Complete Monograph

2025 GROUP B PROPOSED CHANGES TO THE I-CODES

April 27 – May 6, 2025
Doubletree by Hilton
Universal Orlando - Orlando, FL

ICC
INTERNATIONAL CODE COUNCIL®

First Printing

Publication Date: March 2025

PRINTED IN THE U.S.A.

TABLE OF CONTENTS
(2025 Group B)

INTRODUCTION

As utilized during the previous Cycles, code change modifications will be submitted and presented for committee and public viewing at the Committee Action Hearing through the cdpACCESS system. Detailed instructions for modifications will be available at the cdpACCESS website. In addition, printed instructions will be supplied at the CAH hearings. See page v for details on the modification submittal process.

The proposed changes published herein have been submitted in accordance with established procedures [Council Policy 28 Code Development (CP 28)] (see page xiii) and are posted for review. The publication of these changes constitutes neither endorsement nor question of them but is in accordance with established procedures so that any interested individuals may make their views known to the relevant code committee and others similarly interested. In furtherance of this purpose, the committee will hold an open public hearing at the date and place shown below for the purpose of receiving comments and arguments for or against such proposed changes. Those who are interested in testifying on any of the published changes are expected to be represented at these hearings.

This compilation of code change proposals is available in electronic form only. ICC no longer prints and distributes this document. The compilation of code change proposals is posted on two locations on the ICC website: the customary posting which is the linked from the Code Development webpage and from the cdpACCESS webpage.

2025 GROUP B CODE GROUPINGS

Codes to be considered in Group B Cycle:

- Administrative Provisions
- IBC – General
- IBC – Structural
- IEBC
- IgCC (Chapter 1 & Appendix M)
- IRC – Building
- IPMC
- IZC

See page viii for the 2024 – 2026 ICC Code Development Schedule

2025 ICC COMMITTEE ACTION HEARINGS

These proposed changes will be discussed in public hearings to be held on April 27 – May 6, 2025, at the DoubleTree by Hilton at the entrance to Universal Orlando, Orlando, FL. The code committees will conduct their public hearings in accordance with the schedule shown on page liii.

MEMBERSHIP COUNCILS
PRIOR TO THE HEARINGS

Prior to the hearings, some of the Membership Councils will be holding meetings from 9-11am, Sunday, April 27th. This has been identified on the hearing schedule that was posted February.

ADVANCED REGISTRATION AND VOTING

ICC members in attendance will be allowed to vote on procedural “points of order” in accordance with Section 6.4.8. of CP 28 (see page xxii) For **identification purposes, all hearing participants must register. There is no cost to register or participate in the hearings.**

You are encouraged to advance register. Click here to register online.
The registration desk will be open in the lobby of the convention center according to the following schedule:

Saturday, April 26th	2:00 pm to 5:00 pm
Sunday, April 27th	8:00 am to 5:00 pm
Monday, April 28th through Saturday, May 3rd	7:30 am to 5:00 pm
Sunday, May 4th	9:30 am to 5:00 pm
Monday, May 5th through Tuesday, May 6th	7:30 am to 5:00 pm

In order to be eligible to vote at the Public Comment Hearings and the Online Governmental Consensus Vote, CP 28 requires that applications for new and reinstating Governmental Memberships must be received by the ICC at least 180 days prior to the Committee Action Hearing. This deadline is October 21, 2025. Application's (new or renewal) are due on March 20, 2026 for validation of Governmental Member Voting Representatives (GMVRs) to be eligible to vote at Group A and B PCH or OGCV in 2026. Recent revisions to CP 28 require voter validation only once during each code development cycle. (See Section 12.1 bold below).

Applicable

CP 28 sections noted below:

12.1 Eligible Final Action Voters: Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated once each code development cycle. After initial validation, changes to the list of GMVRs for the remainder of the code development cycle shall be made in accordance with Section 12.2. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

12.2 Applications: Applications, whether new or renewed, for Governmental Membership must be received by the ICC at least 180 days prior to the Group A and B Public Comment Hearing in order for its designated representatives to be eligible to vote at the Group A and B Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status (validation) must be received by the Code Council 30 days prior to the commencement of the first day of the Code Group A and B Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

As such, new and reinstating Governmental Member membership applications must be received by ICC's Member Services Department by October 21, 2025 For information on application for new membership and membership renewal, click here or call ICC Member Services at 1-888-ICC SAFE (422-7233)

ANALYSIS STATEMENTS

Various proposed changes published herein contain an "analysis" that appears after the proponent's reason. These comments do not advocate action by the code committees or the voting membership for or against a proposal. The purpose of such comments is to identify pertinent information that is relevant to the consideration of the proposed change by all interested parties, including those testifying, the code committees and the voting membership. Staff analyses customarily identify such things as: conflicts and duplication within a proposed change and with other proposed changes and/or current code text; deficiencies in proposed text and/or substantiation; text problems such as wording defects and vagueness; background information on the development of current text; and staff's review of proposed reference standards for compliance with the Procedures. Lack of an analysis indicates neither support for, nor opposition to a proposal.

NEW REFERENCE STANDARDS

Proposed changes that include the addition of a reference to a new standard (a standard that is not currently referenced in the current edition of the I-Codes) will include in the proposal the number, title and edition of the proposed standard. This identifies to all interested parties the precise document that is being proposed and which would be included in the referenced standards chapter of the code if the proposed change is approved. Section 4.6.3.1.1 of CP 28 requires that a code change proposal will not be processed unless at least a consensus draft version of the standard has been provided. Proponents of code changes which propose a new standard have been requested to provide copies of the standard to the code development committee. An analysis statement will be posted on the ICC website providing information regarding standard content, such as enforceable language, references to proprietary products or services, and references to consensus procedure. The analysis statements for referenced standards will be posted on or before April 1, 2025. This information will also be published and made available at the hearings.

Proposed new reference standards must be completed and readily available prior to the 2026 Public Comment Hearing in accordance with Section 4.6.3.1.1 of CP28.

REFERENCED STANDARDS UPDATES

Updates to currently referenced standards in any of the 2024 Codes will be considered by the Administrative Code Development Committee in the 2025 Group B Cycle.

Note that according to Section 4.6.3.1 of CP28, updates to existing referenced standards that are part of a code change proposal that includes technical revisions to code text to coordinate with such proposed standard(s) update are to be processed as proposed new standards in accordance with Sections 4.4 and 4.6.3.1.2 of CP28. Accordingly, drafts of the revisions would have needed to be supplied at the time of the code change submittal and the standard update will be required to be completed and published on or before the Public Comment Hearing for this 2026 Cycle, April 19, 2026.

It should be noted that, in accordance with Section 5.6 and 5.6.1 of CP 28, standards promulgators will have until December 1, 2026 to finalize and publish any updates to standards in the administrative update. If the standard update is not finalized and published by December 1, 2026, the respective I-Codes will be revised to reference the previously listed year edition of the standard. (See Section 5.6.1 below)

> **5.6.1 Updating ICC Standards Referenced in the Codes.** All standards developed by ICC and referenced by the Codes which are undergoing an update shall be announced by ICC to allow stakeholders to participate in the update process. Where the updated standard is completed and available by December 1 of the third year of the code cycle, the published version of the new edition of the Code which references the standard shall refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued.

ICC WEBSITE

This document is posted on the ICC Website. While great care has been exercised in the publication of this document, errata to proposed changes may occur. Errata, if any, will be identified in updates posted prior to Committee Action Hearing #1. Users are encouraged to periodically review the ICC Website. Additionally, analysis statements for code changes which propose a new referenced standard will be updated and posted to reflect the staff review of the standard for compliance with select portions of Section 4.6 of the Procedures.

PROPONENT CONTACT INFORMATION

In accordance with procedures, proponents are under no obligation to provide an email address for their posted proposal. For most of the code change proposals, an email address for the proponent has been provided. In an effort to continue to provide for proponent's privacy and at the same time allow an initial contact between an interested party and the proponent, we will be utilizing cdpACCESS to allow an interested party to initiate contact with the proponent without identifying the proponent's email address. The process is follows:

- Interested party logs into cdpACCESS and searches for the subject code change.
- Interested party locates the button "Contact the Proponent" to request that cdpACCESS contact the proponent, providing the interested party's name and email address.
- cdpACCESS uses the proponent email address on file and sends a notification to the proponent indicating the name of the interested party and their email address and that the interested party would like to discuss the code change.
- The interested party receives an email noting that the cdpACCESS system has sent the request to the proponent.
- It is up to the proponent to determine if they would like to respond and contact the interested party.
- The proponent is under no obligation to respond to the cdpACCESS request for contact or to contact the interested party. The proponent's contact information is not revealed to the interested party as part of this initial contact.

HEARING ORDER CHANGES AND TABLING OF PROPOSALS

The Code Change Agenda that places the code change proposals in a logical order for each hearing committee is shown at the beginning of the respective committee's group of code change proposals. In accordance with Section 6.4.4 of CP28, any attendee at the hearing is allowed make a motion to revise the hearing order at any time during the hearings except while a code change is being discussed, but usually as the first order of business at the hearing. Preference is given to grouping like subjects together and moving items back to a later position on the agenda.

This motion is considered in order unless the proponent(s) of the moved code change proposals are in attendance and object to the move. If there is objection to the move, the motion is ruled out of order by the Moderator. This ruling is final and not debatable. If the motion is not ruled out of order, the motion is subject to a 2/3 vote of those present.

A motion to table a code change proposal is allowed in accordance with Section 6.4.5 of CP28. Just as with a motion to move a code change proposal in the hearing order, this motion is in order only if there is no objection from the proponent(s) in attendance at the hearing. When the proponent(s) object, the motion to table is ruled out of order by the Moderator. The ruling is final and not subject to debate.

The motion to table must identify the location to where the code change proposal consideration will be resumed by either identifying a specific date and time within the timeframe of the Code Change Agenda for the group of code change proposals under consideration or by designating a specific location in the Code Change Agenda. If the motion to table is not ruled out of order, the motion is subject to a $^2/_3$ vote of those present.

FLOOR MODIFICATIONS

With the implementation of the cdpACCESS online system, CP 28 requires that floor modifications be submitted electronically for the Committee Action Hearing #1 (CAH #1).

The proponent of the modification must be in attendance at the CAH to present the modification as part of his/her testimony**.**

Those who are submitting a modification for consideration by the respective Code Development Committee are required to sign a Copyright Release in order to have their modification(s) considered (Section 4.3.5.5 of CP 28). This feature is built into cdpACCESS similar to the way the release is executed for code changes, comments and public comment submittals.

The Chair rules the modification in or out of order. Note that this is a procedural ruling to determine if the modification is to be permitted to be considered at the hearing. It is not a technical ruling. The ruling is final, with no challenge allowed.

The modification proponent is required to identify the specific text of the code change proposal that is being revised and the revision itself. In this way, it is very similar to the public comment process and that is the way cdpACCESS was developed to process modifications.

Example:
Original code change proposal.
The original code change proposal requested the following change to Section 1506.2 of the IBC: (Note that the example is fictional.)

FS15-25
803.1.1

Proponent: John West representing self

Revise as follows:
803.1.1 Interior wall and ceiling finish materials tested in accordance with NFPA 286. Interior wall and ceiling finish materials shall be classified in accordance with NFPA 286 and comply with Section 803.1.1.1. Materials complying with Section 803.1.1.1 shall be considered to also comply with the requirements of Class A.

Exception: Interior wall and ceiling finish materials qualified in accordance with Section 104.2.3 and approved by the code official.

Proposed modification:

A modification to the code change proposal is proposed:

1. To change "Interior wall and ceiling finish materials" to "Interior wall and ceiling finish systems."
2. To change "conform to" to "comply with."
3. To remove "and approved by the code official" from the exception.

The cdpACCESS system will provide the text of the original code change proposal with the proposed change incorporated into the text. Using the cdpACCESS system, the proponent of the modification locates the original change in the system.

The proponent of the modification will need to manually install strikethrough (ex:" ~~delete~~) and underline (ex: add) formatting showing the additional revisions to the original proposal.

cdpACCESS will show the modification as follows:

FS15-25
803.1.1

Proponent: John West representing self

Revise as follows:

803.1.1 Interior wall and ceiling finish materials tested in accordance with NFPA 286. Interior wall and ceiling finish materials shall be classified in accordance with NFPA 286 and comply with Section 803.1.1.1. Materials complying with Section 803.1.1.1 shall be considered to also comply with the requirements of Class A.

Exception: Interior wall and ceiling finish ~~materials~~ systems qualified in accordance with Section 104.2.3 ~~and approved by the code official~~.

Modification proponents will be able to access the system in advance of the hearings to develop their modification (see "Detailed Steps of the Modification Submission Process via cdpACCESS" on the following pages).
Hard copies of the modification for distribution to the committee are not required. You can preview your modification at any time by downloading a pdf via cdpACCESS.

OVERVIEW OF THE MODIFICATION PROCESS (see CP28 Section 6.5.2 on page xxiii)

1. Modification submitted electronically via cdpACCESS. This submittal is required in advance of the code change proposal being brought to the floor.

2. The code change proposal is brought to the floor by the Moderator.

IMPORTANT NOTE: ONCE A CODE CHANGE PROPOSAL IS BROUGHT TO THE FLOOR, ALL MODIFICATIONS MUST BE IN THE cdpACCESS SYSTEM. SEE NOTE 1.

3. Modification proponent suggests the modification from the floor at the hearing.

4. Modification posted to cdpACCESS for public viewing (including the hearing room via WiFi) and committee viewing.

5. Chair rules the modification in or out of order.

6. Modification displayed on the screen in the hearing room.

7. If ruled in order, testimony on the modification is initiated. (One minute each for support and opposition, thirty seconds each for rebuttal.)

EDITORIAL CODE CHANGES - CODE CORRELATION COMMITTEE

In a typical code change cycle, there are code change proposals that are considered strictly editorial. Section 5.4 of CP 28 (see below) establishes a process by which the Code Correlation Committee (CCC) considers such proposals.

> **5.4 Editorial Code Change Proposals.** When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate Committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate Committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the First Committee Action Hearing (CAH #1). Code Correlation Committee proposals that are not added to a Committee hearing agenda shall be published in the next edition of the code with no further consideration.

There are 21 such proposals in the current 2024 Cycle. The proposals are located after the last code change in the CAH Agenda and are identified by a code change prefix of CCC.

As noted in Section 5.4, anyone may request that any of these proposals be added to the hearing agenda. The deadline to make such a request is 11: 59 pm Pacific on Sunday, April 13, 2025, via email. Be sure to identify the code change number noted above. Such requests must be sent to:

Beth Tubbs
Vice President of Codes
btubbs@iccsafe.org

CODE DEVELOPMENT PROCESS STARTED IN 2024

The ICC board approved a standing motion from the Board Committee on the Long-Term Code Development Process to revise the code development cycle to incorporate two committee action hearings for each code group. This change expands the current process from two independent one-year cycles to a single continuous three-year cycle. This revised process is reflected in the following 2024/2025/2026 ICC Code Development Schedule. Go to https://www.iccsafe.org/products-and-services/i-codes/code-development-changes/ for more information.

2024/2025/2026 ICC CODE DEVELOPMENT SCHEDULE

3/17/2 | Updated 3/5/24

STEP IN CODE DEVELOPMENT CYCLE	DATE		
	2024 – Group A Codes IBC – E, IBC – FS, IFC, IFGC, IMC, IPC, IPSDC, IRC – M, IRC – P, ISPSC, IWUIC	**2025 – Group B Codes Admin, IBC – G, IBC – S, IEBC, IgCC (Ch. 1 & App M), IPMC, IRC – B, IZC**	**2026 - Group A & B Codes Public Comments Posting, Public Comment Hearing, Online Governmental Consensus Vote**
DEADLINE FOR RECEIPT OF ONLINE APPLICATIONS FOR ALL CODE DEVELOPMENT COMMITTEES	June 1, 2023 (See Schedule Notes)		
cdpACCESS OPEN FOR CODE CHANGE SUBMITTALS	October 16, 2023 (Tentative)	October 15, 2024	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF CODE CHANGE PROPOSALS	January 8, 2024	January 10, 2025	
WEB POSTING OF "PROPOSED CHANGES TO THE I-CODES" (Monograph)	February 26, 2024	March 13, 2025	
COMMITTEE ACTION HEARING #1 (CAH #1)	April 7 – 16, 2024	April 27 – May 6, 2025	
cdpACCESS OPEN FOR COMMENT SUBMITTALS TO CAH #1 ACTION	May 16, 2024	June 3, 2025	
WEB POSTING OF "REPORT OF THE COMMITTEE ACTION HEARING #1"	May 16, 2024	June 3, 2025	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF COMMENTS ON CAH #1 ACTIONS	July 8, 2024	July 15, 2025	
WEB POSTING OF "COMMENTS TO CAH #1"	September 5, 2024	September 10, 2025	
COMMITTEE ACTION HEARING #2 (CAH #2)	October 23 – 31, 2024	October 22 - 30, 2025	
WEB POSTING OF "REPORT OF THE COMMITTEE ACTION HEARING #2"	December 2, 2024	November 25, 2025	
cdpACCESS OPEN FOR PUBLIC COMMENT SUBMITTALS FOR 2026 PCH	January 20, 2025 (Tentative)	November 25, 2025 (Tentative)	

STEP IN CODE DEVELOPMENT CYCLE	DATE		
	2024 – Group A Codes IBC – E, IBC – FS, IFC, IFGC, IMC, IPC, IPSDC, IRC – M, IRC – P, ISPSC, IWUIC	**2025 – Group B Codes Admin, IBC – G, IBC – S, IEBC, IgCC (Ch. 1 & App M), IPMC, IRC – B, IZC**	**2026 - Group A & B Codes Public Comments Posting, Public Comment Hearing, Online Governmental Consensus Vote**
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF PUBLIC COMMENTS FOR 2026 PCH	March 14, 2025	January 5, 2026	
WEB POSTING OF "GROUP A & B PUBLIC COMMENT AGENDA"	See 2026	See 2026	March 4, 2026
COMBINED GROUP A & B PUBLIC COMMENT HEARING (PCH)	Combined Group A & B PCH in 2026	Combined Group A & B PCH in 2026	April 19 - 28, 2026
COMBINED GROUP A & B ONLINE GOVERNMENTAL CONSENSUS VOTING (OGCV) PERIOD	Combined Group A & B OGCV in 2026	Combined Group A & B OGCV in 2026	Starts approx. two - three weeks after the last day of PCH.
WEB POSTING OF GROUP A & B FINAL ACTION	See 2026	See 2026	Following Validation Committee certification and ICC Board confirmation.

Schedule Notes:

- This schedule introduces the restructured process starting in 2024 with two Committee Action Hearings (CAH #1 and CAH #2) for each Code Group in 2024 and 2025, followed by a combined Group A and B PCH and OGCV in 2026. Click here for more information.
- Code Development Committee applications: As noted above, the restructured process will include two CAH's for which the same committee members who presided at CAH#1 will also preside at CAH#2. Previous cycles required Code Development Committee members to preside at only a single CAH in the Spring of the given year. Please be sure to consider this when applying for a Code Development Committee position.
- The "cdpACCESS OPEN" steps noted as "(tentative)" reflect availability of the applicable codes in the cdpACCESS system.
- Web posting of the "Proposed Changes to the I-Codes", "Comments to CAH #1" and "Group A & B Public Comment Agenda" will be posted no later than scheduled. ICC will make every effort to post these documents earlier, subject to code change/comment/public comment volume and processing time.
- "Comment" vs "Public Comment": CP28 uses the term "comment" to indicate a submittal in response to CAH #1 action and "public comment" in response to a CAH #2 action to be considered at the PCH. See Sections 7.0 and 9.0 in CP28.

2024 Group A Codes/Code Development Committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11.
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC. See Code Group Notes.
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E. See Code Group Notes.
- IFGC
- IMC
- IPC
- IPSDC: Code changes heard by the IPC committee (combined IPC & IPSDC committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP committee)

- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC – MP committee)
- ISPSC
- IWUIC: Code changes heard by the IFC committee (combined IFC & IWUIC committee)

2025 Group B Codes/Code Development Committees:

- Admin: Chapter 1 of all the I-Codes except the IgCC and IRC. Also includes the update of currently referenced standards in all of the 2021 Codes, except the IgCC. See Code Group Notes below for the IECC and the ICC PC.
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33.
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See Code Group Notes.
- IEBC: IEBC Non-structural provisions. See Code Group Notes.
- IgCC: The administration provisions of Chapter 1 of the IgCC in order to provide for coordination with the other administrative provisions in the I-Codes. Additionally, Appendix M included as it is not included in ASHRAE Standard 189.1. Remainder of the code is based on the provisions of ASHRAE Standard 189.1 *Standard for the Design of High-Performance Green Buildings, Except Low-Rise Residential Buildings*. The IgCC proposals will be heard by the Admin Code Development Committee
- IPMC: Code changes heard by the IPM/ZC (combined IPMC & IZC code committee)
- IRC-B: IRC Building provisions. Chapters 1 – 10
- IZC: Code changes heard by the IPM/ZC (combined IPMC & IZC code committee)

Code Group Notes:

- Be sure to review the document entitled "2024/2025/2026 Group A and B Code Development Committee Responsibilities Matrix" (matrix) which is posted on the ICC website. This identifies responsibilities which are different than Group A and B codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 4 of the IBC (IBC- General), there are numerous sections which include the designation "[F]" which indicates that the provisions of the section are maintained by the IFC committee. Similarly, there are numerous sections in the IEBC which include the designation "[BS]". These are structural provisions which will be heard by the IBC – Structural committee. The designations in the code are identified in the matrix.
- I-Code Chapter 1: Proposed changes to the provisions in Chapter 1 of the majority of the I-Codes are heard in Group B (see Admin above for exceptions). Be sure to review the brackets ([ ]) of the applicable code.
- Definitions. Be sure to review the brackets ([ ]) in Chapter 2 of the applicable code and the matrix to determine which committee will consider proposed changes to the definitions.
- ICC Performance Code (ICC PC): The 2027 edition of the ICC PC is being updated utilizing the ICC standards process. Click link for more information.
- International Energy Conservation Code (IECC) and Chapter 11 of the International Residential Code (IRC): The 2027 edition of the IECC and Chapter 11 of the IRC will be updated utilizing the ICC standards process. Click link for more information.

CP#28-05 – Code Development

Approved: 09/24/05 | **Revised:** 2/05/25

1.0 Introduction

1.1 Purpose of Council Policy: The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).

1.2 Objectives: The ICC Code Development Process has the following objectives:

1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.
1.2.2 The open discussion of code change proposals by all parties desiring to participate.
1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation, implementation or enforcement of laws, ordinances, rules, or regulations relating to the public health, safety, and welfare and by honorary members.
1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.

1.3 Code Publication: The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.

1.3.1 Code Correlation: The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Group A and Group B Code Development Committee Responsibilities Matrix identifies which Code shall be the primary document, and therefore which Code Development Committee shall be responsible for maintenance of the Code text where a given subject matter or Code text could appear in more than one Code. The Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board and posted prior to the code change proposal deadline. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 5.5.

1.4 Process Maintenance: The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes is determined by a vote of the governmental and honorary members in accordance with Sections 10.6 and 11. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

1.5 Secretariat: The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals, comments to Committee action and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.

1.6 Code Development Committee: The members of the respective Code Development Committee presiding over the hearings are appointed by the ICC Board in accordance with Section 6.2. The term "Committee" is used throughout this Council Policy to refer to Code Development Committee members.

1.7 Recording: Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the recording. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

1.8 **Code of Ethics:** Each individual participating in the ICC Code Development Process shall comply with the posted *ICC Code of Ethics.*

2.0 Code Development Cycle

2.1 **Intent:** The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 4.5) and ending with publication of the Final Action on the code change proposals (see Section 13.4).

2.2 **New Editions:** The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the previous edition.

2.3 **Interim Code Amendments:** All revisions to the International Codes shall be processed in accordance with other sections of this Council Policy except for Emergency Actions by the ICC Board complying with Section 2.3.1 and Interim Critical Amendments (ICA) complying with Section 2.3.2.

2.3.1 **Emergency Actions by the ICC Board:** Emergency actions by the ICC Board are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.

2.3.1.1 **Initial Request:** A request for an emergency action shall be based upon perceived immediate threats to health and safety and shall be reviewed by the Codes and Standards Council for referral to the ICC Board for action with their analysis and recommendation.

2.3.1.2 **Board and Member Action:** In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the Governmental Member Voting Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

2.3.2 **Interim Critical Amendments (ICA)**

2.3.2.1 **Submittal**. Anyone may propose an ICA by providing the following information:

a) Name of submitter
b) Contact information
c) Submitters representation
d) Date
e) Relevant section(s) and code edition(s) under consideration
f) Proposed modifications with text changes identified using underlines for new text and strikethroughs for deleted text
g) A statement that substantiates the need for proposed changes and why the proposed submission is of such a critical nature in accordance with Section 2.3.2.3 that it cannot be left to be addressed during the next code development cycle.

h) Written endorsement of the proposed ICA by not less than two members of the Committee(s) responsible for maintaining the affected code section(s)

2.3.2.2 Preliminary Review. An ICA will only be processed if the Codes and Standards Council determines that the proposed ICA appears to be of a critical nature requiring prompt action based on the criteria specified in Section 2.3.2.3. If processed, the question of critical nature shall be further considered by the responsible Committee(s) and the Codes and Standards Council. The text of a proposed ICA shall be processed as submitted or shall be changed with the approval of the submitter. The Codes and Standards Council shall process their preliminary "critical nature" determination within 45 days of the ICA submission.

2.3.2.3 Determination of Critical Nature. Qualification for critical nature shall be based on one or more of the following factors:

a) The proposed ICA corrects an error or an omission that was overlooked during a regular code development process.

b) The proposed ICA resolves a conflict within an individual code or a conflict involving two or more ICC codes.

c) The proposed ICA mitigates a previously unknown hazard.

2.3.2.4 Committee. A proposed ICA that meets the provisions in Sections 2.3.2.2 and 2.3.2.3 shall be submitted to the Committee(s) responsible for the affected section(s) for a ballot and comment period of 30 calendar days. The Committee(s) shall be separately balloted on both the technical merit of the ICA and whether the ICA satisfies the critical nature criteria. Negative votes in the initial ballot, if any, shall require a reason statement and shall be circulated to the full Committee(s) to allow initial ballot votes to be changed.

A Committee recommendation for approval shall require an affirmative vote of at least three-fourths of members who voted, on both technical merit and critical nature. The following shall be omitted from the three-fourths vote calculation:

a) Committee members who have abstained.

b) Committee members whose negative ballots do not include a statement conveying the reason for casting a negative vote.

c) Committee members who do not return their ballots prior to the announced ballot return deadline.

In addition to the three-fourths majority described above, the number of affirmative votes shall be not less than 50% of all Committee members who are eligible to vote. Committee members eligible to vote shall be the total number of individuals who are members of the Committee on the date of ballot distribution and shall not be adjusted based on abstentions or ballots that were not returned.

ICAs that achieve the required number of affirmative votes on both technical merit and critical nature are approved for further processing in accordance with Sections 2.3.2.5 through 2.3.2.9. ICAs that do not achieve the required number of affirmative votes on both technical merit and critical nature are rejected.

2.3.2.5 Publication of Proposed ICA for Comment. An ICA that is approved in accordance with Section 2.3.2.3 shall be published by ICC in appropriate media with a notice inviting the public to comment on the proposed ICA. The comment period shall be open for at least 30 calendar days from the date of posting of the notice. When a proposed ICA revises text that was changed in the most recent code development cycle, the ICA comment notice shall also be directly provided to submitters of proposals, comments to Committee action and public comments to the affected section in the most recent code development cycle.

2.3.2.6 Additional Committee Review. All comments shall be circulated to the responsible Committee(s) for a 30-calendar day ballot and comment period allowing an opportunity for Committee members to change votes taken prior to the comment period. If any votes are changed to negative, negative votes shall be circulated to the full Committee, followed by a final ballot following the voting procedures Section 2.3.2.4.

Approved ICAs shall be forwarded to the Codes and Standards Council with a staff report that includes all comments, ballots, Committee member comments on ballots and concurrence by staff on which code editions should be affected by the ICA.

2.3.2.7 Action of the Codes and Standards Council. The Codes and Standards Council shall review the material submitted in accordance with Section 2.3.2.6 at the next Codes and Standards Council meeting. Approval of an ICA shall require an affirmative vote of at least two-thirds of the Codes and Standards Council members who cast a vote at the meeting.

2.3.2.8 Effective Date and Publication. ICAs that are approved by the Codes and Standards

Council shall become effective 30 calendar days after approval, or in the case of an appeal in accordance with Section 2.3.2.9, 30 calendar days after a decision by the ICC Board upholding a Codes and Standards Council decision to issue an ICA.

An ICA shall apply to code editions specified by the ICC Codes and Standards Council, and ICC staff shall, by an appropriate method, publish approved ICAs and ensure that approved ICAs are distributed with future sales of affected codes. ICAs shall be distributed as a separate document and shall not be incorporated into the text of a published code until such time that the ICA has been approved by the full code development process, following submittal as a proposal in accordance with Section 2.3.2.11.

2.3.2.9 Appeals. A decision of the Codes and Standards Council to approve an ICA shall be appealable to the ICC Board in accordance with CP#1 – Appeals.

2.3.2.10 Applicability. ICAs shall not be considered retroactive requirements.

2.3.2.11 Subsequent Processing. An approved ICA shall automatically become a code change proposal from the Codes and Standards Council in the following code cycle.

2.4 Code Development Record. The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 5.8)
2. Audio and video recording of both Committee Action Hearings for each code group (Sections 6.1 and 8.1)
3. Report of both Committee Action Hearings for each code group (Sections 6.7 and 8.5)
4. Public Comment Agenda (Section 9.6)
5. Public Comment Hearing results (Section 10.5.9.10)
6. Audio and video recording of the Public Comment Hearing (Section 10.0)
7. The Online Governmental Consensus Ballot (Section 11.3)
8. Final Action results (Section 13.4)
9. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

3.0 Restructured Process Starting in 2024 (NEW)

3.1 Process: The 2027 I-Codes, and future editions, shall be developed utilizing a restructured code development process starting in 2024. The process includes the following key process steps:

YEAR ONE

- Code Group A code change proposals due (see Section 4.0)
- Code Group A First Committee Action Hearing (CAH #1) (see Section 6.0)
- Code Group A comments due on the action taken at CAH #1 (see Section 7.0)
- Code Group A Second Committee Action Hearing (CAH #2) (see Section 8.0)

YEAR TWO

- Code Group B code change proposals due (see Section 4.0)
- Code Group A public comments due (see Section 9.0)
- Code Group B First Committee Action Hearing (CAH #1) (see Section 6.0)
- Code Group B comments due on the action taken at CAH #1 (see Section 7.0)
- Code Group B Second Committee Action Hearing (CAH # 2) (see Section 8.0)

YEAR THREE

- Code Group B public comments due (see Section 9.0)
- Combined Code Group A & B Public Comment Hearing (see Section 10.0)
- Combined Code Group A & B Online Governmental Consensus Vote (see Section 11.0)

3.2 Schedule: A schedule of Code Groups, dates, locations and process steps with deadlines shall be posted a minimum of 120 days prior to the code change submittal deadline for Code Group A codes.

4.0 Submittal of Code Change Proposals

4.1 Intent: Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

4.2 Withdrawal of Proposal: A code change proposal may be withdrawn by the proponent (WP) at any time prior to membership action on the consent agenda at the Public Comment Hearing or prior to testimony on the code change proposal on the individual consideration agenda at the Public Comment Hearing. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

4.3 Form and Content of Code Change Submittals: Each code change proposal shall be submitted separately and shall be complete in-itself. Each submittal shall contain the following information:

4.3.1 Proponent: Each code change proposal shall include the name, title and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.

4.3.1.1 If a group, organization or Committee submits a code change proposal, an individual with prime responsibility shall be indicated.

4.3.1.2 If a proponent submits a code change proposal on behalf of a client, group, organization or Committee, the name and email address of the client, group, organization, or Committee shall be indicated.

4.3.2 Code Reference: Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.

4.3.2.1 If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.

4.3.2.2 If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.

4.3.3 Multiple Code Change Proposals to a Code Section. A proponent shall not submit multiple code change proposals to the same code section. Where a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 5.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.

4.3.4 Text Presentation: The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.

4.3.4.1 A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, deletion, or a revision to existing Code text.

4.3.4.2 Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.

4.3.4.3 Each code change proposal shall be in proper code format and terminology.

4.3.4.4 Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.

4.3.4.5 The proposed text shall be in mandatory terms.

4.3.5 Supporting Information: Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.

4.3.5.1 Purpose: The proponent shall clearly state the purpose of the code change proposal (e.g., clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.).

4.3.5.2 Reasons: The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.

4.3.5.3 **Substantiation:** The proponent shall substantiate the code change proposal based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 5.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 5.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with CP#1 - Appeals. The burden of providing substantiating material lies with the proponent of the code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the reason statement. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

4.3.5.4 **Bibliography:** The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing. Supporting documentation may be provided via a link to a website provided by the proponent and included in the bibliography. The reason statement shall include the date the link was created.

4.3.5.5 **Copyright Release:** The proponent of code change proposals, floor modifications, comments to Committee action and public comments shall sign a copyright release developed and posted by ICC.

4.3.5.6 **Cost Impact:** The proponent of the code change proposal, floor modification, and comments shall provide a cost impact statement in accordance with Section 17.0.

4.4 **Online Submittal:** Each code change proposal and all substantiating information shall be submitted online via cdpACCESS. One copy of each proposed new referenced standard in electronic form shall be submitted to staff. Additional electronic copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the Committee. Where such additional copies are requested, it shall be the responsibility of the proponent to secure permission to post the proposed new reference standard on a secure ICC website for Committee viewing. In lieu of electronic copies, hard copies are acceptable.

4.5 **Submittal Deadline:** ICC shall establish and post the submittal deadline for each cycle in accordance with Section 3.2. The posting of the deadline shall occur no later than 120 days prior to the code change deadline. Each code change proposal shall be submitted online via cdpACCESS by the posted deadline. The submitter of a code change proposal is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

4.6 **Referenced Standards:** In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

4.6.1 **Code References:**

4.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.

4.6.1.2 The need for the standard to be referenced shall be established.

4.6.2 **Standard Content:**

4.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.

4.6.2.2 The standard shall be appropriate for the subject covered.

4.6.2.3 All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.

4.6.2.4 The scope or application of a standard shall be clearly described.

4.6.2.5 The standard shall not have the effect of requiring proprietary materials.

4.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.

4.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.

4.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.

4.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.

4.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.

4.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

4.6.3 New and Updated Standards with Text Revisions:

4.6.3.1 Code change proposals with corresponding changes to the Code text which include a reference to a proposed new standard, or a proposed update of an existing referenced standard shall comply with this section.

4.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 4.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the First Committee Action Hearing (CAH #1) by the applicable Committee responsible for the corresponding proposed changes to the code text.

If the Committee action at the Second Committee Action Hearing (CAH #2) is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing. If the Committee action at the Second Committee Action Hearing (CAH #2) is Disapproval, further consideration on the Public Comment Agenda shall state that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing. See Section 10.5.6.1 for availability of new standards at the Public Comment Hearing.

4.6.3.1.2 Update of Existing Standards. Code change proposals which include technical revisions to the Code text to coordinate with a proposed update of an existing referenced standard shall include the submission of the proposed update to the standard in at least a consensus draft form in accordance with Section 4.4. If the proposed update of the existing standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal, including the update of the existing referenced standard, shall be considered at the First Committee Action Hearing (CAH #1) by the applicable Committee responsible for the corresponding changes to the code text.

If the Committee action at the Second Committee Action Hearing (CAH #2) is either As Submitted or As Modified and the updated standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing. If the Committee action at the Second Committee Action Hearing (CAH #2) is Disapproval, further consideration on the Public Comment Agenda shall state that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing. See Section 10.5.6.1 for availability of updated standards at the Public Comment Hearing.

Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 5.6.

4.6.4 Standard Promulgation: The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

5.0 Processing of Code Change Proposals

5.1 Intent: The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published code change proposal accurately reflects that proponent's intent.

5.2 Review: Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different Committees, the Secretariat shall determine the Committee responsible for determining the Committee action in accordance with Section 6.6 and the Group A and Group B Code Development Committee Responsibilities Matrix (see Section 1.3.1).

5.3 Incomplete Code Change Proposals: When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected code change proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies addressed by this section, a code change proposal that incorporates a new referenced standard shall be processed with an analysis of the referenced standard's compliance with the criteria set forth in Section 4.6.

5.4 Editorial Code Change Proposals. When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate Committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate Committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the First Committee Action Hearing (CAH #1). Code Correlation Committee proposals that are not added to a Committee hearing agenda shall be published in the next edition of the code with no further consideration.

5.5 Copy Editing Code Text: The Chief Executive Officer shall have the authority at all times to make editorial style and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. Such editorial style or format changes shall not affect the scope or application of the Code requirements.

5.6 Updating Standards Referenced in the Codes: Standards referenced by the Codes that do not require coordination with a code change proposal to the Code text shall be identified administratively by staff and considered by the Administrative Committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.

5.6.1 Updating ICC Standards Referenced in the Codes. All standards developed by ICC and referenced by the Codes which are undergoing an update shall be announced by ICC to allow stakeholders to participate in the update process. Where the updated standard is completed and available by December 1 of the third year of the code cycle, the published version of the new edition of the Code which references the standard shall refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued.

5.7 Preparation: All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned separate, distinct, and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 4.3.2 to facilitate the hearing process.

5.8 Code Change Agenda: All code change proposals shall be posted on the ICC website at least 30 days prior to the First Committee Action Hearing (CAH #1) on those proposals and shall constitute the agenda for the hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

6.0 First Committee Action Hearing (CAH #1)

6.1 Intent: The intent of the First Committee Action Hearing (CAH #1) is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The Committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals.

6.2 Code Development Committee: The Codes and Standards Council shall review all applications and make Committee appointment recommendations to the ICC Board. The Committees shall be appointed by the ICC Board. (See Section 1.6 for terminology).

6.2.1 Chairperson/Moderator: The Chairperson and Vice-Chairperson shall be selected by the Codes and Standards Council from the appointed members of the Committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action Hearing.

6.2.2 Conflict of Interest: A Committee member shall withdraw from and take no part in those matters with which the Committee member has an undisclosed financial, business or property interest. The Committee member shall not participate in any Committee discussion, or any Committee vote on the matter in which they have an undisclosed interest. A Committee member who is a proponent of a code change proposal shall not participate in any Committee discussion on the matter or any Committee vote. Such Committee member shall be permitted to participate in the floor discussion in accordance with Section 6.5 and Section 8.4.1 by stepping down from the dais.

6.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the Committee.

6.2.4 Committee Composition: The Committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the Committee members shall be Regulators (General Interest category in accordance with CP#7 – Committees and Members).

6.3 Date and Location: The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.

6.4 General Procedures: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the Committee.

6.4.1 Chair Voting: The Chairperson of the Committee shall vote only when the vote cast will break a tie vote of the Committee.

6.4.2 Open Hearing: The Committee Action Hearing is an open hearing. Any interested person may attend and participate in the floor discussion. Only Committee members may participate in the Committee action portion of the hearings (see Section 6.6). Participants shall not advocate a position on specific code change proposals with Committee members other than through the methods provided in this policy.

6.4.3 Presentation of Material at the Committee Action Hearing: Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 6.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 4.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the Committee at the public hearing.

6.4.4 Agenda Order: The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the hearing, or at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.

6.4.4.1 **Proponent Approval:** A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance in the hearing room and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to change the hearing order is not debatable.

6.4.4.2 **Revised Agenda Order Approved:** A motion to revise the agenda order is subject to a 2/3 vote of those present.

6.4.5 **Tabling:** Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Code Change Agenda for the code change proposals under consideration, or

2. To a specific location in the Code Change Agenda for the code change proposals under consideration.

6.4.5.1 **Tabling approved:** A motion to table is subject to a 2/3 vote of those present.

6.4.5.2 **Tabled code change proposals back to the floor:** The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 6.4.5 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

6.4.6 **Reconsideration:** There shall be no reconsideration of a code change proposal after it has been voted on by the Committee in accordance with Section 6.6.

6.4.7 **Time Limits:** Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person testifying on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall identify the time limits on debate at the beginning of the hearing. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

6.4.7.1 **Time Keeping:** Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

6.4.7.2 **Proponent Testimony:** The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

6.4.8 **Points of Order:** Any person participating in the hearing may challenge a procedural ruling of the Moderator or the Chairperson. A majority vote of ICC Members in attendance shall determine the decision.

6.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

6.5.1 Discussion Order:

1. Support. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opposition. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. Rebuttal in support. Those in support shall then have the opportunity to rebut points raised by those in opposition.
4. Rebuttal in opposition. Those in opposition shall then have the opportunity to respond to the rebuttal in support.

6.5.2 Modifications: Modifications to code change proposals may be suggested from the floor by any person participating in the hearing. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification.

6.5.2.1 Submission. All modifications shall be submitted electronically to the ICC Secretariat in a format determined by ICC unless determined by the Chairperson to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the Committee during the hearing and will be projected on the screen in the hearing room.

6.5.2.2 Criteria. The Chairperson shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. changes the scope of the original code change proposal; or

2. is not readily understood to allow a proper assessment of its impact on the original code change proposal or the Code.

The ruling of the Chairperson on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 6.4.8.

6.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairperson, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 6.5.1.

6.5.2.3.1 Time Limits: Time limits on testimony on a modification shall be in accordance with the following:

1. Support: 1 minute
2. Opposition: 1 minute
3. Rebuttal in support: 30 seconds
4. Rebuttal in opposition: 30 seconds

6.6 Committee Action: Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the Committee:

1. Approve the code change proposal As Submitted (AS) or
2. Approve the code change proposal As Modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to Committee members. If a Committee member proposes a modification which had not been proposed during floor discussion, the Chairperson shall rule on the modification in accordance with Section 6.5.2.2. If a Committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the Committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume Committee discussion.

The Committee shall vote on each motion with the majority dictating the Committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each Committee vote shall be supported by a reason.

The ICC shall maintain a record of the hearing proceedings including the action on each code change proposal.

6.7 **Report of the First Committee Action Hearing (CAH #1):** The results of the First Committee Action Hearing (CAH #1), including Committee action and reason, shall be posted on the ICC website not less than 60 days prior to the Second Committee Action Hearing (CAH #2) , except as approved by the ICC Board.

7.0 Submittal of Comments to the First Committee Action Hearing (CAH #1) (NEW)

7.1 **Intent:** Any interested person, persons or group may submit a comment noting disagreement with the action taken at the First Committee Action Hearing (CAH #1). The comment process gives attendees at the Second Committee Action Hearing (CAH #2) an opportunity to consider specific objections to the results of the First Committee Action Hearing (CAH #1) and more thoughtfully prepare for the discussion and comment consideration at the Second Committee Action Hearing (CAH #2).

7.1.1 **Public Comment Hearing consideration:** In order for a code change proposal to be considered for a further modification at the Public Comment Hearing, such proposal must have received a comment and been considered and acted upon at the Second Committee Action Hearing (CAH #2).

7.1.2 **Proposed New Reference Standards and Standards Updates:** Proposed new referenced standards and proposed updates of existing standards with coordinating text are limited to original code change submittals in accordance with Section 4.6.3. Comments proposing a new reference standard or a new proposed update of an existing standard with coordinating text shall not be permitted.

7.2 **Deadline:** The deadline for receipt of a comment to the results of the First Committee Action Hearing (CAH #1) shall be announced at the first hearing but shall not be less than 30 days subsequent to the availability of the Report of the First Committee Action Hearing (CAH #1) (see Section 6.7).

7.3 **Withdrawal of Comment:** A comment may be withdrawn by the commenter at any time prior to comment consideration of that comment at the Second Committee Action Hearing (CAH #2). A withdrawn comment shall not be subject to consideration at the second hearing. If the only comment to a code change proposal is withdrawn by the commenter prior to consideration at the Second Committee Action Hearing (CAH #2), such proposal will be considered as not acted upon at the second hearing and the proposal is not eligible for further modification consideration at the Public Comment Hearing in accordance with Section 7.1.1.

7.4 **Form and Content of Comments:** Any interested person, persons, or group may submit a public comment to the results of the First Committee Action Hearing (CAH #1) which will be considered when in conformance to these requirements. Each comment to a code change proposal shall be submitted separately and shall be complete in itself. Each comment shall contain the following information:

7.4.1 **Comment:** Each comment shall include the name, title, and email address of the commenter. Email addresses shall be published with the comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or committee submits a comment, an individual with prime responsibility shall be indicated. If a comment is submitted on behalf a client, group, organization or committee, the name and email address of the client, group, organization or committee shall be indicated. The scope of the comment shall be consistent with the scope of the original code change proposal or the Committee action. Comments which are determined as not within the scope of the code change proposal or Committee action shall be identified as such. The commenter shall be notified that the comment is considered an incomplete comment in accordance with Section 7.5.1 and the comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section

4.3.5.5 shall be provided with the comment.

7.4.2 Code Reference: Each comment shall include the code change proposal number.

7.4.3 Multiple comments to a code change proposal. A commentor shall not submit multiple comments to the same code change proposal. When a commentor submits multiple comments to the same code change proposal, the comments shall be considered as incomplete comments and processed in accordance with Section 7.5.1. This restriction shall not apply to comments that attempt to address differing subject matter within a Code section.

7.4.4 Desired Action at the Second Committee Action Hearing (CAH #2): In order for a comment to be considered, the comment shall indicate the desired action at the Second Committee Action Hearing (CAH #2) as one of the following:

1. Approve the code change proposal As Submitted (AS), or

2. Approve the code change proposal As Modified by the Committee modification published in the Report of the First Committee Action Hearing (AMC #1) or a comment published in the Second Committee Action Hearing Agenda (AMC #2), or

3. Disapprove the code change proposal (D)

7.4.5 Supporting Information: The comment shall include a statement containing a reason and justification for the desired action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 7.5 and determined as not germane to the technical issues addressed in the code change proposal or first Committee action may be identified as such. The commenter shall be notified that the comment is considered an incomplete comment in accordance with Section 7.5.1 and the comment shall be held until the deficiencies are corrected. The commenter shall have the right to appeal this action in accordance with CP#1 – Appeals. A bibliography of any substantiating material submitted with a comment shall be published with the comment and the substantiating material shall be made available at the Second Committee Action Hearing (CAH #2). Supporting documentation may be provided via a link to a website provided by the commenter and included in the reason statement and bibliography. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

7.4.6 Cost Impact: The comment shall include a cost impact statement in accordance with Section 17.0.

7.4.7 Online submittal: Each comment and substantiating information shall be submitted online via cdpACCESS. Additional electronic copies may be requested when determined necessary by the Secretariat.

7.4.8 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle in accordance with Section 3.2. The posting of the deadline shall occur no later than 120 days prior to the comment deadline. Each comment shall be submitted online via cdpACCESS by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

7.5 Review: The Secretariat shall be responsible for reviewing all submitted comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 5.2).

7.5.1 Incomplete Comment: When a comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the comment shall not be processed. The Secretariat shall notify the commenter of the specific deficiencies and the comment shall be held until the deficiencies are corrected, or the comment shall be returned to the commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected comment.

7.5.2 Duplications: On receipt of duplicate or parallel comments, the Secretariat may consolidate such comments for Second Committee Action Hearing (CAH #2) comment consideration. Each commenter shall be notified of this action when it occurs.

7.5.3 Comments Received after Deadline: Comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the Second Committee Action Hearing (CAH #2) consideration. This deadline shall not apply to comments submitted by the Code Correlation Committee. In order to correlate submitted comments with action taken at the First Committee Action Hearing (CAH #1) on code change proposals that did receive a comment, the Code Correlation Committee, in conjunction with staff processing of comments, shall review the submitted comments and submit the necessary comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Second Committee Action Hearing (CAH #2) Agenda as required in Section 7.6.

7.6 Second Committee Action Hearing Agenda: The comments received to the First Committee Action Hearing (CAH #1) results on code change proposals shall constitute the Second Committee Action Hearing Agenda. The agenda shall be posted on the ICC website at least 30 days prior to the hearing. Any errata to the agenda shall be posted on the ICC website as soon as possible. Code change proposals and comments which have not been published in the original posting or subsequent errata shall not be considered.

8.0 Second Committee Action Hearing (CAH #2) (NEW)

8.1 Intent: The intent of the Second Committee Action Hearing (CAH #2) is to permit interested parties to present their views including cost and benefits on comments received to the action taken by the Committee at the First Committee Action Hearing (CAH #1). The Committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals prior to the public comment portion of the code development process in accordance with Section 9.0.

8.1.1 Code changes not receiving a comment: The Committee action on code changes that do not receive a comment shall be the action taken at the First Committee Action Hearing (CAH #1) and shall not be on the agenda for the Second Committee Action Hearing (CAH #2). Such code changes will not be eligible for further modification as part of public comment consideration (see Section 7.1.1)

8.2 Committee: The Committee shall be the same Committee that presided over the First Committee Action Hearing (CAH #1).

8.3 Date and Location: The date and location of the Second Committee Action Hearing (CAH #2) shall be announced not less than 60 days prior to the date of the hearing.

8.4 Hearing conduct: The Second Committee Action Hearing (CAH #2) shall be conducted in the same fashion as the First Committee Action Hearing (CAH #1) in accordance with Sections 6.2 through 6.4 and 6.6 and Section 8.4.1.

8.4.1 Floor discussion. Discussion on code change proposals being individually considered shall be in accordance with Sections 8.4.1.1 through 8.4.1.4:

8.4.1.1 Initial Discussion: The Committee action from the First Committee Action Hearing (CAH #1) shall be the basis of the initial discussion.

8.4.1.2 Introducing Comments: At any point during the initial floor discussion , a comment published in the CAH#2 Agenda may be called to the floor. Each subsequent comment called to the floor, if any, shall be individually discussed before returning to the initial floor discussion. Comments in the CAH#2 agenda must be called to the floor for consideration.

8.4.1.3 Proponent testimony: The Proponent of a comment is permitted to waive an initial statement. The Proponent of the comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

8.4.1.4 Modifications: Modifications to individual comments may be suggested from the floor by any person participating in the hearing, at any time during the floor discussion of the respective comment. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification. Modifications submission, criteria, testimony, and time limits shall comply with Sections 6.5.2.1 through 6.5.2.3.1

8.5 Report of the Second Committee Action Hearing (CAH #2): The results of the Second Committee Action Hearing (CAH #2), including Committee action and reason, shall be posted on the ICC website not less than 60 days prior to the Public Comment Hearing, except as approved by the ICC Board.

9.0 Submittal of Public Comments to the Second Committee Action Hearing (CAH #2)

9.1 Intent: The public comment process gives attendees at the Public Comment Hearing an opportunity to consider specific objections to the results of the Second Committee Action Hearing (CAH #2) for each code group and more thoughtfully prepare for the discussion for public comment consideration. The public comment process expedites the Public Comment Hearing by limiting the items discussed to consideration of items for which a public comment has been submitted. The Public Comment Hearing will be a combined hearing of both Code Group A and Code Group B code change proposals and public comments in accordance with Sections 3.0 and 10.0.

9.2 Deadline: The deadline for receipt of a public comment to the results of the Second Committee Action Hearing (CAH #2) shall be announced at the hearing but shall not be less than 30 days subsequent to the availability of the Report of the Second Committee Action Hearing (CAH #2) for the respective code group (see Section 8.5). The public comment deadline for Code Group A codes shall be early in the second year of the cycle and the public comment deadline for Code Group B codes shall be early in the third year of the cycle with specific dates posted in accordance with Section 3.2.

9.3 Withdrawal of Public Comment: A public comment may be withdrawn by the public commenter at any time prior to public comment consideration of that comment. A withdrawn public comment shall not be subject to public comment consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 10.5.5, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 10.5.5, the proposal shall continue as part of the individual consideration agenda in accordance with Section 10.5.6, however the public comment shall not be subject to public comment consideration.

9.4 Form and Content of Public Comments: Any interested person, persons, or group may submit a public comment to the results of the Second Committee Action Hearing (CAH #2) which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

9.4.1 Public comment: Each public comment shall include the name, title, and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or Committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or Committee, the name and email address of the client, group, organization or Committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal or Committee action from the Second Committee Action Hearing (CAH #2). Public comments which are determined as not within the scope of the code change proposal or Committee action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 9.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 4.3.5.5 shall be provided with the public comment.

9.4.2 Code Reference: Each public comment shall include the code change proposal number.

9.4.3 Multiple public comments to a code change proposal. A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 9.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

9.4.4 Desired Final Action: In order for a public comment to be considered, the public comment shall indicate the desired Final Action as one of the following:

1. Approve the code change proposal As Submitted (AS), or
2. Approve the code change proposal As Modified by the Committee modification published in the Report of the First or Second Committee Action Hearing (AMC) or published in a public comment in the Public Comment Agenda (AMPC), or
3. Disapprove the code change proposal (D)

9.4.5 Supporting Information: The public comment shall include a statement containing a reason and justification for the desired Final Action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 9.5 and determined as not germane to the technical issues addressed in the code change proposal or Committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 9.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with CP#1 – Appeals. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Public Comment Hearing. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the reason statement and bibliography. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

9.4.6 Cost Impact: The public comment shall include a cost impact statement in accordance with section 17.0.

9.4.7 Online submittal: Each public comment and substantiating information shall be submitted online via cdpACCESS. Additional electronic copies may be requested when determined necessary by the Secretariat.

9.4.8 Submittal Deadline: ICC shall establish and post the submittal deadlines for Code Groups A and B in accordance with Section 3.2. The posting of the deadline shall occur no later than 120 days prior to the public comment deadlines. Each public comment shall be submitted online via cdpACCESS by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

9.5 Review: The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 5.2).

9.5.1 Incomplete Public Comment: When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

9.5.2 Duplications: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for public comment consideration. Each public commenter shall be notified of this action when it occurs.

9.5.3 Public Comments Received after Deadline: Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the public comment consideration. This deadline shall not apply to public comments submitted by the Code Correlation Committee. In order to correlate submitted public comments with action taken at the Second Committee Action Hearing (CAH #2) on code change proposals that did receive a public comment, the Code Correlation Committee, in conjunction with staff processing of public comments, shall review the submitted public comments and submit the necessary public comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Public Comment Agenda as required in Section 9.6.

9.6 Public Comment Agenda: The First and Second Committee Action Hearing results on code change proposals that have not received a public comment and code change proposals from the Second Committee Action Hearing (CAH #2) which received public comments shall constitute the Public Comment Agenda. The Public Comment Agenda shall be posted on the ICC website at least 30 days prior the Public Comment Hearing. Any errata to the Public Comment Agenda shall be posted on the ICC website as soon as possible. Code change proposals and public comments which have not been published in the original posting or subsequent errata shall not be considered.

10.0 Public Comment Hearing

10.1 Intent: The Public Comment Hearing is the first of two steps to make a final determination on all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 12.0). The second step, which follows the Public Comment Hearing, is the Online Governmental Consensus Vote that is conducted in accordance with Section 11.0. Code change proposals from Code Groups A and B considered at the Second Committee Action Hearing (CAH #2) in accordance with Section 8.1 are eligible for public comment consideration at the Public Comment Hearing and the Online Governmental Consensus Vote.

10.2 Date and Location: The date and location of the Public Comment Hearing shall be announced not less than 60 days prior to the date of the hearing.

10.3 Moderator: The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Public Comment Hearing.

10.4 Public Comment Agenda: The Public Comment Consent Agenda shall be comprised of code change proposals which have not received a public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a public comment (see Section 9.1).

10.5 Procedure: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Public Comment Hearing except as these Rules of Procedure may otherwise dictate.

10.5.1 Open Hearing: The Public Comment Hearing is an open hearing. Any interested person may attend and participate in the floor discussion.

10.5.2 Agenda Order: The Secretariat shall publish a Public Comment Agenda for the Public Comment Hearing, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any code change proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.

10.5.2.1 Proponent Approval: A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance at the hearing and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to change the hearing order is not debatable.

10.5.2.2 Revised Agenda Order Approved: A motion to revise the agenda order is subject to a 2/3 vote of those present.

10.5.3 Tabling: Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Public Comment Agenda for the code change proposals under consideration, or

2. To a specific location in the Public Comment Agenda for the code change proposals under consideration.

10.5.3.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

10.5.3.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 10.5.3 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

10.5.4 Presentation of Material at the Public Comment Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 9.4.5 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

10.5.5 Public Comment Consent Agenda: The Public Comment Consent Agenda (see Section 10.4) shall be placed before the assembly with a single motion for Final Action in accordance with the results of the First and Second Committee Action Hearings. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion. This action shall not be subject to the Online Governmental Consensus Vote following the Public Comment Hearing (see Section 11.0).

10.5.6 Public Comment Individual Consideration Agenda: Upon completion of the Public Comment Consent Agenda vote, all code change proposals not on the Public Comment Consent Agenda shall constitute the Public Comment Individual Consideration Agenda and be placed before the assembly for individual consideration of each item (see Section 10.4).

10.5.6.1 New Proposed Standard or Updated Standard Not Available. It is the responsibility of the proponent of the code change proposal to identify whether a new standard or updated standard (where the proposal includes coordinating text revisions) is available. Where the proposed new standard or the updated standard is not available in accordance with Section 4.6.3, the code change will not be considered on the Individual Consideration Agenda and the Final Action shall be Disapproval.

10.5.7 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on in accordance with Section 10.5.9.

10.5.8 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person testifying on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall identify the time limits on debate at the beginning of the Public Comment Hearing. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

10.5.8.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

10.5.9 Discussion and Voting: Discussion and voting on code change proposals being individually considered shall be in accordance with the following procedures and the voting majorities in Section 10.6:

10.5.9.1 Proponent testimony: The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

10.5.9.2 **Points of Order:** Any person participating in hearing may challenge a procedural ruling of the Moderator. A majority vote of ICC Members in attendance shall determine the decision.

10.5.9.3 **Eligible voters:** Voting shall be limited to eligible voters in accordance with Section 12.0.

10.5.9.4 **Allowable Final Action Motions:** The only allowable motions for Final Action are Approval as Submitted (AS), Approval as Modified by the Committee from the First or Second Committee Action Hearing (AMC) or by one or more modifications published in the Public Comment Agenda (AMPC), and Disapproval (D).

10.5.9.5 **Initial Motion:** The Committee action from the Second Committee Action Hearing (CAH #2) shall be the initial motion considered.

10.5.9.6 **Motions for Modifications:** Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Public Comment Agenda may be made (see Section 9.4.4). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.

10.5.9.7 **Voting:** After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If the motion fails to receive the majority required in Section 10.6, the Moderator shall ask for a new motion.

10.5.9.8 **Subsequent Motion:** If the initial motion is unsuccessful, a motion for either Approval as Submitted or Approval as Modified by one or more published modifications is in order. A motion for Disapproval is not in order. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If a successful vote is not achieved, Section 10.5.9.9 shall apply.

10.5.9.9 **Failure to Achieve Majority Vote at the Public Comment Hearing.** In the event that a code change proposal does not receive any of the required majorities in Section 10.6, the results of the Public Comment Hearing for the code change proposal in question shall be Disapproval. The vote count that will be reported as the Public Comment Hearing result will be the vote count on the main motion in accordance with Section 10.5.9.7.

10.5.9.10 **Public Comment Hearing Results:** The result and vote count on each code change proposal considered at the Public Comment Hearing shall be announced at the hearing. In the event the electronic voting system is not utilized and a hand/standing count is taken in accordance with Sections 10.5.9.7 and 10.5.9.8, the vote count will not be announced if an individual standing vote count is not taken. The results shall be posted and included in the Online Governmental Consensus Vote ballot (see Section 11.3).

10.5.9.10.1 **Online Governmental Consensus Ballot Exceptions:** Where Disapproval is the action at all three hearings in the code group cycle (First Committee Action Hearing (CAH #1), Second Committee Action Hearing (CAH #2) and the Public Comment Hearing), the Final Action on the code change proposal shall be Disapproval and the proposal shall not be placed on the Online Governmental Consensus Vote ballot.

10.6 Majorities for Public Comment Hearing Voting: The required voting majority for code change proposals individually considered shall be based on the number of votes cast by eligible voters at the Public Comment Hearing shall be in accordance with the following table.

Second Committee Action Hearing (CAH #2)	**Desired Final Action**		
	AS	**AMC/AMPC**	**D**
AS	Simple Majority	2/3 Majority	Simple Majority
AMC	2/3 Majority	Simple Majority to sustain the Committee Action (AMC) or; 2/3 Majority on each additional modification and 2/3 Majority on entire code change proposal for AMPC	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

11.0 Online Governmental Consensus Vote

11.1 Public Comment Hearing Results: The results from the Individual Consideration Agenda at the combined Code Group A and Code Group B Public Comment Hearing (see Sections 10.5.6 and 10.5.9.10) shall be the basis for the Online Governmental Consensus Vote. The ballot shall include the voting options in accordance with the following table (see Section 11.1.1 for exceptions):

Second Committee Action Hearing (CAH #2)	**Public Comment Hearing result and Voting Majority**	**Online Governmental Consensus Ballot and Voting Majority**	
AS	**AS:** Simple Majority	**AS:** Simple Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AS:** Simple Majority	**D:** Simple Majority
AMC	**AS:** 2/3 Majority	**AS:** 2/3 Majority	**D:** Simple Majority
	AMC: Simple Majority	**AMC:** Simple Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AM:** Simple Majority	**D:** Simple Majority
D	**AS:** 2/3 Majority	**AS:** 2/3 Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AS:** 2/3 Majority	**D:** Simple Majority

11.1.1 Online Governmental Consensus Ballot Exceptions: Where Disapproval is the action at all three hearings in the code group cycle (First Committee Action Hearing (CAH #1), Second Committee Action Hearing (CAH #2) and the Public Comment Hearing), the Final Action on the code change proposal shall be Disapproval and the proposal shall not be placed on the Online Governmental Consensus Vote ballot.

11.2 Online Governmental Consensus Vote Voter Statement: In order to vote on the Online Governmental Consensus Vote, the eligible voter is required to acknowledge the following in order to proceed to the ballot:

1. I am currently an employee or public official actively engaged either full or part time in the administration, formulation, implementation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare, or have Honorary Member status.
2. I am participating in this ICC activity in compliance with the ICC Code of Ethics (see Section 1.8), and I will avoid any circumstance that could create the appearance of a conflict of interest or otherwise compromise professional integrity.
3. As an eligible voting member, I have done my due diligence to become an informed voter on the matters that I am voting on, or as a representative of an ICC Governmental Member, my vote is being directed by the Governmental Member.
4. I am aware that advocacy guides that seek to influence or recommend voter positions are not endorsed by

the International Code Council, and I understand that I am under no obligation to vote in accordance with any such voter guides.
5. I will not vote on any code change that would provide me with a direct personal financial benefit.
6. I will not vote on any code change that would provide a direct financial benefit to any individual or company with which I have a business interest or relationship.

11.3 Online Governmental Consensus Vote Ballot: The ballot for each code change proposal considered at the Public Comment Hearing will include:

1. The Public Comment Hearing result and vote count.
2. The allowable Online Governmental Consensus Vote actions in accordance with Section 11.1.
3. Where the Public Comment Hearing result is As Submitted (AS) or Disapproval (D), the original code change proposal will be presented.
4. Where the Public Comment Hearing result is As Modified by the Committee (AMC) or As Modified by one or more Public Comments (AMPC), the original code change and approved modification(s) will be presented.
5. The Committee action taken at the First and Second Committee Action Hearings.
6. ICC staff identification of correlation issues.
7. For those who voted at the Public Comment Hearing, the ballot will indicate how they voted, unless an electronic vote count is not taken in accordance with Section 10.5.9.10.
8. An optional comment box to provide comments.
9. Access to the Public Comment Agenda which includes: the original code change, the report of the Committee action and the submitted public comments.
10. Access to the audio and video of the First and Second Committee Action and Public Comment Hearing proceedings.
11. Identification of the ballot period for which the online balloting will be open.

11.4 Voting process: Voting shall be limited to eligible voters in accordance with Section 12.0. Eligible voters are authorized to vote during the Public Comment Hearing and during the Online Governmental Consensus Vote; however, only the last vote cast will be included in the final vote tabulation. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

11.4.1 Participation requirement: A minimum number of participants to conduct the Online Governmental Consensus Vote shall not be required unless the code change proposal(s) were not voted upon utilizing the electronic voting devices at the Public Comment Hearing and the resulting vote was not assigned to each eligible voting member in accordance with Sections 10.5.9.7 and 10.5.9.8. If this occurs, a minimum number of participants as determined by the ICC Board shall be required for those code change proposal(s) based on an assessment of the minimum number of votes cast during the entire Public Comment Hearing. The Online Governmental Consensus Vote shall determine the Final Action on the code change proposal(s) in accordance with Section 13.1.

12.0 Eligible Final Action Voters

12.1 Eligible Final Action Voters: Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated once each code development cycle. After initial validation, changes to the list of GMVRs for the remainder of the code development cycle shall be made in accordance with Section 12.2. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

12.2 Applications: Applications, whether new or renewed, for Governmental Membership must be received by the ICC at least 180 days prior to the Group A and B Public Comment Hearing in order for its designated representatives to be eligible to vote at the Group A and B Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status (validation) must be received by the Code Council 30 days prior to the commencement of the first day of the Code Group A and B Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

13.0 Tabulation, Certification and Posting of Results

13.1 Tabulation and Validation: Following the closing of the online ballot period, the votes received will be combined with the vote tally at the Code Group A and B Public Comment Hearing to determine the final vote on the code change proposal. If a hand/standing count is utilized per Subsection 10.5.9.7 or 10.5.9.8, those votes of the Public Comment Hearing will not be combined with the online ballot. ICC shall retain a record of the votes cast and the results shall be certified by a validation Committee appointed by the ICC Board. The validation Committee shall report the results to the ICC Board, either confirming a valid voting process and result or citing irregularities in accordance with Section 13.2.

13.2 Voting Irregularities: Where voting irregularities or other concerns with the Online Governmental Consensus Voting process which are material to the outcome or the disposition of a code change proposal(s) are identified by the Validation Committee, such irregularities or concerns shall be immediately brought to the attention of the ICC Board. The ICC Board shall take whatever action necessary to ensure a fair and impartial Final Action vote on all code change proposals, including but not limited to:

1. Set aside the results of the Online Governmental Consensus Vote and have the vote taken again.
2. Set aside the results of the Online Governmental Consensus Vote and declare the Final Action on all code change proposals to be in accordance with the results of the Public Comment Hearing.
3. Other actions as determined by the ICC Board.

13.3 Failure to Achieve Majority Vote: In the event a code change proposal does not receive any of the required majorities for Final Action in Section 11.1, the Final Action on the code change proposal in question shall be Disapproval.

13.4 Final Action Results: The Final Action on all code change proposals shall be published as soon as practicable after certification of the results. The results shall include the Final Action taken, including the vote tallies from both the Public Comment Hearing and Online Governmental Consensus Vote, as well as the required majority in accordance with Section 11.1. ICC shall maintain a record of individual votes for auditing purposes; however, the record shall not be made public. The exact wording of any resulting text modifications shall be made available to any interested party.

14.0 Code Publication

14.1 Next Edition of the Codes: The Final Action results on code change proposals shall be the basis for the subsequent edition of the respective Code.

14.2 Code Correlation: The Code Correlation Committee is authorized to resolve technical or editorial inconsistencies resulting from actions taken during the Code Development Process by making appropriate changes to the text of the affected code. The process to resolve technical or editorial inconsistencies shall be conducted in accordance with CP#44 – Code Correlation Committee.

15.0 Appeals

15.1 Right to Appeal: Any person may appeal an action or inaction in accordance with CP#1 – Appeals. Any appeal made regarding voter eligibility, voter fraud, voter misrepresentation or breach of ethical conduct must be supported by credible evidence and must be material to the outcome of the final disposition of a code change proposal(s).

The following actions are not appealable:

1. Variations of the results of the Code Group A and B Public Comment Hearing compared to the Final Action result in accordance with Section 13.4.
2. Denied requests to extend the voter balloting period in accordance with Section 11.4.
3. Lack of access to cdpACCESS to submit a code change proposal, to submit a comment to a Committee action, to submit a public comment or to vote.
4. Code Correlation Committee changes made in accordance with Section 14.2.

15.2 Scope and Intent Issues: If an individual has a question about whether a proposed provision falls within the scope and/or intent statements published by the ICC Board, that individual may send the question to the Committee Chair through the ICC Staff Secretariat, who will submit the question to the ICC Board of

Directors through the ICC CEO, along with any relevant background information.

1. The ICC Board shall have full discretion to determine how it conducts its consideration of the question.
2. The ICC Board shall provide a written response to the committee chair within 30 business days of its receipt of the question.
3. ICC will post the question and the ICC Board's response on the committee page on the ICC website.
4. The ICC Board's response to any submitted Scope and Intent inquiry shall be final and the Committee Chair shall ensure the Board's interpretation is applied throughout the code's development process.

16.0 Violations

16.1 ICC Board Action on Violations: Violations of the policies and procedures contained in this Council Policy shall be brought to the immediate attention of the ICC Board for response and resolution. Additionally, the ICC Board may take any actions it deems necessary to maintain the integrity of the code development process.

17.0 Cost Impacts.

17.1 Cost Impact Statement Requirements. The proponent shall indicate one of the following regarding the cost impact of the code change proposal or the net cost impact of the code change proposal and comment submitted:

1. The code change proposal's estimated immediate cost impacts; or
2. The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction.

The proponent shall submit information which substantiates such assertion. This information will be considered by the Committee and will be included in the published code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the cost substantiation statement. The cost substantiation statement shall include the date the link was created.

Any proposal submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

1. The cost estimates provided shall be straightforward, allowing the Code Development Committee (CDC) members and eligible voting members, to rapidly assess their relative validity.
2. The cost estimates shall (a) have succinct information to allow the average person to understand how it was calculated (methodology), and (b) may provide reference for the publicly available data used (basis for variables).
3. The ICC may develop a cost impact guidance document to assist code change and comment submitters in complying effectively with the cost impact requirements.

