior wildfire sprinkler system shall be equipped with a resettable shutoff device that activates automatically after 90 minutes of continuous operation and can be reset without manual intervention to resume the flow of water through the system.

602.3.2 Freeze protection. Any exterior wildfire sprinkler system in an area subject to freezing shall be a dry pipe system or winterized by alternative means where approved by the code official.

602.4 Exterior wildfire sprinkler system components. An exterior wildfire sprinkler system shall consist of approved equipment and devices.

602.4.1 Sprinkler-type devices. An exterior wildfire sprinkler system shall be equipped with approved open sprinkler-type devices at approved locations

602.4.2 Control valves. An exterior wildfire sprinkler system shall have a control valve equipped with an automatic system shutoff mechanism that is capable of being controlled remotely to activate, pause, and deactivate the system. Where permitted, additional control valves shall be identified by signage at the main control valve.

> **Exception:** The code official is authorized to permit a manually controlled exterior wildfire sprinkler system only where constant supervision will be present.

-

602.4.3 **Drain valves.** An *exterior wildfire sprinkler system* shall have a separate drain valve installed on the system-side of each control valve, except where an open sprinkler-type device, top-fed system is arranged to facilitate drainage.

602.4.4 **Pressure gauges.** Each *exterior wildfire sprinkler system* shall be equipped with one or more digital pressure gauges and at least one analog pressure gauge, each of which shall be capable of monitoring static and dynamic system and water supply pressures.

602.4.5 **Pipes and fittings.** All *exterior wildfire sprinkler system* pipes and fittings installed on the exterior of the building or structure shall be non-photodegradable, corrosion resistant, permanently connected to a water supply, and designed to drain upon deactivation of the system.

602.4.6 **Backflow device.** Where any potable water source is connected to or used to supply the exterior wildfire sprinkler system, an approved backflow preventer shall be installed in the riser or feed main.

Reason: 90% of structure ignitions during a wildfire are caused by embers (Wildland Fire Embers and Flames: Home Mitigations That Matter, at p6, IBHS). Embers can travel in excess of 24 miles outside of a wildfire perimeter—the distance being subject to wind and convective heat—as well as ember parent material (IBHS, NIST). Given the distance of ember travel and the quantity of structures simultaneously exposed to embers, it is often impossible for firefighters to actively defend all structures, all at once.

Both regulated and non-regulated fuels are often present within the defensible space perimeter. Although regulated fuels, such as plant fuels and building materials, are subject to regulation under the IWUIC and IBC, non-regulated fuels, such as patio furniture, door mats, accumulated pine needles and leaves, firewood, toys, and other household items and natural materials are not. Regardless, when fuels of either type are subjected to ember cast and subsequently reach combustion, heat transfer from these fuels contributes to structure combustion.

Exterior wildfire sprinkler systems provide added protection for structures and are uniquely effective when used in conjunction with fire-resistant construction materials and defensible space (*see* Fire Sprinklers Technical Fact Sheet #15, *Federal Emergency Management Agency*) (Protect Your Property from Wildfire, California Edition, IBHS). Automatic interior fire sprinkler systems activate from contact with direct heat (i.e., after a fire has already begun and reached the immediate vicinity of the system) and are designed primarily to prevent flashover inside the home while allowing the occupants to escape and the fire department to arrive. In contrast, exterior wildfire sprinkler systems are deployed with a focus on mitigation/prevention, the primary objective being to hydrate combustible materials that comprise or are within a certain distance of a structure, well before the structure is exposed to ignition sources (e.g., air borne embers); exterior wildfire sprinkler systems do not activate from contact with direct heat contact.

Building and maintaining a saturation level of optimal hydration is vital to prevention of ember ignition and, by hydrating the exterior surfaces of a structure and increasing the moisture content of regulated and non-regulated fuels located within the relevant defensible space, exterior wildfire sprinkler systems can prevent or significantly reduce ignition risk (*see* Factsheet: FireSmart Exterior Home Sprinklers and Structure Protection Units, British Columbia FireSmart). This reduces the fire hazard severity of building sites for buildings constructed, modified or relocated into wildland-urban interface areas and can substantially increase the effectiveness of defensible space (whether conforming or nonconforming).

The proposed modifications incorporate exterior wildfire sprinklers into the IWUIC and thereby offer a new self-defense mechanism independent of active firefighter defense. Reducing the number of active defense actions that must be taken by firefighters results in a safer firefighting environment and enables more focused and therefore effective use of limited firefighting resources.

The addition of this new section identifies critical features and functionality of an ideal exterior wildfire sprinkler system.

Bibliography:

1. Wildland Fire Embers and Flames: Home Mitigations That Matter, *IBHS* (April 2023).
2. Fire Sprinklers, Home Builder's Guide to Construction in Wildfire Zones, Technical Fact Sheet #15, *Federal Emergency Management Agency.*
3. Protect Your Property from Wildfire, California Edition, IBHS.
4. Factsheet: FireSmart Exterior Home Sprinklers and Structure Protection Units, British Columbia FireSmart.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

WUIC7-24

WUIC8-24

IWUIC: 603.2

Proponents: Pierson Stoecklein, Frontline Wildfire Defense (pierson@pioneerpublicaffairs.com)

2024 International Wildland Urban Interface Code

Revise as follows:

603.2 Fuel modification.
Buildings or structures, constructed in compliance with the conforming *defensible space* category of Table 503.1, shall comply with the *fuel modification* distances contained in Table 603.2. For all other purposes the *fuel modification* distance shall be not less than 30 feet (9144 mm) or to the lot line, whichever is less. Distances specified in Table 603.2 shall be measured on a horizontal plane from the perimeter or projection of the building or structure as shown in Figure 603.2. Distances specified in Table 603.2 are allowed to be increased by the *code official* because of a site-specific analysis based on local conditions and the *fire protection plan*.

Exception: Where a building or structure is equipped with an approved exterior wildfire sprinkler system and constructed in compliance with the conforming defensible space category of Table 503.1, the code official is permitted to decrease the distances specified in Table 603.2 when utilizing a site-specific analysis accounting for local conditions and the fire protection plan.

Reason: An exterior wildfire sprinkler system substantially increases the effectiveness of defensible space and allows the code official (but does not require) to reduce the minimum area distance/required.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

WUIC8-24

WUIC9-24

IWUIC: SECTION 202 (New)

Proponents: Pierson Stoecklein, Frontline Wildfire Defense

2024 International Wildland Urban Interface Code

Add new definition as follows:

EXTERIOR WILDFIRE SPRINKLER SYSTEM

.
An approved system of piping, devices, and equipment which is automatically or manually activated to discharge water or an approved fire-extinguishing agent onto the exterior surfaces of a structure and the adjacent grade to hydrate the defensible space area required by Section 603.2.

Reason: There is no existing definition in the IWUIC for "exterior wildfire sprinkler system" although there is reference to such a system in the appendices. Including a definition in the code merely establishes a foundation for all related modifications submitted by this proponent and/or any future proposals related to exterior wildfire sprinkler systems without imposing any requirements.

90% of structure ignitions during a wildfire are caused by embers (Wildland Fire Embers and Flames: Home Mitigations That Matter, at p6, IBHS). Embers can travel in excess of 24 miles outside of a wildfire perimeter—the distance being subject to wind and convective heat—as well as ember parent material (IBHS, NIST). Given the distance of ember travel and the quantity of structures simultaneously exposed to embers, it is often impossible for firefighters to actively defend all structures, all at once.

Both regulated and non-regulated fuels are often present within the defensible space perimeter. Although regulated fuels, such as plant fuels and building materials, are subject to regulation under the IWUIC and IBC, non-regulated fuels, such as patio furniture, door mats, accumulated pine needles and leaves, firewood, toys, and other household items and natural materials are not. Regardless, when fuels of either type are subjected to ember cast and subsequently reach combustion, heat transfer from these fuels contributes to structure combustion.

Exterior wildfire sprinkler systems provide added protection for structures and are uniquely effective when used in conjunction with fire-resistant construction materials and defensible space (*see* Fire Sprinklers Technical Fact Sheet #15, *Federal Emergency Management Agency*) (Protect Your Property from Wildfire, California Edition, IBHS). Automatic interior fire sprinkler systems activate from contact with direct heat (i.e., after a fire has already begun and reached the immediate vicinity of the system) and are designed primarily to prevent flashover inside the home while allowing the occupants to escape and the fire department to arrive. In contrast, exterior wildfire sprinkler systems are deployed with a focus on mitigation/prevention, the primary objective being to hydrate combustible materials that comprise or are within a certain distance of a structure, well before the structure is exposed to ignition sources (e.g., air borne embers); exterior wildfire sprinkler systems do not activate from contact with direct heat contact.

Building and maintaining a saturation level of optimal hydration is vital to prevention of ember ignition and, by hydrating the exterior surfaces of a structure and increasing the moisture content of regulated and non-regulated fuels located within the relevant defensible space, exterior wildfire sprinkler systems can prevent or significantly reduce ignition risk (*see* Factsheet: FireSmart Exterior Home Sprinklers and Structure Protection Units, British Columbia FireSmart). This reduces the fire hazard severity of building sites for buildings constructed, modified or relocated into wildland-urban interface areas and can substantially increase the effectiveness of defensible space (whether conforming or nonconforming).

The proposed modifications incorporate exterior wildfire sprinklers into the IWUIC and thereby offer a new self-defense mechanism independent of active firefighter defense. Reducing the number of active defense actions that must be taken by firefighters results in a safer firefighting environment and enables more focused and therefore effective use of limited firefighting resources.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

WUIC9-24

WUIC10-24

IWUIC: TABLE C101.1

Proponents: Pierson Stoecklein, Frontline Wildfire Defense (pierson@pioneerpublicaffairs.com)

2024 International Wildland Urban Interface Code

Revise as follows:

TABLE C101.1 FIRE HAZARD SEVERITY FORM

A. Subdivision Design Points	
1. Ingress/Egress	
Two or more primary roads	1___
One road	3___
One-way road in, one-way road out	5___
2. Width of Primary Road	
20 feet (6096 mm) or more	1___
Less than 20 feet (6096 mm)	3___
3. Accessibility	
Road grade 5% or less	1___
Road grade more than 5%	3___
4. Secondary Road Terminus	
Loop roads, cul-de-sacs with an outside turning radius of 45 feet (13 716 mm) or greater	1___
Cul-de-sac turnaround	2___
Dead-end roads 200 feet (60 960 mm) or less in length	3___
Dead-end roads greater than 200 feet (60 960 mm) in length	5___
5. Street Signs	
Present	1___
Not present	3___
B. Vegetation (IWUIC Definitions)	
1. Fuel Types	
Light	1___
Medium	5___
Heavy	10___
2. Defensible Space	
70% or more of site	1___
30% or more, but less than 70% of site	10___

Less than 30% of site	20___
C. Topography	
8% or less	1___
More than 8%, but less than 20%	4___
20% or more, but less than 30%	7___
30% or more	10___
D. Roofing Material	
Class A Fire Rated	1___
Class B Fire Rated	5___
Class C Fire Rated	10___
Nonrated	20___
E. Fire Protection—Water Source	
500 GPM (1892.5 L/min) hydrant within 1,000 feet (304.8 m) or an approved exterior wildfire sprinkler system	1___
Hydrant farther than 1,000 feet (304.8 m) or draft site	2___
Water source 20 min. or less, round trip	5___
Water source farther than 20 min., and 45 min. or less, round trip	7___
Water source farther than 45 min., round trip	10___
F. Existing Building Construction Materials	
Noncombustible siding/deck	1___
Noncombustible siding/combustible deck	5___
Combustible siding and deck	10___
G. Utilities (gas and/or electric)	
All underground utilities	1___
One underground, one above ground	3___
All above ground	5___
Total for Subdivision	
Moderate Hazard	40–59
High Hazard	60–74
Extreme Hazard	75+

Reason: Installation of an exterior wildfire sprinkler system provides similar impact to hazard severity as proximity to a water source.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

WUIC10-24

WUIC11-24

IWUIC: G101.3.1

Proponents: Pierson Stoecklein, Frontline Wildfire Defense

2024 International Wildland Urban Interface Code

Delete without substitution:

~~**G101.3.1 Exterior sprinkler systems.**~~

~~Currently, there is no nationally accepted standard for the design and installation of exterior fire sprinkler systems. Interior sprinkler systems are regulated by nationally recognized standards that have specific requirements. However, exterior sprinkler systems lack such uniformity. What is generally proposed is a type of sprinkler system, placed on the roofs or eaves of a building, whose primary purpose is to wet down the roof. These types of systems can be activated either manually or automatically. However, the contemporary thought on exterior sprinkler systems is that if the roof classification is of sufficient fire resistance, exterior sprinklers are of little or no value. Another option and alternative with exterior sprinklers is to use them to improve the relative humidity and fuel moisture in the *defensible space*. In this case, the exterior sprinkler is not used to protect the structure as much as it attempts to alter the fuel situation. However, studies do not support the idea that merely spraying water into the air in the immediate vicinity of a rapidly advancing wildland-urban fire does much good. Clearly, irrigation systems that keep plants healthy and fire-resistive plants that resist convection and radiated heat can accomplish the same purpose.~~

Reason: Outdated and inaccurate.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

IWUIC: SECTION 405, 405.1, 405.2, 405.3, 405.4, 602.3 (New), 602.3.1 (New), 602.3.2 (New)

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov); Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION ~~405~~ 602 FIRE PROTECTION PLANS

~~405.1~~ 602.1 General. ~~Where required by the *code official*, a *fire protection plan* shall be prepared.~~
The code official is authorized to require the owner or owner's authorized agent to provide a fire protection plan. The fire protection plan shall be prepared to determine the acceptability of fire protection and life safety measures designed to mitigate wildfire hazards presented for the property under consideration.

The fire protection plan shall be prepared by a registered design professional, qualified landscape architect, qualified fire safety specialist or similar specialist acceptable to the code official and shall analyze the wildfire risk of the building, project, premises or region to recommend necessary changes.

The code official is authorized to require a preliminary fire protection plan prior to the submission of a final fire protection plan.

~~405.2~~ 602.2 Contents. ~~The plan shall be based on a site-specific wildfire risk assessment that includes considerations of location, topography, aspect, flammable vegetation, climatic conditions and fire history. The plan shall address water supply, access, building ignition and fire-resistance factors, fire protection systems and equipment, *defensible space* and vegetation management.~~
The fire protection plan shall be based on a project-specific wildfire hazard assessment that includes considerations of location, topography, aspect, climatic and fire history.

The plan shall identify conformance with all applicable wildfire protection regulations.

The plan shall address fire department access, egress, road and address signage, water supply, and the applicable building codes and standards for wildfire safety. The plan shall identify mitigation measures to address the project's specific wildfire risk and shall include the information required in Sections 602.3 through 602.3.2.

Delete without substitution:

~~**405.3 Cost.** The cost of *fire protection plan* preparation and review shall be the responsibility of the applicant.~~

~~**405.4 Plan retention.** The *fire protection plan* shall be retained by the *code official*.~~

Add new text as follows:

602.3 Project information. . The final fire protection plan shall be reviewed and approved prior to start of construction.

602.3.1 Preliminary fire protection plan. When a preliminary fire protection plan is submitted, it shall include, at a minimum, the following:

1. Total size of the project.
2. Information on the adjoining properties on all sides, including current land uses, and if known, existing structures and densities, planned construction, natural vegetation, environmental restoration plans, roads and parks.

3. A map with all project boundary lines, property lines, slope contour lines, proposed structure foundation footprints, and proposed roads and driveways. The map shall identify project fuel modification zones and method of identifying the fuel modification zone boundaries.

602.3.2 Final fire protection plan. Final fire protection plan shall include items listed in Section 602.3.1 and the following:

1. A map identifying all proposed plants in the fuel modification zones with a legend that includes a symbol for each proposed plant species. The plan shall include specific information on each species proposed, including but not limited to:
   1.1. The plant life-form

   1.2. The scientific and common name

   1.3. The expected height and width for mature growth

2. Identification of irrigated and non-irrigated zones.
3. Requirements for vegetation reduction around emergency access and evacuation routes.
4. Identification of points of access for equipment and personnel to maintain vegetation in common areas.
5. Legally binding statements regarding community responsibility for maintenance of fuel modification zones.
6. Legally binding statements to be included in covenants, conditions and restrictions regarding property owner responsibilities for vegetation maintenance.

Reason: This proposal accomplishes two goals: 1) to relocate the Fire Protection Plan requirements to an appropriate location, and 2) enhance the provisions for the fire protection plan to provide guidance to those developing the fire protection plan.

The scope for Chapter 4 states that the chapter contains regulations for water supply and access. The Fire Protection Plan, currently in Section 405, does not fit under either of the Chapter 4 categories. Chapter 6 contains general requirements for fire protection. The provisions for a Fire Protection Plan fit more appropriately in Chapter 6, so they are mover to Section 602.

The California State Fire Marshal's office (SFM) workgroup 2020 was assembled to take on the task of creating a statewide approach for requiring a fire protection plan for any property under consideration to mitigate the wildfire hazards that may exist. This proposal is being submitted to the IWUIC, because the overall response from the design community has been positive. Nationwide consistency leads to further success in application of the code.

The proposal sets a framework for the elements of a fire protection plan to include. This proposal is a baseline of what a general plan shall consist of for evaluating the associated risks with a property and its location within a wildland-urban interface area. A proposed fire protection plan shall be approved before the start of any construction. This will ensure compliance with the requirements in this code. The enforcement of the protection plan starts at the beginning. The Fire Protection Plan is a document that can be referred to at any stage of a project.

Often, a preliminary Fire Protection Plan is submitted to help move a project along and save money for the owner during the different phases of construction. The preliminary Fire Protection Plan sets the groundwork and foundation for the boundaries of the project. This information is vital for planning departments and for cost analysis to be considered early on.

A final Fire Protection Plan includes all the requirements of the preliminary plan with the added landscaping details that may not have been completed in the early phase of a project. The code official will now have a complete document of the project and the planned fire protection to ensure the safety of the community, neighbors, and first responders. These documents and information will help first responders pre-plan for an incident.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The choice to require a fire protection plan is at the discretion of the code official. The design professional will typically incorporate any design criteria in the project cost. This is already a typical practice.

WUIC13-24

IWUIC: 501.1

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

501.1 Scope.
Buildings and structures shall be constructed in accordance with the *International Building Code* and this code.

Exceptions:

~~1.~~ Accessory structures ~~not exceeding 120 square feet (11 m^2) in floor area~~ and agricultural buildings ~~where~~ located ~~not less than~~ 50 feet (15 240 mm) or more from buildings containing habitable spaces are not required to comply with this code.

~~2. Agricultural buildings not less than 50 feet (15 240 mm) from buildings containing habitable spaces.~~

Reason: Based on the current language, detached accessory structures can essentially be categorized into four groups. These groups are illustrated in Figure 1:

- Group A: Detached accessory structures with a floor area of 120 sq ft and less, located less than 50 feet of the primary structure.
- Group B: Detached accessory structures with a floor area greater than 120 sq ft, located less than 50 feet of the primary structure.
- Group C: Detached accessory structures with a floor area of 120 sq ft and less, located 50 feet or more from the primary structure.
- Group D: Detached accessory structures with a floor area greater than 120 sq ft, located at 50 feet or more from the primary structure.

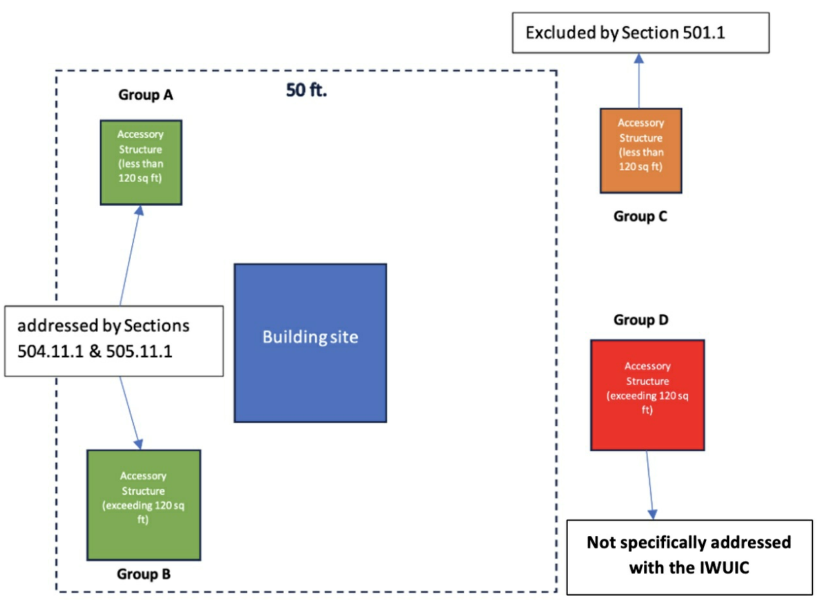

Figure 1. Detached accessory structures condition in 2024 IWUIC Scope.

Section 501.1 exempts Group C from the IWUIC, but all other structures must comply with the IBC and the IWUIC. Furthermore, Sections 504.11 and 505.11 of the IWUIC specifically address Group A and Group B detached accessory structures. Sections 504.11 and 505.11 require exterior walls of detached accessory structures located less than 50 feet from a building containing habitable space to be constructed consistent with the required construction of the exterior walls of primary structure. Group D (located 50 feet or more from the primary building and a floor area exceeding 120 square feet) is not specifically addressed by the IWUIC. The lack of specificity could lead to uncertainty regarding the construction of Group D detached accessory structures. A strict reading of the charging paragraph of Section

501.1, would necessitate compliance with all the requirements detailed in both the IBC and the IWUIC for Group D structures. This would mean that Group D structures would have to meet all the requirements related to ignition resistance class 1 or 2, resulting in construction that is more stringent than Group A and B structures even though Group D structures pose a much lower risk. This is counterintuitive.

504.11 Detached accessory structures. Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed with materials approved for not less than 1-hour fire-resistance-rated construction, heavy timber, log wall construction, or constructed with approved noncombustible materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

504.11.1 Underfloor areas. Where the detached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5 or underfloor protection in accordance with Section 504.6.

Exception: The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the *International Building Code*.

Figure 2. Detached accessory structures requirements for IR Construction classes 1.

To address this issue, the proposed language recommends exempting all detached accessory structures located more than 50 feet away from a habitable building from the scope of IWUIC. This suggestion is supported by the findings of structure separation experiments conducted by the IBHS and NIST. These experiments indicate that when the separation distance between structures exceeds 50 feet, the risk of conflagration and structure ignition is significantly lower [1-3]. Chapter 7A of the California Building Code also includes similar requirements in Section 710A.3 (Figure 3) and this change will align these two codes from this perspective [4].

> ***710A.3 Where required.*** *Miscellaneous structures that require a permit, and accessory buildings of any size, when separated from an applicable building on the same lot by a distance of less than 3 feet (914 mm), shall comply with Section 710A.3.1. Accessory buildings that are greater than 120 square feet (11.15 m²), when separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall comply with Section 710A.3.2.*

When required by the enforcing agency, miscellaneous structures that require a permit, and accessory buildings that are 120 square feet (11.15 m²) or less, when separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm), shall comply with either Section 710A.3.4 or Section 710A.3.3, respectively.

No requirements shall apply to accessory buildings or miscellaneous structures when located 50 feet (15 240 mm) or more from an applicable building on the same lot.

Figure 3. 2022 California Building Code, Chapter 7A, Section 710A, Accessory Buildings and Miscellaneous Structures [4].

4. 2022 California Building Code, California code of regulation, Title 24, Part 2 (Volumes 1 & 2) with Jan 2023 Errata, Section 710A.3.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 or less. This proposed code change provides clarity for detached accessory structures with floor areas exceeding 120 square feet and located 50 feet or more from the main building. Existing language currently requires these detached accessory structures to comply with the IWUIC. This proposed code change will exclude these structures from these requirements. Consequently, detached accessory structures exceeding 120 square feet in floor area and located more than 50 feet away from the main building will no longer need to comply with all the stipulated conditions of IR Class 1 or 2.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will result in a decrease in the cost of construction for detached accessory structures that have a floor area exceeding 120 square feet and are located 50 feet or more from a building containing habitable space.

WUIC13-24

WUIC14-24

IWUIC: SECTION 202 (New), 501.1, 501.1.1 (New)

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Cary Yballa, Central County Fire Department, Cal FPO (cyballa@ccfd.org)

2024 International Wildland Urban Interface Code

Add new definition as follows:

APPLICABLE BUILDING. A building that has residential, commercial, educational, institutional, or similar occupancy type use.

Revise as follows:

501.1 Scope.
Buildings and structures in a wildland urban interface area shall be constructed in accordance with the *International Building Code* and this code.

Exceptions:

1. Group U ~~A~~accessory structures not exceeding 120 square feet (11 m^2) in floor area where located not less than 50 feet (15 240 mm) from applicable buildings ~~containing habitable spaces~~.
2. Group U ~~A~~agricultural buildings not less than 50 feet (15 240 mm) from applicable buildings ~~containing habitable spaces~~.

Add new text as follows:

501.1.1 Other codes. The construction requirements in the *International Building Code* or in the *International Residential Code*, as applicable, shall be supplemented by the construction requirements in this chapter. Where there is a conflict between provisions of this code and those of the *International Building Code* or of the *International Residential Code*, the provisions of this code shall apply.

Reason: The definition was added for comprehensibility of what an applicable building is regarding the WUI regulations. Since “applicable building” is only used in the scope, adding a definition can confidently be done without interfering with the meaning of the rest of the publication.

Group U is the only accessory structured allowed exceptions.

Other codes, is a reminder that this code is an overlay to the building or residential code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is clean up for the intent of where the Wildland code is to be used and that it is an overlay to the building or residential code.

WUIC14-24

WUIC15-24

IWUIC: 501.3, ICC Chapter 07 (New)

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

501.3 Fire-resistance-rated construction.
Where this code requires 1-hour *fire-resistance-rated construction*, the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263.

Exceptions:

1. The fire-resistance rating of building elements, components or assemblies based on the prescriptive designs prescribed in Section 721 of the International Building Code.
2. The fire-resistance rating of building elements, components or assemblies based on the calculation procedures in accordance with Section 722 of the International Building Code.
3. The fire-resistance rating of log wall construction shall be calculated in accordance with the provisions of Section 303 of ICC 400.

Add new standard(s) as follows:

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

400-2022	Standard on the Design and Construction of Log Structures

Staff Analysis: The proposed referenced standard, ***Standard on the Design and Construction of Log Structures (ICC 400-2022)***, is currently referenced in the ***IBC***.

Reason: This code change simply intends to provide more clarity on fire-performance of log wall construction by requiring the fire-resistance rating of log wall construction to be determined in accordance with ICC 400- Standard for the Design and Construction of Log Structures.

Fire-resistant rated construction is a concept by which to evaluate the fire performance of various assemblies that have been tested in accordance with ASTM E119 or UL263 fire tests [2, 3]. Notably, Section 501.3 includes two exceptions to testing in accordance with ASTM E119 or UL 263 by referring to sections 721 and 722 of the 2024 IBC [4]. These sections in the IBC provide prescriptive construction details and calculation methods to establish the fire resistance of a range of assemblies. However, log wall assemblies are not addressed in either of these sections of the IBC. Considering that the IWUIC references log wall construction in several locations, adding an exception referring to section 303 of ICC 400 will provide needed clarity for determining the fire-resistance rating of log wall construction.

In accordance with the definition provided in Chapter 2, "log wall construction" pertains to construction in which the exterior walls consist of solid wood members, and each of these members has a minimum horizontal dimension of at least 6 inches (152 mm). According to Section 303.2.1 of the ICC400, log wall construction with a minimum dimension of 6 inches can be equated to 1-hour fire-resistant rated construction. Referencing Section 303 of the ICC 400 is important as it validates that these assemblies can achieve a 1-hour fire-resistant rating. By referencing Section 303 of ICC 400, key information about the fire-resistant rating of columns and beams constructed with logs, a common practice in log wall construction, is also included.

Background:
Code change WUIC2-9/10, submitted by Marcelo M. Hirschler [5], added Section 501.3 Fire-resistance-rated construction to the 2012 IWUIC.

Code change WUIC1-13, submitted by Jason Thompson [6], added the Exceptions 1 and 2 to section 501.3 of 2015 IWUIC.

Bibliography:

2. ASTM E119-20, Standard test methods for fire tests of building construction and material.

3. ANSI/UL 263. (2011). Standard for Fire Tests of Building Construction and Materials.

4. International Code Council, 2024, International building code, ISBN: 978-1-955636-38-4. https://codes.iccsafe.org/content/ICC4002022P1

5. Marcelo M. Hirschler, GBH International, representing American Fire Safety Council, WUIC2–09/10

6. Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards, WUIC1-13

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal adds a reference to ICC 400 in Section 501.3 and provides to provide clarity to the code regarding log wall construction. ICC 400 is available to the public through the ICC website. This code change will not result any additional cost.

WUIC15-24

WUIC16-24

IWUIC: SECTION 202, 501.4 (New), 501.4.1 (New), 501.4.2 (New), 503.2.1, ASTM Chapter 07 (New)

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Delete without substitution:

~~**NONCOMBUSTIBLE.** As applied to building construction material means a material that, in the form in which it is used, is either one of the following:~~

1. ~~Material of which no part will ignite and burn when subjected to fire. Any material conforming to ASTM E136 shall be considered noncombustible within the meaning of this section.~~
2. ~~Material having a structural base of noncombustible material as defined in Item 1 above, with a surfacing material not over $^1/_8$ inch (3.2 mm) thick, which has a flame spread index of 50 or less. Flame spread index as used herein refers to a flame spread index obtained according to tests conducted as specified in ASTM E84 or UL 723.~~

~~"Noncombustible" does not apply to surface finish materials. Material required to be noncombustible for reduced clearances to flues, heating appliances or other sources of high temperature shall refer to material conforming to Item 1. No material shall be classified as noncombustible that is subject to increase in combustibility or flame spread index, beyond the limits herein established, through the effects of age, moisture or other atmospheric condition.~~

Add new text as follows:

501.4 Noncombustibility tests. The tests indicated in Section 501.4.1 shall serve as criteria for acceptance of building materials. The term noncombustible does not apply to the flame spread characteristics of interior finish or trim materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

501.4.1 Testing. Materials required to be noncombustible shall be tested in accordance with ASTM E136 and pass the test. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

501.4.2 Additional requirements. The term noncombustible does not apply to surface finish materials. Material required to be noncombustible for reduced clearances to flues, heating appliances or other sources of high temperature shall refer to material conforming to the requirements of ASTM E136.

Revise as follows:

503.2.1 Noncombustible material.
Material shall comply with the requirements for noncombustible materials in Section 501.4 ~~definition of *noncombustible* materials in Section 202~~.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

E2652-2018	Test Method for Assessing Combustibility of Materials Using a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C

Staff Analysis: The proposed referenced standard, ***Test Method for Assessing Combustibility of Materials Using a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C, 2022 (ASTM E2652-18)***, is currently referenced in the IBC.

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

It has been a recent practice in ICC codes that definitions should not contain requirements but just concepts. This proposal does exactly that.

This proposal deletes the definition of noncombustible from section 202 of the IWUIC and adds the exact requirements for noncombustibility from section 703 of the IBC into a new section. This makes the requirements for noncombustible materials consistent with those in the IBC (with the same language). Additionally, this proposal retains the added requirements from the IWUIC regarding surface finish materials and materials close to flues or heating appliances.

This proposal is also consistent with other ICC codes and with the requirements of ASTM E136. Note that materials can be noncombustible in accordance with ASTM E136 and yet exhibit some limited flaming.

This proposal also deletes a definition with requirements and incorporates the requirements into the section of the code that deals with Special Building Construction Regulations (Chapter 5) in the General section.This proposal also revises section 503.2.1 that sends the code user to section 202 for the “requirements” got noncombustible materials, now sending the user to the new section 501.4

Comment: Since neither “flues, heating appliances and sources of high temperature” nor “interior finish” are regulated by the IWUIC, a simpler solution would be not to add proposed new section 501.4.2.

See the following from other ICC codes.

1. The IBC does not have a definition for noncombustible material but section 703.3 states as shown below, which is exactly what this proposal does. It is based on
2. The IRC defines as follows: “NONCOMBUSTIBLE MATERIAL. A material that passes ASTM E136.”
3. The IFC does not have a definition.
4. The IMC defines as follows: “NONCOMBUSTIBLE MATERIAL. A material that passes ASTM E136.”

If a material is tested to ASTM E136 it will pass the test requirements even if it ignites (a bit) and has some burning and some mass loss (see the actual language below). Therefore, saying (as the IWUIC says now in item 1) that “no part will ignite or burn” is inconsistent with many materials that pass ASTM E136.

Two different pieces of equipment are used to pass ASTM E136. The first one (now called Option A) is the equipment that was always in ASTM E136. The second one, called Option B, uses the equipment in ASTM E2652 but the acceptance criteria are the same for both pieces of equipment and are in section 15 of ASTM E136. The language from the IBC and ASTM E136 is shown below.

IBC section 703 states as follows (and a change will be proposed to add the words "and pass the test"):

703.3 Noncombustibility tests. The tests indicated in Section 703.3.1 shall serve as criteria for acceptance of building materials as set forth in Sections 602.2, 602.3 and 602.4 in Types I, II, III and IV construction. The term “noncombustible” does not apply to the *flame spread* characteristics of *interior finish* or *trim* materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or *flame spread* beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

ASTM E136 states as follows when it requires that a material pass the test:15. Report

15.1 Report the material as passing the test if at least three of the four test specimens tested meet the individual test specimen criteria detailed either in 15.2 or in 15.3. The three individual test specimens do not need to meet the same individual test specimen criteria.

15.2 If the weight loss of an individual test specimen is 50 % or less, that test specimen is considered as having met the individual test specimen criteria when all the criteria in 15.2.1 through 15.2.3 are met:

15.2.1 For the duration of the test, the recorded temperature of the surface thermocouple does not rise more than 30 °C (54 °F) above the stabilized furnace temperature established at T2 prior to the test.

15.2.2 For the duration of the test, the recorded temperature of the interior thermocouple does not rise more than 30 °C (54 °F) above the stabilized furnace temperature established at T2 prior to the test.

15.2.3 There is no flaming from the test specimen after the first 30 s.

15.3 If the weight loss of an individual test specimen exceeds 50 %, that test specimen is considered as having met the individual test specimen criteria when all the criteria in 15.3.1 through 15.3.3 are met:

15.3.1 For the duration of the test, the recorded temperature of the surface thermocouple does not rise above the stabilized furnace temperature established at T2 prior to the test.

15.3.2 For the duration of the test, the recorded temperature of the interior thermocouple does not rise above the stabilized furnace temperature established at T2 prior to the test.

15.3.3 There is no flaming from the test specimen at any time during the test.

15.4 Report whether the apparatus for Option A or the apparatus for Option B was used.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not have any cost impact. It simply moves a definition with requirements into an appropriate section in the chapter that deals with materials.

WUIC16-24

WUIC17-24

IWUIC: 503.1, 503.2, 503.2.3, 503.2.4, 503.2.4.1, 503.2.4.2, 503.2.4.3, 503.2.4.3.1, 503.2.4.3.2, 503.2.4.3.3, 503.3 (New)

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

503.1 General. Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required to be ignition-resistant building materials shall comply with the requirements of Section 503.2. Materials required to be fire-retardant-treated wood roof coverings shall comply with the requirements of Section 503.3.

503.2 Ignition-resistant building material.
Ignition-resistant building materials shall comply with any one of the requirements in Section 503.2.1 through 503.2.3 ~~503.2.4~~.

~~**503.2.3 Fire-retardant-treated wood roof coverings.**~~
~~Roof assemblies containing fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code.*~~

~~**503.2.4**~~ **503.2.3 Ignition-resistant building material.**
Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^1/_8$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.3.1 through 503.2.3.3 ~~503.2.4.1 through 503.2.4.3~~.

> **Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

~~**503.2.4.1**~~ **503.2.3.1 Flame spread.**
The material shall exhibit a flame spread index not exceeding 25.

~~**503.2.4.2**~~ **503.2.3.2 Flame front.**
The material shall exhibit a flame front that does not progress more than 10 feet 6 inches (3200 mm) beyond the centerline of the burner at any time during the test.

~~**503.2.4.3**~~ **503.2.3.3 Weathering.**
Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. The materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in Sections 503.2.3.3.1 through 503.2.3.3.3 ~~503.2.4.3.1 through 503.2.4.3.3~~, as applicable to the materials and conditions of use.

~~**503.2.4.3.1**~~ **503.2.3.3.1 Evaluation requirements for weathering.**
Fire-retardant-treated wood, wood-plastic composite materials and plastic lumber materials shall be evaluated after weathering in accordance with Method A “Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing” in ASTM D2898.

~~**503.2.4.3.2**~~ **503.2.3.3.2 Wood-plastic composite materials.**
Wood-plastic composite materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first

testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D7032 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

~~503.2.4.3.3~~ 503.2.3.3.3 Plastic lumber materials.
Plastic lumber materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D6662 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

Add new text as follows:

503.3 Fire-retardant-treated wood roof coverings. Roof assemblies containing coverings comprised of fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

Reason: Fire-retardant-treated wood roof coverings are a different class of materials than the other ignition resistant building materials in section 503.2 since they cannot be used for exterior walls or exterior appendages and projections, but are intended explicitly for roofs. However, sections 504.5, 504.7, 505.5, and 505.7, all allow the use of “Ignition-resistant building materials in accordance with Section 503.2.” for those applications. That is incorrect. This change would not affect any requirement for fire-retardant-treated wood roof coverings, since they are not explicitly called for anywhere in the IWUIC.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is simply clarification. See also the proponent’s reason statement.

WUIC17-24

2024 International Wildland Urban Interface Code

Delete without substitution:

~~501.3 Fire-resistance-rated construction~~.
~~Where this code requires 1-hour *fire-resistance-rated construction* , the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263.~~

~~Exceptions:~~

1. ~~The fire-resistance rating of building elements, components or assemblies based on the prescriptive designs prescribed in Section 721 of the International Building Code.~~
2. ~~The fire-resistance rating of building elements, components or assemblies based on the calculation procedures in accordance with Section 722 of the International Building Code.~~

Revise as follows:

SECTION 503
~~IGNITION-RESISTANT~~ CONSTRUCTION AND ~~MATERIAL~~ <u>MATERIALS</u>

503.1 General.
Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required <u>for the ignition-resistant construction classes</u> ~~to be ignition-resistant materials~~ shall comply with the requirements of ~~Section 503.2~~<u>this section</u>.

503.2 Ignition-resistant building material.
Ignition-resistant building materials shall comply with any one of the requirements in Section 503.2.1 through 503.2.4.

503.2.1 Noncombustible material.
Material shall comply with the definition of *noncombustible* materials in Section 202.

503.2.2 Fire-retardant-treated wood.
Fire-retardant-treated wood shall be identified for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

503.2.3 Fire-retardant-treated wood roof coverings.
Roof assemblies containing fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

503.2.4 Ignition-resistant building material.
Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested

with a ripped or cut longitudinal gap of $^1/_8$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3.

Exception: Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

503.2.4.1 Flame spread.
The material shall exhibit a flame spread index not exceeding 25.

503.2.4.2 Flame front.
The material shall exhibit a flame front that does not progress more than 10 feet 6 inches (3200 mm) beyond the centerline of the burner at any time during the test.

503.2.4.3 Weathering.
Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. The materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in Sections 503.2.4.3.1 through 503.2.4.3.3, as applicable to the materials and conditions of use.

503.2.4.3.1 Evaluation requirements for weathering.
Fire-retardant-treated wood, wood-plastic composite materials and plastic lumber materials shall be evaluated after weathering in accordance with Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D2898.

503.2.4.3.2 Wood-plastic composite materials.
Wood-plastic composite materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D7032 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

503.2.4.3.3 Plastic lumber materials.
Plastic lumber materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D6662 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

Add new text as follows:

503.3 Fire-resistance-rated construction. Where this code requires 1-hour fire-resistance-rated construction, the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263 for exposure from the exterior side of the assembly

Exceptions:

1.	The fire-resistance rating of building elements, components or assemblies based on the prescriptive designs prescribed in Section 721 of the *International Building Code* for exposure from the exterior side of the assembly.
2.	The fire-resistance rating of building elements, components or assemblies based on the calculation procedures in accordance with Section 722 of the *International Building Code* for exposure from the exterior side of the assembly.

Reason: This proposal relocates a construction method to a more appropriate section and refines the code language to ensure its seamless integration in the new location. In the 2024 IWUIC, Section 501.3, onwhich addresses the qualification of fire-resistance-rated construction, is located in Section 501, the general section of Chapter 5. Typically, these general sections focus primarily on the scope and purpose of each chapter. Listing construction methods within Section 501 is not consistent with the other general sections of the IWUIC. For clarification purposes, this proposal relocates Section 501.3 to new Section 503.3. Section 503 is specifically dedicated to matters related to construction and materials. The title of section 503 is proposed to be changed from ignition-resistant construction and material to construction and material to construction and materials. The charging paragraph in Section 503.1 has been refined to ensure that the relocation of Section 501.3 to new Section 503.3 will be correlated with this relocation.

Background

In 2012, Section 501.3 was introduced to IWUIC as part of WUIC2-9/10 [1]. Then, in 2015, exceptions 1 and 2 were incorporated into this section via a proposal brought forth by WUIC1-13 [2].