2025 GROUP B ICC CODE DEVELOPMENT CYCLE
CROSS INDEX OF PROPOSED CODE CHANGES

Some of the proposed code changes include sections that are outside of the scope of the chapters, or the code listed in the table of 2024-2026 Staff Secretaries on page xiii. This is done to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page viii. For example, IBC Section 412.7 is proposed for revision in code change F180-24 which is to be heard by the IFC Committee. Chapter 4 of the IBC is typically the responsibility of the IBC-General Code Committee as listed in the table of Staff Secretaries. It is therefore identified in this cross index. Another example is Section 401.1.1 of the International Mechanical Code. The International Mechanical Code is normally maintained by the IMC Committee, but Section 306.1 will be considered for revision in proposed code change G1-24 Part VII which will be placed on the IMC Committee agenda.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 2 of the IBC, locate IBC Chapter 2 in the Cross Index of proposed codes changes, then go to the proposed code changes in the portion of the monograph for the respective proposed change group. For example, the Cross Index indicates that the definition of CONTROL AREA is contained within proposed code change F17-24. The IFC portion of the monograph will contain proposed code change F17-24 for your review. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	**PROPOSED CHANGE GROUP (see monograph table of contents for location)**
ADM	Administrative Provisions
FS	International Building Code - Fire Safety
G	International Building Code – General
S	International Building Code – Structural
EB	International Existing Building Code
IgCC	International Green Construction Code
P	International Plumbing Code
PM	International Property Maintenance Code
RB	International Residential Code – Building
SP	International Swimming Pool and Spa Code
IZC	International Zoning Code

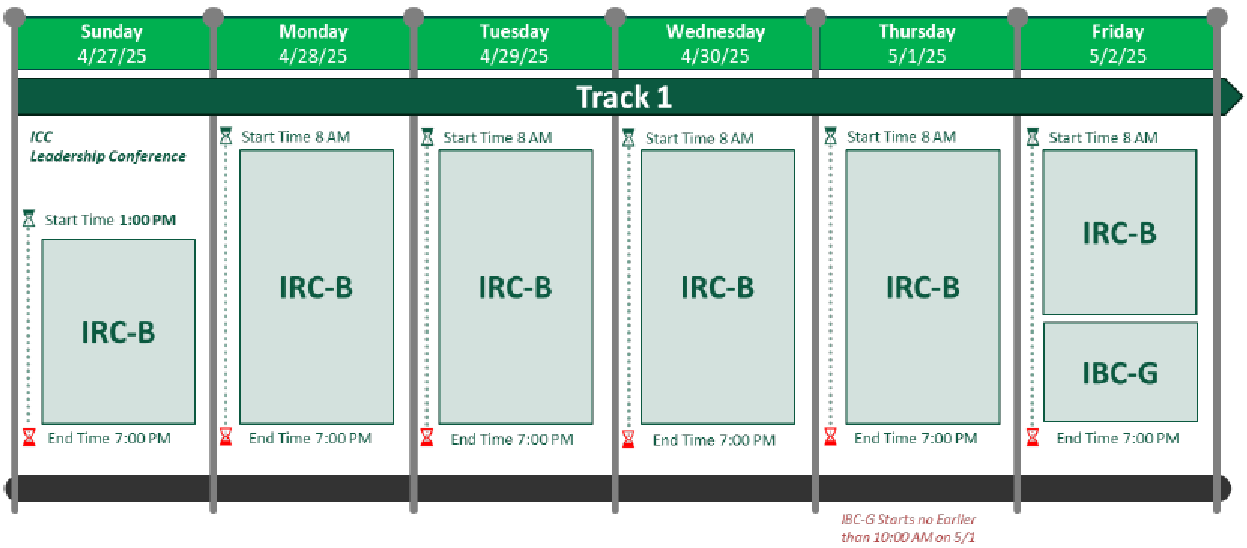
2025 GROUP B COMMITTEE ACTION HEARING SCHEDULE
April 27 – May 6, 2025
DoubleTree by Hilton
at the Entrance to Universal Orlando, Orlando Fl

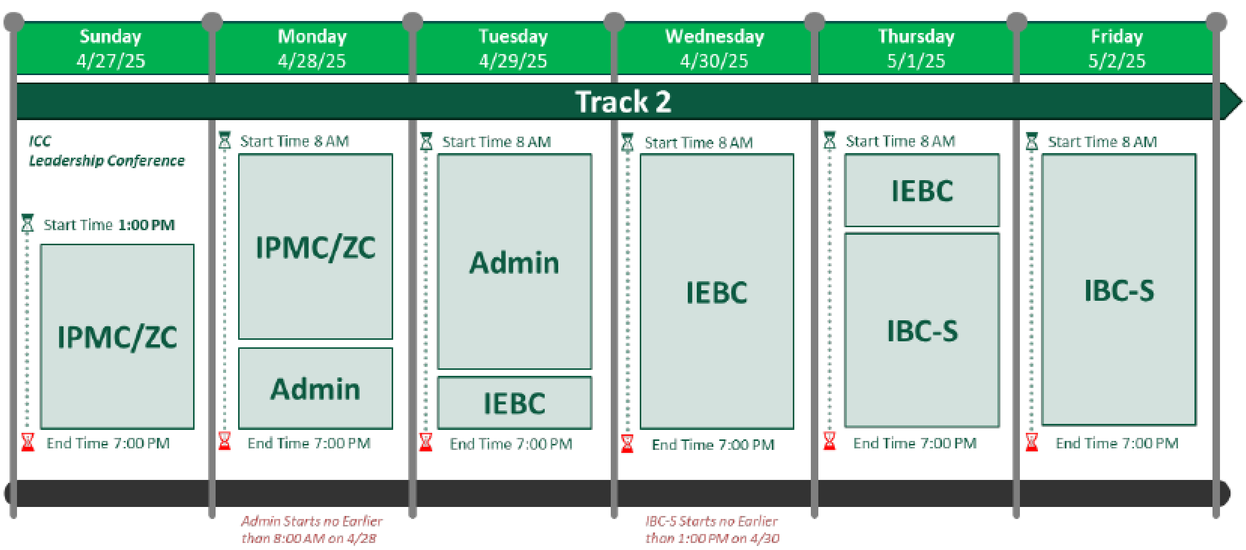
2025 Group B | Committee Action Hearing #1 (CAH #1)

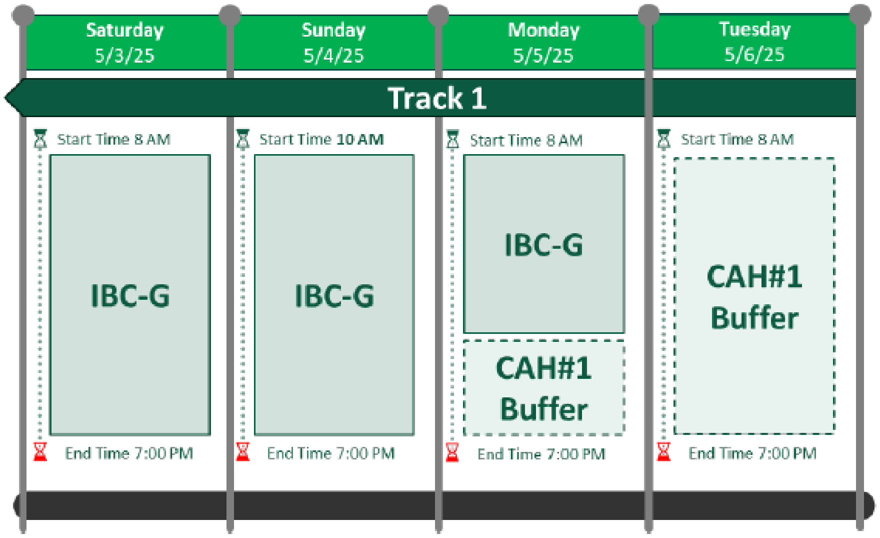
This year the code action hearings will start with a panel discussion and lunch at 12:00 PM on Sunday April 7, 2025. This will allow for Membership Council meetings to be held prior to the start of the hearings and CAH attendees to participate in the panel discussion event where lunch will be provided for attendees.

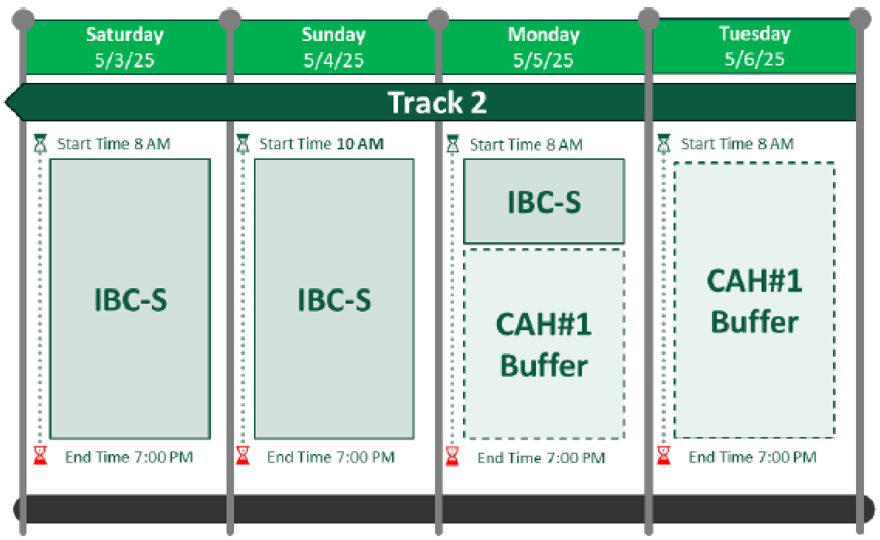
The hearings will be conducted **in-person only**. The hearings will be streamed live for individuals wishing to watch them online (note this is a watch only option).

Unless noted by “Start no earlier than 8 am” each Code Committee will begin immediately upon completion of the hearings for the prior Committee. This includes moving a Committee forward or back from the day indicated based on hearing progress. The actual start times for the various Committees are not stipulated because of uncertainties in hearing progress. The schedule anticipates that the hearings will finish on the date indicated in the schedule provided below. This may require going beyond the scheduled finish time.









Important Notes

1. Code change agenda to be posted on or before March 13, 2025.
2. Hearing times may be modified at the discretion of the Chair based on hearing progress.
3. Morning and afternoon breaks will be announced. A lunch break is planned. A dinner break is not planned. The hearings are scheduled to adjourn for dinner and resume the next day, unless otherwise necessary to complete the agenda.
4. Because of uncertainties in hearing progress, the start time indicated as “Start No Earlier than [8 AM or 12:00 PM]” is conservatively estimated and is not intended to be a hearing progress target.
5. Consult the hearing order in the posted code change agenda for:
    a. Code changes to be heard by a Committee other than the Committee under which the code change is designated.
    b. Code changes comprised of multiple parts where each part is heard by a different Committee.
    c. Code changes to the definitions to determine the applicable Committee who will hear the change to the definition for the respective code.

Code Development Committees (CDC) [Governed by ICC CP 28]

Details related to the sections of the code that each committee covers can be found in the Committee Responsibility Matrix. The 2024 CAH's will include the **Group A** committees.

Acronym	*Cycle Group*	*Description*
ADMIN	B	Provisions (Chapter 1 for all I-Codes except the IECC, IgCC and IRC) and referenced standards updates (multi-discipline committee)
IBC-E	**A**	Building Code – Means of Egress Committee
IBC-FS	**A**	Building Code – Fire Safety Committee
IBC-G	B	International Building Code – General Committee
IBC-S	B	International Building Code – Structural Committee (Includes structural provisions of IEBC)
IEBC	B	International Existing Building Code Committee (Excludes structural provisions)
IFC	**A**	International Fire Code Committee (includes International Wildland – Urban Interface Code)
IFGC	**A**	International Fuel Gas Code Committee
IgCC	B	International Green Construction Code – Chapter 1 only (remaining provisions per ASHRAE 189.1)
IMC	**A**	International Mechanical Code Committee
IPC	**A**	International Plumbing Code Committee (includes International Private Sewage Disposal Code)
IPM/ZC	B	International Property Maintenance and Zoning Code Committee
IRC-B	B	Residential Code –Building Committee
IRC-MP	**A**	International Residential Code – Mechanical-Plumbing Committee
ISPSC	**A**	International Swimming Pool and Spa Code Committee

2025 PROPOSED CHANGES TO THE INTERNATIONAL CODES

2025 GROUP B – PROPOSED CHANGES TO THE ADMINISTRATIVE PROVISIONS CODE

ADMINISTRATIVE PROVISIONS COMMITTEE

Robert (Bob) J. Frances, PE, *Chair*
Director/Building Official
Howard Co. (MD) Dept. of Insp., Lic., & Permits
Ellicott City, MD

Marc Nard, CBO, *Vice Chair*
Building Commissioner
Village of Lake in the Hills
Lake in the Hills, IL

Ken Callahan
Rep: National Association of Home Builders
Industrial Services Manager
Montana-Dakota Utilities
Billings, MT

James Gartside
Deputy Fire Marshal
International Association of Fire Fighters
Henderson, NV

Robert "Rob" Geislinger, AAS, BS, MA
Field Service Coordinator
National Fire Sprinkler Association
Elizabeth, CO

Arsalan Gharaveis, AIA, Ph.D. NCARB, EDAC
Senior Healthcare Architect/Planner
Arcadis (former CRTKL)
Pasadena, CA

William Gould, PE
Director, Building and Product Regulations
MiTek Inc.
Chesterfield, MO

Regina Hanshaw, JD
Executive Secretary
Ohio Board of Building Standards
Reynoldsburg, OH

Scott Moore
Retired Fire Chief
Battlefield, MO

Bonnie Muhigirwa, CBO
Chief Building Official
City of Aspen
Aspen, CO

Merria Norris
Code Development Analyst
SDCI - Department of Construction and Inspections
Port Orange, FL

Michael (Mike) Nugent, CBO
Retired Building Official
Charlotte, NC

Steve Orlowski
CEO, Founder
Sundowne Building Code Consultants, llc
Middletown, MD

Daniel (Dan) Wilkerson, MCP, PA BCO
ICC Combination Commercial Plans Examiner/Inspector
National Code Inspection Agency LLC
Greenville, PA

Staff Secretariat:
Keith Enstrom, PE
Senior Staff Engineer
International Code Council
Central Regional Office

TENTATIVE ORDER OF DISCUSSION 2025 PROPOSED CHANGES TO THE ADMINISTRATIVE PROVISIONS

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some ADM code change proposals may not be included on this list, as they are being heard by another committee.

ADM1-25 Part I

IEBC: [A] 101.2

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net); Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Peter Somers, Magnusson Klemencic Associates, representing self (psomers@mka.com); Julie Furr, Smith Seckman Reid, Inc, representing Julie Furr, PE (jcfurr@ssr-inc.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Existing Building Code

Revise as follows:

[A] 101.2 Scope. The provisions of this code shall apply to the *repair*, *alteration*, *change of occupancy*, *addition* to and relocation of *existing buildings*.

> **Exception:** ~~Detached one- and two-family dwellings and townhouses not more than three stories above grade plane in height with a separate means of egress, and their accessory structures not more than three stories above grade plane in height,~~ Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code.*

ADM1-25 Part I

ADM1-25 Part II

IRC: R101.2

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net); Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Peter Somers, Magnusson Klemencic Associates, representing self (psomers@mka.com); Julie Furr, Smith Seckman Reid, Inc, representing Julie Furr, PE (jcfurr@ssr-inc.com)

2024 International Residential Code

Revise as follows:

R101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, movement, relocation, enlargement, addition to, replacement, *repair*, equipment, use and occupancy, location, removal and demolition of detached one- and two-family *dwellings* and *townhouses* not more than three *stories above grade plane* in height with a separate means of egress and their *accessory structures* not more than three *stories above grade plane* in height.

Exception: The following shall be permitted to be constructed in accordance with this code where provided with an automatic sprinkler system complying with Section P2904, and shall be permitted for the repair, alteration, changes of occupancy, addition to and relocation of the following:

1. Live/work units located in *townhouses* and complying with the requirements of Section 508.5 of the *International Building Code*.
2. *Owner*-occupied *lodging houses* with five or fewer *guestrooms*.
3. A care facility with five or fewer *persons* receiving custodial care within a *dwelling unit*.
4. A care facility with five or fewer persons receiving medical care within a *dwelling unit*.
5. A day care facility for five or fewer *persons* of any age receiving care within a *dwelling unit* .

Reason: This proposal clarifies and confirms the common understanding and application of this IEBC Exception, which is to allow buildings within the scope of the IRC to use the IRC for existing building projects. The proposal makes no substantive changes. Rather, it resolves an inconsistency in the scope wording between the IEBC and the IRC.

The question: The current IEBC exception addresses only the dwellings, townhouses, and accessory buildings covered by IRC Section R101.2. It does not address the five types of buildings listed in the exception to R101.2: certain live/work units, lodging houses, and three types of care facilities. Assuming they meet the size, use, and other limits of R101.2, as currently worded, are these five building types eligible to use the IRC?

The answer: We posed this question to ICC staff in August 2024. On September 14, 2024, we received an opinion from Christopher Reeves of ICC, stating, in relevant part, "[T]he IRC ... may be used for additions, alterations and repairs to all existing buildings, including the five listed occupancy conditions [unless they] result in a use, occupancy, height or means of egress outside the scope of the IRC."

This proposal implements this ICC response, which is consistent with how we understand the exception as typically applied, and with the general expectation when the exception was added to the IEBC for the 2018 edition with proposal ADM31-16 (approved as submitted).

When the IEBC exception was added in 2016, IRC R101.2 did not list the five types the way it does today. IRC R101.2 was revised and expanded with proposals to the 2018 IRC to include these five types. As such, the original ADM31-16 could not have addressed three of the five types if it wanted to – either to explicitly include or exclude them – because they did not yet exist. In general, however, the reason statement for ADM31-16 implies that this IEBC exception should address any and all buildings within the scope of the IRC, to "keep intact the status of the IRC as a stand-alone code" and to avoid "provisions for IRC-regulated structures ... in another I-code." In other words, ADM31-16 argued, if you can build it new with the IRC, you should be able to regulate it as an existing building with the IRC.

What about similar wording in other I-codes? The IEBC exception also occurs verbatim in other I-codes, such as the IMC, IPC, and IFGC. (It does not appear, however, in other I-codes, such as the IPMC, IWUIC, and IFC.) Where the same exception does exist, should the wording of those other codes also be revised? Perhaps yes, if the users of those codes want to clarify that the IRC is an allowed alternative for the five types listed in IRC R101.2. But the clarification proposed here is probably less important for other codes that are primarily for new construction. A code primarily for new construction, such as the IMC, IPC, or IFGC, already works hand in glove with the

IBC, which has its own pointers to the IRC in Chapter 3 (for example, see IBC Sections 308.5, 310.4.1, or 310.4.2). Thus, users of the IMC, IPC, IFGC, etc. already have a path to get to the IRC for the five types listed in IRC R101.2.

By contrast, the IEBC, similar to the IPMC, applies exclusively to existing buildings. To require users to detour through the IBC just to find a vague rationalization for using the IRC is practically a guarantee of inconsistent use. Therefore, this proposal has value even if it means using wording that differs from similar exceptions in other I-codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

First, the proposal merely clarifies what we believe is the current common understanding of the exception to IEBC 101.2, consistent with the intent of the 2016 proposal that created it. Second, the exception merely provides an option to the user. Since there is no new requirement, there is no cost impact.

Staff Analysis: EB53-25 contains related proposed revisions to other IEBC sections that will be heard by the IBC-S committee. Similar exceptions are included in IBC Section 101.2, IFC Section 1001.1, IPC Section 101.2, IMC Section 101.2, and IFGC Section 101.2.

ADM1-25 Part II

ADM2-25

IBC: [A] 101.2

Proponents: John Grenier, National Council of Structural Engineers' Associations (NCSEA), representing NCSEA (jgrenier@greniereng.com)

2024 International Building Code

Revise as follows:

[A] 101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, relocation, enlargement, replacement, *repair*, equipment, use and occupancy, location, maintenance, removal and demolition of every *building* or *structure* or any appurtenances connected or attached to such *buildings* or *structures*. <u>Walls, fences, and retaining walls located on the same site as a building but not located within the *public way*, shall be considered structures and are governed by this code.</u>

Exception: Detached one- and two-family *dwellings* and *townhouses* not more than three *stories above grade plane* in height with a separate *means of egress*, and their accessory *structures* not more than three *stories above grade plane* in height, shall comply with this code or the *International Residential Code* .

Reason: 1. At the Committee Action Hearings in 2022 for Code Change Proposal S157-22 (Adding the requirement for Guards at Retaining Walls), the Committee Reason Statement was as follows: "Approved as modified as this proposal is an important update from a safety aspect. The committee expressed concerns relative to this being a 'site' item vs. a building component. The modification provides needed restructure, clarification and alignment with current code language. (Vote: 11-2)". This highlights some confusion within the Engineering Community on what the Code governs and what it does not (with the emphasized "Site Items" being brought up by the Committee and considered or thought as not governed by the IBC).

2. The 2021 IBC Commentary states, "While such activity may not be as significant as a new building, <u>a fence is considered a structure and, therefore, its erection is within the scope of the code</u>". This clarifies the issue, but having the text in the code will eliminate any confusion or disputes.

3. If the IBC does not govern walls, fences and retaining walls, then what code would? Work within the Public Right of Way would be governed by AASHTO or other locally adopted Codes, but the work on specific sites do not typically fall under those requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost of construction will not increase by this change.

ADM2-25

ADM3-25 Part I

IBC: [A] 101.3

Proponents: David Eisenberg, representing The Development Center for Appropriate Technology (strawnet@gmail.com); Martin Hammer, representing Martin Hammer - Architect (mfhammer@pacbell.net); Anthony Dente, representing Verdant Structural Engineers (anthony@verdantstructural.com); David Arkin, AIA, representing Arkin Tilt Architects (david@arkintilt.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 101.3 Purpose. The purpose of this code is to establish the minimum requirements to provide a reasonable level of safety, health and general welfare through structural strength, *means of egress*, stability, sanitation, light and *ventilation*, energy conservation, and for providing a reasonable level of life safety and property protection from the hazards of fire, *explosion* or *dangerous* conditions, <u>and from other hazards attributable to the built environment,</u> and to provide a reasonable level of safety to fire fighters and emergency responders during emergency operations.

- **BSJ_BldgCodesforaSmallPlanet_all.pdf**
  https://www.cdpaccess.com/proposal/11691/35967/files/download/9798/

Reason: From the 2000 IBC to the 2018 IBC (and similarly from the 2003 IRC to the 2018 IRC), the Intent section of the code included the phrase "and other hazards attributed to the built environment". That phrase is foundational to the understanding that, in plain English, the built environment creates hazards that extend beyond those impacting the occupants of buildings, beyond the scale of individual buildings, and beyond the specific regulatory categories listed in the purpose statement. This proposal reestablishes that phrase as well as replacing the word “attributed” with “attributable” because it implies not only hazards known from past experience, but those emerging in the present and into the future. (See links to attachments at the end of this Reason statement providing fuller background and context.)

There was considerably greater clarity in the IRC's original Purpose section:

From the 2000 IBC:
101.3 Intent. The purpose of this code is to establish the minimum requirements to safeguard the public health, safety and general welfare through structural strength, means of egress facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire and other hazards attributed to the built environment.

From the 2024 IBC:

[A] 101.3 Purpose.

The purpose of this code is to establish the minimum requirements to provide a reasonable level of safety, health and general welfare through structural strength, *means of egress*, stability, sanitation, light and *ventilation*, energy conservation, and for providing a reasonable level of life safety and property protection from the hazards of fire, *explosion* or *dangerous* conditions, and to provide a reasonable level of safety to fire fighters and emergency responders during emergency operations.

The importance of that deleted phrase lies in its acknowledgement that the built environment creates many hazards, and some not obvious. Though not stated explicitly, hazards attributable to the built environment are not limited to those directly impacting the occupants of a specific building or structure, but can come in other forms and occur in other places or timeframes.

The IBC and IRC requirements do an excellent job protecting building occupants from the categories of hazards specifically included in the codes, while failing to recognize or address many other hazards which can be partly or entirely traced to the built environment. These include hazards related to the lifecycle impacts of building materials, their potential toxicity and much more. The complexity of addressing the upstream and downstream impacts of buildings, and the built environment more broadly, while challenging, does not eliminate the responsibility of trying to understand and minimize the hazards created, and to balance the risks they represent at different levels and scales, from individual products, materials and systems to the aggregated and cumulative impacts they create.

What is missing overall in the codes and in code development is a formal process aimed at recognizing and balancing risks and hazards across the full spectrum of potential harm created by the built environment. If we don't acknowledge the existence of these other hazards, it becomes extremely difficult to introduce alternatives that may produce equivalent levels of safety and performance for buildings and their occupants while also addressing these other hazards.

We recognize that this view creates discomfort for many, and that the lack of a definitive line of regulatory authority and responsibility creates problems that are difficult to resolve. On the other hand, what of the blurring of definitive lines with the acceptance of the words "reasonable levels of health, safety and general welfare" into the purpose statements - clearly permissive language not allowed anywhere else in the codes. In fact, it is an illusion that there was ever a definitive line for which hazards should and should not be addressed in the codes.

The codes have continuously responded to emergent and previously unknown or unrecognized hazards and their impacts. That is why lead and asbestos are no longer allowed in building materials, and why we require insulation and have energy conservation requirements, and why we now have a wildland-urban interface code, and of course, why we have three-year code development cycles and appendices to the codes. Among these changing realities is that the climate is changing. Extreme weather events that were once rare are now common occurrences, and we need to be considering both how a changing climate impacts buildings and how the cumulative impacts of the built environment impact the climate.

These two quotes by ICC founding Board Chairman Bob Fowler from a 2000 interview of Bob and David Eisenberg in ICBO's Building Standards magazine are relevant to the intent of this proposal (see link to full interview below):

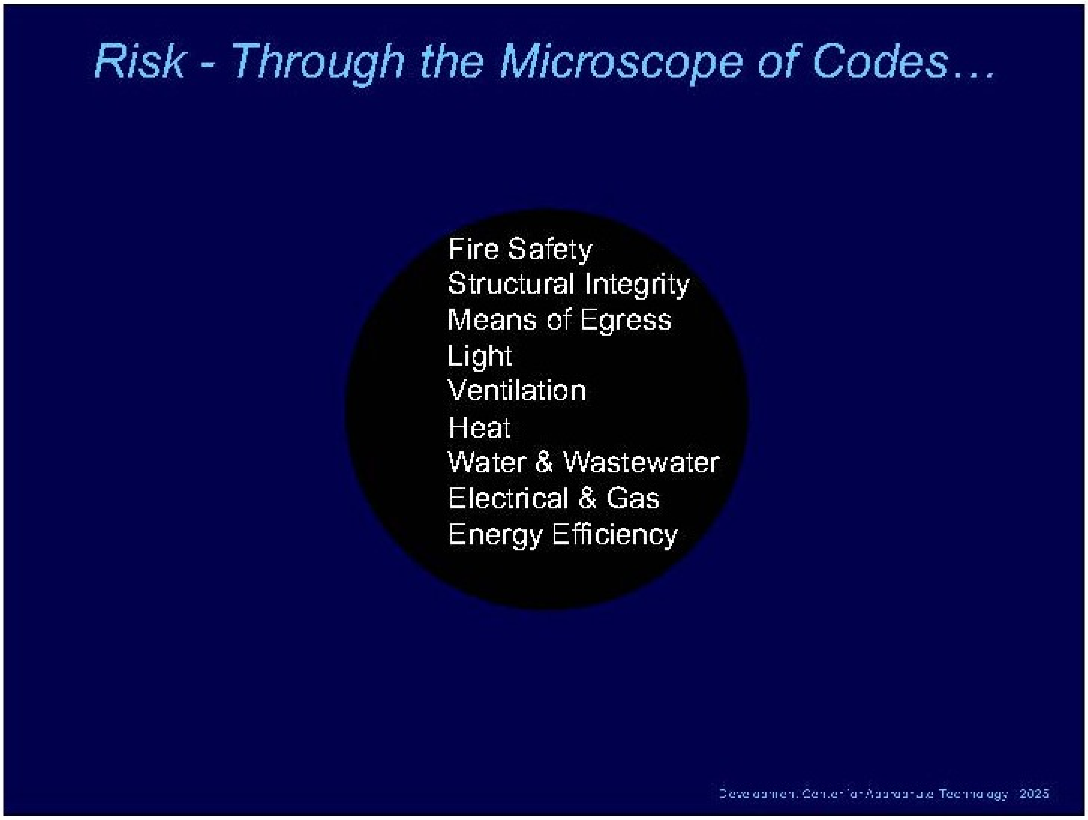
"Safety is very important, but we need to think about the responsibilities for our collective safety; especially the welfare of future generations who, it's worth noting, are unable to represent their interests."

"At some point, we will have to develop criteria for the environmental performance of buildings, similar to energy efficiency requirements. Alternative materials and methods will become much more than just allowable options once that happens. You can tell that I've come a long way personally from the building official I was when I got up and spoke against the first proposed code change to require insulation in buildings. I thought that was the dumbest idea I'd ever heard and that it had no place in the codes. Looking back, I see that the energy efficiency requirements set a very important precedent for our learning to take responsibility for the full range of the consequences of our buildings. We now need to continue that learning process and open our eyes and our minds to the work of creating sustainable buildings. Our great-grandchildren will thank us."

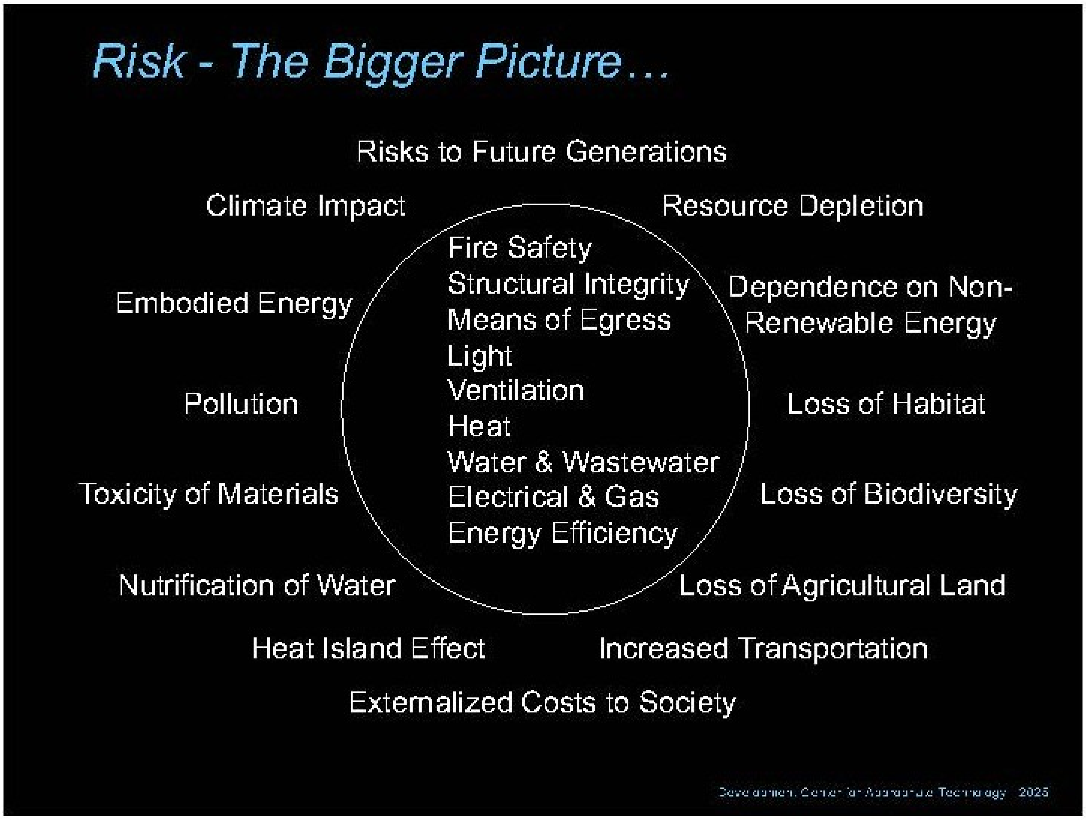
At a minimum, we hope this proposed change to the IBC's Purpose statement brings the issue back to the forefront and opens a conversation to allow honest and responsible exploration of how we can and should balance the full spectrum of hazards attributable to the built environment in our codes.

The following is a set of three slides that David Eisenberg of the Development Center for Appropriate Technology has been presenting to building officials for the past two decades. They graphically represent the way that not all hazards attributable to the built environment are addressed or even recognized in our building codes, revealing the need for a comprehensive process to balance and address them in the codes.

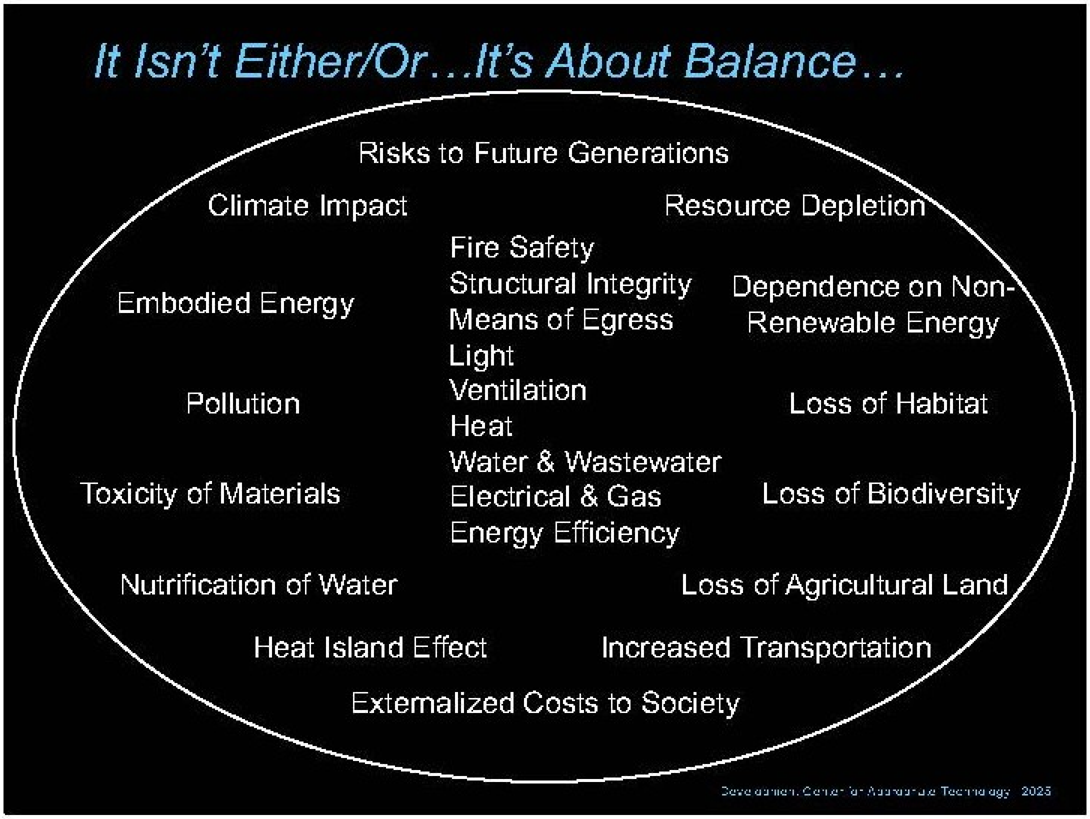
Development Center for Appropriate Technology - 2025



Looking at buildings through codes is like looking through a microscope. These are the main categories of hazards attributable to the built environment that are addressed in building codes. Though what you can see through that lens is very important, there are many other important hazards you can't see while looking through that lens.



Here are some of the other hazards which are attributable or partly attributable to the built environment, yet are not addressed by the codes.



What is critical to recognize is that this should not be an either/or matter – the full scope of hazards attributable to the built environment should be acknowledged and there should be a process to balance these hazards and risks – many of which are cumulative and distributed and occur over time – with the widely recognized hazards that are already addressed in codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed text addition has no direct construction cost impact.

Staff Analysis: Similar text is also in IFC Section 101.3.

ADM3-25 Part I

ADM3-25 Part II

IRC: R101.3

Proponents: David Eisenberg, representing The Development Center for Appropriate Technology (strawnet@gmail.com); Martin Hammer, representing Martin Hammer - Architect (mfhammer@pacbell.net); Anthony Dente, representing Verdant Structural Engineers (anthony@verdantstructural.com); David Arkin, AIA, representing Arkin Tilt Architects (david@arkintilt.com)

2024 International Residential Code

Revise as follows:

R101.3 Purpose. The purpose of this code is to establish minimum requirements to provide a reasonable level of safety, health and general welfare through affordability, structural strength, means of egress, stability, sanitation, light and *ventilation*, energy conservation and safety to life and property from fire and other hazards <u>attributable to the built environment</u> and to provide a reasonable level of safety to firefighters and emergency responders during emergency operations.

Attached Files

  https://www.cdpaccess.com/proposal/11617/35966/files/download/9804/
- **BSJ_BldgCodesforaSmallPlanet_all.pdf**
  https://www.cdpaccess.com/proposal/11617/35966/files/download/9803/

Reason: From the 2003 IRC to the 2018 IRC (and similarly from the 2000 IBC to the 2018 IBC), the Purpose section of the code included the phrase "and other hazards attributed to the built environment". That phrase is foundational to the understanding that, in plain English, the built environment creates hazards that extend beyond those impacting the occupants of buildings, beyond the scale of individual buildings, and beyond the specific regulatory categories listed in the purpose statement. This proposal reestablishes that phrase as well as replacing the word “attributed” with “attributable” because it implies not only hazards known from past experience, but those emerging in the present and into the future. (See links to attachments at the end of this Reason statement providing fuller background and context.)

There was considerably greater clarity in the IRC's original Purpose section:

From the 2003 IRC:

R101.3 Purpose. The purpose of this code is to provide minimum requirements to safeguard the public health, safety and general welfare, through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation, and safety to life and property from fire and other hazards attributed to the built environment.

From the 2024 IRC:

R101.3 Purpose. The purpose of this code is to establish minimum requirements to provide a reasonable level of safety, health and general welfare through affordability, structural strength, means of egress, stability, sanitation, light and *ventilation*, energy conservation and safety to life and property from fire and to provide a reasonable level of safety to firefighters and emergency responders during emergency operations.

The importance of that deleted phrase lies in its acknowledgement that the built environment creates hazards. Though not stated explicitly, hazards attributable to the built environment are not limited to those directly impacting the occupants of a specific building or structure, but can come in other forms and occur in other places or timeframes.

The IRC and IBC requirements do an excellent job protecting buildings and their occupants from the categories of hazards included in the codes, while failing to recognize or address many other hazards which can be partly or entirely traced to the built environment. These include hazards related to the lifecycle impacts of building materials, their potential toxicity and much more. The complexity of addressing the upstream and downstream impacts of buildings, and the built environment more broadly, while challenging, does not eliminate the responsibility of trying to understand and minimize the hazards created, and to balance the risks they represent at different levels and scales, from individual products, materials and systems to the aggregated and cumulative impacts they create.

What is missing overall in the codes and in code development is a formal process aimed at recognizing and attempting to balance risks and hazards across the full spectrum of potential harm created by the built environment. If we don’t acknowledge the existence of these other hazards, it becomes extremely difficult to introduce alternatives that may produce equivalent levels of safety and performance for buildings and their occupants while addressing these other hazards.

We recognize that this view creates discomfort for many, and that the lack of a definitive line of regulatory authority and responsibility creates problems that are difficult to resolve. On the other hand, what of the blurring of definitive lines with the acceptance of the words “reasonable levels of health, safety and general welfare” into the purpose statements - clearly permissive language not allowed anywhere else in the codes. In fact, it is an illusion that there was ever a clear line for which hazards should and should not be addressed in the codes.

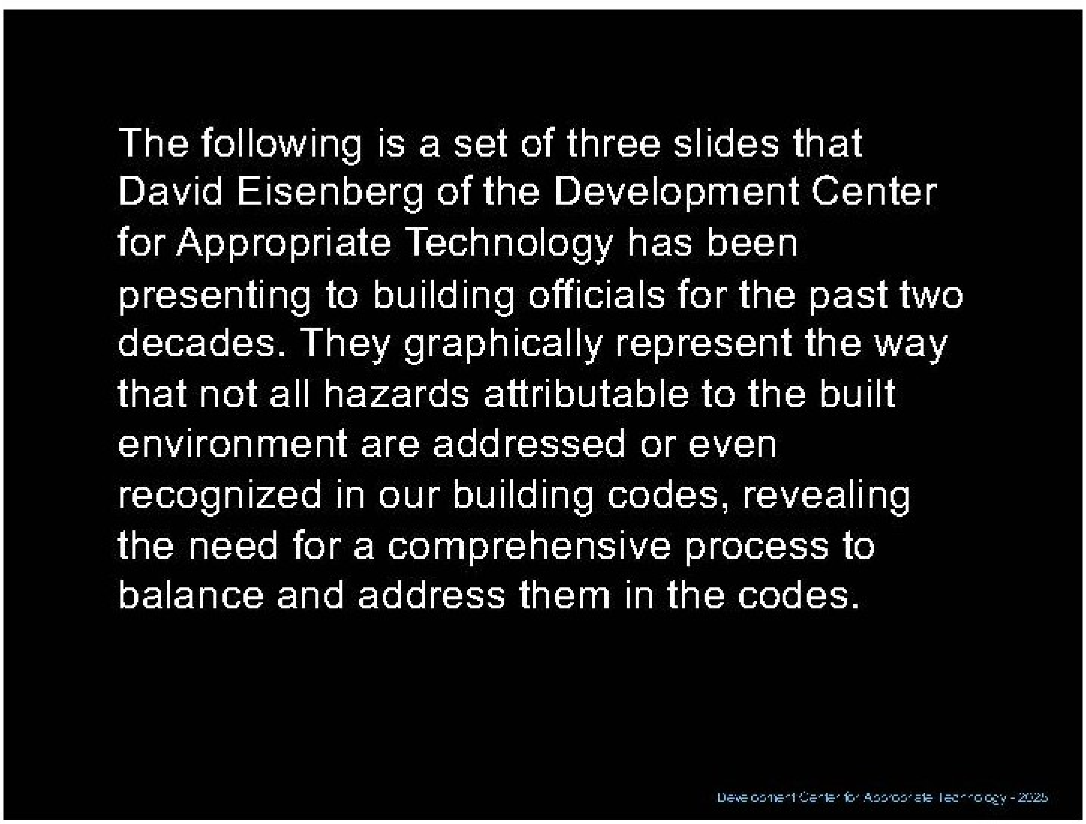
The codes have continuously responded to emergent and previously unknown or unrecognized hazards and their impacts. That is why lead and asbestos are no longer allowed in building materials, and why we require insulation and have energy conservation requirements, and why we now have a wildland-urban interface code, and of course, why we have three-year code development cycles and appendices to the codes. Among these changing realities is that the global climate is changing. Extreme weather events that were once rare are now common, and we need to be considering both how a changing climate impacts buildings and how the cumulative impacts of the built environment impact the climate.

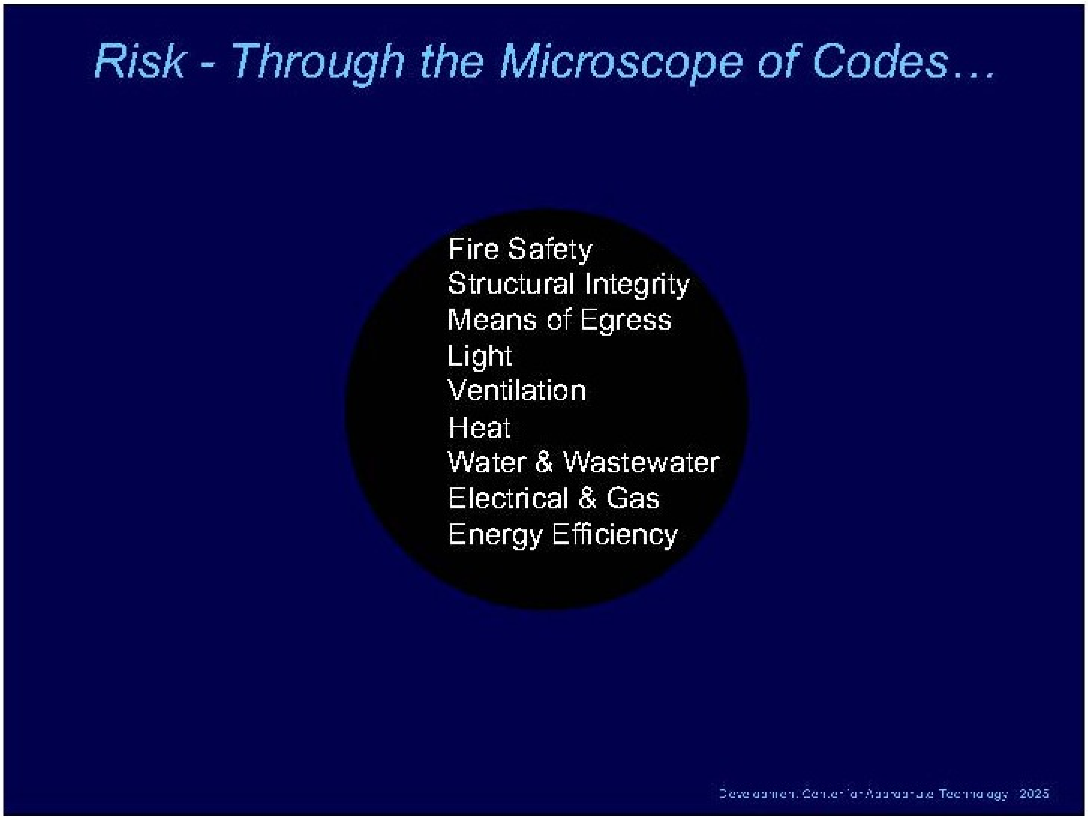
These two quotes by ICC found Board Chairman Bob Fowler from a 2000 interview with Bob and David Eisenberg in ICBO's Building Standards magazine are relevant to the intent of this proposal (see link to full interview below):

“Safety is very important, but we need to think about the responsibilities for our collective safety; especially the welfare of future generations who, it's worth noting, are unable to represent their interests.”

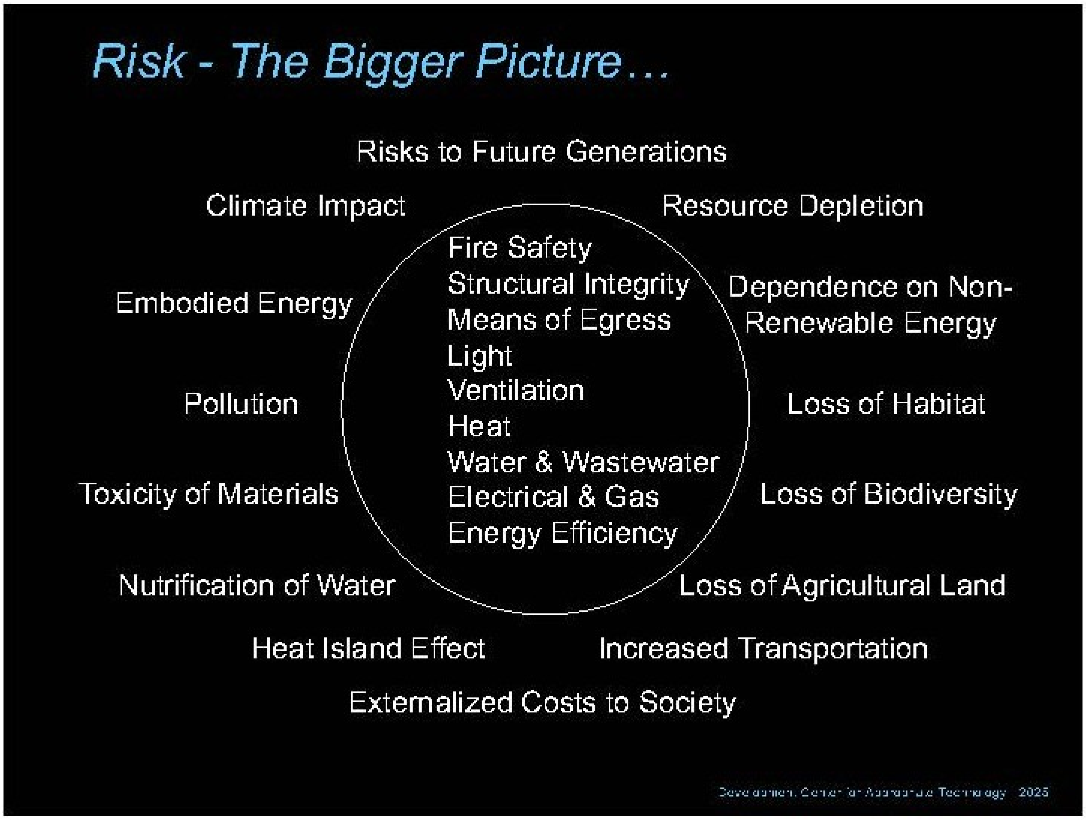
“At some point, we will have to develop criteria for the environmental performance of buildings, similar to energy efficiency requirements. Alternative materials and methods will become much more than just allowable options once that happens. You can tell that I've come a long way personally from the building official I was when I got up and spoke against the first proposed code change to require insulation in buildings. I thought that was the dumbest idea I'd ever heard and that it had no place in the codes. Looking back, I see that the energy efficiency requirements set a very important precedent for our learning to take responsibility for the full range of the consequences of our buildings. We now need to continue that learning process and open our eyes and our minds to the work of creating sustainable buildings. Our great-grandchildren will thank us.”

At a minimum, we hope this proposed change to the IRC’s Purpose statement brings the issue back to the forefront and opens a conversation to allow honest and responsible exploration of how we can and should balance the full spectrum of hazards attributable to the built environment in our codes.

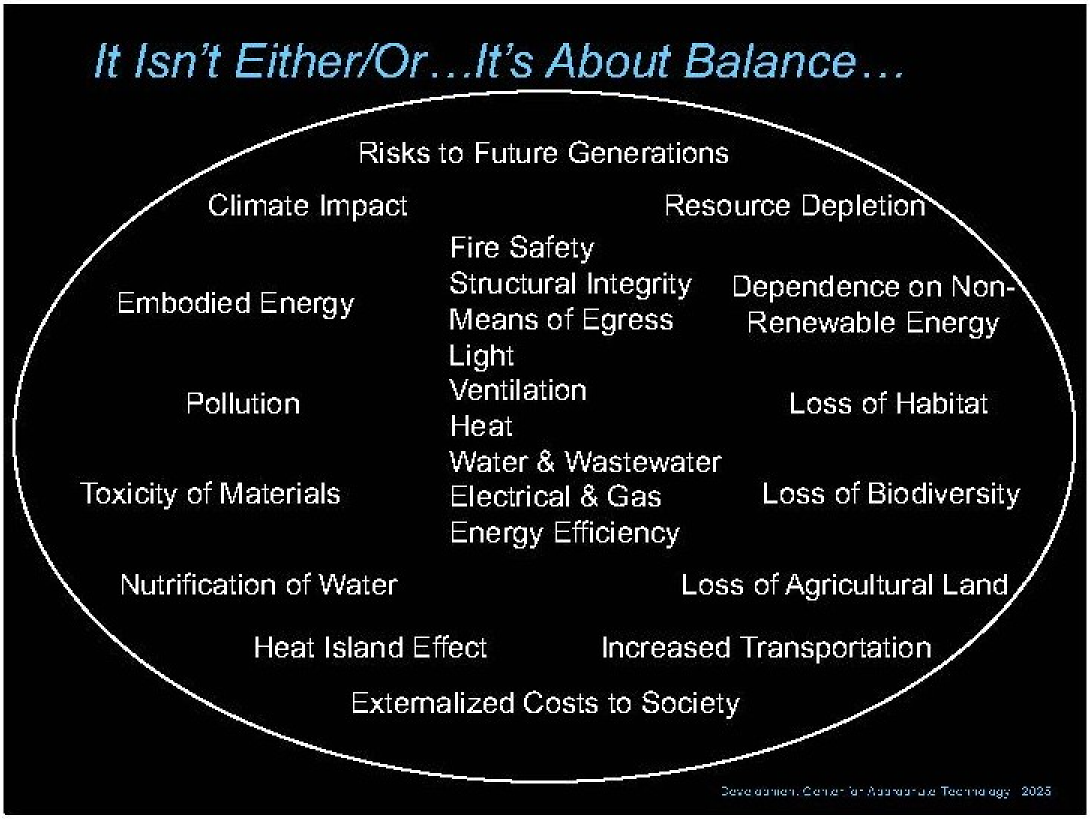




Looking at buildings through codes is like looking through a microscope. These are the main categories of hazards attributable to the built environment that are addressed in building codes. Though what you can see through that lens is very important, there are many other important hazards you can't see while looking through that lens.



Here are some of the other hazards which are attributable or partly attributable to the built environment, yet are not addressed by the codes.



What is critical to recognize is that this should not be an either/or matter – the full scope of hazards attributable to the built environment should be acknowledged and there should be a process to balance these hazards and risks – many of which are cumulative and distributed and occur over time – with the widely recognized hazards that are already addressed in codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed text addition has no direct construction cost impact.

ADM3-25 Part II

ADM4-25

IEBC: [A] 101.4

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

2024 International Existing Building Code

Revise as follows:

[A] 101.4 Applicability. This code shall apply to the *repair*, *alteration*, *change of occupancy*, *addition* and relocation of *existing buildings*, regardless of occupancy, subject to the criteria of Sections 101.4.1 and 101.4.2.

> **Exception:** The provisions of Chapter 5 of the *International Energy Conservation Code* shall apply to all matters governing of the energy efficiency of *existing buildings*.

Reason: The IEBC does not address energy efficiency. Chapter 5 of the IECC provides the relevant requirements for energy efficiency for existing building repairs, alternations, change of occupancy, and additions. It also uses important differences in terminology unique to addressing energy efficiency for existing buildings. This scope clarification is necessary to ensure the IEBC and the IECC are properly coordinated.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of scope of the IEBC and does not change requirements in the IEBC or in the IECC related to existing buildings.

ADM4-25

ADM5-25

IWUIC: [A] 101.6

Proponents: Robert Marshall, representing FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 101.6 Maintenance. Buildings, structures, ~~landscape materials, vegetation, *defensible space* or~~ and other devices or safeguards required by this code shall be maintained in conformance to the code edition under which they were constructed or required to be installed.
Landscape materials, vegetation, and *defensible space* shall be maintained in conformance with this code, an *approved fire protection plan* and any other applicable hazard mitigation requirements imposed by the *code official* at the time of site approval.
The owner or the owner's authorized agent shall be responsible for the maintenance of buildings, structures, landscape materials and vegetation.

Reason: This proposal accomplishes 3 things:

1. It creates a new Chapter for all maintenance requirements applicable to fire hazard mitigation of structures and premises regulated by the IWUIC. New construction requirements remain in Chapters 4, 5 and 6.

2. It relocates all existing requirements that are maintenance related from Chapter 6 into the appropriate sections of this new Chapter for clarity and easier use of this code.

3. It adds reasonable new requirements for maintenance or repair or replacement of features that were identified by F-CAC as gaps that needed to be addressed.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: Increase

Staff Analysis: This was submitted as a part of WUIC70-24 and was determined to be within the scope of the IADMIN committee.

ADM6-25 Part I

IBC: [A] 102.2; IEBC: [A] 102.2; IFC: [A] 102.11; IFGC: [A] 102.10; IGCC: 102.2; IMC®: [A] 102.10; IPC: [A] 102.10; IPSDC: [A] 102.2; IPMC: [A] 102.11; ISPSC: [A] 102.9; IWUIC: [A] 102.2

Proponents: Scott Brody, representing Self (sbrody96@gmail.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 102.2 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Existing Building Code

Revise as follows:

[A] 102.2 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Fire Code

Revise as follows:

[A] 102.11 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Fuel Gas Code

Revise as follows:

[A] 102.10 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Green Construction Code

Revise as follows:

102.2 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Mechanical Code

Revise as follows:

[A] 102.10 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Plumbing Code

Revise as follows:

[A] 102.10 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 102.2 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Property Maintenance Code

Revise as follows:

[A] 102.11 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 102.9 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

2024 International Wildland Urban Interface Code

[A] 102.2 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

ADM6-25 Part I

ADM6-25 Part II

IRC: R102.2

Proponents: Scott Brody, representing Self (sbrody96@gmail.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Residential Code

Revise as follows:

R102.2 Other laws. The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law, <u>or international legal instruments which the nation is a party to.</u>

Reason: This edit adds international law to I-code's law list that is currently shown (local, state, and federal). It makes the code more consistent with Code Council Policy CP 49-21, "CP#49-21 – Conforming Codes and Standards to United States Federal Law and International Law." Because international law is a broad term with numerous potential interpretations, I made the scope more specific than the other authorities mentioned in this clause. This makes it clear that the I-codes only impacted by international legal instruments which the nation is a party to.

Specific mention of international law is justified here because it is distinct from federal, state, and local law. Sometimes, international law is enforceable in domestic courts. Other times, the US will ratify an international treaty, giving the document international legal validity, without passing a corresponding federal law enforcing the treaty or agreement on the states. This can create issues, for example when the federal government took action to diminish sale of more carbon-emitting refrigerants, consistent with international obligations, yet some state codes were not updated to reflect the new situations. In cases of legally recognized but non-self-executing treaties, this code change would meaningfully impact how the I-codes are interpreted, to be consistent with treaty obligations.

As mentioned, ICC Code Council Policy (CP) 49-21 recognizes "International Law." Further, this policy makes it the goal of having the I-codes be globally applicable. With many nations outside the US placing a high degree of importance on international law, this code change will make the I-codes more suitable for global use.
The American National Standards Institute has also adopted policy to align standards activity with international obligations, consistent with the organization's status as the national standards coordinator. This proposal will therefore make the I-codes more aligned with ANSI objectives.

On the day-to-day enforcement side, this reference will queue inspectors to be more aware of possible preemptions. For example, many aspects of marine vessels are regulated in accordance with the United Nations Safety of Life at Sea convention (SOLAS). Clause 107.1 of the IFC authorizes the fire official to enter any "marine vessel" for the purposes of enforcing the IFC. By adding a reference that the IFC does not preempt international legal instruments which the nation is a party to, the fire official's scope of authority is clarified.

Bibliography: CP 49-21 - Conforming Codes and Standards to United States Federal Law and International La. Approved by the ICC Board of Directors 9/18/2021.
https://cdn-www-v2.iccsafe.org/wp-content/uploads/edbcbd8c-0470-475c-9717-c0083424fe2d-upload_any_related_documentation_-CP-49-Conforming-Codes-and-Stan.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Theoretically, any change which clarifies the code has the potential to reduce costs by eliminating wasted time from confusion. However, corrections to issues of improper code enforcement are not really something which is done in the interest of saving money, and the option to select no impact due to the change being editorial seems most appropriate.

ADM6-25 Part II

ADM7-25

IMC®: [A] 102.3, ACCA Chapter 15 (New)

Proponents: David Crawford Bixby, Air Conditioning Contractors of America (ACCA), representing ACCA (david.bixby@acca.org)

2024 International Mechanical Code

Revise as follows:

[A] 102.3 Maintenance. Mechanical systems, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe and sanitary condition. Devices or safeguards that are required by this code shall be maintained in compliance with the edition of the code under which they were installed. The owner or the owner's authorized agent shall be responsible for maintenance of mechanical systems. To determine compliance with this provision, the code official shall have the authority to require a mechanical system to be reinspected.The inspection for maintenance of HVAC systems <u>not within the scope of ACCA 4 QM</u> shall be performed in accordance with ASHRAE/ACCA/ANSI Standard 180.<u>The inspection for maintenance of HVAC systems in one and two family dwellings and multifamily dwellings of three stories or fewer above grade shall be performed in accordance with ACCA 4 QM.</u>

Add new standard(s) as follows:

ACCA

Air Conditioning Contractors of America
2800 Shirlington Road, Suite 300
Arlington, VA 22206

<u>ACCA 4 QM – 2019 (R2024)</u> <u>Quality Maintenance of Residential HVAC Systems</u>

Reason: The proposal is to (1) clarify that the current requirement showing Standard 180 specifically covers inspection for maintenance of commercial HVAC systems, and (2) add a reference to ACCA 4 QM which covers inspection for maintenance of residential HVAC systems for one and two-family dwellings of three stories or less. ACCA 4 QM is a consensus-based ANSI standard. A proposal to add ACCA 4 QM to the IMC Referenced Standards chapter will be submitted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impacts since this is a clarification of the current maintenance requirements.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.
ACCA 4 QM – 2019 (R2024) Quality Maintenance of Residential HVAC Systems

ADM7-25

ADM8-25

IPMC: [A] 102.3

Proponents: Andrew Bevis, Chair, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Property Maintenance Code

[A] 102.3 Application of other codes. Repairs, additions or alterations to a *structure*, or changes of *occupancy*, shall be done in accordance with the procedures and provisions of the *International Building Code*, *International Existing Building Code*, *International Energy Conservation Code*, *International Fire Code*, *International Fuel Gas Code*, *International Mechanical Code*, *International Residential Code*, *International Plumbing Code*, *International Swimming Pool and Spa Code* and NFPA 70. Nothing in this code shall be construed to cancel, modify or set aside any provision of the *International Zoning Code*.

Reason: Any alteration, repair, addition or change of occupancy related to swimming pools and spas should be done in accordance with the International Swimming Pool and Spa Code (ISPSC). There are unique hazards associated with pools and spas that are specifically addressed by the provisions of the ISPSC.PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held numerous virtual meetings open to any interested party. Related documents and reports are posted on the PMGCAC website at PMGCAC webpage. BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Jurisdictions will be already be enforcing the minimum requirements for pools and spas. This clarifies that they would be using the ISPSC as the basis for enforcement.

IBC: 102.5 (New), [A] 102.5; IEBC: 102.5 (New), [A] 102.5; IFC: [A] 101.5, 102.5.1 (New), [A] 102.5; IFGC: 102.5 (New), 102.5.1 (New), [A] 102.5, [A] 105.5.2; IGCC: 102.5 (New), 102.5; IMC®: 102.5 (New), 102.5.1 (New), [A] 102.5, [A] 105.4.2; IPC: 102.5 (New), 102.5.1 (New), [A] 102.5, [A] 105.5.2; IPSDC: 102.5 (New), 102.5.1 (New), [A] 105.3.2; IPMC: 102.5 (New), 102.5.1 (New), [A] 102.5; ISPSC: 102.5 (New), 102.5.1 (New), [A] 102.5, [A] 105.4.2; IWUIC: 102.7 (New), [A] 102.7

Proponents: Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

Revise as follows:

[A] ~~102.5~~ 102.5.1 Partial invalidity. In the event that any part or provision of this code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

2024 International Existing Building Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

Revise as follows:

[A] ~~102.5~~102.5.1 Partial invalidity. In the event that any part or provision of this code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

2024 International Fire Code

Revise as follows:

[A] 102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

Add new text as follows:

102.5.1 Partial invalidity. In the event that any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

Revise as follows:

[A] ~~102.5~~ 102.13 Application of residential code. Where structures are designed and constructed in accordance with the *International Residential Code*, the provisions of this code shall apply as follows:

1. Construction and design provisions of this code pertaining to the exterior of the structure shall apply including, but not limited to, premises identification, fire apparatus access and water supplies. Where interior or exterior systems or devices are installed, construction permits required by Section 105.6 shall apply.
2. Administrative, operational and maintenance provisions of this code shall apply.

2024 International Fuel Gas Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

102.5.1 Partial invalidity. In the event that any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

[A] ~~102.5~~ 102.12 Change in occupancy. It shall be unlawful to make a change in the *occupancy* of a structure that will subject the structure to the special provisions of this code applicable to the new *occupancy* without approval. The *code official* shall certify that such structure meets the intent of the provisions of law governing building construction for the proposed new *occupancy* and that such change of *occupancy* does not result in any hazard to the public health, safety or welfare.

[A] 105.5.2 Validity of licenses, permits and approvals. The issuance of a permit or approval of *construction documents* shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of other ordinances of the jurisdiction. A permit presuming to give authority to violate or cancel the provisions of this code shall be invalid.

The issuance of a permit based on *construction documents* and other data shall not prevent the *code official* from thereafter requiring the correction of errors in said *construction documents* and other data or from preventing building operations from being carried on thereunder where in violation of this code or of other ordinances of this jurisdiction.

2024 International Green Construction Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

Revise as follows:

~~102.5~~ 102.5.1 Partial invalidity. In the event that any part or provision of this code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

2024 International Mechanical Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

102.5.1 Partial invalidity. In the event that any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

Revise as follows:

[A] ~~102.5~~ 102.12 Change in occupancy. It shall be unlawful to make a change in the *occupancy* of any structure that will subject the structure to any special provision of this code applicable to the new *occupancy* without approval. The code official shall certify that such structure meets the intent of the provisions of law governing *building* construction for the proposed new *occupancy* and that such change of *occupancy* does not result in any hazard to the public health, safety or welfare.

[A] 105.4.2 Validity of licenses, permits and approvals. The issuance of a permit or approval of *construction documents* shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of other ordinances of the jurisdiction. A permit presuming to give authority to violate or cancel the provisions of this code shall be invalid.

The issuance of a permit based on *construction documents* and other data shall not prevent the code official from thereafter requiring the correction of errors in said *construction documents* and other data or from preventing building operations from being carried on thereunder where in violation of this code or of other ordinances of this jurisdiction.

2024 International Plumbing Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

102.5.1 Partial invalidity. In the event that any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

Revise as follows:

[A] ~~102.5~~ 102.12 Change in occupancy. It shall be unlawful to make any change in the *occupancy* of any structure that will subject the structure to any special provision of this code applicable to the new *occupancy* without approval of the *code official*. The *code official* shall certify that such structure meets the intent of the provisions of law governing building construction for the proposed new *occupancy* and that such change of *occupancy* does not result in any hazard to the public health, safety or welfare.

[A] 105.5.2 Validity of licenses, permits and approvals. The issuance of a permit or approval of construction documents shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or any other ordinance of the jurisdiction. A permit presuming to give authority to violate or cancel the provisions of this code shall not be valid.

The issuance of a permit based on construction documents and other data shall not prevent the code official from thereafter requiring the correction of errors in said construction documents and other data or from preventing building operations being carried on thereunder where in violation of this code or of other ordinances of this jurisdiction.

2024 International Private Sewage Disposal Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

102.5.1 Partial invalidity. In the event that any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

Revise as follows:

[A] 105.3.2 Validity of licenses, permits and approvals. The issuance of a permit or approval of *construction documents* shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of other ordinances of the jurisdiction. No permit presuming to give authority to violate or cancel the provisions of this code shall be valid.

The issuance of a permit based on *construction documents* and other data shall not prevent the *code official* from thereafter requiring the correction of errors in said *construction documents* and other data or from preventing building operations being carried on thereunder when in violation of this code or of other ordinances of the jurisdiction.

2024 International Property Maintenance Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

102.5.1 Partial invalidity. In the event that any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

Revise as follows:

[A] ~~102.5~~ 102.12 Workmanship. Repairs, maintenance work, alterations or installations that are caused directly or indirectly by the enforcement of this code shall be executed and installed in a *workmanlike* manner and installed in accordance with the manufacturer's instructions.

2024 International Swimming Pool and Spa Code

Add new text as follows:

102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

102.5.1 Partial invalidity. In the event that any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

Revise as follows:

[A] ~~102.5~~ 102.11 Historic buildings. The provisions of this code relating to the construction, *alteration*, repair, enlargement, restoration, relocation or moving of pools, spas or systems shall not be mandatory for existing pools, spas or systems identified and classified by the state or local jurisdiction as part of a historic structure where such pools, spas or systems are judged by the *code official* to be safe and in the public interest of health, safety and welfare regarding any proposed construction, *alteration*, repair, enlargement, restoration, relocation or moving of such pool or spa.

[A] 105.4.2 Validity of licenses, permits and approvals. The issuance of a permit or approval of construction documents shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or any other ordinance of the jurisdiction.

Any permit presuming to give authority to violate or cancel the provisions of this code shall not be valid.

The issuance of a permit based on construction documents and other data shall not prevent the *code official* from thereafter requiring the correction of errors in said construction documents and other data or from preventing building operations being carried on thereunder where in violation of this code or of other ordinances of this jurisdiction.

2024 International Wildland Urban Interface Code

Add new text as follows:

<u>102.7</u> <u>Validity</u>. <u>In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.</u>

Revise as follows:

[A] ~~102.7~~ <u>102.7.1</u> Partial invalidity. In the event that any part or provision of this code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

2024 International Residential Code

Add new text as follows:

R102.5 Validity. In the event any part or provision of this code is held by a court of competent jurisdiction to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions hereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.

Revise as follows:

~~R102.5~~ R102.5.1 Partial invalidity. In the event any part or provision of this code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions.

Reason: Almost all of the code books have language regarding "Validity of license, permits and approvals," but use inconsistent section titles. This code proposals suggests making them all match. Some books also have provisions for "Validity" and "Partial invalidity," but not always both, and sometimes missing both. This code proposals suggests including all of them in each book, as well as using consistent numbering.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code proposal has no cost impact, as it is only editing section numbers and titles. It also include clarifying language that does not change the intent of the code, therefore having no impact on cost.

ADM9-25 Part II

ADM10-25

IFC: [A] 102.8

Proponents: Scott Brody, representing Self (sbrody96@gmail.com)

2024 International Fire Code

[A] 102.8 Subjects not regulated by this code. Where applicable standards or requirements are not set forth in this code, or are contained within other laws, codes, regulations, ordinances or bylaws adopted by the jurisdiction, compliance with applicable standards of the National Fire Protection Association or other nationally or internationally recognized fire safety standards, as *approved*, shall be deemed as prima facie evidence of compliance with the intent of this code. Nothing herein shall derogate from the authority of the *fire code official* to determine compliance with codes or standards for those activities or installations within the *fire code official's* jurisdiction or responsibility.

Reason: The exclusive reference to nationally recognized standards is inconsistent with the World Trade Organization Technical Barriers to Trade Agreement, which the US is a party to.

TBT Agreement Clause 2.4: "Where technical regulations are required and relevant international standards exist or their completion is imminent, Members shall use them, or the relevant parts of them, as a basis for their technical regulations except when such international standards or relevant parts would be an ineffective or inappropriate means for the fulfilment of the legitimate objectives pursued, for instance because of fundamental climatic or geographical factors or fundamental technological problems."

Through WTO dispute settlement body case law, it has also been clarified that the term "relevant" in international standard is impacted by the number of nations using the standard. It is not simply satisfied by calling a code or standard "international". So there are times where the I-codes should be accepting other international/foreign standards to comply with trade agreements.

Rejection of counterarguments:

Some might be concerned this change will diminish safety. But what is being proposed would not allow foreign standards by default, just where approved. So code officials will retain the power to disallow an international standard where such provides inappropriate protection. Further, many international standards do not provide worse protection, as evidenced by the countless nations using non-US standards and have achieved much higher levels of fire safety. It is therefore unnecessary and contrary to the TBT agreement to only allow domestic standards in this section of code.

International Code Council has adopted CP 49-21 -Conforming Codes and Standards to United States Federal Law and International Law. In accordance with that policy, the code committees should be making upmost effort to ensure their codes are consistent with international legal instruments. A further concern under CP49-21 is the code is supposed to be adoptable across nations. But not every nation maintains technical standards for every subject, especially small island countries, so forcing only domestic standards makes this code passage not globally adoptable.

Bibliography: Technical Barriers to Trade Agreement. World Trade Organization. Adopted 1/1/1995. https://www.wto.org/english/docs_e/legal_e/tbt_e.htm

International Code Council Inc Code Council Policy 49-21 - Conforming Codes and Standards to United States Federal Law and International Law. Adopted 9/18/21. https://cdn-www-v2.iccsafe.org/wp-content/uploads/edbcbd8c-0470-475c-9717-c0083424fe2d-upload_any_related_documentation_-CP-49-Conforming-Codes-and-Stan.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

While clarifying the IFC to be consistent with trade agreement obligations could save money from preventing erroneous code enforcement actions, the same argument can be made with all primarily editorial edits. Accordingly, I think it is inappropriate to put a dollar amount on this change.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

SECTION 103
CODE COMPLIANCE AGENCY

[A] 103.1 Creation of enforcement agency. The **[INSERT NAME OF DEPARTMENT]** is hereby created and the official in charge thereof shall be known as the *building official*. The function of the agency shall be the implementation, administration and enforcement of the provisions of this code.

[A] 103.2 Appointment. The *building official* shall be appointed by the chief appointing authority of the *jurisdiction*.

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *building official* shall have the authority to appoint ~~a~~ deputy building officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *building official*.

APPENDIX A
EMPLOYEE QUALIFICATIONS

SECTION A101
BUILDING OFFICIAL QUALIFICATIONS

[A] A101.1 Building official. The *building official* shall have not fewer than 10 years' experience or equivalent as an architect, engineer, inspector, permit technician, plans examiner, contractor or superintendent of construction, or any combination of these, 5 years of which shall have been supervisory experience. The *building official* should be certified as a *building official* through a recognized certification program. The *building official* shall be appointed or hired by the applicable governing authority.

[A] A101.2 Chief inspector. The *building official* can designate supervisors to administer the provisions of this code and the *International Mechanical Code*, *International Plumbing Code* and International Fuel Gas Code. Each supervisor shall have not fewer than 10 years' experience or equivalent as an architect, engineer, inspector, permit technician, plans examiner, contractor or superintendent of construction, or any combination of these, 5 years of which shall have been in a supervisory capacity. They shall be certified through a recognized certification program for the appropriate trade.

[A] A101.3 Inspector and plans examiner. The *building official* shall appoint or hire such number of officers, inspectors, permit technicians, plans examiners, assistants and other employees as shall be authorized by the *jurisdiction*. A *person* who has fewer than 5 years of experience as a contractor, engineer, architect, or permit technician or as a superintendent, foreman or competent mechanic in charge of construction shall not be appointed or hired as inspector of construction or plans examiner. The inspector or plans examiner shall be certified through a recognized certification program for the appropriate trade.

[A] A101.4 Termination of employment. Employees in the position of *building official*, chief inspector, inspector, permit technician, or plans examiner ~~or inspector~~ shall not be removed from office except for cause after full opportunity has been given to be heard on specific charges before such applicable governing authority.

2024 International Existing Building Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Fire Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *fire code official* shall have the authority to appoint ~~a~~ deputy fire code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *fire code official*.

2024 International Fuel Gas Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Green Construction Code

Revise as follows:

103.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the authority having jurisdiction shall have the authority to appoint ~~a~~ deputy authority having jurisdictions, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees ~~as shall be necessary~~. Such employees shall have powers as delegated by the authority having jurisdiction.

2024 International Mechanical Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Plumbing Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Property Maintenance Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Swimming Pool and Spa Code

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint ~~a~~ deputy code officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

2024 International Zoning Code

Delete and substitute as follows:

~~**[A] 104.2 Deputies.** The code official may appoint such number of technical officers and other employees as shall be authorized from time to time. The code official shall be permitted to deputize such employees as may be necessary to carry out the functions of this code.~~

[A] 104.2 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *code official* shall have the authority to appoint deputy code officials, inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *code official*.

ADM11-25 Part I

ADM11-25 Part II

IRC: R103.3

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Residential Code

Revise as follows:

R103.3 Deputies. In accordance with the prescribed procedures of this *jurisdiction* and with the concurrence of the appointing authority, the *building official* shall have the authority to appoint ~~a~~ deputy building officials, ~~other related technical officers,~~ inspectors, permit technicians, plans examiners, and other employees. Such employees shall have powers as delegated by the *building official*.

Reason: This proposal adds "permit technicians" into the IBC and elsewhere, acknowledging the role of permit technicians in a building department and, via IBC Appendix A, their potential to become inspectors, plans examiners, and building/code officials.

Where the appendix is used by incorporation or for reference to job descriptions, the inclusion of permit technicians may open the door to allow already qualified individuals in building departments to fill the ever-growing vacancies therein.

This code change also includes editorial changes to add in plans examiners and various coordinations.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Investing in the professional development of permit technicians is a strategic move that may yield significant long-term benefits for building departments, outweighing any initial investment costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

Through this code change, recognizing permit technicians as a specialized role and creating clear career paths may serve as guidance to other bodies as an option to address the code industry's depleting workforce. By providing opportunities for advancement, departments could tap into their pools of experienced permit technicians, who possess valuable, in-department-honed knowledge, skills, and abilities, to fill the roles of inspectors and plans examiners. Unlike external hires, their competency in administration, code interpretation, and customer service areas is often already established, potentially leading to a net decrease in operational (training) and passed on permitting costs.

ADM11-25 Part II

ADM12-25

IZC: [A] 103.5, [A] 103.6, [A] 108.5, [A] 108.6, [A] 109.4, [A] 110.4

Proponents: Kota Wharton, City of Grove City, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Zoning Code

Revise as follows:

[A] 103.5 Chairperson election and rules adoption. The commission shall elect from its membership a chairperson. It shall establish and adopt rules for its organization and transaction of business and shall keep a ~~public~~ record of its proceedings. Such record shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction.

[A] 103.6 Commission secretary. A secretary to assist the commission shall be appointed by the code official. The secretary shall keep minutes of the commission meetings for ~~public~~ the record and conduct all correspondence, including the notification of decisions. The secretary shall certify such records. The secretary shall prepare and submit the minutes of commission meetings to the chairperson and the commission.

[A] 108.5 Chairperson election and rules adoption. The *board* shall elect from its membership a chairperson. It shall establish and adopt rules for its organization and the transaction of business and shall keep a ~~public~~ record of its proceedings. Such record shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction.

[A] 108.6 Board secretary. A secretary to assist the *board* shall be appointed by the code official. The secretary shall keep minutes of the *board* meetings for ~~public~~ record and conduct all correspondence, including the notification of decisions. The secretary shall certify such records. The secretary shall prepare and submit the minutes of *board* meetings to the chairperson and the *board*.

[A] 109.4 Decisions. The examiner shall, within 10 working days, render a decision. Notice in writing of the decision and the minutes of the board meeting ~~record~~ shall be given to the code official for distribution as required. Decisions shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~kept in accordance with state regulations and such decisions shall be open to the public~~.

[A] 110.4 Voting and notice of decision. There shall be a vote of a majority of the *board* and commission present in order to decide any matter under consideration. Each decision shall be entered in the minutes by the secretary. Records of appeals ~~Appeals~~ shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~kept in accordance with state regulations and such appeals shall be open to the public~~.

Notice in writing of the decision and the disposition of each appeal shall be given to the code official and each appellant ~~by mail or otherwise~~.

Reason: In the world of public record requests and state-specific requirements regarding public records, using the term "public" to preface "records" can, and does, raise unintended interpretation issues and retention burdens.

This code change removes the term "public records" and, paired with other proposals, eliminates the burden of regulating records from the I-Codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change eliminates unintended conflicts with other law.

The code official is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.2.2 Preparer qualifications. Where required by the laws of the *jurisdiction*, the ~~The~~ technical opinion and report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the code official. The code official is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.2.1.2 Preparer qualifications. Where required by the laws of the *jurisdiction*, the~~The~~ technical opinion and report shall be prepared by a qualified engineer, specialist, laboratory or fire safety specialty organization ~~acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a *registered design professional*.

Reason: The laws of the jurisdiction regarding professional practice requirements should govern the qualifications required to prepare the related technical opinions and reports, not the building official's judgment. The test for whether the preparer is qualified to provide the documentation is established by the state and local regulations governing the practice of the applicable profession. A building official should not be put into a position where they must substitute their judgment to accept or reject the offered documentation when the preparer meets the requirements of those regulations, including any permitted exemptions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modification makes the code section compliant with the laws of the jurisdiction by clarifying that the section does not supersede state and local laws governing professional practice. It also avoids placing the burden on the building official to decide when specific credentials are required.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the building official.

Alternative materials, equipment, appliances, designs, or methods of construction shall be approved only when the building official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the *International Code Council Performance Code*. This exception shall not apply to alternative structural materials or to alternative structural designs.

2024 International Fire Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the fire code official.

Alternative materials, equipment, appliances, designs, or methods of construction shall be approved only when the fire code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the *International Code Council Performance Code*. This exception shall not apply to alternative structural materials or to alternative structural designs.

2024 International Existing Building Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction, and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction shall be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the *International Code Council Performance Code*. This exception shall not apply to alternative structural materials or to alternative structural designs.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction shall be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and *equipment* complying with the *International Code Council Performance Code*.

2024 International Green Construction Code

Revise as follows:

104.2.5 ~~Innovative approaches and alternative~~ Alternative materials, appliances, design, and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the authority having jurisdiction.

Alternative materials, equipment, appliances, designs, or methods of construction shall be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and *equipment* complying with the *International Code Council Performance Code*.

2024 International Mechanical Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction may be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the International Code Council Performance Code.

2024 International Plumbing Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction may be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.

2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the *International Code Council Performance Code*.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction may be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the International Code Council Performance Code.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.2.2 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction may be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the *International Code Council Performance Code*.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.3 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction may be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the International Code Council Performance Code.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.2.2 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*, in writing, by the code official.

Alternative materials, equipment, appliances, designs, or methods of construction may be approved only when the code official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the International Code Council Performance Code.

ADM14-25 Part I

ADM14-25 Part II

IRC: R104.2.2

Proponents: Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov)

2024 International Residential Code

Revise as follows:

R104.2.2 Alternative materials, appliances, design and methods of construction and equipment. The provisions of this code are not intended to prevent the installation of any ~~material~~ materials, equipment, or appliances not specifically prescribed by this code, or to prohibit any ~~design~~ designs or ~~method~~ methods of construction not specifically prescribed by this code, provided that any such alternative materials, equipment, appliances, designs, or methods of construction:

1. Are not specifically prohibited by this code, by any other provision of this code.
2. Shall have ~~has~~ been *approved*~~.~~ , in writing, by the building official.

Alternative materials, equipment, appliances, designs, or methods of construction shall be approved only when the building official shall have determined, in writing, that such alternative is:

1. Satisfactory and complies with the intent of the provisions and requirements of this code.
2. Not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability, and safety.

Exception: Performance-based alternative materials, designs or methods of construction and equipment complying with the *International Code Council Performance Code*.

Reason: This code proposals matches the language in all code books regarding Alternative Materials, as well as matching and/or matching exceptions. Clarifying language is also added to provision and section titles.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code proposal has no impact on cost, as it is solely editorial in matching language and exceptions to provisions.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 104.2.3 Alternative ~~materials, design and methods of construction and equipment~~method of compliance. The provisions of this code are not intended to prevent the installation or use of any material, system, design or equipment ~~to prohibit any design or method of construction~~ not specifically prescribed by this code, provided that any such alternative has been *approved*.

> **Exception:** Performance-based alternative ~~materials, designs or methods of construction and equipment complying~~ method of compliance in accordance with the *International Code Council Performance Code*. This exception shall not apply to alternative structural materials or to alternative structural designs.

[A] 104.2.3.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~compliance shall be *approved* where the *building official* finds that the proposed alternative is satisfactory and complies with Sections 104.2.3 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the *building official* for approval. Where the alternative ~~material, design or~~ method of ~~construction~~compliance is not *approved*, the *building official* shall respond in writing, stating the reasons the alternative was not *approved*.

[A] 104.2.3.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *building official*.

[A] 104.2.3.5.1 Fire Tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the *building official*.

[A] 104.2.3.6.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *building official* for the installation. The ~~alternate~~alternative ~~material, design or~~ method of ~~construction and product~~compliance evaluated shall be within the scope of the building official's recognition of the *approved agency*. Criteria used for the evaluation shall be identified within the report and, where required, provided to the *building official*.

[A] 104.2.3.7 Peer review. The *building official* is authorized to require submittal of a *peer review* ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~compliance, prepared by a peer reviewer that is *approved* by the *building official*.

[A] 104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the *building official* for either shall be in writing and shall be retained in the official records.

2024 International Existing Building Code

Revise as follows:

[A] 104.2.3 Alternative ~~materials, design and~~ methods of ~~construction, and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative is not specifically prohibited by this code and has been *approved*.

> **Exception:** Performance-based alternative ~~materials, designs or~~ methods of ~~construction and equipment~~compliance complying with the *ICC Performance Code*. This exception shall not apply to alternative structural materials or to alternative structural designs.

[A] 104.2.3.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall be *approved* where the *code official* finds that the proposed alternative is satisfactory and complies with Sections 104.2.3.2 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the *code official* for approval. Where the alternative ~~material, design or~~ method of ~~construction~~ compliance is not *approved*, the *code official* shall respond in writing, stating the reasons the alternative was not *approved*.

[A] 104.2.3.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction~~ compliance application shall be of a scale that is sufficient to predict performance of the end use configuration. Such tests shall be performed by a party acceptable to the *code official*.

[A] 104.2.3.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

[A] 104.2.3.6.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency,* and use of the evaluation report shall require approval by the *code official* for the installation. The ~~alternate material, design or method of construction and product~~alternative method of compliance evaluated shall be within the scope of the code official's recognition of the *approved agency.* Criteria used for the evaluation shall be identified within the report and, where required, provided to the *code official*.

[A] 104.2.3.7 Peer review. The *code official* is authorized to require submittal of a *peer review* ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~compliance, prepared by a peer reviewer that is *approved* by the *code official*.

[A] 104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction~~compliance and equipment in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the *code official* for either shall be in writing and shall be retained in the official records.

2024 International Fire Code

Revise as follows:

[A] 104.2.3 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved* .

> **Exception:** Performance-based alternative ~~materials, designs or~~ methods of ~~construction and equipment~~compliance complying with the *International Code Council Performance Code*.

[A] 104.2.3.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~compliance shall be *approved* where the *fire code official* finds that the proposed alternative is satisfactory and complies with Sections 104.2.3.2 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the *fire code official* for approval. Where the alternative ~~material, design or~~ method of ~~construction~~compliance is not *approved*, the *fire code official* shall respond in writing, stating the reasons the alternative was not *approved*.

[A] 104.2.3.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *fire code official*.

[A] 104.2.3.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the *fire code official*.

[A] 104.2.3.6.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *fire code official* for the installation. The ~~alternate material, design or method of construction and product~~ alternative method of compliance evaluated shall be within the scope of the *fire code official's* recognition of the *approved agency*. Criteria used for the evaluation shall be identified within the report and, where required, provided to the *fire code official*.

[A] 104.2.3.7 Peer review. The *fire code official* is authorized to require submittal of a *peer review* ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~compliance, prepared by a peer reviewer that is *approved* by the *fire code official*.

[A] 104.7.4 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the *fire code official* for either shall be in writing and shall be retained in the official records.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.2.3 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance.. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative is not specifically prohibited by this code and has been *approved*.

> **Exception:** Performance-based alternative ~~materials, designs or~~ methods of ~~construction and *equipment*~~ compliance complying with the *International Code Council Performance Code*.

[A] 104.2.3.1 Approval authority.. An alternative ~~material, design or~~ method of ~~construction~~compliance shall be *approved* where the *code official* finds that the proposed alternative is satisfactory and complies with Sections 104.2.3 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition.. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the *code official* for approval. Where the alternative ~~material, design or~~ method of ~~construction~~ compliance is not *approved*, the *code official* shall respond in writing, stating the reasons the alternative was not *approved*.

[A] 104.2.3.3 Compliance with code intent.. An alternative ~~material, design or~~ method of ~~construction~~compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

[A] 104.2.3.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

[A] 104.2.3.6.1 Evaluation reports~~.~~. Evaluation reports shall be issued by an *approved agency*, and use of the evaluation report shall require approval by the code official for the installation. The ~~alternate material, design or method of construction and product~~ alternative method of compliance evaluated shall be within the scope of the code official's recognition of the *approved agency*. Criteria used for the evaluation shall be identified within the report and, where required, provided to the *code official*.

[A] 104.2.3.7 Peer review~~.~~. The *code official* is authorized to require submittal of a *peer review* ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~compliance, prepared by a peer reviewer that is *approved* by the *code official*.

[A] 104.7.3 Code alternatives and modifications~~.~~. Application for alternative ~~materials, design and~~ methods of ~~construction and *equipment*~~ compliance in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the *code official* for either shall be in writing and shall be retained in the official records.

2024 International Green Construction Code

Revise as follows:

104.2.5 Innovative approaches and alternative ~~materials, design, and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design, innovative approach or method of construction not specifically prescribed by this code, provided that any such alternative is not specifically prohibited by this code and has been approved.

104.2.5.1 Approval authority. An alternative ~~material, design, innovative approach or~~ method of ~~construction~~ compliance shall be approved where the authority having jurisdiction finds that the proposed alternative is satisfactory and complies with Sections 104.2.5 through 104.2.5.7, as applicable.

104.2.5.2 Application and disposition. Where required, a request to use an alternative ~~material, design, innovative approach or~~ method of ~~construction~~ compliance shall be submitted in writing to the authority having jurisdiction for approval. Where the alternative ~~material, design, innovative approach or~~ method of ~~construction~~ compliance is not approved, the authority having jurisdiction shall respond in writing, stating the reasons the alternative was not approved.

104.2.5.3 Compliance with code intent. An alternative ~~material, design, innovative approach or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

104.2.5.4 Equivalency criteria. An alternative ~~material, design, innovative approach or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

104.2.5.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the authority having jurisdiction.

104.2.5.6.1 Evaluation reports. Evaluation reports shall be issued by an approved agency, and use of the evaluation report shall require approval by the code official for the installation. The ~~alternate material, design or method of construction and product~~ alternative method of compliance evaluated shall be within the scope of the code official's recognition of the approved agency. Criteria used for the evaluation shall be identified within the report and, where required, provided to the code official.

104.2.5.7 Peer review. The authority having jurisdiction is authorized to require submittal of a peer review ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance, prepared by a peer reviewer that is approved by the authority having jurisdiction.

104.8.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section 104.2.5; modifications in accordance with Section 104.2.6; and documentation of the final decision of the authority having jurisdiction for either shall be in writing and shall be retained in the official records.

2024 International Mechanical Code

Revise as follows:

104.2.3 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved* .

> **Exception:** Performance-based alternative ~~materials, designs or~~ methods of ~~construction and equipment~~ compliance complying with the International Code Council Performance Code.

[A] 104.2.3.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall be *approved* where the code official finds that the proposed alternative is satisfactory and complies with Sections 104.2.3 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the code official for approval. Where the alternative ~~material, design or~~ method of ~~construction~~ compliance is not *approved*, the code official shall respond in writing, stating the reasons the alternative was not *approved*.

[A] 104.2.3.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

[A] 104.2.3.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

104.2.3.6.1 Evalutaion reports. Evaluation reports shall be issued by an *approved* agency, and use of the evaluation report shall require approval by the code official for the installation. The ~~alternate material, design or method of construction and product~~ alternative method of compliance evaluated shall be within the scope of the code official's recognition of the *approved* agency. Criteria used for the evaluation shall be identified within the report and, where required, provided to the code official.

104.2.3.7 Peer review. The code official is authorized to require submittal of a peer review ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance, prepared by a peer reviewer that is *approved* by the code official.

104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and *equipment*~~ compliance in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records.

2024 International Plumbing Code

Revise as follows:

[A] 104.2.3 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative is not specifically prohibited by this code and has been *approved*.

> **Exception:** Performance-based alternative ~~materials, designs or~~ methods of ~~construction and equipment~~ compliance complying with the *International Code Council Performance Code*.

[A] 104.2.3.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall be *approved* where the code official finds that the proposed alternative is satisfactory and complies with Sections 104.2.3 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition~~.~~. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the code official for approval. Where the alternative ~~material, design or~~ method of ~~construction~~ compliance is not *approved*, the code official shall respond in writing, stating the reasons the alternative was not *approved*.

[A] 104.2.3.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

[A] 104.2.3.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

[A] 104.2.3.6.1 Evaluation reports~~.~~. Evaluation reports shall be issued by an *approved* agency, and use of the evaluation report shall require approval by the code official for the installation. The alternate ~~material, design or~~ method of ~~construction and product~~ compliance evaluated shall be within the scope of the code official's recognition of the *approved* agency. Criteria used for the evaluation shall be identified within the report and, where required, provided to the code official.

[A] 104.2.3.7 Peer review. The code official is authorized to require submittal of a peer review ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance, prepared by a peer reviewer that is *approved* by the code official.

[A] 104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.2.3 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative is not specifically prohibited by this code and has been approved.

Exception: Performance-based alternative ~~materials, designs or~~ methods of ~~construction and equipment~~ compliance complying with the International Code Council Performance Code.

[A] 104.2.3.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall be approved where the code official finds that the proposed alternative is satisfactory and complies with Sections 104.2.3 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the code official for approval. Where the alternative ~~material, design or~~ method of ~~construction~~ compliance is not approved, the code official shall respond in writing, stating the reasons the alternative was not approved.

[A] 104.2.3.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

[A] 104.2.3.6.1 Evaluation reports. Evaluation reports shall be issued by an approved agency and use of the evaluation report shall require approval by the code official for the installation. The ~~alternate material, design or method of construction and product~~ alternative method of compliance evaluated shall be within the scope of the code official's recognition of the approved agency. Criteria used for the evaluation shall be identified within the report and, where required, provided to the code official.

[A] 104.2.3.7 Peer review. The code official is authorized to require submittal of a peer review ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance, prepared by a peer reviewer that is approved by the code official.

[A] 104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.2.2 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative is not specifically prohibited by this code and has been *approved*.

Exception: Performance-based alternative ~~materials, designs or~~ methods of ~~construction and equipment~~ compliance complying with the *International Code Council Performance Code*.

[A] 105.2.2.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall be approved where the code official finds that the proposed alternative is satisfactory and complies with Sections 105.2.2 through 105.2.2.7, as applicable.

[A] 105.2.2.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the code official for approval. Where the alternative ~~material, design or~~ method of ~~construction~~ compliance is not approved, the code official shall respond in writing, stating the reasons the alternative was not approved.

[A] 105.2.2.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

[A] 105.2.2.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 105.2.2.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

[A] 105.2.2.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the building official.

[A] 105.2.2.6.1 Evaluation reports. Evaluation reports shall be issued by an approved agency and use of the evaluation report shall require approval by the code official for the installation. The alternate ~~material, design or~~ method of ~~construction and product~~ compliance evaluated shall be within the scope of the code official's recognition of the approved agency. Criteria used for the evaluation shall be identified within the report and, where required, provided to the code official.

[A] 105.2.2.7 Peer review. The code official is authorized to require submittal of a peer review ~~report~~ in con-junction with a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance, prepared by a peer reviewer that is approved by the code official.

[A] 105.6.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section 105.2.2; modifications in accordance with Section 105.2.3; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.3 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative is not specifically prohibited by this code and has been approved.

Exception: Performance-based alternative ~~materials, designs or~~ methods of ~~construction and equipment~~ compliance complying with the *International Code Council Performance Code*.

[A] 104.2.3.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall be approved where the code official finds that the proposed alternative is satisfactory and complies with Sections 104.2.3 through 104.2.3.7, as applicable.

[A] 104.2.3.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the code official for approval. Where the alternative material, design or method of construction is not approved, the code official shall respond in writing, stating the reasons the alternative was not approved.

[A] 104.2.3.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

[A] 104.2.3.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.3.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

[A] 104.2.3.6.1 Evaluation reports. Evaluation reports shall be issued by an approved agency and use of the evaluation report shall require approval by the code official for the installation. The ~~alternate material, design or method of construction and product~~ alternative method of compliance evaluated shall be within the scope of the code official's recognition of the approved agency. Criteria used for the evaluation shall be identified within the report and, where required, provided to the code official.

[A] 104.2.3.7 Peer review. The code official is authorized to require submittal of a peer review ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance, prepared by a peer reviewer that is approved by the code official.

[A] 104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section 104.2.3; modifications in accordance with Section 104.2.4; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.2.2 Alternative ~~materials, design and~~ methods of compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been *approved*.

[A] 104.2.2.1 Approval authority. An alternative ~~material, design or~~ method of compliance shall be approved where the *code official* finds that the proposed alternative is satisfactory and complies with Sections 104.2.2.2 through 104.2.2.7, as applicable.

[A] 104.2.2.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the *code official* for approval. Where the alternative ~~material, design or~~ method of ~~construction~~ compliance is not approved, the *code official* shall respond in writing, stating the reasons the alternative was not approved.

[A] 104.2.2.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

[A] 104.2.2.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

[A] 104.2.2.5 Tests~~.~~. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

[A] 104.2.2.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

[A] 104.2.2.6.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the code official for the installation. The ~~alternate material, design or method of construction and product~~alternative method of compliance evaluated shall be within the scope of the code official's recognition of the *approved agency*. Criteria used for the evaluation shall be identified within the report and, where required, provided to the code official.

[A] 104.2.2.7 Peer review. The *code official* is authorized to require submittal of a peer review ~~report~~ in conjunction with a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance, prepared by a peer reviewer that is approved by the *code official*.

[A] 104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section 104.2.2; modifications in accordance with Section 104.2.3; and documentation of the final decision of the *code official* for either shall be in writing and shall be retained in the official records.

2024 International Residential Code

Revise as follows:

R104.2.2 Alternative ~~materials, design and~~ methods of ~~construction and equipment~~compliance. The provisions of this code are not intended to prevent the installation of any material or to prohibit any design or method of construction not specifically prescribed by this code, provided that any such alternative has been approved.

R104.2.2.1 Approval authority. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall be approved where the *building official* finds that the proposed alternative is satisfactory and complies with Sections R104.2.2 through R104.2.2.6.2, as applicable.

R104.2.2.2 Application and disposition. Where required, a request to use an alternative ~~material, design or~~ method of ~~construction~~ compliance shall be submitted in writing to the *building official* for approval. Where the ~~alterna-tive material, design or~~ alternative method of ~~construction~~ compliance is not *approved*, the *building official* shall respond in writing, stating the reasons the alternative was not approved.

R104.2.2.3 Compliance with code intent. An alternative ~~material, design or~~ method of ~~construction~~ compliance shall comply with the intent of the provisions of this code.

R104.2.2.4 Equivalency criteria. An alternative ~~material, design or~~ method of ~~construction~~ compliance ~~construction~~ compliance shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

R104.2.2.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative ~~material, design or~~ method of ~~construction application~~ compliance shall be of a scale that is sufficient to predict performance of the end use configuration. Such tests shall be performed by a party acceptable to the *building official*.

R104.2.2.6.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *building official*for the installation. The alternate ~~material, design or~~ method of ~~construction and product~~ compliance evaluated shall be within the scope of the *building official*'s recognition of the *approved agency*. Criteria used for the evaluation shall be identified within the report and, where required, provided to the *building official*.

R104.7.3 Code alternatives and modifications. Application for alternative ~~materials, design and~~ methods of ~~construction and equipment~~ compliance in accordance with Section R104.2.2; modifications in accordance with Section R104.2.3; and documentation of the final decision of the *building official* for either shall be in writing and shall be retained in the official records.

Reason: Throughout the various I-Codes, the concept of alternative methods and materials is allowed and guidance is provided. However, the terminology is different in several of the codes. This proposal is intended to clean up action taken in ADM13-22 and

ADM14-22 which revised these sections and provide for a single term across all of the codes. The term proposed is “alternative method of compliance.”

The concept of alternative methods is not altered, and the term compliance provides for anything referenced in the codes. Some of the codes used the title “alternative materials or methods of construction”, other used “alternative materials, design and methods of construction and equipment.” Even throughout a single code the terms are not consistent.

The terms used to address this process had become a list of items. The problem with lists is that something is invariably left out. The word “compliance” includes materials, construction methods, equipment, appliances, fixtures, installation methods, design, storage and methods of operation. In other words, any proposed alternative which is not in strict conformance with the code requirements.

This proposal is almost editorial in that it replaces a term with a revised term. The new term is all encompassing because it includes anything regulated in any of the codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial change to the name of Alternative Methods of Compliance.

2024 International Building Code

Revise as follows:

[A] 104.2.1 Listed compliance. Where this code or a referenced standard requires equipment, materials, products or services to be listed and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an *approved* listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the *building official*.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Existing Building Code

Revise as follows:

[A] 104.2.1 Listed compliance. Where this code or a referenced standard requires equipment, materials, products or services to be *listed* and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an *approved* listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the *code official*.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Fire Code

Revise as follows:

[A] 104.2.1 Listed compliance. Where this code or a referenced standard requires equipment, materials, products or services to be listed and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an approved listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the *fire code official*.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Fuel Gas Code

Revise as follows:

[A] 104.2.1 Listed compliance. Where this code or a referenced standard requires *equipment*, materials, products or services to be listed and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an *approved* listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the *code official*.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Green Construction Code

Revise as follows:

104.2.1 Listed compliance. Where this code or a referenced standard requires equipment, materials, products or services to be listed and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on approved listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the code official.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Mechanical Code

Revise as follows:

[A] 104.2.1 Listed compliance. Where this code or a referenced standard requires *equipment*, materials, products or services to be *listed* and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an *approved* listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the code official.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Plumbing Code

Revise as follows:

[A] 104.2.1 Listed compliance. Where this code or a referenced standard requires equipment, materials, products or services to be listed and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an approved listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the code official.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.2.1 Listed compliance.. Where this code or a referenced standard requires equipment, materials, products or services to be listed and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an approved listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the code official.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.1 Listed compliance. Where this code or a referenced standard requires equipment, materials, products or services to be listed and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an approved listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the code official.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

ADM16-25 Part I

ADM16-25 Part II

IRC: R104.2.1

2024 International Residential Code

Revise as follows:

R104.2.1 Listed compliance.. Where this code or a referenced standard requires equipment, materials, products or services to be *listed* and a listing standard is specified, the listing shall be based on the specified standard. Where a listing standard is not specified, the listing shall be based on an *approved* listing criteria. Listings shall be germane to the provision requiring the listing. Installation shall be in accordance with the listing and the manufacturer's instructions, and where required to verify compliance, the listing standard and manufacturer's instructions shall be made available to the *building official*.

Exemption: Other standards and conformity assessment listings shall be permitted to be accepted in lieu of those referenced in this code, provided such alternatives comply with the intent of this code, including its minimum levels of protection, and are *approved.*

Reason: The current code passages lack flexibility to permit alternative standards.

This harms consumers because it limits the market of goods which can be used to conform to the code.

Inflexibility also can harm safety.

For example, in the fire profession, there has been a great deal of helmet innovation in Europe. The European helmet shape reduces the risk of head injury in a fall. If only items listed to US standards are allowed, it blocks innovative products from arriving domestically. Very ridged rules can even harm domestic standard developers if it makes it harder to test foreign standards domestically, thus leaving insufficient data to see if our standards should be changed.

Similar problems exist with US standards and sustainability. Windows and doors tested to US standards are often leakier than their counterparts tested to European standards. This largely owes to Europe having stricter energy efficiency regulations than the US.

The proposed change can be considered conservative because the alternative standards still must meet the intent of these codes, including minimum level of protection. Also, alternative standards require approval.

There are legal issues with the current inflexibility.

1) Only allowing referenced standards, many of which have signed agreements to be available for ICC subscription members, raises tying liability. Tying is an antitrust issue which entails one good being linked to the sale of other goods. Standard developers are partly exempt from anti-trust claims per the Standards Development Organization Advancement Act of 2004. However, as noted by the US Justice Department: "Standards development... is not without antitrust risk, and the Antitrust Division has a strong interest in ensuring that the standard-setting process remains procompetitive."

2) The current wording is inconsistent with the World Trade Organization's Technical Barriers to Trade Agreement. Article 2.7 states:

Members shall give positive consideration to accepting as equivalent technical regulations of other Members, even if these regulations differ from their own, provided they are satisfied that these regulations adequately fulfil the objectives of their own regulations.

Further Article 6.1 states:

Without prejudice to the provisions of paragraphs 3 and 4, Members shall ensure, whenever possible, that results of conformity assessment procedures in other Members are accepted, even when those procedures differ from their own, provided they are satisfied that those procedures offer an assurance of conformity with applicable technical regulations or standards equivalent to their own procedures. It is recognized that prior consultations may be necessary in order to arrive at a mutually satisfactory understanding...

ICC Code Council CP#49 requires US codes be consistent with US and International Law. The disallowance of foreign equivalent standards appears at face a violation of the WTO TBT Agreement, and thus violates international law because the US is a party to such. It is also inconsistent with ICC objectives to make the codes as internationally applicable as possible. For example, in some parts of the world, it can be difficult to find products listed to the US-centric conformity assessments. This is especially true in places with different electrical voltage. Providing more flexibility regarding equivalence determinations will make the I-codes better suited for global adoption.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

To the extent that it will result in cost changes, costs would be expected to mostly go down both from direct importation and domestic manufacturers having to lower their prices when faced with increased competition. There are too many different products the rule could apply to pinpoint a dollar value.

Estimated Life Cycle Cost Impact:

The life cycle costs would generally be cheaper if it becomes easier to use goods listed to other standards (i.e. ISO, CEN) under the ICC prescriptive codes. Many times, there are far more products tested using other standards versus the US standards alone.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Life cycle costs might also go slightly down if it is easier to find replacement parts conforming to approved international standards.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

2024 International Existing Building Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

2024 International Fire Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.

3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. <u>Energy efficiency.</u>

2024 International Fuel Gas Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. <u>Energy efficiency.</u>

2024 International Green Construction Code

Revise as follows:

104.2.5.4 Equivalency criteria. An alternative material, design, innovative approach or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. <u>Energy efficiency.</u>

2024 International Mechanical Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.

3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

2024 International Plumbing Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.2.2.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.

3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.3.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.2.2.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all of the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. Energy efficiency.

ADM17-25 Part I

ADM17-25 Part II

IRC: R104.2.2.4

Proponents: Scott Brody, representing self (sbrody96@gmail.com)

2024 International Residential Code

Revise as follows:

R104.2.2.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.
7. <u>Energy efficiency.</u>

Reason: This code change adds energy efficiency to an existing list of items that must be considered for approval of an equivalency. This list appears across almost all the I-codes, including the International Green Construction Code. Hence, I made the edit uniformly across all codes with the passage.

It does not make sense why the Green Construction Code would list other things like fire safety as needing to be equivalent, but not energy performance. Isn't energy performance the main point of this code? The gap in rules might allow approvals of items under the equivalency section which have inferior energy performance, thus harming homeowners. For example, an exterior door which meets fire and other safety/quality metrics, but leaks heat due to poor seal. Thus, homeowners are left with higher heating and cooling costs.

The existing passages' mention of many other items in equivalency assessment, but not energy efficiency, also creates the perception that energy efficiency is not important. This makes the current language problematic in terms of tone/messaging, irrespective of if there are other authorities a code official could cite to legally address energy performance problems. Many people care about the environment, and consumer protection from flawed construction like leaky windows. Code officials should not make these matters second-class concerns.

Bibliography: See sources in cost impact study

Cost Impact: Increase

Estimated Immediate Cost Impact:

This change is partly editorial. I say that because it appears to be a loophole where other matters are listed in the equivalency assessment process, but not energy efficiency. There is a possibility the code official would still cite other matters to block non-efficient goods being installed, in which case cost change would be zero. But this is not guaranteed.

If this change does prevent installation of some less efficient items, the cost would vary depending on the item. There are a seemingly infinite variety of products which could be impacted by having to be equivalent to the existing code's efficiency benchmarks. To provide an example of costs, the website Angy (Formerly Angies List) reports it typically adds around $200 per window to the starting cost to install a double vs single pane of glass. Costs increase at a slightly higher rate between 2 and 3 panes of glass. These construction costs may partly be recuperable via tax breaks and increased home resale value.

Estimated Immediate Cost Impact Justification (methodology and variables):

For construction costs in example, see *How Much Do Energy-Efficient Windows Cost?* [2025 Data].
Angie: https://www.angi.com/articles/energy-efficient-windows-cost.htm

Estimated Life Cycle Cost Impact:

According to a study in the peer-reviewed journal Energy and Buildings, the cost of energy efficiency upgrades in Passive Houses can generally be recovered in 16-28 years. The International Green Construction Code is not as stringent as the Passive House standard, so its constriction costs, and benefits, would not generally be as high. Nonetheless, it can generally be expected that energy efficiency costs can be recuperated over time.

The Environmental Protection Agency also offers Rule of Thumb costs for various energy efficient items.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

See: *A life-cycle cost analysis of the passive house "POLITEHNICA" from Bucharest.* By Badina et al, 2014. https://www.sciencedirect.com/science/article/abs/pii/S0378778814003703

Tests shall be performed by a party acceptable to the *code official*.

[A] 104.2.2.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative material, design or method of construction application shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

Add new text as follows:

104.2.2.5.2 Fire test properties. The fire tests conducted to demonstrate equivalent fire safety in support of an alternative material, design or method of construction application shall address the relevant fire properties being evaluated in the code section for which the alternative material, design, or method of construction is being proposed.

Reason: Fire safety is a broad concept that covers a large number of fire properties, including ignitability, flame spread, heat release, smoke release, and fire resistance ratings. It is important that the alternative being approved addresses the fire property (or fire properties) being addressed in the relevant code section.

Until the 2024 editions of the ICC codes the issue of fire safety was simply being addressed in these sections by referencing "fire resistance", which was intended to be a surrogate for all fire properties. It became clear at the cycle developing the 2024 I codes that a replacement material could exhibit (for example) the same fire resistance rating as the material being replaced (namely, for example, a fire resistance rating of zero hours) but exhibit much worse fire performance in terms of flame spread. In such a case the replacement material should not be considered a suitable equivalent but the wording in the code could make it difficult for the AHJ to apply the correct logic. That has been correctly fixed in the 2024 I codes.

It is very likely that the AHJ is already aware that this is a potential concern but it is important to have it explicitly in the code.

The existing sections that state that "fire safety" needs to be specifically considered and that the fire tests need to be of the appropriate scale are very important but do not address the potential of alternate fire properties being addressed by the proposed equivalent.

The following are four silly examples of an incorrect equivalent substitution.

1.When a roofing assembly meeting a Class A in accordance with ASTM E108 or UL 790 is required and the "equivalent" product is shown to meet a Class A in accordance wit ASTM E84 or UL 723.

2. When a fire resistance rating of 2 hours in accordance with ASTM E1529 is required and the "equivalent" product is shown to exhibit a fire resistance rating of 2 hours in accordance with ASTM E119.

3. When a flame spread index of Class A (25 or less) in accordance with ASTM E84 or UL 723 is required and the "equivalent" product is shown to exhibit a self-ignition temperature of 650°F (343°C) or greater in accordance with ASTM D1929.

4. When a peak heat release of not exceeding 400 kW/ m^2 when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 is required and the "equivalent" product is shown to comply with the fire propagation performance criteria contained in Test

Method 1 of NFPA 701.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal addresses issues that the AHJ is (I am sure) already addressing but makes it explicit.

ADM18-25 Part I

ADM18-25 Part II

IRC: R104.2.2.4, R104.2.2.5, R104.2.2.5.1 (New), R104.2.2.5.2 (New)

Proponents: Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

2024 International Residential Code

R104.2.2.4 Equivalency criteria. An alternative material, design or method of construction shall, for the purpose intended, be not less than the equivalent of that prescribed in this code with respect to all the following, as applicable:

1. Quality.
2. Strength.
3. Effectiveness.
4. Durability.
5. Safety, other than fire safety.
6. Fire safety.

R104.2.2.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative material, design or method of construction application shall be of a scale that is sufficient to predict performance of the end use configuration. Such tests shall be performed by a party acceptable to the *building official*.

Add new text as follows:

R104.2.2.5.1 Fire Tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative material, design or method of construction application shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the *building official*.

R104.2.2.5.2 Fire Test Properties. The fire tests conducted to demonstrate equivalent fire safety in support of an alternative material, design or method of construction application shall address the relevant fire properties being evaluated in the code section for which the alternative material, design, or method of construction is being proposed.

Reason: Fire safety is a broad concept that covers a large number of fire properties, including ignitability, flame spread, heat release, smoke release, and fire resistance ratings. It is important that the alternative being approved addresses the fire property (or fire properties) being addressed in the relevant code section.

Until the 2024 editions of the ICC codes the issue of fire safety was simply being addressed in these sections by referencing "fire resistance", which was intended to be a surrogate for all fire properties. It became clear at the cycle developing the 2024 I codes that a replacement material could exhibit (for example) the same fire resistance rating as the material being replaced (namely, for example, a fire resistance rating of zero hours) but exhibit much worse fire performance in terms of flame spread. In such a case the replacement material should not be considered a suitable equivalent but the wording in the code could make it difficult for the AHJ to apply the correct logic. That has been correctly fixed in the 2024 I codes.

It is very likely that the AHJ is already aware that this is a potential concern but it is important to have it explicitly in the code.

The existing section 104.2.2.5 that states that "fire safety" needs to be specifically considered is very important because it highlights fire safety and goes beyond just :fire resistance". Other I codes have a section worded like the propose 104.2.2.5.1, specifically for fire tests, which explains that the fire tests need to be of the appropriate scale. That is a very important addition and it should be included in the IRC too. However, neither of those sections (the existing one in the IRC and the proposed one, from the other I codes) address the potential of alternate fire properties being addressed by the proposed equivalent.

The following are four silly examples of an incorrect equivalent substitution. Not all of them address specific IRC examples but the concepts apply.

1.When a roofing assembly meeting a Class A in accordance with ASTM E108 or UL 790 is required and the "equivalent" product is shown to meet a Class A in accordance wit ASTM E84 or UL 723.

2. When a fire resistance rating of 2 hours in accordance with ASTM E1529 is required and the "equivalent" product is shown to exhibit a fire resistance rating of 2 hours in accordance with ASTM E119.

3. When a flame spread index of Class A (25 or less) in accordance with ASTM E84 or UL 723 is required and the "equivalent" product is shown to exhibit a self-ignition temperature of 650°F (343°C) or greater in accordance with ASTM D1929.

4. When a peak heat release of not exceeding 400 kW/ m2 when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 is required and the "equivalent" product is shown to comply with the fire propagation performance criteria contained in Test Method 1 of NFPA 701.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is something that the AHJ is probably already aware of but it is important to have it explicitly in the code.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 104.2.3.6.2 Other reports. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the *building official*. The *building official* is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a *registered design professional*.

2024 International Existing Building Code

Revise as follows:

[A] 104.2.3.6.2 Other reports. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or fire safety specialty organization ~~acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Fire Code

Revise as follows:

[A] 104.2.3.6.2 Other reports. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or fire safety specialty organization ~~acceptable to the *fire code official*. The *fire code official* is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a *registered design professional*.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.2.3.6.2 Other reports.. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a *registered design professional*.

2024 International Green Construction Code

Revise as follows:

104.2.5.6.2 Other reports. Reports not complying with Section 104.2.5.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the authority having jurisdiction. The authority having jurisdiction is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Mechanical Code

Revise as follows:

104.2.3.6.2 Other reports. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the code official. The code official is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a *registered design professional*.

2024 International Plumbing Code

Revise as follows:

[A] 104.2.3.6.2 Other reports. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the code official. The code official is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.2.3.6.2 Other reports.. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the code official. The code official is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.2.2.6.2 Other reports. Reports not complying with Section 105.2.2.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the building official. The building official is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.3.6.2 Other reports. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the code official. The code official is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a registered design professional.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.2.2.6.2 Other reports. Reports not complying with Section 104.2.3.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a *registered design professional*.

ADM19-25 Part I

ADM19-25 Part II

IRC: R104.2.2.6.2

Proponents: Jack Butler, Butler & Butler, LLC, representing American Institute of Building Design (abutler@mpzero.com); Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

2024 International Residential Code

Revise as follows:

R104.2.2.6.2 Other reports. Reports not complying with Section R104.2.2.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. Where required by the laws of the *jurisdiction*, the ~~The~~ report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization ~~acceptable to the *building official*. The *building official* is authorized to require design submittals to be prepared by,~~ and bear the stamp of~~,~~ a *registered design professional.*

Reason: The laws of the jurisdiction regarding professional practice requirements should govern the qualifications required to prepare the related technical opinions and reports, not the building official's judgment. The test for whether the preparer is qualified to provide the documentation is established by the state and local regulations governing the practice of the applicable profession. A building official should not be put into a position where they must substitute their judgment to accept or reject the offered documentation when the preparer meets the requirements of those regulations, including any permitted exemptions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modification makes the code section compliant with the laws of the jurisdiction by clarifying that the section does not supersede state and local laws governing professional practice. It also avoids placing the burden on the building official to decide when specific credentials are required.

2024 International Building Code

Revise as follows:

[A] 104.2.4 Modifications. Where there are practical difficulties involved in carrying out the provisions of this code, the *building official* shall have the authority to grant modifications in accordance with Sections 104.2.4.1, 104.2.4.2 or 104.2.4.3~~for individual cases, provided that the *building official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, *accessibility*, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

[A] 104.2.4.1 Individual cases. The building official shall have the authority to grant modifications for individual cases, provided that the *building official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, *accessibility*, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety.

[A] 104.2.4.2 Natural disasters. In preparation for, during and after a natural disaster event, as determined by the building official, the building official shall have the authority to issue written policies, procedures or rules that modify this code as necessary to protect life and property. Such policies, procedures or rules shall be made available to the public and shall include start and end dates, which can be extended at the building official's discretion.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.3 Flood hazard areas. The *building official* shall not grant modifications to any provision required in *flood hazard areas* as established by Section 1612.3 unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the *site* render the elevation standards of Section 1612 inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the *lot* undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the *flood* hazard.
5. Submission to the applicant of written notice specifying the difference between the *design flood elevation* and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the *design flood elevation* increases risks to life and property.

2024 International Existing Building Code

[A] 104.2.4 Modifications. Where there are practical difficulties involved in carrying out the provisions of this code, the *code official* shall have the authority to grant modifications in accordance with Sections 104.2.4.1, 104.2.4.2 or 104.2.4.3.

~~for individual cases, provided that the *code official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety, or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety.~~

Add new text as follows:

<u>**[A] 104.2.4.1 Individual cases.** The code official shall have the authority to grand modifications for individual cases, provided that the *code official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety, or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety.</u>

<u>**[A] 104.2.4.2 Natural disasters.** In preparation for, during and after a natural disaster event, as determined by the code official, the code official shall have the authority to issue written policies, procedures or rules that modify this code as necessary to protect life and property. Such policies, procedures or rules shall be made available to the public and shall include start and end dates, which can be extended at the code official's discretion.</u>

Revise as follows:

[A] ~~104.2.4.1~~ <u>104.2.4.3</u> Flood hazard areas. For *existing buildings* located in *flood hazard areas* for which *repairs*, *alterations* and *additions* constitute *substantial improvement*, the *code official* shall not grant modifications to provisions related to flood resistance unless a determination is made that:

1. The applicant has presented good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions inappropriate.
2. Failure to grant the modification would result in exceptional hardship.
3. The granting of the modification will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. The modification is the minimum necessary to afford relief, considering the flood hazard.
5. A written notice will be provided to the applicant specifying, if applicable, the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation and that construction below the design flood elevation increases risks to life and property.

Reason: There is no change to the requirements in the first section. It is just split into two to match the format in the IFC.

The focus of this change is added the section for Natural Disasters. Emergencies have happened which demonstrate the need for granting the authority to allow, by policy, conditions that would otherwise constitute code violations. Buildings may be used for purposes other than what they were designed for. A school gymnasium being used for temporary housing for displaced victims of a flood. Over 200,000 people were relocated during the Kincade Fire in California in 2019. Buildings are utilized to handle the needs resulting from the emergency incident. For example, temporary housing is established, outdoor canopies are set up, portable toilets are utilized, electric power and heating is provided. These needs of the people need to be provided for, but many times strict compliance with the code is not possible. These revisions could allow temporary emergency shelters that may not fully meet code requirements for a congregate residential use.

These sections were added into the IFC in the 2022 code cycle. But it is not just fire code regulations that are affected when these emergencies occur. Therefore, this proposal adds these correlating provisions into the IBC so the fire code official and building official can work together to solve these problems that arise in emergency situations.

By adding text to the code that specifically addresses this concern, the building official will be guided to develop written documentation that should globally address special allowances that will be permitted during a disaster event.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC Fire Code Action Committee (FCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

While this is not a change in construction requirements, by allowing for preplanning, this will most likely result in a recuction of cost. This will allow for a quicker response and for officials to work together, and averting additional costs.

ADM20-25

ADM21-25

IBC: [A] 104.2.4, [A] 104.2.4.1 (New), [A] 104.2.4.1; IFC: 104.2.4, 104.2.4.1, 104.2.4.2

2024 International Building Code

Revise as follows:

[A] 104.2.4 Modifications. Where there are practical difficulties involved in carrying out the provisions of this code, the *building official* shall have the authority to grant modifications in accordance with Sections 104.2.4.1, 104.2.4.2 or 104.2.4.3. ~~for individual cases, provided that the *building official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, *accessibility*, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety.~~

Add new text as follows:

[A] 104.2.4.1 Individual cases. The *building official* shall have the authority to grant modifications for individual cases, provided that the *building official* shall first find that special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code, and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. Details of the written request for and action granting modifications shall be in writing and maintained in the files of the department of building safety.

[A] 104.2.4.1 Natural disasters. In preparation for, during and after a natural disaster event, as determined by the *building official*, the *building official* shall have the authority to issue written policies, procedures or rules that modify this code as necessary to protect life and property. Such policies, procedures or rules shall be made available to the public and shall include start and end dates, which can be extended at the *building official's* discretion.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.3 Flood hazard areas. The *building official* shall not grant modifications to any provision required in *flood hazard areas* as established by Section 1612.3 unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the *site* render the elevation standards of Section 1612 inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the *lot* undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the *flood* hazard.
5. Submission to the applicant of written notice specifying the difference between the *design flood elevation* and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the *design flood elevation* increases risks to life and property.

2024 International Fire Code

[A] 104.2.4 Modifications. Where there are practical difficulties involved in carrying out the provisions of this code, the *fire code official* shall have the authority to grant modifications in accordance with Section 104.2.4.1 or 104.2.4.2.

Revise as follows:

[A] 104.2.4.1 Individual cases. The *fire code official* shall have the authority to grant modifications for individual cases, provided that the *fire code official* shall first find that special individual reason makes the strict letter of this code impractical and the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, life and fire safety requirements. ~~The details~~Details of the request for and action granting modifications shall be ~~recorded and entered~~ in writing and maintained in the files of the code compliance agency.

[A] 104.2.4.2 Natural disasters. In preparation for, during and after a natural disaster event, as determined by the *fire code official*, the *fire code official* shall have the authority to issue written policies, procedures or rules that modify this code as necessary to protect life and property. Such policies, procedures or rules shall be made available to the public and shall include start and end dates, which can be extended at the *fire code official ' s* discretion.

Reason: This proposal correlates the IFC and IBC regarding modifications to the code. IFC Section 104.2.4 was revised in the 2022 code cycle and the sections for individual cases and natural disasters were created. But it is not just fire code regulations which can be affected when these emergencies occur. Therefore, this proposal adds these correlating provisions into the IBC so the fire code official and building official can work together to solve these problems that arise in preparation for and during natural disasters.

Emergencies have occurred which demonstrate the need for granting the authority to allow, by policy, conditions that would otherwise constitute code violations. Buildings may be used for purposes other than what they were designed for. A school gymnasium being used for temporary housing for displaced victims of a flood. Over 200,000 people were relocated during the Kincade Fire in California in 2019. Buildings are utilized to handle the needs resulting from the emergency incident. For example, temporary housing is established, outdoor canopies are set up, portable toilets are utilized, electric power and heating is provided. These needs of the people need to be provided for, but many times strict compliance with the code is not possible. These revisions could allow temporary emergency shelters that may not fully meet code requirements for a congregate residential use. This proposal adds correlating provisions into the IBC so the fire code official and building official can work together to solve these problems that arise in emergency situations.

The last sentence in IFC Section 104.2.4.1 is cleaned up with no change in application.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal will allow for a quicker response to the needs of the public and enhance the ability for fire and building officials to work together thus averting additional costs for filing with both agencies.

Estimated Immediate Cost Impact Justification (methodology and variables):

A survey of several agencies resulted in a range of $100 to $350 for filing a request for modification.

2024 International Fire Code

Revise as follows:

104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of~~ the *fire code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *fire code official* shall have the authority to ~~grant~~approve modifications in accordance with Section 104.2.4.1 or 104.2.4.2.

104.2.4.1 Individual cases. ~~The *fire code official* shall have the authority to grant modifications for individual cases, provided that the *fire code official* shall first find that special individual reason makes the strict letter of this code impractical, and the modification is in compliance with the intent and purpose of this code, and that such modification does not lessen health, life and fire safety requirements. The details of action granting modifications shall be recorded and entered in the files of the code compliance agency.~~The *fire code official* shall have the authority to approve modifications for individual cases, provided that the *fire code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

104.2.4.2 Natural disasters. In preparation for, during and after a natural disaster event, as determined by the *fire code official*, the *fire code official* shall have the authority to issue written policies, procedures or rules that modify this code as necessary to protect life and property. Such policies, procedures or rules shall be made available to the public and shall include start and end dates, which can be extended at the *fire code official ' s* discretion.

Add new text as follows:

104.2.4.3 Application and disposition. A request to use a modification shall be submitted in writing to the *fire code official* for approval. Where the modification is not approved, the *fire code official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.4 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.4.5 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *fire code official*.

104.2.4.6 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.6.1 and 104.2.4.6.2.

104.2.4.6.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *fire code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.6.2 Other reports. Reports not complying with Section 104.2.4.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with the intent of the code. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *fire code official*. The *fire code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.7 Peer review. The *fire code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is *approved* by the *fire code official*.

104.2.4.8 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.5.

Revise as follows:

[A] 104.7.5 Tests. The *fire code official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.5.

2024 International Building Code

Revise as follows:

[A] 104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *building official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *building official* shall have the authority to ~~grant~~ approve modifications for individual cases~~, provided that the *building official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, *accessibility*, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.4.1 Approval authority. As a condition of approval, the building official shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.1.1 Flood hazard areas. The *building official* shall not grant modifications to any provision required in *flood hazard areas* as established by Section 1612.3 unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the *site* render the elevation standards of Section 1612 inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the *lot* undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the *flood* hazard.
5. Submission to the applicant of written notice specifying the difference between the *design flood elevation* and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the *design flood elevation* increases risks to life and property.

Add new text as follows:

104.2.4.2 Application and disposition. A request to use a modification shall be submitted in writing to the *building official* for approval. Where the modification is not approved, the *building official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.4.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *building official*.

104.2.4.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.5.1 and 104.2.4.5.2.

104.2.4.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *building official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.5.2 Other reports. Reports not complying with Section 104.2.4.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *building official*. The *building official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.6 Peer review. The *building official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is *approved* by the *building official.*

104.2.4.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.4.

Revise as follows:

[A] 104.7.4 Tests. The *building official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.4.

2024 International Existing Building Code

Revise as follows:

[A] 104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *code official* shall have the authority to ~~grant~~approve modifications for individual cases~~, provided that the *code official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety, or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.1.1 Flood hazard areas. For *existing buildings* located in *flood hazard areas* for which *repairs*, *alterations* and *additions* constitute *substantial improvement*, the *code official* shall not grant modifications to provisions related to flood resistance unless a determination is made that:

1. The applicant has presented good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions inappropriate.
2. Failure to grant the modification would result in exceptional hardship.
3. The granting of the modification will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. The modification is the minimum necessary to afford relief, considering the flood hazard.
5. A written notice will be provided to the applicant specifying, if applicable, the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation and that construction below the design flood elevation increases risks to life and property.

Add new text as follows:

104.2.4.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the *code official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.4.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

104.2.4.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.5.1 and 104.2.4.5.2.

104.2.4.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.5.2 Other reports. Reports not complying with Section 104.2.4.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is *approved* by the *code official*.

104.2.4.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.4.

Revise as follows:

[A] 104.7.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.4.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *code official* shall have the authority to ~~grant~~ *approve* modifications for individual cases~~, provided that the *code official* shall first find that one or more special individual reasons make the strict letter of this code impractical, that the modification is in compliance with the intent and purpose of this code, and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.1.1 Flood hazard areas. The *code official* shall not grant modifications to any provision required in *flood hazard areas* as established by Section 1612.3 of the *International Building Code* unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

Add new text as follows:

104.2.4.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the *code official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.4.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

104.2.4.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.5.1 and 104.2.4.5.2.

104.2.4.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.5.2 Other reports. Reports not complying with Section 104.2.4.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is *approved* by the *code official.*

Revise as follows:

[A] 104.7.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.4.

2024 International Green Construction Code

Revise as follows:

104.2.6 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the authority having jurisdiction determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.5, the authority having jurisdiction shall have the authority to ~~grant~~ approve modifications for individual cases~~, provided the authority having jurisdiction shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen the minimum requirements of this code. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.6.1 Approval authority. As a condition of approval, the authority having jurisdiction shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.5.

104.2.6.2 Application and disposition. A request to use a modification shall be submitted in writing to the authority having jurisdiction for approval. Where the modification is not approved, the authority having jurisdiction shall respond in writing, stating the reasons the modification was not approved.

104.2.6.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen the minimum requirements of this code.

104.2.6.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the authority having jurisdiction.

104.2.6.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.6.5.1 and 104.2.6.5.2.

104.2.6.5.1 Evaluation reports. Evaluation reports shall be issued by an approved agency and use of the evaluation report shall require approval by the authority having jurisdiction. Evaluation of the modification shall be within the scope of the accreditation of the approved agency. Criteria used for the evaluation shall be identified within the report.

104.2.6.5.2 Other reports. Reports not complying with Section 104.2.6.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the authority having jurisdiction. The authority having jurisdiction is authorized to require design submittals to be prepared by, and bear the stamp of, a registered design professional.

10104.2.6.6 Peer review. The authority having jurisdiction is authorized to require submittal of a peer review in conjunction with a modification request, prepared by a peer reviewer that is approved by the authority having jurisdiction.

104.2.6.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section

104.8.4.

Revise as follows:

104.8.4 Tests. The authority having jurisdiction shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.5.5 and 104.2.6.4.

2024 International Mechanical Code

Revise as follows:

[A] 104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *code official* shall have the authority to ~~grant~~ approve modifications for individual cases~~, provided that the code official shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

Revise as follows:

~~**104.2.4.1**~~ **104.2.4.1.1 Flood hazard areas.** The code official shall not grant modifications to any provision required in flood hazard areas, as established by Section 1612.3 of the *International Building Code*, unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the *building* is to be built, stating that the cost of flood ~~in-surance~~ insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

Add new text as follows:

104.2.4.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the *code official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.

2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.4.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

104.2.4.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.5.1 and 104.2.4.5.2.

104.2.4.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.5.2 Other reports. Reports not complying with Section 104.2.4.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is approved by the *code official*.

104.2.4.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.4.

Revise as follows:

104.7.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.4.

2024 International Plumbing Code

Revise as follows:

[A] 104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *code official* shall have the authority to ~~grant~~ approve modifications for individual cases~~, provided that the code official shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.1.1 Flood hazard areas. The *code official* shall not grant modifications to any provision required in flood hazard areas as established by Section 1612.3 of the *International Building Code* unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

Add new text as follows:

104.2.4.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the *code official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.4.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

104.2.4.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.5.1 and 104.2.4.5.2.

104.2.4.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.5.2 Other reports. Reports not complying with Section 104.2.4.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is approved by the *code official*.

104.2.4.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.4.

Revise as follows:

[A] 104.7.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.4.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *code official* shall have the authority to ~~grant~~ approve modifications for individual cases~~, provided that the code official shall first find that one or more special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.1.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas as established by Section 1612.3 of the *International Building Code*, unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

Add new text as follows:

104.2.4.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the *code official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.

4. Fire safety.
5. Structural safety.

104.2.4.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

104.2.4.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.5.1 and 104.2.4.5.2.

104.2.4.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.5.2 Other reports. Reports not complying with Section 104.2.4.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is approved by the *code official*.

104.2.4.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.4.

Revise as follows:

[A] 104.7.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.4.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.2.3 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 105.2.2, the *code official* shall have the authority to ~~grant~~ approve modifications for individual cases~~, provided that the *code official* shall first find that special individual reasons make the strict letter of this code impractical, and that the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

105.2.3.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 105.2.2.

105.2.3.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the *code official* shall respond in writing, stating the reasons the modification was not approved.

105.2.3.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

105.2.3.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

105.2.3.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 105.2.3.5.1 and 105.2.3.5.2.

105.2.3.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

105.2.3.5.2 Other reports. Reports not complying with Section 105.2.3.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

105.2.3.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is approved by the *code official*.

105.2.3.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 105.6.4.

Revise as follows:

[A] 105.6.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 105.2.1.4, ~~and~~ 105.2.2.5 and 105.2.3.4.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.4 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.3, the *code official* shall have the authority to ~~grant~~ approve modifications for individual cases ~~provided that the code official shall first find that one or more special individual reasons make the strict letter of this code impractical, that the modification is in compliance with the intent and purpose of this code, and that such modification does not lessen health, accessibility, life and fire safety or structural requirements. The details of the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety~~.

Add new text as follows:

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it

104.2.4.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.3.

Revise as follows:

[A] ~~104.2.4.1~~ 104.2.4.1.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas as established by Section 1612.3 of the *International Building Code* unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

Add new text as follows:

104.2.4.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the *code official* shall respond in writing, stating the reasons the modification was not approved.

104.2.4.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.4.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

104.2.4.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.4.5.1 and 104.2.4.5.2.

104.2.4.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.4.5.2 Other reports. Reports not complying with Section 104.2.4.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.4.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is approved by the *code official.*

104.2.4.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.4.

Revise as follows:

[A] 104.7.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 104.2.2.4, ~~and~~ 104.2.3.5 and 104.2.4.4.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.2.3 Modifications. Where ~~there are practical difficulties involved in carrying out the provisions of this code~~ the *code official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section 104.2.2, the *code official* shall have the authority to ~~grant~~ approve modifications for individual cases~~, provided that the *code official* shall first find that one or more special individual reasons make the strict letter of this code impractical, that the modification is in conformance with the intent and purpose of this code, and that such modification does not lessen health, life and fire safety requirements. The details of the written request and action granting modifications shall be recorded and entered into the files of the code enforcement agency~~.

Add new text as follows:

104.2.3.1 Approval authority. As a condition of approval, the *code official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section 104.2.2.

104.2.3.2 Application and disposition. A request to use a modification shall be submitted in writing to the *code official* for approval. Where the modification is not approved, the code official shall respond in writing, stating the reasons the modification was not approved.

104.2.3.3 Compliance with code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health.
2. Accessibility.
3. Life safety.
4. Fire safety.
5. Structural safety.

104.2.3.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *code official*.

104.2.3.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification shall comply with Sections 104.2.3.5.1 and 104.2.3.5.2.

104.2.3.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *code official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

104.2.3.5.2 Other reports. Reports not complying with Section 104.2.3.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *code official*. The *code official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

104.2.3.6 Peer review. The *code official* is authorized to require submittal of a *peer review* in conjunction with a modification request, prepared by a peer reviewer that is approved by the *code official*.

104.2.3.7 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section 104.7.4.

Revise as follows:

[A] 104.7.4 Tests. The *code official* shall keep a record of tests conducted to comply with Sections 104.2.1.4, ~~and~~ 104.2.2.5 and 104.2.3.4.

Reason: This proposal adds evaluation and approval parameters for modifications, making them similar to those currently in the code for alternative methods. The primary difference between an alternative method and a modification is that a modification changes a code requirement in unique cases where equivalency cannot be achieved, as opposed to an alternative method, which establishes equivalency with a code requirement.

Accordingly, the provisions for approval of a modification should at least be equivalent to those for approval of an alternative method. However, code text currently suggests that the hurdle to obtain approval of a modification is less stringent. To address this, the modification requirements have been clarified to state that the code official must determine 1) direct compliance with the code is not achievable, and 2) potential alternative methods of compliance have been explored but cannot produce equivalency to the code.

Further, this proposal achieves consistency with changes to the alternative method provisions made under ADM13-22 and ADM 14-22, minus the requirement for code equivalency. Relevant provisions from the requirements for alternative methods have been added to the requirements for modifications. The one exception to this equivalency occurs in the IRC. In the IRC, the code official does not have the authority to require technical reports or a peer review for alternative methods, but if a technical report or peer review is submitted the code official can approve the agency or agent preparing the documentation. The same occurs for modifications in the IRC—the code official does not have the authority to require peer review or a technical report, but if it is submitted, the preparer must meet with the code official's approval.

This proposal will provide consistency across all the codes where modifications are allowed, with the exception of excluding accessibility, given that the IRC does not regulate accessibility.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides guidance to the code official for the administrative process when dealing with modifications.

2024 International Residential Code

Revise as follows:

R104.2.3 Modifications. ~~Where there are practical difficulties involved in carrying out the provisions of this code, the *building official* shall have the authority to grant modifications for individual cases, provided the *building official* shall first find that one or more special individual reasons make the strict letter of this code impractical, and the modification is in compliance with the intent and purpose of this code and that such modification does not lessen health, life and fire safety or structural requirements. The detailsof the written request for and action granting modifications shall be recorded and entered in the files of the department of building safety.~~ Where the *building official* determines that it is not practical to specifically comply with this code or utilize an alternative method of compliance in accordance with Section R104.2.2, the *building official* shall have the authority to approve modifications for individual cases.

Add new text as follows:

R104.2.3.1 Approval authority. As a condition of approval, the *building official* shall find that one or more special individual reasons make it impractical to specifically comply with this code or provide equivalency through an alternative method of compliance in accordance with Section R104.2.2.

Revise as follows:

~~**R104.2.3.1**~~ **R104.2.3.1 Flood hazard areas.** The *building official* shall not grant modifications to any provisions required in flood hazard areas as established by Table R301.2 unless a determination has been made that:

1. There is good and sufficient cause showing that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section R306 inappropriate.
2. Failure to grant the modification would result in exceptional hardship by rendering the lot undevelopable.
3. The granting of modification will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. The modification is the minimum necessary to afford relief, considering the flood hazard.
5. Written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation and stating that construction below the design flood elevation increases risks to life and property, has been submitted to the applicant.

Add new text as follows:

R104.2.3.2 Application and disposition. A request to use a modification shall be submitted in writing to the *building official* for approval. Where the modification is not approved, the *building official* shall respond in writing, stating the reasons the modification was not approved.

R104.2.3.3 Compliance with the code intent. Modifications shall comply with the intent and purpose of this code, and shall not lessen any of the following:

1. Health

2. Life safety
3. Fire safety
4. Structural safety

R104.2.3.4 Tests. Tests conducted in support of a modification shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the *building official*.

R104.2.3.5 Reports. Supporting documentation, where necessary to assist in the approval of a modification, shall comply with Sections R104.2.3.5.1 and R104.2.3.5.2.

R104.2.3.5.1 Evaluation reports. Evaluation reports shall be issued by an *approved agency* and use of the evaluation report shall require approval by the *building official*. Evaluation of the modification shall be within the scope of the accreditation of the *approved agency*. Criteria used for the evaluation shall be identified within the report.

R104.2.3.5.2 Other reports. Reports not complying with Section R104.2.3.5.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with the intent of the code. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the *building official*. The *building official* is authorized to require design submittals to be prepared by, and bear the stamp of, a *registered design professional*.

R104.2.3.6 Records. Records of the written request for and action granting modifications shall be retained in accordance with Section R104.7.4.

Revise as follows:

R104.7.4 Tests. The *building official* shall keep a record of tests conducted to comply with ~~Section~~Sections R104.2.2.5 and R104.2.3.4.

Reason: This proposal adds evaluation and approval parameters for modifications, making them similar to those currently in the code for alternative methods. The primary difference between an alternative method and a modification is that a modification changes a code requirement in unique cases where equivalency cannot be achieved, as opposed to an alternative method, which establishes equivalency with a code requirement.

Accordingly, the provisions for approval of a modification should at least be equivalent to those for approval of an alternative method. However, code text currently suggests that the hurdle to obtain approval of a modification is less stringent. To address this, the modification requirements have been clarified to state that the code official must determine 1) direct compliance with the code is not achievable, and 2) potential alternative methods of compliance have been explored but cannot produce equivalency to the code.

Relevant provisions from the requirements for alternative methods have been added to the requirements for modifications. One difference between the IRC provisions and the other codes is that in the IRC the code official does not have the authority to require technical reports or peer review, but if a technical report or peer review is submitted the code official can approve the agency or agent preparing the documentation.

This proposal will provide consistency across all the codes with the process for review and approval of a request for modification.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is an administrative requirement and does not require the applicant to submit a request for modification. This proposal identifies the review and approval process.

2024 International Building Code

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The *building official* shall not grant modifications to any provision required in *flood hazard areas* ~~as established by Section 1612.3~~ unless a determination has been made that:

1. The applicant has presented ~~A showing of~~ good and sufficient cause that the unique characteristics of the size, configuration or topography of the *site* render compliance with the flood-resistant construction provisions ~~the elevation standards~~ of Section 1612 inappropriate.
2. ~~A determination that failure~~ Failure to grant the modification ~~variance~~ would result in exceptional hardship by rendering the *lot* undevelopable.
3. ~~A determination that the~~ The granting of the modification ~~a variance~~ will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. ~~A determination that the variance~~ The modification is the minimum necessary to afford relief, considering the *flood* hazard.
5. ~~Submission to the applicant of written notice specifying the difference between the *design flood elevation* and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the *design flood elevation* increases risks to life and property.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section 1612, the building official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

2024 International Existing Building Code

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. ~~For *existing buildings* located in *flood hazard areas* for which *repairs*, *alterations* and *additions* constitute *substantial improvement*, the~~ The *code official* shall not grant modifications to provisions required in flood hazard areas ~~related to flood resistance~~ unless a determination has been ~~is~~ made that:

1. The applicant has presented good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions of Section 1612 of the International Building Code or Section R306 of the International Residential Code, as applicable, inappropriate.
2. Failure to grant the modification would result in exceptional hardship by rendering the lot undevelopable.
3. The granting of the modification will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.

4. The modification is the minimum necessary to afford relief, considering the flood hazard.
5. ~~A written notice will be provided to the applicant specifying, if applicable, the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation and that construction below the design flood elevation increases risks to life and property.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section 1612 of the International Building Code or Section R306 of the International Residential Code, as applicable, the code official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The *code official* shall not grant modifications to any provision required in *flood hazard areas* ~~as established by Section 1612.3 of the *International Building Code*~~ unless a determination has been made that:

1. The applicant has presented ~~A showing of~~ good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions ~~the elevation standards~~ of Section 1612 of the *International Building Code* inappropriate.
2. ~~A determination that failure~~ Failure to grant the modification ~~variance~~ would result in exceptional hardship by rendering the lot undevelopable.
3. ~~A determination that the~~ The granting of the modification ~~a variance~~ will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. ~~A determination that the variance~~ The modification is the minimum necessary to afford relief, considering the flood hazard.
5. ~~Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section 1612 of the International Building Code, the code official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

2024 International Mechanical Code

Revise as follows:

104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas~~, as established by Section 1612.3 of the *International Building Code*,~~ unless a determination has been made that:

1. The applicant has presented ~~A showing of~~ good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions ~~the elevation standards~~ of Section 1612 of the *International Building Code* inappropriate.
2. ~~A determination that failure~~ Failure to grant the modification ~~variance~~ would result in exceptional hardship by rendering the lot undevelopable.