Bibliography:

1. Marcelo M. Hirschler, GBH International, representing American Fire Safety Council, WUIC2–09/10, https://www.iccsafe.org/wp-content/uploads/IWUIC1.pdf

2. Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards, WUIC1-13, https://www.iccsafe.org/wp-content/uploads/11-IWUIC.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is strictly a clarification. Relocating existing Section 501.3 to new Section 503.3 pertaining to construction and material will not result in a technical changes to the code. As a result, the proposal will not have an impact on construction costs, either positively or negatively.

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 503
~~IGNITION-RESISTANT~~ CONSTRUCTION AND ~~MATERIAL~~ MATERIALS

503.1 General.
Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required for ignition-resistant construction classes ~~to be ignition-resistant materials~~ shall comply with the requirements of ~~Section 503.2~~ this section.

Delete without substitution:

~~**503.2 Ignition-resistant building material.**~~
~~Ignition-resistant building materials shall comply with any one of the requirements in Section 503.2.1 through 503.2.4.~~

Revise as follows:

~~503.2.1~~ 503.2 Noncombustible material.
Material shall comply with the definition of *noncombustible* materials in Section 202.

~~503.2.2~~ 503.3 Fire-retardant-treated wood.
Fire-retardant-treated wood shall be identified for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

~~503.2.3~~ 503.4 Fire-retardant-treated wood roof coverings.
Roof assemblies containing fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

~~503.2.4~~ 503.5 Ignition-resistant building material.
Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^1/_8$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3.

> **Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

~~503.2.4.1~~ 503.5.1 Flame spread.
The material shall exhibit a flame spread index not exceeding 25.

~~503.2.4.2~~ 503.5.2 Flame front.
The material shall exhibit a flame front that does not progress more than 10 feet 6 inches (3200 mm) beyond the centerline of the burner at any time during the test.

~~503.2.4.3~~ 503.5.3 Weathering.
Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. The materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in Sections 503.2.4.3.1 through 503.2.4.3.3, as applicable to the materials and conditions of use.

~~503.2.4.3.1~~ 503.5.3.1 Evaluation requirements for weathering.
Fire-retardant-treated wood, wood-plastic composite materials and plastic lumber materials shall be evaluated after weathering in accordance with Method A “Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing” in ASTM D2898.

~~503.2.4.3.2~~ 503.5.3.2 Wood-plastic composite materials.
Wood-plastic composite materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D7032 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

~~503.2.4.3.3~~ 503.5.3.3 Plastic lumber materials.
Plastic lumber materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D6662 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

Reason: This code change is intended to provide some clarification on the types of materials permitted for the various ignition resistant construction classes. The current language in Section 503.2 is problematic for the following reasons:

1. Inconsistent usage of the term "ignition-resistant building material":

The term "Ignition-resistant building material" is used both for section and subsection titles, causing confusion when the code refers to materials with ignition-resistant properties. For instance, "Ignition-resistant material" is mentioned twice in Section 504.3 and once in Section 505.5 without specific references to any section. Given the context and the extensive list of materials in each section, it is apparent that the code refers to Section 503.2.4. However, in all other instances with a similar situation, Section 503.2 is referenced for ignition-resistant materials, which leads to confusion.

2. Inclusion of Noncombustible Materials Under "Ignition-resistant building material":

From an ignition perspective, materials can be categorized into two distinct groups: combustible vs noncombustible materials. Combining these two groups under a single category and labeling them all as "Ignition-resistant building material" appears to compromise the classification of noncombustible building materials. According to definitions provided in Section 202 of 2024 IWUIC and Section X1.2 of ASTM E136 [1], noncombustible materials are material of which no part "will ignite" and burn when subjected to fire. Section 202 also defines Ignition-resistant building material. Although the definition doesn't explicitly say the material “can ignite” and burn, it is implied that these materials can ignite and burn.

3. Redundancy in Reference to Fire-retardant-treated Wood Material:

Fire-retardant-treated wood material has a well-established definition provided in Section 2303.2 of the IBC which is also referenced in Section 503.2.2 for Fire-retardant-treated wood. Additionally, the IWUI code references Section 2303.2 of the IBC 18 times. In many of these cases, ignition-resistant building material is presented as an alternative according to the code. Merging these two types of materials and referencing Section 503.2 for ignition-resistant building material would introduce redundancy in the code. Fire-retardant-treated wood has had a defined status in the IBC since 2003, primarily related to wood products impregnated with chemicals, whereas the definition of ignition-resistant building materials was introduced only in IWUIC since 2009 and pertains to composite materials. They should be maintained as separate categories.

4. Discrepancy Between Section 503.2.3 and definition of building materials:

Section 503.2.3 references "fire-retardant-treated wood roof covering" as a roof "assembly" comprising fire-retardant-treated wood shingles and shakes. It also requires compliance with the International Building Code Section 1505.6 and classification as Class A roof assemblies, as mandated in Section 1505.2. This assembly concept conflicts with the definition of building materials.

The proposed language changes do not introduce any technical alterations but rather tackle the listed concerns by recommending individual sections for each one of these materials and refining the code language to ensure its smooth incorporation into the new format.

Bibliography:

1. ASTM Standard E136, 2022, " Standard Test Method for Assessing Combustibility of Materials Using a Vertical Tube Furnace at 750 °C," ASTM International, DOI: 10.1520/E0136-22, www.astm.org.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is administrative cleanup language and does not propose technical alterations to the code provisions. As a result, the proposal will not have an impact on construction costs, either positively or negatively.

WUIC19-24

WUIC20-24

IWUIC: TABLE 503.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION CLASSIFICATION[~~a~~]

~~1.5 × Conforming~~150% or more of distance required in Table 603.2	~~Not Required~~ NR	~~IR~~Class 3	~~IR~~Class 3	~~IR~~Class 2	~~IR~~Class 2	~~IR~~Class 1

NP = Not Permitted; NR = Not Required; Class 1 = Ignition-resistant construction in accordance with Section 504; Class 2 = Ignition-resistant construction in accordance with Section 505; Class 3 = Ignition-resistant construction in accordance with Section 506.

a. ~~Access shall be in accordance with Section 403.~~ Distance of defensible space provided on all sides of structure as required in Table 603.2.

b. ~~Subdivisions shall have a conforming water supply in accordance with Section 402.1.~~ A conforming water supply complying with Section 404.

~~IR 1 = Ignition-resistant construction in accordance with Section 504.~~

~~IR 2 = Ignition-resistant construction in accordance with Section 505.~~

~~IR 3 = Ignition-resistant construction in accordance with Section 506.~~

~~N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.~~

c. ~~Conformance based on Section 603.~~ A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

d. ~~Conformance based on Section 404.~~ In addition to Class 1 construction, the exterior walls shall comply with any of the following:

1. Exterior walls having a fire-resistance rating of 1 hour or more with a noncombustible exterior wall covering.
2. Exterior walls constructed of heavy timber members.
3. Exterior walls of log wall construction.

~~e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.~~

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC

Website

This proposal intends to clarify the application of Table 503.1.

IR 1 through IR 3 are replaced with Class 1 through Class 3. This is consistent with the terminology in the charging section, Section 503.1, and Sections 504, 505 and 506.

Nonconforming and conforming under defensible space is clarified as to what the conformance is referencing—the width of defensible space, or the distance from the structure.

The “IR 1 N.C.” term is replaced with “rated”. Footnote d specifies that rated construction consists of Class 1 ignition-resistant construction and the protection of the exterior walls is increased to one of the 3 options in Footnote d.

For additional clarification, the designation “NP” is intended to mean that any construction in areas with these risk factors is not permitted.

The designation “NR” is intended to mean that ignition resistant construction is not required for exterior walls. All other applicable requirements still apply.

There are three separate code changes dealing with IWUIC Table 503.1. Attached PDF shows the end goal for Table 503.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is an editorial clairification that does not impact cost. See also the proponent’s reason statement.

WUIC20-24

WUIC21-24

IWUIC: TABLE 503.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION[a]

DEFENSIBLE SPACE[c]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply[b]		Water Supply[b]		Water Supply[b]	
	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]
Nonconforming	IR 2	IR 1	IR 1	IR 1 N.C.	IR 1 N.C.	Not Permitted
Conforming	IR 3	IR 2	IR 2	IR 1	IR 1	IR 1 N.C.
1.5 × Conforming[f]	~~Not Required~~ IR 3	IR 3	IR 3	IR 2	IR 2	IR 1

a. Access shall be in accordance with Section 403.

b. Subdivisions shall have a conforming water supply in accordance with Section 402.1.

IR 1 = Ignition-resistant construction in accordance with Section 504.

IR 2 = Ignition-resistant construction in accordance with Section 505.

IR 3 = Ignition-resistant construction in accordance with Section 506.

N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.

c. Conformance based on Section 603.

d. Conformance based on Section 404.

e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

f In accordance with an *approved* Vegetation Management Plan in accordance with Section 502.2

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

This proposal changes the requirement for ignition-resistant construction where the site has 1.5x required defensible space, a conforming water supply in a Moderate Hazard zone from “not required” to a requirement for IR3 construction. The IWUIC has been updated over the past several cycles to enhance the requirements for ignition-resistant construction to achieve a minimum level of building fire resistance/endurance from WUI fires. The Table needs to be updated to require a minimum level of ignition-resistance construction for all conditions and not simply exempt such minimum requirements based on a conforming water supply, as is currently the IWUIC allowance.

Where a dwelling is located in the Moderate Hazard area, the “not required” currently means it has no ignition-resistant construction.

There are three separate code changes dealing with IWUIC Table 503.1. The PDF attached shows the end goal for Table 503.1.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The cost for construction in a Moderate Hazard Fire Severity zone with a conforming water supply provided with the 1.5x required defensible space is estimated to add approximately 1% to the total cost of construction materials for the building.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal will increase the cost of construction by the cost of providing IR 3 construction in a moderate hazard zone, but only for structures which would have benefited from providing the 150% distance.

WUIC21-24

WUIC22-24

IWUIC: 402.2.2, 404.1, 503.1, TABLE 503.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

402.2.2 Water supply.
Individual structures hereafter constructed or relocated into or within *wildland-urban interface areas* shall be provided with a ~~conforming~~ water supply in accordance with Section 404.

Exception ~~Exceptions~~:

~~1.~~ ~~Structures constructed to meet the requirements for the class of ignition-resistant construction specified in Table 503.1 for a nonconforming water supply.~~

~~2~~1. Buildings containing only private garages, carports, sheds and agricultural buildings with a floor area of not more than 600 square feet (56 m^2).

404.1 General.
~~Where provided in order to qualify as a conforming water supply for the purpose of Table 503.1 or as required for new subdivisions in accordance with Section 402.1.2, an~~ An *approved* water source shall have an adequate water supply for the use of the fire protection service to protect buildings and structures from exterior fire sources or to suppress structure fires within the *wildland-urban interface area* of the jurisdiction in accordance with this section.

Exception: Buildings containing only private garages, carports, sheds and agricultural buildings with a floor area of not more than 600 square feet (56 m^2).

503.1 General.
Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required to be ignition-resistant building materials shall comply with the requirements of Section 503.2.

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION~~[a]~~

Portions of table not shown remain unchanged.

DEFENSIBLE SPACE~~[e]~~[a]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	~~Water Supply[b]~~		~~Water Supply[b]~~		Water Supply[b]	
	~~Conforming[d]~~	~~Nonconforming[e]~~	~~Conforming[d]~~	~~Nonconforming[e]~~	~~Conforming[d]~~	~~Nonconforming[e]~~

~~c~~a. Conformance based on Section 603.

~~d.~~ ~~Conformance based on Section 404.~~

~~e.~~ ~~A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.~~

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

The footnote reference to Section 403 (Access) is removed as not necessary. Compliance with Section 403 is required and a footnote "pointer" is redundant.

The footnote reference to Section 404 (Water Supply) is deleted in accordance with deletion of the Water Supply references in the TableWater supply in accordance with Section 404 should be provided for all new construction. As a tool for fire suppression and structure hazard mitigation during a WUI fire, firefighters may not be available to protect structures, so in that instance water supply would not reduce the fire risks or be an effective mitigation. Removing water supply puts the emphasis for protection of structures from wildland fire onto the constriction of the building to be ignition resistant and the defensible space.

There are three separate code changes dealing with IWUIC Table 503.1. The PDF attached shows the end goal for Table 503.1.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Chapter 5 and Table 503.1 are the requirements for newly built structures and subdivisions in areas regulated by the IWUIC. Accordingly, a compliant water supply should always be provided or addressed through approved alternative methods or materials as allowed by the code. The application of this Table as currently written allows for a reduction in required IR Construction materials when the water supply complies with what is already required by this code,

The cost of construction will be increased based on this proposal as compared to the cost reduction (allowance) that is currently provided. That cost will be based on the difference of IR 3 construction vs. IR 2 or IR 2 vs IR1.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of construction will be increased based on this proposal as compared to the cost reduction (allowance) that is currently provided. That cost will be based on the difference of IR 3 construction vs. IR 2 or IR 2 vs IR1. That cost would typically not exceed 1-2% of overall construction cost, but is variable based on the size of the building and the choice of building materials chosen to comply.

WUIC22-24

WUIC23-24

IWUIC: TABLE 503.1

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION[a]

DEFENSIBLE SPACE[c]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply[b]		Water Supply[b]		Water Supply[b]	
	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]
Nonconforming	IR 2	IR 1	IR 1	IR 1 N.C.	IR 1 N.C.	Not Permitted
Conforming	IR 3	IR 2	IR 2	IR 1	IR 1	IR 1 N.C.
~~1.5 × Conforming~~	~~Not Required~~	~~IR 3~~	~~IR 3~~	~~IR 2~~	~~IR 2~~	~~IR 1~~

a. Access shall be in accordance with Section 403.

b. Subdivisions shall have a conforming water supply in accordance with Section 402.1.

IR 1 = Ignition-resistant construction in accordance with Section 504.

IR 2 = Ignition-resistant construction in accordance with Section 505.

IR 3 = Ignition-resistant construction in accordance with Section 506.

N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.

c. Conformance based on Section 603.

d. Conformance based on Section 404.

e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

Reason: This proposal eliminates the last row in Table 503.1. The deleted row only applies where a structure provides a defensible space distance that is 150% or more of a conforming defensible space. Section 503.1 states that the requirements in Table 503.1 only apply to new construction or new structures. Therefore, existing structures which may not have any ignition-resistant construction are not affected by this table.

But for new construction, this provision is at minimum vague and confusing; and then it creates a situation which is nearly impossible to properly enforce for the life of the structure. The provision in the table is based on 150% times a conforming defensible space, and Footnote c directs the user to Section 603. However, this is not clear whether the provision applies to defensible space being 150% of the width required in Table 603.2; or if it means the trees within the defensible space are separated 150% of the distance required in Section 603.2.2; or both.

As far as enforcing this provision for the life of the structure, consider Structure X in the WUI. Structure X is located in the Moderate Hazard area with a conforming water supply. Structure X provides a 150% increase in the distances required in both Table 603.2 and Section 603.2.2, so at the time of construction ignition-resistant building materials are not required. This design complies with Table 503.1 at the time of construction. Three years later, the code official is conducting an inspection of the area for maintenance of the defensible space. The code official will not be aware of the fact that the structure was required to maintain a 45' defensible space, so the code official will require the 30' defensible space requirement similar to all other structures in the Moderate Hazard area.

The only way to determine whether an owner must provide 150% of defensible space is to go back to the original plans and research the applicable code at the time of construction, then determine if the construction of the structure complies or not. While this is a valid avenue for enforcement, we all know that this amount of effort will not be put into every inspection. In fact, I would not be surprised if it is not put into **any** inspection. Most likely, the inspector will simply require the conforming distance as he/she did on every adjacent neighbor. In this fashion, it is an easier inspection; it looks acceptable; and the inspector moves on to next property.

Each year during the spring and early summer, a single WUI inspector can perform hundreds of inspections daily. If the information for a specific lot is not readily available, the provision will be lost. In doing so, the structure now should have been constructed of Class 3 ignition-resistant construction.

Additionally, Structure A is located in the Moderate Hazard area, but was allowed to be constructed with no ignition-resistant construction, not even a fire-resistance-rated roof. The rating of the roof covering is required for Classes 1, 2 and 3 ignition-resistant construction, but Dwelling A did not have to comply since 150% of the defensible space was provided. It is a frequent occurrence that structures are ignited ahead of the fire front by burning embers pushed ahead of the fire and landing on the rooftop. But Dwelling A does not have a rated roof. The 45' defensible space protects from radiant heat and direct flame impingement. The roof is not protected, and Dwelling A is lost when the roof ignites from burning embers.

Some may argue that Dwelling A will be saved because there is a conforming water supply. However, even the best water supply is of no benefit when there are no firefighters available to utilize it. When there are multiple structures needing protection, the Incident Commander will decide where to deploy the firefighters because there are more structures than firefighters and fire engines. Structure A has a 45' defensible space, while others only have the required 30' distance. It is likely that it will be decided that Structure A is less vulnerable because of the increased defensible space and firefighters will be sent to other structures. The water supply does not improve the survivability of Structure A at all in this case.

The concept to allow credit for 150% of the defensible space is flawed and difficult to maintain throughout the life of the structure. The entire row and this allowance should be removed from the code.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal will increase the cost of construction, but only for structures which would have benefited from providing the 150% increase in the defensible space requirements. However, the construction increase will be offset by the one-third reduction in labor for annual pruning and trimming of the vegetation within the defensible space.

Estimated Immediate Cost Impact Justification (methodology and variables):

Utilizing ignition-resistant construction materials will increase the construction cost for the exterior walls, deck and roof by 15%.

2024 International Wildland Urban Interface Code

Revise as follows:

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION[a]

DEFENSIBLE SPACE[c]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply[b]		Water Supply[b]		Water Supply[b]	
	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]
Nonconforming	IR 2	IR 1	IR 1	IR 1 N.C.	IR 1 N.C.	Not Permitted
Conforming	IR 3	IR 2	IR 2	IR 1	IR 1	IR 1 N.C.
1.5 × Conforming	Not Required	IR 3	IR 3	IR 2	IR 2	IR 1

a. Access shall be in accordance with Section 403.

b. Subdivisions shall have a conforming water supply in accordance with Section 402.1.

IR 1 = Ignition-resistant construction in accordance with Section 504.

IR 2 = Ignition-resistant construction in accordance with Section 505.

IR 3 = Ignition-resistant construction in accordance with Section 506.

N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour on the exterior and the exterior surfaces of such walls shall be noncombustible. ~~Usage of log wall construction is allowed.~~

c. Conformance based on Section 603.

d. Conformance based on Section 404.

e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

Reason: The intent of this proposal is to provide clarity regarding Note b of Table 503.1 to prevent potential misinterpretation.

New text is proposed to be added to clarify that the required 1-hour fire-resistance rating (FRR) specified in Note b must be applied on the exterior side of the wall assembly. This is consistent with the language in Section 504.5 (IR1) and Section 505.5 (IR2) and will provide consistency across instances where a 1-hour FRR is used to protect exterior walls.

The second proposed change intends to clarify the use of log wall construction in Note b. In extreme wildfire hazard condition, where defensible space is nonconforming, Table 503.1 neccesiates both a 1-hour FRR "and" a noncombustible exterior surface for exterior walls. Nonconforming defensible space denotes a situation where, in addition to exposure to embers and radiant heat, the structure faces a direct flame exposure risk from adjacent fuel loads during a wildfire. In such instances, the code mandates that wall assemblies fulfill two sets of criteria:

1. A 1-hour fire-resistant rating to shield exterior walls against fire impingement.
2. A noncombustible exterior surface to impede the spread of fire on the external wall surfaces.

Acknowledging that log wall construction, as defined, can attain a 1-hour fire resistance rating, this proposal seeks to make clear that "all" wall assemblies meeting the 1-hour fire-resistant rating, including those employing log wall construction, are acceptable, if they are protected by noncombustible exterior siding.

Construction incorporating heavy timber elements boasts a rich global history.

Figure 1 illustrates five types of construction typical of such elements [1]:

1. Log wall construction,
2. Heavy timber construction,
3. Post and beam construction,
4. Panelized construction, and,
5. Hybrid construction.

Log wall construction historically originated in the northern European region where a Nordic climate, characterized by cold, humid winters and mild, humid summers, made log wall construction desireable. Over time, advancements in the wood industry and environmental considerations led to the introduction of engineered wood products like glue laminated timber (Glulam), laminated veneer lumber (LVL), and cross laminated timber (CLT). This marked a shift from traditional heavy timber and log wall construction to contemporary post and beam, panelized construction, and hybrid construction. Consequently, log wall construction is now primarily practiced in wildland areas of United States facing varying degrees of wildfire hazard. Numerous studies conclude that heavy timber members, including logs thicker than 6 inches, are inherently fire-resistant and can withstand fires by charring [1]. However, concerns exist about the safety of these combustible materials regarding flame spread on their exterior surfaces. Flame spread on the exterior surfaces of combustible materials, including different wood species, poses a risk of fire spreading to other parts of buildings at varying rates. The requirement for a noncombustible exterior surface in Table 503.1 for IR1 N.C. eliminates the possibility of flame spread on exterior walls. The International Building Code (IBC) also addresses this concern and mandates noncombustible exterior protection in sections 602.4.1 through 602.4.4 for all Type IV buildings (A, B, C, and HT) constructed with heavy timber members, as shown in Figure 2.

Log wall construction

Heavy timber construction

Post and Beam construction

Panelized construction

Hybrid construction

Figure 1. Different types of construction with heavy timber members [1].

Numerous reports of fire incidents around the country confirm the flame spread risk on the exterior surface of log wall construction.The 2013 IBHS post-fire investigation on a fire that occurred in Sevier County, Tennessee with moderate fire hazard severity revealed valuable information on fire characteristics of log wall construction [2]. In this fire incident, the average side-to-side cabin spacing (of those measured on-site and exposed to fire conditions) was 32 feet. While the report states that the buildings observed were not constructed in accordance with WUI requirements, Figure 3 clearly shows how fire can spread quickly on the exterior of log wall construction.

602.4.1 Type IV-A. Building elements in Type IV-A construction shall be protected in accordance with Sections 602.4.1.1 through 602.4.1.6. The required fire resistance rating of noncombustible elements and protected mass timber elements shall be determined in accordance with Section 703.2.

602.4.1.1 Exterior protection. The outside face of exterior walls of mass timber construction shall be protected with noncombustible protection with a minimum assigned time of 40 minutes, as specified in Table 722.7.1(1). Components of the exterior wall covering shall be of noncombustible material except water-resistive barriers having a peak heat release rate of less than 150kW/m$_2$, a total heat release of less than 20 MJ/m$_2$ and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m$_2$.

602.4.2 Type IV-B. Building elements in Type IV-B construction shall be protected in accordance with Sections 602.4.2.1 through 602.4.2.6. The required fire resistance rating of noncombustible elements or mass timber elements shall be determined in accordance with Section 703.2.

602.4.2.1 Exterior protection. The outside face of exterior walls of mass timber construction shall be protected with noncombustible protection with a minimum assigned time of 40 minutes, as specified in Table 722.7.1(1). Components of the exterior wall covering shall be of noncombustible material except water-resistive barriers having a peak heat release rate of less than 150kW/m2, a total heat release of less than 20 MJ/m2 and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354, and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m2.

602.4.3 Type IV-C. Building elements in Type IV-C construction shall be protected in accordance with Sections 602.4.3.1 through 602.4.3.6. The required fire resistance rating of building elements shall be determined in accordance with Section 703.2.

602.4.3.1 Exterior protection. The exterior side of walls of combustible construction shall be protected with noncombustible protection with a minimum assigned time of 40 minutes, as determined in Table 722.7.1(1). Components of the exterior wall covering shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150 kW/m$_2$, a total heat release of less than 20 MJ/m$_2$ and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m$_2$.

602.4.4 Type IV-HT. Type IV-HT (Heavy Timber) construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated heavy timber or structural composite lumber (SCL), without concealed spaces or with concealed spaces complying with Section 602.4.4.3. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, SCL and cross-laminated timber (CLT) and the details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.4.1 or 602.4.4.2 shall be permitted. Interior walls and partitions not less than 1- hour fire-resistance rated or heavy timber conforming with Section 2304.11.2.2 shall be permitted.

Figure 2. IBC requirements for noncombustible protection of Type IV constructions.

According to the IBHS report, “combination of road and fire behavior characteristics created hazardous working conditions for firefighters due to the absence of escape routes, safety zones, and defensible space around buildings. At times, firefighters found themselves in situations where buildings were simply too hazardous to protect and had to be abandoned for their own personal safety.”

Figure 3. Two sequence photos taken by firefighters showing the growth of the fire at a cabin. Photo d has been taken 6 minutes after photo a. Photo credit: Chris Knutsen, Training Captain, Pigeon Forge Fire Department.

Failure to specify that the exterior surface of log wall construction must be noncombustible introduces an inconsistency with heavy timber construction. As currently written it is clear that the code requires heavy timber construction to have a 1-hour fire resistance rating and a noncombustible exterior surface. An incorrect interpretation of Note b in Table 503.1 could imply that log wall construction doesn't require a noncombustible exterior surface. This would be in conflict with how heavy timber (HT) construction is treated.

Fire incident reports indicate that log wall construction does not provide more resistance against fire spread and flame propagation than other heavy timber members such as Glulam beams and CLT panels. It is also clear that log wall construction does not perform better during a wildfire than other exterior wall assemblies that include noncombustible walls.

Based on current requirements in the IBC and by considering available reports on fire performance of heavy timber, mass timber and log wall construction, the proposed changes to Note b in Table 503.1 clarifies that all different construction methods including log wall construction are permitted if they are protected on the exterior side with a noncombustible surface.

Bibliography:

1. Milad Shabanian, 2020, *thermos-mechanical performance of dowelled connections in tall timber structures.* PhD thesis, University of North Carolina at Charlotte.

2. Stephen Quarles, Leon Konz (2016), *Black bear cub fire: March 17, 2013*, Insurance Institute for Business & Home Safety, https://ibhs.org/wp-content/uploads/member_docs/Black-Bear-Cub-Fire-Report_IBHS.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is administrative cleanup language, with the sole purpose of enhancing code clarity. As a result, the proposal will not have an impact on construction costs, either positively or negatively.

WUIC24-24

WUIC25-24

IWUIC: 503.2.2

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

503.2.2 Fire-retardant-treated wood.
Fire-retardant-treated wood shall be labeled ~~identified~~ for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

Reason: This proposal makes a simple change. Chapter 5 refers in some instances to fire-retardant-treated wood as having to be labeled (sections 504.5 and 505.5) and in some instances as having to be identified (sections 503.2.2, 504.7 and 505.7). This proposal simply provides consistency and changes so that all sections state "labeled". Other proposals deal with sections 504.7 and 505.7.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Provides consistency and does not effext cost in any way.

WUIC25-24

WUIC26-24

IWUIC: 503.2.4

Proponents: David Bueche, Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Wildland Urban Interface Code

Revise as follows:

503.2.4 Ignition-resistant building material.
Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^{1}/_{8}$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3. <u>The use of paints, coating, stains, or other surface treatments is not an approved method of protection as required in this section.</u>

> **Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

Reason: Efforts are being made by manufacturers seeking approval for painted, coated, stains, or other surface-treated wood that require continuous maintenance in lieu of ignition-resistant building materials. This proposed addition will clarify that paints, coating, stains, and other types of products with vulnerable surface coatings are not approved for use as ignition-resistant building materials in the wildland-urban interface (WUI).

This language already exists in the International Building Code in Section 2303.2.2 for fire-retardant-treated wood (FRTW), which is one of the categories of ignition-resistant building materials in IWUIC (503.2.2). It is also in the 2021 IRC, Section R802.1.5.2. This language is in NFPA 1140 Standard for Wildland Fire Protection for FRTW and is also in Chapters 7A and 23 of the California Building Code.

Finally, note that the required testing referenced in 503.2#1 would require ignition-resistant building materials to undergo the same testing as FRTW.

Adding this proposed language to 503.2 adds clarity and conformity to codes affecting WUI communities and ensures that any ignition-resistant material will perform as well as FRTW.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code is silent on use of coatings and clarification is important.

WUIC26-24

WUIC27-24

IWUIC: SECTION 202 (New), 504.2, 504.2.1 (New), 504.8, 505.2, 505.2.1 (New), 505.8, 506.2, 506.2.1 (New), 506.5 (New), NFPA (New), UL Chapter 07 (New)

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Add new definition as follows:

EXTERIOR GLAZED DOOR. An operable opening in the building envelope that contains fixed glazing.

Revise as follows:

504.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with a Class A rating when tested in accordance with ASTM E108 or UL 790. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be fire-stopped to preclude entry of flames or embers or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Exceptions:

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

Add new text as follows:

504.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 504.8.

Revise as follows:

504.8 Exterior glazing.
Exterior windows, window walls and *exterior glazed doors* ~~glazed door~~ having a glazed area of 25 percent or greater of the door area, windows within exterior doors, and skylights shall be ~~tempered glass,~~ one of the following:
1. Multilayered ~~*multilayered*~~ *glazed panels* containing at least one tempered pane or dome~~,~~; or
2. Glass ~~glass~~ block units; or
3. Have ~~have~~ a minimum fire protection rating of ~~not less than~~ 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test..

505.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with not less than a Class A rating when tested in accordance with ASTM E108 or UL 790, or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be fire-stopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Add new text as follows:

505.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 505.8.

Revise as follows:

505.8 Exterior glazing.
Exterior windows, window walls and ~~glazed doors~~ *exterior glazed doors* having 25 percent or greater of the door area, windows within exterior doors, and skylights shall be ~~tempered glass,~~ one of the following:
1. *Multilayered* ~~*multilayered*~~ *glazed panels* *containing at least one tempered panel or dome*~~,~~ ; or
2. Glass ~~glass~~ block units; or
3. Have ~~have~~ a fire protection rating of ~~not less than~~ 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test..

506.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with not less than a Class B rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be fire-stopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Add new text as follows:

506.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 506.5.

506.5 Exterior Glazing. Exterior windows, window walls and e*xterior glazed doors* having a glazed area of 25 percent or greater of the door area, windows within exterior doors, and skylights shall be one of the following:

1. *Multilayered glazed panels* contain at least one tempered pane; or
2. Glass block units; or
3. Have a minimum fire protection rating of 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

257-2022	Standard on Fire Test for Window and Glass Block Assemblies

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

9-2009	Fire Tests of Window Assemblies, with Revisions through March 2020

Staff Analysis: The proposed referenced standards, are currently referenced in the ***IBC***:

- ***Standard on Fire Test for Window and Glass Block Assemblies (NFPA 257-22)***
- ***Fire Tests of Window Assemblies--with Revisions through March 2020 (UL 9--2009)***

Reason: This proposal provides a definition for “exterior glazed door” to clearly explain this is an exterior door with fixed glazing, commonly referred to as a door lite. Within the Class fire-ignition requirements, the minimum percentage of glazing that would trigger certain requirements is then provided in the sections 504.8, 505.8 and 506.8. Fixed glazing relates to the glazing itself and does not imply that the door is not operable. Further, a glazed door includes various types of doors, including sliding glass doors, side hinged doors, or folding door systems.

In all WUI classes of construction, this proposed requires a least one pane of tempered glass, which has been shown to be effective in the performance to resist fire intrusion. It also adds the NFPA 257 and UL 9 when testing to the fire protection rating but for exempting the hose stream test, which is also exempted in the IBC. The markings to determine NFPA or UL compliance are found within the IBC. The proposal then adds the same exterior glazing requirements Class 3 WUI construction, which currently has no exterior glazing requirements.

The remaining editorial changes are intended to provide needed clarity to prevent misinterpretations of what is required. Those changes are as follows:

1. Adds a pointer under roof assembly for skylights, tubular daylighting devices and sloped glazing, in order to prevent any confusion that these products fall under roof assembly compliance.

2. Makes formatting edits to the exterior glazing sections so it is clear that one of the three options must be chosen.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: Increase

Estimated Immediate Cost Impact:

Eliminating the option of allowing single-pane tempered that has been in the IWUIC since 2003, will increase costs for manufacturers shifting to provide multilayered glazed panels with at least one tempered pane. Multilayered glazed panels are readily available in the industry and being installed to meet other code requirements. However, this proposal will increase the cost per lite of glass (minimum of on tempered pane); and, when that cost is aggregated to the overall cost of the window, it is estimated to be at least 20% more than annealed glass and the actual cost depends on the size and complexity of the fenestration project.

Further, multilayered glazed panels (i.e. insulating glazing), with at least one tempered pane is a makeup that is not designed for meeting full safety glazing requirements in hazardous locations. This new makeup for the IWUIC is available from only some manufacturers that have been meeting California Code requirements for the last five California code cycles.

The proposal provides for options to meet the exterior glazing requirements laid out. If the NFPA or UL testing option is chosen, there will be an increase in cost associated with this testing because it is not currently a common approach that manufacturers utilize.

Estimated Immediate Cost Impact Justification (methodology and variables):

For manufacturers who have not been manufacturing product for California requirements, the cost will be higher to comply with multilayered glazed panels with at least one tempered pane than for those manufacturers who have been producing this product at a greater rate for California compliance.

One of the options to meet the exterior glazing requirements will be an increase in cost for manufacturers to proceed with the testing to either the UL or NFPA standard; however, many may choose to utilize the other options that are currently in the IWUIC, eliminating that cost increase.

2024 International Wildland Urban Interface Code

Add new definition as follows:

GLAZED DOOR. Exterior door having a glazed area of 25 percent or greater of the area of the door.

Add new text as follows:

504.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 504.8

Revise as follows:

504.8 Exterior glazing.
Exterior windows, window walls and glazed doors, windows within exterior doors, and skylights shall be one of the following: ~~tempered glass, *multilayered glazed panels*, glass block or have a fire protection rating of not less than 20 minutes.~~

1. *Multilayered glazed panels* containing at least one tempered pane.
2. Glass block units.
3. Have a fire protection rating of not less than 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new text as follows:

505.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 505.8

Revise as follows:

505.8 Exterior glazing.
Exterior windows, window walls and *glazed doors*, windows within exterior doors, and skylights shall be one of the following: ~~tempered glass, *multilayered glazed panels*, glass block or have a fire protection rating of not less than 20 minutes.~~

1. *Multilayered glazed panels* containing at least one tempered pane.
2. Glass block units.
3. Have a fire protection rating of not less than 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new text as follows:

506.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 506.5.

506.5 Exterior glazing. Exterior windows, window walls and *glazed doors*, windows within exterior doors, and skylights shall be one of the following:

1. *Multilayered glazed panels* containing at least one tempered pane.

2. Glass block units.

3. Have a fire protection rating of not less than 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

257--22	Standard on Fire Test for Window and Glass Block Assemblies

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

9--2009	Fire Tests of Window Assemblies--with Revisions through March 2020

Staff Analysis: The proposed referenced standards, are currently referenced in the IBC:

- ***Standard on Fire Test for Window and Glass Block Assemblies (NFPA 257-22)***
- ***Fire Tests of Window Assemblies--with Revisions through March 2020 (UL 9--2009)***

Reason: This proposal adds a definition for a glazed door in order to provide needed clarity and consistency in what is considered a glazed door, for the purposes of the exterior glazing requirements found in Class 1 and 2, as well as the new Class 3 requirements being proposed. This definition stems from the California Code.

In Class 1 and 2 ignitition-resistant construction, this proposed change eliminates a single pane tempered glass, which has been shown to not be as effective in fire barrier performance. It also adds the NFPA 257 Standard on Fire Test for Window and Glass Block Assemblies and UL 9 Fire Tests of Window Assemblies Standard when testing to the fire protection rating, but for exempting the hose stream test that is included in both standards. The hose stream test is also exempted in section 716.2.5.3 of the IBC. The markings to determine NFPA or UL compliance are found within the IBC, as both of these standards are already referenced and utilized in the IBC.

The proposal then adds the same revised exterior glazing requirements for Class 1 and 2 to Class 3 ignitition-resistant construction, which currently has no exterior glazing requirements. These Class revisions stem from the California Building and Residential Code and requirements in their Wildland Urban Interface Chapter.

The remaining changes are intended to provide needed clarity to prevent misinterpretations of what is required. Those changes are as follows:

- Adds a new subsection under Class 1, 2 and 3 roof assembly sections for skylights, tubular daylighting devices and sloped glazing. This pointer is to prevent any confusion that these products fall under roof assembly compliance.
- Makes formatting edits to the exterior glazing sections so it is clear that ONE of the now three options must be chosen.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Eliminating the option of allowing single-pane tempered that has been in the IWUIC sine 2003, will increase the costs for manufacturers shifting to provide multilayered glazed panels with at least one tempered pane. However, multilayered glazed panels are readily available in the industry and being installed to meet other code requirements. This proposal will increase the cost per lite of glass (minimum of one tempered pane); and, when that cost is aggregated to the overall cost of the window, it is estimated to be at least 20% more than annealed glass and the actual cost depends on the size and complexity of the fenestration project.

Further, multilayered glazed panels (i.e. insulating glazing), with at least one tempered pane is a makeup that is not designed for meeting full safety glazing requirements in hazardous locations. This new makeup for the IWUIC is available from only some manufacturers that have been meeting California Code requirements for the last five California code cycles.

The proposal provides for options to meet the exterior glazing requirements laid out. If the NFPA standard or UL standard testing option is chosen, there will be an increase in cost associated with this testing because it is not currently a common approach that manufacturers utilize.

Estimated Immediate Cost Impact Justification (methodology and variables):

For manufacturers who have not been manufacturing product for California requirements, the cost will be higher to comply with multilayered glazed panels with at least one tempered pane than for those manufacturers who have been producing this product at a greater rate for California compliance.

One of the options to meet the exterior glazing requirements will be an increase in cost for manufacturers to proceed with the testing to either the UL 9 or NGPA 257 standard; however, many may choose to utilize the other options that are currently in the IWUIC, eliminating that cost increase.

WUIC28-24

WUIC29-24

IWUIC: 504.2.1, 505.2.1, 506.2.1

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.2.1 Roof valleys.
Where provided, valley flashings shall run the full length of the valley and be not less than 0.019 inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 or a *roof assembly* classified as Class A when tested in accordance with ASTM E108 or UL 790~~running the full length of the valley~~.

505.2.1 Roof valleys.
Where provided, valley flashings shall run the full length of the valley and be not less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 or a *roof assembly* classified as Class A when tested in accordance with ASTM E108 or UL 790 ~~running the full length of the valley~~.

506.2.1 Roof valleys.
Where provided, valley flashings shall run the full length of the valley and be not less than 0.019-inch (0.44 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 or a *roof assembly* classified as not less than Class B when tested in accordance with ASTM E108 or UL 790~~running the full length of the valley~~.

Reason: Currently, the IWUIC provides only one prescriptive option for constructing roof valleys. The existing prescriptive valley flashing requirement is restrictive and may present long-term issues with function of the installed valley due to abrasion of the corrosion resistant valley metal by granules on the underlying D3909 sheet. The proposal retains the existing option and introduces a performance option which permits a valley to be constructed with an ASTM E108 or UL 790 classified roof assembly equivalent to that required for the roof assembly used in the field of the roof, based on the ignition resistant construction class.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 or less. The proposal may reduce initial cost of construction in some cases by providing additional options for valley construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Analogy method. Availability of additional options supports choice.

Estimated Life Cycle Cost Impact:

No change in life cycle cost is anticipated.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Analogy method. Service life of the alternative valley is expected to equal or exceed that of the existing prescriptive option.

WUIC29-24

WUIC30-24

IWUIC: 504.2, 504.2.2 (New), 505.2, 505.2.2 (New), 506.2, 506.2.2 (New)

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with a Class A rating when tested in accordance with ASTM E108 or UL 790. ~~For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~

Exceptions:

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* ~~also~~ include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

Add new text as follows:

504.2.2 Flame and ember protection at eaves. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall resist flames and embers by one or more of the following methods:

1. Firestopping of the space between the *roof covering* and the *roof deck.*
2. Installation of one layer of 72 pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 over the combustible *roof deck*.

Revise as follows:

505.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with not less than a Class A rating when tested in accordance with ASTM E108 or UL 790, or an *approved noncombustible roof covering*. ~~For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~

Add new text as follows:

505.2.2 Flame and ember protection at eaves. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall resist flames and embers by one or more of the following methods:

1. Firestopping of the space between the *roof covering* and the *roof deck.*
2. Installation of one layer of cap sheet complying with ASTM D3909 over the combustible *roof deck*.

Revise as follows:

506.2 Roof assembly.

Roofs shall have a *roof assembly* that complies with not less than a Class B rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof covering*. ~~For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~

Add new text as follows:

506.2.2 Flame and ember protection at eaves. For *roof assemblies* where the profile allows a space between the *roof covering* and the *roof deck*, the space at the eave ends shall resist flames and embers by one or more of the following methods:

1. Firestopping of the space between the *roof covering* and the *roof deck*.
2. Installation of one layer of cap sheet complying with ASTM D3909 over the combustible *roof deck*.

Reason: As currently configured, roof assembly sections 504.2, 505.2, and 506.2 include two distinct provisions. The first is a requirement for a roof assembly classified as Class A. The second offers two options for addressing flame and ember entry at eaves when the roof covering profile has a space between the roof covering and the roof deck. Including both these requirements in the same section is potentially confusing. In the case of 504.2, these two distinct provisions are followed by a list of exceptions. The exceptions are intended to apply solely to the first provision, i.e., a Class A roof assembly classification. However, based on the current construction of Section 504.2, the exceptions could be interpreted as applying to the second provision as well, which is not the intent.