3. ~~A determination that the~~ The granting of the modification ~~a variance~~ will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. ~~A determination that the variance~~ The modification is the minimum necessary to afford relief, considering the flood hazard.
5. ~~Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the *building* is to be built, stating that the cost of flood in-surance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section 1612 of the International Building Code , the code official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

2024 International Plumbing Code

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas ~~as established by Section 1612.3 of the *International Building Code*~~ unless a determination has been made that:

1. The applicant has presented ~~A showing of~~ good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions ~~the elevation standards~~ of Section 1612 of the *International Building Code* inappropriate.
2. ~~A determination that failure~~ Failure to grant the modification ~~variance~~ would result in exceptional hardship by rendering the lot undevelopable.
3. ~~A determination that the~~ The granting of the modification ~~a variance~~ will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. ~~A determination that the variance~~ The modification is the minimum necessary to afford relief, considering the flood hazard.
5. ~~Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section 1612 of the International Building Code, the code official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas ~~as established by Section 1612.3 of the *International Building Code*,~~ unless a determination has been made that:

1. The applicant has presented ~~A showing of~~ good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions ~~the elevation standards~~ of Section 1612 of the *International Building Code* inappropriate.
2. ~~A determination that failure~~ Failure to grant the modification ~~variance~~ would result in exceptional hardship by rendering the lot undevelopable.

3. ~~A determination that the~~ The granting of the modification ~~a variance~~ will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. ~~A determination that the variance~~ The modification is the minimum necessary to afford relief, considering the flood hazard.
5. ~~Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section 1612 of the International Building Code, the code official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas ~~as established by Section 1612.3 of the *International Building Code*~~ unless a determination has been made that:

1. The applicant has presented ~~A showing of~~ good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions ~~the elevation standards~~ of Section 1612 of the *International Building Code* inappropriate.
2. ~~A determination that failure~~ Failure to grant the modification ~~variance~~ would result in exceptional hardship by rendering the lot undevelopable.
3. ~~A determination that the~~ The granting of the modification ~~a variance~~ will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. ~~A determination that the variance~~ The modification is the minimum necessary to afford relief, considering the flood hazard.
5. ~~Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section 1612 of the International Building Code, the code official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

ADM23-25 Part II

IBC: APPENDIX G, G106.7

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Building Code

APPENDIX G
FLOOD-RESISTANT CONSTRUCTION

Revise as follows:

G106.7 Conditions for issuance. *Variances* shall not~~only~~ be issued by the board ~~where all of the following criteria are met~~unless a determination has been made that:

1. The applicant has presented ~~A technical showing of~~ good and sufficient cause that the unique characteristics of the size, configuration or topography of the *site* render~~s the elevation standards~~ compliance with this appendix inappropriate.
2. ~~A determination that failure~~ Failure to grant the *variance* would result in exceptional hardship by rendering the *lot* undevelopable.
3. ~~A determination that the~~ The granting of a *variance* will not result in increased *flood* heights, additional threats to public safety, extraordinary public expense, nor create nuisances, cause fraud on or victimization of the public or conflict with existing local laws or ordinances.
4. ~~A determination that the~~ The *variance* is the minimum necessary to afford relief, considering the *flood* hazard~~, to afford relief~~.
5. ~~Notification to the applicant in writing over the signature of the floodplain administrator that the issuance of a *variance* to construct a *structure* below the *base flood* level will result in increased premium rates for flood insurance up to amounts as high as $25 for $100 of insurance coverage, and that such construction below the *base flood* level increases risks to life and property.~~

Where a variance permits the lowest floor to be lower than the elevation required by Section 1612, the floodplain administrator shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

ADM23-25 Part II

ADM23-25 Part III

IRC: R104.2.3.1

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Residential Code

Revise as follows:

R104.2.3.1 Flood hazard areas. The *building official* shall not grant modifications to any provisions required in flood hazard areas ~~as established by Table R301.2~~ unless a determination has been made that:

1. The applicant has presented ~~There is~~ good and sufficient cause ~~showing~~ that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions ~~the elevation standards~~ of Section R306 inappropriate.
2. Failure to grant the modification would result in exceptional hardship by rendering the lot undevelopable.
3. The granting of the modification will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. The modification is the minimum necessary to afford relief, considering the flood hazard.
5. ~~Written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation and stating that construction below the design flood elevation increases risks to life and property, has been submitted to the applicant.~~

Where a modification permits the lowest floor to be lower than the elevation required by Section R306, the building official shall provide a written notice to the applicant stating that the cost of federal flood insurance will be commensurate with the increased risk and that construction below the minimum required elevation increases risks to life and property.

Reason: This proposal is editorial to achieve consistent phrasing of similar sections across the IBC, IRC, IEBC, and IMC, IPC, IFGC, ISPSC, IPSDC for granting modifications (variances) to the flood-resistant provisions. The IBC, IRC and IEBC have had these sections for many editions. The sections were added by others to the IMC, IPC, IFGC, ISPSC, and IPSDC starting with the 2024 edition.

The term “variance” is used in floodplain management and is changed to the term “modification” which is used in the I-Codes. The existing list item (5), the written notification, is moved to an independent paragraph because, unlike the remaining four items, it does not require a determination. It is an action taken after a decision on a request for modification has been made.

The origin of this provision is in the regulations of the National Flood Insurance Program at 44 Code of Federal Regulations Section 60.6(a)(3), (4), and (5).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is editorial to make language consistent across similar sections of multiple codes. There is no change to the technical content of the provisions. By making similar language more consistent there will be no cost impact when approving this proposal.

ADM23-25 Part III

ADM24-25

IFC: 104.2.4.2

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Fire Code

[A] 104.2.4.2 ~~Natural disasters~~ Disasters or Emergencies. In preparation for, during and after a ~~natural~~ disaster or other emergency event, as determined by the *fire code official*, the *fire code official* shall have the authority to issue written policies, procedures or rules that modify this code as necessary to protect life and property. Such policies, procedures or rules shall be made available to the public and shall include start and end dates, which can be extended at the *fire code official ' s* discretion.

Reason: A disaster may be natural or man made. The fire official needs to be able to respond to emergency events regardless of initial cause. There is an additional change that puts this section in the IBC and IEBC. It is the intent for all three sections to undergo this change.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

While this is not a change in construction requirements, by allowing for preplanning, this will most likely result in a reduction of cost. This will allow for a quicker response and for officials to work together, and averting additional costs.

ADM24-25

ADM25-25

IFC: 104.2.4.2

Proponents: Jonathan Flannery, representing Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org)

2024 International Fire Code

Revise as follows:

[A] 104.2.4.2 Natural disasters or public health emergencies. In preparation for, during and after a natural disaster event or a public health emergency, ~~as determined by the *fire code official*,~~the *fire code official* shall have the authority to issue written policies, procedures or rules that modify this code as necessary to protect life and property. Such policies, procedures or rules shall be made available to the public and shall include start and end dates, which can be extended at the *fire code official ' s* discretion.

Reason: The IFC Code Development Committee rejected proposal F153-24 in CAH #1 and CAH #2 that would allow the fire code official some enforcement flexibilities regarding occupant loads during specific events. At CAH #2, it was suggested by the committee that this should be located in section 104 of the IFC instead of chapter 10. The original proposal specifically noted allowances for increased or decreased occupant loads while maintaining the intended level of egress required by the code. Although this code change does not provide any specific parameters, the Pandemic Task Force Code Development Work Group recognized that both public health emergencies and natural disasters may require the fire code official to allow modifications and flexibilities for the public good at the same time provide protection of life and property that code intends. Based on the advice of the IFC Code Development Committee, this appear to be a reasonable application of the flexibility needed during these events and emergencies. Upon review of this code section, the PTF CDWG is also suggesting the deletion of a portion of the sentence that suggest the fire code official determines and, by default would declare either the public health emergency or the natural disaster. In the opinion of the group, the fire code official does not make this declaration and deletion of this portion of the sentence clarifies the role of the fire code official.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Tak Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds the intended public health emergency to help clarify that it was intended as part of natural disasters.

If entry is refused,or a *person* having apparent charge or control of the *structure* or premise is unable to be located,the *code official* shall have recourse to every remedy provided by law to secure entry.

2024 International Fire Code

Revise as follows:

[A] 104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *fire code official* has reasonable cause to believe that there exists in a structure or on any premises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the *fire code official* is authorized to enter the structure or premises at all reasonable times to inspect or to perform the duties imposed on the *fire code official* by this code. ~~If such structure or premises is occupied, the *fire code official* shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The*fire code official* shall first make a reasonable effort to locate ~~the *owner*, the *owner 's* authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If entry is refused,or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the *fire code official* shall have recourse to every remedy provided by law to secure entry.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *code official* has reasonable cause to believe that there exists in a structure or on anypremises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the *code official* is authorized to enter the structure or premises at all reasonable times to inspect or to perform the duties imposed by this code. ~~If such structure or premises is occupied, the *code official* shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ the code official shall first make a reasonable effort to locate ~~the owner, the owner's authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If entry is refused or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the code official shall have recourse to every remedy provided by law to secure entry.

2024 International Green Construction Code

Revise as follows:

104.5 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the authority having jurisdiction has reasonable cause to believe that there exists in a structure or on a premises any conditions or violations of this code that make the structure or premises unsafe, dangerous or hazardous, the authority having jurisdiction shall have the authority to enter the structure or premises at all reasonable times to inspect or to perform the duties imposed on the authority having jurisdiction by this code. ~~If such structure or premises is occupied, the authority having jurisdiction shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The authority having jurisdiction shall first make a reasonable effort to locate ~~the owner, the owner's authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If entry is refused, or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the authority having jurisdiction shall have recourse to every remedy provided by law to secure entry.

2024 International Mechanical Code

Revise as follows:

[A] 104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the code official has reasonable cause to believe that there exists in a structure or on any premises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the code official is authorized to enter the structure or premises at all reasonable times to inspect or to perform the duties imposed by this code. ~~If such structure or premises is occupied, the code official shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The code official shall first make a reasonable effort to locate ~~the owner, the owner's authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If entry is refused, or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the code official shall have recourse to every remedy provided by law to secure entry.

2024 International Plumbing Code

Revise as follows:

[A] 104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the code official has reasonable cause to believe that there exists in a structure or on any premises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the code official is authorized to enter the structure or premises at all reasonable times to inspect or to perform the duties imposed by this code. ~~If such structure or premises is occupied, the code official shall present credentials to the occupant and request entry.If such building or premises is occupied, the code official shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The code official shall first make a reasonable effort to locate ~~the owner, the owner's authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If entry is refused, or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the code official shall have recourse to every remedy provided by law to secure entry.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the code official has reasonable cause to believe that there exists in a structure or on any premises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the code official is authorized to enter the structure or premises at all reasonable times to inspect or to perform the duties imposed by this code. ~~If such structure or premises is occupied, the code official shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The code official shall first make a reasonable effort to locate ~~the owner, the owner's authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If entry is refused, or a *person* having charge or control of the *structure* or premise is unable to be located, the code official shall have recourse to every remedy provided by law to secure entry.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.3 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *code official* has reasonable cause to believe that there exists in a *structure* or on any *premises* a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the *code official* is authorized to enter the *structure* or *premises* at all reasonable times to inspect or perform the duties imposed by this code. ~~If such *structure* or *premises* is occupied, the *code official* shall present credentials to the *occupant* and request entry. If such *structure* or *premises* is unoccupied, the~~ The *code official* shall first make a reasonable effort to locate ~~the *owner*, *owner*'s authorized agent or other~~ a *person* having apparent charge or control of the *structure* or *premises* and request entry. If entry is refused, or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the *code official* shall have recourse to every remedy provided by law to secure entry.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *code official* has reasonable cause to believe that there exists in a structure or on a premises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the *code official* is authorized to enter the structure or premises at reasonable times to inspect or to perform the duties imposed by this code. ~~If such structure or premises is occupied, the code official shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The code official shall first make a reasonable effort to locate ~~the owner, the owner's authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If entry is refused, or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the code official shall have recourse to every remedy provided by law to secure entry.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *code official* has reasonable cause to believe that there exists in a structure or on any premises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the *code official* is authorized to enter the structure or premises at all reasonable times to inspect or to perform the duties imposed by this code. ~~If such structure or premises is occupied, the *code official* shall present proper credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The *code official* shall first make a reasonable effort to locate ~~the owner, the owner's authorized agent or other~~ a person having apparent charge or control of the structure or premises and request entry. If such entry is refused,or a *person* having apparent charge or control of the *structure* or premise is unable to be located, then the *code official* shall have recourse to every remedy provided by law to secure entry.

2024 International Residential Code

Revise as follows:

R104.4 Right of entry. Where it is necessary to make an inspection to enforce the provisions of this code, or where the *building official* has reasonable cause to believe that there exists in a *structure* or on any premises a condition that is contrary to or in violation of this code that makes the structure or premises unsafe, dangerous or hazardous, the *building official* is authorized to enter the *structure* or premises at all reasonable times to inspect or to perform the duties imposed by this code. ~~If such structure or premises is occupied, the *building official* shall present credentials to the occupant and request entry. If such structure or premises is unoccupied, the~~ The *building official* shall first make a reasonable effort to locate ~~the *owner*, the *owner*'s authorized agent, or other~~ a *person* having apparent charge or control of the structure or premises and request entry. If entry is refused, or a *person* having apparent charge or control of the *structure* or premise is unable to be located, the *building official* shall have recourse to every remedy provided by law to secure entry.

Reason: The proposed amendments to Section 104.4 "Right of Entry" aims to enhance clarity, efficiency, and compliance with constitutional standards. The deletion of specifics regarding occupancy simplifies the entry procedure, ensuring a uniform approach that reflects broader Fourth Amendment principles; privacy rights should be consistent regardless of whether a property is occupied or not. The introduction of "apparent" charge and control aligns the code with Illinois v. Rodriguez (1990), where the Supreme Court clarified that consent from someone with apparent authority over the premises is valid. Code officials should be well-versed in this case, however this code change will likely necessitate refreshing.

By consolidating specific persons - "the owner, the owner's authorized agent or other [etc.]" - to "a person having apparent charge or control," the amendment removes redundancy and arguable burden of proving formal authorization, focusing instead on practical control, which is more in line with Illinois v. Rodriguez. The clarification on unsuccessful entry maintains the provision for officials to use legal remedies when consent is not forthcoming or when no one with apparent control can be located; the proposed language reinforces the intent in this aspect.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change clarifies administrative provisions to reduce complexity and delete potential search consent issues; there is no direct cost impact.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 104.7 Official records. The *building official* shall keep ~~official~~ records of the agency as required by Sections 104.7.1 through 104.7.5. Such ~~official~~ records shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~for not less than 5 years or for as long as the building or *structure* to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals**. A record of approvals shall be maintained by the *building official* and shall be available for public inspection during business hours in accordance with applicable laws.~~

[A] 104.7.1 Approvals. The *building official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.

Revise as follows:

[A] 104.7.2 Inspections. The *building official* shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ and the findings and disposition of each.

[A] 104.7.3 Code alternatives and modifications. The *building official* shall keep a record of each application, and the final determination of each application, ~~Application~~ for alternative materials, design and methods of construction and equipment submitted in accordance with Section 104.2.3~~;~~ and modifications submitted in accordance with Section 104.2.4~~; and documentation of the final decision of the *building official* for either shall be in writing and shall be retained in the official records~~.

[A] 104.7.4 Tests. The *building official* shall ~~keep a~~ record ~~of tests~~ test information submitted ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

[A] 104.7.5 Fees. The *building official* shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 109.

Delete without substitution:

~~**[A] 107.5 Retention of construction documents.** One set of *approved construction documents* shall be retained by the *building official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~

2024 International Existing Building Code

Revise as follows:

[A] 104.7 ~~Official~~ Agency records. The *code official* shall keep ~~official~~ records of the agency as required by Sections 104.7.1 through 104.7.5. Such official records shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~for not less than 5 years or for as long as the structure or activity to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals.** A record of approvals shall be maintained by the *code official* and shall be available for public inspection during business hours in accordance with applicable laws.~~

[A] 104.7.1 Approvals. The code official shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.

Revise as follows:

[A] 104.7.2 Inspections. The *code official* shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ and the findings and disposition of each.

[A] 104.7.3 Code alternatives and modifications. The *code official* shall keep a record of each application, and the final determination of each application, ~~Application~~ for alternative materials, design and methods of construction and equipment submitted in accordance with Section 104.2.3~~;~~ and modifications submitted in accordance with Section 104.2.4~~; and documentation of the final decision of the *building official* for either shall be in writing and shall be retained in the official records~~.

[A] 104.7.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ test information submitted ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

[A] 104.7.5 Fees. The *code official* shall ~~keep a~~ record ~~of~~ fees collectedand refunded in accordance with Section 108.

Delete without substitution:

~~**[A] 106.5 Retention of construction documents.** One set of *approved* construction documents shall be retained by the *code official* for a period of not less than the period required for retention of public records.~~

2024 International Fire Code

Revise as follows:

[A] 104.7 ~~Official~~ Agency records. The *fire code official* shall keep ~~official~~ records of the agency as required by Sections 104.7.1 through 104.7.6. Such ~~official~~ records shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~for not less than 5 years or for as long as the building or structure to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals.** A record of approvals shall be maintained by the *fire code official* and shall be available for public inspection during business hours in accordance with applicable laws.~~

[A] 104.7.1 Approvals. The fire code official shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.

Revise as follows:

[A] 104.7.2 Inspections. The *fire code official* shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ and the findings and disposition of each.

104.7.3 Fire records. The *fire* code ~~offical~~ official shall ~~keep a~~ record ~~of~~ fires occurring within its jurisdiction and of facts concerning the same, including statistics as to the extent of such fires and the damage caused thereby, together with other information as required by the *fire code official*.

[A] 104.7.4 Code alternatives and modifications. The fire code official shall keep a record of each application, and the final determination of each application, ~~Application~~ for alternative materials, design and methods of construction and equipment submitted in accordance with Section 104.2.3~~;~~ and each modifications submitted in accordance with Section 104.2.4~~; and documentation of the final decision of the *fire code official* for either shall be in writing and shall be retained in the official records~~.

[A] 104.7.5 Tests. The *fire code official* shall ~~keep a~~ record ~~of tests~~ test information submitted ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

[A] 104.7.6 Fees. The *fire code official* shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 108.

[A] 106.4 Retention of construction documents. ~~One set of *construction documents* shall be retained by the *fire code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~ One set of *approved construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.7 ~~Official~~ Agency records. The *code official* shall keep ~~official~~ records of the agency as required by Sections 104.7.1 through 104.7.5. Such ~~official~~ records shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction~~for not less than 5 years or for as long as the building or structure to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals.**. A record of approvals shall be maintained by the *code official* and shall be available for public inspection during business hours in accordance with applicable laws.~~

[A] 104.7.1 Approvals. The *code official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.

Revise as follows:

[A] 104.7.2 Inspections. ~~The *code official* shall have the authority to conduct inspections, or shall accept reports of inspection by *approved agencies* or individuals. Reports of such inspections shall be in writing and be certified by a responsible officer of such *approved agency* or by the responsible individual.~~ The *code official* shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ and the findings and disposition of each.

[A] 104.7.3 Code alternatives and modifications. The *code official* shall keep a record of each application, and the final determination of each application,~~Application~~ for alternative materials, design and methods of construction and *equipment* submitted in accordance with Section 104.2.3~~;~~ and modifications submitted in accordance with Section 104.2.4~~; and documentation of the final decision of the *code official* for either shall be in writing and shall be retained in the official records.~~

[A] 104.7.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ test information submitted ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

[A] 104.7.5 Fees. The *code official* shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 108.

[A] 106.2 Retention of construction documents. ~~One set of *approved construction documents* shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~ One set of *approved construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.

2024 International Green Construction Code

Revise as follows:

104.8 ~~Official~~ Agency records. The authority having jurisdiction shall keep ~~official~~ records of the agency as required by Sections 104.8.1 through 104.8.5. Such ~~official~~ records shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~for not less than 5 years or for as long as the building or structure to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**104.8.1 Approvals**. A record of approvals shall be maintained by the authority having jurisdiction and shall be available for public inspection during business hours in accordance with applicable laws.~~

104.8.1 Approvals. The *authority having jurisdiction*shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.

Revise as follows:

104.8.2 Inspections. The code official shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ and the findings and disposition of each.

104.8.3 Code alternatives and modifications. The *code official* shall keep a record of each application, and the final determination of each application.~~Application~~ for alternative materials, design and methods of construction and equipment submitted in accordance with Section 104.2.5~~;~~ and modifications submitted in accordance with Section 104.2.6~~; and documentation of the final decision of the authority having jurisdiction for either shall be in writing and shall be retained in the official records~~.

104.8.4 Tests. The authority having jurisdictionshall ~~keep a~~ record ~~of tests~~ test information submitted ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.5.5.

104.8.5 Fees. The authority having jurisdiction shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 108.

2024 International Mechanical Code

Revise as follows:

[A] 104.7 ~~Official~~ Agency records. The code official shall keep ~~official~~ records of the agency as required by Sections 104.7.1 through 104.7.5. Such ~~official~~ records shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~for not less than 5 years or for as long as the *building* or structure to which such records relate remains in existence, unless~~

~~otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**104.7.1 Approvals.** A record of approvals shall be maintained by the code official and shall be available for public inspection during business hours in accordance with applicable laws.~~

<u>**104.7.1**</u> <u>**Approvals.**</u> <u>The *code official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.</u>

Revise as follows:

104.7.2 Inspections. ~~The code official shall have the authority to conduct inspections, or shall accept reports of inspection by approved agencies or individuals. Reports of such inspections shall be in writing and be certified by a responsible officer of such approved agency or by the responsible individual.~~ The code official shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ <u>and</u> the findings and disposition of each.

104.7.3 Code alternatives and modifications. <u>The *code official* shall keep a record of each application, and the final determination of each application.</u>~~Application~~ for alternative materials, design and methods of construction and *equipment* <u>submitted</u> in accordance with Section 104.2.3~~;~~ <u>and</u> modifications in accordance with Section 104.2.4~~; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records~~.

104.7.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ <u>test information submitted</u> ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

104.7.5 Fees. The code official shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 108.

[A] 106.2 Retention of construction documents. ~~One set of *approved construction documents* shall be retained by the code official for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~ One set of *approved construction documents* shall be returned to the applicant, and said set shall be kept on the site of the *building* or job at all times during which the work authorized thereby is in progress.

2024 International Plumbing Code

Revise as follows:

[A] 104.7 ~~Official~~ <u>Agency</u> records. The code official shall keep ~~official~~ records <u>of the agency</u> as required by Sections 104.7.1 through 104.7.5. Such ~~official~~ records shall be retained <u>and made available to the public where required by the laws and ordinances of this jurisdiction</u> ~~for not less than 5 years or for as long as the building or structure to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals.** A record of approvals shall be maintained by the code official and shall be available for public inspection during business hours in accordance with applicable laws.~~

<u>**[A]**</u> <u>**104.7.1**</u> <u>**Approvals.**</u> <u>The *code official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.</u>

Revise as follows:

[A] 104.7.2 Inspections. ~~The code official shall have the authority to conduct inspections, or shall accept reports of inspection by~~

~~approved agencies or individuals. Reports of such inspections shall be in writing and be certified by a responsible officer of such approved agency or by the responsible individual.~~ The code official shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ <u>and</u> the findings and disposition of each.

[A] 104.7.3 Code alternatives and modifications. <u>The *code official* shall keep a record of each application, and the final determination of each application,</u>~~Application~~ for alternative materials, design and methods of construction and equipment <u>submitted</u> in accordance with Section 104.2.3~~;~~ <u>and</u> modifications <u>submitted</u> in accordance with Section 104.2.4~~; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records~~.

[A] 104.7.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ <u>test information submitted</u> ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

[A] 104.7.5 Fees. The code official shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 108.

[A] 106.2 Retention of construction documents. ~~One set of *approved* construction documents shall be retained by the code official for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~One set of *approved* construction documents shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.7 ~~Official~~ <u>Agency</u> records. The code official shall keep ~~official~~ records <u>of the agency</u> as required by Sections 104.7.1 through 104.7.5. Such ~~official~~ records shall be retained <u>and made available to the public where required by the laws and ordinances of this jurisdiction</u> ~~for not less than 5 years or for as long as the building or structure to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals**. A record of approvals shall be maintained by the code official and shall be available for public inspection during business hours in accordance with applicable laws.~~

<u>**[A] 104.7.1 Approvals.** The *code official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.</u>

Revise as follows:

[A] 104.7.2 Inspections. ~~The code official shall have the authority to conduct inspections, or shall accept reports of inspection by approved agencies or individuals. Reports of such inspections shall be in writing and be certified by a responsible officer of such approved agency or by the responsible individual.~~ The code official shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ <u>and</u> the findings and disposition of each.

[A] 104.7.3 Code alternatives and modifications. <u>The *code official* shall keep a record of each application, and the final determination of each application,</u>~~Application~~ for alternative materials, design and methods of construction and equipment <u>submitted</u> in accordance with Section 104.2.3~~;~~ <u>and</u> modifications <u>submitted</u> in accordance with Section 104.2.4~~; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records~~.

[A] 104.7.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ <u>test information submitted</u> ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

[A] 104.7.5 Fees. The code official shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 106.

[A] 107.2 Retention of construction documents..

~~One set of approved *construction documents* shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~ One set of approved *construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.6 ~~Official~~ Agency records. The *code official* shall keep ~~official~~ records of the agency as required by Sections 105.6.1 through 105.6.5. Such ~~official~~ records shall be retained and made available to the public where required by the laws and ordinances of this jurisdiction ~~for not less than 5 years or for as long as the building or structure to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 105.6.1 Approvals.** A record of approvals shall be maintained by the code official and shall be available for public inspection during business hours in accordance with applicable laws.~~

[A] 105.6.1 Approvals. The *code official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.

Revise as follows:

[A] 105.6.2 Inspections. ~~The code official shall have the authority to conduct inspections, or shall accept reports of inspection by approved agencies or individuals. Reports of such inspections shall be in writing and be certified by a responsible officer of such approved agency or by the responsible individual.~~ The code official shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ and the findings and disposition of each.

[A] 105.6.3 Code alternatives and modifications. The *code official* shall keep a record of each application, and the final determination of each application.~~Application~~ for alternative materials, design and methods of construction and equipment submitted in accordance with Section 105.2.2~~;~~ and modifications submitted in accordance with Section 105.2.3~~; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records~~.

[A] 105.6.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ test information submitted ~~conducted~~ to comply with Sections 105.2.1.4 and 105.2.2.5.

[A] 105.6.5 Fees. The code official shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 104.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.7 ~~Official~~ Agency records. The code official shall keep ~~official~~ records as required by Sections 104.7.1 through 104.7.5. Such ~~official~~ records shall be retained for not less and made available to the public where required by the laws and ordinances of this jurisdiction ~~than 5 years or for as long as the building or structure to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals**. A record of approvals shall be maintained by the code official and shall be available for public inspection during business hours in accordance with applicable laws.~~

<u>**[A] 104.7.1 Approvals.** The *code official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.</u>

Revise as follows:

[A] 104.7.2 Inspections. ~~The code official shall have the authority to conduct inspections, or shall accept reports of inspection by approved agencies or individuals. Reports of such inspections shall be in writing and be certified by a responsible officer of such approved agency or by the responsible individual.~~ The code official shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ <u>and</u> the findings and disposition of each.

[A] 104.7.3 Code alternatives and modifications. <u>The *code official* shall keep a record of each application, and the final determination of each application,</u>~~Application~~ for alternative materials, design and methods of construction and equipment <u>submitted</u> in accordance with Section 104.2.3~~;~~ <u>and</u> modifications <u>submitted</u> in accordance with Section 104.2.4~~; and documentation of the final decision of the code official for either shall be in writing and shall be retained in the official records~~.

[A] 104.7.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ <u>test information submitted</u> ~~conducted~~ to comply with Sections 104.2.2.4 and 104.2.3.5.

[A] 104.7.5 Fees. The code official shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 109.

[A] 107.2 Retention of construction documents.

~~One set of approved *construction documents* shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~ One set of approved *construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.7 ~~Official~~ <u>Agency</u> records. The *code official* shall keep ~~official~~ records <u>of the agency</u> as required by Sections 104.7.1 through 104.7.5. Such ~~official~~ records shall be retained <u>and made available to the public where required by the laws and ordinances of this jurisdiction</u> ~~for not less than 5 years or for as long as the structure or activity to which such records relate remains in existence, unless otherwise provided by other regulations~~.

Delete and substitute as follows:

~~**[A] 104.7.1 Approvals**. A record of approvals shall be maintained by the *code official* and shall be available for public inspection during business hours in accordance with applicable laws.~~

<u>**[A] 104.7.1 Approvals.** The *code official* shall record each approval issued, including notices and orders issued, showing the finding and disposition of each.</u>

Revise as follows:

[A] 104.7.2 Inspections. The *code official* shall ~~keep a~~ record ~~of~~ each inspection made, including notices and orders issued, ~~showing~~ <u>and</u> the findings and disposition of each.

[A] 104.7.3 Code alternatives and modifications. The *code official* shall keep a record of each application, and the final determination of each application.~~Application~~ for alternative materials, design and methods of construction and equipment submitted in accordance with Section 104.2.2~~;~~ and modifications in accordance with Section 104.2.3~~; and documentation of the final decision of the *code official* for either shall be in writing and shall be retained in the official records~~.

[A] 104.7.4 Tests. The *code official* shall ~~keep a~~ record ~~of tests~~ test information submitted ~~conducted~~ to comply with Sections 104.2.1.4 and 104.2.2.5.

[A] 104.7.5 Fees. The *code official* shall ~~keep a~~ record ~~of~~ fees collected and refunded in accordance with Section 108.

Delete without substitution:

~~**[A] 105.9 Retention of permits.**~~ ~~Permits shall at all times be kept on the premises designated therein and shall at all times be subject to inspection by the *code official* or other authorized representative.~~

Revise as follows:

[A] 106.8 Retention of plans. ~~One set of *approved* plans, specifications and computations shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work or as required by state or local laws;~~ and one set of *approved* plans and specifications shall be returned to the applicant, and said set shall be kept on the site of the building, use or work at all times during which the work authorized thereby is in progress.

Delete without substitution:

~~**405.4 Plan retention.**~~ ~~The *fire protection plan* shall be retained by the *code official*.~~

APPENDIX BA
MANUFACTURED HOUSING USED AS DWELLINGS

~~**BA106.2 Retention of plans.** One set of *approved* plans and specifications shall be returned to the applicant and shall be kept on the site of the *building* or work at all times during which the work authorized thereby is in progress. One set of *approved* plans, specifications and computations shall be retained by the *building official* until final approval of the work.~~

Reason: This code change removes the default 5-year record retention period, clarifying that records must be retained and made available to the public solely according to local laws and ordinances, along with various editorial changes.

Virtually every jurisdiction has established record retention schedules, whether locally or at the state level. The previous 5-year default could cause confusion, as officials might misinterpret it as a minimum requirement, potentially overriding local laws with shorter retention times leading to unintentional non-compliance. Additionally, the public could be misled about actual retention periods, hindering access to information and creating over-reliance on agencies to maintain building records that should ultimately be the owner's responsibility.

Removing the default emphasizes that local laws are the sole authority on record retention. This simplifies the code and encourages code officials and the public to refer to the proper authority for records retention.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes in this code are editorial and emphasizes the codes existing deference to other laws and ordinances.

2024 International Building Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Existing Building Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Fire Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse~~.~~. Materials, *equipment* and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.

2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Green Construction Code

Revise as follows:

104.10.1 Material, product and equipment reuse. Materials, products, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Mechanical Code

Revise as follows:

[A] 104.9.1 Material and equipment reuse. Materials, *equipment* and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Plumbing Code

Revise as follows:

[A] 104.9.1 Material and equipment reuse. Materials, equipment and devices shall not be reused unless such elementscomply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elementsare in good working condition, ~~and~~*approved*, and used in the same type of application as the original installation.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.

2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.8.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

ADM29-25 Part I

ADM29-25 Part II

IRC: R104.9.1

Proponents: Kevin Scott, KH Scott & Associates LLC, representing self (khscottassoc@gmail.com)

2024 International Residential Code

Revise as follows:

R104.9.1 Materials and equipment reuse. Materials, *equipment* and devices shall not be reused unless such elements comply with at least one of the following:

1. The elements are listed as rebuilt equipment and installed in accordance with the listing, the manufacturer's installation instructions and this code.
2. The elements are in good working condition, ~~and~~ *approved*, and used in the same type of application as the original installation.

Reason: The reuse of materials, equipment and devices is very common for a variety of reasons. Those reasons include sustainability, cost, availability of products, installation design, or a product is no longer manufactured. A product that can meet the needs of the owner and still perform the desired functions should not be prohibited just because of being an existing item.
However, guidance and tools to provide approval for their reuse are needed. Current language in Chapter 1 requires reused materials to be in good working condition and to be approved. Certain factors need to be considered before such approval.
Equipment and devices that are recertified to be in accordance with the listing standard are included in Item 1. These items are listed as rebuilt equipment and should be allowed based on the additional listing.

Equipment and devices can also be approved in Item 2 provided they are in good working condition, approved by the code official, and reused in the same application as the original installation. For example, this would allow faucets on a sink to be reinstalled as faucets on a sink provided they are in good working condition. It would not allow gas piping to be reinstalled as water piping.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. This proposal presents the ability to reuse materials rather than purchase new.

Estimated Immediate Cost Impact Justification (methodology and variables):

The fact that this revision allows for the reuse of materials would reduce the cost of construction because new materials would not need to be purchased. There could be a cost to have the previously used material evaluated, examined or tested. The cost for this analysis would be measured against the cost of purchasing new materials or equipment. The owner has the option to choose which path to follow.

2024 International Building Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless ~~such elements are in good working condition and~~ approved <u>in accordance with Sections 104.9.1.1 through 104.9.1.2.</u>

Add new text as follows:

<u>**[A] 104.9.1.1 Condition of reused materials, equipment and devices.** Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:</u>

1. <u>Not damaged, broken, or deteriorated.</u>
2. <u>Reused in the same type of application.</u>
3. <u>In good working condition.</u>
4. <u>Installed and used in compliance with this code.</u>

<u>**[A] 104.9.1.1.1 Electrical equipment exposed to fire or water.** Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.</u>

> <u>**Exception:** Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.</u>

<u>**[A] 104.9.1.2 Required inspection.** The *building official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.</u>

2024 International Existing Building Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements are ~~in good working condition and~~ *approved* <u>in accordance with Sections 104.9.1.1 through 104.9.1.2.</u>

Add new text as follows:

104.9.1.1 **Condition of reused materials, equipment and devices.** Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 Condition of reused materials, equipment and devices. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Fire Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements are ~~in good working order and~~ *approved* in accordance with Sections 104.9.1.1 through 104.9.1.2.

Add new text as follows:

104.9.1.1 **Condition of reused materials, equipment and devices.** Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 **Electrical equipment exposed to fire or water.** Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 **Required inspection.** The *fire code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Fuel Gas Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse.. Materials, *equipment* and devices shall not be reused unless such elements are ~~in good working condition and~~ *approved* in accordance with Sections 104.9.1.1 through 104.9.1.2. .

Add new text as follows:

104.9.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition
4. Installed and used in compliance with this code

104.9.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Mechanical Code

Revise as follows:

[A] 104.9.1 Material and equipment reuse. Materials, *equipment* and devices shall not be reused unless such elements are ~~in good working condition and~~ *approved* in accordance with Sections 104.9.1.1 through 104.9.1.2.

Add new text as follows:

104.9.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

> **Exception:** Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Plumbing Code

Revise as follows:

[A] 104.9.1 Material and equipment reuse. Materials, equipment and devices shall not be reused unless such elements are ~~in good working condition and~~ *approved* in accordance with Sections 104.9.1.1 through 104.9.1.2.

Add new text as follows:

104.9.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

> **Exception:** Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements are ~~in good working condition and~~ approved in accordance with Sections 104.9.1.1 through 104.9.1.2..

Add new text as follows:

104.9.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Property Maintenance Code

Revise as follows:

[A] 105.8.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements are ~~in good working condition and~~ approved in accordance with Sections 105.8.1.1 through 105.8.1.2. .

Add new text as follows:

105.8.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

105.8.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

105.8.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements are ~~in good working condition and~~ approved in accordance with Sections 104.9.1.1 through 104.9.1.2..

Add new text as follows:

104.9.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 104.9.1 Materials and equipment reuse. Materials, equipment and devices shall not be reused unless such elements are ~~in good working order and~~ *approved* in accordance with Sections 104.9.1.1 through 104.9.1.2..

Add new text as follows:

104.9.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *code official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

ADM30-25 Part I

ADM30-25 Part II

IRC: R104.9.1, 104.9.1.1 (New), 104.9.1.1.1 (New), 104.9.1.2 (New)

Proponents: John Taecker, Taecker Codes & Technical Services, representing Taecker Codes & Technical Services (john@taeckercodes.com)

2024 International Residential Code

Revise as follows:

R104.9.1 Materials and equipment reuse. Materials, *equipment* and devices shall not be reused unless such elements are ~~in good working condition and~~ *approved* in accordance with Sections 104.9.1.1 through 104.9.1.2. .

Add new text as follows:

104.9.1.1 Condition of reused materials, equipment and devices. Materials, equipment and devices are permitted to be reused where such elements meet all of the following conditions:

1. Not damaged, broken, or deteriorated.
2. Reused in the same type of application.
3. In good working condition.
4. Installed and used in compliance with this code.

104.9.1.1.1 Electrical equipment exposed to fire or water. Electrical equipment, appliances or devices that have been exposed to fire or water shall not be permitted to be reused.

Exception: Electrical equipment, appliances or devices shall be allowed to be reused where an inspection report from the equipment manufacturer, an *approved* manufacturer's representative or an *approved* field evaluation body indicates that the equipment has not sustained damage, or has been *listed* and *labeled* as rebuilt equipment.

104.9.1.2 Required inspection. The *building official* is authorized to require *approved* professionals to verify, at the expense of the owner, that the used material, equipment or devices are suitable to be reused for the application in accordance with this code. Technical assistance is permitted to be provided in accordance with Section 104.2.2.

Reason: The reuse of materials, equipment and devices is very common for a variety of reasons. Those reasons include sustainability concerns, cost, availability of products, installation design, or a product is no longer manufactured. A product that can meet the needs of the consumer and still perform the desired functions should not be prohibited just because of being an existing item.

However, guidance and tools to provide approval, as well as guardrails to provide reasonable safeguards regarding reuse are needed to address health, safety and welfare as required by the codes. Chapter 1 of the existing codes only require reused materials, equipment and devices to be in good working condition and be approved. Other factors need to be considered before reuse. There are a few specific requirements for some materials, equipment and devices in the codes, but not all situations are addressed. For example, there are specific requirements for salvage lumber in IBC Section 2303.1.1.3 and IRC Sections R502.1.1.1 and R602.1.1.1, but there are no specific requirements that would prohibit the use of a fuel gas pipe for water piping.

Some additional factors to consider, besides "good working condition", include:

1. Damaged, broken, or deteriorated due to time or previous use
2. Not used for its original purpose
3. Subjected to fire, seismic, wind or water damage

There are specific requirements in the International Property Maintenance Code (Sections 604.3.1 and 604.3.2) that address electrical equipment that has been subjected to fire or water damage. There are also specific requirements in NFPA 70 (Sections 110.20 and 110.21) for reuse of electrical equipment.

The code official does have the ability to require technical assistance to determine code compliance in accordance with Section 104.2.2, but that section does not specifically permit the use of a third party inspection to determine if material, equipment or devices are suitable to be reused.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change has the potential to lower cost impacts by allowing materials that are suitable for the purpose to be reused. There is also the potential of a cost impact that would be related to the investigation and creation of a report for a specific product or the cost of a field evaluation. The cost in this case is not the major concern. If an owner desires a specific item, material, or piece of equipment to be reused, the owner needs to evaluate the costs related to the reuse versus the cost of replacing it with new. In other cases, there will be no cost impact.

Proponents: Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov)

2024 International Residential Code

Add new text as follows:

R104.10 Workmanship. Repairs, maintenance, alterations or installations shall be executed and installed in a workmanlike manner in accordance with this code and the manufacturer's installation instructions.

Reason: This code proposal suggests adding a provision to all the code books regarding "workmanship," as well as editing the provision in the International Property Maintenance Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code proposal will have no cost impact, as it is editing the language in the International Property Maintenance Code, as well as adding this provision to all the other code books. It is editorial in nature and does not change the intent of any code language.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 105.1.1 Annual permit. Instead of an individual *permit* for each *alteration* to an already *approved* electrical, gas, mechanical or plumbing installation, the *building official* is authorized to issue an annual *permit* upon application therefor to any *person*~~, firm or corporation~~ regularly employing one or more qualified tradespersons in the building, *structure* or on the premises owned or operated by the applicant for the *permit*.

[A] 114.1 Unlawful acts. It shall be unlawful for any *person*~~, firm or corporation~~ to erect, construct, alter, extend, *repair*, move, remove, demolish or occupy any *building*, *structure* or equipment regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

[BS] APPROVED FABRICATOR. An established and qualified *person*~~, firm or corporation~~ *approved* by the *building official* pursuant to Chapter 17 of this code.
[A] APPROVED SOURCE. An independent *person*~~, firm or corporation,~~ *approved* by the *building official*, who is competent and experienced in the application of engineering principles to materials, methods or systems analyses.
[A] OWNER. Any *person*~~, agent, operator, entity, firm or corporation~~ having any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such *person*, and the executor or administrator of the estate of such *person* if ordered to take possession of real property by a court.
[A] PERSON. An individual, heirs, executors, administrators or assigns, and also includes a firm, partnership or corporation, its or their successors or assigns, or the agent of any of the aforesaid.

[F] 414.1.3 Information required. A report shall be submitted to the *building official* identifying the maximum expected quantities of *hazardous materials* to be stored, used in a *closed system* and used in an *open system*, and subdivided to separately address *hazardous material* classification categories based on Tables 307.1(1) and 307.1(2). The methods of protection from such hazards, including but not limited to *control areas*, *fire protection systems* and Group H occupancies shall be indicated in the report and on the *construction documents*. The opinion and report shall be prepared by a qualified *person*~~, firm or corporation~~ *approved* by the *building official* and provided without charge to the enforcing agency.

For *buildings* and *structures* with an occupancy in Group H, separate floor plans shall be submitted identifying the locations of anticipated contents and processes so as to reflect the nature of each occupied portion of every building and *structure*.

H104.1 Identification. Every outdoor advertising *display sign* hereafter erected, constructed or maintained, for which a *permit* is required, shall be plainly marked with the name of the *person*~~, firm or corporation~~ erecting and maintaining such *sign* and shall have affixed on the front thereof the *permit* number issued for said *sign* or other method of identification *approved* by the *building official*.

2024 International Existing Building Code

Revise as follows:

[A] 105.1.1 Annual permit. Instead of an individual permit for each *alteration* to an already *approved* electrical, gas, mechanical, or plumbing installation, the *code official* is authorized to issue an annual permit on application therefor to any person~~, firm or corporation~~ regularly employing one or more qualified trade persons in the building, structure, or on the premises owned or operated by the applicant for the permit.

[A] 113.1 Unlawful acts. It shall be unlawful for any person~~, firm or corporation~~ to *repair*, alter, extend, add, move, remove, demolish or change the occupancy of any building or equipment regulated by this code or cause same to be done in conflict with or in violation of any of the provisions of this code.

2024 International Fire Code

Revise as follows:

[A] 113.1 Unlawful acts. It shall be unlawful for a person~~, firm or corporation~~ to erect, construct, alter, repair, remove, demolish or utilize a building, occupancy, premises or system regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

[A] 105.1.6 Annual permit. Instead of an individual construction permit for each *alteration* to an already *approved* system or equipment installation, the *fire code official* is authorized to issue an annual permit on application therefor to any person~~, firm or corporation~~ regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

[A] OWNER. Any person~~, agent, operator, entity, firm or corporation~~ having any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such person, and the executor or administrator of the estate of such person if ordered to take possession of real property by a court.
[A] PERSON. An individual, heirs, executors, administrators or assigns, and also includes a firm, partnership or corporation, its or their successors or assigns, or the agent of any of the aforesaid.

2006.4.4 Operators. Aircraft-fueling vehicles that are operated by a person~~, firm or corporation~~ other than the permittee or the permittee's authorized employee shall be provided with a legible sign visible from outside the vehicle showing the name of the person, firm or corporation operating such unit.

5003.3.1.4 Responsibility for cleanup. The person~~, firm or corporation~~ responsible for an unauthorized discharge shall institute and complete all actions necessary to remedy the effects of such unauthorized discharge, whether sudden or gradual, without cost to the jurisdiction. Where deemed necessary by the *fire code official*, cleanup can be initiated by the fire department or by an authorized individual or firm. Costs associated with such cleanup shall be borne by the ~~*owner*, operator or other~~ *person* responsible for the unauthorized discharge.

2024 International Fuel Gas Code

Revise as follows:

[A] 105.1.1 Annual permit. Instead of an individual construction permit for each *alteration* to an already *approved* system or *equipment* installation, the *code official* is authorized to issue an annual permit upon application therefor to any person~~, firm or corporation~~ regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

[A] 113.1 Unlawful acts. It shall be unlawful for a person~~, firm or corporation~~ to erect, construct, alter, repair, remove, demolish or utilize an installation, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

2024 International Mechanical Code

Revise as follows:

[A] 105.1.1 Annual permit. Instead of an individual construction permit for each *alteration* to an already *approved* system or *equipment* or application installation, the code official is authorized to issue an annual permit upon application therefor to any person~~, firm or corporation~~ regularly employing one or more qualified tradespersons in the *building*, structure or on the premises owned or operated by the applicant for the permit.

[A] 114.1 Unlawful acts. It shall be unlawful for a person~~, firm or corporation~~ to erect, construct, alter, repair, remove, demolish or utilize a mechanical system, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

2024 International Plumbing Code

Revise as follows:

[A] 105.1.1 Annual permit. Instead of an individual construction permit for each alteration to an already *approved* system or equipment or appliance installation, the code official is authorized to issue an annual permit upon application therefor to any person~~, firm or corporation~~ regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

[A] 114.1 Unlawful acts. It shall be unlawful for any person~~, firm or corporation~~ to erect, construct, alter, repair, remove, demolish or utilize any plumbing system, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

2024 International Property Maintenance Code

Revise as follows:

[A] 107.1 Unlawful acts. It shall be unlawful for a *person*~~, firm or corporation~~ to be in conflict with or in violation of any of the provisions of this code.

[A] OWNER. Any *person*~~, agent, *operator*, firm or corporation~~ having legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding title to the property; or otherwise having control of the property, including the guardian of the estate of any such *person*, and the executor or administrator of the estate of such *person* if ordered to take possession of real property by a court.

Delete and substitute as follows:

~~**[A] PERSON.** An individual, corporation, partnership or any other group acting as a unit.~~
[A] PERSON. An individual, heirs, executors, administrators or assigns, and also includes a firm, partnership or corporation, its or their successors or assigns, or the agent of any of the aforesaid.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 105.1.1 Annual permit. Instead of an individual construction permit for each alteration to an already approved system or equipment or appliance installation, the *code official* is authorized to issue an annual permit upon application therefor to any person~~, firm or corporation~~ regularly employing one or more qualified tradespersons in the building, structure or on the premises owned or operated by the applicant for the permit.

[A] 113.1 Unlawful acts. It shall be unlawful for any person~~, firm or corporation~~ to erect, construct, alter, repair, remove, demolish or use any *private sewage disposal system*, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 113.1 Unlawful acts. It shall be unlawful for any person~~, firm or corporation~~ to erect, construct, alter, repair, remove, demolish or utilize any system, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

[A] OWNER. Any person~~, agent, operator, entity, firm or corporation~~ having any legal or equitable interest in the property; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such person, and the executor or administrator of the estate of such person if ordered to take possession of real property by a court.

2024 International Zoning Code

[A] PERSON. An individual, heirs, executors, administrators or assigns, and includes a firm, partnership or corporation, its or their successors or assigns, or the agent of any of the aforesaid.

ADM32-25 Part I

ADM32-25 Part II

IRC: R113.1, SECTION 202

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Residential Code

Revise as follows:

R113.1 Unlawful acts. It shall be unlawful for any *person*~~, firm or corporation~~ to erect, construct, alter, extend, *repair*, move, remove, demolish or occupy any *building*, structure or equipment regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code.

[RB] APPROVED SOURCE. An independent *person*~~, firm or corporation,~~ *approved* by the *building official*, who is competent and experienced in the application of engineering principles to materials, methods or systems analyses. For the definition applicable in Chapter 11, see Section N1101.6.

[RB] OWNER. Any *person*~~, agent, firm or corporation~~ having a legal or equitable interest in the property~~.~~; or recorded in the official records of the state, county or municipality as holding an interest or title to the property; or otherwise having possession or control of the property, including the guardian of the estate of any such*person*, and the executor or administrator of the estate of such*person*if ordered to take possession of real property by a court.

[RB] PERSON. An individual, heirs, executors, administrators or assigns, and a firm, partnership or corporation, its or their successors or assigns, or the agent of any of the aforesaid.

Reason: The inclusion of "firm or corporation" in the phrase "person, firm or corporation [,]" is redundant and creates unnecessary complexity in our code. The provided definition of "person" explicitly encompasses firms, partnerships, and corporations. Therefore, specifying "firm or corporation" adds no legal meaning and serves only to clutter the language. This is akin to saying "humans, men or women"—the broader term already encompasses the more specific categories.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change removes redundant language.

ADM32-25 Part II

ADM33-25

IFC: [A] 105.1.5, 105.1.5.1 (New), SECTION 202 (New)

Proponents: Jeffrey Hugo, NFSA - National Fire Sprinkler Association, representing NFSA (hugo@nfsa.org)

2024 International Fire Code

[A] 105.1.5 Repairs. Application or notice to the *fire code official* is not required for ordinary repairs to structures, equipment or systems. Such repairs shall not include the cutting away of any wall, partition or portion thereof, the removal or change of any required *means of egress*, or rearrangement of parts of a structure affecting the egress requirements; nor shall any repairs include addition to, *alteration* of, replacement or relocation of any standpipe, fire protection water supply, *automatic sprinkler system*, fire alarm system or other work affecting fire protection or life safety.

Add new text as follows:

105.1.5.1 Repairs performed as maintenance. *Fire protection system repairs* conducted as maintenance in accordance with Section 901.6 of this code shall not be considered modifications or replacements requiring a permit.

Add new definition as follows:

[A] REPAIR. The reconstruction, replacement or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.

Reason: This proposed new text to Section [A] 105.1.5.1 Repairs Performed as Maintenance clarifies that routine repairs and like-for-like replacements of fire sprinkler system components, as outlined in Section 901.6, do not require a permit. By incorporating the definition of "repair" from the IBC, IRC, and IEBC—the reconstruction, replacement, or renewal of any part of an existing building for maintenance or damage correction—the proposal ensures clear guidance on activities exempt from permit requirements. This amendment aligns with the code's intent to maintain operable fire protection systems while streamlining routine maintenance tasks and supporting timely repairs to enhance life safety.

- Clarifying the Definition of Repairs: Incorporates the existing definition of "repair" in the code (*the reconstruction, replacement, or renewal of any part of an existing building for maintenance or damage correction*), ensuring clear guidance on routine maintenance activities exempt from permit requirements.
- Encouraging Timely Repairs: Exempts like-for-like replacements of fire sprinkler components, such as sprinklers and minor parts (e.g., O-rings, gaskets), from permit requirements, reducing administrative delays and keeping systems operational.
- Inspection and testing per NFPA 25, NFPA 72 and on: Inspection, testing, and maintenance are foundational to system reliability and are already mandated by NFPA 25 and NFPA 72 (and more) enforced by the IFC and IPMC. These activities are routine and ensure systems remain operational. Requiring permits for these routine tasks do not need code official oversight. Many jurisdictions are getting inspection reports through a third party observing the inspections occurring in their jurisdiction already.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The IFC currently allows maintenance to occur without a permit. This change elaborates on the maintenance activities that are exempt from permits.

ADM33-25

ADM34-25 Part I

IBC: [A] 105.2; IWUIC: [A] 105.3

Proponents: Lucas Pump, City of Cedar Rapids, representing Self (l.pump@cedar-rapids.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATION CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. One-story detached accessory *structures* used as tool and storage sheds, playhouses, gazebos, pergolas and similar uses, provided that the floor area is not greater than 120 square feet (11 m^2).
2. Fences, other than swimming pool barriers, not over 7 feet (2134 mm) high.
3. Oil derricks.
4. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge or impounding Class I, II or IIIA liquids.
5. Water tanks supported directly on grade if the capacity is not greater than 5,000 gallons (18 925 L) and the ratio of height to diameter or width is not greater than 2:1.
6. Sidewalks and driveways not more than 30 inches (762 mm) above adjacent grade, and not over any *basement* or *story* below and are not part of an *accessible route*.
7. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
8. Temporary motion picture, television and theater stage sets and scenery.
9. Prefabricated *swimming pools* accessory to a Group R-3 occupancy that are less than 24 inches (610 mm) deep, are not greater than 5,000 gallons (18 925 L) and are installed entirely above ground.
10. Shade cloth *structures* constructed for nursery or agricultural purposes, not including service systems.
11. Swings and other playground equipment accessory to detached one- and two-family *dwellings*.
12. Window *awnings* in Group R-3 and U occupancies, supported by an *exterior wall* that do not project more than 54 inches (1372 mm) from the *exterior wall* and do not require additional support.
13. Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height.

Electrical:

1. ***Repairs* and maintenance:** Minor *repair* work, including the replacement of lamps or the connection of *approved* portable electrical equipment to *approved* permanently installed receptacles.
2. **Radio and television transmitting stations:** The provisions of this code shall not apply to electrical equipment used for radio and television transmissions, but do apply to equipment and wiring for a power supply and the installations of towers and antennas.
3. **Temporary testing systems:** A *permit* shall not be required for the installation of any temporary system required for the testing or servicing of electrical equipment or apparatus.

Gas:

1. Portable heating appliance.
2. Replacement of any minor part that does not alter approval of equipment or make such equipment unsafe.

Mechanical:

1. Portable heating appliance.
2. Portable ventilation equipment.
3. Portable cooling unit.
4. Steam, hot or chilled water piping within any heating or cooling equipment regulated by this code.
5. Replacement of any part that does not alter its approval or make it unsafe.
6. Portable evaporative cooler.
7. Self-contained refrigeration system containing 10 pounds (4.54 kg) or less of refrigerant and actuated by motors of 1 horsepower (0.75 kW) or less.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe, provided, however, that if any concealed trap, drain pipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures and the removal and reinstallation of water closets, provided that such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 105.3 Work exempt from permit. Unless otherwise provided in the requirements of the *International Building Code* or *International Fire Code*, a permit shall not be required for the following:

1. One-story detached accessory structures used as tool and storage sheds, playhouses, gazebos, pergolas and similar uses, provided that the floor area does not exceed 120 square feet (11.15 m^2) and the structure is located more than 50 feet (15 240 mm) from the nearest adjacent structure.
2. Fences not over 6 feet (1829 mm) high.

Exemption from the permit requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction.

The *code official* is authorized to stipulate conditions for permits. Permits shall not be issued where public safety would be at risk, as determined by the *code official*.

Reason: The addition of adding detached gazebos and pergolas under 120 sq. ft. would add clarification that these structures don't require a building permit. These structures typically pose very little safety concern similar to sheds and playhouses which are currently listed.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The average price of a building permit for a detached accessory structure, like a pergola or small gazebo, typically falls between $50 and $150 depending on the local jurisdiction and the size of the structure, with smaller structures often costing closer to the lower end of that range. According to the ICC

Building Valuation Data – August 2024, the valuation of a Utility/Miscellaneous building would be $64.85 per square foot. Most permit fees are calculated based on the square footage or valuation of the structure, so larger accessory structures will have higher permit costs. Some localities may also factor in additional fees based on inspections required, the complexity of the project, and the type of construction materials used.

Estimated Immediate Cost Impact Justification (methodology and variables):

See cost impact

ADM34-25 Part I

ADM34-25 Part II

IRC: R105.2

Proponents: Lucas Pump, City of Cedar Rapids, representing Self (l.pump@cedar-rapids.org)

2024 International Residential Code

Revise as follows:

R105.2 Work exempt from permit. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction.Permits* shall not be required for the following:

Building:

1. Other than *storm shelters*, one-*story* detached *accessory structures,* <u>gazebos, pergolas, and similar structures</u> provided that the floor area does not exceed 200 square feet (18.58 m^2).
2. Fences not over 7 feet (2134 mm) high.
3. *Retaining walls* that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge.
4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
5. Sidewalks and driveways.
6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
8. Swings and other playground equipment.
9. Window awnings supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
10. Decks not exceeding 200 square feet (18.58 m^2) in area, that are not more than 30 inches (762 mm) above *grade* at any point, are not attached to a *dwelling* or *townhouse* and do not serve the exit door required by Section R318.4.

Electrical:

1. *Listed* cord-and-plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Electrical wiring, devices, *appliances,* apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
5. Minor *repair* work, including the replacement of lamps or the connection of *approved* portable electrical equipment to *approved* permanently installed receptacles.

Gas:

1. Portable heating, cooking or clothes drying *appliances*.
2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Mechanical:

1. Portable heating *appliances*.
2. Portable ventilation *appliances*.
3. Portable cooling units.
4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.
5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
6. Portable evaporative coolers.
7. Self-contained refrigeration systems containing 10 pounds (4.54 kg) or less of refrigerant or that are actuated by motors of 1 horsepower (746 W) or less.
8. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Reason: Pergolas and Gazebos have always been a subject of debate on whether or not they require a building permit. Adding this language would make it clear that detached pergolas and gazebos are not required to have a building permit. These types of structures are typically purchased at the box stores and pose a low hazard. I believe that most building departments don't want to chase down pergolas and gazebos, as there isn't any guidance or code language to enforce currently within the I-Codes. Also, by adding "similar structures" it would allow the AHJ to use this language if a similar structure was proposed, like a small greenhouse or pavilion.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The average price of a building permit for a detached accessory structure, like a pergola or small gazebo, typically falls between $50 and $150 depending on the local jurisdiction and the size of the structure, with smaller structures often costing closer to the lower end of that range. According to the ICC Building Valuation Data – August 2024, the valuation of a Utility/Miscellaneous building would be $64.85 per square foot. Most permit fees are calculated based on the square footage or valuation of the structure, so larger accessory structures will have higher permit costs. Some localities may also factor in additional fees based on inspections required, the complexity of the project, and the type of construction materials used.

Estimated Immediate Cost Impact Justification (methodology and variables):

See cost impact statement.

ADM34-25 Part II

ADM35-25

IBC: [A] 105.2

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Building Code

Revise as follows:

[A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. One-story detached accessory structures used as tool and storage sheds, playhouses and similar uses, provided that the floor area is not greater than 120 square feet (11 m2).
2. Fences, other than swimming pool barriers, not over 7 feet (2134 mm) high.
3. Oil derricks.
4. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge or impounding Class I, II or IIIA liquids.
5. Water tanks supported directly on grade if the capacity is not greater than 5,000 gallons (18 925 L) and the ratio of height to diameter or width is not greater than 2:1.
6. Sidewalks and driveways not more than 30 inches (762 mm) above adjacent grade, and not over any basement or story below and are not part of an accessible route.
7. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
8. Temporary motion picture, television and theater stage sets and scenery.
9. Prefabricated swimming pools accessory to a Group R-3 occupancy that are less than 24 inches (610 mm) deep, are not greater than 5,000 gallons (18 925 L) and are installed entirely above ground.
10. Shade cloth structures constructed for nursery or agricultural purposes, not including service systems.
11. Swings and other playground equipment accessory to detached one- and two-family dwellings.
12. Window awnings in Group R-3 and U occupancies, supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
13. Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height.

Electrical:

1. **Repairs and maintenance:** Minor repair work, including the replacement of lamps or the connection of approved portable electrical equipment to approved permanently installed receptacles.**2. ~~Radio and television transmitting~~ Telecommunication and broadcast transmission stations:** The provisions of this code shall not apply to electrical equipment used for ~~radio and television~~ telecommunication and broadcast transmissions ~~,~~ but do apply to equipment and wiring for a power supply and the installations of towers and antennas.**3. Temporary testing systems:** A permit shall not be required for the installation of any temporary system required for the testing or servicing of electrical equipment or apparatus.

Gas:

1. Portable heating appliance.
2. Replacement of any minor part that does not alter approval of equipment or make such equipment unsafe.

Mechanical:

1. Portable heating appliance.
2. Portable ventilation equipment.
3. Portable cooling unit.
4. Steam, hot or chilled water piping within any heating or cooling equipment regulated by this code.
5. Replacement of any part that does not alter its approval or make it unsafe.
6. Portable evaporative cooler.
7. Self-contained refrigeration system containing 10 pounds (4.54 kg) or less of refrigerant and actuated by motors of 1 horsepower (0.75 kW) or less.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe, provided, however, that if any concealed trap, drain pipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a permit shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures and the removal and reinstallation of water closets, provided that such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Reason: This code change modernizes the language to match IBC 3108 for clarity.

Note: cdpACCESS did not copy the entire existing language of 105.2. The intent of this code change is to only affect the parts legislatively marked.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The language is updated for modern terminology and to point to other sections of code. No change to intent is made.

ADM35-25

ADM36-25

IFC: [A] 105.6.1, [A] 105.6.2, [A] 105.6.7, [A] 105.6.8, [A] 105.6.19, [A] 105.6.24

Proponents: Jeffrey Hugo, NFSA - National Fire Sprinkler Association, representing NFSA (hugo@nfsa.org)

2024 International Fire Code

Revise as follows:

[A] 105.6.1 Automatic fire-extinguishing systems. A construction permit is required for installation of or modification to an *automatic fire-extinguishing system* , other than an *automatic sprinkler system* . Maintenance performed in accordance with Section 901.6. of this code is not considered to be a modification and does not require a permit.

[A] 105.6.2 Automatic sprinkler systems. A construction permit is required for installation of or modification to an *automatic sprinkler system*. Maintenance performed in accordance with Section 901.6 of this code is not considered to be a modification and does not require a permit.

[A] 105.6.7 Fire alarm and detection systems and related equipment. A construction permit is required for installation of or modification to fire alarm and detection systems and related equipment. Maintenance performed in accordance with Section 901.6 of this code is not considered to be a modification and does not require a construction permit.

[A] 105.6.8 Fire pumps and related equipment. A construction permit is required for installation of or modification to fire pumps and related fuel tanks, jockey pumps, controllers and generators. Maintenance performed in accordance with Section 901.6 of this code is not considered to be a modification and does not require a construction permit.

[A] 105.6.19 Private fire hydrants. A construction permit is required for the installation or modification of private fire hydrants. Maintenance performed in accordance with Section 901.6 of this code is not considered to be a modification and does not require a permit.

[A] 105.6.24 Standpipe systems. A construction permit is required for the installation, modification or removal from service of a standpipe system. Maintenance performed in accordance with Section 901.6 of this code is not considered to be a modification and does not require a permit.

Reason: This proposal adds language to Section 105.6 to clarify that maintenance performed in accordance with Section 901.6 is not considered a modification and does not require a permit. This change is primarily editorial, points to the maintenance section, Section 901.6, which mandates routine maintenance, inspection, and testing to keep fire protection and life safety systems operational. By explicitly distinguishing maintenance from modifications, this addition ensures consistency in application of this code and its referenced maintenance standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is editorial in nature, as these sections already reference maintenance of the code, which are the standards referenced in Section 901.6.

ADM36-25

ADM37-25

IFC: SECTION 105, [A] 105.6, [A] 105.6.6

Proponents: Robert J Davidson, Davidson Code Concepts LLC, representing Self (rjd@davidsoncodeconcepts.com); Adria Smith, CSG Engineers, representing California Fire Prevention Officers (adrias@csgengr.com); Darcy Davidson, Carlsbad Fire Department, representing California Fire Prevention Officers (darcy.davidson@carlsbadca.gov); Robert Marshall, San Mateo Consolidated Fire Department, representing International Association of Fire Chiefs- Fire and Life Safety Section (rmarshall@smcfire.org); Crystal Sujeski, representing CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov)

2024 International Fire Code

SECTION 105
PERMITS

[A] 105.6 Required construction permits. The *fire code official* is authorized to issue construction permits for work as set forth in Sections 105.6.1 through 105.6.25.

Revise as follows:

[A] 105.6.6 Energy storage systems. A construction permit is required to install energy storage systems regulated by Section 1207 <u>or Section R330 of the *International Residential Code*.</u>

Reason: The relationship between the IFC and the IRC has historically required IFC permits for interior or exterior systems regulated by the IFC.

> ***2024 IFC (and earlier) [A] 102.5 Application of residential code.***
>
> *Where structures are designed and constructed in accordance with the International Residential Code, the provisions of this code shall apply as follows:*
>
> *1. Construction and design provisions of this code pertaining to the exterior of the structure shall apply including, but not limited to, premises identification, fire apparatus access and water supplies. Where interior or exterior systems or devices are installed, construction permits required by Section 105.6 shall apply.*
>
> *2.Administrative, operational and maintenance provisions of this code shall apply.*

Prior to the 2018 IFC and IRC the only regulations that existed for stationary storage battery systems was found within the IFC and the IFC had a permit trigger for the most common systems installed.

> ***2015 IFC***
>
> ***[A] 105.7.2 Battery systems.***
>
> *A permit is required to install stationary storage battery systems having a liquid capacity of more than 50 gallons (189 L).*

When the 2018 IFC was updated, the following change was made which broke the application to the IRC dwellings unintentionally. Extremely limited language was added to the IRC without linkage in the IFC by including a section reference because one did not exist for the IFC to include.

> ***2018 IFC***
>
> ***[A] 105.7.2 Battery systems.***
>
> *A construction permit is required to install stationary storage battery systems regulated by Section 1206.2.*

This has resulted in uneven application of the review process wherein jurisdiction A does a joint Building Code Official/Fire Code Official review for commercial and residential installations and jurisdiction B does a joint Building Code Official/Fire Code Official review for commercial and a Building Code Official review only for residential installations which was never intended. ESS installation consistency requires joint review for both IFC and IRC ESS application since the hazards, standards and testing required are the same.

For many residential ESS installations, they are done in conjunction with solar system installations, based on the current wording, the solar system would require a permit under the IFC, and the fire detection required for the ESS if installed indoors would require a permit under the IFC, but the ESS in and of itself would not require a permit under the IFC because of the error linking the ESS permit to Section 1207.

2024 IFC (and earlier)

[A] 105.6.7 Fire alarm and detection systems and related equipment*.*

A construction permit is required for installation of or modification to fire alarm and detection systems and related equipment. Maintenance performed in accordance with this code is not considered to be a modification and does not require a construction permit.

[A] 105.6.21 Solar photovoltaic power systems. *A construction permit is required to install or modify solar photovoltaic power systems. Maintenance performed in accordance with this code is not considered to be a modification and does not require a permit.*

This proposal corrects an error and properly correlates the permit and plan review process for the systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal does not impact constructions costs. It corrects a correlation error and at most would result in an additional permit fee which is an administrative jurisdiction decision, not a technical issue.

ADM37-25

ADM38-25

IFC: [A] 105.6.6

Proponents: William Koffel, Koffel Associates, Inc., representing California Solar and Storage Association (CALSSA) (wkoffel@koffel.com)

2024 International Fire Code

[A] 105.6.6 Energy storage systems. A construction permit is required to install energy storage systems regulated by Section 1207.

> **Exception:** A construction permit, in addition to the permit required by Section R105 of the International Residential Code, is not required for energy storage systems installed in accordance with Exception 2 of Section 1207.11.

Reason: Section R105 requires a permit to install a stationary ESS. An additional permit should not be required by the IFC when the installation is in accordance with the requirements of the IRC.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Decrease by the cost of obtaining an additional construction permit. Typical permit fees range from $200 to $500.

Estimated Immediate Cost Impact Justification (methodology and variables):

In those jurisdictions in which two construction permits are being issued, if there are any, the cost will decrease.

ADM38-25

ADM39-25

IFC: 105.6.26 (New)

Proponents: Joseph Cervantes, Self, representing Space Age Electronics

2024 International Fire Code

Add new text as follows:

<u>**105.6.26 Two-way communications systems.** A construction permit is required for the installation of or modification to two-way communications systems designated for area of refuge, area of rescue assistance, stairway communications systems, occupant evacuation elevator lobby systems or elevator landings and related equipment. Maintenance performed in accordance with this code is not considered to be a modification and does not require a construction permit.</u>

Reason: The addition of Section 105.6.26 ensures clear regulatory oversight of Two-Way Communications Systems that are critical for occupant safety during emergencies. These systems, including those designated for Areas of Refuge, Areas of Rescue Assistance, Stairway Communication Systems, Occupant Evacuation Elevator Lobby Systems, and Elevator Landings, are integral to the safe evacuation and rescue of individuals, particularly those with disabilities or limited mobility.

Requiring a construction permit for the installation or modification of these systems establishes a mechanism for authorities having jurisdiction (AHJs) to verify compliance with design, installation, and operational standards. It provides an opportunity to ensure that the systems are properly designed, installed, and integrated with other life safety systems, reducing the risk of system failure during emergencies.

Excluding maintenance activities from the permit requirement avoids undue administrative burden while ensuring that essential repairs and inspections remain routine and do not impede functionality.

This amendment aligns with the overall intent of the International Fire Code to enhance public safety, provide clarity in enforcement, and promote the consistent application of life safety provisions across jurisdictions.

Bibliography:

1. **International Fire Code (IFC), 2024 Edition.** International Code Council. Sections pertaining to construction permits and life safety system requirements.
2. **NFPA 72, National Fire Alarm and Signaling Code, 2022 Edition.** National Fire Protection Association. Chapters 24 and 26 on emergency communications systems and design considerations.
3. **Americans with Disabilities Act (ADA) Standards for Accessible Design, 2010.** U.S. Department of Justice. Guidance on Areas of Refuge and Rescue Assistance communication requirements.
4. **2016 Emergency Evacuation Planning Guide for People with Disabilities.** National Fire Protection Association. Recommendations for integrating two-way communication systems into evacuation plans.
5. **Building Fire Safety Systems: Performance-Based Design Approaches.** Society of Fire Protection Engineers, 2020. Analysis of integrated communication systems in high-rise buildings and evacuation scenarios.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The proposed requirement for a construction permit for the installation or modification of Two-Way Communications Systems will have a minimal cost impact on building owners and contractors. The associated costs primarily relate to permit application fees and potential inspections, which are standard components of most construction projects. These costs are typically offset by the benefits of enhanced oversight, ensuring compliance with safety codes and reducing the likelihood of system malfunctions during emergencies.

The amendment does not introduce new technical requirements or system features but rather formalizes the permitting process to ensure the proper installation and modification of existing systems. Maintenance activities, which represent routine operational costs, are explicitly excluded from the permit requirement, minimizing additional financial burdens on system owners.

The benefits of increased life safety, regulatory clarity, and proper system integration during emergency situations far outweigh the nominal costs associated with permit compliance. This amendment aligns with the International Fire Code's mission to enhance public safety without imposing significant financial hardship on stakeholders.

Estimated Immediate Cost Impact Justification (methodology and variables):

1. **Permit Fees:**
    - Average permit fees across jurisdictions typically range from $100 to $500, depending on the scope of work and local government requirements.
    - For large-scale projects (e.g., high-rise buildings or large facilities), permit fees may increase proportionally but remain a small fraction of overall project costs.
2. **Labor for Permit Application and Inspections:**
    - The time required to prepare and submit a permit application is estimated at 2–4 hours, depending on the project's complexity. At an average labor rate of $50/hour, this cost ranges from $100 to $200.
    - Inspections typically require 1–2 hours of coordination, adding another $50 to $100.
3. **Frequency of Applications:**
    - It is estimated that approximately 20–30 new projects or modifications involving Two-Way Communication Systems occur annually in a given jurisdiction.
4. **Exclusion of Maintenance Costs:**
    - Routine maintenance is explicitly excluded from the permit requirement, minimizing additional cost burdens.

Variables

1. **Project Type and Size:** Larger or more complex projects may incur slightly higher costs due to additional documentation or coordination.
2. **Local Permit Fees:** Fees vary by jurisdiction and are subject to local government regulations.
3. **Scope of Work:** Simple modifications may require fewer resources compared to the installation of a new system.

Calculation

- **Average cost per permit application:**
    - Permit Fee: $300 (median estimate)
    - Labor for Application: $150 (3 hours at $50/hour)
    - Inspection Coordination: $75 (1.5 hours at $50/hour)
    - **Total Estimated Cost per Project:** $525
- **Annual Impact (per jurisdiction):**
    - Assuming 25 applications per year: $525 × 25 = **$13,125**

Justification

The cost impact is justified by the critical role these systems play in ensuring life safety during emergencies. Proper permitting provides AHJs the opportunity to confirm compliance with safety standards, reducing the risk of system failures. This small upfront cost supports the long-term safety of building occupants and aligns with the IFC's goals of promoting robust life safety measures. Additionally, these costs are comparable to or less than other permits required for life safety systems, ensuring consistency in enforcement.

ADM39-25

ADM40-25

IFC: [A] 105.6.27 (New)

Proponents: Joseph Cervantes, Self, representing Space Age Electronics

2024 International Fire Code

Add new text as follows:

[A] 105.6.27 Site safety llan. A construction permit is required for the development and approval of a site safety plan as required in Chapter 33. The plan shall be prepared by a site safety director and approved by the authority having jurisdiction prior to the issuance of a building permit. Maintenance and routine updates performed in accordance with this code that do not alter the scope of the original approved plan are not considered modifications and do not require a construction permit.

Reason: The addition of Section 105.6.XX establishes a permitting requirement for the Site Safety Plan mandated in Chapter 33, reinforcing the charging language that requires the plan to be approved by the authority having jurisdiction (AHJ) prior to the issuance of a building permit. This ensures that the AHJ has the opportunity to thoroughly review the proposed safety measures and confirm that they meet the minimum standards of the code before construction begins.

Requiring the Site Safety Plan to be approved through a formal permitting process promotes consistent and thorough evaluation of critical safety elements, including hazard mitigation, emergency response protocols, and temporary fire protection systems. This proactive approach ensures that site-specific safety considerations are addressed during the planning stage, minimizing the potential for incidents that could endanger workers, first responders, and the public.

By linking the approval of the Site Safety Plan to the building permit process, this requirement enhances regulatory oversight, ensures compliance with Chapter 33 provisions, and establishes a clear mechanism for AHJs to enforce safety measures at construction sites. Exempting routine updates and maintenance from requiring additional permits streamlines the process while preserving the integrity of the approved plan. This amendment aligns with the code's intent to safeguard life safety during construction activities.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The proposed requirement for a Site Safety Plan permit has minimal cost impact on construction projects and jurisdictions. The primary cost considerations are related to the preparation, submission, and review of the plan, as follows:

Immediate Costs:

1. **Preparation of the Site Safety Plan:**
   - The cost of developing the plan is already accounted for under the requirements of Chapter 33. This proposal does not introduce new requirements for plan content or preparation, as such plans are already mandated.
2. **Permit Fees:**
   - Typical permit fees range from $200 to $500, depending on the jurisdiction and project complexity. These fees align with standard costs for construction-related permits.

3. **AHJ Review and Approval:**
    - The AHJ's review process may involve 2–4 hours of labor, depending on the complexity of the site safety plan. This is generally absorbed as part of the jurisdiction’s permitting process and covered by the permit fee.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of requiring a permit for the Site Safety Plan is offset by the benefits of regulatory oversight, which ensures that safety measures are adequately addressed before construction begins. This reduces the risk of accidents, litigation, and enforcement actions, ultimately protecting workers, first responders, and the public. The financial impact is minimal and proportional to the overall safety benefits gained.

Estimated Life Cycle Cost Impact:

This requirement does not impose recurring costs as routine updates or maintenance of the Site Safety Plan are explicitly excluded from requiring additional permits.

By ensuring compliance during the planning phase, jurisdictions and project stakeholders can avoid costly incidents, fines, or retrofits due to noncompliance with safety requirements, leading to potential long-term cost savings.

ADM40-25

ADM41-25 Part I

IBC: SECTION 106, [A] 106.1, [A] 106.2, [A] 106.3

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC-S CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Delete without substitution:

~~SECTION 106~~
~~FLOOR AND ROOF DESIGN LOADS~~

~~**[A] 106.1 Live loads posted.** In commercial or industrial *buildings*, for each floor or portion thereof designed for *live loads* exceeding 50 psf (2.40 kN/m^2), such design *live loads* shall be conspicuously posted by the *owner* or the *owner's* authorized agent in that part of each story in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.~~

~~**[A] 106.2 Issuance of certificate of occupancy.** A certificate of occupancy required by Section 111 shall not be issued until the floor load signs, required by Section 106.1, have been installed.~~

~~**[A] 106.3 Restrictions on loading.** It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a *building*, *structure* or portion thereof, a *load* greater than is permitted by this code.~~

Staff Analysis: S49-25 Part II and ADM41-25 Part I address requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

ADM41-25 Part I

ADM41-25 Part II

IBC: 1607.8.5

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1607.8.5 Posting. The maximum weight of vehicles allowed into or on a garage or other *structure* shall be posted on a durable sign in a readily visible location at the vehicle entrance to the building or other approved location ~~by the *owner* or the *owner*'s authorized agent in accordance with Section 106.1~~.

Reason: The intent of this proposal is to remove a section for structural signage from Chapter 1. Signage requirements are ineffective in Chapter 1, do not belong in the administrative provisions and no signage requirements are found in any of the administrative requirements in any of the other codes.

This section was moved to the administrative provisions from structural by S48-07/08. The structural committee felt that this sign did not belong with the loading provisions in Chapter 16.

The BCAC has attempted to move this requirement back to the related requirements in Chapter 16 (S52-19), similar to the signage for occupant load and exits in Chapter 10. There was testimony stating that the existing requirements for signage when live loads exceeded 50 pounds was an erroneous requirement. This code requirement is a hold-over from the legacy codes and its origins are unknown. The Structural committee disapproved this change because they did not want these signs in Chapter 16.

S99-22 attempted to clarify and limit the signage requirements (based on the testimony to S52-19) and move that small portion to Section 1607 with the requirements. The Structural committee again expressed that they felt the requirements were more appropriate however they still did not want the signage requirement in Chapter 16.

The text as currently written in unreasonable and unenforceable. Considering the expected audience of such a sign, it isn't practical that the end user of a building would equate a PSF load posting into a practical limitation as to the use of the structure. Further, the code only requires one sign be posted per story in a building of any area, it is unlikely that a majority of building users would ever even see such a sign. Following is a detailed reasoning for the deletion of this section.

Section 106 - Chapter 1 is an administrative chapter. Signage posting requirements are not an administrative function. These signage requirements should be located with the loading requirements to be consistent with the code - examples include - signage for gas detection alarms (916.9) under gas detection systems (916); occupant load posting (1004.9) with occupant loads (1004); area of refuge and two-way communication requirements (1009.9) with accessible means of egress (1009); stairway identification signage (1023.9) in exit stairways (1023); exit signs (1013) are located with exit requirements in Chapter 10; toilet room signage (2902.4) in minimum plumbing facilities (2902); elevator signage (3002.3) with the elevator provisions (3002), and heavy vehicle loading signage (1607.8.5) are located in Heavy vehicle loads (1607.8).

Section 106.1 - Table 1607.1 does not have 'commercial' or 'industrial' buildings listed and these terms are not defined, leaving it unclear where the signage is required. The weight requirement of "exceeding 50 lbs." could be interpreted to require this signage in many spaces listed in Table 1607.

Section 106.2 - Signage requirements should not be tied to receiving a certificate of occupancy, any more than other code section would be.

Section 106.3 - This is unenforceable. Making sure the loading in a space is not exceeded is an operational issue, not a building code issue. There is no mechanism to enforce this beyond the final building inspection.

Section 1607.8.5 - The proposed language removes the reference to Section 106 and provides more specific information for the required signage. This signage is already in Chapter 16.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the

committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction This technically is a reduction in the signage requirements, but it is our understanding that this is not currently being enforced. This is not a change to the technical requirements.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 107.1 General. Submittal documents consisting of *construction documents*, statement of *special inspections*, geotechnical report and other data shall be submitted in two or more sets, or in ~~a~~ an *approved* digital format where allowed or required by the *building official*, with each *permit* application. The *construction documents* shall be prepared by a *registered design professional* where required by the statutes of the *jurisdiction* in which the project is to be constructed. Where special conditions exist, the *building official* is authorized to require additional *construction documents* to be prepared by a *registered design professional*.

> **Exception:** The *building official* is authorized to waive the submission of *construction documents* and other data not required to be prepared by a *registered design professional* if it is found that the nature of the work applied for is such that review of *construction documents* is not necessary to obtain compliance with this code.

[A] 107.2.1 Information on construction documents. *Construction documents* shall be dimensioned and drawn on suitable material. ~~Electronic media documents are permitted to be submitted where *approved* by the *building official*.~~ *Construction documents* shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the *building official*.

2024 International Existing Building Code

Revise as follows:

[A] 106.1 General. Submittal documents consisting of construction documents, special inspection and structural observation programs, investigation and evaluation reports, and other data shall be submitted in two or more sets, or in ~~a~~ an *approved* digital format where allowed or required by the *code official,* with each application for a permit. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the *code official* is authorized to require additional construction documents to be prepared by a registered design professional.

> **Exception:** The *code official* is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that reviewing of construction documents is not necessary to obtain compliance with this code.

[A] 106.2.1 Construction documents. Construction documents shall be dimensioned and drawn on suitable material. ~~Electronic media documents are permitted to be submitted where *approved* by the *code official*.~~ Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the *code official*. The *work areas* shall be shown.

2024 International Fire Code

Revise as follows:

[A] 106.1 Submittals. *Construction documents* and supporting data shall be submitted in two or more sets, or in an *approved* digital format where allowed or required by the *fire code official*, with each application for a permit ~~and in such form and detail as required by the *fire code official*~~. The *construction documents* shall be prepared by a *registered design professional* where required by the statutes of the jurisdiction in which the project is to be constructed.

Exception: The *fire code official* is authorized to waive the submission of *construction documents* and supporting data not required to be prepared by a *registered design professional* if it is found that the nature of the work applied for is such that review of *construction documents* is not necessary to obtain compliance with this code.

[A] 106.2.1 Information on construction documents. *Construction documents* shall be drawn to scale on suitable material. ~~Documents in a digital format are allowed to be submitted where *approved* by the *fire code official*.~~ *Construction documents* shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations as determined by the *fire code official*.

2024 International Fuel Gas Code

Revise as follows:

[A] 106.1 Construction documents. *Construction documents*, engineering calculations, diagrams and other data shall be submitted in two or more sets, or in ~~a~~ an *approved* digital format where allowed or required by the ~~building official~~ *code official*, with each application for a permit. The *code official* shall require *construction documents*, computations and specifications to be prepared and designed by a *registered design professional* where required by state law. *Construction documents* shall be drawn to scale and shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that the work conforms to the provisions of this code. *Construction documents* for buildings more than two stories in height shall indicate where penetrations will be made for installations and shall indicate the materials and methods for maintaining required structural safety, fire-resistance rating and fireblocking.

Exception: The *code official* shall have the authority to waive the submission of *construction documents,* calculations or other data if the nature of the work applied for is such that reviewing of *construction documents* is not necessary to determine compliance with this code.

2024 International Mechanical Code

Revise as follows:

[A] 106.1 Construction documents. *Construction documents*, engineering calculations, diagrams and other data shall be submitted in two or more sets, or in ~~a~~ an *approved* digital format where allowed or required by the ~~building official~~ *code official*, with each application for a permit. The code official shall require *construction documents*, computations and specifications to be prepared and designed by a *registered design professional* where required by state law. Where special conditions exist, the code official is authorized to require additional *construction documents* to be prepared by a *registered design professional*. *Construction documents* shall be drawn to scale and shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that the work conforms to the provisions of this code. *Construction documents* for *buildings* more than two stories in height shall indicate where penetrations will be made for mechanical systems, and the materials and methods for maintaining required structural safety, fire-resistance rating and fireblocking.

Exception: The code official shall have the authority to waive the submission of *construction documents*, calculations or other data if the nature of the work applied for is such that reviewing of *construction documents* is not necessary to determine compliance with this code.

2024 International Plumbing Code

Revise as follows:

[A] 106.1 Construction documents. Construction documents, engineering calculations, diagrams and other such data shall be submitted in two or more sets, or in ~~a~~ an *approved* digital format where allowed or required by the code official, with each application for a permit. The code official shall require construction documents, computations and specifications to be prepared and designed by a registered design professional where required by state law. Construction documents shall be drawn to scale and shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that the work conforms to the provisions of this code. Construction documents for buildings more than two stories in height shall indicate where penetrations will be made for pipes, fittings and components and shall indicate the materials and methods for maintaining required structural safety, fire-resistance rating and fireblocking.

Exception: The code official shall have the authority to waive the submission of construction documents, calculations or other data if the nature of the work applied for is such that the reviewing of construction documents is not necessary to determine compliance with this code.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 107.1 Construction documents. An application for a permit shall be accompanied by not less than two copies of *construction documents* drawn to scale, or in ~~a~~ an *approved* digital format where allowed or required by the ~~building official~~ *code official*, with sufficient clarity and detail dimensions showing the nature and character of the work to be performed. Specifications shall include pumps and controls, dose volume, elevation differences (vertical lift), pipe friction loss, pump performance curve, pump model and pump manufacturer. The *code official* is permitted to waive the requirements for filing *construction documents* where the work involved is of a minor nature. Where the quality of the materials is essential for conformity to this code, specific information shall be given to establish such quality, and this code shall not be cited, or the term “legal” or its equivalent used as a substitute for specific information.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 107.1 Construction documents. Construction documents, engineering calculations, diagrams and other such data shall be submitted in two or more sets, or in an *approved* digital format where allowed or required by the *code official*, with each application for a permit. The *code official* shall require construction documents, computations and specifications to be prepared and designed by a registered design professional where required by state law. Construction documents shall be drawn to scale and shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that the work conforms to the provisions of this code.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 106.1 General. Plans, engineering calculations, diagrams and other data shall be submitted in not fewer than two sets, or in ~~a~~ an *approved* digital format where allowed or required by the ~~building official~~ *code official*, with each application for a permit. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the *code official* is authorized to require additional documents to be prepared by a registered design professional.

Exception: Submission of plans, calculations, construction inspection requirements and other data, if it is found that the nature of the work applied for is such that reviewing of plans is not necessary to obtain compliance with this code.

ADM42-25 Part I

ADM42-25 Part II

IRC: R106.1, R106.1.1

Proponents: Kota Wharton, City of Grove City, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Residential Code

Revise as follows:

R106.1 Submittal documents. Submittal documents consisting of *construction documents*, and other data shall be submitted in two or more sets, or in ~~a~~ an *approved* digital format where allowed or required by the *building official*, with each application for a *permit.* The *construction documents* shall be prepared by a *registered design professional* where required by the statutes of the *jurisdiction* in which the project is to be constructed. Where special conditions exist, the *building official* is authorized to require additional *construction documents* to be prepared by a *registered design professional*.

Exception: The *building official* is authorized to waive the submission of *construction documents* and other data not required to be prepared by a *registered design professional* if it is found that the nature of the work applied for is such that reviewing of *construction documents* is not necessary to obtain compliance with this code.

R106.1.1 Information on construction documents. *Construction documents* shall be drawn upon suitable material. ~~Electronic media documents are permitted to be submitted where *approved* by the *building official*.~~ *Construction documents* shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the *building official.*

Reason: This code change intends to allow code officials to transition to entirely digital submittal models while maintaining the options for hybrid and paper-only models for others.

The code change also enhances existing submittal models by giving the code official explicit authority to regulate the file format of documents received and, if needed, permissions for such documents.

Note: The language intentionally does not specify the required file formats or permissions and relies on *approved*. Such granular requirements would need to be established at the jurisdiction level by policy to allow flexibility based on the jurisdiction's capabilities and needs

An example policy could be described simply as follows:

> Effective [insert date], construction documents [may/are required to] be submitted in digital format to the [insert jurisdiction name].
>
> [Insert jurisdiction name] requires all digital construction documents to be submitted in PDF or PDF/A format without file modification restrictions (e.g., may not be locked to restrict markup).
>
> Supporting documentation that does not need to be stamped by the jurisdiction may only be submitted in PDF, PDF/A, JPEG, PNG, TIFF, DOC, or DOCX format and may have file modification restrictions (e.g., markup restrictions).
>
> Raw and HEIF images and DWG files are not supported file formats.

Various editorial changes are also made throughout with narrow scope.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. This code change will impact costs; however, the magnitude is likely insignificant and unmeasurable.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost decreases could be as follows:

- Reduction of printing costs.
- Reduction of administrative time unlocking or transacting unreadable or unmodifiable plans.

There are limited cost increase considerations other than potential costs to digitalize submittals at submittal.

ADM42-25 Part II

ADM43-25 Part I

IBC: [A] 107.1, SECTION 202 (New); IEBC: [A] 106.1, SECTION 202 (New)

Proponents: Jack Butler, Butler & Butler, LLC, representing American Institute of Building Design (abutler@mpzero.com); Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

2024 International Building Code

[A] 107.1 General. Submittal documents consisting of *construction documents*, statement of *special inspections*, geotechnical report and other data shall be submitted in two or more sets, or in digital format where allowed by the *building official*, with each *permit* application. The construction documents shall be prepared by a *registered design professional* where required by the statutes of the *jurisdiction* in which the project is to be constructed. Where special conditions exist, the *building official* is authorized to require ~~additional~~ *supplemental construction documents* to be provided to explain how the proposed design complies with this code. Where required by the laws of the *jurisdiction*, a *supplemental construction document* shall be prepared by a *registered design professional*.

> **Exception:** The *building official* is authorized to waive the submission of *construction documents* and other data ~~not required to be prepared by a *registered design professional*~~ if it is found that the nature of the work applied for is such that review of the waived *construction documents* is not necessary to obtain compliance with this code.

Add new definition as follows:

SPECIAL CONDITION. An element of the construction site or design that is outside the parameters upon which the code is based or exceeds the prescriptive guidance found in the code and is unique to the project rather than generally applicable within the project area. General project characteristics, such as size of the structure and the cost of construction, are not special conditions.

SUPPLEMENTAL CONSTRUCTION DOCUMENT. A construction document not normally provided as part of the standard *permit* application package for the type of work proposed that demonstrates how the proposed design addresses a *special condition* presented by the project so as to meet the intent of the code.

2024 International Existing Building Code

Revise as follows:

[A] 106.1 General. Submittal documents consisting of construction documents, special inspection and structural observation programs, investigation and evaluation reports, and other data shall be submitted in two or more sets, or in a digital format where allowed by the *code official*,with each application for a permit. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the *code official* is authorized to require ~~additional~~ *supplemental* construction documents to be provided to explain how the proposed design complies with this code. Where required by the laws of the *jurisdiction*, a *supplemental construction document* shall be prepared by a registered design professional.

> **Exception:** The *code official* is authorized to waive the submission of construction documents and other data ~~not required to be prepared by a registered design professional~~ if it is found that the nature of the work applied for is such that reviewing of the waived construction documents is not necessary to obtain compliance with this code.

Add new definition as follows:

SPECIAL CONDITION. An element of the construction site or design that is outside the parameters upon which the code is based or exceeds the prescriptive guidance found in the code and is unique to the project rather than generally applicable within the project area. General project characteristics, such as size of the structure and the cost of construction, are not special conditions.

SUPPLEMENTAL CONSTRUCTION DOCUMENT. A construction document not normally provided as part of the standard *permit* application package for the type of work proposed that demonstrates how the proposed design addresses a *special condition* presented by the project so as to meet the intent of the code.

Attached Files

- **ICC Opinion email of 11-27-2023 (1).pdf**
  https://www.cdpaccess.com/proposal/11255/35348/files/download/9627/

Reason: Many jurisdictions have deployed or plan to implement online building permit application processes that require digital rather than paper plan submittals. This fact is already recognized by the wording of R106.1, which is repeated here.

The second proposed modification reflects the need to recognize the intent of the original term "additional construction documents," which is to demonstrate how the proposed design addresses the special conditions, by replacing "additional" with "supplemental," adding the reason for requesting the supplemental documents, and clarifying who may prepare such documents. The proposed deletion of "registered design professional" recognizes that state professional practice laws determine who may or must prepare these additional construction documents depending on their nature. In addition, the current wording fails to allow the exemptions that exist in the majority of states for non-registered persons and property owners to prepare construction documents for residential and smaller commercial projects, which creates a conflict with these state laws. However, the requirement for a registered design professional to prepare any supplemental document is preserved.

The revised wording in the Exception clause is intended to recognize that it is the nature of the proposed work, and not the person who might prepare an unnecessary construction document, that should determine whether a specific construction document is not necessary for the contemplated project. For example, an interior modification may not need an exterior elevation, which, under the laws of the jurisdiction, might be prepared by anyone. A building official should be able to avoid the submission and subsequent review of any unnecessary construction documents in accordance with the nature of the proposed work.Two phrases are italicized in the modified section: special conditions and supplemental construction documents. This font notation reflects the related proposal of new definitions for these terms in order to remove ambiguity that is creating issues in multiple jurisdictions regarding the intent behind these phrases. Services of a registered design professional are often not required by the laws of the jurisdiction when the prescriptive guidance needed is found in the code or in the referenced standards on which that guidance is based and the laws of the jurisdiction provide an exemption for registration in order to prepare such submittals.

The new definitions proposed for *supplemental construction document* and *special condition* are needed to clarify the current intent related to the provisions of the sentence in Section 107.1 that says, "Where *special conditions* exist, the *building official* is authorized to require additional *construction documents* to be prepared by a *registered design professional*." The intent of the subject sentence was confirmed in an advisory opinion provided to the proponent by ICC staff (see attachment). The proposed definitions seek to clarify the intent by removing ambiguity, which is leading some local jurisdictions to declare construction cost, livable space, or even just the project's presence within the jurisdiction as being a special condition, and then requiring that all construction documents be prepared by a registered design professional. Special conditions should only exist where design parameters or site conditions are outside those accommodated by the prescriptive guidance found in the code. Additional construction documents should not include the documents that are common for the proposed type of construction; they should address how the proposed design will meet the intent of the code relative to those special conditions. Replacing "additional" with "supplemental" will reinforce that intent.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Allowing the submittal of digital documents will save permit applicants the cost of printing paper documents and will save the building safety departments the cost of long-term paper storage. There may also be some savings from reducing the number of construction documents that must be prepared by registered design professionals when the laws of the jurisdiction do not require such persons to prepare the documents.

For an average commercial project - 35 sheets x $6.75 per sheet x 2 sets = $472.50 cost per project.

Estimated Immediate Cost Impact Justification (methodology and variables):

Although the savings from not printing construction documents depends on the number of sheets and the local cost of production, the fact that any printing costs may be avoided through electronic submission of the documents is readily apparent. Long-term storage costs of submitted construction documents depends on the retention requirements of the jurisdiction, but clearly accumulate over time as the volume increases. Many jurisdictions are actually converting paper documents to an electronic form in order to avoid these storage costs. Receiving such documents in an original electronic form will additionally avoid the cost of digitization. It can also speed the plan review process.

ADM43-25 Part I

ADM43-25 Part II

IRC: R106.1, SECTION 202 (New)

Proponents: Jack Butler, Butler & Butler, LLC, representing American Institute of Building Design (abutler@mpzero.com); Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

2024 International Residential Code

R106.1 Submittal documents. Submittal documents consisting of *construction documents*~~,~~ and other data shall be submitted in two or more sets, or in a digital format where allowed by the *building official*, with each application for a *permit.* The *construction documents* shall be prepared by a *registered design professional* where required by the statutes of the *jurisdiction* in which the project is to be constructed. Where special conditions exist, the *building official* is authorized to require ~~additional~~ *supplemental* *construction documents* to be ~~prepared~~ provided to explain how the proposed design complies with this code. Where required by the laws of the jurisdiction, a *supplemental construction document* shall be prepared by a *registered design professional*.

> **Exception:** The *building official* is authorized to waive the submission of *construction documents* and other data ~~not required to be prepared by a *registered design professional*~~ if it is found that the nature of the work applied for is such that reviewing of the waived *construction documents* is not necessary to obtain compliance with this code.

Add new definition as follows:

SPECIAL CONDITION. An element of the construction site or design that is outside the parameters upon which the code is based or exceeds the prescriptive guidance found in the code and is unique to the project rather than generally applicable within the project area. A general project characteristic, such as size of the structure or the cost of construction, is not a special condition.

SUPPLEMENTAL CONSTRUCTION DOCUMENT. A construction document not normally provided as part of the standard *permit* application package for the type of work proposed that demonstrates how the proposed design addresses a *special condition* presented by the project so as to meet the intent of the code.

Attached Files

- **ICC Opinion email of 11-27-2023 (1).pdf**
  https://www.cdpaccess.com/proposal/11286/35361/files/download/9628/

Reason: The first proposed modification is to remove the serial comma after the first instance of 'construction documents', as there are only two items in the list. The first proposed substantive modification reflects the need to recognize the intent of the original term "additional construction documents," which is to demonstrate how the proposed design addresses the special conditions, by replacing "additional" with "supplemental." The verb 'prepared' is replaced with 'provided' in recognition that some supplemental documents, such as product certifications and manufacturer's installation instructions, are existing documents that only need to be supplied to the building official to satisfy the requirement. Two phrases are italicized in the modified section: *special conditions* and *supplemental construction documents*. This font notation reflects the related proposal of new definitions for these terms in order to remove ambiguity that is creating issues in multiple jurisdictions regarding the intent behind these phrases.

The revised wording in the Exception clause is intended to recognize that it is the nature of the proposed work, and not the person who might prepare an unnecessary construction document, that should determine whether a specific construction document is necessary for the contemplated project. For example, an interior modification may not need an exterior elevation, which, under the laws of the jurisdiction, might be prepared by anyone. A building official should be able to avoid the submission and subsequent review of any unnecessary construction documents in accordance with the nature of the proposed work.

Services of a registered design professional are often not required by the laws of the jurisdiction when the prescriptive guidance needed is found in the code or in the referenced standards on which that guidance is based and the laws of the jurisdiction provide an exemption for registration in order to prepare such submittals.

The new definitions proposed for supplemental construction document and special condition are needed to clarify the current intent related to the provisions of the sentence in Section R106.1 that says, "Where special conditions exist, the building official is authorized to require additional construction documents to be prepared by a registered design professional." (A related proposed modification alters the wording of this section to be consistent with the proposed definition.) The intent of the subject sentence was confirmed in an advisory opinion provided to the proponent by ICC staff (see attachment). The proposed definitions seek to clarify the intent by removing ambiguity, which is leading some local jurisdictions to declare construction cost, livable space, or even just the project's presence within the jurisdiction as being a special condition, and then requiring that all construction documents be prepared by a registered design professional. Special conditions should only exist where design parameters or site conditions are outside those accommodated by the prescriptive guidance found in the code. Supplemental construction documents should not include the documents that are common for the proposed type of construction; they should address how the proposed design will meet the intent of the code relative to those special conditions. Replacing "additional" with "supplemental" will reinforce that intent.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modification seeks to clarify the original intent of this subsection.

ADM43-25 Part II

ADM44-25

IPMC: 107, [A] 107.1, [A] 107.2, [A] 107.3, [A] 107.4, [A] 107.5

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Property Maintenance Code

SECTION 107
VIOLATIONS

[A] 107.1 Unlawful acts. It shall be unlawful for a *person*, firm or corporation to be in conflict with or in violation of any of the provisions of this code.

[A] 107.2 Notice of violation. The *code official* shall serve a notice of violation or order in accordance with Section 109.4.

Delete and substitute as follows:

~~**[A] 107.3 Prosecution of violation.** Any *person* failing to comply with a notice of violation or order served in accordance with Section 109.4 shall be deemed guilty of a misdemeanor or civil infraction as determined by the local municipality, and the violation shall be deemed a *strict liability offense*. If the notice of violation is not complied with, the *code official* shall institute the appropriate proceeding at law or in equity to restrain, correct or abate such violation, or to require the removal or termination of the unlawful *occupancy* of the *structure* in violation of the provisions of this code or of the order or direction made pursuant thereto. Any action taken by the authority having jurisdiction on such *premises* shall be charged against the real estate upon which the *structure* is located and shall be a lien upon such real estate.~~

[A] 107.3 Prosecution of violation. Persons who shall violate a provision of this code or shall fail to comply with any of the requirements thereof or who shall erect, install, alter, repair or do work in violation of the approved construction documents or directive of the *code official*, or of a permit or certificate used under provisions of this code, shall be guilty of a **[specify offense]**, punishable by a fine of not more than **[amount]** dollars or by imprisonment not exceeding **[number of days]**, or both such fine and imprisonment. Each day that a violation continues after due notice has been served shall be deemed a separate offense.

Any action taken by the authority having jurisdiction on such *premises* shall be charged against the real estate upon which the *structure* is located and shall be a lien upon such real estate.

Delete without substitution:

~~**[A] 107.4 Violation penalties.** Any *person* who shall violate a provision of this code, or fail to comply therewith, or with any of the requirements thereof, shall be prosecuted within the limits provided by state or local laws. Each day that a violation continues after due notice has been served shall be deemed a separate offense.~~

Delete and substitute as follows:

~~**[A] 107.5 Abatement of violation.** The imposition of the penalties herein prescribed shall not preclude the legal officer of the jurisdiction from instituting appropriate action to restrain, correct or abate a violation, or to prevent illegal *occupancy* of a building, *structure* or *premises*, or to stop an illegal act, conduct, business or utilization of the building, *structure* or *premises*.~~

[A] 107.4 Abatement of violation.
In addition to the imposition of the penalties herein described, the code official is authorized to institute appropriate action to prevent unlawful construction or to restrain, correct or abate a violation; or to prevent illegal occupancy of a structure or premises; or to stop an illegal act, conduct of business or occupancy of a structure on or about any premises.

Reason: This code change coordinates langage between the International Fire Code and IPMC.

It removes the prescriptive classifications of offenses that were previously present in the model code and instead defers the responsibility of classifying these offenses to the respective jurisdictions. The approach allows for greater flexibility and adaptability, as acknowledges that the many different jurisdictional legal frameworks and enforcement priorities.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Impacted jurisdictions would have revised this section during adoption. This code change creates a simple fill-in-the-blank for easier adoption and to remove potential conflicts.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 107.3.1 Approval of construction documents. When the *building official* issues a *permit*, the *construction documents* shall be *approved*, in writing or by stamp.~~, as "Reviewed for Code Compliance." One set of *construction documents* so reviewed shall be retained by the *building official*. The other set shall be returned to the applicant, shall be kept at the *site* of work and shall be open to inspection by the *building official* or a duly authorized representative.~~

2024 International Existing Building Code

Revise as follows:

[A] 106.3.1 Approval of construction documents. Where the *code official* issues a permit, the construction documents shall be *approved* in writing or by stamp. ~~as "Reviewed for Code Compliance." One set of construction documents so reviewed shall be retained by the *code official*. The other set shall be returned to the applicant, shall be kept at the site of work, and shall be open to inspection by the *code official* or a duly authorized representative.~~

2024 International Fire Code

Revise as follows:

[A] 106.2.4 Approved documents. Where the *fire code official* issues a permit, the *construction documents* shall be approved in writing or by stamp.~~*Construction documents approved* by the *fire code official* are *approved* with the intent that such *construction documents* comply in all respects with this code. Review and approval by the *fire code official* shall not relieve the applicant of the responsibility of compliance with this code.~~

[A] 106.4 Retention of construction documents. One set of *construction documents* shall be retained by the *fire code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws. ~~One set of *approved construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.~~

2024 International Fuel Gas Code

Revise as follows:

[A] 105.5.1 Approved construction documents. ~~When~~ Where the code official issues the permit ~~where *construction documents* are required~~, the *construction documents* shall be ~~endorsed~~ approved in writing or by a stamp. ~~and stamped "APPROVED." Such *approved construction documents* shall not be changed, modified or altered without authorization from the code official.~~ Work shall be done in accordance with the *approved construction documents*.

The *code official* shall have the authority to issue a permit for the construction of part of an installation before the *construction documents* for the entire installation have been submitted or *approved*, provided adequate information and detailed statements have been filed complying with all pertinent requirements of this code. The holder of such permit shall proceed at his or her own risk without assurance that the permit for the entire installation will be granted.

[A] 106.2 Retention of construction documents. One set of *approved construction documents* shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws. ~~One set of *approved construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.~~

2024 International Mechanical Code

Revise as follows:

[A] 105.4.1 Approved construction documents. ~~When~~ Where the code official issues the permit ~~where *construction documents* are required~~, the *construction documents* shall be ~~endorsed~~ approved in writing or by a stamp. ~~and stamped "APPROVED." Such *approved construction documents* shall not be changed, modified or altered without authorization from the code official.~~ Work shall be done in accordance with the *approved construction documents*.

The code official shall have the authority to issue a permit for the construction of part of a mechanical system before the *construction documents* for the entire system have been submitted or *approved*, provided that adequate information and detailed statements have been filed complying with all pertinent requirements of this code. The holder of such permit shall proceed at his or her own risk without assurance that the permit for the entire mechanical system will be granted.

[A] 106.2 Retention of construction documents. One set of *approved construction documents* shall be retained by the code official for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws. ~~One set of *approved construction documents* shall be returned to the applicant, and said set shall be kept on the site of the *building* or job at all times during which the work authorized thereby is in progress.~~

2024 International Plumbing Code

Revise as follows:

[A] 105.5.1 Approved construction documents. ~~When~~ Where the code official issues the permit ~~where *construction documents* are required~~, the *construction documents* shall be ~~endorsed~~ approved in writing or by a stamp. ~~and stamped "APPROVED." Such *approved construction documents* shall not be changed, modified or altered without authorization from the code official.~~ Work shall be done in accordance with the *approved construction documents*.The code official shall have the authority to issue a permit for the construction of a part of a plumbing system before the entire construction documents for the whole system have been submitted or *approved*, provided that adequate information and detailed statements have been filed complying with all pertinent requirements of this code. The holders of such permit shall proceed at their own risk without assurance that the permit for the entire plumbing system will be granted.

[A] 106.2 Retention of construction documents. One set of *approved* construction documents shall be retained by the code official for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.~~One set of *approved* construction documents shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.~~

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 105.3.1 Approved construction documents. ~~When~~ Where the code official issues the permit ~~where *construction documents* are required~~, the *construction documents* shall be ~~endorsed~~ approved in writing or by a stamp. ~~and stamped "APPROVED." Such *approved construction documents* shall not be changed, modified or altered without authorization from the code official.~~ Work shall be done in accordance with the *approved construction documents*.

The *code official* shall have the authority to issue a permit for the construction of a part of a *private sewage disposal system* before the *construction documents* for the whole system have been submitted or approved, provided adequate information and detailed statements have been filed complying with all pertinent requirements of this code. The holder of such permit shall proceed at his or her own risk without assurance that the permit for the entire system will be granted.

[A] 107.2 Retention of construction documents. One set of approved *construction documents* shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws. ~~One set of approved *construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.~~

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 105.4.1 Approved construction documents. ~~When~~ Where the code official issues the permit ~~where *construction documents* are required~~, the *construction documents* shall be ~~endorsed~~ approved in writing or by a stamp. ~~and stamped "APPROVED." Such *approved construction documents* shall not be changed, modified or altered without authorization from the code official.~~ Work shall be done in accordance with the *approved construction documents*.The *code official* shall have the authority to issue a permit for the construction of a part of a system before the entire construction documents for the whole system have been submitted or *approved*, provided that adequate information and detailed statements have been filed complying with pertinent requirements of this code. The holders of such permit shall proceed at their own risk without assurance that the permit for the entire system will be granted.

[A] 107.2 Retention of construction documents.

One set of approved *construction documents* shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws. ~~One set of approved *construction documents* shall be returned to the applicant, and said set shall be kept on the site of the building or work at all times during which the work authorized thereby is in progress.~~

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 105.6 Permit issuance. ~~When~~ Where the code official issues the permit ~~where *construction documents* are required~~, the *construction documents* shall be ~~endorsed~~ approved in writing or by a stamp. ~~and stamped "APPROVED." Such *approved construction documents* shall not be changed, modified or altered without authorization from the code official.~~ Work shall be done in accordance with the *approved construction documents*.

When the *code official* issues the permit, the *code official* shall endorse in writing or stamp the plans and specifications APPROVED. Such *approved* plans and specifications shall not be changed, modified or altered without authorization from the *code official*, and work regulated by this code shall be done in accordance with the *approved* plans.

[A] 106.8 Retention of plans. One set of *approved* plans, specifications and computations shall be retained by the *code official* for a period of not less than 180 days from date of completion of the permitted work or as required by state or local laws~~; and one set of *approved* plans and specifications shall be returned to the applicant, and said set shall be kept on the site of the building, use or work at all times during which the work authorized thereby is in progress.~~

ADM45-25 Part I

ADM45-25 Part II

IRC: R106.3.1

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Residential Code

Revise as follows:

R106.3.1 Approval of construction documents. Where the *building official* issues a *permit*, the *construction documents* shall be *approved* in writing or by a stamp. ~~that states "REVIEWED FOR CODE COMPLIANCE." One set of *construction documents* so reviewed shall be retained by the *building official*. The other set shall be returned to the applicant, shall be kept at the site of work and shall be open to inspection by the *building official* or a duly authorized representative.~~

Reason: This code change coordinates the language - but not placement - of construction document approval and removes prescriptive verbiage for how agencies must stamp plans.

The deletion of language in the IFC is done as editorial clean up. The intent of the language can already be found in IFC 105.3.6 and is satisfactory in all other codes.

The deletion of plan return and retention on site is deleted in observation increasingly prevalent digital capabilities. If necessary, a department could go so far as to issue a policy that construction documents are to be maintained on site and in what manner; but a prescriptive requirement in the code is not needed.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 - This code change has limited cost impact in it's first part - removing prescriptive stamp verbiage. There is a decrease in cost associated deleting the requirement for physical sets of plans, their return, and availability on site.

Estimated Immediate Cost Impact Justification (methodology and variables):

The immediate cost decrease is appreciated in the reduction of printing costs.

ADM45-25 Part II

ADM46-25

IFC: 108.2.3 (New), 109.3 (New), SECTION 202 (New), NFPA Chapter 80 (New)

Proponents: Jason Webb, representing Potter Electric Signal (jasonw@pottersignal.com)

2024 International Fire Code

Add new text as follows:

108.2.3 Remote inspections and automated tests. Where remote inspections and tests, automated inspection and testing or distance monitoring are allowed by the *fire code official*, remote inspections and tests, automated inspection and testing, or distance monitoring shall be in accordance with NFPA 915 or other approved program.

109.3 Remote inspections and automated tests. Where remote inspections and tests, automated inspection and testing or distance monitoring are allowed by the fire code official, remote inspections and tests, automated inspection and testing, or distance monitoring shall be in accordance with NFPA 915 or other approved program.

Add new definition as follows:

REMOTE INSPECTION. The performance of an inspection or witnessing of a test conducted by *approved* agencies or individuals using audio-visual devices or other technologies where the *fire code official* is not physically present on site.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

NFPA 915-2024 Standard for Remote Inspections and Tests

Reason: NFPA 915 – the Standard for Remote Inspections and Tests, is proposed to be referenced by chapter 1 as it contains guidance intended to provide the fire code official with tools to implement a remote inspection program, should they choose to do so. The standard is written in a manner which permits the code official to customize the remote inspection/automated testing program in ways that suit their need. Included in NFPA 915 are considerations such as what tools and methods of remote inspections and automated tests are permitted, responsibilities of the person performing the remote inspection, data transmission and ownership, among others. This proposal also gives the fire code official the option of allowing for other approved remote inspection programs.

This language is an important addition to the code for several reasons. No reference to remote inspections or automated tests appears in the code today, although many code official allow for the practice. NFPA 915 was developed with strong influence of building and fire code officials to help fill a gap in a fast-expanding practice which presently has little regulation by the fire code. Besides the guidance provided by NFPA 915 for routine remote inspections (one in which the code official is not physically present) it is important to recognize that many of the fire protection standards currently referenced by the fire code contain language permitting automated testing. Much of this language is coordinated in the various standards, but not all. By referencing NFPA 915 in the fire code, it gives the fire code official the have a standard, consistent practice in place for these inspections and tests.

It is also important to recall that this reference is proposed for what will be the 2027 edition of the fire code. Should it not be approved this cycle, the next edition will be the 2030, likely not adopted by a majority of jurisdictions until 2031 or 2032 at the earliest. The technology driving remote inspection and automated testing is already moving at a much faster pace that the codes can keep up with. Pushing out the reference, and therefore the attempt to standardize the regulations surrounding remote inspections and automated testing another 8 or 9 years for a practice that is already in common practice and increasing rapidly is inadvisable.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal allows for inspections and tests to be conducted remotely or using automated devices when acceptable to the AHJ and when a program is in place. It does not mandate any new inspections or tests and does not impact the cost of construction.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.
NFPA 915-2024 Standard for Remote Inspections and Tests

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 109.3 Permit valuations. The applicant for a *permit* shall provide an estimated value of the work for which the *permit* is being issued at time of application. Such estimated valuations shall include the total value of work, including materials and labor, for ~~which the *permit* is being issued~~ work, such as electrical, gas, mechanical, plumbing equipment and permanent systems. ~~Where, in the opinion of the *building official*, the valuation is underestimated, the *permit* shall be denied, unless the applicant can show detailed estimates acceptable to the *building official*. The building official shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the building official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the building official, the building official shall have the authority to adjust the final valuation used to determine permit fees. The building official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Existing Building Code

Revise as follows:

[A] 108.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include total value of work, including materials and labor for ~~which the permit is being issued~~ work, such as electrical, gas, mechanical, plumbing equipment and permanent systems. ~~Where, in the opinion of the *code official*, the valuation is underestimated, the permit shall be denied unless the applicant can show detailed estimates acceptable to the *code official*. The code official shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the code official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the code official, the code official shall have the authority to adjust the final valuation used to determine permit fees. The code official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Fire Code

Revise as follows:

108.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at the time of application. Such estimated valuations shall include the total value of work, including materials and labor, for ~~which the permit is being issued~~ work, such as electrical, gas, mechanical, plumbing equipment and permanent systems. ~~Where , in the opinion of the *fire code official*, the valuation is underestimated, the permit shall be denied unless the applicant can show detailed estimates acceptable to the *fire code official*. The *fire code official* shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the fire code official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the fire code official, the fire code official shall have the authority to adjust the final valuation used to determine permit fees. The fire code official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Fuel Gas Code

Revise as follows:

[A] 108.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include total value of work, including materials and labor, for ~~which the permit is being issued~~ work, such as plumbing *equipment* and permanent systems. ~~Where, in the opinion of the *code official*, the valuation is underestimated, the permit shall be denied unless the applicant can show detailed estimates acceptable to the *code official*. The *code official* shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the code official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the code official, the code official shall have the authority to adjust the final valuation used to determine permit fees. The code official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Green Construction Code

Revise as follows:

107.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at the time of application. Such estimated valuations shall include the total value of work, including materials and labor, for ~~which the permit is being issued~~ work, such as electrical, gas, mechanical, and plumbing equipment and permanent systems. ~~In the opinion of the building official, where the valuation is underestimated, the permit shall be denied unless the applicant can show detailed estimates acceptable to the building official. The building official shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the building official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the building official, the building official shall have the authority to adjust the final valuation used to determine permit fees. The building official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Mechanical Code

Revise as follows:

[A] 108.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at the time of application. Such estimated valuations shall include the total value of work, including materials and labor, for ~~which the permit is being issued~~ work, such as mechanical *equipment* and permanent systems. ~~Where, in the opinion of the code official, the valuation is underestimated, the permit shall be denied unless the applicant can show detailed estimates to the code official. The code official shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the code official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the code official, the code official shall have the authority to adjust the final valuation used to determine permit fees. The code official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Plumbing Code

Revise as follows:

[A] 108.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include the total value of work, including materials and labor, for ~~which the permit is being issued~~ work, such as electrical, gas, mechanical, plumbing equipment and permanent systems. ~~Where, in the opinion of the building official, the valuation is underestimated, the permit shall be denied, unless the applicant can show detailed estimates acceptable to the building official. The building official shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the code official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the code official, the code official shall have the authority to adjust the final valuation used to determine permit fees. The code official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 106.3 Permit valuations. The applicant for a *permit* shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include the total value of work, including materials and labor, for ~~which the *permit* is being issued~~ work, such as electrical, gas, mechanical, plumbing equipment and permanent systems. ~~Where, in the opinion of the *building official*, the valuation is underestimated, the *permit* shall be denied, unless the applicant can show detailed estimates acceptable to the *building official*. The building official shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the building official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the building official, the building official shall have the authority to adjust the final valuation used to determine permit fees. The building official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Swimming Pool and Spa Code

Revise as follows:

[A] 109.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include total value of work, including materials and labor, for ~~which the permit is being issued~~ work, such as mechanical equipment and permanent systems. ~~Where, in the opinion of the *code official*, the valuation is underestimated, the permit shall be denied unless the applicant can show detailed estimates tothe *code official*. The code official shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the code official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the code official, the code official shall have the authority to adjust the final valuation used to determine permit fees. The code official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 108.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include the total value of work, including materials and labor, for ~~which the permit is being issued~~ work. ~~Where, in the opinion of the applicable governing authority, the valuation is underestimated, the permit shall be denied, unless the applicant can show detailed estimates acceptable to the applicable governing authority. The applicable governing authority shall have the authority to adjust the final valuation for permit fees.~~ Where, in the opinion of the applicable governing authority, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the applicable governing authority, the applicable governing authority shall have the authority to adjust the final valuation used to determine permit fees. The applicable governing authority shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

ADM47-25 Part I

ADM47-25 Part II

IRC: R108.3, R108.6, R108.4, R108.5

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Residential Code

Revise as follows:

R108.3 ~~Building permit~~ Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated ~~Building permit~~ valuations shall include the total value of work, including materials and labor, for work~~for which the permit is being issued~~, such as electrical, gas, mechanical, plumbing equipment and permanent systems, ~~including materials and labor~~. Where, in the opinion of the building official, the applicant underestimates the valuation of the work on the application, or the applicant fails to provide detailed estimates acceptable to the building official, the building official shall have the authority to adjust the final valuation used to determine permit fees. The building official shall notify the applicant in writing, stating the final valuation and the reasons why the valuation was altered.

~~R108.6~~ R108.4 Work commencing before permit issuance. Any *person* who commences work requiring a *permit* on a *building*, structure, electrical, gas, mechanical or plumbing system before obtaining the necessary *permits* shall be subject to a fee established by the applicable governing authority that shall be in addition to the required *permit* fees.

~~R108.4~~ R108.5 Related fees. The payment of the fee for the construction, *alteration*, removal or demolition for work done in connection to or concurrently with the work authorized by a building *permit* shall not relieve the applicant or holder of the *permit* from the payment of other fees that are prescribed by law.

~~R108.5~~ R108.6 Refunds. The *building official* is authorized to establish a refund policy.

Reason:
To address concerns about the strict directive to deny a permit based on disagreement over a buildings valuation used for permit fees, this proposal replaces the last two sentences with clarifying text. Examples where the construction cost is different from the building valuation might be a volunteer organization where materials or labor were donated. The building valuation is used to determine the amount of work required by the building department for plan review and inspection costs.
This proposed language provides the building official the authority to set accurate building valuations as currently regulated within the I-codes. At the same time, it provides the applicant the documentation they are entitled to proceed with any potential appeals, the same as any other code section. This eliminates potential subjectivity from either party and ensures consistency in collecting the fees implemented by the locality.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This could affect the cost of the permit for buildings where the actual construction cost was different than the valuation of the building.

ADM47-25 Part II

ADM48-25 Part I

IBC: [A] 107.2.4, [A] 110.3.5 (New)

Proponents: Theresa Weston, The Holt Weston Consultancy, representing Air Barrier Association of America (ABAA) (holtweston88@gmail.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC-S CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 107.2.4 Exterior wall ~~envelope~~ assembly. *Construction documents* for all *buildings* shall describe the *exterior wall ~~envelope~~ assembly* in sufficient detail to determine compliance with this code. The *construction documents* shall provide details of the *exterior wall ~~envelope~~ assembly* as required, including flashing, intersections with dissimilar materials, corners, end details, control joints, intersections at roof, eaves or parapets, means of drainage, *water-resistive barrier* and details around openings.

The *construction documents* shall include manufacturer's installation instructions that provide supporting documentation that the proposed penetration and opening details described in the *construction documents* maintain the weather resistance of the *exterior wall ~~envelope.~~ assembly*. The supporting documentation shall fully describe the *exterior wall* system that was tested, where applicable, as well as the test procedure used.

Add new text as follows:

[A] 110.3.5 Water-resistive barrier installation. Inspection is required for the *water-resistive barrier* material and installation in accordance with the construction documents. The inspection shall be conducted during construction while the water-resistive barrier is still accessible for inspection and repair.

Exception: Where *special inspections* are provided in accordance with Section 1705.1.1, Item 3.or Section 1705.21

ADM48-25 Part I

ADM48-25 Part II

IBC: 1705.21 (New), TABLE 1705.21 (New)

Proponents: Theresa Weston, The Holt Weston Consultancy, representing Air Barrier Association of America (ABAA) (holtweston88@gmail.com)

2024 International Building Code

Add new text as follows:

1705.21 Water-resistive barrier installation. Where required by the *building official*, a special inspection shall be conducted for the installation of the *water-resistive barrier* and the intersection of the water-resistive barrier with flashing in accordance with Sections 1704.2 and Table 1705.21. A statement of special inspections shall be included in the construction documents and shall include the proposed inspection schedule, the list of inspection items, and inspection documentation to be provided. The periodic inspection shall be conducted during construction while the water-resistive barrier is still accessible for inspection and repair.

TABLE 1705.21 REQUIRED SPECIAL INSPECTIONS FOR WATER-RESISTIVE BARRIER INSTALLATION

WATER-RESISTIVE BARRIER TYPE	INSPECTION ITEM	
All water-resistive barriers	Verify the water-resistive barrier is continuous to the top of walls.	
	Verify the water-resistive barrier is integrated with flashing installed at wall and roof intersections as described in section 1503.2.	
	Verify the water-resistive barrier is terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section 1402.2 and is integrated with flashings in accordance with Section 1404.4	
Applicable to specific types of water-resistive barriers.	No 15 felt, and water-resistive barriers complying with ASTM E2556	Verify the water-resistive barrier is applied shingle fashion with the upper layer lapped over the lower layer not less than 2 inches (51 mm).
		Verify vertical joints in the water-resistive barrier sheets are lapped not less than 6 inches (152 mm)
	Foam plastic insulating sheathing water-resistive barriers systems	Verify installation in accordance with manufacturer's installation instructions.
	Water-resistive barrier approved through ASTM E331 testing in accordance with Section 1402.2	Verify installation is in accordance with the installation specified in the testing report.
	Water-resistive barriers approved as alternative materials	Verify the water-resistive barrier is installed in accordance with the manufacturer’s installation instructions

Reason: This proposal updates the code sections on the specification and inspection of the e*xterior wall assembly* and *water-resistive barrier* installation, as follows:

1. Updates the terminology in Section 107.2.4 to include the revision of the term "exterior wall envelope" to "exterior wall assembly" that was made in the 2024 IBC Section 202: *exterior wall envelope* was replaced with *exterior wall assembly.*
2. Adds a new section with requirements for inspection of the *water-resistive barrier* installation (and renumbers subsequent sections). The section has an exception for special inspections.
3. Adds a new section in Chapter 17 with the *water-resistive barrier* special inspection criteria to be used when required by the building official.

Water-resistive barriers and their installation are critical to the weather resistance performance of the exterior wall assembly. It is estimated that 70% of construction claims are due to water and moisture issues in the enclosure. [2,5] According to a recent report on building enclosure damage, "Water intrusion... .dreaded by homeowners, contractors, and insurance adjusters alike. It is evident why, as it ranks as the second most common cause for property insurance claims and first for the most expensive type of claim. In addition, water intrusion accounts for 70% of construction litigation. On average, each incident costs $11,098; collectively, water intrusion costs over $20 billion annually throughout the United States.[6]Water-resistive barrier detailing is currently required in the construction documents. However, these details need to be installed correctly as data suggests these water intrusion issues are often a result of incorrect installation: A survey of "top 100" general contracting firms found the "53% of all defects of defects originate from poor workmanship, supervision and inspection of trade contractors during construction." [2] A third party quality assurance inspection firm lists several defects in water-resistive barrier and flashing integration among the "top 10 construction defects observed across the U.S. in 2018." [3] This proposal seeks to reduce water intrusion issues resulting from incorrect installation of the water-resistive barrier and/or integration of flashings with the water-resistive barrier through requiring a special inspection of water-resistive barrier installation.

The new Section 1705.21 was contains a table of inspection items which are based on the requirements in Sections 1403.2 and a survey of common errors in water-resistive barrier installation based on industry audit information, interviews with industry professionals, and internet searches.[2, 5, 7] The table aligns with requirements based on requirements for specific types of water-resistive barriers 1403.2. It should be noted that EIFS and EIFS water-resistive barriers already are subject to special inspections.

6. Swart, Amelia, "Damage Report: Water Intrusion", Forum Forensics, September 20, 2022, https://www.forumforensics.com/blog/damage-report-water-intrusion

Cost Impact: Increase

Estimated Immediate Cost Impact:

$.20 to .40 per square foot of opaque wall area for the case when special inspections were conducted.

Estimated Immediate Cost Impact Justification (methodology and variables):

This estimate was based on the cost of quality audits reported by the Air Barrier Association of America [1] and is likely a high estimate as an air barrier quality audit would cover more items than a special inspection of the water-resistive barrier and flashing alone. The increased immediate cost needs to be weighed against the liability for potential water intrusion damage if the water-resistive barrier and flashing are not installed correctly. Experience has shown that because of the relative inaccessibility of the water management components in the building enclosures, rebuilding a wall system can cost twice as much as the original wall cost per sq. ft. IBC: SECTION 111, [A] 111.1, [A] 111.2, [A] 111.3, [A] 111.4, [A] 111.5 (New), [A] 111.5.1 (New)

Proponents: Joseph Summers, Mashantucket Pequot Tribal Nation, representing Self

2024 International Building Code

SECTION 111
CERTIFICATE OF OCCUPANCY

Revise as follows:

[A] 111.1 ~~Change of~~ Use and occupancy. A *building* or *structure* shall not be used or occupied in whole or in part, and a *change of occupancy* of a *building* or *structure* or portion thereof shall not be made, until the *building official* has issued a certificate of occupancy therefor as provided herein. Issuance of a certificate of occupancy shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the *jurisdiction*. Certificates presuming to give authority to violate or cancel the provisions of this code or other ordinances of the *jurisdiction* shall not be valid.

~~Exception~~ Exceptions:

1. Certificates of occupancy are not required for work exempt from *permits* in accordance with Section 105.2.
2. Work for which a certificate of approval issued in accordance with Section 111.5.

[A] 111.2 Certificate issued. After the *building official* inspects the building or *structure* and does not find violations of the provisions of this code or other laws that are enforced by the department, the *building official* shall issue a certificate of occupancy that contains the following:

1. The *permit* number.
2. The address of the *structure*.
3. The name and address of the *owner* or the *owner*'s authorized agent.
4. A description of that portion of the *structure* for which the certificate is issued.
5. A statement that the described portion of the *structure* has been inspected for compliance with the requirements of this code.
6. The name of the *building official*.
7. The edition of the code under which the *permit* was issued.
8. The use and occupancy, in accordance with the provisions of Chapter 3.
9. The type of construction as defined in Chapter 6.
10. The design *occupant load*.
11. Where an *automatic sprinkler system* is provided, whether the sprinkler system is required.
12. Any special stipulations and conditions of the building *permit*.

[A] 111.3 Temporary occupancy. The *building official* is authorized to issue a temporary certificate of occupancy before the completion of the entire work covered by the *permit*, provided that such portion or portions shall be occupied safely. The *building official* shall set a time period during which the temporary certificate of occupancy is valid.

[A] 111.4 Revocation. The *building official* is authorized to suspend or revoke a certificate of occupancy or completion issued under the provisions of this code, in writing, wherever the certificate is issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or *structure* or portion thereof is in violation of the provisions of this code or other ordinance of the *jurisdiction* .

Add new text as follows:

[A] 111.5 Certificate of approval. The *building official* shall issue a certificate of approval indicating substantial compliance with the requirements of this code for all completed work that requires a building *permit* but does not require a *certificate of occupancy*. Such work shall include, but not be limited to: fences greater than 7 feet (2134 mm) in height; retaining walls greater than 3 feet (914 mm) in height; decks; garages; *swimming pool*s; basements and attics converted to *habitable space*; electrical, plumbing, and mechanical *repairs* or *alterations*.

[A] 111.5.1 Certificate requirements. After the *building official* inspects the building or *structure* and does not find violations of the provisions of this code or other laws that are enforced by the department, the *building official* shall issue a certificate of approval that contains the following:

1. The *permit* number.
2. The address of the *structure*.
3. A description of that portion of the *structure* for which the certificate is issued.
4. A statement that the described portion of the *structure* has been inspected for compliance with the requirements of this code.
5. The name of the *building official*.
6. The edition of the code under which the *permit* was issued.
7. Any special stipulations and conditions of the building *permit*.

Reason: Currently as worded it can be viewed that a certificate of occupancy is required to be issued every time a permit is issued. This proposal provides a simplified path for the building official to issue a document without providing all of the information that is required on a certificate of occupancy.

Bibliography: The State of Connecticut has similar language as part of the State Building Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will not increase or decrease the cost of construction as it is an administrative matter for the building official.

Staff Analysis: Similar requirements for Certificate of Occupancy is also included in the IEBC Section 111 and IRC Sectin 110

ADM49-25

ADM50-25 Part I

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

SECTION 111
CERTIFICATE OF OCCUPANCY AND CERTIFICATE OF COMPLETION

[A] 111.1 ~~Change of occupancy~~ Approval before use. A *building,* or *structure* shall not be used or occupied in whole or in part, and a *change of occupancy* of a *building* or *structure* or portion thereof shall not be made, until the *building official* has issued an approval in the form of a certificate of occupancy or certificate of completion therefor as provided herein. Issuance of a certificate of occupancy or certificate of completion shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the *jurisdiction*. Certificates presuming to give authority to violate or cancel the provisions of this code or other ordinances of the *jurisdiction* shall not be valid.

Exception: Certificates of occupancy and certificates of completion are not required for work exempt from *permits* in accordance with Section 105.2.

[A] 111.2 Certificate issued. After the *building official* inspects the building or *structure* and does not find violations of the provisions of this code or other laws that are enforced by the department, the *building official* shall issue a certificate of occupancy or certificate of completion that contains the following:

1. The *permit* number.
2. The address of the *structure*.
3. The name and address of the *owner* or the *owner*'s authorized agent.
4. A description of that portion of the *structure* for which the certificate is issued.
5. A statement that the described portion of the *structure* has been inspected for compliance with the requirements of this code.
6. The name of the *building official*.
7. The edition of the code under which the *permit* was issued.
8. The use and occupancy, in accordance with the provisions of Chapter 3.
9. The type of construction as defined in Chapter 6.
10. The design *occupant load*.
11. Where an *automatic sprinkler system* is provided, whether the sprinkler system is required.
12. Any special stipulations and conditions of the building *permit*.

Exception: The building official is authorized to issue certificates of completion, without items 8 and 10, for *structures*.

[A] 111.3 Temporary ~~occupancy~~ certificates. The *building official* is authorized to issue a temporary certificate of occupancy or temporary certificate of completion before the completion of the entire work covered by the *permit*, provided that such portion or portions shall be occupied safely. The *building official* shall set a time period during which the temporary certificate of occupancy or temporary certificate of completion is valid.

[A] 111.4 Revocation. The *building official* is authorized to suspend or revoke a certificate of occupancy or <u>certificate of </u>completion issued under the provisions of this code, in writing, wherever the certificate is issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or *structure* or portion thereof is in violation of the provisions of this code or other ordinance of the *jurisdiction*.

2024 International Existing Building Code

Revise as follows:

SECTION 110
CERTIFICATE OF OCCUPANCY <u>AND CERTIFICATE OF COMPLETION</u>

[A] 110.1 ~~Change of occupancy~~ <u>Approval before use</u>. A <u>building or </u>structure shall not be used or occupied in whole or in part, and a *change of occupancy* of a structure or portion thereof shall not be made until the *code official* has issued <u>an approval in the form of </u>a certificate of occupancy <u>or certificate of completion</u> therefor as provided herein. Issuance of a certificate of occupancy <u>or certificate of completion </u>shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction. Certificates presuming to give authority to violate or cancel the provisions of this code or other ordinances of the jurisdiction shall not be valid.

Exception: Certificates of occupancy <u>and certificates of completion</u> are not required for work exempt from permits in accordance with Section 105.2.

[A] 110.2 Certificate issued. After the *code official* inspects the structure and does not find violations of the provisions of this code or other laws that are enforced by the department, the *code official* shall issue a certificate of occupancy <u>or certificate of completion</u> that contains the following:

1. The permit number.
2. The address of the structure.
3. The name and address of the owner or the owner’s authorized agent.
4. A description of that portion of the structure for which the certificate is issued.
5. A statement that the described portion of the structure has been inspected for compliance with the requirements of this code for the occupancy and division of occupancy and the use for which the proposed occupancy is classified.
6. The name of the *code official*.
7. The edition of the code under which the permit was issued.
8. The use and occupancy in accordance with the provisions of the *International Building Code*.
9. The type of construction as defined in the *International Building Code*.
10. The design occupant load and any impact the *alteration* has on the design occupant load of the area not within the scope of the work.
11. Where an automatic sprinkler system is provided, and whether an automatic sprinkler system is required.
12. Any special stipulations and conditions of the building permit.

<u>**Exception:** The code official is authorized to issue a certificate of completion, without items 8 and 10, for *structures*.</u>

[A] 110.3 Temporary ~~occupancy~~ <u>certificates</u>. The *code official* is authorized to issue a temporary certificate of occupancy <u>or temporary certificate of completion </u>before the completion of the entire work covered by the permit, provided that such portion or portions shall be occupied safely. The *code official* shall set a time period during which the temporary certificate of occupancy or <u>temporary certificate of completion</u> is valid.

[A] 110.4 Revocation. The *code official* is authorized to suspend or revoke a certificate of occupancy or <u>certificate of </u>completion issued under the provisions of this code, in writing, wherever the certificate is issued in error or on the basis of incorrect information supplied, or where it is determined that the building or structure or portion thereof is in violation of the provisions of this code or other ordinance of the jurisdiction.

2024 International Green Construction Code

Revise as follows:

SECTION 109—CERTIFICATE OF OCCUPANCY AND CERTIFICATE OF COMPLETION

109.1 Violations. Issuance of a certificate of occupancy or certificate of completion shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction.

2024 International Wildland Urban Interface Code

SECTION 110 CERTIFICATE OF COMPLETION

Revise as follows:

[A] 110.1 ~~General~~ Approval before use. A building, structure, ~~or~~ premises, or system thereof shall not be used or occupied, and a change in the existing use or occupancy classification of a building, structure, premise or portion thereof shall not be made until the *code official* has issued an approval in the form of a certificate of completion therefor as provided herein. ~~The certificate of occupancy shall not be issued until the certificate of completion indicating that the project is in compliance with this code has been issued by the *code official*.~~

[A] 110.2 Certificate of occupancy. Issuance of a certificate of completion ~~occupancy~~ shall not be construed as an approval of a violation of the provisions of this code or of other pertinent laws and ordinances of the jurisdiction. Certificates presuming to give authority to violate or cancel the provisions of this code or other laws or ordinances of the jurisdiction shall not be valid.

Exceptions:

1. Certificates of ~~occupancy~~ completion are not required for work exempt from permits under Section 105.3.
2. Accessory structures.

[A] 110.3 Temporary ~~occupancy~~ certificates. The *code official* is authorized to issue a temporary certificate of ~~occupancy~~ completion before the completion of the entire work covered by the permit, provided that such portion or portions shall be occupied safely. The *code official* shall set a time period during which the temporary certificate of ~~occupancy~~ completion is valid.

[A] 110.4 Revocation. The *code official* is authorized to, in writing, suspend or revoke a certificate of ~~occupancy or~~ completion issued under the provisions of this code wherever the certificate is issued in error, on the basis of incorrect information supplied, or where it is determined that the building or structure, premise or portion thereof is in violation of any ordinance or regulation or any of the provisions of this code.

ADM50-25 Part I

ADM50-25 Part II

IRC: SECTION R110, R110.1, R110.2, R110.3, R110.4

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Residential Code

Revise as follows:

SECTION R110
CERTIFICATE OF OCCUPANCY AND CERTIFICATE OF COMPLETION

R110.1 ~~Use and change of occupancy~~ Approval before use. A *building* or structure shall not be used or occupied in whole or in part, and a *change of occupancy* of a *building* or structure or portion thereof shall not be made, until the *building official* has issued an approval in the form of a certificate of occupancy or certificate of completion therefor as provided herein. Issuance of a certificate of occupancy or certificate of completion shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the *jurisdiction*. Certificates presuming to give authority to violate or cancel the provisions of this code or other ordinances of the *jurisdiction* shall not be valid.

Exceptions:

1. Certificates of occupancy and certificates of completion are not required for work exempt from *permits* under Section R105.2.
2. Accessory *buildings* or structures.

R110.2 Certificate issued. After the *building official* inspects the building or structure and does not find violations of the provisions of this code or other laws that are enforced by the department, the *building official* shall issue a certificate of occupancy or certificate of completion containing the following:

1. The *permit* number.
2. The address of the structure.
3. The name and address of the *owner* or the *owner*'s authorized agent.
4. A description of that portion of the structure for which the certificate is issued.
5. A statement that the described portion of the structure has been inspected for compliance with the requirements of this code.
6. The name of the *building official*.
7. The edition of the code under which the *permit* was issued.
8. Where an automatic sprinkler system is provided and whether the sprinkler system is required.
9. Any special stipulations and conditions of the building *permit*.

R110.3 Temporary ~~occupancy~~ certificates. The *building official* is authorized to issue a temporary certificate of occupancy or temporary certificate of completion before the completion of the entire work covered by the *permit*, provided that such portion or portions shall be occupied safely. The *building official* shall set a time period during which the temporary certificate of occupancy or temporary certificate of completion is valid.

R110.4 Revocation. The *building official* is authorized to suspend or revoke a certificate of occupancy or temporary certificate of completion issued under the provisions of this code, in writing, wherever the certificate is issued in error, or on the basis of incorrect information supplied, or where it is determined that the building or structure or portion thereof is in violation of the provisions of this code or other ordinance of the *jurisdiction*.

Reason: Certificates of completion have been present in the code for some time, but their purpose has not been clearly defined. This code change aims to clarify their use by allowing certificates of completion to be issued in lieu of certificates of occupancy when the scope of work doesn't warrant occupancy or a change in occupancy.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is administrative and does not any measurable cost impact.

ADM50-25 Part II

ADM51-25 Part I

IBC: [A] 111.2; IEBC: [A] 110.2

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] 111.2 Certificate issued. After the *building official* inspects the building or *structure* and does not find violations of the provisions of this code or other laws that are enforced by the department, the *building official* shall issue a certificate of occupancy that contains the following:

1. The *permit* number.
2. The address of the *structure*.
3. The name and address of the *owner* or the *owner*'s authorized agent.
4. A description of that portion of the *structure* for which the certificate is issued.
5. A statement that the described portion of the *structure* has been inspected for compliance with the requirements of this code.
6. The name of the *building official*.
7. The edition of the code under which the *permit* was issued.
8. The use and occupancy, in accordance with the provisions of Chapter 3.
9. The type of construction as defined in Chapter 6.
10. The design *occupant load*.
11. Where an *automatic sprinkler system* is provided, whether the sprinkler system is required.
12. For *buildings* and *structures* in *flood hazard areas*, a statement that documentation of the lowest floor elevation or documentation of the elevation of dry floodproofing, as applicable, has been provided and is retained in the records of the department.

~~12.~~ 13. Any special stipulations and conditions of the building *permit*.

2024 International Existing Building Code

Revise as follows:

[A] 110.2 Certificate issued. After the *code official* inspects the structure and does not find violations of the provisions of this code or other laws that are enforced by the department, the *code official* shall issue a certificate of occupancy that contains the following:

1. The permit number.
2. The address of the structure.
3. The name and address of the owner or the owner's authorized agent.
4. A description of that portion of the structure for which the certificate is issued.

5. A statement that the described portion of the structure has been inspected for compliance with the requirements of this code for the occupancy and division of occupancy and the use for which the proposed occupancy is classified.

6. The name of the *code official*.

7. The edition of the code under which the permit was issued.

8. The use and occupancy in accordance with the provisions of the *International Building Code*.

9. The type of construction as defined in the *International Building Code*.

10. The design occupant load and any impact the *alteration* has on the design occupant load of the area not within the scope of the work.

11. Where an automatic sprinkler system is provided, and whether an automatic sprinkler system is required.

12. For *buildings* and *structures* in *flood hazard areas*, a statement that documentation of the lowest floor elevation or documentation of the elevation of dry floodproofing, as applicable, has been provided and is retained in the records of the department.

~~12.~~ 13. Any special stipulations and conditions of the building permit.

ADM51-25 Part I

ADM51-25 Part II

IRC: R110.2

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Residential Code

Revise as follows:

R110.2 Certificate issued. After the *building official* inspects the building or structure and does not find violations of the provisions of this code or other laws that are enforced by the department, the *building official* shall issue a certificate of occupancy containing the following:

1. The *permit* number.
2. The address of the structure.
3. The name and address of the *owner* or the *owner*'s authorized agent.
4. A description of that portion of the structure for which the certificate is issued.
5. A statement that the described portion of the structure has been inspected for compliance with the requirements of this code.
6. The name of the *building official*.
7. The edition of the code under which the *permit* was issued.
8. Where an automatic sprinkler system is provided and whether the sprinkler system is required.
9. For *buildings* and *structures* in *flood hazard areas*, a statement that documentation of the lowest floor elevation has been provided and is retained in the records of the department.

~~9.~~ 10. Any special stipulations and conditions of the building *permit*.