This proposal places the second provision from 504.2, 505.2, and 506.2 into new subsections for flame and ember protection at eaves. The new subsections incorporate a numbered list of options which can be expanded if other approaches for eave protection are developed. As a final, minor cleanup, an unnecessary "also" is removed from the list of exceptions in section 504.2.

Please note that the discrepancy in the description of D3909 product between existing sections 505.2/506.2 and 504.2 is addressed in a separate proposal. If that separate proposal is successful, the desire is for ICC staff to carry the change to 504.2 offered in that proposal forward into new section 504.2.2 of this proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal rearranges and clarifies existing provisions without an intent to make technical changes. Therefore, no change in construction cost is anticipated if this proposal is approved.

WUIC30-24

WUIC31-24

IWUIC: 504.2

Proponents: Mark S. Graham, National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with a Class A rating when tested in accordance with ASTM E108 or UL 790. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers or have one layer of ~~72-pound (32.4 kg) mineral-surfaced, nonperforated~~ cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Exceptions:

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

Reason: This code change proposal is intended to clarify the existing code and facilitate compliance and enforcement.

The designation "72-pound (32.4 kg)..." is proposed to be struck here as it is an outdated nominal designator for the product already designated product standard, ASTM D3909. ASTM D3909's Table 1-Dimensinons and Masses of Asphalt Roll Roofing (Glass Felt) Surfaced with Mineral Granules," provides minimum average mass per roll and minimum mass per unit area of mineral granule-surfaced cap sheet. Products complying with ASTM D3909 are required to be labeled with the ASTM D3909 designation to assist in identifying the product and enforcement.

Identifying this product by its ASTM designation and not its outdated nominal designation has already been incorporated into Section 504.2.1-Roof Valleys, Section 505.2-Roof Assembly, Section 505.2.1-Roof Valleys, Section 506.2-Roof Assembly and Section 506.2.1-Roof Valleys.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal removes an outdated nominal product designator and does not increase or decrease the stringency of the code.

WUIC31-24

WUIC32-24

IWUIC: 504.2, 504.2.1, 505.2.1, 506.2.1

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with a Class A rating when tested in accordance with ASTM E108 or UL 790. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers or have one layer of ~~72-pound (32.4 kg) mineral-surfaced, nonperforated~~cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Exceptions:

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

504.2.1 Roof valleys.
Where provided, valley flashings shall be not less than 0.019 inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of ~~72-pound (32.4 kg) mineral-surfaced, nonperforated~~ cap sheet complying with ASTM D3909 running the full length of the valley.

505.2.1 Roof valleys.
Where provided, valley flashings shall be not less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of ~~72-pound (32.4 kg) mineral-surfaced, nonperforated~~ cap sheet complying with ASTM D3909 running the full length of the valley.

506.2.1 Roof valleys.
Where provided, valley flashings shall be not less than 0.019-inch (0.44 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of ~~72-pound (32.4 kg) mineral-surfaced, nonperforated~~ cap sheet complying with ASTM D3909 running the full length of the valley.

Reason: The provisions for roof valleys in sections 504.2.1, 505.2.1, and 506.2.1 were added into the 2009 IWUIC through action by the California Office of the State Fire Marshal (WUIC22-06/07, WUIC32-06/07, and WUIC45-06/07). The sections 504.2, 505.2, and 506.2 provisions for use of a D3909 product as an eave protection for roof coverings with a space between the roof covering and the roof deck were added into the 2009 IWUIC by the same proponent (WUIC21-06/07, WUIC31-06/07, and WUIC44-06/07). In all cases, the original proposals were modified by the Committee to change the description from "No. 72 ASTM cap sheet" to "72 pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909." It appears the intent of the Committee was to replace a generic description of an acceptable material with a reference to an ASTM standard specification. Unfortunately, the generic "No. 72" reference of the original proposal was transformed into a requirement for a "72-pound" product, which may conflict with the weight limits contained in ASTM D3909.

ASTM D3909 sets a minimum mass per unit area of the granule-surfaced product at 63.2 lbs/100 square feet. It further requires an average mass per roll of 68 lbs/108 square feet for products with a 2-inch selvage width, 69 lbs/108 square feet for products with no selvage, and 70 lbs/114 square feet for products with a 4-inch selvage. These requirements were in place when the standard was added in these sections of the 2009 IWUIC and remains the same in the current edition of D3909.

The IWUIC requirement that D3909 products used for either valley lining or eave protection be exactly 72 pounds resulted from the transformation of the original proponent's "No. 72" to "72-pound." The code development record provides no technical substantiation for the weight requirement in addition to D3909 compliance to function effectively as either a valley lining or an eave protection material. In fact, presence of the "72 pound" requirement makes compliance with these provisions unlikely if interpreted literally, since 72 pounds is established as an absolute value instead of a minimum or maximum.

During the cycle which generated the 2021 IWUIC, the Committee modified proposals WUIC11-18 and WUIC16-18 to strike the phrase "72 pound (32.4 kg) mineral-surfaced, nonperforated" from sections 505.2 and 506.2, respectively. During that cycle, there were no proposals which included sections 504.2, 504.2.1, 505.2.1, or 506.2.1, so the Committee had no opportunity to make the same change in those sections for D3909. This proposal provides an opportunity to remove the weight limit associated with use of D3909 product.

In addition to removing the prescription that acceptable D3909 products be exactly 72 pounds, this proposal removes the unnecessary descriptive language "mineral-surfaced, nonperforated" to align with the changes to 505.2 and 506.2 which were made in the prior cycle. Products which comply with D3909 are mineral-surfaced and are nonperforated.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal may be seen as not strictly editorial, since it removes an existing weight requirement that is in addition to compliance with ASTM D3909. The absence of an area associated with the current weight requirement makes a comparison of the effect of its removal on construction cost challenging. The expectation, based on review of several products present in the market, is that removal of the current weight provision will not cause significant changes in available products. No change in installation costs should occur.

WUIC32-24

WUIC33-24

IWUIC: 504.2, 505.2, 506.2, TABLE C101.1; IFC: 1207.9.5

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.2 Roof assembly.
Roofs shall have a *roof assembly* ~~that complies with a~~ <u>classified as</u> Class A ~~rating~~ when tested in accordance with ASTM E108 or UL 790. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Exceptions:

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

2024 International Fire Code

Revise as follows:

1207.9.5 Rooftop installations.
ESS and associated equipment that are located on rooftops and not enclosed by building construction shall comply with the following:

1. Stairway access to the roof for emergency response and fire department personnel shall be provided either through a bulkhead from the interior of the building or a stairway on the exterior of the building.
2. Service walkways at least 5 feet (1524 mm) in width shall be provided for service and emergency personnel from the point of access to the roof to the system.
3. ESS and associated equipment shall be located from the edge of the roof a distance equal to at least the height of the system, equipment or component but not less than 5 feet (1524 mm).
4. The roofing materials under and within 5 feet (1524 mm) horizontally from an ESS or associated equipment shall be noncombustible or shall be ~~have~~ a Class A *roof assembly* ~~rating~~ when tested in accordance with ASTM E108 or UL 790.
5. A Class I standpipe outlet shall be installed at an *approved* location on the roof level of the building or in the stairway bulkhead at the top level.
6. The ESS shall be the minimum of 10 feet (3048 mm) from the fire service access point on the rooftop. [material based on NFPA 855 (2023)]

Reason: ASTM E108 or UL 790 tests are performed on *roof assemblies* to establish a classification (Class A, B, or C) based on exposure to simulated fire sources originating outside the building. The outcome of the test is a classification of the roof assembly. In contrast, ASTM E119 or UL 263 tests evaluate the duration for which building elements contain a fire, retain their structural integrity, or exhibit both properties during a predetermined test exposure. The result of these tests is expressed as a *fire resistance rating.*

This proposal adjusts language in several sections to clarify the distinction between these important fire tests. Specifically, it corrects cases where E108 or UL 790 tests results are characterized as a "rating" by changing those instances to "classified" or "classification." In IFC Section 1207.9.5, proposed changes remove the description of E108/UL 790 test results as a rating and recognize that an E108/UL 790 fire classification is applicable to the *roof assembly* instead of the roof materials.

As a minor cleanup, the phrase "not less than" is removed from 505.2, because there are no E108/UL790 classifications greater than Class A.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change corrects language used to describe ASTM E108 or UL 790 test results without making any technical change to existing language. No impact on cost of construction should occur.

WUIC33-24

WUIC34-24

IWUIC: 504.5, 505.5

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.5 Exterior walls.
Exterior walls of buildings or structures shall be constructed with one of the following methods:

1. Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.
2. *Approved noncombustible* materials.
3. Heavy timber or *log wall construction*.
4. ~~Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

~~5.~~4. Ignition-resistant building materials complying with Section 503.2 on the exterior side.

Such material shall extend from the top of the foundation to the underside of the roof sheathing.

505.5 Exterior walls.
Exterior walls of buildings or structures shall be constructed with one of the following methods:

1. Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.
2. *Approved noncombustible* materials.
3. *Heavy timber* or *log wall construction*.
4. ~~Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

~~5~~ 4. Ignition-resistant building materials complying with Section 503.2 on the exterior side.

Such material shall extend from the top of the foundation to the underside of the roof sheathing.

Reason: This proposal addresses the fact that Section 503.2 describes the requirements for “ignition resistant building materials”. Therefore, the important distinction for the requirements on exterior walls is whether the entire assembly (the exterior wall assembly) is addressed or just the exterior side (the exterior wall covering). Therefore, there are four categories of materials to be addressed, namely exterior wall assemblies (materials providing 1 hour fire resistance rating, approved noncombustible materials making up the entire exterior wall assembly, or heavy timber or log wall construction) and exterior wall coverings, as represented by ignition-resistant building materials on the exterior side. Note that the word "building" between "ignition-resistant" and "materials" is missing in comparison with the defined term (also used in Section 503.2).

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial cleanup. There are no changes in technical requirements.

WUIC35-24

IWUIC: 504.5, 504.5.1 (New), 504.5.1, ASTM Chapter 07 (New)

Proponents: William Koffel, Koffel Associates, Inc., Fire Safe North America (wkoffel@koffel.com)

2024 International Wildland Urban Interface Code

Revise as follows:

504.5 Exterior walls.
Exterior walls of buildings or structures shall be constructed of materials that comply with one or more of the following methods:

1. Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.
2. *Approved noncombustible* materials.
3. Heavy timber or *log wall construction*.
4. Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.
5. Ignition-resistant materials complying with Section 503.2 on the exterior side.
6. Exterior wall coverings or exterior wall assemblies complying with Section 504.5.1

Such materials shall extend from the top of the foundation to the underside of the roof sheathing.

Add new text as follows:

504.5.1 Flame Propagation and Flame Impingement. *Approved wall coverings* or *exterior wall assemblies* that have been tested in accordance with the test procedures for a 10-minute direct flame contact exposure test set forth in ASTM E2707 meeting the following conditions of acceptance:

1. No flame propagation to the top of the test specimen during the full duration of the test when tested with a modified flame exposure of 75 kW.
2. For *exterior wall assemblies*, no evidence of glowing combustion on the interior surface of the assembly during the full duration of the test.
3. For *exterior wall assemblies*, no evidence of flame penetration through the wall assembly during the full duration of the test.

Revise as follows:

504.5.~~1~~2 Flashing.
A minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the wall shall be installed at the ground, decking and roof intersections.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

E2707-22	Standard Test Method for Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure

Staff Analysis: A review of the standard proposed for inclusion in the code, ***Standard Test Method for Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure (ASTM E2707-22)***, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Reason: During the last revision cycle, the additional option included in this proposal was proposed to be the mandatory requirement, with some exceptions that recognized the existing five methods. The Committee was not convinced that the existing five methods needed to be changed. Therefore, the flame propagation and flame impingement test approach is being proposed as an additional compliance approach.

The new performance option addresses the potential for flame propagation on an exterior wall. It recognizes the need to evaluate two separate and distinct aspects of fire safety pertaining to exterior walls. The proposed language maintains the provisions that address fire mitigating to the interior of an exterior wall, while adding language that addresses the tendency for flames to spread across the exterior of an exterior wall. The proposed test standard, ASTM E2707, was adopted by the California State Fire Marshal Standard 7A, Materials and Construction Methods for Exterior Wildfire Exposure, that is referenced in the California Building Code. A modified ASTM E2707 test is used to address flame propagation. Testing was conducted both in a 2011 research project conducted at UL, as well as in 2019 and 2020 as part of work being done through the ASTM Committee E05 on Fire Standards. Multiple assemblies have been successfully tested to date, including some with wood and vinyl siding. The UL research report is available at https://fsri.org/research-update/wall-fire-experiments-examine-exterior-fire-spread-changes

It should be noted that Subcommittee ASTM E05.14, External Fire Exposures, is working on a new standard test method to determine fire propagation of exterior wall assemblies using a direct flame. The proposal is consistent with the current draft of the new standard, including reducing the fire exposure from the 100 kW that was proposed last cycle to 75kW. If the new standard is completed in time, it is our intent to revise the proposed language to reference the new ASTM standard.

Bibliography: https://fsri.org/research-update/wall-fire-experiments-examine-exterior-fire-spread-changes

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal provides an additional compliance option without changing or deleting the existing compliance option.

WUIC35-24

WUIC36-24

IWUIC: SECTION 202 (New), 504.5, 504.5.1 (New), 504.5.2 (New), 504.5.1

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Add new definition as follows:

EXTERIOR SURFACES. Weather-exposed surfaces.

EXTERIOR WALL. A wall, bearing or nonbearing, that is used as an enclosing wall for a building, other than a fire wall, and that has a slope of 60 degrees (1.05 rad) or greater with the horizontal plane.

Revise as follows:

504.5 Exterior walls.
Where defensible space conforms to the provisions of Section 603, exterior~~Exterior~~ walls of buildings or structures shall be constructed in accordance with Section 504.5.1 or Section 504.5.2.
Where defensible space does not conform to the provisions of Section 603, exterior walls of buildings or structures shall be constructed in accordance with Section 504.5.1 and Section 504.5.2.

Flashing shall be applied in accordance with Section 504.5.3. ~~one of the following methods:~~

1. ~~Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.~~
2. ~~*Approved noncombustible* materials.~~
3. ~~Heavy timber or *log wall construction*.~~
4. ~~Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~
5. ~~Ignition-resistant materials complying with Section 503.2 on the exterior side.~~

~~Such material shall extend from the top of the foundation to the underside of the roof sheathing.~~

Add new text as follows:

504.5.1 Exterior wall assemblies. Exterior wall assemblies of buildings or structures shall have a minimum of 1-hour fire-resistance-rating, rated for exposure on the exterior side in accordance with Section 501.3.
The exposed bottom edge of combustible sheathing shall be protected with noncombustible building material with a minimum assigned protection time of 40 minutes, or the sheathing shall be inset to rest directly on the foundation.

> **Exception:** The bottom edge of exposed combustible sheathing is permitted to be covered with corrosion-resistant metal flashing provided there is an air gap of at least 1 inch between the metal flashing and the bottom edge of the combustible sheathing. Both legs of the flashing shall be attached a maximum of 6 inches (152.4 mm) on center.

504.5.2 Exterior surfaces. The exterior surfaces shall be constructed in accordance with one or more of the followings:

1. Approved noncombustible materials complying with Section 503.2.1.
2. Fire-retardant-treated wood complying with Section 503.2.2.

3. Ignition-resistant building materials complying with Section 503.2.4.

Revise as follows:

~~504.5.1~~ 504.5.3 Flashing.
A minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the wall shall be installed at the ground, decking and roof intersections.

Reason: Table 503.1 requires the use of Ignition Resistant Construction Class 1 (IR1) in situations where defensible space is nonconforming. In such scenarios during a wildfire, the exterior walls of the structure may be exposed to embers, radiation heat, and direct flame exposures. Accordingly, the exterior wall assembly needs to provide a minimum resistance against these exposures. intermediate-scale, and full-scale experiments performed at the IBHS Research Center illustrate that the current requirements do not provide the needed resistance against wildfire exposures. Section 504.5 provides 5 alternatives for construction of exterior walls:

1. Materials approved for not less than 1-hour fire-resistance-rated (FRR) construction on the exterior side.
2. Approved noncombustible materials.
3. Heavy timber or log wall construction.
4. Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.
5. Ignition-resistant materials complying with Section 503.2 on the exterior side. According to section 503.2 ignition-resistant materials include the followings: noncombustible, FRTW and IR building materials.

There is a notable inconsistency in the current alternatives for exterior walls of this class of construction, particularly in terms of resistance against fire impingement and flame spread. The first method permits 1-hour FRR construction when tested in accordance with ASTM E119 or UL 263. In this test the wall assembly is tested without a siding material, and it is possible to have 1-hour FRR wall assembly with different combustible siding materials and different rates of flame spread on the exterior surface. Therefore, there is significant risk of fire spreading to other sections of the building, including eaves, roofs, and openings (vents, windows, doors), with less restrictive fire resistance requirements. Figure 1 displays a moment captured during the wind-driven fire spread tests conducted at the IBHS research center at the separation distance of 20 ft. The "source structure" comprises metal and wooden sheds containing 15, 6-A wood cribs (UL 711 standard cribs). The “target structure” is a one-and-a-half-story residential structure featuring an open eave, double-pane tempered windows, and a one-hour-rated exterior wall. The cladding consists of a combination of combustible engineered wood siding material on left side and fiber cement panels on the right. Both structures face a nominal wind speed of 35 mph, and the thermal impact on the target building is observed using heat flux gauges, thermocouples, and cameras. As can be seen in Figure 1, about 10 minutes after a point ignition inside the shed, the target building ignited and within the next few seconds, the fire could spread on the surface causing severing damage to the eaves, vents, and windows. The test was terminated after a minute due to safety reasons. In this test the target structure had 1-hr FRR from exterior. The dark gray siding was fiber cement board (noncombustible siding) while the light gray siding was engineered wood (combustible) siding material.

Figure 1. a. The test setup for wind driven building to building fire spread tests. The target building has an hour fire resistant rated wall assembly.

Figure 1. b. ignition of the combustible siding.

Figure 1. c. fire spread on the surface and flames touching all components in about 10 seconds on left side.

Figure 1. d. after suppression; severe damage can be seen on all components on the left-side.

Another concern with 1-hour FRR alone is the wide range of wall assemblies that can meet the performance requirements of ASTM E119. Figure 2 shows two different wall assemblies that achieve 1-hr FRR from either side.

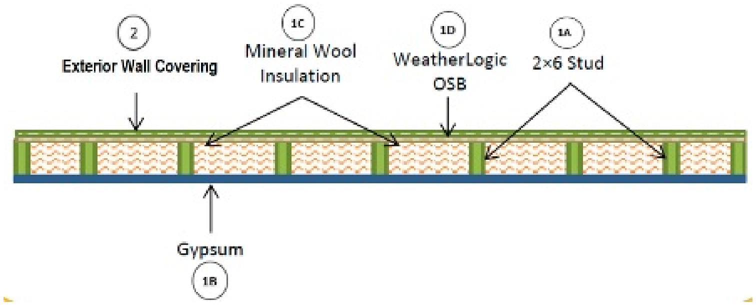

Figure 2. *a.* 1-hour fire resistance rated exterior wall with *OSB sheathing panel on the exterior side [1].*

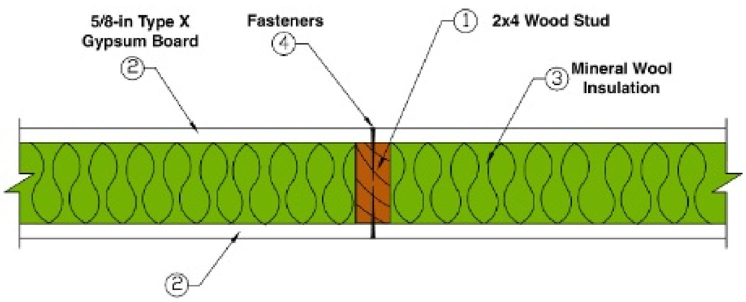

Figure 2. b. 1-hour fire resistance rated exterior wall with *Type X gypsum board on the exterior side [2].*

While Figure 2a and 2b both qualify as 1-hr FRR construction, the assembly in Figure 2a is particularly vulnerable to wildfire exposure at the base because combustible sheathing material is used in the assembly. Figure 3 shows a series of fire tests conducted at the IBHS Research Center where different configurations of 1-hour fire-resistant rated assembly with combustible engineered wood siding material were exposed to a small fire at the base. Figure 3a is about a typical 1-hour fire-resistant rated assembly constructed with OSB sheathing material. In this test the OSB sheathing material is exposed from bottom. During this experiment, the fire spread across the surface of the combustible exterior siding and impinged inside the wall cavity because of the exposed bottom surface of OSB sheathing material. Figure 3b shows a 1-hour fire-resistant rated assembly constructed with noncombustible sheathing material in accordance with Figure 2b. In this experiment the fire only ignited the combustible engineered wood siding material and did not impinge inside the wall assembly.

Figure 3. a. 1-hr FRR assembly with unprotected OSB Sheathing material at the bas3. Photo curtesy by Milad Shabanian, IBHS.

Figure 3. b. 1-hr FRR assembly with noncombustible sheathing material. Photo curtesy by Milad Shabanian, IBHS.

Item 2 of Section 504.5 permits the use of noncombustible materials. While this construction method provides comprehensive protection against fire spread, it does not specifically address the fire resistance rating and protection against fire impingement. Item 3 permits the use of heavy timber or log wall construction suggesting they offer similar protection. However, Section 602.4.4 in the IBC requires exterior walls of heavy timber construction to be noncombustible, which arguably aligns more appropriately with Item 2 or constructed with FRTW or cross-laminated timber. In case that the exterior walls constructed with cross-laminated timber and heavy timber elements the exterior surface of such element shall be protected with: FRTW, Gypsum board or noncombustible materials.

In contrast, log wall construction technically aligns more with Item 1. According to Section 303 of ICC 400, 6-inch-thick logs can provide a 1-hour fire resistance against fire impingement. However, given their combustible nature, log wall constructions may exhibit varying fire spread rates, influenced by the different flame spread indices associated with various wood species.

Items 4 and 5 do not explicitly address fire impingement. These methods are only intended to limit the flame spread index of exterior surfaces. Figure 4 illustrates two typical exterior wall assembly constructed with ignition-resistant building material. Figure 4a is a typical exterior wall assembly protected on the exterior with noncombustible metal siding and Figure 4b is a wall protected with noncombustible fiber cement lap siding material.

Figure 4. a. Typical exterior wall assemblies constructed on the exterior with noncombustible metal siding. Photo curtesy by Milad

Shabanian, IBHS.

Figure 4. b. Typical exterior wall assemblies constructed on the exterior with noncombustible fiber cement siding material. Photo curtesy by Milad Shabanian, IBHS.

An additional inconsistency in the IWUIC is that requirements for exterior wall construction are the same for IR1 and IR2. This is clearly a discrepancy as IR1 construction is required in conditions more severe than those requiring IR2 construction in Table 503.1.

This proposed code change will increase the level of fire protection and provide a more logical and consistent level of performance for exterior wall assemblies against fire impingement and flame spread for IR1 where defensible space is nonconforming by:

- Requiring a minimum of 1 hr. fire resistance rating for all exterior wall assemblies to address fire impingement, and,
- Limiting the flame spread index of exterior siding materials to address flame spread to other areas of the building.

Note: IBC is the source of all suggested definitions.

Bibliography:

1. INTERTEK DIRECTORY OF BUILDING PRODUCTS, Louisiana-Pacific - LP WeatherLogic® Air & Water Barrier Fire Performance, https://bpdirectory.intertek.com/pages/DLP_SearchDetail.aspx?SpecID=67818

2. Design for code acceptance 3, American Wood Council, Fire-resistance-rated wood-frame wall and floor/ceiling assemblies. https://awc.org/wp-content/uploads/2021/12/awc-dca3_20210209_awcwebsite.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

This modification to the code will raise construction costs by introducing two stipulations for exterior walls.

Estimated Immediate Cost Impact Justification (methodology and variables):

The existing code mandates that exterior walls should be built with either a one-hour fire-resistant rated assembly or an ignition-resistant exterior surface. In contrast, the proposed amendment will necessitate exterior walls to be constructed with both a one-hour fire-resistant rated assembly and an ignition-resistant exterior surface where provisions of Section 603 (defensible space requirement) are not met.

WUIC36-24

WUIC37-24

IWUIC: 504.6

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.6 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5.

Exception:

1. Where defensible space conforms to the provisions of Section 603, complete ~~Complete~~ enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed with one of the following: ~~protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~
   1.1 Exterior 1-hour fire-resistance-rated construction.

   1.2. Noncombustible material.

   1.3. Heavy timber or log wall construction.

   1.4. Fire-retardant treated wood labeled for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.

   1.5. Ignition-resistant building material on the exterior surface.

2. Where defensible space does not conform to the provisions of Section 603, complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour fire-resistance-rated construction in accordance with Section 501.3 and the exterior surfaces of these assemblies are constructed with one of the following materials:
   2.1. Noncombustible material complying with Section 503.2.1

   2.2. Fire-retardant-treated wood complying with Section 503.2.2

   2.3. Ignition-resistant building materials complying with Section 503.2.4.

Reason: Table 503.1 requires the use of Ignition Resistant Construction Class 1 (IR1) in situations where defensible space is nonconforming. In such conditions, the structure may be exposed to embers, radiation heat, and direct flame contact during a wildfire. Accordingly, the underfloor area of the building needs to provide a minimum resistance against these exposures.

Currently, the exception in section 504.6 provides 3 alternatives for constructing the unenclosed underfloor areas of buildings:

1. Materials approved for not less than 1-hour fire-resistance-rated (FRR) construction on the exterior side.
2. Heavy timber construction
3. Fire-retardant treated wood.

These methods do not provide protection from flame spread during a wildfire. This proposal addresses this issue by creating two exceptions addressing conditions with nonconforming defensible space and conditions with conforming defensible space.

For the nonconforming defensible space condition, this proposal requires the underside of exposed floors and exposed structural columns, beams and supporting walls to protected with 1-hour fire-resistant-rated construction and also protected on the exterior surfaces by ignition-resistant building materials complying with Section 503.2. This would provide protection from flame impingement and reduce rate of flame spread in areas where defensible space is nonconforming.

For the confirming defensible space condition, this proposal permits the use of the currently specified materials but expands the options to include noncombustible construction, log wall construction, and ignition resistant building materials on the exterior surface consistent with construction methods permitted by other areas in Section 504.

An additional inconsistency is that requirements for underfloor areas in the IWUIC are the same for IR1 and IR2. This is clearly a discrepancy as IR1 construction is required in conditions more severe than those requiring IR2 construction in Table 503.1. This proposed code change will increase the level of fire protection and provide a more logical and consistent level of performance for underfloor areas against fire impingement and flame spread for IR1 where defensible space is nonconforming by:

- Requiring a minimum of 1 hr. fire resistance rating to address fire impingement, and,
- Limiting the flame spread index of exterior surfaces to address flame spread to other areas of the building.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 or more. This code change proposal may increase the construction cost only where the underfloor area height is enough to be usable and 1-hour rated columns or walls covered on the exterior with combustible materials having a flame spread index more than 25 when tested in accordance with ASTM E84 (Figure 1). In such a case, the siding material will need to be removed or replaced with an ignition-resistant building material (noncombustible, FRTW, IR material) having a flame spread index less than 25.

Estimated Immediate Cost Impact Justification (methodology and variables):

Figure 1. Usable unenclosed underfloor areas.

WUIC37-24

WUIC38-24

IWUIC: 504.6, 505.6, 506.3

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org); Jason Smart, American Wood Council (jsmart@awc.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.6 Underfloor enclosure.
~~Buildings or structures shall have underfloor~~ Underfloor areas of buildings and structures shall be enclosed to the ground with exterior walls in accordance with Section 504.5.

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

505.6 Underfloor enclosure.
~~Buildings or structures shall have underfloor~~ Underfloor areas of buildings and structures shall be enclosed to the ground, with exterior walls in accordance with Section 505.5.

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

506.3 Underfloor enclosure.
~~Buildings or structures shall have underfloor~~ Underfloor areas of buildings and structures shall be enclosed to the ground with exterior walls.

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction*, fire-retardant-treated wood or *heavy timber construction*. Fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

Reason: Current provisions in Sections 504.6, 505.6 and 506.3 could be interpreted as requiring all buildings or structures to have underfloor areas. Many buildings and structures, such as those with slab-on-grade foundations or basements, do not have underfloor areas, nor should they be required to. This proposal clarifies that the provisions of Sections 504.6, 505.6 and 506.3 only apply where underfloor areas exist.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a simple clarification of existing provisions. See also the proponent’s reason statement.

2024 International Wildland Urban Interface Code

Revise as follows:

504.6 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5.

> **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code. A minimum of 6 inches of noncombustible material or metal flashing extending vertically from grade is required on the exterior of columns and walls.

Add new text as follows:

505.5.1 Flashing. A minimum of 6 inches of noncombustible material or metal flashing extending vertically is required on the exterior of the wall at the ground, decking and roof intersections.

Revise as follows:

505.6 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground, with exterior walls in accordance with Section 505.5.

> **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code. A minimum of 6 inches of noncombustible material or metal flashing extending vertically from grade is required on the exterior of columns and walls.

Add new text as follows:

506.3 Exterior walls. A minimum of 6 inches of noncombustible material or metal flashing extending vertically is required on the exterior of the wall at the ground, decking and roof intersections.

Revise as follows:

~~506.3~~ 506.4 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 506.3.

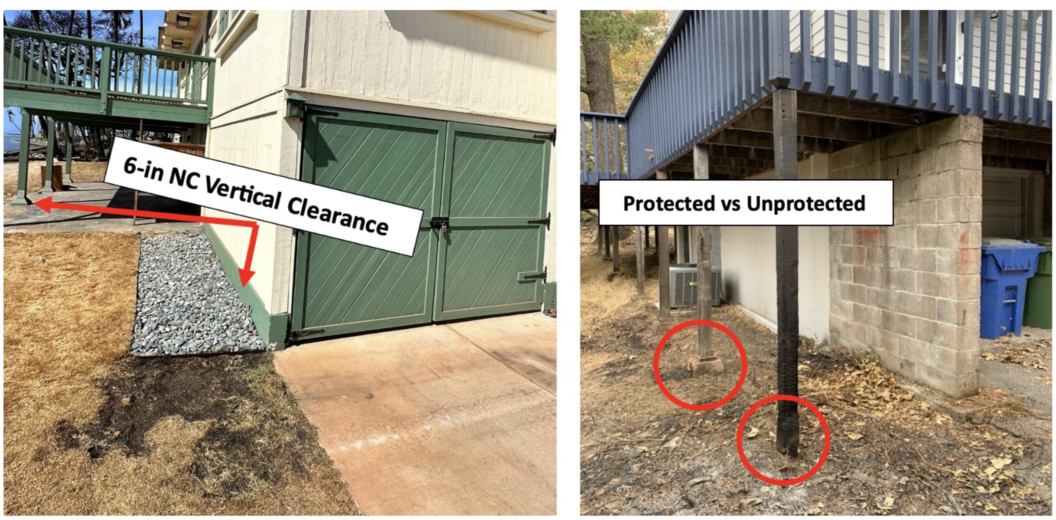
> **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction*, fire-retardant-treated wood or *heavy timber construction*. Fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code. A minimum of 6 inches of noncombustible material or metal flashing extending vertically from grade is required on the exterior of columns and walls.

504.5.1 Flashing.
A minimum of 6 inches (152 mm) of ~~metal flashing or~~ noncombustible material or metal flashing extending~~applied~~ vertically is required on the exterior of the wall ~~shall be installed~~ at the ground, decking and roof intersections.

Reason: In the 2024 IWUIC, a new section was added to Class 1 ignition resistant construction (IR1) that requires a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of the wall at the ground, decking and roof intersections. In a wildfire event, buildings are threatened by at least one of the three fundamental wildfire exposures: embers, radiant heat, or direct flame contact. Of these exposures, ember exposure stands out as a prevalent cause of building ignition. Embers, propelled for miles by the wind, can penetrate small openings and accumulate around buildings, particularly where combustible debris is also present (Figure1).

Figure 1. 6-in noncombustible vertical clearance worked as fuel break at the base of exterior walls in Lahaina wildfire. Photo credit: Steve Hawks, IBHS.

Therefore, this proposal will add protection against embers for all structures in wildfire-prone areas by expanding ember protection requirements in IR1 and adding ember protection for IR2 and IR3. Figure 2 shows a 6-in noncombustible vertical clearance at the base of exterior walls and underfloor columns.



a *b*

Figure 2. 6-in Noncombustible vertical clearance at the base of exterior walls and underfloor area columns: a. Lahaina Fire 2023 (Photo curtesy Milad Shabanian, IBHS), b. Glass Fire 2020 (Photo curtesy Steve Hawks, IBHS).

The objective of this proposal is to enhance the resilience of buildings in wildfire-prone regions against embers by requiring a 6-inch noncombustible vertical clearance on exterior walls for all ignition resistant construction classes where they intersect with horizontal surfaces such as the ground, decks, and roof assemblies.

This code change intends to improve the protection of a vertical surface where the vertical surface intersects with a horizontal surface. The intersection of a vertical and horizontal surface is a known area where debris tends to accumulate and where embers tend to accumulate during a wildfire. The combination of accumulated debris and embers can ignite the debris, enabling the fire to spread to the vertical surface. The first part of this proposal adds a minimum 6 inches of noncombustible flashing on the exterior walls of Ignition-Resistant Class 2 and 3 constructions at points where exterior walls intersect with horizontal surfaces. The remainder of this proposal extends an equivalent level of ember-resistance to exposed columns and vertical members within unenclosed underfloor areas across all three classes of ignition-resistant construction.

Section 504.5.1 is proposed to be revised to match the language proposed for Sections 504.6, 505.5.1, 505.6, 506.3 and 506.4 and to provide some clarity. As currently written, Section 504.5.1 could be interpreted to require metal flashing or noncombustible materials on a noncombustible wall such as a concrete or masonry wall. This clearly was not the intent of the original language. The revised language is intended to clarify this.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This code change may increase the construction cost only where the exterior walls intersect with unenclosed projections such as attached decks, balconies, and roofs such as dormers.

Estimated Immediate Cost Impact Justification (methodology and variables):

The noncombustible flashing that needs to be installed instead of exterior siding material in these cases may be cheaper or more expensive than the siding material considering the range of flashing products available in the market. But in general the cost increase will not be significant. A review of common retailers websites indicates that the cost of 6 inch wide metal flashing varies according to the quantity purchased. Galvanized steel metal flashing that is 6 inches wide costs approximately $24.24 for a 50 foot length. This is approximately $0.48 per foot of material. Labor and fastener costs are estimated to be minimal.

2024 International Wildland Urban Interface Code

Revise as follows:

504.6 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5.

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are ~~protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~ constructed with one of the following:

1. Exterior 1-hour fire-resistance-rated construction.
2. Noncombustible material.
3. Heavy timber or log wall construction.
4. Fire-retardant treated wood labeled for exterior use and meeting the requirements of Section 2303.2 of the *International Building Code*.
5. Ignition-resistant building material on the exterior surface.

505.6 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground, with exterior walls in accordance with Section 505.5.

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are ~~protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~ constructed with one of the following:

1. Exterior 1-hour fire-resistance-rated construction.
2. Noncombustible material.
3. Heavy timber or log wall construction.
4. Fire-retardant treated wood labeled for exterior use and meeting the requirements of Section 2303.2 of the *International Building Code*.
5. Ignition-resistant building material on the exterior surface.

506.3 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls.

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are ~~protected as required for exterior 1-hour *fire-resistance-rated construction*, fire-retardant-treated wood or *heavy timber construction*. Fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~ constructed with one of the following:

1. Exterior 1-hour fire-resistance-rated construction.
2. Noncombustible material.
3. Heavy timber or log wall construction.

4. Fire-retardant treated wood labeled for exterior use and meeting the requirements of Section 2303.2 of the *International Building Code.*
5. Ignition-resistant building material on the exterior surface.

Reason: This code change proposal intends to address the gaps in the exception for open underfloor areas for all three ignition-resistant construction classes. Currently, the exception to complete enclosure only permits the use of a 1-hour fire-resistance-rated construction, heavy timber construction, and fire-retardant-treated wood. However, it is very common to use noncombustible columns and beams for underfloor areas. Considering the fire performance of noncombustible materials in comparison to the other permitted types of construction, noncombustible materials should be added to the exception. Figure 1 shows two examples of an unenclosed underfloor area constructed with noncombustible materials. Ignition-resistant building materials are also proposed to be added as an option consistent with fire-retardant-treated wood which is currently permitted.

Figure 1. Noncombustible unenclosed underfloor areas.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change intends to address the alternatives missed in current code language for underfloor areas. This code change provides more alternatives for unenclosed underfloor areas and therefore will not increase the construction cost.

WUIC41-24

IWUIC: 504.7, 505.7

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.7 ~~Appendages and projections~~ Attachments. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be ~~be not less than 1-hour fire-resistance-rated construction, heavy timber construction or~~ constructed with ~~of~~ one of the following methods, except that coated materials shall not be used as the walking surface of decks::

1. Materials *approved* for not less than 1-hour fire resistance-rated construction on the exterior side.
2. *Approved noncombustible* materials.
3. ~~2.~~3. ~~Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.~~ Heavy timber or log wall construction.
4. ~~3.~~4. Ignition-resistant building materials complying ~~in accordance~~ with Section 503.2 on the exterior side.

    ~~**Exception:** Coated materials shall not be used as the walking surface of decks.~~

505.7 ~~Appendages and projections~~ Attachments.
Unenclosed accessory structures attached to buildings with habitable spaces and projections, such as decks, shall be ~~not less than 1-hour fire-resistance-rated construction, heavy timber construction or~~ constructed with ~~of~~ one of the following methods, except that coated materials shall not be used as the walking surface of decks::

1. Materials *approved* for not less than 1-hour fire-resistance-rated construction on the exterior side.
2. *Approved noncombustible* materials.
3. ~~2.~~3. ~~Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code~~ Heavy timber or log wall construction.
4. ~~3.~~4. Ignition-resistant building materials complying ~~in accordance~~ with Section 503.2 on the exterior side.

    ~~**Exception:** Coated materials shall not be used as the walking surface of decks.~~

Reason: This proposal is an editorial cleanup. There are no technical change in requirements.

This proposal addresses the fact that section 503.2 describes the requirements for “ignition resistant building materials”. Therefore, the important distinction for the requirements on attachments (including appendages, projections, and decks) is whether the entire assembly (the exterior assembly) is addressed or just the exterior side (the exterior covering). Therefore, there are four categories of materials to be addressed, namely exterior assemblies for the attachments (materials providing 1 hour fire resistance rating, approved noncombustible materials making up the entire exterior assembly, or heavy timber or log wall construction) and exterior coverings, as represented by ignition-resistant building materials, complying with Section 503.2, on the exterior side.

The title is being changed from “Appendages and projections” to “Attachments”. Also, the prohibition for using coated materials on the walking surface of decks is being moved from an exception into the charging paragraph.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a simple clairificatin of existing requirements has has no affect on cost

WUIC41-24

WUIC42-24

IWUIC: 504.7, 505.7

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org); Jason Smart, American Wood Council (jsmart@awc.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.7 Appendages and projections.
Unenclosed accessory structures attached to buildings with habitable spaces and projections, such as decks, shall be ~~not less than 1-hour fire-resistance-rated construction, *heavy timber construction* or~~ constructed of one of the following:

1. 1-hour *fire-resistance-rated construction.*
2. *Heavy timber construction.*
3. ~~1.~~3. *Approved noncombustible* materials.
4. ~~2.~~4. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
5. ~~3.~~5. Ignition-resistant building materials in accordance with Section 503.2.

    Exception: Coated materials shall not be used as the walking surface of decks.

6. Any materials permitted by code where all exterior walls to which the *unenclosed accessory structure* is attached have a 1-hour fire-resistance rating, rated for exposure to fire from the exterior side, and have ignition-resistant materials complying with Section 503.2 on the exterior side.

505.7 Appendages and projections.
Unenclosed accessory structures attached to buildings with habitable spaces and projections, such as decks, shall be ~~not less than 1-hour *fire-resistance-rated construction*, *heavy timber construction* or~~ constructed of one of the following:

1. 1-hour *fire-resistance-rated construction.*
2. *Heavy timber construction.*
3. ~~1.~~3. *Approved noncombustible* materials.
4. ~~2.~~4. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
5. ~~3.~~5. Ignition-resistant building materials in accordance with Section 503.2.

    Exception: Coated materials shall not be used as the walking surface of decks.

6. Any materials permitted by code where all exterior walls to which the *unenclosed accessory structure* is attached have a 1-hour fire-resistance rating, rated for exposure to fire from the exterior side, and have ignition-resistant materials complying with Section 503.2 on the exterior side.

Reason: The two options currently listed in the charging language of Sections 504.7 and 505.7 for appendages and projections are moved down into the existing list of other options. An additional option is added to the requirements for unenclosed accessory structures, such as decks, in Class 1 and Class 2 ignition-resistant construction. This additional option allows for unenclosed accessory structures to be constructed of any materials permitted by code where the exterior walls, to which the unenclosed accessory structures are attached, comply with enhanced fire protection requirements. These enhanced fire protection requirements for exterior walls require both a 1-hour fire-resistance rating and use of ignition-resistant materials on the exterior side. These requirements are more stringent than current exterior wall requirements in Class 1 ignition-resistant construction, which is permitted to be used where defensible space provisions of Section 603 are not met. This option for enhanced protection of the adjacent exterior walls will help prevent entry of fire into the building in the event of ignition of the unenclosed accessory structure, such as decks.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 or less. There could be a cost decrease for some buildings.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal provides one additional option for compliance (Item 6). This new option allows for more cost-effective deck construction in cases where exterior walls meet enhanced fire protection requirements. The other existing provisions and options currently allowed in 504.7 and 505.7 remain functionally unchanged.

WUIC42-24

WUIC43-24

IWUIC: 504.7, 505.7

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.7 Appendages and projections.
Unenclosed accessory structures and projections, such as decks, balconies, porches, and stairs attached to buildings with habitable spaces ~~and projections, such as decks,~~ shall be ~~not less than 1-hour fire-resistance-rated construction, *heavy timber construction* or~~ constructed ~~of~~with one of the following:

1. Not less than 1-hour fire resistance rated construction on the exterior side.

~~1~~2. *Approved noncombustible* materials.

3. *Heavy timber construction.*

~~2~~4. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.

~~3~~5. Ignition-resistant building materials in accordance with Section 503.2.

Exception: Coated materials shall not be used as the walking surface of decks.

505.7 Appendages and projections.
Unenclosed accessory structures and projections, such as decks, balconies, porches, and stairs attached to buildings with habitable spaces ~~and projections, such as decks,~~ shall be ~~not less than 1-hour *fire-resistance-rated construction*, *heavy timber construction* or~~ constructed ~~of~~ with one of the following:

1. Not less than 1-hour fire-resistance-rated construction on the exterior side.

~~1~~2. *Approved noncombustible* materials.

3. Heavy timber construction.

~~2~~4. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.

~~3~~5. Ignition-resistant building materials in accordance with Section 503.2.

Exception: Coated materials shall not be used as the walking surface of decks.

Reason: This primary intent of this proposal is to provide clarity to the criteria for appendages and projections. Sections 504.7 and 505.7 are proposed to be reorganized by relocating the allowable construction methods to a numbered list which is a similar format to other sections in the IWUIC. Additionally, Chapter 2 defines unenclosed accessory structures as "an accessory structure without a complete exterior wall system enclosing the area under roof or floor above. The IWUIC commentary also states that “this definition refers to structures without walls, or without walls on all sides. Most commonly, this would include a deck or platform.” Balconies, porches and stairs are also other platforms that should be listed to provide clarity around construction of these attached structures. For example, in post-event investigations performed by IBHS, it is clear that stairs constructed of inappropriate materials that are attached to a building are at risk of ignition and need to be included in the list of examples in Sections 504.7 and 505.7. Figure 1 provides an example of a nonconforming attached stair ignited by surrounding fuel sources. The intent of this proposal is to make clear that all attached accessory structures, including stairs, proches and balconies, are required to be constructed in accordance with the requirements of IWUIC.

Figure 1. Nonconforming attached accessory structure (stair). Photo by Milad Shabanian, IBHS.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal does not result in technical changes to the code and will not impact construction costs.

WUIC43-24

WUIC44-24

IWUIC: 504.7.1, 505.7.1, 506.6 (New), 506.6.1 (New)

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.7.1 Underfloor areas.
~~Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5.~~
Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with exterior wall construction in accordance with Section 504.5.

> **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 504.7 and a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of the vertically aligned structural elements such as columns and supporting walls at the ground.

505.7.1 Underfloor areas.
~~Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 505.5.~~
Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with one of the following methods:

1. Exterior wall construction in accordance with Section 505.5.
2. Noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

> **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 505.7 and a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of the vertically aligned structural elements such as columns and supporting walls at the ground.

Add new text as follows:

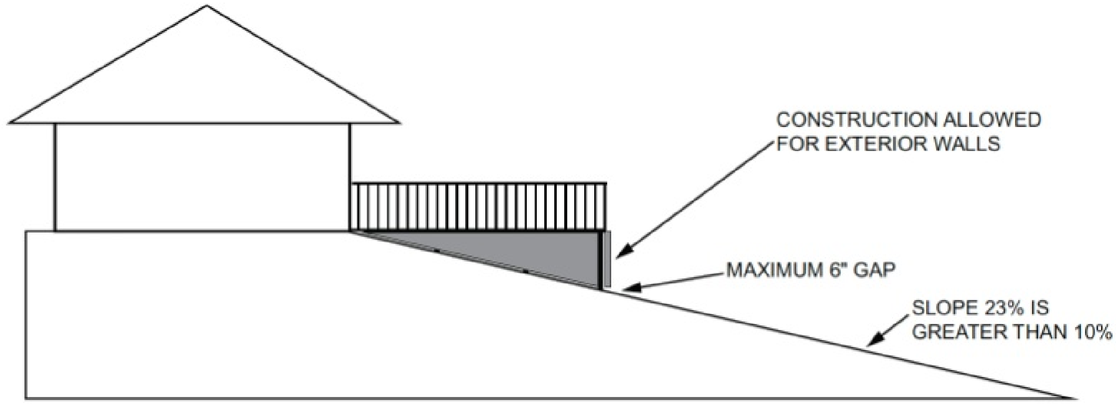
506.6 Appendages and projections. The underfloor areas of unenclosed accessory structures and projections, such as decks, balconies, porches, and stairs attached to buildings with habitable spaces shall be constructed in accordance with Section 506.6.1

506.6.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

> **Exception:** Complete enclosure shall not be required where a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of columns and supporting walls at the ground.

Reason: Figure 1 clarifies the intention of sections 504.7.1 and 505.7.1. There are 4 concerns surrounding the current requirements of the IWUIC regarding the construction of an underfloor area of attached accessory structures.
First, there is no scientific reason to support the slope limitations provided in these sections. All structures, their attached accessory structures, detached accessory structures and their underfloor areas are exposed to at least one of the wildfire exposures. As it is well studied, wildfires can threaten buildings through three different exposures: embers, radiation heat, and direct flame contact. Excluding

the underfloor area of attached accessory structures located on a surface with a slope less than 10 percent will result in excluding many balconies, decks, stairs, and other attached accessory structures constructed on flat surfaces. The code requirements should not differentiate between underfloor areas of building and attached structures. This is also against the requirements provided in the California Building Code (Chapter 7A, Section 707.9A).



Commentary Figure 504.7.1
PROTECTION UNDER DECK ON A SLOPE

Figure 1. 6-in gap at the ground level (IWUIC Commentary).

Second, technical concerns around having a 6-in opening at the base of walls. Currently, the code requires the underfloor areas of attached accessory structures to be fully enclosed to within 6 inches (152 mm) of the ground (Figure 1). The 6-in opening seems to be required for water irrigation purposes. However, this requirement does not align well with provided construction methods for attached accessory structures.

According to sections 504.7 and 505.7, appendages and projections shall be constructed with one of the following alternatives:

1. 1-hour fire-resistant construction.
2. Heavy timber construction.
3. Approved noncombustible materials.
4. Fire-retardant-treated wood.
5. Ignition-resistant building materials in accordance with section 503.2.

In a 1-hour fire-resistant floor assembly, the fire shall not pass the floor assembly for at least 1 hour during ASTM E119 or UL 263 fire test. Consequently, water intrusion through the floor system is not possible.

In heavy timber construction, based on the definition (Figure 2) from IBC, “the exterior walls are of noncombustible materials” with some exceptions.

602.4.4 Type IV-HT. Type IV-HT (Heavy Timber) construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated heavy timber or structural composite lumber (SCL), without concealed spaces or with concealed spaces complying with Section 602.4.4.3. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, SCL and cross-laminated timber (CLT) and the details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.4.1 or 602.4.4.2 shall be permitted. Interior walls and partitions not less than 1- hour fire-resistance rated or heavy timber conforming with Section 2304.11.2.2 shall be permitted.

Figure 2. IBC requirements for Heavy Timber (HT) construction.

Figure 3 provides examples of attached accessory structure constructed with noncombustible materials. It is evident that building a noncombustible attached accessory structure with maximum 6-in gap at the base is unnecessary and impractical in many cases. IWUIC provides an exception for underfloor areas of buildings and detached accessory structures while missing a similar requirement for attached accessory structures. In many instances such as examples provided in Figure 3, attached accessory structures are required to have unenclosed underfloor areas and having an exception is unavoidable.

Figure 3. Unenclosed and enclosed attached accessory structure nonconforming with current requirements.

In addition, there is a safety concern about having a 6-in gap at the base during a wildfire. Combustible debris and embers can both collect in corners and around the building where exterior walls intersect with horizontal surfaces (Figure 4). IBHS research shows that protecting these areas with noncombustible materials can protect the building from ignitions caused by embers. Leaving a gap at the base of exterior walls of attached accessory structures will increase the chance of combustible debris and ember accumulation under the deck area.

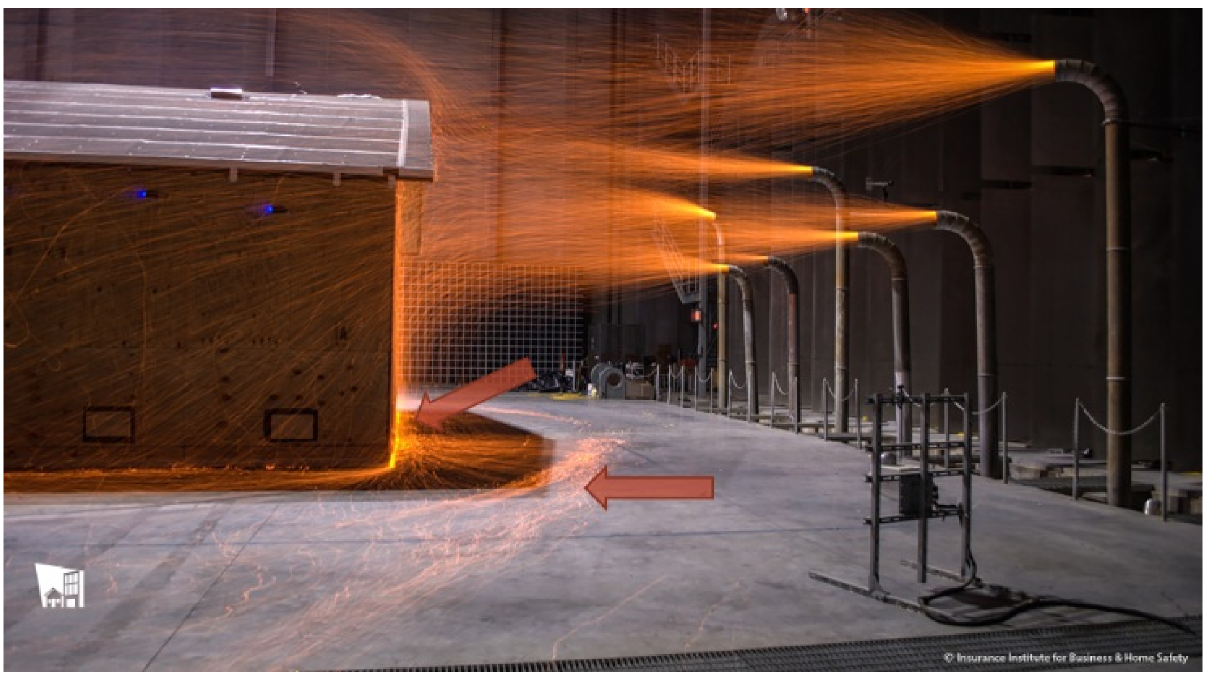


Figure 4. Ember accumulation around a building, IBHS Research Center.

Finally, the IWUIC provides identical requirements for construction of underfloor areas of attached accessory structures in IR1 and IR2. On the other hand, the IWUIC does not address this known vulnerability in IR3. All buildings located in wildfire prone areas need to be always protected against ember exposure.

This code change proposal intends to address these concerns by revising the requirements in sections 504.7.1 and 505.7.1 and adding a new section forIR3.

Section 504.7.1 revised to:

- Eliminate the slope limitation.
- Eliminate the 6-in opening at the base.
- Add exception for unenclosed underfloor areas.
- Add a 6-in noncombustible flashing requirement to columns and walls of unenclosed underfloor areas.

Section 505.7.1 revised to:
- Eliminate the slope limitation.
- Eliminate the 6-in gap at the base.
- Provide additional alternative (1/8-in noncombustible mesh) for protection of underfloor areas to make it less restrictive than IR Class 1.
- Add exception for unenclosed underfloor areas.
- Add a 6-in noncombustible flashing requirement to columns and walls of unenclosed underfloor areas.

New section added to IR Class 3 to:
- Add a 1/8-in noncombustible screen mesh protection for underfloor areas to make it ember-resistant with less restrictive requirements than IR Class 1 and 2.
- Add exception for unenclosed underfloor areas.
- Add a 6-in noncombustible flashing requirement to columns and walls of unenclosed underfloor areas to make unenclosed underfloor areas ember-resistant.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This code change proposal will increase the construction cost where it expands the scope of these sections through eliminating the limitation of the ground slope. However, the code change will reduce construction costs by proposing exceptions for unenclosed underfloor areas. It will also increase the construction cost in IR Class 3 construction where the code change will mandate additional requirements for protecting underfloor areas with 1/8-in noncombustible mesh screen or 6-in metal flashing.

Estimated Immediate Cost Impact Justification (methodology and variables):

-

2024 International Wildland Urban Interface Code

Revise as follows:

504.9 Exterior doors.
Exterior doors shall be *approved noncombustible* construction, solid-core wood not less than 1$^3/_4$ inches thick (44 mm) and protected with a minimum 6-inch noncombustible material, such as a kick plate, applied at the base on the exterior of the door~~,~~ or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 504.8.

~~**Exception**~~ **Exceptions**: ~~Vehicle access doors.~~

1. Vehicle access doors.
2. The 6 inches of noncombustible material at the base is not required for solid-core wood doors not less than 1$^3/_4$ inches thick (44 mm) protected by an approved noncombustible door such as a storm door.

Add new text as follows:

504.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum of 6-in noncombustible material that extends vertically from the base.

Revise as follows:

505.9 Exterior doors.
Exterior doors shall be *approved noncombustible* construction, solid core wood not less than 1$^3/_4$ inches thick (45 mm) and protected with a minimum 6-inch noncombustible material such as a kick plate at the base on the exterior of door ~~,~~ or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 505.8.

~~**Exception**~~ **Exceptions**: ~~Vehicle access doors.~~

1. Vehicle access doors.
2. The 6 inches of noncombustible material at the base is not required for solid-core wood door not less than 1$^3/_4$ inches thick (44 mm) protected by an approved noncombustible door such as a storm door.

Add new text as follows:

505.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum 6-in noncombustible material that extends vertically at the base.

506.9 Exterior doors. Exterior doors shall be protected with a minimum 6-inch noncombustible material at the base on the exterior of the door.

Exceptions:

1. Vehicle access doors.
2. Exterior doors protected by an approved noncombustible door such as a storm door.

506.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum 6-in noncombustible material that extends vertically at the base.

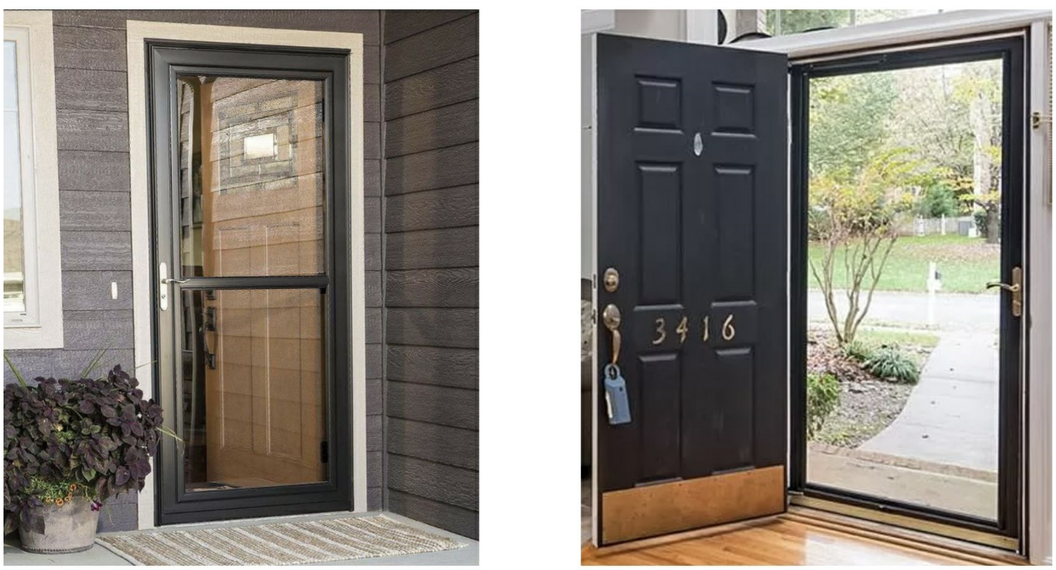
Reason: Like other parts of the building envelope, exterior doors can be exposed to flames, radiant heat, and embers. NIST's Waldo Canyon Fire (2012) post-investigation in El Paso County, Colorado, reports doors as a frequent damaged component of the building [1]. Maintaining a proper defensible space around the building reduces the potential thermal insults from flames. However, embers can still accumulate at the base of a door and potentially penetrate through the door jamb. IBHS's post-Marshall Fire (2021) investigation in Boulder County, Colorado, showed damage to exterior doors due to ember accumulation at the base, as can be seen in Figure 1a. Figure 1b demonstrates ignition of the door jamb due to ember penetration during the Victorian Bushfire (2009) in Australia [2].

(a) *(b)*

Figure 1. ignition from accumulation of embers and debris at the base of the door.

This code change proposal intends to address this vulnerability by providing requirements for all buildings located in wildfire prone areas (IR1,2 and 3) to protect the exterior doors against embers.

Requiring a 6-in noncombustible vertical protection by a kickplate at the base of exterior doors or a storm door will reduce this vulnerability (Figure 2).



(a) *(b)*

Figure 2. Protection for exterior doors (a) storm door, (b) kickplate.

The 6-in noncombustible vertical clearance at the base of the door can protect the exterior door assembly against embers. As a part of this effort, a new section was added to the IR1, 2, and 3 exterior doors to protect exterior underfloor access doors (Figure 3) against embers.

(a) (b)

Figure 3. Exterior underfloor access doors (a) unprotected vs. (b) protected against embers.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This code change will slightly increase the construction cost by requiring a 6-in noncombustible protection at the base for exterior doors and exterior underfloor access doors.

Estimated Immediate Cost Impact Justification (methodology and variables):

A web search of several retailers carrying kickplate, storm doors and a metal underfloor access door revealed that a kickplate costs approximately $33, a storm door costs approximately $400 and 12-in by 12-in metal underfloor access door costs around $40. Additional labor costs are estimated to be negligible.

WUIC45-24

WUIC46-24

IWUIC: 504.9.1 (New), ASTM Chapter 07, UL Chapter 07

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Add new text as follows:

504.9.1 Garage door perimeter gap. Exterior garage doors for vehicles shall resist the intrusion of embers by protecting the gaps between each door and the opening at the bottom, sides and top by all of the following:

1. Bottom opening shall provide a maximum gap of 1/8 inch (3.2 mm) between the surface and the door opening seal.
2. Sides and top by one or more of he following:

    2.1 Provide a maximum gap of 1/8 inch (3.2 mm) between the door and the door opening.

    2.2 Cover or block the gap with weather-stripping products constructed of materials which comply with both of the following:

    2.2.1 The tensile strength of he material shall be tested in accordance with ASTM D638 before and after light exposure in accordance with ASTM G155 for a period of 2000 hours, and the maximum allowable difference in tensile strength values between exposed and non-exposed samples shall not exceed 10 percent.

    2.2.2 The material shall be tested in accordance with UL 94 and have a flammability rating of V-2 or better.

    2.3 Cover or block the gap with metal flashing.

Northbrook, IL 60062-2096

94-2023	Tests for Flammability of Plastic Materials for Parts in Devices and Appliances, 7th edition

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024:

- ***Standard Test Method for Tensile Properties of Plastics (ASTM D638-22)***
- ***Practice for Operating Xenon Arc Light Apparatus For Exposure of Nonmetallic Materials (ASTM G155-21)***
- ***Safety of Flammability of Plastic Materials for Parts in Devices and Appliances, 7th edition (UL 94-2023)***

Reason: One of the issues with wildland fires is the spread of flaming or hot embers into structures. This proposal is intended to address protection of vehicle door of a garage to reduce this exposure and eliminate a route of ember entry by addressing the gap created between the garage door and the garage door opening.

Section 504.9.1 requires a battery backup for motorized garage door openers. Often in a wildland fire, utility power is shut down, or damaged, to an area or region. When the utility power is no longer available, and the residents need to evacuate, the garage door can still be opened to allow vehicles to exit and then closed to protect the opening into the garage.

Section 504.9.2 addresses the gap, or clearance, provided around the garage door allowing for door movement and operation. This gap needs to be evaluated to inhibit the passage of flaming embers. There are four methods of protection offered in this section: 1) design the door so there is a maximum ⅛" gap on all four sides of the door; 2) provide weatherstripping to cover or fill the gap—weatherstripping must be designed to stay in place during the impact of the fire so criteria is provided (Items 2.1 and 2.2) to address the strength and flammability of the material; and 3) install metal flashing to cover the gap. Any one of the methods can be utilized, or a combination of these methods will suffice. For example, the door may have less than a 1/8” gap along the header (Item 3) and be provided with weatherstripping on the bottom and sides (Item 2).

As part of the requirements for protecting the gap, new test standards are included to ensure that where weather-stripping is chosen as the solution, the weather-stripping material is reliable and dependable for the purpose.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: Increase

Estimated Immediate Cost Impact:

The approximate cost of compliance to add an approved protection material around the edges of a vehicle garage door is $50. As this is only one of the compliance options, the added cost will be applicable in an estimated 1/3 to 1/2 of the cases.

Estimated Immediate Cost Impact Justification (methodology and variables):

The materials needed for compliance with this proposal are readily available in the retail and wholesale building supply chain. Installation labor is minimal or can be DIY.

325—2017 Door, Drapery, Gate, Louver, and Window Operators and Systems

Staff Analysis: The standard proposed for inclusion in the code, Door, ***Drapery, Gate, Louver, and Window Operators and Systems (UL 325-2017)***, is currently referenced in the IRC.

Reason: One of the tragic situations that has occurred in wildland fires is the inability to open the electrically operated garage door vehicle doors so the occupants can utilize their vehicle to evacuate as a fire approaches. This proposal adds Section 504.9.1 which will require garage doors in the interface area to be provided with backup power for operation when utility power is unavailable.

Section 504.9.1 requires a battery backup for motorized garage door openers. Often in a wildland fire, utility power is shut down or power lines are damaged—both possibly affecting an entire area or region. Regardless of the cause, when utility power is no longer available and residents need to evacuate, the backup power supply will allow the garage door to be opened allowing occupants and vehicles to exit. After the occupants have driven out of the garage, the garage door can then be closed to protect the opening into the garage from the approaching fire.

It is true that motorized garage door opening devices have a release to allow for manual operation; however, manual operation is difficult, if not impossible, for elderly residents. Even if they are able to open the door, they most likely will not stop the vehicle to return and manually close the garage door as they evacuate. The battery backup allows for the normal opening and closing that they are accustomed to and increases the likelihood that the garage door will be closed when they depart.

In October 2017 Northern California wildfires were the most deadly in California's history, killing 43 people and forcing thousands to evacuate from their homes. News media told the story of one Santa Rosa resident who was obstructed from evacuating her home when her garage door would not open as a result of an associated power outage. With the help of neighbors, she was able to manually open the door and escape. Not everyone was so fortunate. It has been reported that at least five of people lost their lives during the evacuation because they could not get out of their garages because of the power outages. Several people were found in their cars inside their garage. As strong winds accelerate the spread of wildfires, utilities often shut off the power to prevent a falling line from igniting new fires. Several utilities routinely shut down power during specific weather conditions as part of a pre-emptive plan to eliminate a potential fire start should an active power line be damaged and fall as a result of the weather. Cutting power increases the risk of residents being blocked by their garage doors, which do not operate during an outage. Requiring that automatic garage door openers include a backup battery will assist residents in safely evacuating their residence during an evacuation.

Providing a battery backup for garage door openers is not a new concept. The technology and equipment for battery backup is currently available. Manufacturers offer a battery backup as an option for new devices, and even offer a battery backup kit that can be added to existing garage door openers. Garage door opener manufacturers have been providing a backup battery for all garage door openers sold in California since January 1, 2019.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal does not mandate the installation or use of an automatic garage door opener. For owners that choose to purchase one, a new garage door opener with an integral backup battery costs approximately $30-$40 more than an opener with no battery backup.

Estimated Immediate Cost Impact Justification (methodology and variables):

Average retail price for automatic door openers with and without battery backup.

WUIC47-24

WUIC48-24

IWUIC: 504.10, 505.10

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Vents.
Where provided, ~~ventilation~~ openings ~~for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening~~ intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

505.10 Vents.
Where provided, ~~ventilation~~ openings ~~for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening~~ intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

Reason: The existing charging language of sections 504.10 and 505.10 contains a lengthy and potentially incomplete list which includes a mixture of constructions (e.g., enclosed attics, enclosed eave soffit spaces, enclosed rafter spaces) and ventilation opening locations (e.g., gable ends, ridge ends, under eaves and cornices, foundations). However, a careful review of the current language reveals the intent is for the provisions to apply to any "opening intended to permit ventilation." This proposal simplifies the charging language by removing the list and relying on the heart of the provision, i.e., all ventilation openings are to be protected.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal makes no technical change to existing provisions. Therefore, there should be no impact on construction cost. See also the proponent’s reason statement.

WUIC48-24

WUIC49-24

IWUIC: 504.10, 504.10.1, 504.10.2, 505.10, 505.10.1, 505.10.2, ASTM Chapter 07 (New)

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Vents.
Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 ~~to resist building ignition from the intrusion of burning embers and flame through the ventilation openings~~.

504.10.1 Performance requirements.
Ventilation openings shall be fully covered with listed vents, tested in accordance with ASTM E2886, to demonstrate compliance with all the following requirements:

1. There shall be no flaming ignition of the cotton material during the Ember Intrusion Test.
2. There shall be no flaming ignition during the Integrity Test portion of the Flame Intrusion Test.
3. The maximum temperature of the unexposed side of the vent shall not exceed 662°F (350°C).

<u>Joints around such vents shall be sealed with sealants complying with ASTM E814 or ASTM E1966 and in accordance with vent manufacturer installation instructions to avoid flame intrusion through the joints.</u>

504.10.2 Prescriptive requirements.
Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed $^1/_8$ inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.

Revise as follows:

505.10 Vents.
Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 ~~to resist building ignition from the intrusion of burning embers and flame through the ventilation openings~~.

505.10.1 Performance requirements.
Ventilation openings shall be fully covered with listed vents, tested in accordance with ASTM E2886, to demonstrate compliance with all the following requirements:

1. There shall be no flaming ignition of the cotton material during the Ember Intrusion Test.
2. There shall be no flaming ignition during the Integrity Test portion of the Flame Intrusion Test.
3. The maximum temperature of the unexposed side of the vent shall not exceed 662°F (350°C).

<u>Joints around such vents shall be sealed with sealants complying with ASTM E814 or ASTM E1966 and in accordance with vent manufacturer installation instructions to avoid flame intrusion through the joints.</u>

505.10.2 Prescriptive requirements.
Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

<u>ASTM E814-2013A(2017)</u>	<u>Standard Test Method for Fire Tests of Penetration Firestop Systems</u>
<u>ASTM E1966-15 (Reapproved 2019)</u>	<u>Standard Test Method for Fire-Resistive Joint Systems</u>

Staff Analysis: The following standards proposed for inclusion in the code are currently referenced by the IBC:
- ***Standard Test Method for Fire Tests of Penetration Firestop Systems (ASTM E814-2013A(2017))***
- ***Standard Test Method for Fire-Resistive Joint Systems (ASTM E1966-15 (Reapproved 2019)***

Reason: This code modification is intended to improve the fire performance of and enhance the clarity of the existing IWUI code requirements related to vents.

The last sentence in the charging paragraph is deemed unnecessary and potentially misleading. This sentence stipulates that vents must be constructed according to either the performance or prescriptive requirements to resist ember and "flame" intrusion. While performance-based requirements can achieve ember and flame resistance, prescriptive requirements only protect against ember intrusion, not flame intrusion. Deleting this unnecessary portion of the charging paragraph will eliminate confusion around flame intrusion and accurately acknowledge that mesh screens can only resist ember intrusion.
The second concern pertains to flame intrusion through joints around approved vents tested in accordance with ASTM E2886. Experiments at the IBHS research center revealed that, in the absence of appropriate sealant, flames can pass through unsealed joints around these vents (see Figure 1). A review of approved vent manufacturers' installation instructions regarding sealants for vent joints revealed some inconsistencies. This proposal specifically requires vent joints to be sealed with a sealant complying with ASTM E814 or ASTM E1966.

Figure 1.

Fire intrusion through the joints around an ASTM E2886 approved eave vent.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The primary purpose of this modification is to enhance the clarity of IWUIC provisions regarding the fire performance of vents. Most manufacturers of these vents already require a specific fire resistant sealant as part of their installation instructions. For these manufacturers, this proposal will not have any impact on the cost of construction. However, for manufacturers that do not specifiy a sealant, it is anticipated that this proposal will have a cost impact of $15-$30 depending on the number of ventilation openings and the size of the building. For typical single family dwellings, it is estimated that one tube of sealant (approximately $15) will be sufficient to seal all ventilation openings.

Estimated Immediate Cost Impact Justification (methodology and variables):

A web search of several retailers carrying sealants complying with ASTM E814 or ASTM E1966 revealed that one tube of sealant costs approximately $15. Additional labor costs are estimated to be negligible.

WUIC50-24

IWUIC: 504.10.3, 505.10.3

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.10.3 Vent locations.
~~Attic ventilation openings shall not be located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas.~~ Gable-end and dormer vents shall be located not less than 10 feet (3048 mm) from lot lines. Underfloor ventilation openings shall be located as close to grade as practical.

505.10.3 Vent locations.
~~Attic ventilation openings shall not be located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas.~~ Gable-end and dormer vents shall be located not less than 10 feet (3048 mm) from lot lines. Underfloor ventilation openings shall be located as close to grade as practical.

Reason: Sections 504.10 and 505.10 permit ventilation openings "for enclosed attics, ... under eaves and cornices, enclosed eave soffit spaces, [and] enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters ...." Sections 504.10.3 and 505.10.3 expressly exclude attic ventilation openings "located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas." This proposal corrects this logical inconsistency by removing the restriction on vents located in soffits, in eave overhangs, between rafters at eaves, or in other overhang areas from Sections 504.10.3 and 505.10.3. Vents must comply with the performance or prescriptive requirements within Sections 504.10 or 505.10, and those that do so should be permitted for any ventilation opening regardless of location.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal corrects a logical inconsistency between code sections for IR 1 and IR 2 construction. As such, the changes proposed are not expected to change the cost of construction.

WUIC50-24

WUIC51-24

IWUIC: 504.10, 504.10.2, 505.10, 505.10.2, 506.5

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Vents.
Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, ~~either in a horizontal or vertical surface~~, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

504.10.2 Prescriptive requirements.
~~Where provided, attic ventilation~~ Ventilation openings~~, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m²) each. Such vents~~ shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed $^1/_8$ inch (3.2 mm) or with vents ~~shall be~~ designed and *approved* ~~approved~~ to prevent flame or ember penetration into the structure.

505.10 Vents.
Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, ~~either in a horizontal or vertical surface,~~ shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

505.10.2 Prescriptive requirements.
~~Where provided, attic ventilation~~ Ventilation openings~~, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m²) each. Such vents~~ shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or with vents ~~shall be~~ designed and *approved* ~~approved~~ to prevent flame or ember penetration into the structure.

506.5 Vents.
~~Where provided, attic ventilation~~ Ventilation openings~~, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m²) each. Such vents~~ shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or with vents~~shall be~~ designed and *approved* ~~approved~~ to prevent flame or ember penetration into the structure.

Reason: This proposal makes changes to the IWUIC vent provisions (1) to clarify that ventilation openings are permitted on sloped surfaces, (2) to remove the ventilation opening size limitation from the prescriptive compliance option, and (3) to require full coverage of ventilation openings regardless of the compliance path. Also, the proposal cleans up the prescriptive options (sections 504.10.2 and 505.10.2) and section 506.5 by removing the unnecessary and potentially confusing list of ventilation opening locations.

Ventilation Openings on Sloped Surfaces. The ventilation sections in the 2024 IWUIC restrict ventilation openings to horizontal or vertical surfaces. This could imply that ventilation openings on sloped surfaces (e.g., rooftops) are not subject to these requirements, which is not understood to be the intention or a desirable interpretation. Ventilation openings on all surfaces of the building should provide protection, and removal of the restriction to horizontal and vertical surfaces from sections 504.10 and 505.10 clarifies that all ventilation openings must be addressed.

Prescriptive Option Size Limitation. The size of ventilation openings is limited to 144 square inches when complying via the prescriptive option. This restriction has been in the IWUIC since the first edition, but no technical justification was discovered during an examination of the available code development records or through discussions with several parties involved in creation of the original IWUIC and California Building Code Chapter 7A provisions. It is worth noting that California provisions have not included such a size limitation.

Full Coverage of Ventilation Openings. The performance compliance option in sections 504.10.1 and 505.10.1 includes the important provision that ventilation openings be fully covered. This proposal adds this practical requirement to the prescriptive path and to section 506.5.

Cleanup. Sections 504.10.2, 505.10.2 and 506.5 include an unnecessary list of ventilation opening locations. In their simplest form, these sections state, "Where provided, ventilation openings ... in vertical or horizontal surfaces and vents through roofs ...." The intention is clearly to require these provisions to apply to any ventilation opening. The cleanup simplifies the language and eliminates potential misinterpretation of the requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes offered in this proposal primarily improve clarity of existing provisions. Removal of the ventilation opening size restriction which is present in the prescriptive requirements should not affect construction cost because the existing performance path already provides a means to demonstrate compliance for vents installed over ventilation openings which are larger than 144 square inches.

Revise as follows:

504.11 Detached accessory structures.
Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed in accordance with Section 504.5, underfloor areas constructed in accordance with Section 504.6, roof assemblies constructed in accordance with Section 504.2, gutters and downspouts constructed in accordance with Section 504.4 and vents constructed in accordance with Section 504.10.
Where detached accessory structures are located less than 20 feet (6096 mm) from a building containing habitable space, exterior glazing and exterior doors in the detached accessory structure shall not be located in walls that face the building containing habitable space.

Exception: Exterior glazing complying Section 504.8 and exterior doors complying Section 504.9.

~~with materials *approved* for not less than 1-hour *fire-resistance-rated construction*, heavy timber, *log wall construction*, or constructed with *approved noncombustible* materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

Delete without substitution:

~~**504.11.1 Underfloor areas.**~~
~~Where the detached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5 or underfloor protection in accordance with Section 504.6.~~

~~**Exception:** The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

Revise as follows:

505.11 Detached accessory structures.
Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed in accordance with Section 505.5, underfloor areas constructed in accordance with Section 505.6, roof assemblies constructed in accordance with Section 505.2, gutters and downspouts constructed in accordance with Section 505.4 and vents constructed in accordance with Section 505.10.
Where detached accessory structures are located less than 20 feet (6096 mm) from a building containing habitable space, exterior glazing and exterior doors in the detached accessory structure shall not be located in walls that face the building containing habitable space.

Exception: Exterior glazing complying Section 505.8 and exterior doors complying Section 505.9.

~~with materials *approved* for not less than 1-hour *fire-resistance-rated construction*, heavy timber, *log wall construction*, or constructed with *approved noncombustible* materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

Delete without substitution:

~~**505.11.1 Underfloor areas**~~**.**

~~Where the detached *accessory structure* is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 505.5 or underfloor protection in accordance with Section 505.6.~~

> ~~**Exception:** The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or heavy-timber construction or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

Reason: This proposal is intended to improve and enhace the construciton of detached accessory structures in Class 1 and Class 2 ignition-resistant construction. The current language in sections 504.11 and 505.11 contains three primary flaws:

1. The requirements fail to completely safeguard detached accessory structures from ember exposure, which is the most likely scenario in a wildfire event. Consequently, this lack of protection against embers may jeopardize the primary structure, making it vulnerable to direct flame contact and radiant heat exposure emanating from the detached accessory structure.
2. The requirements for exterior walls of detached accessory structures do not align completely with the requirements for the exterior walls of the main structure. Specifically, these sections do not refer to ignition-resistant materials.
3. The requirements for the underfloor area of detached accessory structures in Sections 504.11.1 and 505.11.1 are essentially the same as the requirements in Sections 504.7.1 and 505.7.1 pertaining to appendages and projections. However, they should conform to the requirements for the underfloor areas of structures outlined in sections 504.6 and 505.6.

The proposed language addresses these issues through three key revisions:

1. New language incorporates specific references to requirements for roof assemblies, gutters and downspouts, vents, and windows and doors for detached accessory structures to enhance their resistance to embers.
2. Referring to sections 504.5 and 505.5 for exterior walls to ensure comprehensive coverage and prevent future misalignment.
3. Referring to sections 504.6 and 505.6 for underfloor areas to ensure all possible options are available, reducing the likelihood of confusion and misalignment.

While the second and third items above are primarily intended to correlate the technical requirements with the current language, the first item is intended to enhance the ember resistance of detached accessory structures. It does this by mandating a Class A roof assembly, noncombustible gutters and downspouts, gutter protection, and vent protection. Additionally, it restricts the proximity of exterior openings facing the main structure to a minimum of 20 feet. This restriction is designed to shield the main structure from potential direct flame contact and radiant heat exposure caused by fire jetting out of window and door openings in detached accessory structures.

Based on structural separation experiments conducted by IBHS and NIST [1-3] and observations during these experiments, (see Figure 1) it is evident that the orientation of openings plays a significant role in the fire exposure for the target structure, particularly when the detached accessory structure is located less than 20 feet from the building. Therefore, it is recommended that openings in detached accessory structures located within this range not be located in walls that face the primary structure.

Figure 1. Possible fire exposure to target structure caused by noncombustible detached accessory structures 20 ft away from target structure.

4. Barrett, K., Quarles, S., Gorham, D. (2022). *Construction costs for a wildfire-resistant home, California edition.* Headwaters Economics and Institute for business & home safety (IBHS).

Cost Impact: Increase

Estimated Immediate Cost Impact:

The proposed alteration will result in increased construction costs as it necessitates compliance with specific sections concerning the roof assembly, gutters, vents, and openings within a 20-foot proximity to the main structure.

Estimated Immediate Cost Impact Justification (methodology and variables):

In 2022, a study conducted by IBHS and Headwaters Economics assessed the expenses associated with constructing more wildfire-resistant homes in California. According to the findings, addressing the vulnerability of various elements, including those mentioned above, can be achieved for a cost of less than $3,000 during new construction [4].

Estimated Life Cycle Cost Impact:

The proposed change also has cost advantages, both in the short and long term, of implementing new requirements that will enhance the safety of first responders during a wildfire incident, as well as improve fire and life safety measures.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This proposal will enhance the resilience of detached accessory structures to ember exposure, consequently improving the fire safety of buildings with living spaces next to these detached structures. This increased resilience at the property level will yield lasting economic advantages for the community and the businesses within it.

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 503
~~IGNITION-RESISTANT~~ WILDLAND CONSTRUCTION AND MATERIAL

503.1 General.
Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall ~~meet~~comply with the construction requirements in ~~accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively~~ Section 504. Materials required to be ignition-resistant materials shall comply with the requirements of Section 503.2.

Delete without substitution:

~~TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION[a]~~

DEFENSIBLE SPACE[c]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply[b]		Water Supply[b]		Water Supply[b]	
	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]
Nonconforming	IR 2	IR 1	IR 1	IR 1 N.C.	IR 1 N.C.	Not Permitted
Conforming	IR 3	IR 2	IR 2	IR 1	IR 1	IR 1 N.C.
1.5 × Conforming	Not Required	IR 3	IR 3	IR 2	IR 2	IR 1

~~a. Access shall be in accordance with Section 403.~~

~~b. Subdivisions shall have a conforming water supply in accordance with Section 402.1.~~

~~IR 1 = Ignition-resistant construction in accordance with Section 504.~~

~~IR 2 = Ignition-resistant construction in accordance with Section 505.~~

~~IR 3 = Ignition-resistant construction in accordance with Section 506.~~

~~N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.~~

~~c. Conformance based on Section 603.~~

~~d. Conformance based on Section 404.~~

~~e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.~~

Revise as follows:

503.2 Ignition-resistant building material.
Ignition-resistant building materials shall be designed for exterior use and comply with any one of the requirements in Section 503.2.1 through ~~503.2.4~~ 503.2.4.3.3.

503.2.1 Noncombustible material.
Material shall comply with the definition of *noncombustible* materials in Section 202.

503.2.2 Fire-retardant-treated wood.
Fire-retardant-treated wood shall be identified for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

503.2.3 Fire-retardant-treated wood roof coverings.
Roof assemblies containing fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

503.2.4 Ignition-resistant building material.
Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^1/_8$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3.

Exception: Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

503.2.4.1 Flame spread.
The material shall exhibit a flame spread index not exceeding 25.

503.2.4.2 Flame front.
The material shall exhibit a flame front that does not progress more than 10 feet 6 inches (3200 mm) beyond the centerline of the burner at any time during the test.