Reason:
The IBC, IRC, and IEBC all require submission of documentation of the elevation of the lowest floor, or elevation of dry floodproofing, if applicable, before the final inspection of buildings and structures in in flood hazard areas (see IBC Sec. 110.3.12.1, IRC Sec. R109.1.6.1, and IEBC Sec. 109.3.10). This proposal adds a statement regarding that documentation to the other building- and permit-specific information that must be contained in the Certificate of Occupancy. The Florida Building Code has included a similar requirement since 2014.

There are a number of benefits to adding the proposed note to the list of what is required to be included in Certificates of Occupancy. It is beneficial for property owners, local governments, future buyers, attorneys, contractors, design professionals, realtors, and insurance companies and lenders. Anyone who requests a copy of the certificate will see the statement and know that they can request copies of the documentation on file to validate that the lowest floor or dry floodproofing elevation was compliant at the time of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no impact on the cost of construction. Implementation of the proposed change requires changing Certificate of Occupancy forms, which is a minimal one-time cost for communities, but does not impact the overall cost of construction. Certificates of Occupancy forms are completed for each property when permits are issued. The Florida Building Code has had a similar requirement for 15 years; a number of Florida communities confirmed that checking a box to confirm the required documentation is on record does not add any cost.

ADM51-25 Part II

ADM52-25

IMC®: SECTION 113, [A] 113.1; IPC: SECTION 113, [A] 113.1

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Mechanical Code

Delete without substitution:

~~SECTION 113~~
~~BOARD OF APPEALS~~

~~**[A] 113.1 Membership of board.**~~ ~~The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for 5 years; one for 4 years; one for 3 years; one for 2 years; and one for 1 year. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.~~

2024 International Plumbing Code

Delete without substitution:

~~SECTION 113~~
~~BOARD OF APPEALS~~

~~**[A] 113.1 Membership of board.**~~ ~~The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for 5 years; one for 4 years; one for 3 years; one for 2 years; and one for 1 year. Thereafter, each new member shall serve for 5 years or until a successor has been appointed.~~

Reason: ADM43-19 added and/or coordinated the appendix with the criteria for the Board of Appeals to all the codes. The makeup of the Board should be an administrative item and not part of the codes. This section was revised in that proposal. Rather than make this an errata, this proposal is to delete this information at this time.
This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination item with no change to construction requirements.

ADM52-25

ADM53-25

IFC: [A] 113.3

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Fire Code

Delete and substitute as follows:

~~**[A] 113.3 Notice of violation.** Where the *fire code official* finds a building, premises, vehicle, storage facility or outdoor area that is in violation of this code, the *fire code official* is authorized to prepare a written notice of violation describing the conditions deemed unsafe and, where compliance is not immediate, specifying a time for reinspection.~~

[A] 113.3 Notice of violation. The *fire code official* is authorized to serve a notice of violation or order on the *person* responsible for a building or structure, premises, vehicle, storage facility or outdoor area in violation of the provisions of this code, or in violation of a permit or certificate issued under the provisions of this code. Such order shall direct the discontinuance of the illegal action or condition and the abatement of the violation.

Reason: This code change aligns the NOV provisions of the IFC with the IBC while maintaining the scope of the IFC.

For reference; the IBC's language is as follows: The building official is authorized to serve a notice of violation or order on the person responsible for the erection, construction, alteration, extension, repair, moving, removal, demolition or occupancy of a building or structure [...] in violation of the provisions of this code, or in violation of a permit or certificate issued under the provisions of this code. Such order shall direct the discontinuance of the illegal action or condition and the abatement of the violation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This langage coordinates sections while maintaining the intent of the language. There are no realistic cost impacts.

ADM53-25

ADM54-25

IBC: [A] 116.1

Proponents: John-Jozef Proczka, representing City of Phoenix Planning and Development Department (john-jozef.proczka@phoenix.gov)

2024 International Building Code

Revise as follows:

[A] 116.1 Unsafe conditions. *Structures* or ~~existing~~ equipment that are or hereafter become unsafe, insanitary or deficient ~~because of inadequate *means of egress facilities*, inadequate light and *ventilation*, or that constitute a fire hazard, or are otherwise *dangerous* to human life or the public welfare, or that involve illegal or improper occupancy or inadequate maintenance,~~ shall be deemed an unsafe condition.
An unsafe condition is any condition that, as deemed by the *building official*, poses a danger to human life or the public welfare, including, but not limited to, the following:

1. Inadequate structural performance.
2. Inadequate sanity system performance.
3. Inadequate *means of egress* facilities.
4. Inadequate light.
5. Inadequate ventilation.
6. Constituting an explosion hazard.
7. Constituting a fire hazard.
8. Constituting a shock hazard.
9. Constituting a toxicity hazard.
10. Involve occupancy of a higher relative hazard than the structure is built to support or shelter.

Unsafe *structures* shall be taken down and removed or made safe, as the *building official* deems necessary and as provided for in this section. A vacant *structure* that is not secured against unauthorized entry shall be deemed unsafe.

Reason: This change is intended only to clarify the provisions in this section. The current run on sentence is very difficult to follow, so a list is introduced for the types of reasons that may constitute an unsafe condition. Some new possible reasons are included to help guide the code user, but some of them are obviously already intended to be included, such as structural performance.

The one possible intent change here has to do with the "illegal or improper occupancy" being replaced with the higher relative hazard occupancy. This is a concept that is most easily seen in the IEBC Section 1011 change of occupancy classification provisions.

The user of this section is cautioned that not all instances of inadequate performance are intended to be unsafe conditions. Only those that are sufficiently deficient are intended to be considered unsafe conditions, as determined by the building official. For instance, a non-draining shower would not be an unsafe condition, however sewage backing up into a building could be an unsafe condition.

Depending on the functioning of the building department with respect to neighborhood blight, it may be appropriate to amend out the provision for vacant structures being considered unsafe conditions, as they do not appear to be dangerous just by being vacant. If the department does regulate neighborhood blight, it may also be appropriate to re-introduce illegal occupancy as a condition that wishes to be enforced for these purposes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is only a reorganization and clarification of this section.

ADM55-25

IEBC: SECTION 116, [A] 116.1, [A] 116.2, [A] 116.3, [A] 116.4, [A] 116.5, [A] 116.6, SECTION 202 (New); IPMC: 110, 110.1, 110.2, 110.3, 110.4, 110.5, 110.6, SECTION 202 (New)

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

SECTION 116
EMERGENCY MEASURES

[A] 116.1 Imminent danger. Where, in the opinion of the *code official*, there is imminent danger of failure or collapse of a building that endangers life, or where any building or part of a building has fallen and life is endangered by the occupation of the building, or where there is actual or potential danger to the building occupants or those in the proximity of any ~~structure~~ building because of explosives, explosive fumes or vapors, or the presence of toxic fumes, gases, or materials, or operation of defective or dangerous equipment, the *code official* is hereby authorized and empowered to order and require the occupants to vacate the premises forthwith. The *code official* shall cause to be posted at each entrance to such ~~structure~~ building a notice reading as follows: "This ~~Structure~~ Building Is Unsafe and Its Occupancy Has Been Prohibited by the Code Official." It shall be unlawful for any person to enter such ~~structure~~ building except for the purpose of securing the ~~structure~~ building , making the required *repairs*, removing the hazardous condition, or of demolishing the same.

[A] 116.2 Temporary safeguards. Notwithstanding other provisions of this code, whenever, in the opinion of the *code official*, there is imminent danger due to an *unsafe* condition, the *code official* shall order the necessary work to be done, including the boarding up of openings, to render such ~~structure~~ building temporarily safe whether or not the legal procedure herein described has been instituted; and shall cause such other action to be taken as the *code official* deems necessary to meet such emergency.

[A] 116.3 Closing streets. Where necessary for public safety, the *code official* shall temporarily close ~~structures~~buildings and close or order the authority having jurisdiction to close sidewalks, streets, public ways and places adjacent to *unsafe* ~~structures~~buildings , and prohibit the same from being utilized.

[A] 116.4 Emergency repairs. For the purposes of this section, the *code official* shall employ the necessary labor and materials to perform the required work as expeditiously as possible.

[A] 116.5 Costs of emergency repairs. Costs incurred in the performance of emergency work shall be paid by the jurisdiction. The legal counsel of the jurisdiction shall institute appropriate action against the owner of the premises or the owner's authorized agent where the *unsafe* ~~structure~~ building is or was located for the recovery of such costs.

[A] 116.6 Hearing. Any person ordered to take emergency measures shall comply with such order forthwith. Any affected person shall thereafter, on petition directed to the appeals board, be afforded a hearing as described in this code.

Add new definition as follows:

IMMINENT DANGER. A condition that could cause serious or life-threatening injury or death at any time.

2024 International Property Maintenance Code

SECTION 110
EMERGENCY MEASURES

110.1 Imminent danger. When, in the opinion of the *code official*, there is *imminent danger* of failure or collapse of a building ~~or *structure*~~ that endangers life, or ~~when~~ where any ~~structure~~ building or part of a ~~structure~~ building has fallen and life is endangered by the occupation of the ~~structure~~ building , or ~~when~~ wherethere is actual or potential danger to the building *occupants* or those in the proximity of any ~~structure~~ building because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials, or operation of defective or *dangerous* equipment, the *code official* is hereby authorized and empowered to order and require the *occupants* to vacate the *premises* forthwith. The *code official* shall cause to be posted at each entrance to such *structure* a notice reading as follows: "This ~~Structure~~ Building Is Unsafe and Its *Occupancy* Has Been Prohibited by the *Code Official*." It shall be unlawful for any *person* to enter such ~~structure~~ building except for the purpose of securing the ~~structure~~ building , making the required repairs, removing the hazardous condition or of demolishing the same.

110.2 Temporary safeguards. Notwithstanding other provisions of this code, whenever, in the opinion of the *code official*, there is *imminent danger* due to an unsafe condition, the *code official* shall order the necessary work to be done, including the boarding up of openings, to render such ~~structure~~ building temporarily safe whether or not the legal procedure herein described has been instituted; and shall cause such other action to be taken as the *code official* deems necessary to meet such emergency.

110.3 Closing streets. When necessary for public safety, the *code official* shall temporarily close ~~structures~~buildingsand close, or order the authority having jurisdiction to close, sidewalks, streets, *public ways* and places adjacent to unsafe ~~structures~~buildings, and prohibit the same from being utilized.

110.4 Emergency repairs. For the purposes of this section, the *code official* shall employ the necessary labor and materials to perform the required work as expeditiously as possible.

110.5 Costs of emergency repairs. Costs incurred in the performance of emergency work shall be paid by the jurisdiction. The legal counsel of the jurisdiction shall institute appropriate action against the *owner* of the *premises*~~structure~~ buildingor *owner*'s authorized agent where the unsafe *structure* is or was located for the recovery of such costs.

110.6 Hearing. Any *person* ordered to take emergency measures shall comply with such order forthwith. Any affected *person* shall thereafter, upon petition directed to the appeals board, be afforded a hearing as described in this code.

Add new definition as follows:

[A] BUILDING. Any structure utilized or intended for supporting or sheltering any occupancy.
UNSAFE. Buildings, structures or equipment that are unsanitary, or that are deficient due to inadequate means of egress facilities, inadequate light and ventilation, or that constitute a fire hazard, or in which the structure or individual structural members meet the definition of "Dangerous," or that are otherwise dangerous to human life or the public welfare, or that involve illegal or improper occupancy or inadequate maintenance shall be deemed unsafe. A vacant structure that is not secured against entry shall be deemed unsafe.

Reason: The intent of this proposal is to coordinate the sections for Emergency Measures in IPMC and IEBC. The current text uses 'building', 'structure' or sometimes both. The text is not consistent. Given the definitions, 'building' seems more appropriate where you are talking about vacating and placarding for safety of occupants.

Currently, the relevant definitions are only in one of the two codes.

IEBC only - **BUILDING.** Any structure utilized or intended for supporting or sheltering any occupancy.

IPMC only - **IMMINENT DANGER.** A condition that could cause serious or life-threatening injury or death at any time.

IPMC only - [A] **STRUCTURE.** That which is built or constructed.

IEBC only - **UNSAFE.** Buildings, structures or equipment that are unsanitary, or that are deficient due to inadequate means of egress facilities, inadequate light and ventilation, or that constitute a fire hazard, or in which the structure or individual structural members meet the definition of "Dangerous," or that are otherwise dangerous to human life or the public welfare, or that involve illegal or improper occupancy or inadequate maintenance shall be deemed unsafe. A vacant structure that is not secured against entry shall be deemed unsafe.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In

addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial correlation between the administrative provisions in the I-codes. There is no change to constructions requirements.

ADM55-25

2024 International Building Code

Add new text as follows:

SECTION 117 EMERGENCY MEASURES

[A] 117.1 Imminent danger. The occupants shall vacate premises when any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 117.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: “This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official.” It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Existing Building Code

Add new text as follows:

SECTION 118 EMERGENCY MEASURES

[A] 118.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 118.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: "This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official." It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Fire Code

Add new text as follows:

SECTION 116
EMERGENCY MEASURES

[A] 116.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 116.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: "This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official." It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Fuel Gas Code

Add new text as follows:

SECTION 115
EMERGENCY MEASURES

[A] 115.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 115.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: "This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official." It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Green Construction Code

Add new text as follows:

SECTION 111
EMERGENCY MEASURES

111.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

111.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: "This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official." It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Mechanical Code

Add new text as follows:

SECTION 116
EMERGENCY MEASURES

[A] 116.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 116.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: “This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official.” It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Plumbing Code

Add new text as follows:

SECTION 116
EMERGENCY MEASURES

[A] 116.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 116.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: "This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official." It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Private Sewage Disposal Code

Add new text as follows:

SECTION 115 EMERGENCY MEASURES

[A] 115.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 115.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: "This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official." It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Property Maintenance Code

Add new text as follows:

SECTION 112 EMERGENCY MEASURES

[A] 112.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.

4. Operation of defective or dangerous equipment.

112.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: “This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official.” It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

2024 International Swimming Pool and Spa Code

Add new text as follows:

SECTION 115
EMERGENCY MEASURES

[A] 115.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

[A] 115.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: “This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official.” It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

IRC: SECTION R115 (New), R115.1 (New), R115.2 (New)

Proponents: Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov)

2024 International Residential Code

Add new text as follows:

SECTION R115 EMERGENCY MEASURES

R115.1 Imminent danger. The occupants shall vacate premises where any of the following exists:

1. Imminent danger of failure or collapse of a building or structure which endangers life.
2. A structure where the entire structure, or part of the structure, has fallen and life is endangered by the occupation of the structure.
3. Actual or potential danger to the building occupants or those in the proximity of any structure because of explosives, explosive fumes or vapors or the presence of toxic fumes, gases or materials.
4. Operation of defective or dangerous equipment.

R115.2 Notice. There shall be posted at each entrance to such structure a notice reading as follows: "This Structure is Unsafe and its Occupancy Has Been Prohibited by the Fire Code Official." It shall be unlawful for any person to enter such structure except for the purpose of securing the structure, making the required repairs, removing the hazardous condition or demolishing the structure.

Reason: This code proposal is suggesting adding language for vacating when imminent danger is present, as well as posting a notice on premises.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact, as the changes suggested are editorial and only add language that do not change any intent of the code.

ADM56-25 Part II

ADM57-25

IEBC: [A] 117.1

Proponents: Sean Denniston, Heritage Green Consulting, representing Association for Preservation Technology (sean@heritagegreenconsulting.com); James Lindberg, representing National Trust for Historic Preservation (jlindberg@savingplaces.org)

2024 International Existing Building Code

Revise as follows:

[A] 117.1 General. When the *code official* determines any structure is so old, dilapidated or has become so out of repair and is dangerous, unsafe, insanitary and otherwise unfit for human habitation or occupancy the *code official* can order either of the following:

1. The code official is permitted to authorize the owner or owner's authorized agent to make the structure safe by *repairs* in order to make the structure safe and sanitary. Where there has been a cessation of construction repairs of any structure for a period of more than 2 years, the structure will be ordered demolished and removed.
2. The code official is permitted to order the owner or owner's authorized agent to demolish and remove any such structure.

Exception: A *historic building* shall only be ordered demolished by the *code official* where it poses an imminent danger to public safety that cannot be remedied through means other than demolition.

Attached Files

- **Support for amendments to IEBC.pdf**
  https://www.cdpaccess.com/proposal/11776/35734/files/download/9280/

Reason: Many jurisdictions have historic preservation requirements in their municipal or building codes intended to protect the historic character and integrity of historic buildings. These regulations typically include restrictions on the demolition of historic buildings. These vary in stringency, but generally make demolishing a historic building more difficult than demolishing non-historic buildings. These restrictions generally require the owner to demonstrate that the historic building meets some criteria for technical or financial infeasibility before the historic building can be demolished. However, these restrictions also typically include an exception for buildings that have been found unsafe/unfit and ordered demolished by the building official. Here is an example from Vancouver, WA (VMC 20.510.050(A)(3)):

> "A structure as identified above (ed: a historic building) shall not be demolished except in the following manner:
>
> a. Demolition of Unsafe Buildings. If the City Building Official has found the structure to be unsafe under the provisions of Chapter 17.32 VMC, Unfit Buildings and Premises Code, and has ordered that the structure be demolished."

Or this example from the City of Milwaukee's historic preservation regulations (320-21-16):

> "EMERGENCY RAZING NOT PROHIBITED. Nothing contained in this section shall prohibit the demolition of a structure for which a court order has been issued or for which the commissioner of neighborhood services has issued an emergency raze order under s. 218-4.5."

These kinds of exceptions to historic building demolition restrictions make sense, as we do not want preservation requirements in the code to create a barrier to the jurisdiction protecting public safety. However, they also create significant problems. The historic building owner who knows that their building doesn't meet the requirements for demolition under the jurisdiction's preservation regulation is incentivized to try to get the jurisdiction to order demolition in order to avoid those restrictions. In fact, they are even incentivized to allow their building to deteriorate to the point that it will qualify as unsafe. This creates very significant problems for preservation, for public safety and for code officials.

The first problem is for preservation. Communities enact historic preservation ordinances to protect their local cultural heritage. One of the most important protections is the one against the loss of historic buildings to demolition. If there is an end-run around these demolition restrictions, particularly a path that does not require engagement with preservation authorities, then those protections are significantly weakened. Any building owner that wants to demolish a historic building can just allow their building to deteriorate to the point of unsafeness and negate the protections on their building. This "demolition by neglect" is a long-established issue faced by preservationists.

The second problem is for public safety. The potential end-run around preservation regulations creates an incentive for owners to allow their buildings to become unsafe. That building will likely pose risks to public safety long before it reaches the state where they can be considered unsafe or where they come to the attention of the code official. Disinvestment in the building also then creates a drag on the value of neighboring buildings and economic viability of the neighborhood.

The third problem is for code officials. This path around preservation requirements goes straight through the code official. Code officials can be pressured by building owners to condemn their buildings. They may even find themselves being accused of neglecting public safety if they don't, in an effort to shift the blame for the hazard from the owner to the building official. This is exactly what is happening in Vancouver, WA. In Vancouver, permits for the demolition of certain historic buildings requires meeting a set of requirements to determine financial infeasibility of preservation (VMC 20.510.050(A)(3)). These are substantially more stringent than the standards for a demolition order for an unsafe building. Since 2020, the owners of four historic buildings with demolition restrictions on them have requested that the code official find these buildings unfit and order their demolition, which has created significant backlash from the preservation community (as seen in the discussions at Historic Preservation Commission meetings).

This proposal addresses these issues through a simple modification to Section 117. Section 117 gives the code official two options for an unsafe building: order repair or order demolition. The exception makes it clear that the code official can only order demolition of a historic building (a defined term in the I-Codes) if the historic building poses an immanent danger to public safety that cannot be remedied through means other than demolition. This eliminates the potential conflict between this code section and local preservation regulations, and the likelihood of the code official getting caught between preservation regulations/authorities and an owner seeking to circumvent them. The proposed wording ensures that the code official does not lose the authority to protect public safety. If an unsafe historic building poses an immanent threat to public safety, the code official can still order demolition if that is the only means of remedying the danger.

This proposal is submitted by the Association for Preservation Technology and the National Trust for Historic Preservation and further supported by Main Street America, National Trust Community Investment Corporation and RePurpose Capital (see attached letter of support), which represent a significant portion of national historic preservation organizations.

2024 International Building Code

Revise as follows:

[A] ~~BUILDING~~ CODE OFFICIAL. The ~~officer or other~~ designated authority charged with the administration and enforcement of this code, or a duly authorized representative.

Add new definition as follows:

FIRE CODE OFFICIAL. The fire chief or other designated authority charged with the administration and enforcement of the *International Fire Code*, or a duly authorized representative.

2024 International Existing Building Code

Add new definition as follows:

FIRE CODE OFFICIAL. The fire chief or other designated authority charged with the administration and enforcement of the *International Fire Code*, or a duly authorized representative.

RESOURCE A
GUIDELINES ON FIRE RATINGS OF ARCHAIC MATERIALS AND ASSEMBLIES

Revise as follows:

2.1 PRELIMINARY EVALUATION. A preliminary evaluation should begin with a building survey to determine the existing materials, the general arrangement of the structure and the use of the occupied spaces, and the details of construction. The designer needs to know "what is there" before a decision can be reached about what to keep and what to remove during the rehabilitation process. This preliminary evaluation should be as detailed as necessary to make initial plans. The fire-related properties need to be determined from the applicable building or rehabilitation code, and the materials and assemblies existing in the building then need to be evaluated for these properties. Two worksheets are shown below to facilitate the preliminary evaluation.

Two possible sources of information helpful in the preliminary evaluation are the original building plans and the building code in effect at the time of original construction. Plans may be on file with the local building department or in the offices of the original designers (e.g., architect, engineer) or their successors. If plans are available, the investigator should verify that the building was actually constructed as called for in the plans, as well as incorporate any later alterations or changes to the building. Earlier editions of the local building code should be on file with the ~~building~~ code official. The code in effect at the time of construction will contain fire performance criteria. While this is no guarantee that the required performance was actually provided, it does give the investigator some guidance as to the level of performance which may be expected. Under some code administration and enforcement systems, the code in effect at the time of construction also defines the level of performance that must be provided at the time of rehabilitation.

Table 2.1(1) illustrates one method for organizing preliminary field notes. Space is provided for the materials, dimensions and condition of the principal building elements. Each floor of the structure should be visited and the appropriate information obtained. In practice, there will often be identical materials and construction on every floor, but the exception may be of vital importance. A schematic diagram should be prepared of each floor showing the layout of exits and hallways and indicating where each element described in the field notes fits into the structure as a whole. The exact arrangement of interior walls within apartments is of secondary importance from a fire safety point of view and need not be shown on the drawings unless these walls are required by code to have a fire-resistance rating.

The location of stairways and elevators should be clearly marked on the drawings. All exterior means of escape (e.g., fire escapes) should be identified. (Note: Problems providing adequate exiting are discussed at length in the *Egress Guideline for Residential Rehabilitation.*)

The following notes explain the entries in Table 2.1(1).

Exterior Bearing Walls. Many old buildings utilize heavily constructed walls to support the floor/ceiling assemblies at the exterior of the building. There may be columns and/or interior bearing walls within the structure, but the exterior walls are an important factor in assessing the fire safety of a building.

The field investigator should note how the floor/ceiling assemblies are supported at the exterior of the building. If columns are incorporated in the exterior walls, the walls may be considered nonbearing.

Interior Bearing Walls. It may be difficult to determine whether or not an interior wall is load bearing, but the field investigator should attempt to make this determination. At a later stage of the rehabilitation process, this question will need to be determined exactly. Therefore, the field notes should be as accurate as possible.*Exterior Nonbearing Walls*. The fire resistance of the exterior walls is important for two reasons. These walls (both bearing and nonbearing) are depended upon to: a) contain a fire within the building of origin; or b) keep an exterior fire *outside* the building. It is therefore important to indicate on the drawings where any openings are located as well as the materials and construction of all doors or shutters. The drawings should indicate the presence of wired glass, its thickness and framing, and identify the materials used for windows and door frames. The protection of openings adjacent to exterior means of escape (e.g., exterior stairways, fire escapes) is particularly important. The ground floor drawing should locate the building on the property and indicate the precise distances to adjacent buildings.*Interior Nonbearing Walls (Partitions)*. A partition is a “wall that extends from floor to ceiling and subdivides space within any story of a building” (see Bibliography entry 35). Table 2.1(1) has two categories (A & B) for Interior Nonbearing Walls (Partitions) which can be used for different walls, such as hallway walls as compared to inter-apartment walls. Under some circumstances there may be only one type of wall construction; in others, three or more types of wall construction may occur.

The field investigator should be alert for differences in function as well as in materials and construction details. In general, the details within apartments are not as important as the major exit paths and exit stairways. The preliminary field investigation should attempt to determine the thickness of all walls. A term introduced below called “thickness design” will depend on an accurate (± $^1/_4$ inch) determination. Even though this initial field survey is called “preliminary,” the data generated should be as accurate and complete as possible.

The field investigator should note the exact location from which observations are recorded. For instance, if a hole is found through a wall enclosing an exit stairway which allows a cataloguing of the construction details, the field investigation notes should reflect the location of the “find.” At the preliminary stage it is not necessary to core every wall; the interior details of construction can usually be determined at some location.

Structural Frame. There may or may not be a complete skeletal frame, but usually there are columns, beams, trusses or other like elements. The dimensions and spacing of the structural elements should be measured and indicated on the drawings. For instance, if there are 10-inch-square columns located on a 30-foot-square grid throughout the building, this should be noted. The structural material and cover or protective materials should be identified wherever possible. The thickness of the cover materials should be determined to an accuracy of ± $^1/_4$ inch. As discussed above, the preliminary field survey usually relies on accidental openings in the cover materials rather than a systematic coring technique.*Floor/Ceiling Structural Systems*. The span between supports should be measured. If possible, a sketch of the cross-section of the system should be made. If there is no location where accidental damage has opened the floor/ceiling construction to visual inspection, it is necessary to make such an opening. An evaluation of the fire resistance of a floor/ceiling assembly requires detailed knowledge of the materials and their arrangement. Special attention should be paid to the cover on structural steel elements and the condition of suspended ceilings and similar membranes.*Roofs*. The preliminary field survey of the roof system is initially concerned with watertightness. However, once it is apparent that the roof is sound for ordinary use and can be retained in the rehabilitated building, it becomes necessary to evaluate the fire performance. The field investigator must measure the thickness and identify the types of materials which have been used. Be aware that there may be several layers of roof materials.*Doors*. Doors to stairways and hallways represent some of the most important fire elements to be considered within a building. The uses of the spaces separated largely controls the level of fire performance necessary. Walls and doors enclosing stairways or elevator shafts would normally require a higher level of performance than between the bedroom and bath. The various uses are differentiated in Table 2.1(1).

Careful measurements of the thickness of door panels must be made, and the type of core material within each door must be determined. It should be noted whether doors have self-closing devices; the general operation of the doors should be checked. The latch should engage and the door should fit tightly in the frame. The hinges should be in good condition. If glass is used in the doors, it should be identified as either plain glass or wired glass mounted in either a wood or steel frame.

Materials. The field investigator should be able to identify ordinary building materials. In situations where an unfamiliar material is found, a sample should be obtained. This sample should measure at least 10 cubic inches so that an ASTM E136 fire test can be conducted to determine if it is combustible.*Thickness*. The thickness of all materials should be measured accurately since, under certain circumstances, the level of fire resistance is very sensitive to the material thickness.*Condition*. The method of attaching the various layers and facings to one another or to the supporting structural element should be noted under the appropriate building element. The "secureness" of the attachment and the general condition of the layers and facings should be noted here.*Notes*. The "Notes" column can be used for many purposes, but it might be a good idea to make specific references to other field notes or drawings.

After the building survey is completed, the data collected must be analyzed. A suggested work sheet for organizing this information is given as Table 2.1(2).

The required fire resistance and flame spread for each building element are normally established by the local building or rehabilitation code. The fire performance of the existing materials and assemblies should then be estimated, using one of the techniques described below. If the fire performance of the *existing building* element(s) is equal to or greater than that required, the materials and assemblies may remain. If the fire performance is less than required, then corrective measures must be taken.

The most common methods of upgrading the level of protection are to either remove and replace the *existing building* element(s) or to *repair* and upgrade the existing materials and assemblies. Other fire protection measures, such as automatic sprinklers or detection and alarm systems, also could be considered, though they are beyond the scope of this guideline. If the upgraded protection is still less than that required or deemed to be acceptable, additional corrective measures must be taken. This process must continue until an acceptable level of performance is obtained.

2.2 FIRE RESISTANCE OF EXISTING BUILDING ELEMENTS. The fire resistance of the *existing building* elements can be estimated from the tables and histograms contained in the Appendix. The Appendix is organized first by type of building element: walls, columns, floor/ceiling assemblies, beams and doors. Within each building element, the tables are organized by type of construction (e.g., masonry, metal, wood frame) and then further divided by minimum dimensions or thickness of the building element.

A histogram precedes every table that has 10 or more entries. The X-axis measures fire resistance in hours; the Y-axis shows the number of entries in that table having a given level of fire resistance. The histograms also contain the location of each entry within that table for easy cross-referencing.

The histograms, because they are keyed to the tables, can speed the preliminary investigation. For example, Table 1.3.2, *Wood Frame Walls 4" to Less Than 6" Thick*, contains 96 entries. Rather than study each table entry, the histogram shows that every wall assembly listed in that table has a fire resistance of less than 2 hours. If the building code required the wall to have 2-hour fire resistance, the designer, with a minimum of effort, is made aware of a problem that requires closer study.

Suppose the code had only required a wall of 1-hour fire resistance. The histogram shows far fewer complying elements (19) than noncomplying ones (77). If the existing assembly is not one of the 19 complying entries, there is a strong possibility the existing assembly is deficient. The histograms can also be used in the converse situation. If the existing assembly is not one of the smaller number of entries with a lower than required fire resistance, there is a strong possibility the existing assembly will be acceptable.

At some point, the *existing building* component or assembly must be located within the tables. Otherwise, the fire resistance must be determined through one of the other techniques presented in the guideline. Locating the building component in the Appendix tables not only guarantees the accuracy of the fire-resistance rating, but also provides a source of documentation for the ~~building~~ code official.

3.1 THE EXPERIMENTAL APPROACH. If a material or assembly found in a building is not listed in the Appendix tables, there are several other ways to evaluate fire performance. One approach is to conduct the appropriate fire test(s) and thereby determine the fire-related properties directly. There are a number of laboratories in the United States which routinely conduct the various fire tests.

The contract with any of these testing laboratories should require their observation of specimen preparation as well as the testing of the specimen. A complete description of where and how the specimen was obtained from the building, the transportation of the specimen, and its preparation for testing should be noted in detail so that the ~~building~~ code official can be satisfied that the fire test is representative of the actual use.

The test report should describe the fire test procedure and the response of the material or assembly. The laboratory usually submits a cover letter with the report to describe the provisions of the fire test that were satisfied by the material or assembly under investigation. A building official will generally require this cover letter but will also read the report to confirm that the material or assembly complies with the code requirements. Local code officials should be involved in all phases of the testing process.

The experimental approach can be costly and time consuming because specimens must be taken from the building and transported to the testing laboratory. When a load-bearing assembly has continuous reinforcement, the test specimen must be removed from the building, transported and tested in one piece. However, when the fire performance cannot be determined by other means, there may be no alternative to a full-scale test.

A “nonstandard” small-scale test can be used in special cases. Sample sizes need only be 10–25 square feet (0.93–2.3 m^2), while full-scale tests require test samples of either 100 or 180 square feet (9.3 or 17 m^2) in size. This small-scale test is best suited for testing nonload-bearing assemblies against thermal transmission only.

2024 International Fire Code

[A] BUILDING CODE OFFICIAL. The ~~officer or other~~ designated authority charged with the administration and enforcement of the *International Building Code*~~, or a duly authorized representative~~.

2024 International Green Construction Code

Revise as follows:

107.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at the time of application. Such estimated valuations shall include the total value of work, including materials and labor, for which the permit is being issued, such as electrical, gas, mechanical, and plumbing equipment and permanent systems. In the opinion of the ~~building~~ code official, where the valuation is underestimated, the permit shall be denied unless the applicant can show detailed estimates acceptable to the ~~building~~ code official. The ~~building~~ code official shall have the authority to adjust the final valuation for permit fees.

107.4 Work commencing before permit issuance. Any person who commences any work before obtaining the necessary permits shall be subject to a fee established by the ~~building~~ code official that shall be in addition to the required permit fees.

107.6 Refunds. The ~~building~~ code official is authorized to establish a refund policy.

2024 International Mechanical Code

Revise as follows:

[A] 106.1 Construction documents. *Construction documents*, engineering calculations, diagrams and other data shall be submitted in two or more sets, or in a digital format where allowed by the ~~building~~ code official, with each application for a permit. The code official shall require *construction documents*, computations and specifications to be prepared and designed by a *registered design professional* where required by state law. Where special conditions exist, the code official is authorized to require additional *construction documents* to be prepared by a *registered design professional*. *Construction documents* shall be drawn to scale and shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that the work conforms to the provisions of this code. *Construction documents* for *buildings* more than two stories in height shall indicate where penetrations will be made for mechanical systems, and the materials and methods for maintaining required structural safety, fire-resistance rating and fireblocking.

Exception: The code official shall have the authority to waive the submission of *construction documents*, calculations or other data if the nature of the work applied for is such that reviewing of *construction documents* is not necessary to determine compliance with this code.

[F] 512.12.1 Verification. Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override and the presence of power downstream of all disconnects. A preprogrammed weekly test sequence shall report abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, *equipment* and components used for smoke control.

Exception: Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with, and produce unwanted effects to, normal *building* operation, such individual components are permitted to be bypassed from the preprogrammed weekly testing, where *approved* by the ~~building~~ code official and in accordance with both of the following:

1. Where the operation of components is bypassed from the preprogrammed weekly test, presence of power downstream of all disconnects shall be verified weekly by a *listed* control unit.
2. Testing of all components bypassed from the preprogrammed weekly test shall be in accordance with Section 909.20.5 of the *International Fire Code*.

2024 International Plumbing Code

Revise as follows:

[A] 108.3 Permit valuations. The applicant for a permit shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include the total value of work, including materials and labor, for which the permit is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. Where, in the opinion of the ~~building~~ code official, the valuation is underestimated, the permit shall be denied, unless the applicant can show detailed estimates acceptable to the ~~building~~ code official. The building official shall have the authority to adjust the final valuation for permit fees.

2024 International Property Maintenance Code

Add new definition as follows:

FIRE CODE OFFICIAL. The fire chief or other designated authority charged with the administration and enforcement of the *International Fire Code*, or a duly authorized representative.

[A] 105.2.2.5 Tests. Tests conducted to demonstrate equivalency in support of an alternative material, design or method of construction application shall be of a scale that is sufficient to predict performance of the end use configuration. Tests shall be performed by a party acceptable to the code official.

Revise as follows:

[A] 105.2.2.5.1 Fire tests. Tests conducted to demonstrate equivalent fire safety in support of an alternative material, design or method of construction application shall be of a scale that is sufficient to predict fire safety performance of the end use configuration. Tests shall be performed by a party acceptable to the ~~building~~ code official.

[A] 105.2.2.6.2 Other reports. Reports not complying with Section 105.2.2.6.1 shall describe criteria, including but not limited to any referenced testing or analysis, used to determine compliance with code intent and justify code equivalence. The report shall be prepared by a qualified engineer, specialist, laboratory or specialty organization acceptable to the ~~building~~ code official. The code official is authorized to require design submittals to be prepared by, and bear the stamp of, a registered design professional.

2024 International Private Sewage Disposal Code

Revise as follows:

[A] 106.3 Permit valuations. The applicant for a *permit* shall provide an estimated value of the work for which the permit is being issued at time of application. Such estimated valuations shall include the total value of work, including materials and labor, for which the *permit* is being issued, such as electrical, gas, mechanical, plumbing equipment and permanent systems. Where, in the opinion of the ~~*building*~~ *code official*, the valuation is underestimated, the *permit* shall be denied, unless the applicant can show detailed estimates acceptable to the *building official*. The building official shall have the authority to adjust the final valuation for permit fees.

[A] 107.1 Construction documents. An application for a permit shall be accompanied by not less than two copies of *construction documents* drawn to scale, or in a digital format where allowed by the ~~building~~ code official, with sufficient clarity and detail dimensions showing the nature and character of the work to be performed. Specifications shall include pumps and controls, dose volume, elevation differences (vertical lift), pipe friction loss, pump performance curve, pump model and pump manufacturer. The *code official* is permitted to waive the requirements for filing *construction documents* where the work involved is of a minor nature. Where the quality of the materials is essential for conformity to this code, specific information shall be given to establish such quality, and this code shall not be cited, or the term “legal” or its equivalent used as a substitute for specific information.

2024 International Wildland Urban Interface Code

Revise as follows:

[A] BUILDING CODE OFFICIAL. The ~~officer or other~~ designated authority charged with the administration and enforcement of the *International Building Code*~~, or a duly authorized representative~~.

Add new definition as follows:

FIRE CODE OFFICIAL. The fire chief or other designated authority charged with the administration and enforcement of the *International Fire Code*, or a duly authorized representative.

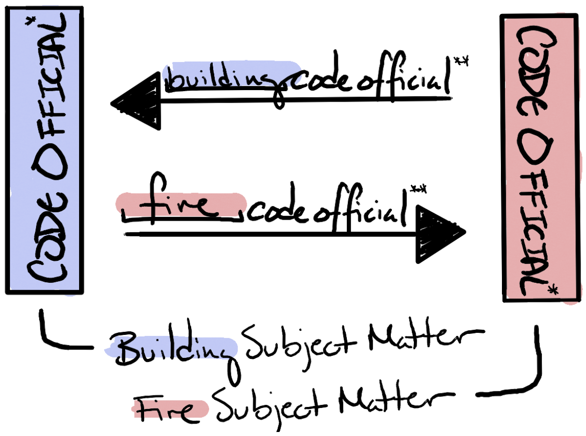
2024 International Zoning Code

Revise as follows:

1008.2.2 Development and construction signs. *Signs* temporarily erected during construction to inform the public of the developer, contractors, architects, engineers, the nature of the project or anticipated completion dates, shall be permitted in all zoning districts, subject to the following limitations:

1. Such *signs* on a single residential *lot* shall be limited to one *sign*, not greater than **[JURISDICTION TO INSERT NUMBER]**feet in height and**[JURISDICTION TO INSERT NUMBER]**square feet in area.
2. Such *signs* for a residential *subdivision* or multiple residential *lots* shall be limited to one *sign*, at each entrance to the *subdivision* or on one of the *lots* to be built on, and shall be not greater than **[JURISDICTION TO INSERT NUMBER]**feet in height and**[JURISDICTION TO INSERT NUMBER]**square feet in area.
3. Such *signs* for nonresidential *uses* in residential districts shall be limited to one *sign*, and shall be not greater than **[JURISDICTION TO INSERT NUMBER]**feet in height and**[JURISDICTION TO INSERT NUMBER]**square feet in area.
4. Such *signs* for commercial or *industrial* projects shall be limited to one *sign* per *street* front, not to exceed **[JURISDICTION TO INSERT NUMBER]**feet in height and**[JURISDICTION TO INSERT NUMBER]**square feet for projects on parcels 5 acres (20 235 m^2) or less in size, and not to exceed**[JURISDICTION TO INSERT NUMBER]**feet in height and**[JURISDICTION TO INSERT NUMBER]**square feet for projects on parcels larger than 5 acres (20 235 m^2).
5. Development and construction *signs* shall not be displayed until after the issuance of construction permits by the building code official, and must be removed not later than 24 hours following issuance of an occupancy permit for any or all portions of the project.

Reason: To harmonize terminology across all model codes, this code change modifies "building official" and "fire code official" to "code official" within their respective codes and revises "building official" to "building code official" where necessary to cross reference from one code, such as the IFC and IWUIC.



* Within a subject matter, the official having jurisdiction would be referred to as "code official"

** Outside a subject matter, the official having jurisdiction would be referred to as "[subject matter] code official", indicating which subject matter to refer to

Various editorial changes and additions are also included. This change aligns with language in the IEBC, IFGC, IMC, IPC, IPSDC, IPMC, ISPSC, IWUIC and IZC, will make code writing simpler and easier to coordinate (especially in administrative provisions), and a similar code change is being presented to the IRC.

The purpose of this code change is to replace every instance of "building official" with "code official" in the IBC and every instance of "building official" in the IFC and IWUIC with "building code official". Additionally every instance of "fire code official" in the IFC is intended to be changed to "code official". In the interest of reciting hundreds of instances of the occurrence across the IBC and IFC/IWUIC the proponent respectfully asks staff to make these changes administratively.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change a terminology change that will have no effect on construction costs.

Staff Analysis: The proposed definition of **FIRE CODE OFFICIAL** is from the IFC and is scoped to the IFC committee. The same definition is being proposed to be added to the other codes as shown.

IBC: APPENDIX A, SECTION A101, [A] A101.1, [A] A101.2, [A] A101.3, [A] A101.4

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Building Code

APPENDIX A
EMPLOYEE QUALIFICATIONS

SECTION A101
BUILDING OFFICIAL QUALIFICATIONS

[A] A101.1 Building official. The *building official* shall have not fewer than 10 years' experience or equivalent as an architect, engineer, inspector, contractor or superintendent of construction, or any combination of these, 5 years of which shall have been supervisory experience. The *building official* should be certified as a *building official* through a recognized certification program. The *building official* shall be appointed or hired by the applicable governing authority.

[A] A101.2 Chief inspector. The *building official* can designate supervisors to administer the provisions of this code and the *International Mechanical Code*, *International Plumbing Code* and International Fuel Gas Code. Each supervisor shall have not fewer than 10 years' experience or equivalent as an architect, engineer, inspector, contractor or superintendent of construction, or any combination of these, 5 years of which shall have been in a supervisory capacity. They shall be certified through a recognized certification program for the appropriate trade.

[A] A101.3 Inspector and plans examiner. The *building official* shall appoint or hire such number of officers, inspectors, assistants and other employees as shall be authorized by the *jurisdiction*. A *person* who has fewer than 5 years of experience as a contractor, engineer, architect, or as a superintendent, foreman or competent mechanic in charge of construction shall not be appointed or hired as inspector of construction or plans examiner. The inspector or plans examiner shall be certified through a recognized certification program for the appropriate trade.

Delete without substitution:

~~**[A] A101.4 Termination of employment.** Employees in the position of *building official*, chief inspector or inspector shall not be removed from office except for cause after full opportunity has been given to be heard on specific charges before such applicable governing authority.~~

Reason: Termination provisions exceeds the appendix's stated purpose of providing optional qualification criteria for code officials.
By addressing employment termination procedures, this section inappropriately delves into employment law and due process, matters that are better suited to be regulated by existing state and local labor laws.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is editorial in nature and removes potential conflicts.

~~APPENDIX A~~
~~EMPLOYEE QUALIFICATIONS~~

~~SECTION A101~~
~~BUILDING OFFICIAL QUALIFICATIONS~~

~~**[A] A101.1 Building official.** The *building official* shall have not fewer than 10 years' experience or equivalent as an architect, engineer, inspector, contractor or superintendent of construction, or any combination of these, 5 years of which shall have been supervisory experience. The *building official* should be certified as a *building official* through a recognized certification program. The *building official* shall be appointed or hired by the applicable governing authority.~~

~~**[A] A101.2 Chief inspector.** The *building official* can designate supervisors to administer the provisions of this code and the *International Mechanical Code*, *International Plumbing Code* and International Fuel Gas Code. Each supervisor shall have not fewer than 10 years' experience or equivalent as an architect, engineer, inspector, contractor or superintendent of construction, or any combination of these, 5 years of which shall have been in a supervisory capacity. They shall be certified through a recognized certification program for the appropriate trade.~~

~~**[A] A101.3 Inspector and plans examiner.** The *building official* shall appoint or hire such number of officers, inspectors, assistants and other employees as shall be authorized by the *jurisdiction*. A *person* who has fewer than 5 years of experience as a contractor, engineer, architect, or as a superintendent, foreman or competent mechanic in charge of construction shall not be appointed or hired as inspector of construction or plans examiner. The inspector or plans examiner shall be certified through a recognized certification program for the appropriate trade.~~

~~**[A] A101.4 Termination of employment.** Employees in the position of *building official*, chief inspector or inspector shall not be removed from office except for cause after full opportunity has been given to be heard on specific charges before such applicable governing authority.~~

~~SECTION A102~~
~~REFERENCED STANDARDS~~

~~**[A] A102.1 General.** See Table A102.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.~~

~~TABLE A102.1 REFERENCED STANDARDS~~

~~STANDARD ACRONYM~~	~~STANDARD NAME~~	~~SECTIONS HEREIN REFERENCED~~
~~IBC—24~~	~~*International Building Code*~~	~~A101.2~~
~~IMC—24~~	~~*International Mechanical Code*~~	~~A101.2~~
~~IPC—24~~	~~*International Plumbing Code*~~	~~A101.2~~
~~IFGC—24~~	~~*International Fuel Gas Code*~~	~~A101.2~~

Reason: This appendix is only in the IBC. Employee qualification is a jurisdictional decision. This is not something that should be in the code, even as guidance material. Definitely not as an adoptable appendix.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This appendix does not include any construction requirements.

C616/C616M—~~2015~~ 22	Standard Specification for Quartz-Based Dimension Stone	IRC							
C629/C629M—~~2015~~ 22	Standard Specification for Slate Dimension Stone	IRC							
C631—09(2020)	Standard Specification for Bonding Compounds for Interior Gypsum Plastering	IBC	IRC						
C635/C635M—~~2017~~ 22	Specification for the Manufacture, Performance and Testing of Metal Suspension Systems for Acoustical Tile and Lay-In Panel Ceilings	IBC							
C652—~~21~~ 22	Specification for Hollow Brick (Hollow Masonry Units Made from Clay or Shale)	IBC	IRC						
C685/C685M—~~2017~~ 24	Specification for Concrete Made by Volumetric Batching and Continuous Mixing	IRC							
C700—~~2018~~ 18(2022)	Specification for Vitrified Clay Pipe, Extra Strength, Standard Strength, and Perforated	IPC	IPSDC	IRC					
C726—~~2017~~ 24	Standard Specification for Mineral Wool Roof Insulation Board	IBC	IRC						
C728—~~2017A~~ 17a(2022)	Standard Specification for Perlite Thermal Insulation Board	IBC	IRC						

C744—~~2016~~ 21	Specification for Prefaced Concrete and Calcium Silicate Masonry Units	IBC							
C840—~~20~~ 23	Specification for Application and Finishing of Gypsum Board	IBC							
C841—~~2003(2018)~~ 23	Standard Specification for Installation of Interior Lathing and Furring	IBC	IRC						
C843—~~2017~~ 23	Specification for Application of Gypsum Veneer Plaster	IBC	IRC						
C913—~~08~~ 23	Specification for Precast Concrete Water and Wastewater Structures	IPSDC							
C926—~~2021~~ 24	Specification for Application of Portland Cement-Based Plaster	IBC	IRC						
C932—06~~(2019)~~ (2024)	Specification for Surface-Applied Bonding Compounds for Exterior Plastering	IBC							
C933—~~2018~~ 23	Specification for Welded Wire Lath	IBC	IRC						
C946—~~2018~~ 23	Standard Practice for Construction of Dry-Stacked, Surface-Bonded Walls	IBC	IRC						
C954—~~2018~~ 22	Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 inch (0.84 mm) to 0.112 inch (2.84 mm) in Thickness	IBC	IRC						
C956—~~04(2019)~~ 24	Specification for Installation of Cast-In-Place Reinforced Gypsum Concrete	IBC							
C957/C957M—~~2017~~ 17(2024)	Specification for High-Solids Content, Cold Liquid-Applied	IBC	IRC						

	Elastomeric Waterproofing Membrane with Integral Wearing Surface								
C1002—~~20~~ 22	Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs	IBC	IRC						

C1007—20(2024)	Specification for Installation of Load Bearing (Transverse and Axial) Steel Studs and Related Accessories	IBC							
C1032/C1032M—~~2018~~ 24	Specification for Woven Wire Plaster Base	IBC	IRC						
C1063—~~21~~ 23	Specification for Installation of Lathing and Furring to Receive Interior and Exterior Portland Cement-based Plaster	IBC	IRC						
C1088—~~20~~ 23	Specification for Thin Veneer Brick Units Made from Clay or Shale	IBC	IRC						
C1116/C116M—~~20~~ 23	Standard Specification for Fiber-Reinforced Concrete ~~and Shotcrete~~	IRC							
C1157/C1157M—~~20a~~ 23	Standard Performance Specification for Hydraulic Cement	IBC	IRC						
C1167—~~2011(2017)~~ 22	Specification for Clay Roof Tiles	IBC	IRC						
C1173—~~2018~~ 22	Specification for Flexible Transition Couplings for Underground Piping System	IPC	IPSDC	IRC					
C1177/C1177M—~~2017~~ 24	Specification for Glass Mat Gypsum Substrate for Use as Sheathing	IBC	IRC						
C1178/C1178M—~~2018~~ 24	Standard Specification for	IBC	IRC						

	Coated Glass Mat Water-Resistant Gypsum Backing Panel								
C1186—~~2008(2016)~~ 22e1	Specification for Flat Fiber Cement Sheets	IBC	IRC						
C1261—~~2013(2017)E1~~ 22	Specification for Firebox Brick for Residential Fireplaces	IBC	IRC						
C1278/C1278M—~~2017~~ 24	Specification for Fiber-Reinforced Gypsum Panels	IBC	IRC						
C1280—18(2023)	Specification for Application of Exterior Gypsum Panel Products for Use as Sheathing	IBC	IRC						
C1288—~~2017~~ 23	Standard Specification for Fiber-Cement Interior Substrate Sheets	IBC	IRC						
C1289—~~22~~ 23a	Standard Specification for Faced Rigid Cellular Polyisocyanurate Thermal Insulation Board	IBC	IRC						
C1321—15(2020)	Standard Practice for Installation and Use of Interior Radiation Control Coating Systems (IRCCS) in Building Construction	IRC							
C1325—~~21~~ 22e1	Standard Specification for Fiber-Mat Reinforced Cementitious Backer Units	IBC	IRC						
C1328/C1328M—~~19~~ 23	Specification for Plastic (Stucco Cement)	IBC	IRC						
C1363~~-19~~ 24	Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus	IECC	IRC						
C1364—~~19~~ 23e1	Standard Specification for Architectural Cast Stone	IRC							
C1372—~~17~~ 23	Standard Specification for Dry-	IBC							

	Cast Segmental Retaining Wall Units								
C1396/C1396M—~~2017~~ 24	Specification for Gypsum Board	IBC	IRC						
C1405—~~20a~~ 23	Standard Specification for Glazed Brick (Single Fired, Brick Units)	IRC							
C1492—~~2003(2016)~~ 24	Standard Specification for Concrete Roof Tile	IBC	IRC						
C1531—~~15~~ 22	Standard Test Methods for In Situ Measurement of Masonry Mortar Joint Shear Strength Index	IEBC							
C1569—~~03(2016)~~ 22	Standard Test Method for Wind Resistance of Concrete and Clay Roof Tiles (Wind Tunnel Method)	IBC							
C1570—~~03(2016)~~ 22	Standard Test Method for Wind Resistance of Concrete and Clay Roof Tiles (Air Permeability Method)	IBC							
C1600/C1600M—~~19~~ 23	Standard Specification for Rapid Hardening Hydraulic Cement	IBC							
C1629/C1629M—~~19~~ 23	Standard Classification for Abuse-Resistant Nondecorated Interior Gypsum Panel Products and Fiber-Reinforced Cement Panels	IBC							
C1634—~~20~~ 23a	Standard Specification for Concrete Facing Brick and Other Concrete Masonry Facing Units	IRC							
C1644—06(2017)	Specification for Resilient Connectors Between Reinforced Concrete On-Site Wastewater Tanks and Pipes	IPSDC							
		IBC	IRC						

C1658/C1658M—~~19e1~~ (2024)	Standard Specification for Glass Mat Gypsum Panels								
C1668—~~20~~ 24	Standard Specification for Externally Applied Reflective Insulation Systems on Rigid Duct in Heating, Ventilation, and Air Conditioning (HVAC) Systems	IRC							
C1670/1670M—~~21b~~ 24	Standard Specification for Adhered Manufactured Stone Masonry Veneer Units	IBC	IRC						
C1691—~~2021~~ 21	Standard Specification for Unreinforced Autoclaved Aerated Concrete (AAC) Masonry Units	IRC							
C1743—~~2019~~ 19(2024)	Standard Practice for Installation and Use of Radiant Barrier Systems (RBS) in Residential Building Construction	IRC	IECC						
C1822-~~2015~~ 21	Standard Specification for Insulating Covers on Accessible Lavatory Piping	IPC							
C1902—~~20~~ 22a	Standard Specification for Cellular Glass Insulation Used in Building and Roof Applications	IBC	IRC						
D25-~~2012(2017)~~ 12(2022)	Specification for Round Timber Piles	IBC							
D41/D41M-~~2011(2016)~~ 11(2023)	Specification for Asphalt Primer Used in Roofing, Dampproofing and Waterproofing	IBC	IRC						
D43/D43M-~~2000(2018)~~ 00(2024)	Specification for Coal Tar Primer Used in Roofing, Dampproofing and Waterproofing	IBC	IRC						
D56-~~21a~~ 22	Test Method for Flash Point by Tag Closed Cup Tester	IBC	IFC	IMC					

D86-~~20b~~ 23ae1	Test Method for Distillation of Petroleum Products and Liquid Fuels at Atmospheric Pressure	IBC	IFC						

D226/D226M-~~2017~~ 17(2023)	Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing	IBC	IRC						
D227/D227M-~~2003(2018)~~ 03(2024)	Specification for Coal-Tar-Saturated Organic Felt Used in Roofing and Waterproofing	IBC	IRC						
D312/D312M-~~2016a~~ 16a(2023)	Specification for Asphalt Used in Roofing	IBC	IRC						
D448-~~2012(2017)~~ 12(2022)	Standard Classification for Sizes of Aggregate for Road and Bridge Construction	IBC							
D450/D450M-~~2017(2018)~~ 07(2024)	Specification for Coal-Tar Pitch Used in Roofing, Dampproofing and Waterproofing	IBC	IRC						
D635-~~18~~ 22	Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position	IBC							
D1143/D1143M-20e1	Standard Test Methods for Deep Foundation Elements Under Static Axial Compressive Load	IBC							
D1227/D1227M-13~~(2019)e1~~ (2024)	Specification for Emulsified Asphalt Used as a Protective Coating for Roofing	IBC	IRC						
D1248-~~2016~~ 16	Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable	IRC							
D1593-~~19~~ 22	Standard Specification for Nonrigid Vinyl Chloride Plastic Film and Sheeting	ISPSC							
D1863/D1863M-~~2005(2018)~~ 05(2024)	Specification for Mineral	IBC	IRC						

	Aggregate Used on Built-up Roofs								
D1869-15(2022)	Specification for Rubber Rings for Fiber-Reinforced Cement Pipe	IPSDC	IRC						
D1929-~~20~~ 23	Standard Test Method for Determining Ignition Temperature of Plastics	IBC							
D2235-~~2021~~ 22	Specification for Solvent Cement for Acrylonitrile-Butadiene-Styrene (ABS) Plastic Pipe and Fittings	IMC	IPSDC	IRC					
D2239-~~21~~ 22	Specification for Polyethylene (PE) Plastic Pipe (SIDR-PR) Based on Controlled Inside Diameter	IPC	IRC						
D2241-~~20~~ 24	Specification for Poly (Vinyl Chloride) (PVC) Pressure-rated Pipe (SDR-Series)	IMC	IPC	IRC	ISPSC				
D2464-~~15~~ 23	Standard Specification for Threaded Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80								
D2466-~~21~~ 24	Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40	IMC	IRC	ISPSC					
D2467-~~20~~ 24	Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80	IMC	IPC	IRC	ISPSC				
D2513-~~20~~ 24	Specification for Polyethylene (PE) Gas Pressure Pipe, Tubing and Fittings	IFGC	IRC						
D2564-20(2024)	Specification for Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Piping Systems	IMC	IPSDC	IRC					
D2609-~~21~~ 24	Specification for Plastic Insert Fittings for Polyethylene (PE) Plastic Pipe	IPC	IRC						

D2657-~~2007(2015)~~ 07(2023)	Standard Practice for Heat Fusion Joining of Polyolefin Pipe and Fittings	IMC	IPC	IPSDC	IRC				
D2661-~~21~~ 24	Specification for Acrylonitrile-butadiene-styrene (ABS) Schedule 40 Plastic Drain, Waste, and Vent Pipe and Fittings	IPC	IPSDC	IRC					
D2665-~~20~~ 24	Specification for Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste and Vent Pipe and Fittings	PC	IPSDC	IRC					
D2729-~~2021~~ 21	Specification for Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings	IPC	IPSDC	IRC					
D2737-~~21~~ 22	Standard Specification for Polyethylene (PE) Plastic Tubing	IBC	IMC	IPC	IRC				
D2824/D2824M-2018(2024)	Standard Specification for Aluminum-pigmented Asphalt Roof Coatings, Nonfibered and Fibered without Asbestos	IBC	IRC						
D2846/ D2846M-~~19a~~ 24	Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Hot- and Cold-water Distribution Systems	IMC	IPC	IRC	ISPSC				
D2855-20(2024)	Standard Practice for the Two-Step (Primer and Solvent Cement) Method of Joining Poly (Vinyl Chloride) (PVC) or Chlorinated Poly (Vinyl Chloride) (CPVC) Pipe and Piping Components with Tapered Sockets	IPC	IPSDC	IRC					
D2859-~~2016~~ 16(2021)	Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials	IBC	IFC						
D2898-~~2010(2017)~~ 10(2024)	Standard Practice for	IBC	IRC	IWUIC					

	Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing								
D2949-~~18~~ 24	Specification for 3.25-in. Outside Diameter Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste and Vent Pipe and Fittings	IPC	IPSDC	IRC					
D2996-~~2017~~ 23	Specification for Filament-Wound Fiberglass (Glass Fiber Reinforced Thermosetting Resin) Pipe	IMC							
D3019/D3019-~~2017~~ 17(2024)	Specification for Lap Cement Used with Asphalt Roll Roofing, Nonfibered, Asbestos Fibered and Nonasbestos Fibered	IBC	IRC						
D3034-~~21~~ 24	Specification for Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings	IRC							
D3035-~~21~~ 22	Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter	IMC							
D3261-~~2016~~ 24	Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing	IMC	IPC	IRC					
D3311-~~2017(2021)~~ 22	Specification for Drain, Waste and Vent (DWV) Plastic Fittings Patterns	IPC	IRC						
D3350-~~21~~ 24	Specification for Polyethylene Plastic Pipe and Fitting Materials	IRC							
D3462/D3462M-~~19~~ 23	Specification for Asphalt Shingles Made from Glass Felt and Surfaced with Mineral Granules	IBC							
D3679-~~21~~ 24	Specification for Rigid Poly (Vinyl Chloride) (PVC) Siding	IBC							
D3737-~~2018E1~~ 18(2023)e1	Practice for Establishing Allowable Properties for Structural Glued Laminated Timber (Glulam)	IBC							
D3746/D3746M-~~1985(2015)E1~~	Test Method for Impact Resistance of Bituminous Roofing Systems	IBC							
	Standard Specification for Asphalt Roll Roofing (Glass Felt)	IBC	IRC	IWUIC					

D3909/D3909M-~~14(2021)~~ 22	Surfaced With Mineral Granules								

D4479/D4479M—~~2007(2018)~~ 07(2024)	Specification for Asphalt Roof Coatings—Asbestos-Free	IBC	IRC						
D4551~~—2017~~ 22	Specification for Poly (Vinyl Chloride) (PVC) Plastic Flexible Concealed Water-containment Membrane	IBC	IRC						
D4586/D4586M-~~2007(2018)~~ 07(2024)	Specification for Asphalt Roof Cement—Asbestos-Free	IBC	IRC						
D4637/D4637M-~~2015(2021)~~ 15(2021)e1	Specification for EPDM Sheet Used in Single-Ply Roof Membrane	IBC	IRC						
D4897/D4897M-~~2016~~ 16(2023)	Specification for Asphalt- Coated Glass Fiber Venting Base Sheet Used in Roofing	IBC	IRC						
D5019-07a~~(2013)~~	Specification for Reinforced Nonvulcanized Polymeric Sheet Used in Roofing Membrane	IBC	IRC						
D5034-~~09(2017)~~ 21	Standard Test Method for Breaking Strength and Elongation of Textile Fabrics (Grab Test)	ISPSC							
D5643/D5643M-~~2006 (2018)~~ 06(2024)	Specification for Coal Tar Roof Cement, Asbestos-Free	IBC	IRC						
D6083/D6083M-~~21~~ 24	Specification for Liquid Applied Acrylic Coating Used in Roofing	IBC	IRC						
D6162/D6162M-~~2016~~ 21	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	IBC	IRC						
D6163/D6163M-~~2016~~ 21	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Glass Fiber Reinforcements	IBC	IRC						

D6164/D6164M-~~2016~~ 21	Standard Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Polyester Reinforcements	IBC							

D6222/D6222M-~~2016~~ 16(2023)	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using Polyester Reinforcements	IBC	IRC						
D6223/D6223M-~~2016~~ 21	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	IBC	IRC						
D6298-~~2016~~ 16(2023)	Specification for Fiberglass Reinforced Styrene-Butadiene-Styrene (SBS) Modified Bituminous Sheets with a Factory Applied Metal Surface	IBC	IRC						
D6380/D6380M-~~2003(2018)~~ 03(2022)	Standard Specification for Asphalt Roll Roofing (Organic Felt)	IBC	IRC						
D6509/D6509M-~~2016~~ 16(2023)	Standard Specification for Atactic Polypropylene (APP) Modified Bituminous Base Sheet Materials Using Glass Fiber Reinforcements	IBC							
D6694/D6694M-~~08(2013)E1~~ 15(2023)	Standard Specification for Liquid-Applied Silicone Coating Used in Spray Polyurethane Foam Roofing Systems	IBC	IRC						
D6754/D6754M-~~2015~~ 23	Standard Specification for Ketone Ethylene Ester Based Sheet Roofing	IBC	IRC						

D6757/D6757M-~~2018~~ 18(2023)	Specification for Underlayment Felt Containing Inorganic Fibers Used in Steep Slope Roofing	IBC	IRC						
D6947/D6947M-~~2016~~ 16(2023)	Standard Specification for Liquid Applied Moisture Cured Polyurethane Coating Used in Spray Polyurethane Foam Roofing System	IBC	IRC						
D7158-D7158M-~~20~~ 24a	Standard Test Method for Wind Resistance of Asphalt Shingles (Uplift Force/Uplift Resistance Method)	IBC	IRC						
D7655/D7655M-~~2012(2017)~~ 12(2022)	Standard Classification for Size of Aggregate Used as Ballast for Roof Membrane Systems	IBC							
D7672-~~19~~ 24	Standard Specification for Evaluating Structural Capacities of Rim Board Products and Assemblies	IBC	IRC						
D7793-~~20~~ 24	Standard Specification for Insulated Vinyl Siding	IBC	IRC						
D7957/D7957M-~~17~~ 22	Standard Specification for Solid Round Glass Fiber Reinforced Polymer Bars for Concrete Reinforcement	IBC							
D8257/D8257M-~~20~~ 22	Standard Specification for Mechanically Attached Polymeric Roof Underlayment Used in Steep Slope Roofing	IBC	IRC						
E84-~~21a~~ 24	Standard Test Method for Surface Burning Characteristics of Building Materials	IBC	IFC	IMC	IPC	IRC	IWUIC		
E90-~~09(2016).~~ 23	Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements	IBC	IRC						

E96/E96M-~~21~~ 24	Standard Test Methods for Gravimetric Determination of Water Vapor Transmission Rate of Materials	IBC	IRC						
E119-~~20~~ 24	Standard Test Methods for Fire Tests of Building Construction and Materials	IBC	IEBC	IMC	IRC	IWUIC			
E136-~~2022~~ 24c	Standard Test Method for Assessing Combustibility of Materials Using a Vertical Tube Furnace at 750 Degrees C	IBC	IEBC	IFGC	IMC	IRC	IWUIC		
E331-~~2000(2016)~~ 00(2023)	Standard Test Method for Water Penetration of Exterior Windows, Skylights, Doors and Curtain Walls by Uniform Static Air Pressure Difference	IBC	IRC						
E336-~~20~~ 24	Standard Test Method for Measurement of Airborne Sound Attenuation between Rooms in Buildings	IBC	IRC						
E488/E488M -~~15~~ 22	Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements	IEBC							
E492-~~09~~ 22	Specification for Laboratory Measurement of Impact Sound Transmission through Floor-ceiling Assemblies Using the Tapping Machine	IBC	IRC						
E519/E519M -~~2010~~ 22	Standard Test Method for Diagonal Tension (Shear) in Masonry Assemblages	IEBC							
E605/E605M-19(2023)	Test Method for Thickness and Density of Sprayed Fire-Resistive Material (SFRM) Applied to Structural Members	IBC							
E648-~~2017A~~ 23	Standard Test Method for Critical Radiant Flux of Floor- Covering Systems Using a Radiant Heat Energy Source	IBC							

E681-~~09(2015)~~ 09(2023)	Standard Test Method for Concentration Limits of Flammability of Chemicals (Vapors and Gases)	IBC	IFC						
E736/E736M-19(2023)	Test Method for Cohesion/Adhesion of Sprayed Fire-Resistive Materials Applied to Structural Members	IBC							
E814-~~2013A(2017)~~ 24	Standard Test Method for Fire Tests of Penetration Firestop Systems	IBC	IMC	IRC					
E903-20	Standard Test Method for Solar Absorptance, Reflectance and Transmittance of Materials Using Integrating Spheres ~~(Withdrawn 2005)~~	IECC							
E970-~~2017~~ 23	Standard Test Method for Critical Radiant Flux of Exposed Attic Floor Insulation Using a Radiant Heat Energy Source	IBC	IRC						
E1300-~~2016~~ 24	Practice for Determining Load Resistance of Glass in Buildings	IBC							
E1354-~~2017~~ 24	Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter	IBC	IFC	IWUIC					
E1509-~~2012(2017)~~ 22	Specification for Room Heaters, Pellet Fuel-Burning Type	IMC	IRC						
E1529-~~16e1~~ 22	Standard Test Methods for Determining Effects of Large Hydrocarbon Pool Fires on Structural Members and Assemblies	IFC							

E1554/E1554 M-~~13(2018)~~ 13(2023)	Standard Test Methods for Determining Air Leakage of Air Distribution Systems by Fan Pressurization	IRC							
E1590-~~2022~~ 23	Test Method for Fire Testing of Mattresses	IFC							
E1677-~~19:~~ 23	Specification for Air Barrier (AB) Material or Systems for Low-rise Framed Building Walls	ICCPC	IECC						
E1745-17(2023)	Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs	IRC							
E1996-~~20~~ 23	Specification for Performance of Exterior Windows, Curtain Walls, Doors and Impact Protective Systems Impacted by Windborne Debris in Hurricanes	IBC	IRC						
E2072-~~14~~ 24	Standard Specification for Photoluminescent (Phosphorescent) Safety Markings	IBC	IFC						
E2307-~~20~~ 23b	Standard Test Method for Determining Fire Resistance of Perimeter Fire Barriers Using the Intermediate-Scale, Multistory Test Apparatus	IBC							
E2357-~~23~~ 24	Standard Test Method for Determining Air Leakage of Air Barriers Assemblies	IECC							
E2392/E2392M-~~10(2016)~~ 24	Standard Guide for Design of Earthen Wall Building Systems	IBC	IRC						
E2404-~~17~~ 22	Standard Practice for Specimen Preparation and Mounting of Textile, Paper or	IBC	IFC						

	Polymeric (Including Vinyl) and Wood Wall or Ceiling Coverings, Facing and Veneers to Assess Surface Burning Characteristics								
E2556/E2556M-~~2010(2016)~~ 10(2022)	Standard Specification for Vapor Permeable Flexible Sheet Water-resistive Barriers Intended for Mechanical Attachment	IBC	IRC						
E2573-~~19~~ 24	Standard Practice for Specimen Preparation and Mounting of Site-Fabricated Stretch Systems to Assess Surface Burning Characteristics	IBC	IFC						
E2579-~~21~~ 23b	Standard Practice for Specimen Preparation and Mounting of Wood Products to Assess Surface Burning Characteristics	IBC	IFC						
E2599-~~2018~~ 22	Standard Practice for Specimen Preparation and Mounting of Reflective Insulation, Radiant Barrier and Vinyl Stretch Ceiling Materials for Building Applications to Assess Surface Burning Characteristics	IBC							
E2634-~~2018~~ 18(2022)	Standard Specification for Flat Wall Insulating Concrete Form (ICF) Systems	IBC	IRC						
E2635-~~14~~ 22	Standard Practice for Water Conservation Through In-Situ Water Reclamation	IPC							
E2652-~~18~~ 22	Standard Test Method for Assessing Combustibility of Materials Using a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750^{o}C	IBC							
E2751/E2751M-~~2017A~~ 21	Practice for Design and	IBC							

	Performance of Supported Laminated Glass Walkways								
E2837-~~2013(2017)~~ 23ae1	Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies	IBC							
E3158-~~18~~ 24	Standard Test Method for Measuring the Air Leakage Rate of a Large or Multizone Building	IECC	IRC						
F405-~~05~~ 13	Specification for Corrugated Polyethylene (PE) Pipe and Fittings	IPC	IPSDC	IRC					
F409-~~2017~~ 22	Specification for Thermoplastic Accessible and Replaceable Plastic Tube and Tubular Fittings	IPC	IRC						
F437-~~21~~ 24	Standard Specification for Threaded Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80	IMC	IPC	IRC	ISPSC				
F438-~~2017~~ 23	Specification for Socket Type Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 40	IMC	IPC	IRC	ISPSC				
F439-~~19~~ 24	Standard Specification for ~~Socket Type~~ Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80	IMC	IPC	IRC	ISPSC				
F441/F441M-~~20~~ 23	Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80	IMC	IPC	IRC					
F442/F442M-~~20~~ 23	Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe (SDR-PR)	IMC	IPC	IRC					

F493-~~20~~ 22	Specification for Solvent Cements for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe and Fittings	IMC	IPC	IRC					
F547-~~2017~~ 22	Terminology of Nails for Use with Wood and Wood-Base Materials	IBC							
F628-~~2012E2~~ 23	Specification for Acrylonitrile-Butadiene-Styrene (ABS) Schedule 40 Plastic Drain, Waste, and Vent Pipe with a Cellular Core	IPC	IPSDC	IRC					
F714-~~21a~~ 24	Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) Based on Outside Diameter	IMC	IPC	IRC					
F844-~~19~~ 19(2024)	Standard Specification for Washers, Steel, Plain (Flat), Unhardened for General Use	IRC							
F876-~~20b~~ 24a	Specification for Cross-linked Polyethylene (PEX) Tubing	IMC	IPC	IRC					
F877-~~20~~ 24	Specification for Cross-Linked Polyethylene (PEX) Plastic Hot- and Cold-Water Distribution Systems	IMC	IRC						
F891-~~2016~~ 24	Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Plastic Pipe with a Cellular Core	IPC	IPSDC	IRC					
F1055-~~2016A~~ 16a(2022)	Specification for Electrofusion Type Polyethylene Fittings for Outside Diameter Controlled Polyethylene and Crosslinked Polyethylene (PEX) Pipe and Tubing	IMC	IPC	IRC					
F1085-19(2024)	Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels	IFC							

F1281-~~2017(2021)e1~~ 24	Specification for Cross-linked Polyethylene/Aluminum/Cross -linked Polyethylene (PEX-AL-PEX) Pressure Pipe	IECC	IMC	IPC	IRC				
F1282-~~2017~~ 23a	Specification for Polyethylene/Aluminum/Polyethylene (PE-AL-PE) Composite Pressure Pipe	IMC	IPC	IRC					
F1346-~~1991(2018)~~ 23	Standard Performance Specification for Safety Covers and Labeling Requirements for All Covers for Swimming Pools, Spas and Hot Tubs	ISPSC							
F1412-~~2016~~ 22	Specification for Polyolefin Pipe and Fittings for Corrosive Waste Drainage	IRC							
F1484-18(2023)	Standard Test Method for Performance of Steam Cookers	IECC							
F1499-~~2017~~ 22	Specification for Coextruded Composite Drain Waste and Vent Pipe (DWV)	IPSDC							
F1504 - ~~21~~ 21e1	Standard Specification for Folded Poly (Vinyl Chloride) (PVC) for Existing Sewer and Conduit Rehabilitation	IPC							
F1548-~~2001(2018)~~ 01(2023)	Standard Specification for the Performance of Fittings for Use with Gasketed Mechanical Couplings Used in Piping Applications	IMC	IPC						
F1760-~~01 (2011)~~ 16(2020)	Standard Specification for Coextruded Poly (Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content	IRC							

F1807~~-19b~~ 23	Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring, or Alternate Stainless Steel Clamps, for SDR9 Cross-Linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing	IMC	IRC						
F1866~~-2018~~ 23	Specification for Poly (Vinyl Chloride) (PVC) Plastic Schedule 40 Drainage and DWV Fabricated Fittings	IPC	IRC						
F1871 ~~-20~~ 24	Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation	IPC							
F1901~~-10~~ 22	Standard Specification for Polyethylene (PE) Pipe and Fittings for Roof Drain Systems	IRC							
F1960~~-21~~ 24	Standard Specification for Cold-Expansion Fittings with PEX Reinforcing Rings for Use with Cross-Linked Polyethylene (PEX) and Polyethylene of Raised Temperature (PE-RT) Tubing	IMC	IRC						
F1970~~-19~~ 23	Standard Specification for Special Engineered Fittings, Appurtenances or Valves for Use in Poly (Vinyl Chloride) (PVC) or Chlorinated Poly (Vinyl Chloride) (CPVC) Systems	IRC							
F1974~~-09(2020)~~ 23	Specification for Metal Insert Fittings for Polyethylene/Aluminum/Polyethylene and Cross-Linked Polyethylene/Aluminum/Cross-Linked Polyethylene Composite Pressure Pipe	IMC	IPC	IRC					

F2080-~~19~~ 23	Specification for Cold-Expansion Fittings with Metal Compression-Sleeves for Cross-Linked Polyethylene (PEX) Pipe	IMC	IRC						
F2093-18(2023)	Standard Test Method for Performance of Rack Ovens	IECC							
F2098-~~18~~ 24	Standard Specification for Stainless Steel Clamps for Securing SDR9 Cross-Linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) to Metal Insert and Plastic Insert Fittings	IRC							
F2158-~~08 (2016)~~ 08(2024)	Standard for Residential Central-vacuum Tube and Fittings	IRC							
F2159-~~21~~ 23a	Standard Specification for Plastic Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-Linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing	IMC	IRC						
F2200-~~20~~ 24	Standard Specification for Automated Vehicular Gate Construction	IBC	IFC	IRC					
F2286-16(2023)	Standard Design and Performance Specification for Removable Mesh Fencing for Swimming Pools, Hot Tubs, and Spas	ISPSC							
F2389-~~21~~ 24a	Standard Specification for Pressure-Rated Polypropylene Piping Systems	IMC	IRC						
F2599-~~20~~ 22	Standard Practice for	IPC							

	Sectional Repair of Damaged Pipe by Means of an Inverted Cured-in-Place Liner								
F2618-~~19~~ 24	Standard Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Pipe and Fittings for Chemical Waste Drainage Systems	IPC							
F2623-~~19~~ 24e1	Standard Specification for Polyethylene of Raised Temperature (PE-RT) SDRG Tubing	IRC							
F2648/F2648M-~~20~~ 23	Standard Specification for 2 to 60 inch [50 to 1500 mm] Annular Corrugated Profile Wall Polyethylene (PE) Pipe and Fittings for Land Drainage Applications	IPC							
F2735-~~21~~ 23	Standard Specification for Plastic Insert Fittings for SDR9 Cross-Linked Polyethylene (PEX) and Polyethylene of Raised Temperature (PE-RT) Tubing	IMC	IRC						
F2763-16(2021)e1	Standard Specification for 12 to 60 in. [300 to 1500 mm] Dual and Triple Profile-Wall Polyethylene (PE) Pipe and Fittings for Sanitary Sewer Applications	IPC							
F2764/F2764M-~~19~~ 24	Standard Specification for 6 to 60 in. [150 to 1500 mm] Polypropylene (PP) Corrugated Double and Triple Wall Pipe and Fittings for Non- Pressure Sanitary Sewer Applications	IPC							
F2769-~~18~~ 24	Polyethylene or Raised Temperature (PE-RT) Plastic Hot and Cold-Water Tubing and Distribution Systems	IRC							
F2806-~~20~~ 23	Standard Specification for	IMC	IRC						

	Acrylonitrile-Butadiene-Styrene (ABS) Plastic Pipe (Metric SDR-PR)								

F2831-19(2024)	Standard Practice for Internal Non Structural Epoxy Barrier Coating Material Used in Rehabilitation of Metallic Pressurized Piping Systems	IPC							
F2855-19(2024)	Standard Specification for Chlorinated Poly (Vinyl Chloride)/Aluminum/Chlorinat ed Poly (Vinyl Chloride) (CPVC AL CPVC) Composite Pressure Tubing	IRC							
F2945-~~2018~~ 18(2023)	Standard Specification for Polyamide 11 Gas Pressure Pipe, Tubing and Fittings	IFGC	IRC						
F2947/F2947M-~~20~~ 21a	Standard Specification for 150 to 1500 mm [6 to 60 in] Annular Corrugated Profile- Wall Polyethylene (PE) Pipe and Fittings for Sanitary Sewer Applications	IPC							
F3202-~~19a~~ 24	Standard Specification for Solid Wall Poly (Vinyl Chloride) PVC Fittings for Joining Corrugated Wall High Density Polyethylene (PE) and Propylene (PP) Piping	IPC							
F3240-~~19e1~~ 19(2023)	Standard Practice for Installation of Seamless Molded Hydrophilic Gaskets (SMHG) for Long Term Watertightness of Cured-in-Place Rehabilitation of Main and Lateral Pipelines	IPC							
F3253-~~19~~ 24	Standard Specification for Crosslinked Polyethylene (PEX) Tubing with Oxygen Barrier for Hot- and Cold-Water Hydronic Distribution Systems	IMC	IRC						

F3328-18(2024)	Standard Practice for the One-Step (Solvent Cement Only) Method of Joining Poly (Vinyl Chloride) (PVC) or Chlorinated Poly (Vinyl Chloride) (CPVC) Pipe and Piping Components with Tapered Sockets	IPC							
F3347-~~20a~~ 23	Standard Specification for Metal Press Insert Fittings with Factory Assembled Stainless Steel Press Sleeve for SDR9 Cross-Linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing	IMC	IRC						
F3348-~~20b~~ 23a	Standard Specification for Plastic Press Insert Fittings with Factory Assembled Stainless Steel Press Sleeve for SDR9 Cross-Linked Polyethylene (PEX) Tubing and SDR9 Polyethylene of Raised Temperature (PE-RT) Tubing	IMC	IPC	IRC					
F3371-~~19~~ 22	Standard Specification for Polyolefin Pipe and Fittings for Drainage, Waste, and Vent Applications	IPC	IRC

Reason: This is the ADM Code Change for Group B

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact: The ADM code change does not affect the cost of construction.