503.2.4.3 Weathering.
Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. The materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in Sections 503.2.4.3.1 through 503.2.4.3.3, as applicable to the materials and conditions of use.

503.2.4.3.1 Evaluation requirements for weathering.
Fire-retardant-treated wood, wood-plastic composite materials and plastic lumber materials shall be evaluated after weathering in accordance with Method A “Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing” in ASTM D2898.

503.2.4.3.2 Wood-plastic composite materials.
Wood-plastic composite materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D7032 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

503.2.4.3.3 Plastic lumber materials.
Plastic lumber materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D6662 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

Reason: This code change proposes one construction method for buildings and structures in the wildland-urban interface area. This is a companion proposal to another proposal which deletes Sections 505 and 506. In other words, the other proposal removes Ignition Resistant Construction Classes 2 and 3. Replacing these multiple classifications with a single defined Ignition Resistant Construction as provided by Section 504 of this code. As the IWUIC is intended to provide a minimum standard of protection for the Wildland-Urban Interface areas, a single classification of Ignition Resistant Construction should be provided to accomplish the following goals:

1. Protect lives and property within the Wildland-Urban Interface areas
2. Provide clear and consistent standards, simplifying the construction process
3. Providing a minimum standard of protection, with appendices providing potential pathways for increased protection beyond the minimum

Defensible space is a component of home hardening and the benefits go hand in hand with the construction materials. Embers will find the path of least resistance.

Defensible space is the buffer between your structure and the surrounding area.

Adequate defensible space acts as a barrier to slow or halt the progress of fire that would otherwise engulf your property. It also helps ensure the safety of firefighters defending your home. Defensible space is the first line of defense for your home against wildfire.

The intensity of wildfire fuel management varies within the 100-foot perimeter of the home, with more intense fuels’ reduction occurring closer to your home. Start at the home and work your way out to 100 feet or to your property line, whichever is closer. Learn more about the Defensible Space Zones below.

It takes the combination of both Defensible Space and Home Hardening to give your home and property the best chance of surviving a wildfire.

Fire Research Division | NIST

https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2205.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

Construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs

Estimated Immediate Cost Impact Justification (methodology and variables):

In 2004, and as a precursor to California adopting Building Code Chapter 7A, the Office of the State Fire Marshal requested an analysis identifying the costs and benefits associated with proposed regulations in the state's wildfire-prone areas. The study was conducted by Fire Cause Analysis and evaluated economic and construction data within various business sectors to analyze construction costs if proposed regulations were implemented.33 The study found construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs. As an aggregated total at the state level, construction costs would increase approximately $30 million per year for the estimated 14,000 new homes built in areas where regulations would apply. The authors concluded the costs of not implementing regulations, in the form of property losses and suppression costs, exceeded the projected costs for regulations and therefore recommended adopting mitigation standards in wildfire-prone areas.

In 2019, the National Institute of Building Sciences (NIBS) released a report identifying the benefit-cost ratio (BCR) of investing in hazard mitigation, including wildfires.35 The authors found that for every $1 spent on up-front costs for wildfire mitigation, a benefit of $4 was received.

In 2021, the National Research Council of Canada released a study analyzing the benefit-cost ratio for building new construction to comply with the country's wildland urban interface (WUI) Guide.38 In its examination, approximately $12,000 CAD (~$9,500 USD) was added to the overall costs for a new, 2,000-square-foot home to meet the provision of Canada's National WUI Guide. The comprehensive report also examined costs for retrofitting existing structures, as well as transferred costs at the community and national scale. Similar to the NIBS study in 2019, the NRC report found an up-front investment in wildfire-resistant construction and vegetation management yielded benefits that exceeded long-term costs and losses.

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 504
~~CLASS 1 IGNITION-RESISTANT CONSTRUCTION~~ CONSTRUCTION METHODS FOR EXTERIOR WILDFIRE EXPOSURE

504.1 General.
~~Class 1 ignition~~ Ignition-resistant construction shall be in accordance with Sections 504.2 through ~~504.11~~ 504.11.6.

504.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with a Class A ~~rating~~ fire classification when tested in accordance with ASTM E108 or UL 790. ~~For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible *roof deck*~~.

Exceptions:

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

Add new text as follows:

504.2.1 Roof covering gaps. Roof covering gaps and voids shall be protected as follows:

1. Where the roofing covering profile has an airspace under the roof covering and is installed over a combustible deck, the combustible deck shall be protected by any of the following:
   - 1.1 Install a 72-pound (32.7 kg) cap sheet, complying with ASTM D3909, over the roof deck.
   - 1.2 Install mineral wool board or other noncombustible material with a minimum thickness of 1 inch (25.4 mm) between the roofing material and the wood framing or deck.
   - 1.3 Install a Class A fire classification roof underlayment, tested in accordance with ASTM E108 or UL 790. If the sheathing consists of exterior fire-retardant treated wood, the underlayment shall not be required to comply with a Class A classification.
2. Bird stops shall be used at the eaves, when the profile fits, to prevent debris from entering at the eave. Hip and ridge caps shall be mudded to prevent intrusion of fire or embers.

Revise as follows:

~~504.2.1~~ 504.2.2 Roof valleys.
Where provided, valley flashings shall be not less than 0.019 inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.~~4~~7 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 running the full length of the valley.

Add new text as follows:

504.2.3 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 504.8

Revise as follows:

504.3 Protection of enclosed eaves.
The exposed underside of enclosed roof ~~Eaves~~eaves and soffits shall be protected on the exposed underside by any of the following:

1. Noncombusible materials.
2. ~~ignition-resistant I~~gnition-resistant materials. ~~or by~~
3. Fire-retardant-treated wood labeled for exterior use.
4. ~~materials~~Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.~~,~~
5. 2-inch (51 mm) nominal dimension lumber.~~, or~~
6. 1-inch (25 mm) nominal fire-retardant-treated lumber or $^3/_4$-inch (19.1 mm) nominal fire-retardant-treated plywood~~,~~ identified for exterior use ~~and meeting the requirements of Section 2303.2 of the International Building Code~~.
7. Boxed-in roof eave soffit assemblies with an underside that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

Fascias are required and shall be ~~protected on the backside by~~ ignition-resistant materials, fire retardant-treated wood labeled for exterior use ~~or by~~ materials *approved* for not less than 1-hour *fire-resistance-rated construction* or 2-inch (51 mm) nominal dimension lumber.

Add new text as follows:

504.3.1 Protection of open eaves. The exposed roof deck on the underside of unenclosed roof eaves shall consist of one or more of the following:

1. Noncombustible material.
2. Ignition-resistant material.
3. Fire-retardant-treated wood labeled for exterior use.
4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side.
5. 2-inch (51 mm) nominal dimension lumber.
6. One layer of 5/8-inch (16 mm) Type X gypsum sheathing applied behind an exterior covering on the underside of the roof deck.
7. The exterior portion of a 1-hour fire-resistance-rated exterior assembly applied to the underside of the roof deck designed for exterior fire exposure, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.

Fascias, if provided, shall be of fire-retardant-treated wood, ignition-resistant materials, materials approved for not less than 1-hour fire-resistance -rated construction or 2-inch (51 mm) nominal dimension lumber.

504.4 Gutters and downspouts.
Gutters and downspouts shall be constructed of *noncombustible* material. Gutters shall be provided with an *approved* means to prevent

the accumulation of leaves and debris in the gutter.

Revise as follows:

504.5 Exterior walls.
Exterior walls of buildings or structures shall be constructed with one of the following methods:

1. ~~Materials *approved* for not less than~~ 1-hour *fire-resistance-rated construction* ~~on the exterior side~~.
2. *Approved noncombustible* materials.
3. Heavy timber. ~~or *log wall construction*~~ Assembly of sawn lumber or glue-laminated wood with the smallest minimum nominal dimension of 4 inches (102 mm). Sawn or glue-laminated planks splined, tongue-and-grove or set close together and well spiked.
4. Log wall construction. Assembly that has been tested in accordance with the test procedures for a 10-minute direct flame contact exposure test set forth in ASTM E2707 with the conditions of acceptance shown in Section 504.9.3.
5. Wall assemblies suitable for exterior fire exposure containing one layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind the exterior wall covering or cladding on the exterior side of the framing.

~~4.~~ 6. Fire-retardant-treated wood ~~on the exterior side. The fire-retardant-treated wood~~ shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

~~5~~ 7. Ignition-resistant materials complying with Section 503.2 ~~on the exterior side~~.

Such material shall extend from the top of the foundation to the underside of the roof sheathing.

Add new text as follows:

504.5.1 Exterior wall coverings. The exterior wall covering shall comply with one or more of the following requirements, except as permitted for exterior walls complying with Section 504.5:

1. Noncombustible material.
2. Ignition-resistant material labeled for exterior use.
3. Fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and shall meet the requirements of Section 2303.2 of the International Building Code.

Revise as follows:

504.5.~~1~~ 2 Flashing.
A minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the wall shall be installed at the ground, decking and roof intersections.

504.6 Underfloor enclosure.
Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5.

> **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

Revise as follows:

504.7 ~~Appendages and projections~~ Projections.
Unenclosed accessory structures attached to buildings with habitable spaces and projections, ~~such as~~other than decks, shall be ~~not less than 1-hour fire-resistance-rated construction,~~ *heavy timber construction* or constructed of one of the following:

1. ~~*Approved noncombustible*~~ Noncombustible materials.
2. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
3. Ignition-resistant building materials in accordance with Section 503.2.

   ~~**Exception:** Coated materials shall not be used as the walking surface of decks.~~

4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side, as tested in accordance with ASTM E119 or UL 263.
5. One layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind the exterior covering on the underside of the ceiling.
6. The exterior portion of a 1-hour fire-resistance-rated exterior assembly, as tested in accordance with ASTM E119, applied to the underside of the ceiling assembly, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.
7. The underside of a floor projection assembly that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

504.7.1 ~~Underfloor areas~~ Underside of projections.
~~Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5.~~
The underside of projections shall be enclosed to grade in accordance with the requirements of this chapter or the underside of the exposed underfloor shall be protected by one or more of the following:

Exception: Structural columns and beams are not required to be protected in accordance with Section 504.7.1 when constructed with sawn lumber or glue-laminated wood with the smallest minimum nominal dimension of 4 inches (102 mm). Sawn or glue-laminated planks shall be splined, tongue-and-groove, or set close together and well spiked.

1. Noncombustible material.
2. The ignition-resistant material shall be labeled for exterior use and shall meet the requirements of Section 503.2.
3. The fire-retardant-treated wood shall be labeled for exterior use and shall meet the requirements of Section 2303.2 of the International Building Code.
4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side, as tested in accordance with ASTM E119 or UL 263.
5. One layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind an exterior covering on the underside of the floor projection.
6. The exterior portion of a 1-hour fire-resistance-rated exterior assembly, as tested in accordance with ASTM E119 or UL 263, applied to the underside of the floor, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.
7. The underside of a floor assembly that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

Add new text as follows:

504.7.2 Conditions of acceptance for ASTM E2957. The ASTM E2957 test shall be conducted on a minimum of three test specimens and meet the conditions of acceptance in Items 1 through 3 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Absence of flame penetration of the eaves or horizontal projection assembly at any time.
2. Absence of structural failure of the eaves or horizontal projection subassembly at any time.
3. Absence of sustained combustion of any kind at the conclusion of the 40-minute test.

504.7.3 Decks. The walking surface material of decks, porches, balconies and stairs shall comply with the requirements of Sections 504.7.3.1 through 504.7.3.4.

504.7.3.1 Flashing. A minimum of a 6-inch (150 mm) metal flashing, applied vertically on the exterior of the wall, shall be installed at all deck-to-wall intersections.

504.7.3.2 Decking surfaces. The walking surface material of decks, porches, balconies and stairs shall be constructed with any of the following materials:

1. Material that complies with the performance requirements of Section 504.7.3.3.
2. Ignition-resistant material that complies with the performance requirements of Section 504.7.2.
3. Fire-retardant-treated wood labeled for exterior use and shall meet the requirements of section 2302 of the International Building Code.
4. Noncombustible material.
5. Any material that complies with the performance requirements of Section 504.7.3.4 when tested in accordance with ASTM E2632 provided that any attached exterior wall covering is noncombustible or ignition-resistant materials.

    Exception: Wall material shall be permitted to be of any material that otherwise complies with this chapter when the decking surface material complies with the performance requirements ASTM E84 with a Class B flame spread index.

504.7.3.3 Performance requirements for Section 504.7.3.2, Item 1. Materials shall be tested in accordance with both ASTM E2632 and ASTM E2726 and comply with the conditions of acceptance in Sections 504.7.3.3.1 and 504.7.3.3.2. The material shall also be tested in accordance with ASTM E84 or UL 723 and comply with the performance requirements of Section 503.2.4.

504.7.3.3.1 Conditions of acceptance for ASTM E2632. . The ASTM E2632 test shall be conducted on a minimum of three test specimens and meet the conditions of acceptance in Items 1 through 3 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Peak heat release rate of less than or equal to 25 kW/ft^2 (269 kW/m^2).
2. Absence of sustained flaming or glowing combustion of any kind at the conclusion of the 40-min observation period.
3. Absence of falling particles that are still burning when reaching the burner or floor.

504.7.3.3.2 Conditions of acceptance for ASTM E2726. The ASTM E2726 test shall be conducted, using a "Class A" size roof test brand, on a minimum of three test specimens and meet the conditions of acceptance in Items 1 and 2 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Absence of sustained flaming or glowing combustion of any kind at the conclusion of the 40-minute observation period.
2. Absence of falling particles that are still burning when reaching the burner or floor.

504.7.3.4 Performance requirements for Section 504.7.3.2, Item 5. The ASTM E2632 test shall be conducted on a minimum of three test specimens and meet the condition of acceptance in Item 1 below. If any one of the three tests does not meet the condition of acceptance, three additional tests shall be performed. All three additional tests must show a peak heat release rate shall be 25 kW/ft^2 (269 kW/ m^2) or less.

Revise as follows:

504.8 Exterior glazing.
Exterior windows, window walls and <u>exterior</u> glazed doors <u>having a glazed area of 25 percent or more of the door area</u>, windows within exterior doors, and skylights shall be <u>constructed of any of the following:</u>

1. ~~tempered glass, multilayered glazed panels,~~ Multilayered glazed panels <u>with at least one tempered panel or dome</u> <u>complying with Section 2406 of the International Building Code.</u> ~~,~~
2. ~~glass~~ <u>Glass</u> block <u>units.</u> ~~, or have a~~
3. <u>A minimum</u> fire-protection rating of ~~not less than~~ 20 minutes <u>when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.</u>

Add new text as follows:

<u>**504.8.1**</u> <u>**Structural glass veneer.**</u> <u>The wall assembly behind structural glass veneer shall comply with Section 504.5.</u>

<u>**504.8.2**</u> <u>**Operable skylights.**</u> <u>Operable skylights shall be protected by a non-combustible mesh screen and the dimensions of the openings in the screen shall not exceed ⅛ inch (3.2 mm).</u>

Revise as follows:

504.9 Exterior doors.
Exterior doors shall be <u>constructed in accordance with any of the following:</u>

1. ~~*approved noncombustible*~~ <u>Noncombustible</u> construction<u>.</u>~~,~~
2. ~~solid core~~ <u>Solid-core</u> wood not less than $1^3/_4$ inches thick (44 mm)<u>.</u>~~, or~~
3. ~~have~~ <u>Have</u> a fire protection rating of not less than 20 minutes <u>when tested according to NFPA 252.</u>
4. <u>The exterior door shall be constructed of solid core wood that complies with the following requirements:</u>
   4.1. <u>Stiles and rails shall not be less than 1 3/8 inches (35 mm) thick.</u>
   4.2. <u>Panels shall not be less than 1¼ inches thick, except for the exterior perimeter of the panel that shall be permitted to taper to a tongue not less than 3/8 inch (35 mm) thick.</u>
5. <u>The exterior surface or cladding shall be tested to meet the performance requirements of Section 504.9.3 when tested in accordance with ASTM E2707 with the conditions of acceptance shown in Section 504.9.3.</u>

Windows within doors and exterior glazed doors shall be in accordance with Section 504.8.

~~**Exception:** Vehicle access doors.~~

Add new text as follows:

<u>**504.9.1**</u> <u>**Garage doors.**</u> <u>Automatic garage door openers for vehicle doors serving a residential building shall be equipped with a battery backup function.</u>

<u>**504.9.2**</u> <u>**Garage door perimeter gap.**</u> <u>Exterior garage doors shall resist the intrusion of embers from entering by preventing gaps between doors and door openings, at the bottom, sides and tops of doors, from exceeding ⅛ inch (3.2 mm). Gaps between doors and door openings shall be controlled by one of the following methods:</u>

1. <u>Weather-stripping products shall be constructed of materials which comply with both of the following:</u>
   1.1. <u>The tensile strength of the material shall be tested in accordance with ASTM D638 before and after exposure to ASTM G155 for a period of 2,000 hours, and the maximum allowable difference in tensile strength values between exposed and non-exposed samples shall not exceed 10 percent.</u>
   1.2. <u>When tested to UL 94, the materials shall have a flammability rating of V-2 or better.</u>
2. <u>Door overlaps onto jambs and headers.</u>

3. Garage door jambs and headers covered.

504.9.3 Conditions of acceptance for ASTM E2707. The ASTM E2707 test shall be conducted on a minimum of three test specimens and meet the conditions of acceptance in Items 1 and 2 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Absence of flame penetration through the wall assembly at any time.
2. Absence of evidence of glowing combustion on the interior surface of the assembly at the end of the 70-minute test.

504.10 Vents.

Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

504.10.1 Performance requirements.

Ventilation openings shall be fully covered with listed vents, tested in accordance with ASTM E2886, to demonstrate compliance with all the following requirements:

1. There shall be no flaming ignition of the cotton material during the Ember Intrusion Test.
2. There shall be no flaming ignition during the Integrity Test portion of the Flame Intrusion Test.
3. The maximum temperature of the unexposed side of the vent shall not exceed 662°F (350°C).

Delete and substitute as follows:

~~**504.10.2 Prescriptive requirements**~~**.**

~~Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m²) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.~~

504.10.2 Off ridge and ridge vents. Vents that are installed on a sloped roof, such as dormer vents, shall comply with all of the following:

1. Vents shall be covered with a mesh where the dimensions of the mesh therein shall be a minimum of 1/16 inch (1.6 mm) and shall not exceed ⅛ inch (3.2 mm) in diameter.
2. The mesh material shall be noncombustible.
3. The mesh material shall be corrosion resistant.

504.10.3 Vent locations.

Attic ventilation openings shall not be located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas. Gable-end and dormer vents shall be located not less than 10 feet (3048 mm) from lot lines. Underfloor ventilation openings shall be located as close to grade as practical.

Delete and substitute as follows:

~~**504.11 Detached accessory structures**~~**.**

~~Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed with materials *approved* for not less than 1-hour *fire-resistance-rated construction* , heavy timber, *log wall construction*, or constructed with *approved noncombustible* materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

504.11 Accessory buildings and miscellaneous structures. Accessory buildings and miscellaneous structures shall be constructed to conform to the ignition-resistance requirements of Sections 504.11.1 through 504.11.6.

~~**504.11.1 Underfloor areas.**~~
~~Where the detached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5 or underfloor protection in accordance with Section 504.6.~~

~~**Exception:** The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

504.11.1 Applicability. Sections 504.11.2 through 504.11.6 apply to accessory buildings, and attached or detached miscellaneous structures, on the same lot as an applicable building, including but not limited to trellises, arbors, patio covers, gazebos and similar structures.

Exceptions:

1. Decks shall comply with the requirements of Section 504.7.3.
2. Awnings and canopies shall comply with the requirements of Section 3105 of the International Building Code.

Add new text as follows:

504.11.2 Miscellaneous structures and accessory buildings within 3 feet.. Miscellaneous structures and accessory buildings of any size, when separated from an applicable building on the same lot by a distance of less than 3 feet (914 mm), shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4.

504.11.3 Accessory buildings greater than 120 square feet, located 3 feet or more but less than 50 feet. Accessory buildings that are greater than 120 square feet (11.15 m²) in size and separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4., located 3 feet or more but less than 50 feet.

504.11.4 Accessory buildings 120 square feet or less, located 3 feet or more but less than 50 feet. When required by the enforcing agency, accessory buildings 120 square feet (11.15 m²) or less and separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4.

504.11.5 Miscellaneous structures located 3 feet or more but less than 50 feet. When required by the enforcing agency, miscellaneous structures that require a permit and are separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4.

504.11.6 Roof construction. Roof assemblies and roof coverings of accessory buildings required to be constructed entirely of noncombustible materials or of ignition-resistant materials shall comply with Sections 504.2 and 504.2.1.

Reason: This code change is to propose one construction method for building and structures in the wildland area. This is the companion to another proposal to delete sections 505 and 506 with the intent to remove Ignition Resistant Construction Classes 2 and 3. Replacing these multiple classifications will be a single defined Ignition Resistant Construction as provided by Section 504. As the IWUIC is intended to provide a minimum standard of protection for the Wildland-Urban Interface areas, a single classification of Ignition Resistant Construction should be provided to accomplish the following goals:

1. Protect lives and property within the Wildland-Urban Interface areas
2. Provide clear and consistent standards, simplifying the construction process
3. Provide a minimum standard of protection, with appendices providing potential pathways for increased protection beyond the minimum

Findings during a NIST case study of the 2018 Camp Fire (https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2135.pdf) found that a primary factor in fire spread was significant ember exposure. As stated in the case study "In agreement with the other NIST case studies of WUI fires, the Camp Fire has demonstrated that embers can have significant impact on WUI communities. Laboratory and field work by NIST [57] has demonstrated that embers with enough energy to cause ignitions are readily generated from parcel-level combustibles such as landscaping mulch, fences, and firewood piles. These parcel-level fuels can cause ignitions over 40 m (130 ft) downwind. Ember ignitions downwind from parcel-level combustibles enable fire to readily spread from parcel to parcel. In high hazard areas, WUI structures therefore need to be able to withstand the exposures generated from both wildland and parcel-level combustibles." (A Case Study of the Camp Fire, pg.141)

Given the distances that embers can travel, this minimum standard of protection should be across all Wildland-Urban Interface areas; regardless of whether they have been designated as Moderate, High or Extreme hazards. An analysis of California structures damaged by wildfire in 2017 found that more homes were damaged in the areas designated as moderate fire hazard severity (3645 damaged) than those damaged in areas designated as very high fire hazard severity (2215 damaged). Of those damaged, a similar percentage of those structures were recorded as destroyed; 92% of damaged structures being destroyed in moderate fire hazard severity zones, and 86% of damaged structures being destroyed in very high fire hazard severity zones. This data indicates that the requirements proposed in 504 which mirror the California Building Code Chapter 7A requirements are working.

Construction Costs for a Wildfire Resistant Home, California Edition (headwaterseconomics.org)

The Headwaters Economics study by the Insurance Institute for Business & Home Safety outlines that California's Chapter 7A requirements should be the bare minimum. If there is a proposal for three construction versions, using the proposed code provisions as the minimum with an enhanced version and an optimum version for best performance standards. "In preliminary research conducted by Baylis and Boomhower (2021), the authors examined home survivability factors for nearly 50,000 homes exposed to wildfires between 2007 and 2020 across California. The authors reported that a home built in 2010 or later was nearly 40% less likely to be destroyed by a wildfire compared to a home built in 1985 or before. Home survivability was closely correlated to modern building codes requiring homeowner mitigation measures. Additionally, a home was more likely to survive if its nearest neighbor also complied with recent mitigation regulations resulting in a positive net spillover effect for the larger neighborhood.

Roof - Section 504.2

Roofs are highly vulnerable to ignition due to their relatively large horizontal surface area. The exposure of roof coverings to a range of climatic conditions, including wind, rain, and sun, means the roof covering will require maintenance and eventual replacement. Many

Class A fire-rated roof covering options are available (e.g., asphalt fiberglass composition shingles). A main reason the roof is vulnerable is because the roof edge—including gutters and roof-to-wall intersections where roof covering meets other materials (e.g., siding used in dormers and split-level homes)—is exposed to ember ignitions. These areas must be properly protected by adding additional flashing at roof-to-wall locations.

Under-Eave Area - Sections 504.3 and 504.3.1

Research suggests eaves are extremely important in structure survivability. Eaves play an important role for building design but they also create vulnerabilities and pathways for the building to ignite. Embers can travel through vents in the eave into the attic and accumulate in gaps between blocking and rafters in open-eave construction. Should flames reach the under-eave area, open eaves can also trap heat. Once there is an ignition in the under-eave area, fire will spread laterally more quickly.

Vents in the under-eave area are inlet openings and therefore allow air to enter the attic space. During a wildfire, vent openings can allow the entry of wind-blown embers into the interior attic space. If combustible materials in the attic ignite, the house can burn from the inside out. The importance of ember and flame entry through vents during a wildfire, and as per requirements in Chapter 7A, have resulted in the development of vents designed to resist the intrusion of flames and embers.

Exterior Wall and Wall Covering - Sections 504.5 and 504.5.1

Exterior walls and components in the wall assembly can be vulnerable if exposed to embers, flames, or prolonged exposure to radiant heat from burning items located close to the home. These exposures can ignite combustible siding and the resulting flames can spread vertically and laterally to other wall components such as windows and the under-eave area. Siding extending close to the ground can be vulnerable to ignition by embers accumulating at the base of the wall that ignite it or components in the wall assembly (e.g., wood sheathing). Requirements are included to address the wall assembly itself, along with the exterior wall covering. The wall could be fire resistant, but a combustible exterior wall covering could carry fire up the wall to the eaves and attic.

Attached Deck - Sections 504.7.3 through 504.7.3.4

Similar to a roof, a deck can cover a large horizontal surface area and can be vulnerable to embers and under-deck flame impingement exposures. A burning deck can expose the side of the house to extended radiant heat and/or direct flame contact. The deck walking surface and structural support members, as well as what is stored on or below the deck are therefore important considerations.

Most commonly used deck board products (including wood and plastic composite boards) are combustible. Decks with noncombustible walking surfaces include lightweight concrete or a flagstone product. Regardless of the walking surface, decks are typically supported by solid wood joists, beams, and columns that will be vulnerable to ignition if nearby combustible materials ignite.

Enclosing the under-deck area vertically around the perimeter can minimize the accumulation of vegetative debris, vegetation, and other combustible materials. For enclosed decks, installing vents to ensure that excessive moisture does not accumulate in the under-deck area is critical to avoid moisture-related degradation.

Glazing - Sections 504.8 through 804.8.2

Window manufacturers and suppliers indicated that where dual-pane windows are required to be tempered, most window manufacturers only supply windows with both panes tempered. Other manufacturers will supply what the customer requests, and will only provide one-pane tempered. Since all comparative versions of the wildfire-resistant home are compliant, the price of windows would not result in a significant cost difference.

Doors - Section 504.9

Doors and door frames can fail for the same reasons as windows. Embers can accumulate in the small gaps between the door and frame, resulting in ignition of the door-framing and weather-sealing material.

Vents - Section 504.10 through 504.10.3

Flame- and ember-resistant vents are required to be listed. Currently, only vents in a vertical orientation are listed. Where vents are installed in other than by the OSFM Building Materials Listing Program, will be required for all attic and crawl space vents.

Accessory Structures - Section

The following table helps visualize the resultant requirements.

NIST Technical note 2205 explains how the mitigation of accessory structures help in hardening a building in the wildland area.

Bibliography: Construction costs for a wildfire-resistant home: California edition - Headwaters Economics

Fire Research Division | NIST

https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2205.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

Construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

In 2004, and as a precursor to California adopting Building Code Chapter 7A, the Office of the State Fire Marshal requested an analysis identifying the costs and benefits associated with proposed regulations in the state's wildfire-prone areas. The study was conducted by Fire Cause Analysis and evaluated economic and construction data within various business sectors to analyze construction costs if proposed regulations were implemented.33 The study found construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs. As an aggregated total at the state level, construction costs would increase approximately $30 million per year for the estimated 14,000 new homes built in areas where regulations would apply. The authors concluded the costs of not implementing regulations, in the form of property losses and suppression costs, exceeded the projected costs for regulations and therefore recommended adopting mitigation standards in wildfire-prone areas.

In 2019, the National Institute of Building Sciences (NIBS) released a report identifying the benefit-cost ratio (BCR) of investing in hazard mitigation, including wildfires.35 The authors found that for every $1 spent on up-front costs for wildfire mitigation, a benefit of $4 was received.

In 2021, the National Research Council of Canada released a study analyzing the benefit-cost ratio for building new construction to comply with the country's wildland urban interface (WUI) Guide.38 In its examination, approximately $12,000 CAD (~$9,500 USD) was added to the overall costs for a new, 2,000-square-foot home to meet the provision of Canada's National WUI Guide. The comprehensive report also examined costs for retrofitting existing structures, as well as transferred costs at the community and national scale. Similar to the NIBS study in 2019, the NRC report found an up-front investment in wildfire-resistant construction and vegetation management yielded benefits that exceeded long-term costs and losses.

~~SECTION 505~~
~~CLASS 2 IGNITION-RESISTANT CONSTRUCTION~~

Revise as follows:

~~505.1 General~~.
~~Class 2 ignition-resistant construction shall be in accordance with Sections 505.2 through 505.11.~~

~~505.2 Roof assembly~~.
~~Roofs shall have a *roof assembly* that complies with not less than a Class A rating when tested in accordance with ASTM E108 or UL 790, or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~

~~505.2.1 Roof valleys~~.
~~Where provided, valley flashings shall be not less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 running the full length of the valley.~~

~~505.3 Protection of eaves~~.
~~Combustible eaves, fascias and soffits shall be enclosed with solid materials with a minimum thickness of $^3/_4$ inch (19 mm). Exposed rafter tails shall not be permitted unless constructed of heavy timber materials.~~

~~505.4 Gutters and downspouts~~.
~~Gutters and downspouts shall be constructed of *noncombustible* material. Gutters shall be provided with an *approved* means to prevent the accumulation of leaves and debris in the gutter.~~

~~505.5 Exterior walls~~.
~~Exterior walls of buildings or structures shall be constructed with one of the following methods:~~

1. ~~Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.~~
2. ~~*Approved noncombustible* materials.~~
3. ~~*Heavy timber* or *log wall construction*.~~
4. ~~Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~
5. ~~Ignition-resistant materials on the exterior side.~~

~~Such material shall extend from the top of the foundation to the underside of the roof sheathing.~~

~~505.6 Underfloor enclosure~~.

~~Buildings or structures shall have underfloor areas enclosed to the ground, with exterior walls in accordance with Section 505.5.~~

> ~~**Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

~~505.7 Appendages and projections~~.

~~*Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be not less than 1-hour *fire-resistance-rated construction*, *heavy timber construction* or constructed of one of the following:~~

1. ~~*Approved noncombustible* materials.~~
2. ~~Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.~~
3. ~~Ignition-resistant building materials in accordance with Section 503.2.~~

   ~~**Exception:** Coated materials shall not be used as the walking surface of decks.~~

~~505.7.1 Underfloor areas~~.

~~Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 505.5.~~

~~505.8 Exterior glazing~~.

~~Exterior windows, window walls and glazed doors, windows within exterior doors, and skylights shall be tempered glass, *multilayered glazed panels*, glass block or have a fire protection rating of not less than 20 minutes.~~

~~505.9 Exterior doors~~.

~~Exterior doors shall be *approved noncombustible* construction, solid core wood not less than 1³/₄ inches thick (45 mm), or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 505.8.~~

> ~~**Exception:** Vehicle access doors.~~

~~505.10 Vents~~.

~~Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.~~

~~505.10.1 Performance requirements~~.

~~Ventilation openings shall be fully covered with listed vents, tested in accordance with ASTM E2886, to demonstrate compliance with all the following requirements:~~

1. ~~There shall be no flaming ignition of the cotton material during the Ember Intrusion Test.~~
2. ~~There shall be no flaming ignition during the Integrity Test portion of the Flame Intrusion Test.~~
3. ~~The maximum temperature of the unexposed side of the vent shall not exceed 662°F (350°C).~~

~~505.10.2 Prescriptive requirements~~.

~~Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.~~

~~505.10.3 Vent locations~~.

~~Attic ventilation openings shall not be located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas. Gable-end and dormer vents shall be located not less than 10 feet (3048 mm) from lot lines. Underfloor ventilation openings shall be located as close to grade as practical.~~

~~505.11 Detached accessory structures~~.

~~Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed with materials *approved* for not less than 1-hour *fire-resistance-rated construction*, heavy timber, *log wall construction*, or constructed with *approved noncombustible* materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

~~505.11.1 Underfloor areas~~.

~~Where the detached *accessory structure* is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 505.5 or underfloor protection in accordance with Section 505.6.~~

> **~~Exception:~~** ~~The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or heavy-timber construction or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

Delete without substitution:

~~SECTION 506~~
~~CLASS 3 IGNITION-RESISTANT CONSTRUCTION~~

Revise as follows:

~~506.1 General~~.

~~Class 3 ignition-resistant construction shall be in accordance with Sections 506.2 through 506.4~~.

~~506.2 Roof assembly~~.

~~Roofs shall have a *roof assembly* that complies with not less than a Class B rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~

~~506.2.1 Roof valleys~~.

~~Where provided, valley flashings shall be not less than 0.019-inch (0.44 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 running the full length of the valley.~~

~~506.3 Underfloor enclosure~~.

~~Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls.~~

> **~~Exception:~~** ~~Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction*, fire-retardant-treated wood or *heavy timber construction*. Fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

~~506.4 Gutters and downspouts~~.

~~Gutters and downspouts shall be constructed of *noncombustible* material. Gutters shall be provided with an *approved* means to prevent~~

~~the accumulation of leaves and debris in the gutter.~~

~~506.5 Vents~~.

~~Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.~~

Reason: This code change is to propose one construction method for building and structures in the wildland area. This is the companion to another proposal to delete sections 505 and 506 with the intent to remove Ignition Resistant Construction Classes II and III. Replacing these classifications will be a single defined Ignition Resistant Construction as provided by Section 504 of this code. As the IWUIC is intended to provide a minimum standard of protection for the Wildland-Urban Interface areas, a single classification of Ignition Resistant Construction should be provided to accomplish the following goals:

1. Protect lives and property within the Wildland-Urban Interface areas

2. Provide clear and consistent standards, simplifying the construction process

3. Providing a minimum standard of protection, with appendices providing potential pathways for increased protection beyond the minimum

Findings during a NIST case study of the 2018 Camp Fire (https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2135.pdf) found that a primary factor in fire spread was significant ember exposure. As stated in the case study "In agreement with the other NIST case studies of WUI fires, the Camp Fire has demonstrated that embers can have significant impact on WUI communities. Laboratory and field work by NIST [57] has demonstrated that embers with enough energy to cause ignitions are readily generated from parcel-level combustibles such as landscaping mulch, fences, and firewood piles. These parcel-level fuels can cause ignitions over 40 m (130 ft) downwind. Ember ignitions downwind from parcel-level combustibles enable fire to readily spread from parcel to parcel. In high hazard areas, WUI structures therefore need to be able to withstand the exposures generated from both wildland and parcel-level combustibles." (A Case Study of the Camp Fire, pg.141)

Given that this far distances that embers can travel, this minimum standard of protection should be across the Wildland-Urban Interface areas; regardless of whether they have been designated as Moderate, High or Extreme hazards. In an analysis of California structures damaged by wildfire in 2017 found that of more homes were damaged in the areas designated as moderate fire hazard severity (3645 damaged) than those damaged in areas designated as very high fire hazard severity (2215 damaged). Of those damaged, a similar percentage of those structures were recorded as destroyed. 92% of damaged structures being destroyed in moderate fire hazard severity zones. 86% of damaged structures being destroyed in very high fire hazard severity zones. This data indicates that the requirements proposed in 504 which mirror the California 7A requirements are working.

In an analysis of California structures damaged by wildfire in 2017 found that of more homes were damaged in the areas designated as moderate fire hazard severity (3645 damaged) than those damaged in areas designated as very high fire hazard severity (2215 damaged). Of those damaged, a similar percentage of those structures were recorded as destroyed. 92% of damaged structures being destroyed in moderate fire hazard severity zones. 86% of damaged structures being destroyed in very high fire hazard severity zones.

Whereas the designated fire hazard severity zone did not play a large determining factor in whether a structure was damaged or destroyed, the date of construction did play a large role. In 2017, 33,508 structures that were constructed prior to 2009 were damaged in wildfires. In the same year, only 592 structures that were built after 2009 were damaged or destroyed by wildfire. The year 2009 is significant as it was the first full year that structures build in Wildland-Urban Interface areas were required to comply with California Building Code, Chapter 7A requirements. This data indicates that the requirements proposed in 504 which mirror the California 7A requirements are working.

Construction Costs for a Wildfire Resistant Home, California Edition (headwaterseconomics.org)

The Headwaters Economics study by the Insurance Institute for Business & Home Safety outlines that California's Chapter 7A requirements are a minimum. If there is a proposal for three construction versions, using the proposed code provisions as the minimum with an enhanced version and an optimum version for best performance standards. "In preliminary research conducted by Baylis and Boom hower (2021), the authors examined home survivability factors for nearly 50,000 homes exposed to wildfires between 2007 and 2020 across California.30 The authors reported that a home built in 2010 or later was nearly 40% less likely to be destroyed by a wildfire compared to a home built in 1985 or before. Home survivability was closely correlated to modern building codes requiring homeowner mitigation measures. Additionally, a home was more likely to survive if its nearest neighbor also complied with recent mitigation regulations resulting in a positive net spillover effect for the larger neighborhood.

Roof

Roofs are highly vulnerable to ignition due to their relatively large horizontal surface area. The exposure of roof coverings to a range of climatic conditions, including wind, rain, and sun, means the roof covering will require maintenance and eventual replacement. Many Class A fire-rated roof covering options are available (e.g., asphalt fiberglass composition shingles). A main reason the roof is vulnerable is because the roof edge—including gutters and roof-to-wall intersections where roof covering meets other materials (e.g., siding used in dormers and split-level homes)—is exposed to ember ignitions. These areas must be properly protected by adding additional flashing t roof-to-wall locations.

Under-Eave Area

Research suggests eaves are extremely important in structure survivability.1 Eaves play an important role for building design but they also create vulnerabilities and pathways for the building to ignite. Embers can travel through vents in the eave into the attic and accumulate in gaps between blocking and rafters in open-eave construction. Should flames reach the under-eave area, open eaves can also trap heat. Once there is an ignition in the under-eave area, fire will spread laterally more quickly.

Vents in the under-eave area are inlet vents and therefore allow air to enter the attic space. During a wildfire, vent openings can allow the entry of wind-blown embers into the interior attic space. If combustible materials in the attic ignite, the house can burn from the inside out.2 The importance of ember and flame entry through vents during a wildfire, and as per requirements in Chapter 7A, have resulted in the development of vents designed to resist the intrusion of flames and embers.

Exterior Wall

Exterior walls and components in the wall assembly can be vulnerable if exposed to embers, flames, or prolonged exposure to radiant heat from burning items located close to the home. These exposures can ignite combustible siding and the resulting flames can spread vertically and laterally to other wall components such as windows and the under-eave area. Siding extending close to the ground can be vulnerable to ignition by embers accumulating at the base of the wall that ignite it or components in the wall assembly (e.g., wood sheathing).

Attached Deck

Similar to a roof, a deck can cover a large horizontal surface area and can be vulnerable to embers and under-deck flame impingement exposures. A burning deck can expose the side of the house to extended radiant heat and/or direct flame contact. The deck walking surface and structural support members, as well as what is stored on or below the deck are therefore important considerations.

Most commonly used deck board products (including wood and plastic composite boards) are combustible. Decks with noncombustible walking surfaces include lightweight concrete or a flagstone product. Regardless of the walking surface, decks are typically supported by solid wood joists, beams, and columns that will be vulnerable to ignition if nearby combustible materials ignite. Enclosing the under-deck area vertically around the perimeter can minimize the accumulation of vegetative debris, vegetation, and other combustible materials. For enclosed decks, installing vents to ensure that excessive moisture does not accumulate in the under-deck area is critical to avoid moisture-related degradation.

Glazing Window manufacturers and suppliers indicated that whereas Chapter 7A only requires one pane in a dual-paned window to be tempered, many window manufacturers only supply windows with both panes tempered. Other manufacturers will supply what the customer requests but will default to one-pane tempered. Since all comparative versions of the wildfire-resistant home are Chapter 7A-compliant, the price of windows would not result in a net cost difference.

Doors

Doors (including window glass set in doors) and door frames can fail for the same reasons as windows. Embers can accumulate in the small gaps between the door and frame, resulting in ignition of the door-framing and weather-sealing material. Vents: Flame- and ember-resistant vents, approved and listed by the OSFM Building Materials Listing Program, will be required for all attic and crawlspace vents. Separation Distance from accessory structures NIST Technical note 2205 explains how the mitigation of accessory structures help in hardening a building in the wildland area.

https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2205.pdf

Bibliography: https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2135.pdf

https://headwaterseconomics.org/natural-hazards/wildfire-resistant-costs-california/

Cost Impact: Increase

Estimated Immediate Cost Impact:

Construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

In 2004, and as a precursor to California adopting Building Code Chapter 7A, the Office of the State Fire Marshal requested an analysis identifying the costs and benefits associated with proposed regulations in the state's wildfire-prone areas. The study was conducted by Fire Cause Analysis and evaluated economic and construction data within various business sectors to analyze construction costs if proposed regulations were implemented.33 The study found construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs. As an aggregated total at the state level, construction costs would increase approximately $30 million per year for the estimated 14,000 new homes built in areas where regulations would apply. The authors concluded the costs of not implementing regulations, in the form of property losses and suppression costs, exceeded the projected costs for regulations and therefore recommended adopting mitigation standards in wildfire-prone areas.