Staff Analysis: Under ANSI essential requirements concerning usage of all ANSI marking and designations ICC will be updating future editions of the I-Codes per these rules. This specifically means that within referenced standards chapters all referenced standards will be listed under their promulgator and not ANSI. ANSI designation may remain in the unique alphanumeric designation, however it will not be allowed in the title of the standard.

Within the body of the code text, where an affected referenced standard is identified with an ANSI acronym, the reference will be followed with “See promulgator acronym” in parenthesis. This will assist readers to be able to locate the correct promulgator under which to refer in the referenced standards chapter.

IBC – Fire Safety Code Change Proposals

The following code change proposals are labeled as FS code change proposals because they are proposals for changes to sections in chapters of the International Building Code that are designated as the responsibility of the IBC – Fire Safety Code Development Committee (see page viii of the Introductory pages of this monograph), which met in the Group A cycle in 2024. However, the changes included in this Group B code development cycle are to sections of the code that have been prefaced with a [G] and [S], meaning that they are the responsibility of a different IBC Code Development Committee— the IBC-General [G] and the IBC-Structural [S] Committees.

The committee assigned for each code change proposal is indicated in a banner statement near the beginning of the proposal. See the IBC-General and IBC-Structural hearing orders.

FS1-25

IBC: [BS] 1402.3

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1402.3 Wind <u>and tornado</u> resistance. *Exterior walls*, exterior wall coverings, exterior soffits and fascias, and the associated openings, shall be designed and constructed to resist safely the <u>greater of wind pressures or tornado pressures determined in accordance with ASCE 7 and other</u> superimposed *loads* required by Chapter 16.

Reason: ASCE 7-22 introduced Chapter 32 Tornado Loads and related provisions in Chapter 1 General, Chapter 2 Combination of Loads, and Chapter 26 Wind Loads: General Requirements. While IBC 2024 generally adopted the new ASCE 7-22 provisions, several sections of IBC 2024 do not adequately clarify the tornado design requirements. The proposal includes the clarifications to IBC 2024 Chapter 14 (Section 1402.3) explicitly referencing tornado resistance in addition to wind resistance. The proposed clarification aligns with Section 1609.6.1 for roof decks.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proposed IBC code changes are generally editorial clarifications that improve the thoroughness of IBC for alignment to the introduction of tornado loads in ASCE 7-22 and IBC 2024.

FS1-25

FS2-25

IBC: [BS] 1402.3

Proponents: Theresa Weston, The Holt Weston Consultancy, representing Rainscreen Association in North America (holtweston88@gmail.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1402.3 ~~Wind~~ Load resistance. *Exterior walls*, exterior wall coverings, exterior soffits and fascias, and the associated openings, shall be designed and constructed to resist safely the superimposed *loads* required by Chapter 16.

Reason: This proposal updates the title of the section to reflect that loads, not confined to wind, are covered under the section and Chapter 16. The section references the defined term "loads" which is defined as "forces or other actions that result from the weight of *building* materials, occupants and their possessions, environmental effects, differential movement and restrained dimensional changes."

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This updates a section title and does not change any technical requirements.

FS2-25

FS3-25

IBC: [BS] 1404.5

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.5 Fastening. Exterior wall coverings shall be securely fastened with corrosion-resistant fasteners in accordance with this code or the *approved* manufacturer's instructions. Fastening of claddings or furring through foam plastic insulating sheathing shall comply with Section 1404.5.1, 1404.5.2 or 1404.5.3, as applicable<u>, or Chapter 4 of ANSI/ABTG FS200.1</u>.

Reason: This proposal adds an ANSI consensus standard, FS200.1, which includes design, testing, and prescriptive requirements for attachment of cladding through foam plastic insulating sheathing. It is the basis for the prescriptive fastening provisions that are currently in Sections 1404.5.1, 1404.5.2, and 1404.5.3 of the code. It provides additional options that can be used by designers and manufacturers to properly evaluate or design attachment solutions consistent with the provisions in the code. The standard is available as a free download at: https://www.appliedbuildingtech.com/standards

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.

Estimated Immediate Cost Impact Justification (methodology and variables):

This standard is consistent with current code but adds additional options for designers and manufacturers and would tend to have a cost decrease that is difficult to quantify or forecast. Thus, it will support alternative equivalent solutions which would have the general effect of reducing cost of compliance by providing more options.

Estimated Life Cycle Cost Impact:

Life cycle cost impact is not applicable to this proposal.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Life cycle cost impact is not applicable to this proposal. However, it is expected that this proposal would have no change to the life-cycle cost in comparison to the equivalent solutions currently in the code.

Staff analysis: FS115-24 was AS and is now on the consent agenda. That proposal included the new standard ANSI/ABTG FS200.1 – 2022

FS3-25

FS4-25

IBC: [BS] 1404.5, TABLE 1404.5 (New)

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.5 Fastening. Exterior wall coverings shall be securely fastened to the wall structure with corrosion-resistant fasteners in accordance with this code or the *approved* manufacturer's instructions. Fastening of claddings or furring through foam plastic insulating sheathing shall comply with Section 1404.5.1, 1404.5.2 or 1404.5.3, as applicable. Where the components and cladding allowable stress wind load determined in accordance with Section 1609 is not greater than 30 psf (negative pressure), siding shall be permitted to be fastened to minimum 7/16-inch (11 mm) wood structural panel sheathing in accordance with the siding manufacturer's installation instructions, Table 1404.5, or an *approved* design.

Add new text as follows:

TABLE 1404.5 OPTIONAL CLADDING ATTACHMENT SCHEDULE FOR FASTENER INTO MINIMUM 7/16-IN-THICK WOOD STRUCTURAL PANEL SHEATHING

APPLICATION	NUMBER AND TYPE OF FASTENER	SPACING OF FASTENERS[b]
Exterior wall covering (weighing 3 psf or less) attachment to wood structural panel sheathing, either direct or over foam sheathing a maximum of 2 inches thick.[a] Note: Does not apply to vertical siding.	Ring shank roofing nail (0.120" min. dia.)	12" o.c.
	Ring shank nail (0.148" min. dia.)	15" o.c.
	No. 6 screw (0.128" min. dia.)	12" o.c.
	No. 8 screw (0.164" min. dia.)	16" o.c.

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.479 kPa

a. Fastener length shall be sufficient to penetrate the back side of the wood structural panel by at least 1/4 inch. The wood structural panel sheathing shall be not less than 7/16 inch in thickness.

b. Spacing of fasteners is per 12 inches of siding width. For other siding widths, multiply "Spacing of Fasteners" above by a factor of 12/s, where "s" is the siding width in inches. Fastener spacing shall never be greater than the manufacturer's minimum recommendations.

Reason: This proposal coordinates the IBC with a siding/cladding attachment option in the IRC (Section R703.3.3 and Table R703.3.3). The attachment options in proposed Table 1404.5 are limited to an ASD components and cladding wind load of 30 psf which is the limit of the IRC cladding connection provisions. Other solutions are permitted, such as manufacturer installation instructions or an approved design. This cladding attachment method provides a simple and robust means for installation of light-weight (less than 3 psf) exterior wall coverings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is providing an additional option and therefore does not change existing requirements in the code. In some cases, this option could result in a cost decrease but the purpose of this proposal is merely to add an option that is currently also an option in the IRC.

FS5-25

IBC: [BS]TABLE 1404.5.2.1, [BS]TABLE 1404.5.2.2, [BS]TABLE 1404.5.3.1, [BS]TABLE 1404.5.3.2

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS]TABLE 1404.5.2.1 CLADDING MINIMUM FASTENING REQUIREMENTS FOR DIRECT ATTACHMENT OVER FOAM PLASTIC SHEATHING TO SUPPORT CLADDING WEIGHT[a]

CLADDING FASTENER THROUGH FOAM SHEATHING INTO:	CLADDING FASTENER TYPE AND MINIMUM SIZE[b]	CLADDING FASTENER VERTICAL SPACING (inches)[d]	MAXIMUM THICKNESS OF FOAM SHEATHING[c] (inches)							
			16″ o.c. fastener horizontal spacing				24″ o.c. fastener horizontal spacing

	#10 screw into 43 mil steel or thicker	6	4.00	4.00	4.00	3.60	4.00	4.00	3.45	2.70
		8	4.00	4.00	3.70	3.00	4.00	3.85	2.80	1.80
		12	4.00	3.85	2.80	1.80	4.00	3.05	1.50	DR

For SI: 1 inch = 25.4 mm, 1 pound per square foot (psf) = 0.0479 kPa, 1 pound per square inch = 0.00689 MPa.

DR = design required, o.c. = on center.

a. Cold-formed steel framing shall be minimum 33 ksi steel for 33 mil and 43 mil steel and 50 ksi steel for 54 mil steel or thicker.

b. Screws shall comply with the requirements of AISI S240.

c. Foam sheathing shall have a minimum compressive strength of 15 pounds per square inch in accordance with ASTM C578 or ASTM C1289.

d. Fastener vertical spacing is an average spacing associated with the following fastener count per foot: 6 inch spacing is associated with 2 fasteners per foot; 8 inch spacing is associated with 1.5 fasteners per foot, and 12 inch spacing is associated with 1 fastener per foot.

e. Cladding weight is the maximum weight of cladding materials to the exterior side of the foam plastic insulating sheathing in pounds per square foot of wall area. The 3 psf category typically applies to panel and lap siding materials; the 11 psf category typically applies to conventional 3-coat stucco of nominal 7/8-inch thickness; and 15 psf to 25 psf categories typically apply to adhered masonry veneers.

[BS] TABLE 1404.5.2.2 FURRING MINIMUM FASTENING REQUIREMENTS FOR APPLICATION OVER FOAM PLASTIC SHEATHING TO SUPPORT CLADDING WEIGHT[a]

FURRING MATERIAL	FRAMING MEMBER	FASTENER TYPE AND MINIMUM SIZE[b]	MINIMUM PENETRATION INTO WALL FRAMING (inches)	FASTENER SPACING IN FURRING (inches)	MAXIMUM THICKNESS OF FOAM SHEATHING[d] (inches)

				24	4.00	2.25	DR	DR	4.00	0.65	DR	DR

For SI: 1 inch = 25.4 mm, 1 pound per square foot (psf) = 0.0479 kPa, 1 pound per square inch = 0.00689 MPa.

DR = Design Required, o.c. = on center.

a. Wood furring shall be spruce-pine-fir or any softwood species with a specific gravity of 0.42 or greater. Steel furring shall be minimum 33 ksi steel. Cold-formed steel studs shall be minimum 33 ksi steel for 33 mil and 43 mil thickness and 50 ksi steel for 54 mil steel or thicker.

b. Screws shall comply with the requirements of AISI S240.

c. Where the required cladding fastener penetration into wood material exceeds $^{3}/_{4}$ inch and is not more than $1^{1}/_{2}$ inches, a minimum 2-inch nominal wood furring or an approved design shall be used.

d. Foam sheathing shall have a minimum compressive strength of 15 pounds per square inch in accordance with ASTM C578 or ASTM C1289.

e. Furring shall be spaced not more than 24 inches on center, in a vertical or horizontal orientation. In a vertical orientation, furring shall be located over wall studs and attached with the required fastener spacing. In a horizontal orientation, the indicated 8-inch and 12-inch fastener spacing in furring shall be achieved by use of two fasteners into studs at 16 inches and 24 inches on center, respectively.

f. Cladding weight is the maximum weight of cladding materials to the exterior side of the foam plastic insulating sheathing in pounds per square foot of wall area. The 3 psf category typically applies to panel and lap siding materials; the 11 psf category typically applies to conventional 3-coat stucco of nominal 7/8-inch thickness; and 15 psf to 25 psf categories typically apply to adhered masonry veneers.

[BS] TABLE 1404.5.3.1 CLADDING MINIMUM FASTENING REQUIREMENTS FOR DIRECT ATTACHMENT OVER FOAM PLASTIC SHEATHING TO SUPPORT CLADDING WEIGHT[a]

CLADDING FASTENER THROUGH FOAM SHEATHING INTO:	CLADDING FASTENER TYPE AND MINIMUM SIZE[c]	CLADDING FASTENER VERTICAL SPACING (INCHES)[d]	MAXIMUM THICKNESS OF FOAM SHEATHING[e]~~[d]~~ (INCHES)

		8	4.00	2.55	1.45	0.95	4.00	1.60	0.85	0.50

CLADDING FASTENER THROUGH FOAM SHEATHING INTO:	0.162" diameter nail CLADDING FASTENER TYPE AND MINIMUM SIZE	CLADDING FASTENER VERTICAL SPACING (INCHES)	MAXIMUM THICKNESS OF FOAM SHEATHING (INCHES)							
			16″ o.c. fastener horizontal spacing				24″ o.c. fastener horizontal spacing			
			Cladding weight:				Cladding weight:			
			3 psf	11 psf	18 psf	25 psf	3 psf	11 psf	18 psf	25 psf
		12	4.00	1.60	0.85	0.50	4.00	0.95	DR	DR

For SI: 1 inch = 25.4 mm, 1 pound per square foot (psf) = 0.0479 kPa.

DR = Design Required, o.c. = on center.

a. Wood framing shall be spruce-pine-fir or any wood species with a specific gravity of 0.42 or greater in accordance with ANSI/AWC NDS.

b. The thickness of *wood structural panels* complying with the specific gravity requirement of Note a shall be permitted to be included in satisfying the minimum penetration into framing.

c. Nail fasteners shall comply with ASTM F1667, except nail length shall be permitted to exceed ASTM F1667 standard lengths.

d. Fastener vertical spacing is an average spacing associated with the following fastener count per foot: 6 inch spacing is associated with 2 fasteners per foot, 8 inch spacing is associated with 1.5 fasteners per foot, and 12 inch spacing is associated with 1 fastener per foot.

e. ~~d.~~ Foam sheathing shall have a minimum compressive strength of 15 psi in accordance with ASTM C578 or ASTM C1289.

f. Cladding weight is the maximum weight of cladding materials to the exterior side of the foam plastic insulating sheathing in pounds per square foot of wall area. The 3psf category typically applies to panel and lap siding materials; the 11 psf category typically applies to conventional 3-coat stucco of nominal 7/8-inch thickness; and 15 psf to 25 psf categories typically apply to adhered masonry veneer.

[BS] TABLE 1404.5.3.2 FURRING MINIMUM FASTENING REQUIREMENTS FOR APPLICATION OVER FOAM PLASTIC SHEATHING TO SUPPORT CLADDING WEIGHT[a, b]

FURRING MATERIAL	FRAMING MEMBER	FASTENER TYPE AND MINIMUM SIZE	MINIMUM PENETRATION INTO WALL FRAMING (INCHES) [c]	FASTENER SPACING IN FURRING (INCHES)	MAXIMUM THICKNESS OF FOAM SHEATHING[e] (INCHES)							
					16″ o.c. furring [f]				24″ o.c. furring [f]

		$^1/_4$" lag screw	$1^1/_2$	12	4.00	2.65	1.50	0.90	4.00	1.65	0.80	DR
				16	4.00	1.95	0.95	0.50	4.00	1.10	DR	DR
				24	4.00	1.10	DR	DR	3.25	0.50	DR	DR

For SI: 1 inch = 25.4 mm, 1 pound per square foot (psf) = 0.0479 kPa, 1 pound per square inch = 0.00689 MPa.

DR = Design Required, o.c. = on center.

a. Wood framing and furring shall be spruce-pine-fir or any wood species with a specific gravity of 0.42 or greater in accordance with ANSI/AWC NDS.

b. Nail fasteners shall comply with ASTM F1667, except nail length shall be permitted to exceed ASTM F1667 standard lengths.

c. The thickness of *wood structural panels* complying with the specific gravity requirements of Note a shall be permitted to be included in satisfying the minimum required penetration into framing.

d. Where the required cladding fastener penetration into wood material exceeds $^{3}/_{4}$ inch and is not more than $1^{1}/_{2}$ inches, a minimum 2-inch nominal wood furring or an *approved* design shall be used.

e. Foam sheathing shall have a minimum compressive strength of 15 psi in accordance with ASTM C578 or ASTM C1289.

f. Furring shall be spaced not greater than 24 inches on center in a vertical or horizontal orientation. In a vertical orientation, furring shall be located over wall studs and attached with the required fastener spacing. In a horizontal orientation, the indicated 8-inch and 12-inch fastener spacing in furring shall be achieved by use of two fasteners into studs at 16 inches and 24 inches on center, respectively.

g. Cladding weight is the maximum weight of cladding materials to the exterior side of the foam plastic insulating sheathing. The 3 psf category typically applies to panel or lap siding materials; the 11 psf category typically applies to conventional 3-coat stucco of nominal 7/8-inch thickness; and 15 psf to 25 psf categories typically apply to adhered masonry veneers.

Reason: This proposal coordinates with the exterior wall covering weight and fastener spacing explanations added as footnotes to the identical tables found in IRC Section R703. A cladding manufacturer requested this additional information to better explain the basis of the table fastening schedules to avoid mis-interpretation or mis-application. This information will help users of the code properly apply the tables and also address fastening schedules that may vary in spacing or arrangement for different cladding types.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal clarifies application of the table and does not change requirements. Therefore, there is no cost impact.

FS5-25

FS6-25

IBC: [BS] 1404.11, [BS] 1404.11.1, ASTM Chapter 35 (New)

Proponents: Nicholas Lang, representing Concrete Masonry & Hardscapes Association (nlang@masonryandhardscapes.org); Charles Clark Jr, representing Brick Industry Association (cclark@bia.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.11 Adhered masonry veneer. *Adhered masonry veneer* shall comply with the applicable requirements in this section and Sections 13.1 and 13.3 ~~13.2~~ of TMS 402.

[BS] 1404.11.1 Exterior adhered masonry veneer. Exterior *adhered masonry veneer* shall be installed in accordance with one of the following: ~~Section 1404.11 and the manufacturer's instructions.~~

1. Section 1404.11
2. Article 3.3D of TMS 602
3. For concrete masonry or manufactured stone veneer units, ASTM C1780.
4. For clay or shale masonry units, ASTM C1935.
5. Manufacturer's instructions.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

C1780-24	Standard Practice for Installation Methods for Cement-based Adhered Masonry Veneer
C1935-24	Standard Practice for Installation Methods for Adhered Veneer Systems Using Thin Brick Units Made from Clay or Shale

Reason: This ballot proposes to add new options for installation of adhered masonry veneer. The first proposed option is Section 1404.11. This option currently exists, as such, no change is proposed. The second option is Article 3.3D of TMS 602. This option is applicable to all veneer types, and is already included as an installation option in the IRC. The third option is ASTM C1780, which is a consensus standard for installation of adhered masonry veneers where the units are cement based. In particular, this option is applicable to concrete masonry and manufactured stone veneer masonry units. The fourth option is ASTM C1935, which is a consensus standard for installation of adhered masonry veneers where the units are made of clay or shale. The fifth option is manufacturer's instructions. This option currently exists, as such, no change is proposed.

ASTM C1780 and ASTM C1935 have been developed by ASTM Committee C15 on Masonry. They include specific sets of installation information for the applicable units, and are valuable resources to installers. The addition of these standards will improve the quality of adhered veneer installations, and provide important information to installers of adhered veneers. These standards have also been aligned with requirements of TMS 602 to provide consistency across standards.

Finally, the pointer to the relevant sections of TMS 402 for design criteria in 1404.11 is being corrected. Adhered masonry veneers are covered in Sections 13.1 and 13.3. The reference to 13.2 is erroneous and requires correction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change provides additional options for the installer. The requirements of both new reference standards are aligned with the IBC and TMS 602, so application of those would not impact construction cost.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:
ASTMC1780-24 Standard Practice for Installation Methods for Cement-based Adhered Masonry Veneer
ASTMC1935-24 Standard Practice for Installation Methods for Adhered Veneer Systems Using Thin Brick Units Made from Clay or Shale

FS6-25

FS7-25

IBC: [BS] 1404.11.3, [BS] 1404.11.2, TCNA (New)

Proponents: Brian Trimble, representing International Masonry Institute (btrimble@imiweb.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] ~~1404.11.3~~ 1404.11.2 Interior adhered masonry veneers. Interior *adhered masonry veneers* shall have a maximum weight of 20 psf (0.958 kg/m^2) and shall be installed in accordance with Section 1404.11. Where the interior *adhered masonry veneer* is supported by wood construction, the supporting members shall be designed to limit deflection to $^1/_{600}$ of the span of the supporting members.

[BS] ~~1404.11.2~~ 1404.12 Exterior adhered ~~masonry veneers -~~ porcelain tile. Adhered units weighing more than 3.5 pounds per square foot (0.17 kN/m^2) shall not exceed 48 inches (1219 mm) in any face dimension nor more than 9 square feet (0.8 m^2) in total face area and shall not weigh more than 6 pounds per square foot (0.29 kN/m^2). Adhered units weighing less than or equal to 3.5 pounds per square foot (0.17 kN/m^2) shall not exceed 72 inches (1829 mm) in any face dimension nor more than 17.5 square feet (1.6 m^2) in total face area. *Porcelain tile* shall be adhered to an *approved backing* system and installed in accordance with ANSI A108.1A, ANSI A108.1B, ANSI A108.1C, ANSI A108.5, or ANSI A108.20 (See TCNA).

Add new standard(s) as follows:

TCNA

Tile Council-North America Inc
100 Clemson Research Blvd
Anderson, SC 29625
USA

A108.1C-2021	Contractor's Option: Installation of Ceramic Tile in the Wet-Set Method with Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Mortar Bed with Dry-Set or Latex-Portland Cement Mortar
A108.20-2021	Exterior Installation of Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs 2023 TCNA Handbook for Ceramic, Glass, and Stone Tile Installation

Reason: Porcelain tile is a ceramic tile material and should not be required to comply with TMS 402 "Building Code Requirements for Masonry Structures" which covers clay, concrete and stone masonry units. Since porcelain tile is found within Section 1404.11.2, it would be required to conform to all of Section 1404.11 requirements which invoke TMS 402, which is not correct. As defined by the Code, porcelain tile is addressed by ANSI A137.1:2022 "American National Standards Specifications for Ceramic Tile" and ANSI A137.3 "American National Standard Specifications for Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs." Standards for the installation of porcelain tile on exterior walls that accompany these ANSI specifications include ANSI A108.1A "Installation of Ceramic Tile in the Wet-Set Method, with Portland Cement Mortar," ANSI A108.1B "Installation of Ceramic Tile on a Cured Portland Cement Mortar Setting Bed with Dry-Set or Latex-Portland Cement Mortar," ANSI A108.1C "Contractor's Option: Installation of Ceramic Tile in the Wet-Set Method with Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Mortar Bed with Dry-Set or Latex-Portland Cement Mortar," ANSI A108.5 "Setting of Ceramic Tile with Dry-Set Mortar, Modified Dry-Set Cement Mortar, EGP (Exterior Glue Plywood) Modified Dry-Set Cement Mortar, or Improved Modified Dry-Set Mortar," and A108.20 "Exterior Installation of Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs" and not by TMS 402. By moving porcelain tile to its own separate section, the installation requirements of TMS 402 will not apply since they are different than those found in the ANSI standards relevant to porcelain tile.

The section on interior adhered veneer masonry veneers has been moved up to follow directly after exterior adhered masonry veneer with the new number of 1404.11.2. The section on porcelain tile would follow that section with its own section number of 1404.12. Current Sections 1404.12 through the 1404.19 would have to be renumbered along with any references to those sections.

Bibliography: ANSI A137.1:2022 "American National Standards Specifications for Ceramic Tile"

ANSI A137.3:2022 "American National Standard Specifications for Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs."

ANSI A108.1A:2021 "Installation of Ceramic Tile in the Wet-Set Method, with Portland Cement Mortar"

ANSI A108.1B:2021 "Installation of Ceramic Tile on a Cured Portland Cement Mortar Setting Bed with Dry-Set or Latex-Portland Cement Mortar"

ANSI A108.1C:2021 "Contractor's Option: Installation of Ceramic Tile in the Wet-Set Method with Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Mortar Bed with Dry-Set or Latex-Portland Cement Mortar"

ANSI A108.5"2021 "Setting of Ceramic Tile with Dry-Set Mortar, Modified Dry-Set Cement Mortar, EGP (Exterior Glue Plywood) Modified Dry-Set Cement Mortar, or Improved Modified Dry-Set Mortar"

ANSI A108.20:2021 "Exterior Installation of Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs 2023 TCNA Handbook for Ceramic, Glass, and Stone Tile Installation"

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a rearrangement of sections with reference to appropriate ANSI standards and does not have a cost impact.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:
TCNA ANSIA108.1C-2021 Contractor's Option: Installation of Ceramic Tile in the Wet-Set Method with Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Mortar Bed with Dry-Set or Latex-Portland Cement Mortar
TCNA ANSIA108.20-2021 Exterior Installation of Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs 2023 TCNA Handbook for Ceramic, Glass, and Stone Tile Installation

TCNA ANSI A108.1A, ANSI A108.1B, and ANSI A108.5 are currently referenced in the IBC. They are in Chapter 35 under ANSI.

FS7-25

FS8-25

IBC: [BS] 1404.15, [BS] 1404.15.2

Proponents: Matthew Dobson, representing Polymeric Exterior Products Association (mdobson@vinylsiding.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.15 Vinyl siding, backed vinyl siding, and insulated vinyl siding. *Vinyl siding*, backed vinyl siding, and insulated *vinyl siding* conforming to the requirements of this section and complying with ASTM D3679, ASTM D7445, and ASTM D7793, respectively, shall be permitted on *exterior walls* where the design wind pressure determined in accordance with Section 1609 does not exceed 30 pounds per square foot (1.44 kN/m^2). Where the design wind pressure exceeds 30 pounds per square foot (1.44 kN/m^2), tests or calculations indicating compliance with Chapter 16 shall be submitted.

[BS] 1404.15.2 Installation over foam plastic insulating sheathing. Where *vinyl siding*, backed vinyl siding, or insulated *vinyl siding* is installed over foam plastic insulating sheathing, the *vinyl siding* or insulated *vinyl siding* shall comply with Section 1404.15 and shall have a wind load design pressure rating in accordance with Table 1404.15.2.

Exceptions:

3. Where the foam plastic insulating sheathing and its attachment has a design wind pressure resistance complying with Sections 1609 and 2603.10, the ~~*vinyl siding* or insulated *vinyl*~~ siding shall be installed in accordance with Section 1404.15.1.
2. Where the ~~*vinyl siding* or insulated *vinyl*~~ siding manufacturer's product specifications provide an *approved* wind load design pressure rating for installation over foam plastic insulating sheathing, use of this wind load design pressure rating shall be permitted and the siding shall be installed in accordance with the manufacturer's installation instructions.
1. Where the foam plastic insulating sheathing is applied directly over *wood structural panels*, *fiberboard*, *gypsum sheathing* or other *approved backing* capable of independently resisting the design wind pressure, the ~~*vinyl siding* or insulated *vinyl*~~ siding shall be installed in accordance with Section 1404.15.1.

Reason: This change provides direction on the requirements for the installation of backed siding, as it is the same as vinyl and insulated vinyl siding. The material standard was added during the Group A cycle. The change also makes small edits to clean up and remove unnecessary words in relevant sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This changes simply provides installation requirements for backed siding if it is chosen, it does not add any additional requirements that would add cost.

Staff Analysis: FS111-24 was AMC1 and is now on the consent agenda. That proposal included the new standard ASTM D7445-24 and a new defintion for 'backed vinyl siding.'

FS8-25

FS9-25

IBC: [BS] 1404.15.1, [BS] 1404.18.1

Proponents: Matthew Dobson, representing Polymeric Exterior Products Association (mdobson@vinylsiding.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

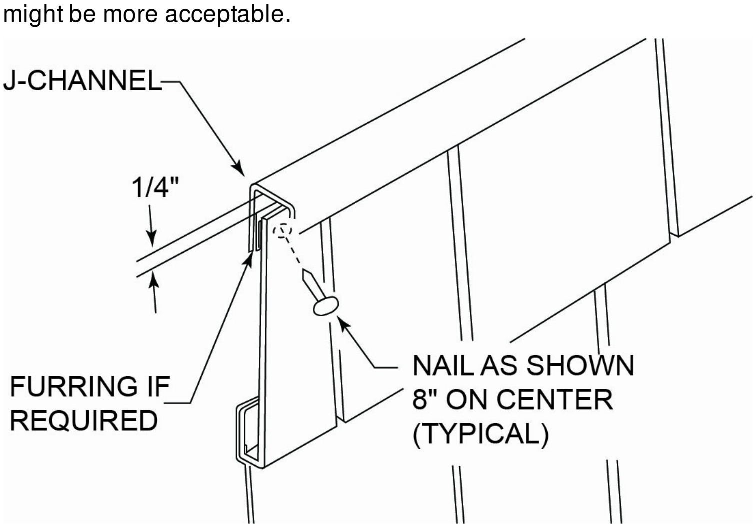
[BS] 1404.15.1 Application. The siding shall be applied over sheathing or materials listed in Section 2304.6. Siding shall be applied to conform to the *water-resistive barrier* requirements in Section 1402. Siding and accessories shall be installed in accordance with the approved manufacturer's instructions <u>and the following:</u>

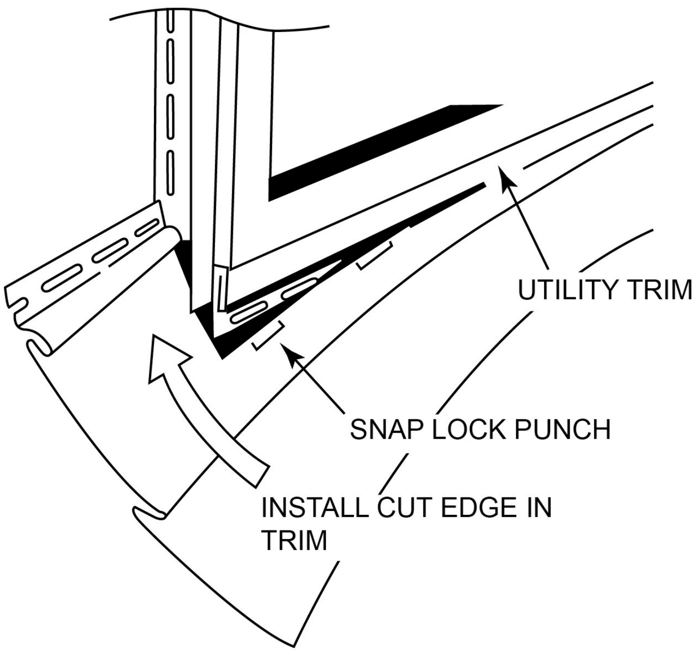
1. <u>Horizontal siding shall be installed with a starter strip at the initial course at any location.</u>
2. <u>Under windows, and at the top of walls, utility trim shall be used with snap locks.</u>

[BS] 1404.18.1 Installation. *Polypropylene siding* and accessories shall be installed over and attached to *wood structural panel sheathing* with *nailable substrate* not less than $^7/_{16}$ inch (11.1 mm) in thickness or other substrate suitable for mechanical fasteners in accordance with the approved manufacturer's instructions <u>and the following:</u>

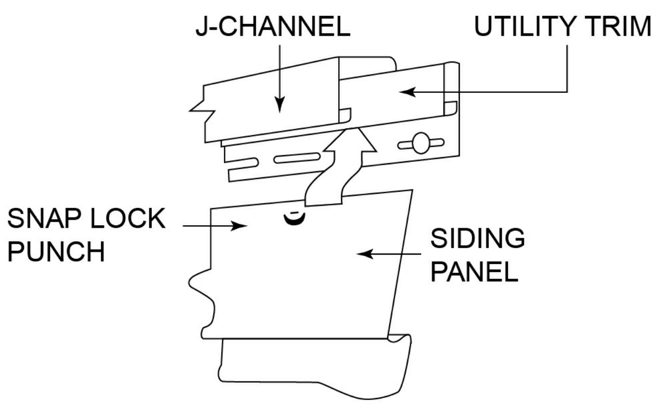
1. <u>Horizontal siding shall be installed with a starter strip at the initial course at any location.</u>
2. <u>Where nail hem is removed for application under windows and top of walls, nail slot punch or pre-drilled holes shall be constructed for the fasteners.</u>

Reason: This change provides critical installation point requirement, that ensure system performance. These areas have been noted in the field as missing in some cases. By adding them, the code will require these specific connection points and by do so doing create more durable structures.Below are the drawings adopted by the IRC and also adopted by the Florida Residential Code. These drawings could be offered as part of the proposal as well, but based on input from the committee last year, I thought starting with simple language might be more acceptable.

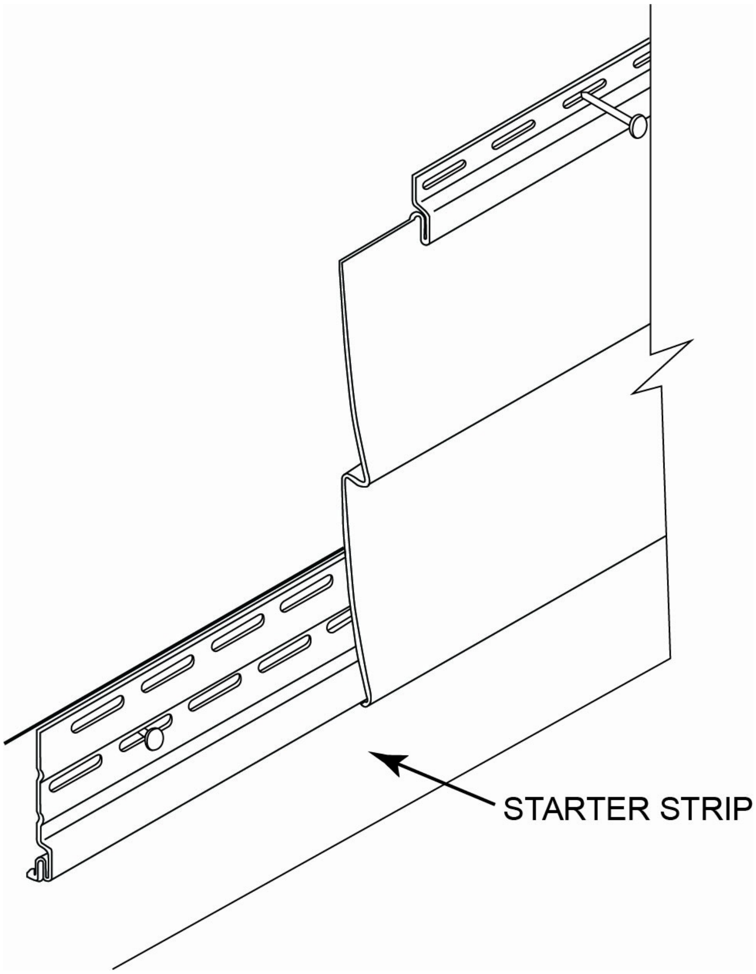




UTILITY TRIM
SNAP LOCK PUNCH
INSTALL CUT EDGE IN TRIM



J-CHANNEL
UTILITY TRIM
SNAP LOCK PUNCH
SIDING PANEL



Cost Impact: Increase

Estimated Immediate Cost Impact:

This change literally will add cost, however it is a requirement by the industry and manufacturers instructions, so if the siding is installed properly it will include these components.

Estimated Immediate Cost Impact Justification (methodology and variables):

Since the these items are already require by industry standards and manufacturers installation instructions, their added cost is critical to the systems performance.

The added costs for and average 20 square house, based on industry cost information.

Starter Strip

160 lf material - $30

Labor to install $80

Utility Trim

260 lf material $40

Labor to install $120

Total added cost of change on an average house approximately. $270

However, it is worth noting all manufacturer installation instructions require this, so correct installations will include these components as part of the system. In other words, these components should already be used as it is generally required by the code already through the manufacturer installation instruction default.

IBC: [BS] 1404.15.1, [BS] 1404.15.1.1, [BS] 1404.15.1.2, [BS] 1404.15.1.3, TABLE 1404.15.1 (New)

Proponents: Matthew Dobson, representing Polymeric Exterior Products Association (mdobson@vinylsiding.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.15.1 Application. The siding shall be applied over sheathing or materials listed in Section 2304.6. Siding shall be applied to conform to the *water-resistive barrier* requirements in Section 1402. Siding and accessories shall be installed in accordance with the approved manufacturer's instructions. Fasteners for vinyl siding, backed vinyl siding and insulated vinyl siding shall comply with Table 1404.15.1.

Delete without substitution:

~~**[BS] 1404.15.1.1 Fasteners and fastener penetration for wood construction.** Unless otherwise specified in the approved manufacturer's instructions, nails used to fasten the siding and accessories shall be corrosion resistant and have not less than a 0.313-inch (7.9 mm) head diameter and $^{1}/_{8}$-inch (3.18 mm) shank diameter. The penetration into *nailable substrate* shall be not less than 1$^{1}/_{4}$ inches (32 mm).~~

Revise as follows:

[BS] ~~1404.15.1.2~~ 1404.15.1.1 Fasteners and fastener penetration for cold-formed steel light-fame construction. For cold-formed steel light-frame construction, corrosion-resistant fasteners shall be used. Screw fasteners shall penetrate through the steel with not fewer than three exposed threads. Other fasteners shall be installed in accordance with the *approved construction documents* and manufacturer's instructions.

Delete without substitution:

~~**[BS] 1404.15.1.3 Fastener spacing.** Unless specified otherwise by the approved manufacturer's instructions, fasteners shall be installed in the middle third of the slots of the nail hem and spacing between fasteners shall be not greater than 16 inches (406 mm) for horizontal siding and 12 inches (305 mm) for vertical siding.~~

Add new text as follows:

TABLE 1404.15.1 PRESCRIPTIVE FASTENER REQUIREMENTS FOR VINYL SIDING, BACKED VINYL SIDING, AND INSULATED VINYL SIDING

GENERAL			
Fastner[a]	**Substrate[b]**	**Penetration depth[c]**	**Spacing**
Smooth shank nail, not less than 0.120" nail shank with 0.313(5/16)" head or 16 gage staple with 3/8 to 1/2 inch crown	Nailable Subtrate	Not less than 1-1/4"	Horizontal siding - not greater than 16-inches on center
Ring shank nail, not less than 0.120" shank with 0.313(5/16)" head	min. 7/16" nailable substrate	Through substrate plus a minimum of 1/4" through	Horizontal siding - not greater than 12-inches on center
Ring shank nail, not less than 0.120" shank with 0.313(5/16)" head	> 15/32" thick nailable substrate	Through substrate plus a minimum of 1/4" through	Horizontal siding - not greater than 16-inches on center

Either smooth shank or ring shank (as specified above)	min. 7/16" nailable substrate	Through substrate plus a minimum of 1/4" through	Vertical siding - Not greater than 12-inches on center each way
Ring shank nail, not less than 0.120" shank with 0.313(5/16)" head or screw not less than 0.138 shank with a .423" truss or pan head	min. 3/4" thick wood furring	Into furring 3/4"	Horizontal sidng - Not greater than 12-inches on center
24-INCH O.C. FRAMING (For 20 psf or less settings design wind pressure)[d]			
Fastner[a]	**Substrate[b]**	**Penetration depth[c]**	**Spacing**
All fastener types	Nailable subtrate	1-1/4"	Horizontal siding - Not greater than 24-inches on cente

For SI: 1 inch=25.4 mm

a. Fasteners shall comply with ASTM F1667

b. Wood framing and furring shall have a minimum specific gravity of 0.42. Other nailable substrates with equal or greater fastener withdrawal performance shall also be permitted. Where fiberboard, gypsum, foam plastic or other non-nailable substrate is use, fasteners must go into studs or other form of nailable substrate.

c. The total thickness of wood structural panel, wood furring, and other nailable substrates shall be satisfying the required penetration depth.

d. For 0.120 inch roofing nail only, 24 inches on center fastener spacing for horizontal siding shall be permitted where the allowable stress design wind pressure is 20 psf or less in accordance with Section 1609. Alternatively, it shall be permitted where the mean roof height of the building is 30 feet or less and the design wind speed does not exceed 115 mph for Exposure B or 110 mph Exposure C.

Reason: This change moves away from the long-standing "standard" installation prescription of 16" oc into the stud to a prescriptive table that offers practical fastener alternatives to installation depending on the framing and sheathing patterns. It is based on industry testing using ASTM D5206 and engineering calculations and in short it requires the use of ring shank nails where it's more difficult to hit the stud framing.

In addition in "low wind" areas (a good portion of the country), 20 psf or less where 24" oc framing is used the nailable sheathing is not being used, is provides allowance for this construction method.

This change offers options of installation while addressing trends in construction related to energy efficiency and alternative framing concepts.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This change offers alternatives which could add additional fasteners and ring shank nails vs. smooth shank nail which are more expensive.

Estimated Immediate Cost Impact Justification (methodology and variables):

5lbs of 1 1/4" Roofing Smooth Shank Nails $19

5 lbs of 1 1/4" Roofing Ring Shank Nails $25

Adds about 25% in material costs and potentially additional labor cost.

Estimated additional cost for an average 20 square home is between $50 - $150.

Estimated Life Cycle Cost Impact:

Life cycle costs is not relevant here as the change in fastener type will not impact this issue.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

NA

FS10-25

FS11-25

IBC: [BS] 1404.17.1

Proponents: Alexander Haldeman, representing James Hardie Building Products (alex.haldeman@jameshardie.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.17.1 Panel siding. *Fiber-cement* panels shall comply with the requirements of ASTM C1186, Type A, minimum Grade II (or ISO 8336, Category A, minimum Class 2). Panels shall be installed with the long dimension either parallel or perpendicular to framing. Vertical and horizontal joints shall occur over framing members<u>, furring, *wood structural panel* or other *approved* supporting material</u> and shall be protected with caulking, with battens or flashing, or be vertical or horizontal shiplap or otherwise designed to comply with Section 1402.2. Panel siding shall be installed with fasteners in accordance with the approved manufacturer's instructions.

Reason: This proposal attempts to clarify that means of support and attachment of edges/joints of fiber-cement panels can be achieved by multiple methods, including framing members, but also including furring, wood structural panel, and other means/materials not falling into the above methods, which may or may not require *approval* from the building official or an approved agency.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is editorial in nature, and merely provides clarification that fiber-cement panel products' joints can be supported and attached using methods/materials more than *just* framing members.

FS11-25

FS12-25

IBC: [BS] 1404.17.2

Proponents: Alexander Haldeman, representing James Hardie Building Products (alex.haldeman@jameshardie.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.17.2 Lap siding. *Fiber-cement* lap siding having a maximum width of 12 inches (305 mm) shall comply with the requirements of ASTM C1186, Type A, minimum Grade II (or ISO 8336, Category A, minimum Class 2). Lap siding shall be lapped not less than $1^1/_4$ inches (32 mm) and lap siding not having tongue-and-groove end joints shall have the ends protected with caulking, covered with an H-section joint cover, located over a strip of metal or non-metal flashing or shall be otherwise designed to comply with Section 1402.2. Lap siding courses shall be installed with the fastener heads exposed or concealed in accordance with the approved manufacturer's instructions.

Reason: This proposal is editorial in nature, and aims to provide clarification that the materials listed with the intent to comply with section 1402.2 may be made of metal or non-metal materials and still fulfil the intent of this section. (caulking, H-section joint cover, strip of metal or non-metal flashing, or otherwise designed to comply with Section 1402.2). (prevents the accumulation of water within the exterior wall assembly, and provides a means for draining water to the exterior)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is simply a clarification that *both* metal and non-metal flashing materials satisfy the intent of 1404.17.2.

FS12-25

FS13-25

IBC: [BS] 1404.18.2

Proponents: Matthew Dobson, representing Polymeric Exterior Products Association (mdobson@vinylsiding.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 1404.18.2 Fastener requirements. Unless otherwise specified in the approved manufacturer's instructions, nails shall be corrosion resistant, with a minimum 0.120-inch (3 mm) shank and a minimum 0.313-inch (8 mm) head diameter. Nails shall be not less than 1 $^{1}/_{4}$ inches (32 mm) long or as necessary to penetrate sheathing or *nailable substrate* not less than $^{3}/_{4}$ inch (19.1 mm). Where the nail fully penetrates the sheathing or *nailable substrate*, the end of the fastener shall extend not less than $^{1}/_{4}$ inch (6.4 mm) beyond the opposite face of the sheathing or *nailable substrate*. ~~Spacing of~~ Fasteners shall be spaced ~~installed~~ in accordance with the ~~approved~~ manufacturer's instructions.

Reason: This is a simple edit of word order, it is more consistent with how the code with written.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Just switching word order.

FS13-25

FS14-25

IBC: 1404.14.2 (New), FIGURE 1404.14.2(1) (New)

Proponents: Craig Drumheller, representing WDMA (cdrumheller@wdma.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Add new text as follows:

1404.14.2 Door systems with a Limited Water (LW) Rating. Door systems *labeled* with a Limited Water (LW) rating as specified in AAMA/WDMA/CSA 101/I.S.2/A440 shall require additional water exposure protection by an overhang with an OH Ratio greater than or equal to 1.0, approval by a *registered design professional*, or by other *approved* methods. The OH Ratio, as depicted in Figure 1404.14.2(1), shall be determined in accordance with the following equation:OH Ratio = OH Length/OH HeightWhere:OH Length = The minimum horizontal projection of the permanent overhang measured from the nearest portion of the door face. OH Height = The maximum vertical distance from the elevation of the bottom of the door to the underside of the outer edge of the permanent overhang over the door.

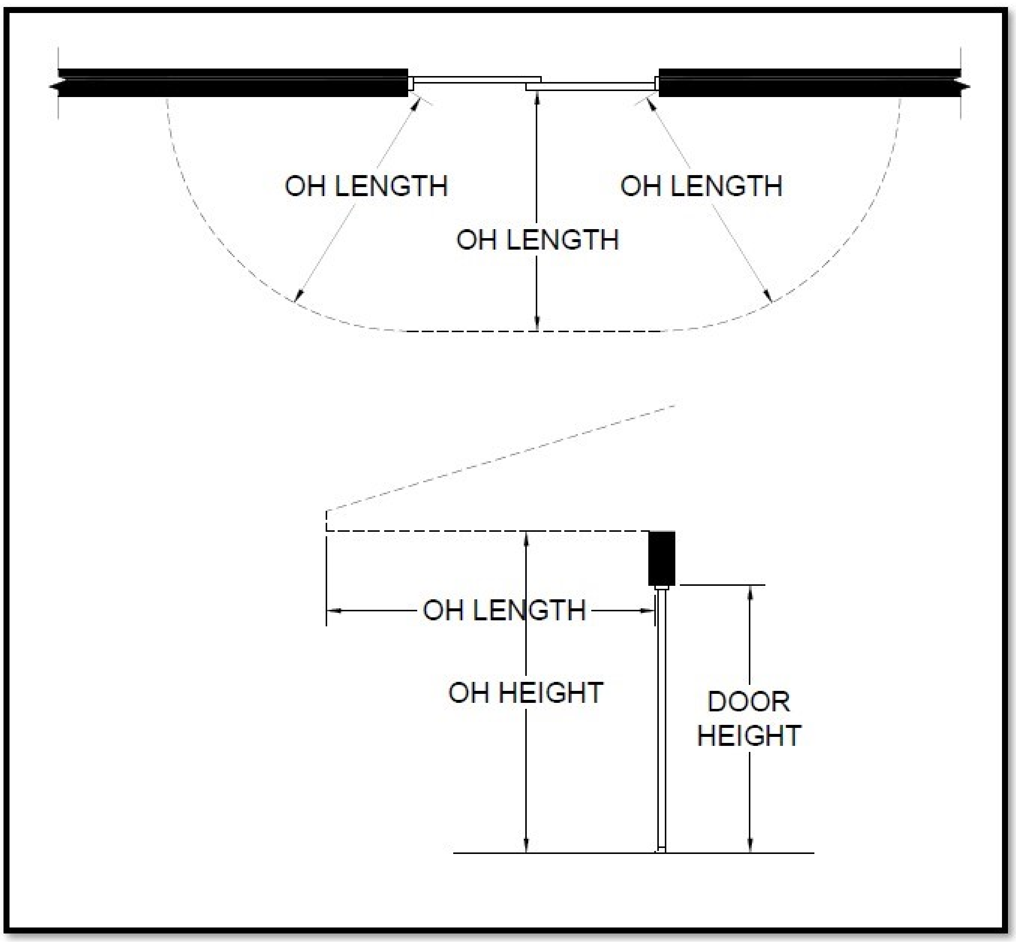

FIGURE 1404.14.2(1) OVERHANG RATIO

Reason: The proposed code change introduces a requirement for doors labeled with a Limited Water (LW) rating under standard AAMA/WDMA/CSA 101/I.S.2/A440 (NAFS). The Limited Water (LW) designation specifies products intended for use in locations where adequate protection from water exposure is provided. Currently, the code has no additional requirements for LW-rated windows as the NAFS standard recommends. This proposal seeks to integrate this designation into the building code with clear door overhang criteria, thereby reducing the ambiguity of the LW designation and ensuring consistency with industry intent.

WDMA members have determined that an overhang-to-height ratio of 1.0 offers adequate protection against wind-driven rain for LW-rated doors. This criterion is practical and measurable, ensuring that doors installed in such configurations meet the LW designation's intent without requiring additional water infiltration testing or increasing the exposure risk. By adopting this requirement, the building code will reflect current industry standards, support effective design practices, and streamline compliance for projects with adequate water infiltration protection for doors. A provision for a registered design professional and other approved methods is included to allow for alternate solutions that provide adequate water protection.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Using overhangs for additional weather protection is already a compliance approach intended for LW-rated doors in the referenced standard. This proposal may reduce the cost of construction for doors installed over large overhangs.

Staff Analysis: CC # FS14-25 and CC # FS15-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

FS14-25

FS15-25

IBC: CHAPTER 14, 1404.14.2 (New)

Proponents: Cesar Lujan, representing Window & Door Manufacturers Association (clujan@wdma.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

CHAPTER 14
EXTERIOR WALLS

Add new text as follows:

<u>**1404.14.2** **Door systems with a Limited Water (LW) rating.** Door systems labeled with a Limited Water (LW) rating as specified in AAMA/WDMA/CSA 101/I.S.2/A440 shall be adequately protected from water exposure as determined by a registered design professional or other approved methods.</u>

Reason: The proposed code change introduces a requirement for doors labeled with a Limited Water (LW) rating, as defined under the AAMA/WDMA/CSA 101/I.S.2/A440 (NAFS) standard. This requirement aligns with the referenced NAFS standard and will help ensure that the LW designation is applied appropriately. The LW designation identifies products intended for use in locations where adequate protection from water exposure is provided.

Currently, the building code does not include any reference or requirements for LW-rated doors, as recommended by the NAFS standard. This lack of oversight could result in improper installations that fail to meet the intended water protection criteria. By requiring additional review and approval by a registered design professional or code official, this proposal will help prevent the misapplication of products with an LW designation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Since the NAFS standard already requires additional protection for LW-rated doors, this proposal does not increase the cost of construction for doors conforming to the NAFS standard.

Staff Analysis: CC # FS15-25 and CC # FS14-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

FS15-25

FS16-25

IFC: 903.2.3 (New); IBC: 903.2.3 (New)

Proponents: Greg Johnson, Johnson & Associates Consulting Services, representing self (gjohnsonconsulting@gmail.com); Jay Peters, representing Codes and Standards International (peters.jay@me.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Fire Code

Add new text as follows:

903.2.3 Group D. An *automatic sprinkler system* shall be provided throughout all *buildings* containing a Group D occupancy where one or more of the following conditions exists:

1. The Group D *fire area* exceeds 12,000 square feet (1115 m^2).
2. The Group D *fire area* is located more than three stories above *grade plane*.
3. The combined area of all Group D *fire areas* on all floors, including any *mezzanines*, exceeds 24,000 square feet (2230 m^2).

2024 International Building Code

Add new text as follows:

903.2.3 Group D. An *automatic sprinkler system* shall be provided throughout all *buildings* containing a Group D occupancy where one or more of the following conditions exists:

1. The Group D *fire area* exceeds 12,000 square feet (1115 m^2).
2. The Group D *fire area* is located more than three stories above *grade plane*.
3. The combined area of all Group D *fire areas* on all floors, including any *mezzanines*, exceeds 24,000 square feet (2230 m^2).

Reason: Data centers are unique uses and are being proposed to be added as a new occupancy classification. As such there needs to be clear direction for when sprinkler requirements are triggered. The triggers proposed are consistent with the most conservative occupancy classifications currently being assigned to these unique uses, Groups F-1 and S-1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Data centers are typically sprinklered throughout so this represents codification of current practices and no additional costs.

TENTATIVE ORDER OF DISCUSSION
2025 PROPOSED CHANGES TO THE
INTERNATIONAL BUILDING CODE – GENERAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some G code change proposals may not be included on this list, as they are being heard by another committee.

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART III WILL BE HEARD BY THE IPMC/IZC COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

CHAPTER 3
OCCUPANCY CLASSIFICATION AND USE

Revise as follows:

SECTION 301
~~SCOPE~~GENERAL

301.1 ~~General~~Scope. Classification of all buildings and structures as to occupancy and use shall comply with this chapter.~~The provisions of this chapter shall control the classification of all *buildings* and *structures* as to occupancy and use. Different classifications of occupancy and use represent varying levels of hazard and risk to *building* occupants and adjacent properties.~~

CHAPTER 4
SPECIAL DETAILED REQUIREMENTS BASED ON OCCUPANCY AND USE

SECTION 401
~~SCOPE~~GENERAL

401.1 Scope~~Detailed occupancy and use requirements~~. Occupancies and use described herein in addition to the occupancy and construction requirements in this code shall comply with this chapter.~~In addition to the occupancy and construction requirements in this code, the provisions of this chapter apply to the occupancies and use described herein.~~

CHAPTER 5
GENERAL BUILDING HEIGHTS AND AREAS

SECTION 501
GENERAL

501.1 Scope. ~~The provisions of this chapter control the height~~Height and area of buildings and *structures* hereafter erected and *additions* to *existing structures* *shall comply with this chapter*.

CHAPTER 6
TYPES OF CONSTRUCTION

SECTION 601
GENERAL

601.1 Scope. ~~The provisions of this chapter shall control the classification~~ Classification of *buildings* as to type of construction shall comply with this chapter.

CHAPTER 12
INTERIOR ENVIRONMENT

SECTION 1201
GENERAL

1201.1 Scope. Building features associated with the interior environment shall comply with this chapter.~~The provisions of this chapter shall govern ventilation, temperature control, lighting, *yards* and *courts*, sound transmission, enhanced classroom acoustics, interior space dimensions, access to unoccupied spaces, toilet and bathroom requirements and ultraviolet (UV) germicidal irradiation systems associated with the interior spaces of *buildings*.~~

CHAPTER 27
ELECTRICAL

SECTION 2701
GENERAL

2701.1 Scope. ~~The provisions of~~ Electrical systems and equipment shall comply with this chapter and NFPA 70. ~~shall govern the design, construction, erection and installation of the electrical components, appliances, equipment and systems used in *buildings* and structures covered by this code. The *International Fire Code*, the *International Property Maintenance Code* and NFPA 70 shall govern the use and maintenance of electrical components, appliances, equipment and systems. The *International Existing Building Code* and NFPA 70 shall govern the *alteration*, *repair*, relocation, replacement and addition of electrical components, appliances, or equipment and systems.~~

CHAPTER 30
ELEVATORS AND CONVEYING SYSTEMS

SECTION 3001
GENERAL

3001.1 Scope. ~~This chapter governs the design~~Design, ~~construction,~~ installation, and construction~~*alteration* and *repair*~~ of elevators and conveying systems and their components shall comply with this chapter.

CHAPTER 31
SPECIAL CONSTRUCTION

SECTION 3101
GENERAL

3101.1 Scope. ~~The provisions of this chapter shall govern special~~Special *building* construction elements and components included in the building and structures covered by this code shall also comply with this chapter. ~~including membrane *structures*, *temporary structures*, *pedestrian walkways* and tunnels, *awnings* and *canopies*, *marquees*, signs, telecommunications and broadcast towers, *swimming pools* , spas and hot tubs, automatic vehicular gates, solar energy systems, *greenhouses*, relocatable buildings and *intermodal shipping containers*.~~

CHAPTER 32
ENCROACHMENTS INTO THE PUBLIC RIGHT-OF-WAY

SECTION 3201
GENERAL

3201.1 Scope. ~~The provisions of this chapter shall govern the encroachment~~Encroachment of *structures* into the public right-of-way shall comply with this chapter.

CHAPTER 33
SAFEGUARDS DURING CONSTRUCTION

SECTION 3301
GENERAL

3301.1 Scope. ~~The provisions of this chapter shall govern safety~~Safety during construction and the protection of adjacent public and private properties shall comply with this chapter. ~~Fire safety during construction shall also comply with the applicable provisions of Chapter 33 of the *International Fire Code*.~~

2024 International Existing Building Code

CHAPTER 15
CONSTRUCTION SAFEGUARDS

SECTION 1501
GENERAL

Revise as follows:

[BG] 1501.1 Scope. ~~The provisions of this chapter shall govern safety~~ Safety during construction and the protection of adjacent public and private properties shall comply with this chapter. ~~Fire safety during construction shall also comply with the applicable provisions of Chapter 33 of the *International Fire Code*.~~

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, representing Self (sorlowski@sbcc.codes); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

CHAPTER 15
ROOF ASSEMBLIES AND ROOFTOP STRUCTURES

SECTION 1501
GENERAL

1501.1 Scope. ~~The provisions of this chapter shall govern the design, materials, construction and quality of~~ ~~*roof*~~ Roof *assemblies*, and *rooftop structures* shall comply with this chapter.

CHAPTER 16
STRUCTURAL DESIGN

SECTION 1601
GENERAL

1601.1 Scope. ~~The provisions of this chapter shall govern the structural~~Structural design of *buildings*, *structures* and portions thereof shall comply with this chapter.

CHAPTER 17
SPECIAL INSPECTIONS AND TESTS

SECTION 1701
GENERAL

1701.1 Scope. Special inspections and tests shall comply with this chapter.~~The provisions of this chapter shall govern the quality, workmanship and requirements for materials covered. Materials of construction and tests shall conform to the applicable standards listed in this code.~~

CHAPTER 18
SOILS AND FOUNDATIONS

SECTION 1801
GENERAL

1801.1 Scope. Soils and foundations shall comply with this chapter.~~The provisions of this chapter shall apply to~~ ~~*building*~~ ~~and foundation systems.~~

CHAPTER 19
CONCRETE

SECTION 1901
GENERAL

1901.1 Scope. Use of concrete in structures shall comply with this chapter.~~The provisions of this chapter shall govern the materials, quality control, design and construction of concrete used in *structures*.~~

CHAPTER 20
ALUMINUM

SECTION 2001
GENERAL

2001.1 Scope. ~~This chapter shall govern the quality, design, fabrication and erection~~Use of aluminum in structures shall comply with this chapter.

CHAPTER 21
MASONRY

SECTION 2101
GENERAL

2101.1 Scope. ~~This chapter shall govern the materials, design, construction and quality~~Use of *masonry*in structures shall comply with this chapter.

CHAPTER 22
STEEL

SECTION 2201
GENERAL

2201.1 Scope. ~~The provisions of this chapter govern the quality, design, fabrication and erection of steel construction~~Use of steel in structures shall comply with this chapter.

CHAPTER 23
WOOD

SECTION 2301
GENERAL

2301.1 Scope. ~~The provisions of this chapter shall govern the materials, design, construction and quality of wood members and their fasteners~~Use of wood in structures shall comply with this chapter.

CHAPTER 24
GLASS AND GLAZING

SECTION 2401
GENERAL

2401.1 Scope. ~~The provisions of this chapter shall govern the materials, design, construction and quality of glass, light-transmitting ceramic and light-transmitting plastic panels for exterior and interior use in both vertical and sloped applications in *buildings* and *structures*.~~Use of glass and glazing in structures shall comply with this chapter. Light-transmitting *plastic glazing* shall also ~~meet the~~ comply with the applicable requirements of Chapter 26.

CHAPTER 25
GYPSUM PANEL PRODUCTS AND PLASTER

SECTION 2501
GENERAL

2501.1 Scope. ~~Provisions of this chapter shall govern the materials, design, construction and quality of *gypsum panel products* , lath, *gypsum plaster*, *cement plaster* and reinforced gypsum concrete.~~ Use of gypsum panel products and plaster in structures shall comply with this chapter.

CHAPTER 26
PLASTIC

SECTION 2601
GENERAL

2601.1 Scope. ~~These provisions shall govern the materials, design, application, construction and installation of foam plastic, *foam plastic insulation*, plastic *veneer*, interior plastic finish and *trim*, light-transmitting plastics and plastic composites, including *plastic lumber*.~~Use of plastics in structures shall comply with this chapter.

Reason: Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained.

The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make

it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

This proposal is submitted with the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial and there is no cost impact on the cost of construction.

2024 International Zoning Code

CHAPTER 3
USE DISTRICTS

Revise as follows:

SECTION 301
~~DISTRICT CLASSIFICATIONS~~ GENERAL

Add new text as follows:

301.1 Scope. Use Districts shall comply with this chapter.

Revise as follows:

~~301.1~~301.2 District classification ~~Classification~~. In order to classify, regulate and restrict the locations of *uses* and locations of *buildings* designated for specific areas; and to regulate and determine the areas of *yards*, *courts* and other *open spaces* within or surrounding such *buildings*, property ~~is hereby~~ shall be classified into districts ~~as prescribed in this chapter~~.

CHAPTER 4
AGRICULTURAL ZONES

Add new text as follows:

SECTION 401
GENERAL

401.1 Scope. Agricultural zones shall comply with this chapter.

Revise as follows:

SECTION ~~401~~ 402
AGRICULTURAL ZONE DIVISION ~~ZONES DEFINED~~

~~401.1~~ 402.1 Agricultural zone. Allowable agricultural (A) zone *uses* shall be:

Division 1. Any designated *open space* as set forth in this code.

Division 2. Any agricultural *use*, including, but not limited to, dwellings, maintenance/storage *buildings* and other such *uses* necessary for the *principal use*.

Division 3. Any public *park* land or other similar recreational *use*, including, but not limited to, amusement rides, office *buildings*, retail *buildings* and dwellings necessary for the maintenance of the *principal use*.

CHAPTER 5
RESIDENTIAL ZONES

Add new text as follows:

<u>SECTION 501</u>
<u>GENERAL</u>

<u>501.1</u> <u>Scope</u>. <u>Residential zones shall comply with this chapter.</u>

Revise as follows:

SECTION ~~501~~<u>502</u>
RESIDENTIAL<u> ZONE DIVISION</u> ~~ZONES DEFINED~~

~~501.1~~ <u>502.1</u> Residential zone. Allowable residential (R) zone *uses* shall be:

Division 1. The following *uses* are permitted in an R, Division 1 zone:
Single-family dwellings, publicly owned and operated *parks*, *recreation* centers, swimming pools and playgrounds, police and fire department stations, public and governmental services, public libraries, schools and colleges (excluding colleges or trade schools operated for profit), public *parking lots*, *private garages*, *buildings* accessory to the above permitted *uses* (including *private garages* , *accessory dwelling units* and *accessory living quarters*), and temporary *buildings*.

Division 2. The following *uses* are permitted in an R, Division 2 zone:
Any *use* permitted in R, Division 1 zones and two-family dwellings.