In 2019, the National Institute of Building Sciences (NIBS) released a report identifying the benefit-cost ratio (BCR) of investing in hazard mitigation, including wildfires.35 The authors found that for every $1 spent on up-front costs for wildfire mitigation, a benefit of $4 was received.

In 2021, the National Research Council of Canada released a study analyzing the benefit-cost ratio for building new construction to comply with the country's wildland urban interface (WUI) Guide.38 In its examination, approximately $12,000 CAD (~$9,500 USD) was added to the overall costs for a new, 2,000-square-foot home to meet the provision of Canada's National WUI Guide. The comprehensive report also examined costs for retrofitting existing structures, as well as transferred costs at the community and national scale. Similar to the NIBS study in 2019, the NRC report found an up-front investment in wildfire-resistant construction and vegetation management yielded benefits that exceeded long-term costs and losses.

WUIC55-24

WUIC56-24

IWUIC: 506.2

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); Mark S. Graham, National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Wildland Urban Interface Code

Revise as follows:

506.2 Roof assembly.
Roofs shall have a *roof assembly* that complies with not less than a Class A ~~B~~ rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Reason: Marcelo Hirschler:

Experience shows that the roof of a building in the WUI area is the most likely area (or perhaps one of the most likely areas) where burning embers can deposit and start a fire that will consume the building. The experience of fires in California, in particular, has shown that fire hardening the roof assembly can make a significant improvement in the probability of a building surviving a wildfire. The California Chapter 7A (the local version of a wildland urban interface code) requires that all roof assemblies in the WUI area meet a Class A rating when tested to ASTM E108 or UL 790 and the IWUIC should do the same. The IWUIC already requires Class A for classes 1 and 2 WUI construction and it should require the same for all WUI areas.The size of the Class B brand in ASTM E108 is 6 inches square by 2 1/4 inches thick Douglas fir wood, weighing approximately 500 g (1.1 lb), with a gas flame applied for 4 minutes. That is unlikely to be sufficient to ensure fire safety for a roof (and the corresponding structure) from a wildfire, since each individual burning brand can be up to 7 square inches in area and weigh several grams, and a wildfire generates large numbers of burning brands.

The attached publication by researchers at NIST (namely "Role of Firebrand Combustion in Large Outdoor Fire Spread", by S. Manzello, S. Suzuki, M. Gollner and C. Fernandez-Pello, from Prog Energy Combust Sci. 2020 ; 76: . doi:10.1016/j.pecs.2019.100801.) (https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7047831/pdf/nihms-1548454.pdf) discusses the sizes and masses of firebrands in actual wildfires.

ASTM E108 explains as follows for the 3 classes of roof exposures:

Class A Tests are applicable to roof coverings that are expected to be effective against severe fire exposure, afford a high degree of fire protection to the roof deck, do not slip from position, and are not expected to present a flying brand hazard.

Class B Tests are applicable to roof coverings that are expected to be effective against moderate fire exposure, afford a moderate degree of fire protection to the roof deck, do not slip from position, and are not expected to present a flying brand hazard.

Class C Tests are applicable to roof coverings that are effective against light fire exposure, afford a light degree of fire protection to the roof deck, do not slip from position, and are not expected to present a flying brand hazard.

Mark Graham:

This code change proposal proposes to increase the required fire classification for roof coverings for Section 506-Class 3 Ignition-Resistant Construction from Class B to Class A. Section 504-Class 1 Ignition-Resistant Construction and Section 505-Class 2 Ignition-Resistant Construction already require roof coverings to be Class A. Changing the roof covering requirement for Class 3 Ignition-Resistant Construction will simplify interpretation and enforcement, and enhance resistance to spread of flame on roof coverings.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Marcelo Hirschler:

The cost of a Class A fire rated roof assembly will be higher than the cost of a Class B fire rated roof assembly, but there will be less danger of destruction in case of a wildfire.

Mark Graham:

$0 - This code change proposal will have no cost impact for most roof coverings. The U.S. roofing industry already has tens of thousands of different ASTM E108 or UL 790 Class A roof coverings that are regularly designed and installed. In most instances designers already specify Class A roof coverings, whether or not they are required by the code.As an example, the U.S. product standard for asphalt shingles, ASTM D3462, "Standard Specification for Asphalt Shingles made from Glass Felt and Surfaced with Mineral Granules," which is a requirement for asphalt shingles in IBC and IRC, has a Class A minimum requirement; Class B or C asphalt shingles are no longer produced and are not permitted.

In those rare situations were a particular roof covering is a Class B, lower cost Class A roof coverings are readily available.

Estimated Immediate Cost Impact Justification (methodology and variables):

Marcelo Hirschler:

I cannot assess the difference in price between the various fire classified roof assemblies. It is known that virtually all asphalt roofing assemblies are already Class A. In the case of metal roofing assemblies, a membrane would have to be placed underneath the metal (to avoid heat transmission) and this may affect cost. In fact, other than some metal-covered roof assemblies, it is likely that most roof assemblies in the market that are not constructed of wood will actually be Class A.

WUIC56-24

WUIC57-24

IWUIC: 507.1

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov); Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

507.1 General.
The *roof covering* on buildings or structures in existence prior to the adoption of this code that are replaced or have 25 percent or more replaced in a 12-month period shall be replaced with a *roof covering* required for new construction ~~based on the type of ignition-resistant construction specified~~ in accordance with ~~Section~~ Sections ~~503~~ 504.2 and 504.21. All repairs or maintenance of a roof covering with a Class A fire classification shall be accomplished to maintain the Class A fire classification.

Reason: Fire-resistance of the roof construction, by overwhelming consensus, is recognized as the “Achilles Heel” when protecting structures from wildfires. All new construction must meet a Class A fire classification in accordance with Section 504.2. This proposal addresses 3 scenarios where the roof covering must comply with a Class A fire classification.

Existing structures often have a lesser degree of fire classification than Class A. When these existing roofs are replaced, they must be replaced with a roof covering with a Class A fire classification. When a repair occurs that is 25% or more of the roof area, the entire roof covering must be replaced and it must meet a Class A fire classification. When an existing structure has a roof covering with ah Class A fire classification, any repair or maintenance must be done to maintain the Class A rating. This last scenario applies even if the roof area repaired is less than 25%.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 or nominal cost increase.

Estimated Immediate Cost Impact Justification (methodology and variables):

Now with the increased production of rated roof assemblies that cost is no longer a controlling factor. It was determined that there was little to no cost difference for the change.

WUIC57-24

WUIC58-24

IWUIC: 507.1

Proponents: Mark S. Graham, National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Wildland Urban Interface Code

Revise as follows:

507.1 General.
The *roof covering* on buildings or structures in existence prior to the adoption of this code that are replaced ~~or have 25 percent or more replaced in a 12-month period~~ shall be replaced with a *roof covering* required for new construction based on the type of ignition-resistant construction specified in accordance with Section 503.

Reason: This code change proposal is intended to clarify IWUIC's requirements regarding roof covering replacement and bring consistency with what is already included in IBC and IRC. IWUIC's current language on roof replacements includes the "25 percent rule," which was included in two of the legacy codes at one point, but has not been included in the IBC or IRC. Striking the 25 percent rule from IWUIC's Section 507.1-General will make IWUIC's requirements for roof covering replacement consistent with those of IBC and IRC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal coordinates IWUIC's requirements for roof covering replacement with those already contained in IBC and IRC. There are no changes in the codes stringency.

WUIC58-24

WUIC59-24

IWUIC: 602.1

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

602.1 General.
An *approved* automatic sprinkler system shall be installed in all occupancies in new buildings required to meet the requirements for Class 1 ignition-resistant construction in Chapter 5. The installation and maintenance of the automatic sprinkler systems shall be in accordance with ~~nationally recognized standards~~the *International Building Code* or *International Residential Code*, as applicable.

Reason: This section was written before the IRC contained references to sprinkler design standards and the IBC did not reference NFPA 13D. Changes in both codes now allow for the referenced code to be the IBC or the IRC. The appropriate code will be the code the building is constructed under. The IFC is not referenced since it does the sprinkler criteria in the IFC does not apply to dwellings, but the IBC contains the same requirements as the IFC. In this fashion, the section now refers to the applicable construction code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not change the code application or provide new requirements. It clarifies the reference to the specific construction code, which includes the reference to the appropriate sprinkler standards.

WUIC59-24

WUIC60-24

IWUIC: SECTION 603, 603.1, 603.2, TABLE 603.2, FIGURE 603.2, 603.2.1, 603.2.2, 603.2.3, 603.1 (New), 603.2 (New), 603.3 (New), 603.3.1 (New), 603.4 (New), 603.4.1 (New), 603.4.2 (New), 603.4.2.1 (New)

Proponents: Cary Yballa, Central County Fire Department, Cal FPO (cyballa@ccfd.org); Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov)

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 603
~~DEFENSIBLE SPACE~~ VEGETATION PLAN

603.1 ~~**Objective.** Provisions of this section are intended to modify the fuel load in areas adjacent to structures to create a *defensible space*~~

~~**603.2 Fuel modification.**~~

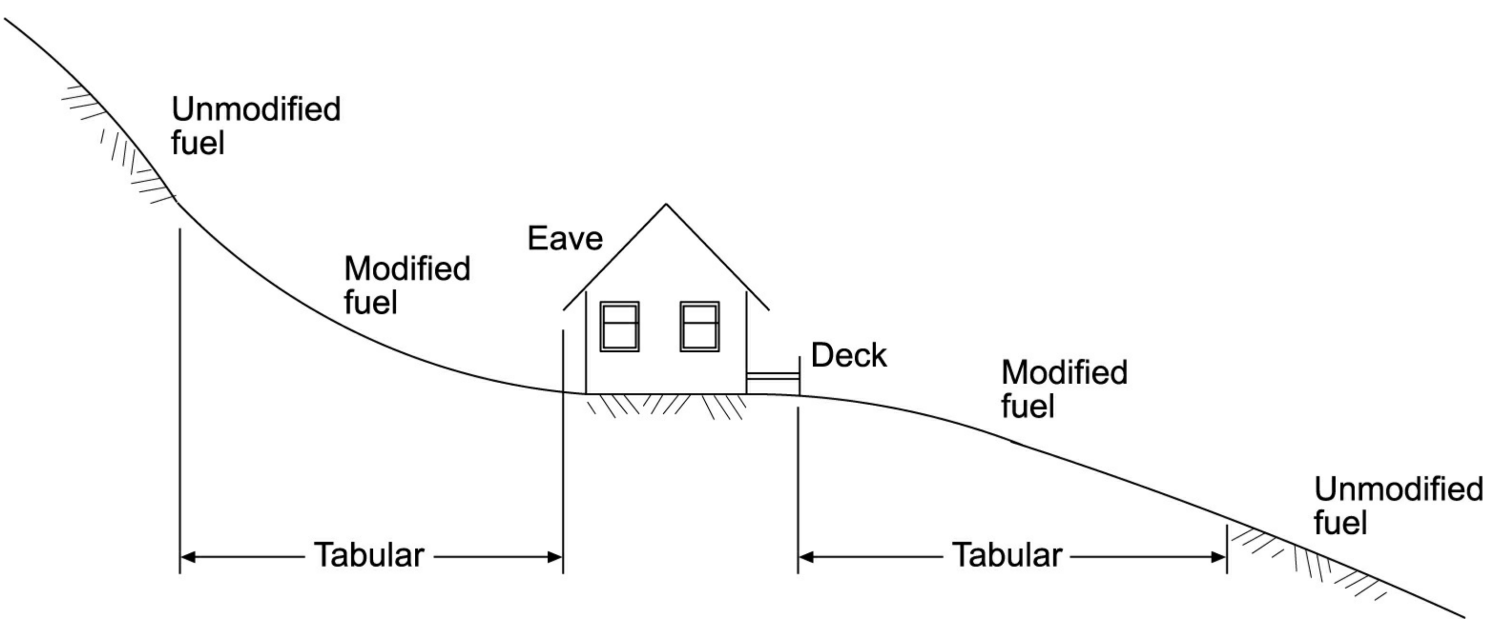
~~Buildings or structures, constructed in compliance with the conforming *defensible space* category of Table 503.1, shall comply with the *fuel modification* distances contained in Table 603.2. For all other purposes the *fuel modification* distance shall be not less than 30 feet (9144 mm) or to the lot line, whichever is less. Distances specified in Table 603.2 shall be measured on a horizontal plane from the perimeter or projection of the building or structure as shown in Figure 603.2. Distances specified in Table 603.2 are allowed to be increased by the *code official* because of a site-specific analysis based on local conditions and the *fire protection plan*.~~

~~TABLE 603.2 REQUIRED DEFENSIBLE SPACE~~

~~WILDLAND-URBAN INTERFACE AREA~~	~~FUEL MODIFICATION DISTANCE (feet)~~[a]
~~Moderate hazard~~	~~30~~
~~High hazard~~	~~50~~
~~Extreme hazard~~	~~100~~

~~For SI: 1 foot = 304.8 mm.~~

~~a. Distances are allowed to be increased due to site-specific analysis based on local conditions and the *fire protection plan*.~~



~~**FIGURE 603.2 MEASUREMENTS OF FUEL MODIFICATION DISTANCE**~~

~~**603.2.1 Responsible party.** Persons owning, leasing, controlling, operating or maintaining buildings or structures requiring *defensible spaces* are responsible for modifying or removing nonfire-resistive vegetation on the property owned, leased or controlled by said person.~~

~~**603.2.2 Trees.** Trees are allowed within the *defensible space*, provided that the horizontal distance between crowns of adjacent trees and crowns of trees and structures, overhead electrical facilities or unmodified fuel is not less than 10 feet (3048 mm).~~

~~**603.2.3 Ground cover**~~**.**
~~Deadwood and litter shall be regularly removed from trees. Where ornamental vegetative fuels or cultivated ground cover, such as green grass, ivy, succulents or similar plants are used as ground cover, they are allowed to be within the designated *defensible space*, provided that they do not form a means of transmitting fire from the native growth to any structure.~~

Add new text as follows:

603.1 General. Planting of vegetation for new landscaping shall be selected to reduce vegetation in proximity to a structure and to maintain vegetation as it matures.

603.2 Application. All new plantings of vegetation in designated Wildland-Urban Interface areas shall comply with Sections 603.3 through 603.4.2.1.

603.3 Landscape plans. Landscape plans shall be provided when required by the enforcing agency. The landscape plan shall include development and maintenance requirements for the vegetation management zone adjacent to structures and roadways, and to provide significant fire hazard reduction benefits for public and firefighting safety.

603.3.1 Contents. In addition to the construction site plan as outlined in the International Building Code landscape plans shall contain the following:

1. Delineation of the 30-foot (9144 mm) and 100-foot (3048 mm) fuel management zones from all structures.
2. Identification of existing vegetation to remain and proposed new vegetation.
3. Identification of irrigated areas.
4. A plant legend with both botanical and common names, and identification of all plant material symbols.
5. Identification of ground coverings within the 30-foot (9144 mm) zone.

603.4 Vegetation. All new vegetation shall be fire-smart vegetation in accordance with this section.

Exception: Trees classified as fire-smart vegetation complying with Section 603.4.2.1.

To be considered fire-smart vegetation, it must meet at least one of the following:

1. Be identified as fire-smart vegetation in an approved book, journal or listing from an approved organization.
2. Be identified as fire-smart vegetation by a licensed landscape architect with supporting justification.
3. Plants considered fire-smart vegetation and approved by the local enforcing agency.

603.4.1 Shrubs. All new plantings of shrubs shall comply with the following:

1. Shrubs shall not exceed 6 feet (1829 mm) in height.

2. Groupings of shrubs are limited to a maximum aggregate diameter of 10 feet (3048 mm).

3. Shrub groupings shall be separated from other groupings a minimum of 15 feet (4572 mm).

4. Shrub groupings shall be separated from structures a minimum of 30 feet (9144 mm).

5. Where shrubs are located below or within a tree's drip line, the lowest tree branch shall be a minimum of three times the height of the understory shrubs or 10 feet (3048 mm), whichever is greater.

603.4.2 Trees. Trees shall be managed as follows within the 30-foot zone (9144 mm) of a structure:

1. New trees shall be planted and maintained so that the tree's drip line at maturity is a minimum of 10 feet (3048 mm) from any combustible structure.

2. The horizontal distance between crowns of new trees and crowns of adjacent trees shall not be less than 10 feet (3048 mm).

3. Existing trees shall be trimmed to provide a minimum separation of 10 feet (3048 mm)away from chimney and stovepipe outlets

603.4.2.1 Non-fire-smart vegetation. New trees not classified as fire-smart vegetation, such as conifers, palms, pepper trees and eucalyptus species, shall be permitted provided the tree is planted and maintained so that the tree's drip line at maturity is a minimum of 30 feet from any combustible structure.

Exception: New, single specimen trees, planted so that the tree's drip line at maturity is a minimum of 10 feet (3048 mm) from any combustible structure and are well pruned and maintained to not form a means of rapidly transmitting fire from other nearby vegetation to a structure or from a structure to other nearby vegetation or to interrupt the advance of embers toward a structure.

Reason: The proposal to relocate section "Defensible Space" to follow the newly created section titled "Vegetation Plan" focuses on the planting of vegetation for new landscaping and to maintain defensible space for structures within the wildland urban interface areas. Chapter 5 of the Wildland Urban Interface Code requires vegetation management compliance prior to the final approval for building permits issued, this new section will give guidance on how to comply with the vegetation plan compliance when new landscaping is planted in these areas.

This section will apply only to new plantings of vegetation (other than a brief mention of existing trees in section 603.4.2) only in the Wildland Urban Interface area. Existing vegetation management is addressed in the Defensible Space section.

Requirements for landscape plans are laid out in this section. Since many local fire departments manage the Vegetation Plan Compliance requirements through submittals of landscape plans, there is a need for language to spell out the minimum requirements. This section provides these requirements to ensure adequate information is provided on the plans to conduct a plan review. Defensible space and Vegetation Management go hand in hand. Defensible space is based on the location of the structures in relation to the property lines as well as manmade and natural fire breaks. These topographic features are an essential factor in determining the risks of wildfire spread.

It also addresses how to select fire smart vegetation and provide basic information on planting to ensure that as the plantings grow to maturity, they can be maintained per the section for the Defensible Space requirements. Specifically addressed are shrubs and trees. The intention for shrubs is to select fire-smart species and to purposefully plant them in groupings and arrangements that ensure they create a landscape that can be easily maintained as they grow. Similarly with shrubs, new tree plantings must also be carefully considered. Trees have the added ability to create a pathway that will lead a fire up to the most vulnerable portions of a house (eaves, vents, and roofs), but also considered was the understanding that trees can provide much needed shade and can prevent the “urban heat island” effect.

The existing tree requirements that are briefly mentioned in this section because it will be very likely existing trees will be part of a new landscape plan as property owners landscape their yards.

Unique to the trees section are the requirements for non-fire-smart vegetation. Since so many of the popular varies of trees may not qualify for fire-smart status, requirements for non-fire-smart vegetation are also found in the trees section. The requirement for non-fire-smart vegetation is to simply plant them further away from structures to mitigate the additional hazard these trees may bring. This subsection allows property owners to have a path of compliance when they have a robust maintenance plan in place. The exception allows for small lots to have some kind of landscaping closer to the structure. The spacing an maintenance are the most important factors. Tree species become secondary when the spacing and maintenance are in compliance.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 or it may increase of the cost of construction dependent upon the landscaping material and vegetation selected to comply with this section.

Estimated Immediate Cost Impact Justification (methodology and variables):

It is a property owners design choices that will determine the cost of landscaping. With many variables of cost per region and area will be driven by the local contractor, supply and demand.

IWUIC: [A] 106.6, SECTION 202 (New), SECTION 202, 603.2.1, 604.2, 604.3, A102.2, A104.4, A104.7.1, A105.4.2, A106.2, A107.3, APPENDIX F, F101.1, G101.3.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 106.6 Other data and substantiation.
Where required by the *code official*, the plans and specifications shall include classification of fuel loading, fuel model light, medium or heavy, and substantiating data to verify classification of ~~fire-resistive vegetation~~ *fire-smart vegetation*.

Add new definition as follows:

FIRE-SMART VEGETATION.
Plants, shrubs, trees and other vegetation that exhibit properties, such as high moisture content, little accumulation of dead vegetation and low sap or resin content, that make them less likely to ignite or contribute heat or spread flame in a fire than native vegetation typically found in the region.

Revise as follows:

FUEL MODIFICATION. A method of modifying fuel load by reducing the amount of ~~nonfire-resistive~~ vegetation or altering the type of vegetation to reduce the fuel load.

603.2.1 Responsible party. Persons owning, leasing, controlling, operating or maintaining buildings or structures requiring *defensible spaces* are responsible for modifying or removing ~~nonfire-resistive vegetation~~other than *fire-smart vegetation* on the property owned, leased or controlled by said person.

604.2 Modified area.
~~Nonfire-resistive vegetation~~ Vegetation other than *fire-smart vegetation* ~~or growth~~ shall be kept clear of buildings or structures, in accordance with Section 603, in such a manner as to provide a clear area for fire suppression operations.

604.3 Responsibility. Persons owning, leasing, controlling, operating or maintaining buildings or structures are responsible for maintenance of *defensible spaces*. Maintenance of the *defensible space* shall include modifying or removing ~~nonfire-resistive~~ vegetation other than *fire-smart vegetation* and keeping leaves, needles and other dead vegetative material regularly removed from roofs of buildings and structures.

A102.2 Clearance of brush or vegetative growth from roadways. The *code official* is authorized to require areas within 10 feet (3048 mm) on each side of portions of fire apparatus access roads and driveways to be cleared of ~~nonfire-resistive~~ vegetation ~~growth~~ other than *fire-smart vegetation.*

Exception: Single specimens of trees, ornamental vegetative fuels or cultivated ground cover, such as green grass, ivy, succulents or similar plants used as ground cover, provided they do not form a means of readily transmitting fire.

A104.4 Smoking. Where required by the *code official*, signs shall be posted stating NO SMOKING. Persons shall not smoke within 15 feet (4572 mm) of combustible materials or ~~nonfire-resistive~~ vegetation other than *fire-smart vegetation.*

Exception: Places of habitation or in the boundaries of established smoking areas or campsites as designated by the *code official*.

A104.7.1 General.
Persons shall not build, ignite or maintain any outdoor fire of any kind for any purpose in or on any *wildland-urban interface area*, except by the authority of a written permit from the *code official*.

Exception: Outdoor fires within inhabited premises or designated campsites where such fires are in a permanent barbecue, portable barbecue, outdoor fireplace, incinerator or grill and are not less than 30 feet (9144 mm) from any combustible material or ~~nonfire-resistive~~ vegetation other than fire-smart vegetation.

A105.4.2 Separation. A clear space of not less than 40 feet (12 192 mm) shall be provided between piles. The clear space shall not contain combustible material or nonfire-resistive vegetation.

Revise as follows:

A106.2 Ashes and coals.
Ashes and coals shall not be placed, deposited or dumped in or on *wildland-urban interface areas*.

Exceptions:

1. In the hearth of an established fire pit, camp stove or fireplace.
2. In a noncombustible container with a tightfitting lid, which is kept or maintained in a safe location not less than 10 feet (3048 mm) from ~~nonfire-resistive vegetation or~~ structures and vegetation other than fire-smart vegetation.
3. Where such ashes or coals are buried and covered with 1 foot (305 mm) of mineral earth not less than 25 feet (7620 mm) from ~~nonfire-resistive vegetation or~~ structures and vegetation other than fire-smart vegetation.

A107.3 Fuel modification area. Water storage and pumping facilities shall be provided with a *defensible space* of not less than 30 feet (9144 mm) clear of ~~nonfire-resistive vegetation or growth~~ vegetation other than *fire-smart vegetation* around ~~and adjacent to~~ such facilities.
Persons owning, controlling, operating or maintaining water storage and pumping systems requiring this *defensible space* are responsible for clearing and removing ~~nonfire-resistive~~ vegetation other *than fire-smart vegetation* and maintaining the *defensible space* on the property owned, leased or controlled by said person.

APPENDIX F CHARACTERISTICS OF ~~FIRE-RESISTIVE VEGETATION~~ FIRE-SMART VEGETATION

F101.1 Characteristics of ~~fire-resistive vegetation~~ fire-smart vegetation.
All plants will burn under extreme fire weather conditions, such as drought. However, plants burn at different intensities and rates of consumption. ~~Fire-resistive plants burn~~ *Fire-smart vegetation* burns at a relatively low intensity, slow rates of spread and with short flame lengths. The following are characteristics of ~~fire-resistive vegetation~~ *fire-smart vegetation*:

1. Growth with little or no accumulation of dead vegetation (either on the ground or standing upright).
2. Non-resinous plants (willow, poplar or tulip trees).
3. Low volume of total vegetation (for example, a grass area as opposed to a forest or shrub-covered land).
4. Plants with high live fuel moisture (plants that contain a large amount of water in comparison to their dry weight).
5. Drought-tolerant plants (deeply rooted plants with thick, heavy leaves).
6. Stands without ladder fuels (plants without small, fine branches and limbs between the ground and the canopy of overtopping shrubs and trees).
7. Plants requiring little maintenance (slow-growing plants that, when maintained, require little care).
8. Plants with woody stems and branches that require prolonged heating to ignite.

G101.3.1 Exterior sprinkler systems.
Currently, there is no nationally accepted standard for the design and installation of exterior fire sprinkler systems. Interior sprinkler systems are regulated by nationally recognized standards that have specific requirements. However, exterior sprinkler systems lack such uniformity. What is generally proposed is a type of sprinkler system, placed on the roofs or eaves of a building, whose primary purpose is to wet down the roof. These types of systems can be activated either manually or automatically. However, the contemporary thought on exterior sprinkler systems is that if the roof classification is of sufficient fire resistance, exterior sprinklers are of little or no value. Another option and alternative with exterior sprinklers is to use them to improve the relative humidity and fuel moisture in the *defensible space*. In

this case, the exterior sprinkler is not used to protect the structure as much as it attempts to alter the fuel situation. However, studies do not support the idea that merely spraying water into the air in the immediate vicinity of a rapidly advancing wildland-urban fire does much good. Clearly, irrigation systems that keep plants healthy and ~~fire-resistive plants~~ *fire-smart vegetation* that resist convection and radiated heat can accomplish the same purpose.

Reason: The term “fire-resistive vegetation” is a misnomer. All vegetation will burn. The IWUIC already uses the term of “ignition-resistant construction” which is applicable to construction features, not vegetation.

Since there are no fire-resistant plants, the term misleads the code user and can be misapplied. To add clarity and so that the term does not create confusion, “fire-resistive vegetation” is proposed to be replaced with “fire-smart vegetation.” This term is clear and does not imply that imply that the vegetation will not burn.

To assist with the new term, a definition is added which addresses the characteristics that are crucial for fire-smart vegetation.In the definition of “fuel modification”, the term “non-fire-resistive” is intentionally not included because the vegetation that is modified could be fire-smart vegetation or vegetation other than fire-smart vegetation. There are situations where even fire-smart vegetation needs to be modified or trimmed or removed. This revised definition of “fuel modification” means that it applies to all types of vegetation.

NOTE: The proposal to create a new Chapter 7 for all maintenance requirements would delete Section 603.2.1 (Responsible party).

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Bibliography: https://anrcatalog.ucanr.edu/pdf/8228.pdf
https://www.firefree.org/wp-content/uploads/2016/02/Fire-Resistant-Plants.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Changing the term of "fire-resistive vegetation" to the more correct term of "fire-smart vegetation" is editorial and has no regulatory impact.

WUIC61-24

WUIC62-24

IWUIC: 603.2.2.1 (New)

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Add new text as follows:

603.2.2.1 New Trees. Planting of new trees shall be permitted within the defensible space provided they are separated or planted so that the tree's drip line at maturity is a minimum of 10 feet (3048 mm) from adjacent trees, overhead electrical facilities or unmodified vegetation and combustible structures.

Reason: This proposal addresses basic information on planting of new trees to ensure that as the trees grow to maturity, they can be maintained per defensible space requirements. The intention for new tree plantings must be carefully considered. Trees have the added ability to create a pathway for fire extension to the most vulnerable portions of a structure (eaves, vents, and roofs). The 10 foot minimum gives consideration and understanding that trees can provide much needed shade and can prevent the "urban heat island" effect.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This section merely provides requirements for the type of trees that may be planted in a designated defensible space. There is no increase to the cost of construction.

WUIC62-24

WUIC63-24

IWUIC: 603.2.3.1 (New), 604.3

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Add new text as follows:

603.2.3.1 Combustible mulch. Combustible materials used for mulch shall be prohibited within 5 feet when measured on a horizontal plane from the perimeter or projection of the building or structure as shown in Figure 603.2.

Revise as follows:

604.3 Responsibility. Persons owning, leasing, controlling, operating or maintaining buildings or structures are responsible for maintenance of *defensible spaces*. Maintenance of the *defensible space* shall include modifying or removing nonfire-resistive vegetation and keeping leaves, needles and other dead vegetative material regularly removed from roofs of buildings and structures. Combustible debris including but not limited to deadwood, dead leaves, and pine needles shall be cleared and maintained a minimum of 5 feet when measured on a horizontal plan from the perimeter or projection of the building and structure as shown in Figure 603.2.

Reason: Combustible mulch and combustible debris located within 5 ft of exterior walls and decks are susceptible to potential ignition due to ember accumulation during a wildfire. Clearing this area of combustible debris and mulch plays an important role in reducing the likelihood of ignition. Quarles and Smith (2011) studied the fire behavior of eight different kinds of mulch including composted wood chips, medium pine bark nuggets, pine needles, shredded western red cedar, Tahoe chips, Tahoe chips with fire retardant, single layer Tahoe chips, and shredded rubber. They reported that, “with the exception of the composted wood chips, all of the mulch treatments demonstrated active flaming combustion” and that “shredded rubber, pine needles and shredded western red cedar demonstrated the most hazardous fire behavior” [1]. The fire behavior of surface fuels like mulch markedly changes with wind and slope [2]. As shown in Figures 1, investigations following the Glass Fire (2020) in Napa and Sonoma Counties, California, highlighted this pathway where embers landed in the front yard and ignited the wood mulch. The mulch enabled the fire to make direct flame contact with a hot tub, igniting the hot tub which resulted in the damage to the home.

Figure 1. Example of vegetation in small amounts located in Zone 0 creating a pathway for fire spread: (a) Wood mulch provided a pathway for fire to get close to the building and ignite a hot tub during the Glass Fire (2020) in Napa and Sonoma Counties, California; (b) Ground-level plants during the Glass Fire (2020).

Note the landscape barrier in Figure 1, which separates wood mulch from bare ground surface. There is no visible damage to the building where wood mulch is not against the home. This can also be observed at another home in Figure 2 where the fire stops where the ground cover changes from grass to gravel.

Figure 2. Noncombustible mulch breaks the fuel path in Lahaina wildfire. Photo curtesy Milad Shabanian, IBHS.

Bibliography: [1] Quarles, S. L., & Smith, E. (2011). The Combustibility of Landscape Mulches. U. o. N. C. Extension. https://cecentralsierra.ucanr.edu/files/145298.pdf

[3] Headwaters Economics and Insurance Institute for Business & Home Safety, 2022, Construction costs for a wildfire-resistant home, California Edition. https://headwaterseconomics.org/wp-content/uploads/2022_HE_IBHS_WildfireConstruction.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

This modification to the code will not increase or decrease the construction costs. However it could either raise or lower the maintenance expenses. If combustible mulch is eliminated and the ground cover is exposed soil, the removal of combustible mulch will lead to a cost reduction. The maintenance costs will only rise in locations where less expensive combustible mulch is replaced with pricier noncombustible hardscaping materials such as river rocks.

Estimated Immediate Cost Impact Justification (methodology and variables):

According to a recent cost study conducted by IBHS and Headwaters Economics for a wildfire resistant home in California [3], one-foot-long bark mulch with depth of three inches and 5 feet width cost $520 while same amount of pea gravel will cost $2790.

Estimated Life Cycle Cost Impact:

Although there is an initial rise in maintenance expenses when substituting bark mulch with pea gravel, over the long term, pea gravel proves to be more cost-effective. This is due to the consideration of the necessity for regularly reapplying bark mulch, while pea gravel offers a maintenance-free advantage as a noncombustible mulch, making it more economical after six years.

WUIC64-24

IWUIC: 603.2.4 (New)

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Add new text as follows:

603.2.4 Fences. Fences located within 5 feet of a building with habitable space shall be constructed with approved noncombustible materials.

Reason: This proposal intends to reduce the possibility of direct flame contact exposure caused by ignition of combustible fences adjacent to the structure. Combustible fences that are in contact with or within 5 feet of the main building can act as a conduit for fire spread. Laboratory experiments and post-event investigations highlight the vulnerability of combustible fences, as illustrated in Figure 1 [1, 2].

Combustible fences create a pathway for fire to reach a residence (Figure 1 a and b). Even for homes featuring noncombustible cladding, flames originating from a burning fence can pose a threat to vulnerable components like eaves, vents, and glazing. As shown in Figure 1c, the installation of a noncombustible fence within Zone 0 disrupts the fire's path to a home [3].

a *b* *c*

Figure 1. Examples of combustible fencing providing a pathway for fire to the house, damaging the noncombustible siding.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This modification can increase the construction cost. According to the cost study analysis performed by IBHS and Headwaters Economics in 2022, replacing 5 ft of cedar fence with a metal fence can increase the construction cost around $200 in California [4].

Estimated Immediate Cost Impact Justification (methodology and variables):

According to the cost study analysis performed by IBHS and Headwaters Economics in 2022, replacing 5 ft of cedar fence with a metal fence can increase the construction cost around $200 in California [4].

WUIC64-24

WUIC65-24

IWUIC: 604.1, 604.5 (New)

Proponents: Cary Yballa, Central County Fire Department, Cal FPO (cyballa@ccfd.org); Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov)

2024 International Wildland Urban Interface Code

Revise as follows:

604.1 General.
~~*Defensible spaces* required by Section 603 shall be maintained in accordance with Section 604.~~Hazardous vegetation and fuels shall be managed to reduce the severity of potential exterior wildfire exposure to buildings and to reduce the risk of fire spreading to buildings.

Add new text as follows:

604.5 Disposal of flammable vegetation and fuels. The disposal, including burning or removal to a site approved by the local jurisdiction, in consultation with the fire authority, of flammable vegetation and fuels removed from the site as a result of building construction, road or driveway construction or vegetation management shall be in accordance with all applicable laws and regulations.

Reason: This proposal clarifies that maintenance of the vegetation in the defensible space is required for all buildings.

It also adds Section 604.5 which addresses the disposal of fuels or debris resulting from clearing land for construction or annual vegetation maintenance.

This section allows for the material to be disposed of or burned provided the burning is in accordance with all regulations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is for clarification of the methods of handling vegetation maintenance and disposal of the resultant debris.

WUIC65-24

WUIC66-24

IWUIC: 604.3

Proponents: Matthew Dobson, VSI, VSI (mdobson@vinylsiding.org)

2024 International Wildland Urban Interface Code

Revise as follows:

604.3 Responsibility. Persons owning, leasing, controlling, operating or maintaining buildings or structures are responsible for maintenance of *defensible spaces*. Maintenance of the *defensible space* shall include modifying or removing nonfire-resistive vegetation , combustible mulch, and keeping leaves, needles, and other dead vegetative material regularly removed from roofs of buildings and structures.

Reason: Over the past code cycles there has been concern over smoker habits and wildfires and combustible mulch, and the potential hazard they pose with combustion of exterior walls. This change focuses on providing protections from two ignition sources discarded cigarettes or pre-rolls (joints) and wildfires. Many fire service members, the UL fire fighter safety institute, and other material stakeholders, like the Vinyl Siding Institute, have been focused on this issue over close to 10 years or more. The problem identified is the spread of fire from the exterior into to the unprotected attic space and then spreading quickly to other parts of the building either through discarded cigarettes or wildfire. Note that the term "combustible ground cover" could lead to misinterpretation associated with temporary materials placed on the ground during repairs or upgrades and they should not be regulated.

Over the decade, fire departments in the Washington, DC region (Loudon County, VA) have been confronted with structure fires which have demonstrated a consistent pattern of starting on the outside. These fires have the potential for rapid loss of structural integrity and catastrophic collapse before occupants are alerted. As attention has grown locally, it is apparent that this type of fire is becoming common on a national basis.

These fires tend to follow a distinct pattern. These fires start at a low point on the exterior ground or in a waste basket with discarded cigarette and spread vertically along the exterior wall producing flammable gases, which are readily admitted into the attic area through ventilation soffits. If not cooled, these heated gases accumulate and combust, creating rapidly spreading fire conditions in the attic area, often without occupant awareness. The unchecked fire can result in full roof involvement, creating a dangerous and difficult situation for occupants and fire fighters.

The group examined a number of structure fires which have exhibited the pattern described above. There is agreement over 3 common aspects. First, these fires often result from careless smoking habits or wilfires. Second, when the smoking materials are not properly disposed of, they come into contact with combustible ground cover adjacent to a building and, very commonly, this is mulch or wildfires (flying embers) start the combustible ground cover (kindling). And, last, the combustible exterior wall is a factor in the the growth of these fires into the attic space.

The careless smoker is an impediment to effective fire prevention efforts. The fire service has consistently provided data that shows smoking is the leading cause of fatal fires in the United States. Public fire and life safety efforts have been reasonably effective at communicating the message to not smoke in bed, and various medical organizations have demonstrated the health risk associated with “second hand” smoke. We now see that people are routinely smoking outside, at or near the entrance to a building, which increases the possibility of an accidental ignition of outside combustibles.

If one were to chronicle the actions of today’s smoker, it shows the last action they take when exiting a building is to “light up.” When returning inside, they often drop the cigarette near the entrance. Many smokers seem to believe that dropping a match or cigarette onto the combustible ground cover or into a flower pot is an effective method of extinguishment, however, this behavior often places the smoking material directly into the mulch, initiating the low fire described earlier.

Combustible ground cover (mulch) has become a common exterior decorative material which aids in suppressing weed growth while enhancing a building’s curb appeal. However, most mulch is a dead organic material, comprised of chipped wood, tree bark or pine needles. Mulch is most effective when it is maintained in a moist state, however it can dry out very quickly and become a readily ignitable fuel source. Because of its relatively small mass in comparison to its surface area, when ignited, it will progress and sustain open flame.

The group discussed a method in which to proceed, the interest being to add ress, in the quickest manner, industrial and social changes which could reduce the possibility of a fire on the outside of a building. Each aspect presents unique challenges for fire prevention efforts:

1. Changing the behavior of the smoker is an ongoing and difficult challenge, especially as social pressures have resulted in regulatory changes to require people to smoke outside of a building. Further development of the “fire safe” cigarette, by way of testing using mulch, could be deemed too costly for the industry, and would have no effect on improper disposal of matches. Thus, the quickest and most practical strategy for this aspect of the problem is to expand public fire and life safety education to focus on the hazards of improper disposal of smoking materials, coupled with enforcement of applicable requirements for regulation of smoking and disposal of products. However, in this age of “information overflow” it is questionable if this would result in widespread behavioral changes for smokers.

2. Regulating the use and placement of mulch, that the study group believes could have the quickest and most significant impact toward reducing the exterior fire problem, while additional strategies to address the other problems noted are pursued. The use of wood and wood related mulch for building decoration is purely optional. It is not a required construction component under current building codes. Therefore, regulations to curtail its use or require that it be separated from a building’s combustible exterior are reasonable and could be codified on a national basis. On a large scale, the mere action of creating separation of combustible materials has been a wildland fire tactic for years. Several states and local jurisdictions have already employed this theory by either recommending or requiring that wood-based mulch be separated from exterior combustible walls:

1. The Virginia Department of Forestry recommends to “provide a minimum of an 18 inch clearance between landscaping mulch beds and combustible building materials” and to “ensure proper clearance to electric devices, such as decorative lights, by following the manufacturer’s instructions;”

2. In Raleigh, NC, following a disastrous fire in a multi-family building, the city passed a pine straw mulch ordinance that bans the use of pine straw as ground cover within 10 feet of multi-family dwellings. The ordinance exempts 1 and 2-family dwellings, however, the city strongly encourages these homeowners to comply with the pine straw restrictions;

3. The Commonwealth of Massachusetts prohibits the new application of mulch within 18 inches around combustible exteriors of buildings, such as wood or vinyl but not brick or concrete. Residential buildings with six units or less are exempted from this regulation, but it is recommended that all homeowners adopt these safety practices. The regulation applies to all other buildings including commercial properties.

4. Ventura County, CA prohibits mulch and wood chips within the required “defensible space” zone (which ranges from 0’ to 30’ from the exterior of a building).

Cost Impact: Increase

Estimated Immediate Cost Impact:

This change could increase the cost of construction and maintenance, as non-combustible mulch can be more expensive than combustible mulch.

Estimated Immediate Cost Impact Justification (methodology and variables):

Typical retail cost of non-combustible mulch (pea gravel) vs. combustible mulch, can range from 2-5 times more expensive.

Estimated Life Cycle Cost Impact:

However typical combustible mulch will need to be replaced every 1-2 years vs. non-combustible mulch which may last 10+ years.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Based on estimated lifecycle of typical combustible vs. non-combustible mulch.

WUIC66-24

WUIC67-24

IWUIC: 606.3 (New)

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov); Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Add new text as follows:

<u>**606.3 Clear Area.** LP-gas installations shall be surrounded by a 10-foot (3048 mm) wide clear area to bare mineral soil. An additional 10 feet (3048 mm) beyond the bare mineral soil is permitted to have vegetation provided it is fire smart vegetation.</u>

Reason: This first part of this requirement is consistent with the International Fire Code for a 10 foot clearance of combustible material around LPG tanks. The second requirement for an additional 10 feet is based on the fact that this LP-gas installation is located in the wildland fire area. The additional 10 feet of fire smart vegetation will provide for a reduce heat impact on the LP-gas components.

The term fire smart vegetation is addressed and defined in a separate proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is consistent with requirements that are already contained in the International Fire Code.

Add new text as follows:

SECTION 608
BUILDING SITING AND SETBACKS

608.1 General. All parcels shall provide a minimum 30-foot (9144 mm) setback for all buildings from property lines and the center of a road, except as provided for in Section 608.1.1.

608.1.1 Setback reduction. A reduction in the minimum setback shall be based upon practical reasons, which may include but are not limited to, parcel dimensions or size; topographic limitations; development density requirements or other development patterns that promote low-carbon emission outcomes; sensitive habitat; or other site constraints, and shall provide for an alternative method to reduce structure-to-structure ignition by incorporating features such as, but not limited to:

1. Non-combustible block walls or fences.
2. Non-combustible material extending 5 feet (1524 mm) horizontally from the furthest extent of the building.
3. Hardscape landscaping.
4. A reduction of exposed windows on the side of the structure with a setback less than 30 feet (9144 mm).

Reason: The principle concept of building setbacks is to maintain fire separation distances from vegetation or other structures. This setback typically exceeds any zoning or building code setback requirement, but is crucial in inhibiting the extension of a wildfire. The NIST Technical Note 2205 evaluates separation distances and supports the 30 foot setback requirements.

Cost Impact: Increase

Estimated Immediate Cost Impact:

It is expected that there will be a $0 cost in some situations however setbacks may impact the housing density of a subdivision.

A basic representative cost comparison example is as follows:

Residential development with requirement = $16, 110

Residential development with exception to requirement = $15, 460

Residential development without requirement = $12, 890

Estimated Immediate Cost Impact Justification (methodology and variables):

The separation distance benefits the entire wildland community.

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov)

2024 International Wildland Urban Interface Code

Add new text as follows:

SECTION 609
RIDGELINES, FUEL BREAKS AND GREENBELTS

609.1 Ridgelines. The local jurisdiction shall identify strategic ridgelines, if any, to reduce fire risk and improve fire protection through an assessment of the following factors:

1. Topography.
2. Vegetation.
3. Proximity to any existing or proposed residential, commercial, or industrial land uses.
4. Construction where mass grading may significantly alter the topography resulting in the elimination of ridgeline fire risks.
5. Ability to support effective fire suppression.
6. Other factors, as required by the code official.

609.1.1 Undeveloped ridgelines. Undeveloped ridgelines identified as strategic ridgelines shall be preserved as follows:

1. New buildings on undeveloped strategic ridgelines are prohibited.
   - 1.1. New residential units are prohibited within or at the top of drainages or other topographic features common to ridgelines that act as chimneys to funnel convective heat from wildfires.
   - 1.2. Nothing in this subsection shall be construed to alter the extent to which utility infrastructure, may be constructed on undeveloped ridgelines.
   - 1.3. Where approved, buildings on strategic ridgelines where development activities such as mass grading will significantly alter the topography that results in the elimination of ridgeline fire risks.
2. The code official may implement further specific requirements to preserve undeveloped ridgelines.

609.2 Fuel breaks. When new projects meet any of the following criteria, the code official shall determine the need and location for fuel breaks in consultation with the fire chief:

1. The permitting or approval of three or more new parcels, excluding lot line adjustments.
2. A request for a change of zoning which will increase zoning intensity or density.
3. A request for a change in use permit which will increase the use intensity or density.

609.2.1 Exposures. Fuel breaks required by the code official, in consultation with the fire chief, shall be located, designed and maintained in a condition that reduces the potential of damaging radiant and convective heat or ember exposure to access routes, buildings or infrastructure within the development.

609.2.2 Fire department access. Fuel breaks shall have a minimum of one entry point for fire fighters and fire apparatus. The specific number of entry points and entry requirements shall be determined by the code official, in consultation with the fire chief.

609.2.3 Location of fuel breaks. Fuel breaks may be required at locations such as, but not limited to:

1. Directly adjacent to defensible space to reduce radiant and convective heat exposure and ember impacts, or support fire fighting tactics.
2. Directly adjacent to roads to manage radiant and convective heat exposure and ember impacts, increase evacuation safety, or support fire fighting tactics.
3. Directly adjacent to a hazardous land use to limit the spread of fire from such uses, reduce radiant and convective heat exposure, or support fire fighting tactics.
4. Strategically located along ridgelines, in greenbelts or other locations to reduce radiant and convective heat exposure, ember impacts, or support fire fighting tactics.

609.2.4 Timing. Fuel breaks shall be completed prior to the commencement of any permitted construction.

609.2.5 Construction. Fuel breaks shall be constructed using the most ecologically and site appropriate treatment option, such as, but not limited to, prescribed burning, manual treatment, mechanical treatment, prescribed herbivory and targeted ground application of herbicides.

609.2.6 Maintenance of fuel breaks. Where fuel breaks are required, maintenance mechanisms shall be established to ensure the fire behavior objectives and thresholds are maintained over time.
The mechanisms required shall be binding upon the property for which the fuel break is established, shall ensure adequate maintenance levels, and may include written legal agreements; permanent fees, taxes, or assessments; assessments through a homeowners' association; or other funding mechanisms.

Reason: This proposal introduces the concept of land use planning when it comes to development of buildings and structures in the wildland area.

Ridgeline requirements ensure that minimal visual and environmental impacts of development are associated with building and structures constructed in these areas.

The concept behind fuel breaks is to create a corridor that facilitates firefighter movement during a wildfire. These areas are often where certain wildfire firefighting techniques are employed such as backfires or burn-outs (when fire fighters set their own fire to burn the vegetation in front of an advancing wildfire).

This proposal provides the authority to the code official to designate fire breaks as appropriate to protect developments and assist in fire management.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The benefits of ridgeline and fuel break preservations for the environmental impact out way the costs of construction

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 102.8 Existing conditions.
The legal occupancy or use of any structure ~~or condition~~ existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically ~~covered~~ provided for in this code, the International Fire Code or the *International Property Maintenance Code*, or as is deemed necessary by the *code official* for the general safety and welfare of the occupants and the public. Existing properties shall comply with the defensible space requirements in Section 603 and Chapter 7.

Add new text as follows:

CHAPTER 7 MAINTENANCE REQUIREMENTS

SECTION 701 GENERAL

701.1 Scope. Where a building or structure was constructed in accordance with this code or was previously *approved*,maintenance of new and existing buildings, structures, systems and premises shall comply with this chapter. The construction requirements of this chapter are not intended to apply retroactively.

SECTION 702 IGNITION-RESISTANT CONSTRUCTION

702.1 General. Ignition-resistant construction features found to be damaged, missing or non-compliant shall be repaired or replaced.

SECTION 703 FIRE PROTECTION AND LIFE SAFETY SYSTEMS

703.1 General. *Fire protection* and *life safety system*s shall be maintained operable at all times in accordance with the applicable standard

SECTION 704 FIRE ACCESS ROADS

704.1 Obstructions. Fire access roads shall not be obstructed in any manner, including the parking of vehicles. The minimum widths and clearances established in Section 403.3 shall be maintained at all times.

704.2 Maintenance. Fire access roadsshall be maintained in a condition equal to or better than the condition at the time of approval.

704.3 Signs and marking. Road identification signs required in Section 403.4.1 and marking of fire protection equipment required in

Section 403.5 shall be maintained and legible.

SECTION 705
PREMISES IDENTIFICATION

705.1 General. Signs and markings for premise identification required in Section 403.6 shall be maintained and legible.

SECTION 706
WATER SUPPLY

Revise as follows:

~~404.9~~706.1 ~~Testing and maintenance~~General. Water sources, draft sites, and hydrants ~~and other fire protection equipment~~ required by this code shall be subject to periodic tests as required by the *code official*. ~~Such equipment installed under the provisions of this code shall be maintained in an operative condition at all times and shall be repaired or replaced where defective. Additions, repairs, alterations and servicing of such fire protection equipment and resources shall be in accordance with *approved* standards.~~

Add new text as follows:

706.2 Maintenance. Water sources, draft sites and hydrants shall be maintained in an operative condition at all times.

SECTION 707
DEFENSIBLE SPACE AND VEGETATION MANAGEMENT

Revise as follows:

~~604.1~~ 707.1 General.
Defensible spaces required by Section 603 or by an *approved* vegetation management plan in accordance with 502.2 shall be maintained at all times in accordance with 706.2 through 706.4.2 ~~Section 604~~.

Add new text as follows:

707.1.1 Fire protection plans. Where an *approved fire protection plan* contains *defensible space* requirements other than those in Table 603.2, the *defensible space* requirements in the *approved fire protection plan* shall be maintained at all times.

Revise as follows:

~~604.2~~ 707.2 Modified area.
Nonfire-resistive vegetation or growth shall be kept clear of buildings or structures, in accordance with Section 603, in such a manner as to provide a clear area for fire suppression operations.

~~604.3~~ 707.3 Responsibility. Persons owning, leasing, controlling, operating or maintaining buildings or structures are responsible for maintenance of *defensible spaces*. Maintenance of the *defensible space* shall include modifying or removing nonfire-resistive vegetation and keeping leaves, needles and other dead vegetative material regularly removed from roofs of buildings and structures.

~~604.4~~ 707.4 Trees. Tree crowns extending to within 10 feet (3048 mm) of any structure shall be pruned to maintain a minimum horizontal clearance of 10 feet (3048 mm). Tree crowns within the *defensible space* shall be pruned to remove limbs located less than 6 feet (1829 mm) above the ground surface ~~adjacent to the trees~~.

~~604.4.1~~ 707.4.1 Chimney clearance. Portions of tree crowns that extend to within 10 feet (3048 mm) of the outlet of a chimney shall be pruned to maintain a minimum horizontal clearance of 10 feet (3048 mm).

~~**604.4.2**~~ <u>**707.4.2**</u> **Deadwood removed.** Deadwood and ~~litter~~ <u>dying branches</u> shall be regularly removed from trees.

Delete without substitution:

~~**603.2.1 Responsible party.** Persons owning, leasing, controlling, operating or maintaining buildings or structures requiring *defensible spaces* are responsible for modifying or removing nonfire-resistive vegetation on the property owned, leased or controlled by said person.~~

Add new text as follows:

<u>**707.5 Accumulation of dead vegetation.** Leaves, needles, or other vegetation on roofs, in gutters, on or below decks, porches, balconies or exterior stairways shall be regularly removed.</u>

<u>**707.6 Woodpiles.** A minimum of 10 feet (3048 mm) clearance to combustible materials shall be maintained in all directions around all exposed woodpiles.</u>

<u>**Exception:** Where an approved vegetation management plan requires a different clearance distance.</u>

<u>**707.7 Liquid Propane Gas (LPG) storage tanks.** A minimum of 10 feet clearance to combustible materials shall be maintained in all directions around aboveground Liquid Propane Gas (LPG) storage tanks.</u>

<u>**Exception:** Where an *approved* vegetation management plan requires a different clearance distance.</u>

Revise as follows:

~~**603.2.3**~~<u>**707.8**</u> **Ground cover.**

~~Deadwood and litter shall be regularly removed from trees. Where o~~<u>O</u>rnamental vegetative fuels or cultivated ground cover, such as green grass, ivy, succulents or similar plants ~~are~~ used as ground cover, ~~they are allowed~~ <u>shall be permitted</u> to be within the designated *defensible space*, provided that they do not form a means of transmitting fire from the native growth to any structure.

Reason: This proposal accomplishes 3 things:

1. It creates a new Chapter for all maintenance requirements applicable to fire hazard mitigation of structures and premises regulated by the IWUIC. New construction requirements remain in Chapters 4, 5 and 6.
2. It relocates all existing requirements that are maintenance related from Chapter 6 into the appropriate sections of this new Chapter for clarity and easier use of this code.
3. It adds reasonable new requirements for maintenance or repair or replacement of features that were identified by F-CAC as gaps that needed to be addressed.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal does not impose any new or additional cost to initial construction. However, there are new requirements for the maintenance and/or repair of wildfire mitigation measures that are already required for new construction. Maintenance and repair costs are variable and specific cost estimates could vary significantly over the lifespan of a building or property.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal will impose additional costs related to ongoing maintenance, repair or replacement of features that were required for initial construction and site approval but do not increase the cost of initial construction.

Estimated Life Cycle Cost Impact:

Maintenance and repair costs are variable and specific cost estimates could vary significantly over the lifespan of a building or property. Costs may necessitate purchase of replacement materials, labor (which could by DIY) and increase as time goes by.

Add new text as follows:

SECTION C101
COMMUNITY WUI FIRE HAZARD EVALUATION FRAMEWORK

C101.1
Definitions. The Community WUI Hazard Evaluation Framework presented here is intended for communities as small as a few hundred to tens of thousands of residents. The methodology is not intended for the documentation of single residences or large cities. It is intended to provide a community with an overview of the overall WUI fire-related hazards and to enable the code official to compare the relative hazards and preparedness levels of different communities. The information collected can be used by first responders and community and county officials to prioritize hazard mitigation within and around the community and to develop “tabletop” responses to different WUI fire scenarios. In the event of an actual WUI fire, the information collected could be used by first responders and local officials to safely evacuate civilians, to reduce the risk of first responder injuries and to enhance fire containment. The following are definitions and uses of the different components of Table C101.1 Community WUI Fire Hazard Evaluation Framework. This framework may be expanded to include additional characteristics that are not specifically listed in this preliminary version.

C101.2 Community. In the sense of WUI fire hazard, the community should be viewed in the context of evacuation arteries rather than jurisdictional boundaries. As such, the community may have parts that are incorporated or unincorporated. Community size is reported in acres, and the community boundary selected for this hazard evaluation can be provided for use in a geographic information system (GIS) layer in a number of formats, including but not limited to shapefile, geodatabase or Geo-Package. A topographic overview of the area (community) is used to describe the general conditions using one or more of the following key words: flat terrain, rolling hills, moderate slopes, valleys, steep slopes and/or plateau.

Information about prevailing weather patterns, such as localized winds or significant wind events (strength and direction), should also be included in the community profile.

C101.3 Fuels. The fuels section is intended to provide an overview of the structural, vegetative and other fuels present in the community. This is not a parcel-level assessment; however, if defensible space assessment data is available, it can be aggregated and utilized within this framework to provide higher resolution assessment of community fire hazard. Structure density is a simple metric to capture structure-to-structure spacing and provide insight on the potential structure-to-structure fire spread. For uniform communities, a representative structure separation distance (SSD) may be sufficient, whereas nonuniform communities will be better described using a histogram of SSD. The age of structures may also be a factor in structure vulnerability due to changes in building codes associated with structure hardening. Similarly, a community that was built over a short period of time can be represented by a single value representing the decade of construction, while a community that grew and expanded over long periods will be better represented by a histogram of structure ages.

A database such as LANDFIRE (www.landfire.gov/) can provide the vegetative fuel type and fuel loading throughout the community. This data will be limited by the age of the last LANDFIRE overflight and the 100 feet (30 meters) pixel spatial resolution.

Natural and artificial fuel breaks, including fuel treatments within and around the community, should be represented in a geospatial format and should include the year the vegetative fuel treatment was conducted. Fuel treatments should also include any logging activities in the area surrounding the community. Fire history in and around the community will describe the last time the community experienced direct impacts from fire. Shapefiles of the fuel treatments and fire history will allow for spatial documentation of this data. Fuel treatments and fire history should be documented at least 10 miles (16 km) out from the edge of the community. Local conditions (e.g., fuel, topography, weather, evacuation routes) may require documentation well beyond 10 miles (16 km). The last large fire in the area of the community perimeter, together with the vegetative fuel loading, will provide information on the potential energy content of the vegetative fuels in the event of a short- or long-term drought.

The documentation of other community hazards, such as hazmat or high fuel load facilities (e.g., fixed propane tanks, hazardous material storage and use facilities, ammunition facilities lumber yards, pallet storage, tire storage), is important as they can affect civilians and first responder safety during evacuations, fire containment and mop-up activities. The information should be provided in the form of a GIS layer and may then be used by first responders to develop "tabletop" responses for emergency preparedness, and to direct response actions during a WUI fire event.

C101.4 Population. The population of the selected community will impact, among other factors, the minimum time required for evacuation. Population and population density, expressed as the number of residents per acre, are both important metrics that provide information that can be used for evacuation assessment. The permanent to transient population density ratio is intended to capture the fraction of the community that may be visiting for tourism and may not be aware of community evacuation and other fire related activities.

C101.5 Notification. The notification section of the Community WUI Hazard Evaluation is designed to capture the presence and type of mass-notification tools available to emergency managers. It should be noted that reliance on individual notification methods may result in limited notifications. If a Reverse 911 system is in place, the percentage of the community that will potentially receive the notifications from this system will estimate the number of residents that may require different notifications. Sirens or other fixed notification systems with power backup should also be listed in this section along with the fraction of the population covered by these systems. Additional notification systems that don't require phone or internet are also captured in this section, since WUI events frequently result in power outages or other service interruptions.

C101.6 Evacuation. This section of the Community WUI Hazard Evaluation is not intended to replace a full community evacuation study or act as a community evacuation plan. The primary purpose of this section is to compute, given a number of assumptions, a Minimum Throughput Time (MTT), to provide an initial idealized order of magnitude time to be considered in the early stages of evacuation pre-planning. This information can be of value to first responders and community emergency planning personnel, as it may potentially highlight critical evacuation bottlenecks inside or outside the community.

The MTT concept is a traffic engineering calculation of roadway capacity to provide an initial lower bound for planning community evacuation. The MTT is intended for isolated and partly isolated interface and intermix communities rather than a city setting with large populations and complex evacuation routes. A community should consider a detailed evacuation study to further enhance the community evacuation plan. There is a significant body of work associated with developing dynamic evacuation models. An example of a framework which includes coupled fire and evacuation considerations, as well as background on the individual model components, was published in 2019 in Safety Science, Volume 118, authored by Ronchi et al., titled "An open multi-physics framework for modelling WUI fire evacuations," on pages 868-880.

The MTT considers two significant factors: bottlenecks within and beyond town, and the total number of vehicles that must be accommodated. Bottlenecks slowing traffic throughput may be located within or outside of jurisdictional boundaries. Bottlenecks occurring well beyond the evacuating community may cause ripple effects significantly impacting community evacuation. In identifying the population for computing the MTT, consideration should be given to neighboring settlements/communities that may share the same evacuation route(s). The MTT should consider the minimum number of traffic lanes (i.e., 8 lanes merging into 2 lanes should be treated as 2 lanes) available for evacuation, the community population and the average speed limit of the egress routes. Contraflow, the implementation of reverse direction traffic flow, may be considered here, along with provisions for first responder access to the community. The computed Minimum Throughput Time (MTT) does not account for any of the numerous potential hindrances to evacuation traffic, such as road accidents, reduced speed due to smoke obscuration, merging of traffic in town to feed the primary arteries, large vehicles that occupy more space than cars and have reduced maneuverability, or fire activity impacts, such as burn overs, causing evacuation lane(s) closures and potential slowdowns associated with traffic redirections.

The evacuation section is also used to identify vulnerabilities of egress arteries including vegetative fuel setbacks as well as any hazardous material facilities which might affect evacuation. Fuel setback information, collected in 0.15 miles (0.25 km) increments along egress routes, presented in the form of a histogram and a GIS layer, could help identify vulnerable spots that may potentially impact evacuation and identify candidate locations for fuel treatments.

The presence of a Community Evacuation Plan, the presence and capacity of safety zones and other large crowd assembly areas, and whether evacuation drills are performed will contribute to the community evacuation preparedness overview. The number of hospitals and senior care facilities and their total capacity will provide further information to assess overall community evacuation needs.

C101.7 Infrastructure / COOP / COG. The locations and needs of key facilities for maintaining continuity of operations (COOP) and continuity of government (COG), such as police, fire, EMS, hospitals, government buildings, cell towers, water sources, water provider infrastructure, electrical utility key infrastructure and natural gas key infrastructure should be listed and incorporated in this part of the evaluation framework.

Infrastructure characteristics, particularly related to water supply and electric utilities, can impact response and potential pre-fire hazard reduction. The public water system dependence on power supply, including the availability of backup power sources (i.e., generator backup) will provide insight into the resilience of the water system. The location of power lines (i.e., above or below ground) can impact evacuation, as downed power lines can impact evacuation and mobility throughout the community.

C101.8 Fire Fighting Response. The type of fire department, whether volunteer, career, or combined, may impact the likely availability and response time of first responder resources. The density of firefighting (ff) responders, as a ratio of the number of personnel on shift to the number of structures (number of ffs/number of structures) will provide information on the maximum possible coverage by the local resources.

In this section, mutual aid resources should be counted only if mutual aid agreements are in place and can ensure rapid deployment. Mutual aid response is captured through a histogram in 1-, 2-, 3- and 4-hour travel times. This may also be approximated using a geographic radius of distance from the community. The purpose of this information is to provide insight into the minimum response times by mutual aid.

TABLE C101.1 COMMUNITY WUI FIRE HAZARD EVALUATION FRAMEWORK

COMMUNITY	DATA TYPE	DATA LAYER IN MDS
Community shapefile, geodatabase or Geo-Package including topography and geographic attributes, and prevailing weather patterns (e.g., wind)	GIS layer	X
FUELS		
Structure Density (structure separation distances—SSD)	SSD histogram	
Age of structures	Histogram	
Vegetative fuel loading Fuel type Fuel loading	Fuel type Tons/acre

Density of firefighting (FF) responder to number of structures (FF/structure ratio)	FF/structure	
Mutual aid response (engines-hours histogram) and agreements with mutual aid	Engines-hours histogram	

Reason: The proposed appendix in the Wildland Urban Interface Code is meant to be a tool to enable communities to collect, assemble, and represent the associated risks within the Wildland Urban Interface (WUI) fire area.

Community level fire hazard data is not always readily available in a centralized location and not in a standard format. The proposed framework enables communities' leaders to collect their WUI fire hazard data in an immediately accessible format.

This framework allows the community WUI fire hazard area data to be an inclusive picture. Part of the data assembled in the framework layout will help first responders during an incident. This data may enhance situational awareness, facilitate ingress and egress routes, and increase structure survivability through targeted fire responder actions.

The framework allows decision makers the ability to access WUI fire hazard risks across multiple communities when implemented in this standardized method. For example, a comparison can be made between a community of 5,000 residents to a community with 20,000 residents. They will be able to compare their overall fire hazard as well as the relative fire hazard.

The information from the standardized framework may be used to assist with making design and prioritize resources at the community, county, and state level. These resources may include funding for fuel treatment around communities in designated very high fire hazard severity zones.

The proposed framework has the benefit of enabling communities, county and state to use a methodized approach to assess hazards, offer property solutions and inform first responders before and during incidents.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost impact will be varied. Much of the data is already available but may be in many different documents. Pulling the data together will range from zero to "X" amount for a new community starting from scratch. The intent is to be a standard approach for any size community.

2024 International Wildland Urban Interface Code

Revise as follows:

~~APPENDIX G SELF-DEFENSE MECHANISM~~

~~SECTION G101~~ ~~GENERAL~~

~~G101.1 Identification of the problem.~~
~~The *International Wildland-Urban Interface Code* establishes a set of minimum standards to reduce the loss of property from wildfire. The purpose of these standards is to prevent wildfire spreading from vegetation to a building. Frequently, proposals are made by property or landowners of buildings located in the wildland-urban interface to consider other options and alternatives instead of meeting these minimum standards. This appendix chapter provides discussion of some elements of the proposed self-defense mechanisms and their role in enhancing the protection of exposed structures.~~

~~G101.2 Structural survivability.~~
~~Various stages of assault occur as a building is exposed to a wildland-urban fire. Ashes are cast in front of a fire out of a smoke or convection column, which can result in secondary ignitions. Heavier embers that have more body weight and may contain more heat to serve as sources of ignition follow. Finally, the actual intrusion of a flame front and the radiant heat flux can expose combustibles outside of a building and the exterior structure of a building to various levels of radiant heat. A study revealed that the actual exposure of a building to the flame front by the perimeter of the fire was usually less than 6 minutes. However, the exposure to the forms of other materials that can result in proliferation of other ignitions can vary, depending on wind, topography and fuel conditions.~~
~~To enhance structural survivability, the self-defense mechanisms must, first, do everything possible to prevent the ignition of materials from objects that are cast in front of the fire and, second, they must withstand the assault of the fire on the structure to prevent flames from penetrating into the building and resulting in an interior fire. There are considerable problems in achieving both of these objectives using some of the proposed alternative forms of protection such as the lack of definitive standards for self-defense mechanisms on the exterior of buildings. Although fire service has done considerable research into the evaluation of technology, such as smoke detectors, fire alarms, and interior sprinkler systems, very limited amount of study has been done on exterior sprinkler systems.~~
~~All forms of fire protection are classified as either active or passive. Active fire protection is taking specific action to control the fire in some manner. Passive fire protection uses resistance to ignition or provides some form of warning that allows other action to be taken. These two classifications of self-defense mechanisms create different problems with regard to being accepted as alternatives for building construction. Furthermore, certain self-defense mechanisms must be built in during new construction, and others may only be capable of being added as a retrofit to existing structures. As a matter of public policy, most *code officials* are reluctant to accept passive fire protection as an equivalent to a construction requirement, but are also reluctant to accept active fire protection systems that require intervention by suppression personnel.~~
~~The unequal distribution of self-defense mechanisms within a specific neighborhood poses another problem. If an individual is granted a waiver or exemption on the basis of putting in a nonmandated self-defense mechanism, and the neighbors to either side choose not to do so, or are not given the same options, there is a potential operational problem.~~

~~G101.3 Alternative concepts.~~
~~Sections G101.3.1 through G101.3.6 provide consideration of several alternative self-defense mechanisms.~~

~~G101.3.1 Exterior sprinkler systems.~~

~~Currently, there is no nationally accepted standard for the design and installation of exterior fire sprinkler systems. Interior sprinkler systems are regulated by nationally recognized standards that have specific requirements. However, exterior sprinkler systems lack such uniformity. What is generally proposed is a type of sprinkler system, placed on the roofs or eaves of a building, whose primary purpose is to wet down the roof. These types of systems can be activated either manually or automatically. However, the contemporary thought on exterior sprinkler systems is that if the roof classification is of sufficient fire resistance, exterior sprinklers are of little or no value. Another option and alternative with exterior sprinklers is to use them to improve the relative humidity and fuel moisture in the *defensible space*. In this case, the exterior sprinkler is not used to protect the structure as much as it attempts to alter the fuel situation. However, studies do not support the idea that merely spraying water into the air in the immediate vicinity of a rapidly advancing wildland-urban fire does much good. Clearly, irrigation systems that keep plants healthy and fire-resistive plants that resist convection and radiated heat can accomplish the same purpose.~~

~~G101.3.2 Alternative water supply systems for exposure protection~~.

~~Pools and spas are often offered as an alternative water source for fire departments. These water sources must be reliable and able to be accessed to be of any use by fire protection forces. Accessibility means that the fire department must be able to withdraw the water without having to go through extraordinary measures such as knocking down fences or having to set up drafting situations. Designs have been created to put liquid- or gas-fueled pumps or gravity valves on pools and spas to allow fire departments to access these water systems. A key vulnerability to the use of these alternative water systems is loss of electrical power. When the reliability of a water system depends on external power sources, it cannot be relied upon by fire fighters to be available in a worst-case scenario.~~

~~G101.3.3 Class A foam systems~~.

~~One technology is Class A foam devices. These are devices that allow a homeowner to literally coat the exterior of their house with a thick layer of foam that prevents the penetration of embers and radiant heat to the structure. Experiments in various wildland fire agencies advocate foaming houses in advance of fire and flame fronts. To be accepted by the *code official*, the Class A foam system should pass rigorous scrutiny with regard to the manner and needs in which it is activated, the ways and means in which it is properly maintained, and a ways and means to test the system for its operational readiness during hiatus between emergencies.~~

~~G101.3.4 Enhanced exterior fire protection~~.

~~This alternative method would increase the degree of fire resistance on the exterior of a building. This is most often an alternative recommended as a retroactive application when individual properties cannot achieve adequate *defensible space* on the exterior of a building. Normally, fire resistance and building scenarios are concerned with containing a fire. Fire-resistance ratings within building design ensures resistance to a fire for the specified time to compartmentalize the building's interior.~~

~~To improve fire resistance on the exterior of the structure, the primary emphasis is on preventing intrusion into the building. This means protection of apertures and openings that may or may not be required to have any degree of fire resistance by accepted building codes. The option that is available here is for individuals to provide coverage in the form of shutters or closures to these areas, which, along with maintenance of combustible-free perimeters, can often prevent intrusion.~~

~~There are obvious limitations to this alternative. First and foremost is the means of adequately evaluating the proposed fire resistance of any given assembly. Testing techniques to determine fire resistance for such objects as drywall and other forms of construction may not be applicable to exterior application. Nonetheless, *code officials* should determine the utility of a specific fire resistance proposal by extrapolating conservatively.~~

~~G101.3.5 Shelter in place~~.

~~Developments in the wildland-urban interface may be designed to allow occupants to "Shelter in place." Use of this design alternative should include ignition-resistant construction, access, water supply, automatic sprinkler systems, provisions for and maintenance of *defensible space*, and a *Fire Protection Plan*.~~

~~A *Fire Protection Plan* describes ways to minimize the fire problems created by a specific project or development. The purpose for the *Fire Protection Plan* is to reduce the burden and impact of the project or development on the community's fire protection delivery system. The plan may utilize components of land use, building construction, vegetation management and other design techniques and technologies. It should include specific mitigation measures consistent with the unique problems resulting from the location, topography, geology, flammable vegetation and climate of the proposed site. The plan shall be consistent with this code, and approved by the fire *code official*. The cost of preparation and review is to be borne by the project or development proponent.~~

~~G101.3.6 Building location~~.

~~The location of a new building within lot lines should be considered as it relates to topography and fire behavior. Buildings located in natural chimneys, such as narrow canyons and saddles, are especially fire prone because winds are funneled into these areas and eddies are created. Buildings located on narrow ridges without setbacks may be subjected to increased flame and convective heat exposure from a fire advancing from below. Stone or masonry walls can act as heat shields and deflect the flames. Swimming pools and rated or noncombustible decks and patios can be used to create a setback, decreasing the exposure to the structure. Attic and under-floor vents, picture windows and sliding glass doors should not face possible corridors due to the increased risk of flame or ember penetration.~~

~~G101.4 Conclusion~~.
~~The purpose of the *International Wildland-Urban Interface Code* is to establish minimum standards that prevent the loss of structures, even if fire department intervention is absent. To accept alternative self-defense mechanisms, the *code official* must carefully examine whether these devices will be in place at the time of an event and whether they will assist or actually complicate the defense of the structure by fire suppression forces if they are available.~~
~~The best alternative to having a building comply with all of the provisions of this code is to remove sources of fuel. This is closely paralleled by excellent housekeeping between the vegetation and the structure. Alternative ways of achieving each of these goals can and should be considered after scrutiny by appropriately credentialed and qualified fire protection personnel.~~

Add new text as follows:

APPENDIX G VOLUNTARY HOME-HARDENING RECOMMENDATIONS

SECTION G101 GENERAL

G101.1 Identification of the problem. The International Wildland-Urban Interface Code establishes a set of minimum standards to reduce the loss of property from wildfire. The purpose of these standards is to prevent wildfire from spreading from vegetation to a building. Many homes were built in the wildland-urban interface areas prior to the implementation of provisions found in this code. As a result, many homes are lacking in their ability to survive an approaching wildfire. Many of the features discussed herein are designed as low-cost features to retrofit existing homes. Additionally, many owners desire to increase the survivability of their home and provide additional protection beyond the minimums prescribed in this code. This appendix chapter provides discussion of some elements of possible features to enhance survivability and harden the structure against an approaching wildfire.

G101.2 Structural survivability. The home hardening features listed in Section G101.21 were developed as a best practices guide to assist homeowners to increase the ignition-resistance of their homes from wildfires. Some of these items are based on upgrading to more stringent building materials when that building component is due for replacement as part of its normal maintenance or lifespan, such as the roof covering.

G101.2.1 Home hardening features. If homes are not already provided with the suggested protection, the following items should be considered in hardening a home against wildfire:

1. When it is time to replace your roof, replace it with a Class A fire rated roof.

2. Block any spaces between your roof covering and sheathing with noncombustible materials (bird stops).

3. Install a noncombustible gutter cover on gutters to precent the accumulation of leaves and debris in the gutter.

4. Cover your chimney and stovepipe outlets with a noncombustible corrosion resistant metal mesh screen (spark arrestor), with 3/8-inch to 1/2-inch openings.

5. Install ember and flame-resistant vents.

6. Caulk and plug gaps greater than 1/8-inch around exposed rafters and blocking to prevent ember intrusion into the attic or other enclosed spaces.

7. Inspect exterior siding for dry rot, gaps, cracks, and warping. Caulk or plug gaps greater than 1/8-inch in siding and replace any damaged boards, including those with dry rot

8. Install weather-stripping to fill gaps greater than 1/8-inch between garage doors and door frames to prevent ember intrusion. The weather-stripping must be compliant with UL Standard 10C.

9. When it's time to replace your windows or skylights, replace them with multilayered glazed panels containing at least one tempered pane or dome.

10. When it's time to replace your siding or deck, use compliant noncombustible or ignition-resistant materials.

11. Cover openings to operable skylights with noncombustible metal mesh screen with openings in the screen not to exceed 1/8-inch.

12. Install a minimum 6-inch metal flashing, applied vertically on the exterior of the wall at the deck-to-wall intersection to protect the building siding material.

G101.3 Defensible space features. The maintenance and defensible space features listed in Section G101.31 were developed as a best practices guide to assist homeowners to increase the effectiveness of their defensible space and improve the effects of the home hardening features to increase the survivability of their homes from wildfires.

G101.3.1 Maintenance and defensible space. The following maintenance and operational procedures assist to limit the impact on a home from an approaching wildfire:

1. Regularly clean your roof, gutters, decks, and the base of walls to avoid the accumulation of fallen leaves, needles, and other flammable materials.

2. Ensure that all combustible materials are removed from underneath, on top of, or within five feet of a deck.

3. Remove vegetation or other combustible materials that are within five feet of windows and glass doors.

4. Replace wood mulch products within five feet of all structures with noncombustible products such as dirt, stone, or gravel.

5. Remove all dead or dying grass, plants, shrubs, trees, branches, leaves, weeds, and pine needles within 30 feet of all structures or to the property line.

6. Ensure exposed firewood is stored at least 30 feet away from structures or completely covered in a fire-resistant material that will not allow embers to penetrate. Additionally, make sure you have 10 feet of clearance around your wood piles.

7. Be sure to store combustible outdoor furnishings away from your home when not in use.

8. Remember to properly store retractable awnings and umbrellas when not in use so they do not collect leaves and embers.

Reason: Home hardening is the term used to describe vegetation management compliance and building materials used to resist the intrusion of flames or embers projected by a wildland fire. It can be applied to new construction or for retrofitting an older home. Home Hardening considers the relationship between your home and its exposure to nearby combustible features such as vegetation, vehicles, accessory buildings, or even miscellaneous structures like a fence.

Your roof is one of the most vulnerable areas of your home! Due to its large surface area, your roof is more susceptible to embers and flame.

How is a roof vulnerable?

- Combustible roof coverings such as a non-fire-retardant treated wood shake or shingle roof. California requires roof coverings and assemblies to be Class A-ratedExternal Link. Common Class A roof coverings include asphalt shingles, tile or cement shingles, or metal panels.
- Gaps or openings in your roof assembly that have degraded exposing unprotected roof components.
- Debris accumulation on your roof, especially when located next to vulnerable areas such as combustible wall intersections.

What to do about a roof

- Keep your roof clear of debris and vegetation.
- Fill in gaps between the roof covering and the sheathing to prevent the intrusion of embers and flame.
- When it is time to replace your roof, install a Class A-rated roof covering such as asphalt fiberglass composition shingles.
- Replace combustible siding at roof-to-wall intersections with noncombustible siding.

How are roof attachments vulnerable?

- Debris accumulation around roof attachments.
- Gaps or penetrations in the roof covering from the installation of a roof attachment like a solar panel.

What to do about roof attachments

- Check periodically and keep areas around roof attachments free of debris.
- Ensure that roof attachments have enough space underneath them so that debris does not accumulate.
- Ensure openable skylights have a noncombustible metal mesh screen not exceeding 1/8 inch and have multipaned glazing with one layer of tempered glass.
- Install metal flashing around exposed wood frame skylights.

Check your gutters! Clean gutters regularly and install noncombustible gutter covers on gutters.

How are gutters vulnerable?

- Gutters without a gutter cover can allow accumulation of debris making it highly susceptible to embers and fire. If the debris catches on fire, it exposes unprotected combustible areas of your roof assembly.
- Gutters made of combustible materials such as vinyl can catch on fire and expose unprotected combustible areas of your roof assembly.

What to do about gutters

- At a minimum, install a noncombustible gutter cover to reduce the buildup of debris. When it is time to replace your gutters, replace them with a non-combustible option such as metal.
- Ensure your roof has a metal drip edge installed that completely covers the space above your gutter system.

Make sure your vents are protected from embers and fire. Upgrade your vents!

How are vents vulnerable?

- Access points such as your attic or crawlspace vents are areas embers or flames can enter and ignite combustible materials inside your home.
- Inlet vent that allows for the entry of wind-blown vegetative debris. Ridge or off-ridge vents located on your roof are more susceptible.
- Vents constructed of flammable materials such as plastic are highly vulnerable to embers and flames.

What to do about vents

- At a minimum, vents should have metal mesh screening that is at least 1/8 inch to protect against embers and flame.
- Upgrade to WUI-rated ember/flame-resistant vents. Be sure to accommodate for proper ventilation. Consult your local building official or licensed contractor for local building requirements for wildland areas.
- Keep debris away from all vents.
- Properly seal all openings including around blocking in vent areas.

Plug gaps or openings in your eaves and remove all vegetation and combustible materials that are directly underneath.

How are eaves vulnerable?

- Open eave construction with gaps or penetrations between the rafter tails and blocking as they are entry points for embers.
- Vents in eaves with gaps or penetrations in the blocking.
- Wide overhangs.
- Combustible fuel sources next to your home that can create a fire pathway for embers or flames to your eaves.

What to do about eaves

- Remove vegetation and combustible materials directly below eaves.
- Create a soffit eave (horizontal) or enclose eave (angled) using noncombustible material. Consult your local building official or licensed contractor for building codes in your area.
- Inspect eaves for gaps around rafter roof tails and blocking. Plug or caulk gaps.

Exterior siding that is combustible, has gaps, holes, or rot is vulnerable to both embers and flame.

How is siding vulnerable?

- If ignited, combustible siding can provide a path for flames to penetrate through other vulnerable areas such as windows, under-eave areas, or vents.
- Siding ignition from nearby combustibles that are too close to the house.
- Roof-to-wall areas where combustible siding is present.
- Gaps or penetrations in the exterior covering that are larger than 1/8 of an inch.

What to do about siding

- Plug or repair all gaps, holes, or rot in your exterior siding.
- Consider replacing combustible siding with a noncombustible or ignition-resistant material option. Consult your local building official or licensed contractor for local building codes in wildland areas.
- If a full replacement of your exterior covering is not possible then consider a partial replacement by using a noncombustible siding material for the bottom 2 feet from the ground and add metal flashing to protect the bottom edge sheathing.

Close the gap! Poorly sealed doors with gaps or penetrations provide a path for embers to enter your home or garage.

How are doors vulnerable?

- Doors that have rot or decay.
- Combustible door framing material as embers tend to accumulate at the bottom thresholds and sides.
- Doors that have gaps or penetrations greater than 1/8 inch.
- Door screens that are not made of metal mesh.
- Fuel sources stored nearby or inside a garage which increases its ignition potential.
- Garage doors that lack gasketing or have gaps that allow for the intrusion of embers.

What to do about doors

- Install or replace non-compliant wood screen or sliding doors with a noncombustible option.
- Install metal mesh screens in sliding or screen doors.
- Relocate combustibles and flammables inside your garage so they are not located next to ignition sources.
- Add metal flashing at garage door jambs and headers.
- Add gasketing (weather-striping) to garage doors to prevent ember intrusion.

Remove combustibles and vegetation around windows and upgrade older vulnerable single-pane windows with ones designed for areas that experience wildland fire.

How are windows vulnerable?

- Windows that are left open unattended.
- Combustible framing material that, when ignited, glass breaks or falls out providing a path for embers or flames to enter your home.
- Radiant heat which can cause windows to break even before fire reaches the house. Single-pane and large windows are particularly vulnerable.
- Windows that face large vegetation areas or have vegetation directly underneath.
- Vinyl windows that do not have an internal reinforcement bar in the horizontal or vertical separator member as they are prone to failure from radiant exposure due to deformation of the frame.

What to do about windows

- Install or upgrade to double-pane tempered glass windows. Tempered glass is about four times more resistant to breaking during a wildfire.
- Noncombustible metal framing material is an optimal choice.
- Confirm if vinyl windows have a vertical or horizontal reinforcement bar.
- Create a 0 to 5 ember-resistant zone by removing vegetation and other combustibles by all windows.
- Install metal mesh window screens to improve the performance of windows subjected to radiant heat exposure.

Protect your deck! Deck ignitions can start from flames underneath or embers on top.

How is a deck vulnerable?

- Combustible damaged or rotting deck boards as they are more easily ignitable.
- Deck boards made of combustible materials that are attached to the residence.
- Deck-to-wall intersections that have combustible siding and no metal flashing.
- Combustibles within the first 0 to 5 feet zone around a combustible deck (patio furniture, planter boxes, door mats, etc.)
- Combustible items stored underneath your deck that could be an ignition source for fire.
- Decks that overhang a slope that can be exposed to flames from trees or other vegetation downslope.
- Lattice or other combustible fencing options are used as a vertical enclosure under a deck, as it is readily ignitable.

What to do about decks

- Create an ember-resistant zone under the deck footprint extending five feet outward to reduce the likelihood of under-deck flame exposure. Use hardscapes like gravel, pavers, or concrete.
- Ensure sufficient defensible space if your deck is overhanging and located on a slope to minimize flame spread.
- Replace deck boards with ignition-resistant, noncombustible, fire-retardant-treated wood, or material that complies with performance testing standards (this includes steps, stairs, and railings).
- Replace any damaged or rotting deck boards as they ignite more easily.
- Install a minimum of a 6-inch metal flashing applied vertically on the exterior wall and at deck-to-wall intersections.
- If a full replacement of your deck is not possible then consider a partial replacement by replacing the walking surface boards with a noncombustible option for the first 1 ft. away from the residence.
- Remove combustible items stored under your deck.
- Regularly clear debris on top of or underneath your deck.

Bibliography: https://www.fire.ca.gov/home-hardening

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The section is voluntary. The cost is determined based on the recommendations to harden an existing structure in the Wildland Urban area.

WUIC73-24

IWUIC: APPENDIX H, SECTION H101, H101.1, FIGURE H101.1(1), FIGURE H101.1(2), FIGURE H101.1(3), FIGURE H101.1(4)

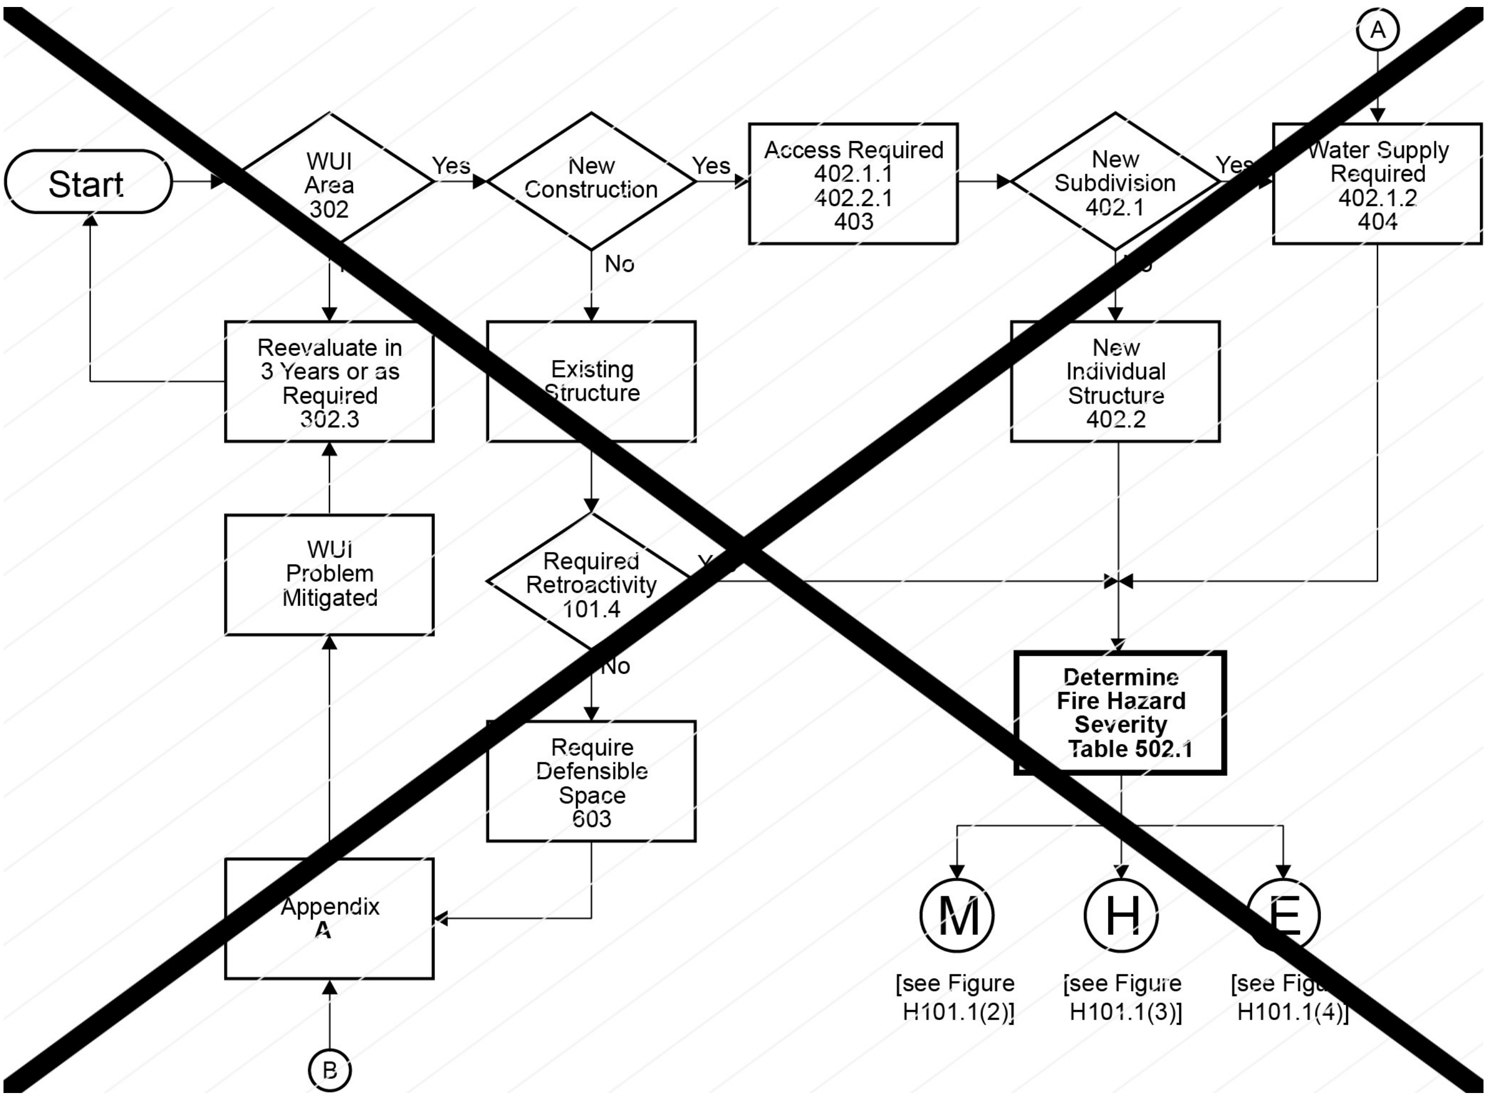
Delete without substitution:

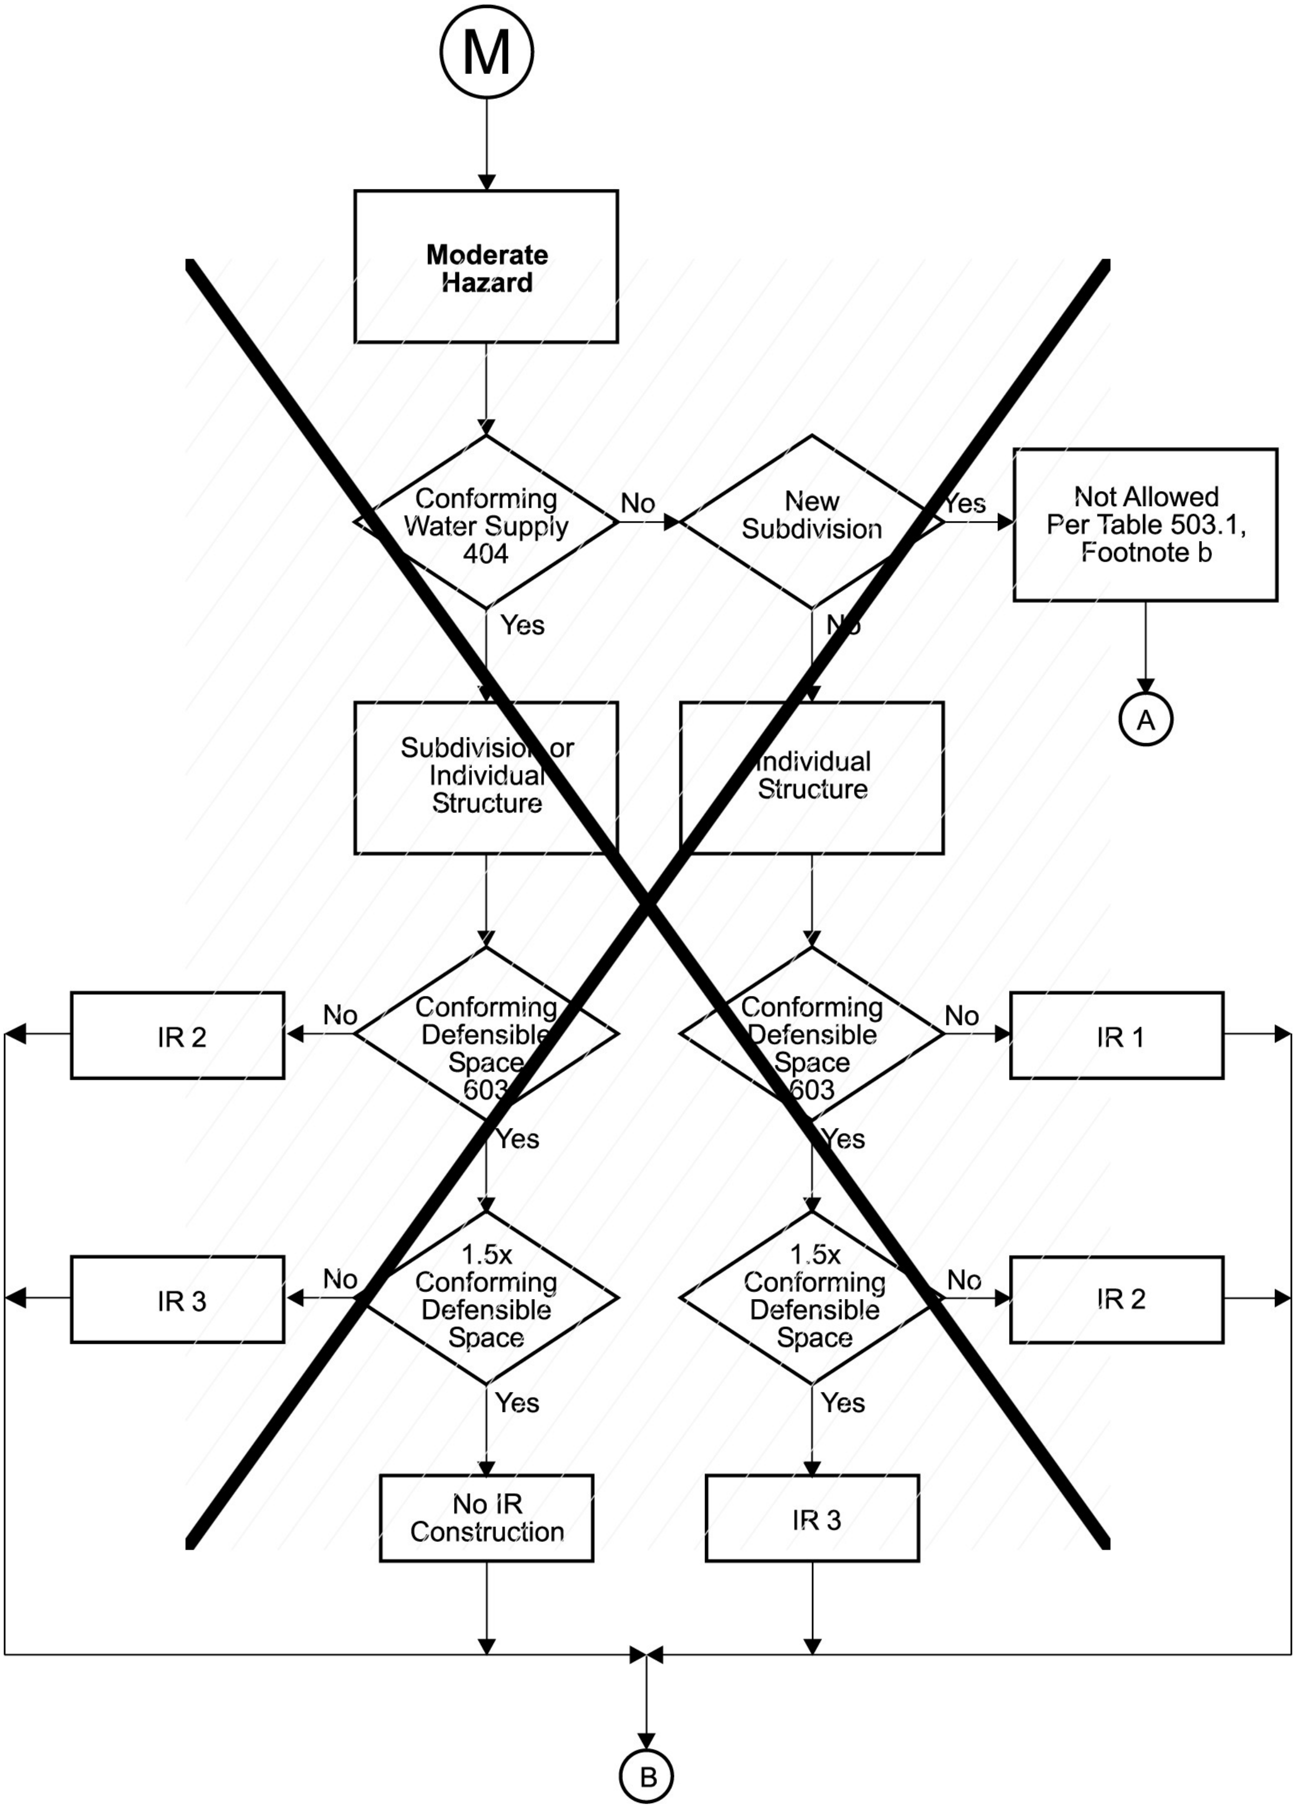
~~APPENDIX H INTERNATIONAL WILDLAND-URBAN INTERFACE CODE FLOWCHART~~

~~SECTION H101~~
~~GENERAL~~

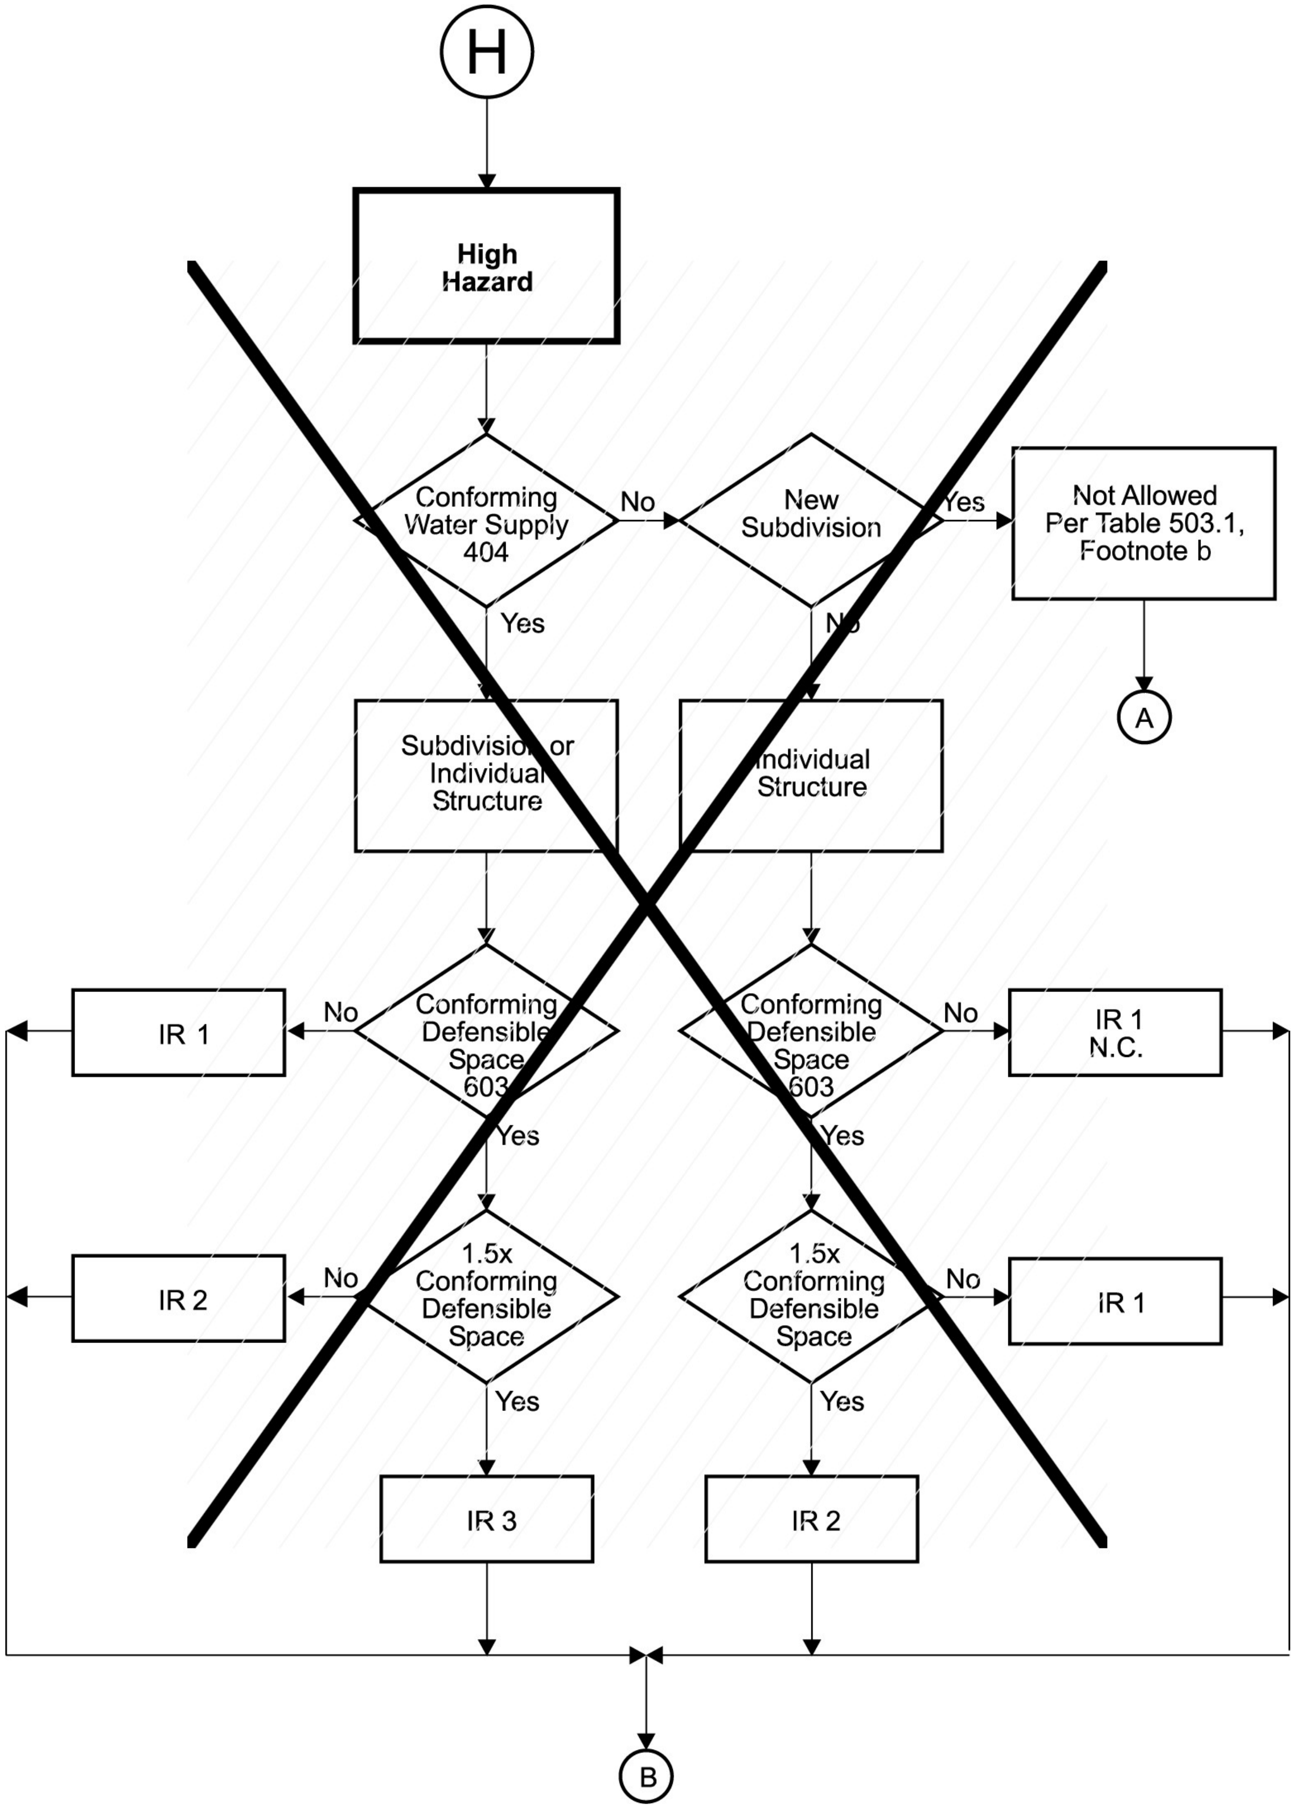
~~H101.1 Flowchart.~~
~~The flowchart shown in Figures H101.1(1) through H101.1(4) is based on the "Decision Tree" concept and is intended to provide the~~ ~~*code official*~~ ~~with a graphical representation of how this code is to be applied.~~



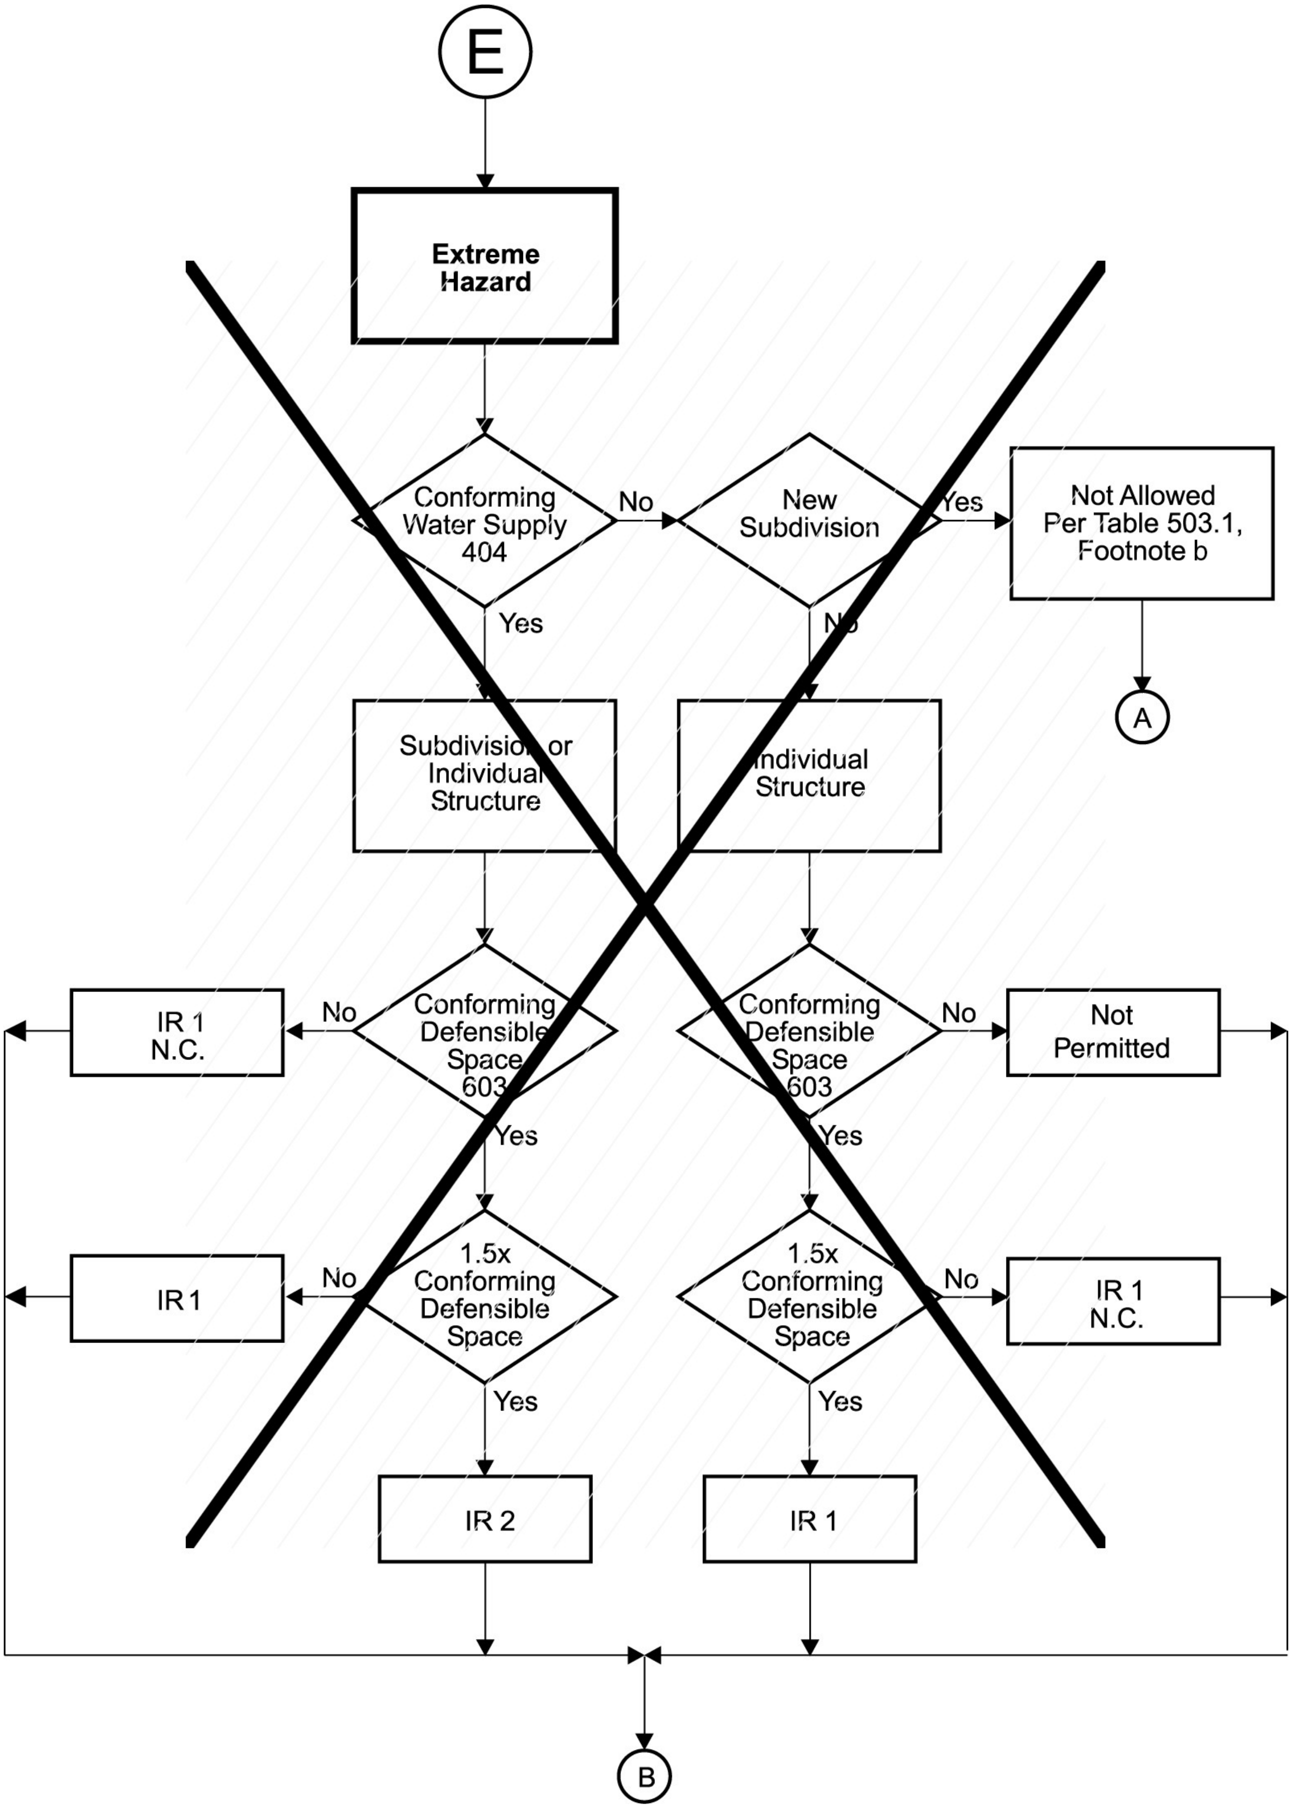
~~FIGURE H101.1(1) DETERMINATION OF REQUIREMENTS~~



~~FIGURE H101.1(2) MODERATE HAZARD~~



~~FIGURE H101.1(3) HIGH HAZARD~~



~~FIGURE H101.1(4) EXTREME HAZARD~~

Reason: This proposal recommends deleting Appendix H without substitution. This appendix is an informational flowchart based on Table 503.1. It has been in the IWUIC since its first edition, in 2003, just like the Table it is based on.

Several other proposals will recommend changes to that Table 503.1. In particular, the flowchart assumes that the issue of water supply is part of the table and that is proposed to be deleted since the intent is to make the structure capable of withstanding the approaching fire on its own, and not be dependent on the arrival of firefighters or application of water to the structure. The flowchart also contains nomenclature (such as IR 1 and IR 1 N.C.) that is proposed to be revised.

This flowchart is unique in the IWUIC code as a guide for a particular table in the code and is unnecessary.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply deletes an optional appendix since proposed changes to Table 503.1 will make it inconsistent with the code requirements.

	C′F′[b]		12	28.6	150	$1^1/_2$	7.00	1.57	3.2	5.02	—	
	D′E′[b]		12	28.6	150	$1^1/_2$	7.00	1.57	3.2	5.02	—	
K	Total pipe friction losses (hot)				—	—	—	—	—	—	7.99	—
L	Difference (Line J minus Line K)				—	—	—	—	—	—	—	1.37

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 psi = 6.895 kPa, 1 gpm = 3.785 L/m.

a. To be considered as pressure gain for fixtures below main (to consider separately, omit from "I" and add to "J").

b. To consider separately, in K use C-F only if greater loss than above.

Reason: This is an editorial proposal. The corrections are on intermediate values that do not affect the outcome of the final answer. The corresponding table in the IRC is correct.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a simple cleanup of incorrect values in a table.

CCCIPC1-24

CCCIWUIC1-24

IWUIC: 503.2, 503.2.1, 503.2.2, 503.2.3, 503.2.4

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

503.2 Ignition-resistant building material.

Ignition-resistant building materials shall comply with any one of the requirements in Section 503.2.1 through 503.2.4.

503.2.1 Noncombustible material.

Material shall comply with the definition of *noncombustible* materials in Section 202.

503.2.2 Fire-retardant-treated wood.

Fire-retardant-treated wood shall be identified for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

503.2.3 Fire-retardant-treated wood roof coverings.

Roof assemblies containing fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

Revise as follows:

503.2.4 <u>Other</u> Ignition-resistant building material.

Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^1/_8$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3.

> **Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

Reason: Editorial cleanup. No change in technical requirements.Section 503.2 has the title of “Ignition-resistant building material” and a subsection has the same title.

This proposal adds the word “Other” in front of “ignition-resistant building material”, to differentiate it from the overall title.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

CCCIWUIC1-24

CCCIFC1-24

IFC: CHAPTER 33, SECTION 3301, 3301.1, 3301.2

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

CHAPTER 33 FIRE SAFETY DURING CONSTRUCTION<u>, ALTERATION,</u> AND DEMOLITION

SECTION 3301
GENERAL

3301.1 Scope.
This chapter shall apply to structures in the course of construction, *alteration* or demolition, including those in underground locations. Compliance with NFPA 241 is required for items not specifically addressed herein.

3301.2 Purpose. This chapter prescribes minimum safeguards for construction, *alteration* and demolition operations to provide reasonable safety to life and property from fire during such operations.

Reason: The purpose of this code change is to add the term "alteration" to the title of Chapter 33, as the term used throughout the chapter in conjunction with construction and demolition. Some will make the argument that by definition alteration is a form of construction, which is true. However, if the use of the term is necessary in both the scope and purpose sections of this chapter and where the chapter includes different safety provision for buildings undergoing an alteration, it should be specifically included in the title.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Chapter 33 already includes several provisions for alterations to comply with the construction safety requirements. This proposal is purely editorial, as it adds the term Alteration to the title. There are no new technical requirements included in this proposal, therefore there is no change in the cost of construction.

CCCIFC1-24

CCCIMC1-24

IMC®: 1108.5

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1108.5 Copper <u>or copper-alloy</u> pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, press-connect, soldered, threaded or welded joints conforming to Section 1108.3.

Reason: With the change during the last cycle to combine brass pipe and copper pipe, the title was not modified. To avoid confusion, the reference to copper-alloy is added to the title of the section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in nature.

CCCIMC1-24

CCCIBC1-24

IBC: [F] 907.5.2.3.1, 909.21.1, 2406.4.3; IFC: 907.5.2.3.1, [BF] 909.21.1

Proponents: Stephen Kerr, Josephson Werdowatz Inc, self, Self (skerr@jwa-se.com)

2024 International Building Code

Revise as follows:

[F] 907.5.2.3.1 Public use areas and common use areas.
Visible alarm notification appliances shall be provided in *public use areas* and *common use areas*.

Exception: Where *employee work areas* have audible alarm coverage, the notification appliance circuits serving the *employee work areas* shall be initially designed with not less than 20-percent spare capacity to account for the potential of adding visible notification appliances in the future to accommodate hearing-impaired employee~~(s)~~.

909.21.1 Pressurization requirements.
Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 0.10 inch of water (25 Pa) and a maximum positive pressure of 0.25 inch of water (67 Pa) with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The pressure differentials shall be measured between the hoistway and the adjacent elevator landing. The opening and closing of hoistway doors at each level must be demonstrated during this test. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

Exceptions:

1. On floors containing only Group R occupancies, the pressure differential is permitted to be measured between the hoistway and a *dwelling unit* or *sleeping unit*.
2. Where an elevator opens into a lobby enclosed in accordance with Section 3007.6 or 3008.6, the pressure differential is permitted to be measured between the hoistway and the space immediately outside the door~~(s)~~ from the floor to the enclosed lobby.
3. The pressure differential is permitted to be measured relative to the outdoor atmosphere on floors other than the following:
   3.1. The fire floor.
   3.2. The two floors immediately below the fire floor.
   3.3. The floor immediately above the fire floor.
4. The minimum positive pressure of 0.10 inch of water (25 Pa) and a maximum positive pressure of 0.25 inch of water (67 Pa) with respect to occupied floors are not required at the floor of recall with the doors open.

2406.4.3 Glazing in windows. Glazing in an individual fixed or operable panel that meets all of the following conditions shall be considered to be a hazardous location:

1. The exposed area of an individual pane is greater than 9 square feet (0.84 m^2).
2. The bottom edge of the glazing is less than 18 inches (457 mm) above the floor or adjacent walking surface.
3. The top edge of the glazing is greater than 36 inches (914 mm) above the floor or adjacent walking surface.
4. One or more walking surface~~(s)~~ are within 36 inches (914 mm), measured horizontally and in a straight line, of the plane of the glazing.

Exceptions:

1. *Decorative glazing*.

2. Where a horizontal rail is installed on the accessible side~~(s)~~ of the glazing 34 to 38 inches (864 to 965 mm) above the walking surface. The rail shall be capable of withstanding a horizontal *load* of 50 pounds per linear foot (730 N/m) without contacting the glass and be not less than $1^1/_2$ inches (38 mm) in cross-sectional height.

3. Outboard panes in insulating glass units or multiple glazing where the bottom exposed edge of the glass is 8 feet (2438 mm) or more above any grade or walking surface adjacent to the glass exterior.

2024 International Fire Code

Revise as follows:

907.5.2.3.1 Public use areas and common use areas. Visible alarm notification appliances shall be provided in *public use areas* and *common use areas*.

Exception: Where employee work areas have audible alarm coverage, the notification appliance circuits serving the employee work areas shall be initially designed with not less than 20-percent spare capacity to account for the potential of adding visible notification appliances in the future to accommodate hearing-impaired employee~~(s)~~.

[BF] 909.21.1 Pressurization requirements.
Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 0.10 inch of water (25 Pa) and a maximum positive pressure of 0.25 inch of water (67 Pa) with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The pressure differentials shall be measured between the hoistway and the adjacent elevator landing. The opening and closing of hoistway doors at each level must be demonstrated during this test. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

Exceptions:

1. On floors containing only Group R occupancies, the pressure differential is permitted to be measured between the hoistway and a *dwelling unit* or *sleeping unit*.
2. Where an elevator opens into a lobby enclosed in accordance with Section 3007.6 or 3008.6 of the International Building Code, the pressure differential is permitted to be measured between the hoistway and the space immediately outside the door ~~(s)~~ from the floor to the enclosed lobby.
3. The pressure differential is permitted to be measured relative to the outdoor atmosphere on floors other than the following:
   3.1. The fire floor.
   3.2. The two floors immediately below the fire floor.
   3.3. The floor immediately above the fire floor.
4. The minimum positive pressure of 0.10 inch of water (25 Pa) and a maximum positive pressure of 0.25 inch of water (67 Pa) with respect to occupied floors is not required at the floor of recall with the doors open.

Staff Analysis: The ICC Code Correlation Committee (CCC) determined that removing the parentheses and maintaining the "s" (plural form of the word) was appropriate formatting. The CCC approved this item As Modified reflecting this formatting.

Reason: In discussion with ICC staff it was pointed out that in IBC Section 201 (201.2 Interchangeability) words used in the singular number includes the plural and the plural, the singular. To remove redundant language this proposal simply intends to eliminate where both the singular and plural are used together with the "(s)" text.

Bibliography: IBC Section 201.2:

201.2 Interchangeability. Words used in the present tense include the future; words stated in the masculine gender include the feminine and neuter; the singular number includes the plural and the plural, the singular.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is purely editorial and does not intend to change any requirements of the building code.

CCCIBC1-24

CCCIPC2-24

IPC: 918.2

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com); Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Revise as follows:

918.2 Installation.
~~The~~ Air admittance valves shall be installed in accordance with the requirements of this section and the manufacturer's instructions. Air admittance valves shall be installed after the DWV testing required by Section 312.2 or 312.3 has been performed.

Reason: This proposed change is clerical in nature and clarifies that this section is referencing air admittance valves.

Bibliography: Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

- **Studor Engineered Products Manual - 10th Edition.pdf**
  https://www.cdpaccess.com/proposal/9351/30430/documentation/145736/attachments/download/4295/

Justification for no cost impact:

This is a clerical update to the wording and should not affect the cost.

CCCIPC2-24

CCCIFC2-24

IFC: 3206.7.5

Proponents: Sandie Hastings, Self (sandiehastings@gmail.com)

2024 International Fire Code

Revise as follows:

3206.7.5 Number of doors required. The required fire department access doors shall be distributed such that the ~~lineal~~ linear distance between adjacent fire department access doors does not exceed 125 feet (38 100 mm) measured center to center.

Exception: The linear distance between adjacent access doors shall not exceed 200 feet (60 960 mm) in existing buildings where change in occupancy is not proposed.

Staff Analysis: The ICC Code Correlation Committee (CCC) determined that the appropriate term, by definition, is "linear" rather than "lineal". The CCC approved this item As Modified to replace the term "lineal" with "linear".

Reason: Editorial. The exception should use the same word (lineal) as the body of the code section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal is editorial in nature and has no cost impact on the cost of construction.

CCCIFC2-24