Division 3. The following *uses* are permitted in an R, Division 3 zone:
All *uses* permitted in R, Division 2 zones, multiple-unit dwellings, such as *apartment houses*, *boarding houses*, *condominiums* and *congregate residences*.

CHAPTER 6
COMMERCIAL AND COMMERCIAL/RESIDENTIAL ZONES

Add new text as follows:

<u>SECTION 601</u>
<u>GENERAL</u>

<u>601.1</u> <u>Scope</u>. <u>Commercial and commercial/residential zones shall comply with this chapter.</u>

Revise as follows:

SECTION ~~601~~ 602
COMMERCIAL AND COMMERCIAL/RESIDENTIAL ZONES DEFINED

~~601.1~~ 602.1 **Commercial and commercial/residential zones.** Allowable commercial (C) zone and commercial/residential (CR) zone *uses* shall be:

C Zone

Division 1. The following *uses* are permitted in a C, Division 1 zone:
Minor automotive repair, automotive motor fuel dispensing facilities, *automotive self-service motor fuel dispensing facilities*, *business or financial services*, convenience and *neighborhood commercial centers* (excluding wholesale sales), family and *group day care* facilities, libraries, *mortuary* and funeral homes, public and governmental services, police and fire department stations, places of religious worship, *public utility stations*, and *restaurants*.

Division 2. The following *uses* are permitted in a C, Division 2 zone:
Any *uses* permitted in C, Division 1 zones, and *light commercial* (excluding wholesale sales), *group care facilities*, physical fitness centers, *religious*, cultural and fraternal activities, *rehabilitation centers*, and schools and colleges operated for profit (including commercial, vocational and trade schools).

Division 3. The following *uses* are permitted in a C, Division 3 zone:
Any *uses* permitted in C, Division 2 zones, and *amusement centers* (including bowling alleys, golf driving ranges, miniature golf courses, ice rinks, pool and billiard halls, and similar recreational uses), automotive sales, building material supply sales (wholesale and retail), cultural institutions (such as museums and art galleries), *community commercial centers* (including wholesale and retail sales), health and medical institutions (such as *hospitals*), *hotels* and *motels* (excluding other residential occupancies), commercial printing and publishing, taverns and cocktail lounges, indoor *theaters*, and self-*storage warehouses*.

Division 4. The following *uses* are permitted in a C, Division 4 zone:
Any *uses* permitted in C, Division 3 zones, and *major automotive repair*, commercial bakeries, *regional commercial centers* (including wholesale and retail sales), plastic products design, molding and assembly, small metal products design, casting, fabricating, and processing, manufacture and finishing, storage yards, and wood products manufacture and finishing.

CR Zone Permitted (commercial/residential) (CR) zone *uses* shall be:

Division 1. The following *uses* are permitted in a CR, Division 1 zone:
Any *use* permitted in a C, Division 1 zone, and residential *use* permitted, except in the *story* or *basement* abutting *street grade*.

Division 2. The following *uses* are permitted in a CR, Division 2 zone:
Any *use* permitted in a C, Division 2 zone, and residential *use* permitted, except in the *story* or *basement* abutting *street grade*.

CHAPTER 7
FACTORY/INDUSTRIAL ZONES

Add new text as follows:

SECTION 701
GENERAL

701.1 Scope. Factory/industrial zones shall comply with this chapter.

Revise as follows:

SECTION ~~701~~ 702
FACTORY/INDUSTRIAL ZONES DEFINED

~~701.1~~ 702.1 FI zones. Allowable factory/*industrial* (FI) zone *uses* shall be:

Division 1. Any *light-manufacturing* or industrial *use*, such as *warehouses*, research or testing laboratories, product distribution centers, woodworking shops, auto body shops, furniture assembly, dry cleaning plants, places of religious worship, public and governmental services, machine shops, and boat building storage yards.

Division 2. Any *use* permitted in the FI, Division 1 zone and stadiums and arenas, indoor swap meets, breweries, liquid fertilizer manufacturing, carpet manufacturing, monument works, and a regional recycling center.

Division 3. Any *use* permitted in the FI, Division 2 zone and auto-dismantling yards, alcohol manufacturing, cotton gins, paper manufacturing, quarries, salt works, petroleum refining, and other similar *uses*.

CHAPTER 8
GENERAL PROVISIONS

Add new text as follows:

SECTION 801
GENERAL

801.1 Scope. General zoning provisions shall comply with this chapter.

Revise as follows:

SECTION ~~801~~ 802
OFF-STREET PARKING

~~801.1~~ 802.1 General. Off-*street* parking shall be provided in compliance with this chapter where any *building* is erected, altered, enlarged, converted or increased in size or capacity.

CHAPTER 9
SPECIAL REGULATIONS

Add new text as follows:

SECTION 901
GENERAL

901.1 Scope. Special zoning regulations shall comply with this chapter.

Revise as follows:

SECTION ~~901~~ 902

HOME OCCUPATIONS

~~901.1~~ 902.1 General. *Home occupations* shall be permitted in all zones, provided that the *home occupation* is clearly and obviously subordinate to the main *use* or *dwelling unit* for residential purposes. *Home occupations* shall be conducted wholly within the primary *structure* on the premises.

CHAPTER 10
SIGN REGULATIONS

SECTION 1001
GENERAL ~~PURPOSE~~

1001.1 ~~Purpose~~ Scope. ~~The purpose of this chapter is to protect the safety and orderly development of the community through the regulation of *signs*~~*Signs* and *sign* structures shall comply with this chapter.

CHAPTER 11
NONCONFORMING STRUCTURES AND USES

SECTION 1101
GENERAL

Add new text as follows:

1101.1 Scope. Nonconforming Structures and uses shall comply with this chapter.

Revise as follows:

~~1101.1~~ 1101.2 Continuance. Except as otherwise required by law, a *structure* or *use* legally established prior to the adoption date of this code be maintained unchanged. In other than criminal proceedings, the owner, occupant or user shall have the burden to show that the *structure*, *lot* or *use* was lawfully established.

CHAPTER 12
CONDITIONAL USES

SECTION 1201
GENERAL

Add new text as follows:

1201.1 Scope. Conditional-use permit requests shall comply with this chapter.

Revise as follows:

~~1201.1~~ 1201.2 Conditional-use permit. A *conditional-use* permit shall be obtained for certain *uses*, which would become harmonious or compatible with neighboring *uses* through the application and maintenance of qualifying conditions and located in specific locations within a zone, but shall not be allowed under the general conditions of the zone as stated in this code.

CHAPTER 13
PLANNED UNIT DEVELOPMENT

SECTION 1301
GENERAL

Add new text as follows:

1301.1 Scope. Planned unit developments (PUDs) shall comply with this chapter.

Revise as follows:

~~**1301.1**~~ **1301.2 Approval.** *Planned unit developments* (PUDs) shall be allowed by planning commission approval in any zoning district. Such *planned unit development* permit shall not be granted unless such development will meet the *use* limitations of the zoning district in which it is located and meet the *density* and other limitations of such districts, except as such requirements may be lawfully modified as provided by this code. Compliance with the regulations of this code in no way excuses the developer from the applicable requirements of a *subdivision* ordinance, except as modifications thereof are specifically authorized in the approval of the application for the *planned unit development*.

Delete without substitution:

~~**1301.2 Intent.** These regulations are to encourage and provide means for effecting desirable and quality development by permitting greater flexibility and design freedom than that permitted under the basic district regulations, and to accomplish a well-balanced, aesthetically satisfying city and economically desirable development of building sites within a PUD. These regulations are established to permit latitude in the development of the building site if such development is found to be in accordance with the purpose, spirit and intent of this ordinance and is found not to be hazardous, harmful, offensive or otherwise adverse to the environment, property values or the character of the neighborhood or the health, safety and welfare of the community. It is intended to permit and encourage diversification, variation and imagination in the relationship of uses, *structures*, *open spaces* and heights of *structures* for developments conceived and implemented as comprehensive and cohesive unified projects. It is further intended to encourage more rational and economic development with relationship to *public services*, and to encourage and facilitate the preservation of open lands.~~

Reason: Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained.

The Scoping Task group proposes that the recommended changes will improve the code by:
1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

This proposal is submitted with the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

G1-25 Part III

G2-25

IBC: SECTION 202 (New), SECTION 202, 306.3, 312.1, C101.1; IFC: [BG] 203.5.2, [BG] 203.11

Proponents: Joe Scibetta, representing Self

2024 International Building Code

Revise as follows:

[BG] AGRICULTURAL BUILDING. A *structure* designed and constructed to house farm implements, hay, grain, ~~poultry, livestock~~ or other horticultural products. This *structure* shall not be a place of human habitation or a place of employment where agricultural products are processed, treated or packaged, nor shall it be a place used by the public.

Add new definition as follows:

<u>**ANIMAL HOUSING FACILITIES.**</u> <u>Area of a building or structure, including interior and exterior adjacent spaces, where animals are fed, rested, worked, exercised, treated, exhibited or used for production.</u>

SECTION 306 FACTORY GROUP F

Revise as follows:

306.3 Low-hazard factory industrial, Group F-2. Factory industrial uses that involve <u>the care of animals or</u> the fabrication or manufacturing of noncombustible materials that during finishing, packing or processing do not involve a significant fire hazard shall be classified as Group F-2 occupancies and shall include, but not be limited to, the following:

<u>Animal housing facilities</u>

Beverages: up to and including 20-percent alcohol content

Brick and *masonry*

Ceramic products

Foundries

Glass products

Gypsum

Ice

Metal products (fabrication and assembly)

SECTION 312 UTILITY AND MISCELLANEOUS GROUP U

312.1 General. *Buildings* and *structures* of an accessory character and miscellaneous *structures* not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings

Aircraft hangars, accessory to a one- or two-family residence (see Section 412.4)

Barns

Carports

Communication equipment *structures* with a *gross floor area* of less than 1,500 square feet (139 m^2)

Fences more than 7 feet (2134 mm) in height

Grain silos, accessory to a residential occupancy

~~Livestock shelters~~

Private garages

Retaining walls

Sheds

~~Stables~~

Tanks

Towers

APPENDIX C
GROUP U—AGRICULTURAL BUILDINGS

SECTION C101
GENERAL

C101.1 Scope. The provisions of this appendix shall apply exclusively to *agricultural buildings*. Such *buildings* shall be classified as Group U and shall include the following uses:

~~1.~~ ~~Livestock shelters or *buildings*, including shade *structures* and milking barns.~~

~~2.~~ ~~Poultry *buildings* or shelters.~~

~~3~~ 1. Barns for storage other than animals.

~~4~~ 2. Storage of equipment and machinery used exclusively in agriculture.

~~5~~ 3. Horticultural *structures*, including detached production *greenhouses* and crop protection shelters.

~~6~~ 4. Sheds.

~~7~~ 5. Grain silos.

~~8.~~ ~~Stables~~.

2024 International Fire Code

Revise as follows:

[BG] AGRICULTURAL BUILDING. A structure designed and constructed to house farm implements, hay, grain~~, poultry, livestock~~ or other horticultural products. This structure shall not be a place of human habitation or a place of employment where agricultural products are processed, treated or packaged, nor shall it be a place used by the public.

Add new definition as follows:

ANIMAL HOUSING FACILITIES. Area of a building or structure, including interior and exterior adjacent spaces, where animals are fed, rested, worked, exercised, treated, exhibited or used for production.

SECTION 203

OCCUPANCY CLASSIFICATION AND USE

Revise as follows:

[BG] 203.5.2 Low-hazard factory industrial, Group F-2. Factory industrial uses that involve the the care of animals or fabrication or manufacturing of noncombustible materials that during finishing, packing or processing does not involve a significant fire hazard shall be classified as Group F-2 occupancies and shall include, but not be limited to, the following:

Animal housing facilities

Beverages: up to and including 20-percent alcohol content

Brick and masonry

Ceramic products

Foundries

Glass products

Gypsum

Ice

Metal products (fabrication and assembly)

[BG] 203.11 Miscellaneous Group U. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings

Aircraft hangar, accessory to a one- or two-family residence (see Section 412.4 of the *International Building Code*)

Barns

Carports

Communication equipment structures with a gross floor area of less than 1,500 square feet (139 m^3)

Fences more than 7 feet (2134 mm) in height

Grain silos, accessory to a residential occupancy

~~Livestock shelters~~

Private garages

Retaining walls

Sheds

~~Stables~~

Tanks

Towers

Reason: This proposal would incorporate new animal housing facilities into the IBC as separate and distinct from agricultural buildings, where farm supplies and implements are stored. A definition has been added accordingly and Appendix C has been edited as the new definition of animal housing facilities would incorporate, in addition to to other types of animals, poultry and livestock. Poultry and livestock facilities would no longer be considered Group U/Agricultural Buildings. Obviously, this proposal would **not** apply to existing animal housing facilities.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

G3-25

IBC: SECTION 202; IEBC: SECTION 202; IFC: SECTION 202; IMC®: SECTION 202; IPC: SECTION 202

2024 International Building Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less-than-24-hour basis to persons who are rendered *incapable of self-preservation by* the services provided or staff has accepted responsibility for care <u>of</u> recipients <u>who are</u> already incapable.

2024 International Existing Building Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less-than-24-hour basis to persons who are rendered *incapable of self-preservation by* the services provided or staff has accepted responsibility for care <u>of</u> recipients <u>who are</u> already incapable.

2024 International Fire Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less-than-24-hour basis to persons who are rendered *incapable of self-preservation by* the services provided or staff has accepted responsibility for care <u>of</u> recipients <u>who are</u> already incapable.

2024 International Mechanical Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less-than-24-hour basis to persons who are rendered *incapable of self-preservation by* the services provided or staff has accepted responsibility for care <u>of</u> recipients <u>who are</u> already incapable.

2024 International Plumbing Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less-than-24-hour basis to persons who are rendered *incapable of self-preservation by* the services provided or staff has accepted responsibility for care <u>of</u> recipients <u>who are</u> already incapable.

Reason: Change is editorial. Words are added for clarity.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal is editorial in nature and has no impact on the cost of construction.

G3-25

G4-25

IBC: SECTION 202; IEBC: SECTION 202; IFC: SECTION 202; IMC®: SECTION 202; IPC: SECTION 202

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Building Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. *Buildings* or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than *24-hour basis* to *persons* who are ~~rendered~~ ~~*incapable of self-preservation*~~ ~~by the services provided or staff has accepted responsibility for care recipients already~~ incapable of self-preservation or are rendered incapable of self-preservation by the services provided.

2024 International Existing Building Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. *Buildings*or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than*24-hour basis*to*persons*who are~~rendered~~~~*incapable of self-preservation*~~~~by the services provided or staff has accepted responsibility for care recipients already~~incapable of self-preservation or are rendered incapable of self-preservation by the services provided.

2024 International Fire Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. *Buildings*or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than*24-hour basis*to*persons*who are~~rendered~~~~*incapable of self-preservation*~~~~by the services provided or staff has accepted responsibility for care recipients already~~incapable of self-preservation or are rendered incapable of self-preservation by the services provided.

2024 International Mechanical Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. *Buildings*or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than*24-hour basis*to*persons*who are~~rendered~~~~*incapable of self-preservation*~~~~by the services provided or staff has accepted responsibility for care recipients already~~incapable of self-preservation or are rendered incapable of self-preservation by the services provided.

2024 International Plumbing Code

Revise as follows:

[BG] AMBULATORY CARE FACILITY. *Buildings*or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than*24-hour basis*to*persons*who are~~rendered~~~~*incapable of self-preservation*~~~~by the services provided or staff has accepted responsibility for care recipients already~~incapable of self-preservation or are rendered incapable of self-preservation by the services provided.

Reason: This term is included in the IBC, IFC, IMC, IPC and IEBC.

This is a clarification of the existing definition. It was brought to our attention that the end of this definition is somewhat confusing and runs on. These are facilities such as outpatient surgery centers. These facilities could render someone incapable of leaving on their own during a procedure. Or someone could come in injured and be coming for care.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial clarification for the definition and has no impact on construction.

G4-25

G5-25 Part I

IBC: SECTION 202

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, representing Self (jcrandell@aresconsulting.biz)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] APPROVED SOURCE. An independent *person*, firm or corporation, *approved* by the *building official*, who is competent and experienced in the relevant subject matter and, where applicable, the application of engineering principles to materials, methods or systems analyses.

Reason: There are now uses of this defined term in the code where the application of engineering principles (or the implication of a licensed design professional) is not required for the subject matter in question. Competent and experienced is always required, but knowledge of engineering principles is not always required. This proposal makes the definition more consistent with the range of uses of this term in the ICC codes and the IECC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the definition with no change in requirements.

G5-25 Part I

G5-25 Part II

IRC: SECTION 202

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, representing Self (jcrandell@aresconsulting.biz)

2024 International Residential Code

Revise as follows:

[RB] APPROVED SOURCE. An independent *person*, firm or corporation, *approved* by the *building official*, who is competent and experienced in the <u>relevant subject matter and, where applicable, the</u> application of engineering principles to materials, methods or systems analyses. For the definition applicable in Chapter 11, see Section N1101.6.

Reason: There are now uses of this defined term in the code where the application of engineering principles (or the implication of a licensed design professional) is not required for the subject matter in question. Competent and experienced is always required, but knowledge of engineering principles is not always required. This proposal makes the definition more consistent with the range of uses of this term in the ICC codes and the IECC. A separate proposal to the IECC-R committee has been submitted with respect to the same definition in Section N1101.6 of the IRC Chapter 11.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the definition and does not change requirements.

G5-25 Part II

G6-25

IBC: SECTION 202, 1805.2.2.1, 2109.2.4.8.9.4, 2510.7, 2512.8.1

Proponents: Shamim Rashid-Sumar, representing National Ready Mixed Concrete Association (ssumar@nrmca.org); James Farny, Portland Cement Association, representing US cement manufacturers (jfarny@cement.org); Dr. Julian Mills-Beale, representing National Ready Mixed Concrete Association (jmills-beale@nrmca.org); Nicholas Lang, representing Concrete Masonry & Hardscapes Association (nlang@masonryandhardscapes.org)

THIS CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] BRICK.

Calcium silicate (sand lime brick). A pressed and subsequently autoclaved unit that consists of sand and lime, with or without the inclusion of other materials.

Clay or shale. A solid or hollow *masonry unit* of *clay or shale*, usually formed into a rectangular *prism*, then burned or fired in a kiln; brick is a ceramic product.

Concrete. A concrete *masonry unit* made from ~~Portland~~ hydraulic cement, water, and suitable aggregates, with or without the inclusion of other materials.

[BS] CAST STONE. A building stone manufactured from ~~Portland~~hydraulic cement concrete precast and used as a *trim*, *veneer* or facing on or in *buildings* or *structures*.

[BS] CEMENT PLASTER. A mixture of hydraulic cement (~~Portland~~ portland,~~or~~ blended, or performance hydraulic cement),~~Portland cement or blended~~ hydraulic cement and hydrated lime, *masonry* cement or plastic cement and aggregate and other *approved* materials as specified in this code.

[BS] CONCRETE.

Carbonate aggregate. Concrete made with aggregates consisting mainly of calcium or magnesium carbonate, such as limestone or dolomite, and containing 40 percent or less quartz, chert or flint.

Cellular. A lightweight insulating concrete made by mixing a preformed foam with ~~Portland~~ hydraulic cement slurry and having a dry unit weight of approximately 30 pcf (480 kg/m^3).

Lightweight aggregate. Concrete made with aggregates of expanded clay, shale, slag or slate or sintered fly ash or any natural lightweight aggregate meeting ASTM C330 and possessing equivalent fire-resistance properties and weighing 85 to 115 pcf (1360 to 1840 kg/m^3).

Perlite. A lightweight insulating concrete having a dry unit weight of approximately 30 pcf (480 kg/m^3) made with *perlite* concrete aggregate. Perlite aggregate is produced from a volcanic rock which, when heated, expands to form a glass-like material of cellular structure.

Sand-lightweight. Concrete made with a combination of expanded clay, shale, slag, slate, sintered fly ash, or any natural lightweight aggregate meeting ASTM C330 and possessing equivalent fire-resistance properties and natural sand. Its unit weight is generally between 105 and 120 pcf (1680 and 1920 kg/m^3).

Siliceous aggregate. Concrete made with normal-weight aggregates consisting mainly of silica or compounds other than calcium or magnesium carbonate, which contains more than 40-percent quartz, chert or flint.

Vermiculite. A light weight insulating concrete made with *vermiculite* concrete aggregate which is laminated micaceous material produced by expanding the ore at high temperatures. When added to a ~~Portland~~ hydraulic cement slurry the resulting concrete has a dry unit weight of approximately 30 pcf (480 kg/m^3).

CHAPTER 18
SOILS AND FOUNDATIONS

1805.2.2.1 Surface preparation of walls. Prior to application of dampproofing materials on concrete walls, holes and recesses resulting from the removal of form ties shall be sealed with a bituminous material or other *approved* methods or materials. Unit *masonry* walls shall be parged on the exterior surface below ground level with not less than $^3/_8$ inch (9.5 mm) of ~~Portland~~ hydraulic (portland, blended, or performance hydraulic) cement *mortar*. The parging shall be coved at the footing.

Exception: Parging of unit *masonry* walls is not required where a material is *approved* for direct application to the *masonry*.

CHAPTER 21 MASONRY

2109.2.4.8.9.4 Prohibited finish coat. Plaster containing ~~Portland~~ hydraulic cement shall not be permitted as a finish over clay plaster.

CHAPTER 25 GYPSUM PANEL PRODUCTS AND PLASTER

2510.7 Preparation of masonry and concrete. Surfaces shall be clean, free from efflorescence, sufficiently damp and rough for proper bond. If the surface is insufficiently rough, *approved* bonding agents or a ~~Portland~~ cement dash bond coat mixed in proportions of not more than two parts volume of sand to one part volume of ~~Portland~~ cement or plastic cement shall be applied. The dash bond coat shall be left undisturbed and shall be moist cured not less than 24 hours.

2512.8.1 Admixtures. Where using this method of application, calcium aluminate cement up to 15 percent of the weight of the ~~Portland~~ cement is permitted to be added to the mix.

Reason: This proposal is part of a series of proposals to the IBC and IRC to update cement terminology in the building codes.

The brick definition change aligns the definition for concrete brick in the IBC with the that currently within ASTM standards. The definition for concrete brick refers to the definition for 'concrete masonry unit', which in turn uses the following language "manufactured masonry unit made of concrete in which the binder is a combination of water and cementitious materials." The change better aligns IBC and ASTM definitions.

The proposed cement related revisions reflect current cement technology and market conditions, which can vary across regions. Nationally, the market is no longer dominated by portland cement. More than sixty percent of the current cement market consists of blended cements, including portland-limestone cement (PLC) and other blended cements that meet the requirements of ASTM C595/C595M, Specification for Blended Hydraulic Cements (Portland Cement Association, 2025). ASTM C595/C595M is referenced in the International Building Code/ International Residential Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed revision to the definition is editorial and will not impact the cost of construction. See reason statement.

Proponents: Jack Butler, Butler & Butler, LLC, representing American Institute of Building Design (abutler@mpzero.com); Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

THIS IS A 2 PART CODE CHANGE.

PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE.

PART II WILL BE HEARD BY THE RESIDENTIAL BUILDING CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new definition as follows:

BUILDING DESIGNER. A person engaged by the *owner* or the *owner*'s authorized agent to prepare construction documents. Where required by law, the *building designer* shall be a *registered design professional*.

Delete without substitution:

~~**DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE, REGISTERED.** See "Registered design professional in responsible charge."~~

Revise as follows:

[A] REGISTERED DESIGN PROFESSIONAL. ~~An individual~~ A *building designer* who is registered or licensed to practice their respective design profession as defined by the statutory requirements of the professional registration laws of the state or *jurisdiction* in which the project is to be constructed.
[A] ~~REGISTERED DESIGN PROFESSIONAL~~ BUILDING DESIGNER IN RESPONSIBLE CHARGE. A ~~*registered design professional*~~ *building designer* engaged by the *owner* or the *owner*'s authorized agent to review and coordinate certain aspects of the project, as determined by the *building official*, for compatibility with the design of the building or *structure*, including submittal documents prepared by others, *deferred submittal* documents and phased submittal documents.

SECTION 107
CONSTRUCTION DOCUMENTS

[A] 107.3.4 ~~Design professional~~ Building designer in responsible charge. ~~Where it is required that documents be prepared by a *registered design professional*, the~~ The *building official* shall be authorized to require the *owner* or the *owner*'s authorized agent to engage and designate on the *building permit* application a *building designer* ~~*registered design professional*~~ who shall act as the ~~*registered design professional*~~ *building designer in responsible charge*. If the circumstances require, the *owner* or the *owner*'s authorized agent shall designate a substitute ~~*registered design professional*~~ *building designer in responsible charge* who shall perform the duties required of the original ~~*registered design professional*~~ *building designer in responsible charge*. The *building official* shall be notified in writing by the *owner* or the *owner*'s authorized agent if the ~~*registered design professional*~~ *building designer in responsible charge* is changed or is unable to continue to perform the duties.The ~~*registered design professional*~~ *building designer in responsible charge* shall be responsible for reviewing and coordinating submittal documents prepared by others, including phased and *deferred submittal* items, for compatibility with the design of the building. Where the laws of the jurisdiction require all construction documents to be prepared by a *registered design professional*, the *building designer in responsible charge* shall be a *registered design professional*.

[A] 107.3.4.1 Deferred submittals. Deferral of any submittal items shall have the prior approval of the *building official*. The ~~*registered design professional*~~ *building designer in responsible charge* shall list the *deferred submittals* on the *construction documents* for review by the *building official*.

Documents for *deferred submittal* items shall be submitted to the

~~*registered design professional*~~ building designer *in responsible charge* who shall review them and forward them to the *building official* with a notation indicating that the *deferred submittal* documents have been reviewed and found to be in general conformance to the design of the building. The *deferred submittal* items shall not be installed until the *deferred submittal* documents have been *approved* by the *building official*.

CHAPTER 17
SPECIAL INSPECTIONS AND TESTS

SECTION 1703
APPROVALS

1703.1.1 Independence. An *approved agency* shall be objective, competent and independent from the contractor responsible for the work being inspected. The agency shall disclose to the *building official* and the ~~*registered design professional*~~ building designer *in responsible charge* possible conflicts of interest so that objectivity can be confirmed.

SECTION 1704
SPECIAL INSPECTIONS AND TESTS, CONTRACTOR RESPONSIBILITY AND STRUCTURAL OBSERVATION

1704.2.1 Special inspector qualifications. Prior to the start of the construction, the *approved agencies* shall provide written documentation to the *building official* demonstrating the competence and relevant experience or training of the *special inspectors* who will perform the *special inspections* and tests during construction. Experience or training shall be considered to be relevant where the documented experience or training is related in complexity to the same type of *special inspection* or testing activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

The ~~*registered design professional*~~ building designer *in responsible charge* and engineers of record involved in the design of the project are permitted to act as an *approved agency* and their personnel are permitted to act as *special inspectors* for the work designed by them, provided they qualify as *special inspectors*.

1704.2.4 Report requirement. *Approved agencies* shall keep records of *special inspections* and tests. The *approved agency* shall submit reports of *special inspections* and tests to the *building official* and to the ~~*registered design professional*~~ building designer *in responsible charge* at frequencies required by the approved *construction documents* or *building official* . All reports shall describe the nature and extent of inspections and tests, the location where the inspections and tests were performed, and indicate that work inspected or tested was or was not completed in conformance to *approved construction documents*. Discrepancies shall be brought to the immediate attention of the contractor for correction. If they are not corrected, the discrepancies shall be brought to the attention of the *building official* and to the ~~*registered design professional*~~ building designer *in responsible charge* prior to the completion of that phase of the work. A final report documenting required *special inspections* and tests, and correction of any discrepancies noted in the inspections or tests, shall be submitted at a point in time agreed upon prior to the start of work by the *owner* or the *owner 's* authorized agent to the *building official*.

1704.3 Statement of special inspections. Where *special inspections* or tests are required by Section 1705, ~~the~~ a *registered design professional* ~~*in responsible charge*~~ shall prepare a statement of *special inspections* in accordance with Section 1704.3.1 for submittal by the applicant in accordance with Section 1704.2.3.

> **Exception:** The statement of *special inspections* is permitted to be prepared by a qualified *person approved* by the *building official* for construction not designed by a *registered design professional*.

SECTION 1705
REQUIRED SPECIAL INSPECTIONS AND TESTS

1705.7 Driven deep foundations. *Special inspections* and tests shall be performed during installation of driven *deep foundation* elements as specified in Table 1705.7. The *approved* geotechnical report and the *construction documents* prepared by the *registered design professionals* shall be used to determine compliance.

TABLE 1705.7 REQUIRED SPECIAL INSPECTIONS AND TESTS OF DRIVEN DEEP FOUNDATION ELEMENTS

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION
1. Verify element materials, sizes and lengths comply with the requirements.	X	—
2. Determine capacities of test elements and conduct additional load tests, as required.	X	—
3. Inspect driving operations and maintain complete and accurate records for each element.	X	—
4. Verify placement locations and plumbness, confirm type and size of hammer, record number of blows per foot of penetration, determine required penetrations to achieve design capacity, record tip and butt elevations and document any damage to foundation element.	X	—
5. For steel elements, perform additional special inspections in accordance with Section 1705.2.	In accordance with Section 1705.2	
6. For concrete elements and concrete-filled elements, perform tests and additional special inspections in accordance with Section 1705.3.	In accordance with Section 1705.3	
7.For specialty elements, perform additional inspections as determined by the ~~registered design professionalin responsible charge~~ engineer of record.	In accordance with Statement of Special Inspections	

1705.9 Helical pile foundations. *Continuous special inspections* shall be performed during installation of *helical pile* foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque and other pertinent installation data as required by the ~~*registered design professional in responsible charge*~~ engineer of record for the foundation design. The *approved* geotechnical report and the *construction documents* prepared by the *registered design professional* shall be used to determine compliance.

2024 International Existing Building Code

Add new definition as follows:

BUILDING DESIGNER. A person engaged by the *owner* or the *owner*'s authorized agent to prepare construction documents. Where required by law, the *building designer* shall be a *registered design professional*.

Revise as follows:

[A] ~~REGISTERED DESIGN PROFESSIONAL~~ BUILDING DESIGNER IN RESPONSIBLE CHARGE. A ~~registered design professional~~ *building designer* engaged by the owner or the owner's authorized agent to review and coordinate certain aspects of the project, as determined by the *code official*, for compatibility with the design of the building or structure, including submittal documents prepared by others, *deferred submittal* documents and phased submittal documents.

SECTION 106
CONSTRUCTION DOCUMENTS

[A] 106.3.4 Deferred submittals. Deferral of any submittal items shall have the prior approval of the *code official*. The~~*registered design professional*~~ *building designer in responsible charge* shall list the *deferred submittals* on the construction documents for review by the *code official*.

Submittal documents for *deferred submittal* items shall be submitted to the ~~*registered design professional*~~ *building designer in responsible charge* who shall review them and forward them to the *code official* with a notation indicating that the *deferred submittal* documents have been reviewed and that they have been found to be in general conformance to the design of the building. The *deferred submittal* items shall not be installed until their *deferred submittal* documents have been *approved* by the *code official*.

[A] 106.6 ~~Design professional~~ Building designer in responsible charge. ~~Where it is required that documents be prepared by a registered design professional, the~~ The *code official* shall be authorized to require the owner or the owner's authorized agent to engage and designate on the building permit application a ~~registered design professional~~ building designer who shall act as the ~~*registered design professional*~~ *building designer in responsible charge*. Where the laws of the jurisdiction require all construction documents to be prepared by a *registered design professional*, the *building designer in responsible charge* shall be a *registered design professional*. If the circumstances require, the owner or the owner's authorized agent shall designate a substitute ~~*registered design professional*~~ *building designer in responsible charge* who shall perform the duties required of the original ~~*registered design professional*~~ *building* *designer in responsible charge*. The *code official* shall be notified in writing by the owner or the owner's authorized agent if the ~~*registered design professional*~~ *building designer in responsible charge* is changed or is unable to continue to perform the duties. The ~~*registered design professional*~~ *building designer in responsible charge* shall be responsible for reviewing and coordinating submittal documents prepared by others, including phased and *deferred submittal* items, for compatibility with the design of the building. Where structural observation is required, the inspection program shall name the individual or firms who are to perform structural observation and describe the stages of construction at which structural observation is to occur.

Reason: The new definitions proposed for Building Designer and Building Designer in Responsible Charge are intended to address multiple problems. First, the code and its many referenced standards presently do not have a uniform term to reference the person who prepares construction documents. The proposed term of 'Building Designer' is used in ANSI/TPI 1, so it already has some recognition in the industry. Second, most states allow unregistered persons to prepare construction documents for residential and small commercial construction. Many of these states extend the ability to property owners. Using the term 'Design Professional' as the generic version of Registered Design Professional adds an implied level of qualification that may not be appropriate in all cases; Building Designer is a more neutral term that is applicable in all cases. Extending the term to modify the existing defined term of Registered Design Professional in Responsible Charge allows the code to accommodate variations between jurisdictions and preserves consistency between the code and referenced standards.The revised definition of Registered Design Professional is offered to maintain consistency with the proposed new definitions while allowing the term to remain unaffected throughout its many uses within the code. By providing a broader defined term of Building Designer in Responsible Charge, the definition for Registered Design Professional in Responsible Charge is redundant. A related modification to edit IBC section 107.3.4 to utilize the proposed replacement term has been separately submitted by the proponent. Collectively, the proposed modifications will allow the code to be consistent with referenced standards and better recognize the varying jurisdictional requirements imposed on persons who prepare construction documents.

107.3 - The original title of the subsection appropriately omits the qualifier "registered"; so, too, should the text. State professional practice laws control who is authorized to produce construction documents and coordinate their delivery to the building official for review as part of the application and construction process. Persons other than registered design professionals are permitted to provide construction documents and oversee construction of residential and small commercial projects in almost all states. Requiring only registered design professionals to fulfill the responsible charge role is contrary to public policy is those states, particularly where the IBC chapter 1 is applied to residential construction. For example, it is common for a non-registered building designer or the property owner to prepare the basic construction documents for residential construction. State laws may require that components of these documents, such as foundations or roof trusses, be prepared by a licensed engineer hired by the building designer. In such cases, the non-registered design professional is the appropriate choice to be in responsible charge of the overall design effort, as the registered design professional would be generally unfamiliar with the overall project. In addition, the scope of their practice might not allow them to oversee other elements of the proposed construction. Requiring the owner to hire a third-party person to act as the owner's agent just to meet the code requirement adds a potential source of confusion rather than offering a means of reducing it. The revised language preserves the requirement for a registered design professional to serve in the role of responsible charge when justified by the laws of the jurisdiction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change clarifies the original intent of the terms for which new and revised definitions are offered. Two new definitions provide more generic terms that provide consistency with state regulation of design professions (and their exemptions), as well as being more in line with referenced standards, such as ANSI/TPI 1. Two related definitions are no longer needed and are proposed for removal. Two other new definitions proposed in the modification reinforce the existing intent of the code relative to special conditions. The revised definitions seek to establish consistency with relevant state professional regulation laws and the proposed substitution of building designer for design professional as a reflection of the other proposed code modifications. The value of the added and revised definitions is not dependent on the adoption of the related proposed modifications from the same proponent.

G7-25 Part I

G7-25 Part II

IRC: SECTION 202 (New), SECTION 202

Proponents: Jack Butler, Butler & Butler, LLC, representing American Institute of Building Design (abutler@mpzero.com); Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

2024 International Residential Code

Add new definition as follows:

BUILDING DESIGNER. A person engaged by the *owner* or the *owner*'s authorized agent to prepare *construction documents.* Where required by law, the building designer shall be a *registered design professional*.

Delete without substitution:

~~**[RB] DESIGN PROFESSIONAL.** See " *Registered design professional* ."~~

Revise as follows:

[RB] REGISTERED DESIGN PROFESSIONAL. ~~An individual~~ A *building designer* who is registered or licensed to practice their respective design profession, as defined by the statutory requirements of the professional registration laws of the state or *jurisdiction* in which the project is to be constructed.

Reason: The new definition proposed for Building Designer is intended to address multiple problems. First, the code and its many referenced standards presently do not have a uniform term to reference the person who prepares construction documents. The proposed term of 'Building Designer' is used in ANSI/TPI 1 and IRC section R502.12.4, so it already has some recognition in the industry. Second, most states allow unregistered persons to prepare construction documents for residential construction. Many of these states extend the ability to property owners. Using the term 'Design Professional' as the generic version of Registered Design Professional adds an implied level of qualification that may not be appropriate in all cases; Building Designer is a more neutral term and does not imply any specific qualifications. The revised definition of Registered Design Professional is offered to maintain consistency with the proposed new definition for Building Designer while allowing the term to remain unaffected throughout its many uses within the code. Collectively, the proposed modifications will allow the code to be consistent with referenced standards and better recognize the varying jurisdictional requirements imposed on persons who prepare construction documents.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes clarify the original intent of the code. The revised definitions seek to establish consistency with relevant state professional regulation laws. The value of the added and revised definitions is not dependent on the adoption of the related proposals.

G7-25 Part II

G8-25

IBC: SECTION 202, 1103.2.13, 1105.1.5, [P] TABLE 2902.1, E106.4.8; IPC: TABLE 403.1

Proponents: Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov)

2024 International Building Code

Revise as follows:

[BG] CELL (Group I-3 occupancy). A room within a *housing unit* in a detention or correctional *facility* used to confine incarcerated individuals. ~~inmates or prisoners.~~

CHAPTER 11 ACCESSIBILITY

1103.2.13 Detention and correctional facilities. In detention and correctional *facilities*, *common use* areas that are used only by ~~inmates~~ incarcerated individuals or detainees and security personnel, and that do not serve holding *cells* or housing *cells* required to be *Accessible units*, are not required to comply with this chapter.

1105.1.5 Entrances for ~~inmates~~ incarcerated individuals or detainees. Where entrances used only by ~~inmates~~ incarcerated individuals or detainees and security personnel are provided at judicial *facilities*, detention *facilities* or correctional *facilities*, at least one such entrance shall be accessible.

CHAPTER 29 PLUMBING SYSTEMS

[P] TABLE 2902.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 2902.1.1 and 2902.2)
Portions of table not shown remain unchanged.

a. The fixtures shown are based on one fixture being the minimum required for the number of *persons* indicated or any fraction of the number of *persons* indicated. The number of occupants shall be determined by this code.

b. Toilet *facilities* for employees shall be separate from *facilities* for ~~inmates~~ incarcerated individuals or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient *sleeping units* shall be permitted, provided that each patient sleeping unit has direct access to the toilet room and provisions for privacy for the toilet room user are provided.

d. The *occupant load* for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of *facilities* required.

e. For business and mercantile classifications with an *occupant load* of 15 or fewer, a service sink shall not be required.

f. The required number and type of plumbing fixtures for indoor and outdoor swimming pools shall be in accordance with Section 609 of the *International Swimming Pool and Spa Code*.

[BE] APPENDIX E SUPPLEMENTARY ACCESSIBILITY REQUIREMENTS

E106.4.8 Detention and correctional facilities. In detention and correctional *facilities*, where a public pay telephone is provided in a secured area used only by detainees or ~~inmates~~ incarcerated individuals and security personnel, then not fewer than one TTY shall be provided in not fewer than one secured area.

2024 International Plumbing Code

CHAPTER 4
FIXTURES, FAUCETS AND FIXTURE FITTINGS

Revise as follows:

TABLE 403.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)
Portions of table not shown remain unchanged.

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for ~~inmates~~ incarcerated individuals or care recipients.

c. A single-user toilet facility with one water closet and one lavatory serving not more than two adjacent care recipient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile classifications with an occupant load of 15 or fewer, service sinks shall not be required.

f. The required number and type of plumbing fixtures for indoor and outdoor public swimming pools shall be in accordance with Section 609 of the *International Swimming Pool and Spa Code*.

Reason: Criminal justice advocates have long called for utilizing "humanizing language" in regards to incarcerated or detained individuals. The change from "inmates" to "incarcerated individuals" provides such individuals with a measure of humanity that can otherwise be ignored. Terms like "inmate" or "detainee" reduce the person to the crime for which they have been charged, without consideration for the person as a whole human being. This also helps remove the stigmatization and ostracization of individuals who have not committed crimes, but have been detailed wrongfully and/or awaiting trial.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal has no cost impact, as it is only updating terms in the IBC to utilize humanizing language, and not changing any requirements.

G8-25

G9-25

IBC: SECTION 202

Proponents: Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, representing NYSDOS (kevin.duerr-clark@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov); Stephen Van Hoose, representing NYS DOS (stephen.vanhoose@dos.ny.gov); Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov)

THIS CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] DESIGN FLOOD. The *flood* associated with the greater flood elevation of the following two areas:

1. Area with a flood plain subject to a 1-percent or greater chance of *flooding* in any year.
2. Area designated as a *flood hazard area* on a community's flood hazard map, or otherwise legally designated.

Reason: As the definition is currently written, the word "greater" appears to apply to the size of the areas specified in items 1 and 2. This proposal clarifies that "greater" is associated with the flood elevation specified by said areas, rather than the size of the areas themselves.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the intent of the definition and is purely editorial.

Staff Analysis: CC # G9-25 and CC # S97-25 Part I addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

G9-25

G10-25

IBC: SECTION 202 (New)

Proponents: Donald Monahan, Parking-Xpert.com, LLC, representing National Parking Association (don.monahan@comcast.net); mary smith, Walker consultants, representing National Parking Association (msmith@walkerconsultants.com)

2024 International Building Code

Add new definition as follows:

ELECTRIC VEHICLE (EV) CHARGER. A device with one or more charging ports and connectors for charging electric vehicles. The device may include a subscription user ID, payment provisions, and network/data communications.

Reason: This definition is the one currently proposed on 9/3/2024 by the ATBCB with the second sentence proposed by the National Parking Association/Parking Consultant's Council for clarification.

Bibliography: Document Number ATBCB 2024-0001, Federal Register 9/3/2024, Section 106.5 Definitions

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding EV charging terminology does not impact cost.

G10-25

G11-25

IBC: SECTION 202 (New)

Proponents: Donald Monahan, Parking-Xpert.com, LLC, representing National Parking Association (don.monahan@comcast.net); mary smith, Walker consultants, representing National Parking Association (msmith@walkerconsultants.com)

2024 International Building Code

Add new definition as follows:

ELECTRIC VEHICLE (EV) CHARGING SPACE. A space to park an electric vehicle while charging. Such space is a marked or an unmarked area next to an EV charger.

Reason: The National Parking Association recommends harmonizing the definitions in IBC, IgCC, and A117.1 to the same terms as the U.S. Access Board definition.

Bibliography: ADA and ABA Accessibility Guidelines, EV Charging Stations, ATBCB 36 CFR Part 1191 Docket Number ATBCB 2024-0001, Federal Register 9 3 2024 Section 106.5 Definitions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding terminology does not have a cost impact.

G11-25

G12-25

IBC: SECTION 202

Proponents: Donald Monahan, Parking-Xpert.com, LLC, representing National Parking Association (don.monahan@comcast.net); mary smith, Walker consultants, representing National Parking Association (msmith@walkerconsultants.com)

2024 International Building Code

Revise as follows:

[BG] ELECTRIC VEHICLE (EV) CHARGING STATION. ~~One or more vehicle spaces served by an electric vehicle charging system.~~The designated area surrounding EV chargers, including the chargers, supporting equipment, adjacent EV charging spaces, and access lanes for vehicle entry and exit.

Reason: The term 'Station' is used inconsistently across IBC, IgCC, and A117.1 and differs from the definition provided by the Access Board. It is advisable to adopt the Access Board's terminology and definition of 'EV Station,' which aligns with that of a gas station, and to use 'EV Charger' to refer to the device.

Bibliography: ADA and ABA Accessibility Guidelines EV Charging Stations, ATBCB 36 CFR Part 1191 Docket number ATBCB 2024-0001, Federal Register 93 2024 Section 106.5 Definitions

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifying the difference between the EV charging device itself and all the collateral equipment required to deliver electricity to the EV charger and the vehicle.

G12-25

G13-25

IBC: SECTION 202 (New)

Proponents: Donald Monahan, Parking-Xpert.com, LLC, representing National Parking Association (don.monahan@comcast.net); mary smith, Walker consultants, representing National Parking Association (msmith@walkerconsultants.com)

2024 International Building Code

Add new definition as follows:

ELECTRIC VEHICLE SUPPLY EQUIPMENT (EVSE). Equipment for the plug-in power transfer, including the ungrounded, grounded, and equipment grounding conductors, electric vehicle connectors, attachment plugs, personal protection system, and all other fittings, devices, power outlets, or apparatus installed specifically for the purpose of transferring energy between the premises wiring and the electric vehicle.

Reason: The National Parking Association recommends harmonizing the definitions in IBC, IgCC, and A117.1 to the same terms as the U.S. Access Board definition.

Bibliography: ADA and ABA Accessibility Guidelines, EV Charging Stations, ATBCB 36 CFR Part 1191 Docket Number ATBCB 2024-0001, Federal Register 9 3 2024 Section 106.5 Definitions

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifying the difference between the EV charging device itself and the collateral equipment required to deliver electricity to the EV charger and the vehicle has no cost impact.

G13-25

G14-25 Part I

IBC: SECTION 202; IEBC: SECTION 202

Proponents: Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, representing NYSDOS (kevin.duerr-clark@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); Stephen Van Hoose, representing NYS DOS (stephen.vanhoose@dos.ny.gov); Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Christopher Jensen, representing NYS DOS - Division of Building Standards and Codes (christopher.jensen@dos.ny.gov); Brian Tollisen, representing NYS Department of State, Division of Building Standards and Codes (brian.tollisen@dos.ny.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE ADMINISTRIVE CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] EXISTING BUILDING. A *building* ~~erected prior to the date of adoption of the appropriate code, or one for which a legal building *permit* has been~~ that is legally occupied or for which a certificate of occupancy authorizing its uses has been issued, without regard to the date on which such legal occupancy began or the date on which such certificate of occupancy was issued.
[A] EXISTING STRUCTURE. A *structure* ~~erected prior to the date of adoption of the appropriate code, or one for which a legal building *permit* has been~~ that is legally occupied or for which a certificate of occupancy authorizing its uses has been issued, without regard to the date on which such legal occupancy began or the date on which such certificate of occupancy was issued.

2024 International Existing Building Code

Revise as follows:

[A] EXISTING BUILDING. A building ~~erected prior to the date of adoption of the appropriate code, or one for which a legal building permit has been~~that is legally occupied or for which a certificate of occupancy authorizing its uses has been issued, without regard to the date on which such legal occupancy began or the date on which such certificate of occupancy was issued.
[A] EXISTING STRUCTURE. A structure ~~erected prior to the date of adoption of the appropriate code, or one for which a legal building permit has been~~that is legally occupied or for which a certificate of occupancy authorizing its uses has been issued, without regard to the date on which such legal occupancy began or the date on which such certificate of occupancy was issued.

G14-25 Part I

G14-25 Part II

IRC: SECTION 202

Proponents: Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, representing NYSDOS (kevin.duerr-clark@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); Stephen Van Hoose, representing NYS DOS (stephen.vanhoose@dos.ny.gov); Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Christopher Jensen, representing NYS DOS - Division of Building Standards and Codes (christopher.jensen@dos.ny.gov); Brian Tollisen, representing NYS Department of State, Division of Building Standards and Codes (brian.tollisen@dos.ny.gov)

2024 International Residential Code

Revise as follows:

[RB] EXISTING BUILDING. ~~*Existing building* is a~~ A building ~~erected prior to the adoption of this code, or one for which a legal *building permit* has been~~ that is legally occupied or for which a certificate of occupancy authorizing its uses has been issued, without regard to the date on which such legal occupancy began or the date on which such certificate of occupancy was issued.

Reason: This proposal will clarify when a building should be classified as an existing building and subject to the requirements for existing buildings. The current definition of existing building classifies any building that was erected prior to the adoption of the current code or has a legal building permit as an existing building. So, under the current definition a building that was illegally built (no permits) prior to the adoption of the current code would be considered an existing building and only subject to the requirements for existing buildings. Also, under the current definition any building with a legal building permit is an existing building, so as soon as a permit is issued for a building it can now be classified as existing.

The same modifications to the definition for existing building are being proposed for the residential provisions of the IECC and there is a proposal to add this definition back into the commercial provisions, as the exisiting building definition was removed in the 2024 IECC update.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial (see reason statement).

G14-25 Part II

G15-25

IBC: SECTION 202 (New), SECTION 1412

Proponents: Matthew Dobson, representing Polymeric Exterior Products Association (mdobson@vinylsiding.org)

2024 International Building Code

Add new definition as follows:

EXTERIOR SOFFIT. A material or assembly of materials applied on the underside of exterior overhangs, attached carports, ceilings of raised buildings that create a full story, and porch ceilings.

Revise as follows:

SECTION 1412 EXTERIOR SOFFITS AND FASCIAS AT ROOF OVERHANGS

Reason: This change helps to create stronger understanding of how exterior soffit is regulated by the code. The definition is similar to the IRC, and the minor edit simply identifies that this applied to exterior soffits.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change adds no additional requirements.

G15-25

G16-25

IBC: SECTION 202 (New)

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

Add new definition as follows:

[F] FIRE CODE OFFICIAL. The fire chief or other designated authority charged with the administration and enforcement of the *International Fire Code*, or a duly authorized representative.

Reason: The term “Fire Code Official” is used in dozens of locations in the 2024 IBC. However, this term is not formally defined in the 2024 IBC.

The proposed definition of “Fire Code Official” was taken verbatim from Section 202 of the 2024 *International Fire Code*, except that the phrase “the code” was replaced with the phrase “the *International Fire Code*”. This clarification is required since the phrase “the code” would otherwise signify the building code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal adds a necessary definition and has no impact to the cost of construction.

G16-25

G17-25 Part I

IBC: SECTION 202, 308.3; IFC: SECTION 202, [BG] 203.7.2

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IPMC/IZC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[BG] HOSPITAL ~~HOSPITALS AND PSYCHIATRIC HOSPITALS~~. ~~*Facilities* that provide care or treatment for the~~ Buildings or portions thereof used to provide medical, psychiatric, obstetrical, or surgical or similar care on a *24-hour basis* to persons who are ~~treatment of care recipients who are~~ *incapable of self-preservation* or are rendered *incapable of self-preservation* by the services provided.

Delete without substitution:

~~**PSYCHIATRIC HOSPITALS.** See "Hospitals and psychiatric hospitals."~~

Revise as follows:

308.3 Institutional Group I-2. Institutional Group I-2 occupancy shall include *buildings* and *structures* used for *medical care* on a *24-hour basis* for more than five *persons* who are *incapable of self-preservation*. This group shall include, but not be limited to, the following:

Foster care facilities

Detoxification facilities

Hospitals

Nursing homes

~~*Psychiatric hospitals*~~

2024 International Fire Code

Revise as follows:

[BG] HOSPITAL~~HOSPITALS AND PSYCHIATRIC HOSPITALS~~. ~~*Facilities*that provide care or treatment for the~~Buildings or portions thereof used to provide medical, psychiatric, obstetrical, or surgical or similar care on a *24-hour basis* to persons who are ~~treatment of care recipients who are~~*incapable of self-preservation*or are rendered *incapable of self-preservation* by the services provided.

Delete without substitution:

~~**[B] PSYCHIATRIC HOSPITALS.** See "*Hospitals and psychiatric hospitals*."~~

Revise as follows:

[BG] 203.7.2 Institutional Group I-2. Institutional Group I-2 occupancy shall include buildings and structures used for medical care on a 24-hour basis for more than five persons who are incapable of self-preservation. This group shall include, but not be limited to, the following:

Foster care facilities

Detoxification facilities

Hospitals

Nursing homes

~~Psychiatric hospitals~~

G17-25 Part I

G17-25 Part II

IZC: SECTION 202

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Zoning Code

Revise as follows:

HOSPITAL. ~~An institution designed for the diagnosis, treatment and care of human illness or infirmity and providing health services, primarily for inpatients, and including as related facilities, laboratories, outpatient departments, training facilities and staff offices.~~ Buildings or portions thereof used to provide medical, psychiatric, obstetrical, or surgicalor similar care on a 24-hour basis to persons who are incapable of self-preservation or are rendered incapable of self-preservation by the services provided.

Reason: The term 'psychiatric hospital' is only used in Section 308.3. 'Psychiatric' is in the definition for a type of hospital treatment, so the definition and specific term are not needed. It is already addressed in the definition of 'hospital'. Psychiatric treatment areas are addressed in Section 407.2.3; which can be all or part of a hospital. There is a correllative change from this committee to improve the language in the definition of 'ambulatory care facilities'.

This are also aligning better with the federal definitions for hospitals. This better answers the questions where not all patients are incapable or self-preservation.

Existing related definitions are:

[BG] 24-HOUR BASIS. The actual time that a person is an occupant within a facility for the purpose of receiving care. It shall not include a facility that is open for 24 hours and is capable of providing care to someone visiting the facility during any segment of the 24 hours.

[BG] AMBULATORY CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than 24-hour basis to persons who are rendered incapable of self-preservation by the services provided or staff has accepted responsibility for care recipients already incapable.

[BG] DETOXIFICATION FACILITIES. Facilities that provide treatment for substance abuse, serving care recipients who are incapable of self-preservation or who are harmful to themselves or others.

[BG] FOSTER CARE FACILITIES. Facilities that provide care to more than five children, 21/2 years of age or less.

[BG]MEDICAL CARE. Care involving medical or surgical procedures, nursing or for psychiatric purposes.

[BG] NURSING HOMES. Facilities that provide care, including both intermediate care facilities and skilled nursing facilities where any of the persons are incapable of self-preservation.

International Zoning Code -

ICC staff identified that 'Hospital' is defined in the IZC. For consistency, the defintions should be the same across codes. It is hoped that this can be scoped to General by the CCC. The defintion is only used in the IZC defintions to say a hosptial is not a 'group care facility' or a 'congregate residence'; and as an example of a health and medical institution in CZone Division 3. The defintions should be consistent across codes to avoid possible confusion.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of the definition with no change to construction requirements.

G17-25 Part II

G18-25

IBC: SECTION 202 (New)

Proponents: Jeff Bowlsby, representing Self (jabowlsby@gmail.com)

2024 International Building Code

Add new definition as follows:

OTHERWISE SPECIFIED. Where stated without context, term shall mean either of the following: 1. As alternatively specified within this subject code or referenced code or referenced standard. 2. As alternatively specified in mandatory language by the *registered design professional in responsible charge* where an alternative material, design, method of construction and equipment in accordance with Section 104.11 is *approved.*

Reason: This proposed code change includes a new definition for this currently undefined term "otherwise specified" where required context is not stated, to specify the required context in mandatory language, eliminating the terms's vagueness and ambiguity, and to support uniform code interpretation, application, compliance and enforcement. This proposed code change resolves these conflicts and conundrums.

Where used in the primary code documents (e.g. the IBC, referenced codes and referenced standards):

Use of this undefined term "otherwise specified" without required context does not establish minimum code requirements as set forth by IBC **101.3 Purpose.**

No context is given for the undefined term "otherwise specified." This undefined term is sometimes used without required context to provide mandatory language; therefore, the term does not comply with IBC **201.4 Terms not defined** and yet is codified. This undefined term is vague and ambiguous, and creates significant difficulties for code interpretation, application, compliance and enforcement.

> Example: 2021 IBC "**1408.9 Surface-burning characteristics.** Unless otherwise specified, HPL shall have a *flame spread index* of 75 or less and a *smoke-developed index* of 450 or less when tested in the minimum and maximum thicknesses intended for use in accordance with ASTM E84 or UL 723." A literal reading of this code section can cause a misinterpretation of this undefined term "otherwise specified" in that an implied 'specifier' entity has an implied, unrestricted authority and discretion to "otherwise specify" alternative specifications such as an HPL with a greater flame spread index and smoke-developed index than the limits specified in 1408.9 allow. Surely this is not the intent of the code.

Items "otherwise specified" may imply that a 'specifier' entity has unrestricted authority and discretion to create alternative specifications which may vary from the minimum requirements of the code because there is no stated condition of approval where this term is used.

> Example: ASTM F1667"10.1.4Mechanically deposited zinc coatings applied to fasteners after forming shall have a thickness in accordance with Specification B695, Class 40, unless otherwise specified." No condition of approval for this alternative specification is stated such as the review and approval requirements for alternatives in IBC **104.11 Alternative materials, design and methods of construction and equipment**. Surely this is not the intent of this referenced standard.

-

This undefined term "otherwise specified" provides no helpful references to establish context.

For undefined terms, the 2021 IBC Commentarydirects the code user to rely on a dictionary definition, referenced standards, and the vague term 'published textbooks' to establish the context for defining this term. This undefined term "otherwise specified" is vague and ambiguous, and no definition or context establishing minimum codified requirements for this term can be gleaned from any of these documents.

This undefined term "otherwise specified" does not satisfy the requirement of mandatory language for use of defined terms in ICC

CP#28-05 for referenced standards. As applies to referenced standards, CP#28-05 – Code Development. 4.6.2.1 requires that "A standard or portions of a standard intended to be enforced shall be written in mandatory language" and 4.6.2.3 requires that "All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition." Where this undefined term "otherwise specified" is used in referenced standards without additional required context written in mandatory language, its use conflicts with and does not satisfy either of these CP#28-05 requirements.

The term "specified" implies a "specifier," whose characteristics are undefined.

No qualifications or restrictions are stated or implied preventing any entity from functioning as a 'specifier'. The 'specifier' entity implied in this undefined term "otherwise specified" is without context for the specifier's qualifications or relationship to the permitted work. Therefore, the vague and ambiguous term 'specifier' can be (mis)interpreted and (mis)applied in the literal sense by code users to grant an unrestricted authority and discretion to any entity the code user determines to be a 'specifier' to 'specify otherwise.' A 'specifier' may be a licensed or unlicensed designer preparing construction documents, a contractor in a bid qualification, a manufacturer within their product data, a product or material supplier using their purchase order, a property developer or a homeowner, or any other entity. A 'specifier' entity may vary with the situation and may include legally or technically unqualified persons or the possibility that some of these 'specifiers' may have limited roles on the project.

The ordinarily accepted meaning of 'specifier' as used in the broader context of primary code documents is the *registered design professional in responsible charge* as defined in IBC Section 202. However, this undefined term "otherwise specified" does not limit the 'otherwise specifying' of an alternative to the *registered design professional in responsible charge* even though that professional is professionally responsible for the permitted work. Further, this 'specifier' may not be in a position to fulfill all the requirements of a *registered design professional in responsible charge* as required in Section 202.

The ubiquitous practice of omitting drawings or specifications from work requiring compliance with the requirements for permit approval, conflicts with the essential purpose and requirements of the primary code documents 'to establish minimum requirements' and is not compliant with IBC 101.3. Items requiring review and compliance and intentionally or unintentionally NOT depicted on drawings and specifications submitted for permit approval are oftentimes as important as the items depicted. Because this undefined term "otherwise specified" without additional context implies a 'specifier' has the unrestricted authority and discretion to 'specify otherwise,' the term can be interpreted in the opposite sense - to 'intentionally or unintentionally NOT specify something because it is not wanted' by the 'specifier,' even where code compliance may require it. Compliance with codified requirements in primary code documents may simply be intentionally or unintentionally omitted from drawings or specifications submitted for permit approval such as when they are aesthetically objectionable or to reduce construction costs.Some code users will (incorrectly) interpret the intentional or unintentional omissions from the 'approved for permit' documents as *approved* omissions. Silence on whether code compliance and building official review and approval of the item 'otherwise specified' is or is not required creates conflicts during construction.

Where this undefined term "otherwise specified" is used these combined factors cause misinterpretation and misapplication of the primary code documents and are a significant obstruction to effective code interpretation, application, compliance, and enforcement.

This undefined term "otherwise specified" has surreptitious functional similarities to the IBC 104.11 process, but the results of 'otherwise specified' are not *approved* unless the requirements of IBC 104.11 are satisfied.

This undefined term "otherwise specified" does not specifically mandate that 'specifying otherwise' shall comply with the full list of requirements of the IBC 104.11 process. Consider that the (mis)interpretation and (mis)application of this term may be a potential and intentional attempt at an unconditional, de facto approach to circumvent the IBC 104.11 process simply by "otherwise specifying" an alternative to minimum requirements of the primary code documents which is never presented to the building official for review or approval or for the testing and *approval* requirementsand authorityof the building official.

This undefined term "otherwise specified" does not establish the minimum requirements for WHERE the item 'otherwise specified' (alternative) shall be specified. Where the undefined term "otherwise specified" is used in a code or referenced standard, is the item specified within the same code or referenced standard or somewhere else? If the term means an Alternative is specified within an *approved* code or referenced standard then the context is established. However, this undefined term does not explicitly require in mandatory language: “unless otherwise specified within this code or referenced standard”.

This undefined term “otherwise specified” indicates no requirement to identify items “otherwise specified” or Alternatives on construction documents listed in IBC Section 107, or specifically in IBC **107.4 Amended construction documents**.

This undefined term “otherwise specified” in its current form where used without context in the code, referenced codes, or referenced standards, is illegal and void and a partial invalidity as specified in IBC **102.5 Partial invalidity**, but does not make void or illegal any of the other parts or provisions.

More broadly, this undefined term “otherwise specified” is used not only within the IBC, but also within the referenced codes and referenced standards. The number and various types of codified referenced documents using the term is significant enough that coordinating changes to each of the codified referenced documents by proponents will take many years if not decades to correct, justifying this proposed code change for a single new definition in the IBC as the most appropriate and expedient solution, for uniformity of interpretation, application, compliance, and enforcement of the primary code documents.

Going forward, the term “otherwise specified” without an ordinarily accepted meaning for context should not be allowed in code development of the primary code documents. CP#28-05 should also be considered for specific revision to not allow this term in reference standards for the same reason.

This proposed code change includes a new definition for this currently undefined term “otherwise specified” where required context is not stated, to specify the required context in mandatory language, eliminating the terms’s vagueness and ambiguity, and to support uniform code interpretation, application, compliance and enforcement. This proposed code change resolves these conflicts and conundrums.
A few examples:

Building Codes

- **2024 IBC @1406.9 Surface-burning characteristics.** Unless otherwise specified, MCM shall have a *flame spread index* of 75 or less and a *smoke-developed index* of 450 or less when tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723.

- **2024 IBC @1408.9 Surface-burning characteristics.** Unless otherwise specified, HPL shall have a *flame spread index* of 75 or less and a *smoke-developed index* of 450 or less when tested in the minimum and maximum thicknesses intended for use in accordance with ASTM E84 or UL 723.

- **2024 IBC @1607.4 Concentrated live loads.** Floors, roofs and other similar surfaces shall be designed to support the uniformly distributed *live loads* prescribed in Section 1607.3 or the concentrated *live loads*, given in Table 1607.1, whichever produces the greater *load effects*. Unless otherwise specified, the indicated concentration shall be assumed to be uniformly distributed over an area of 21/2 feet by 21/2 feet (762 mm by 762 mm) and shall be located so as to produce the maximum *load effects* in the structural members.

Referenced Codes

- **2024 IPC @ 301.2 Overlap.** Unless otherwise specified, clear floor spaces, clearances at fixtures, maneuvering clearances at doors, and turning spaces shall be permitted to overlap

- **2024 IPC @ 304.4 Door swing.** Unless otherwise specified, doors shall be permitted to swing into turning spaces.

- **2024 IPC @ 305.4 Knee and toe clearance.** Unless otherwise specified, clear floor space shall be permitted to include knee and toe clearance complying with Section 306.

- **2024 IPC @ 305.5 Position.** Unless otherwise specified, clear floor spaces shall be positioned for either forward or parallel approach to an element.

-

Referenced Standards (excerpts from current edition of referenced standards listed in IBC Chapter 35)

-

- **ASTM A36@ 5.1 Standard Specification for Carbon Structural Steel** Unless otherwise specified, plates used as bearing plates for bridges shall be subjected to mechanical tests and shall conform to the tensile requirements of Section 8.

- **ASTM B88 @ 1.2 Standard Specification for Seamless Copper Water Tube** The tube shall be produced from the following coppers, and the manufacturer has the option to supply any one of them, unless otherwise specified.

- **ASTM C844 @3.2.4 Standard Specification for Application of Gypsum Base to Receive Gypsum Veneer Plaster** *framing member, n*—that portion of the framing, furring, blocking, and so forth, to which the gypsum base is attached. Unless otherwise specified, the surface to which abutting edges or ends are attached shall be not less than 11⁄2 in. (38 mm) wide for wood members, not less than 11⁄4 in. (32 mm) wide for steel members, and not less than 6 in. (152 mm) wide for gypsum studs. For internal corners or angles, the bearing surface shall be not less than 3⁄4 in. (19 mm).

- **ASTM C844 @ 14.4 Standard Specification for Application of Gypsum Base to Receive Gypsum Veneer Plaster** "…Partitions shall be secured at the floor and ceiling in accordance with the gypsum base manufacturer's details or as otherwise required."

- **ASTM C926 @ 6.1 Standard Specification for Application of Portland Cement-Based Plaster** Metallic lath and lath fasteners used to receive plaster shall be installed in conformance with Specification C1063, except as otherwise specified.

- **ASTM C1063 @ 7.3.1.3Standard Specification for Installation of Lathing and Furring to Receive Interior and Exterior Portland Cement-Based Plaster** Lath shall be installed with the long dimension at right angles to the framing members, unless otherwise specified.

- **ASTM C1280 @ 7.1Standard Specification for Application of Exterior Gypsum Panel Products for Use as Sheathing** Framing members shall be installed so that the surface will be in an even plane, unless otherwise specified, after the gypsum panel products have been applied.

- **ASTM F1667 @ 10.1.2.1Standard Specification for Driven Fasteners: Nails, Spikes, and Staples** Hot-dip galvanized steel wire for the manufacture of fasteners shall have a coating weight in accordance with Specification A641/A641M, Supplementary Requirements, Class 3S, when a heavier coating for exterior use and/or use in treated wood is specified. The minimum zinc coating shall be in accordance with Supplementary Requirements, Class 1, unless otherwise specified.

- **ASTM F1667 @ 10.1.3Standard Specification for Driven Fasteners: Nails, Spikes, and Staples** Electrogalvanized steel fasteners cut and formed from electrogalvanized steel wire or electrogalvanized after forming shall have a regular coating (no minimum weight of coating specified) in accordance with Specification A641/A641M, 9.2, unless otherwise specified.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

New defined term will assist in code interpretation, application, compliance and enforcement

G18-25

G19-25 Part I

IBC: SECTION 202 (New)

Proponents: Amanda Hickman, The Hickman Group, representing Anchor Products (amanda@thehickmangroup.com)

THIS IS A 2 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC-GENERAL CODE COMMITTEE.

PART II WILL BE HEARD BY THE RESIDENTIAL BUILDING CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new definition as follows:

POSITIVE CONNECTION. A connection that provides a continuous load path with sufficient strength and stiffness to transfer forces between structural elements without consideration of frictional resistance produced by the effects of gravity (see "*Positively Anchored*").

POSITIVELY ANCHORED. A connection that provides a continuous load path with sufficient strength and stiffness to transfer forces between structural elements without consideration of frictional resistance produced by the effects of gravity (see "*Positive connection"*).

G19-25 Part I

G19-25 Part II

IRC: SECTION 202 (New)

Proponents: Amanda Hickman, The Hickman Group, representing Anchor Products (amanda@thehickmangroup.com)

2024 International Residential Code

Add new definition as follows:

POSITIVE CONNECTION. A connection that provides a continuous load path with sufficient strength and stiffness to transfer forces between structural elements without consideration of frictional resistance produced by the effects of gravity (see "*Positively anchored*").
POSITIVELY ANCHORED. A connection that provides a continuous load path with sufficient strength and stiffness to transfer forces between structural elements without consideration of frictional resistance produced by the effects of gravity (see "*Positive connection*").

Reason: The terms "positive connection" and "positively anchored" are used in several places throughout the codes, however the terms are not defined and are very subjective to interpretation. In the IBC, these terms are specifically addressed in the Chapter 16 concerning deck attachment to the primary structure, and in Chapter 23 about the means of egress attachment to the primary structure. In the IRC, these terms can be found in chapter 3 for the attachment to primary structures for landings, decks, balconies, and decks and stairs.

Without a definition, the code official is forced to determine what "positive connection" or "positively anchored" should mean and if the installation they are reviewing and inspecting complies with the code. Since there is no definition and the term itself is so subjective this leaves a lot of room for interpretation. Adding the new definitions clarifies that a "positive connection" or "positive anchorage" is a connection that will provide a continuous load path to transmit forces between structural elements, thereby making enforcement and compliance with the code easier.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding this definition is a clarification to the code and will not result in cost changes as a result of including the definition in the code.

G19-25 Part II

G20-25 Part I

IBC: SECTION 202

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

THIS IS A 2 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC-STRUCTURAL CODE COMMITTEE.

PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[BS] POSITIVE ROOF DRAINAGE. A design that accounts for deflections from all *design loads* and has sufficient ~~additional~~ slope to ensure that drainage of the roof occurs within 48 hours of precipitation.

G20-25 Part I

G20-25 Part II

IRC: SECTION 202

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Residential Code

Revise as follows:

[RB] POSITIVE ROOF DRAINAGE. The drainage condition in which consideration has been made for the loading deflections of the *roof deck*, and <u>sufficient</u> ~~additional~~ slope has been provided to ensure drainage of the roof within 48 hours of precipitation.

Reason: The basic premise of positive drainage is that the roof drains water within 48 hours after precipitation ends. Additional slope is not always needed, but sufficient slope is always necessary. The current version of the definition implies that adding slope is always required. The proposed change clarifies that changes to add slope are not necessary if the existing slope is sufficient.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal offers a clarification to the existing definitions without making technical changes. As such, no impact on cost of construction is expected.

G20-25 Part II

G21-25

IBC: SECTION 202

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

PUBLIC-OCCUPANCY TEMPORARY STRUCTURE. ~~Any *building* or~~ A *temporary structure* designed for ~~erected for a period of 1 year or less that serves~~ an assembly occupancy or other public use with greater than 50 occupants .

Reason: Based on previous events resulting in injury as well as loss of life the definition should provide clear direction. The definition as currently proposed does not conclusively provide regulatory direction with regards to the focus of concern. The assignment of an occupant load of 50 individuals is aligned with the long standing understanding of an assembly concern. A temporary structure may not be used in a traditional assembly function but the proposed revision to the definition recognizes a gathering of 50 or more individuals. The specific term "Public-Occupancy" Temporary Structure should be addressed in the future. Adding the term "Public" potentially creates a unintentional categorization between public, employees and even volunteers. It should be noted that larger temporary shelters may require additional structural criteria and those should be higher than a 50 occupant threshold, but this is at least a starting point.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarfication and limit for size, not a change in requirements.

G21-25

G22-25

IBC: SECTION 202

Proponents: Jonathan Siu, Jon Siu Consulting, LLC, representing Washington Association of Building Officials Technical Code Development Committee; Constadino 'Gus' Sirakis, representing NYC Department of Buildings; Micah Chappell, Seattle Dept. of Construction and Inspections (SDCI), representing Washington Association of Building Officials Technical Code Development Committee (WABO TCD) (micah.chappell@seattle.gov); Julius Carreon, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee (jcarreon@bellevuewa.gov)

2024 International Building Code

Revise as follows:

PUBLIC-OCCUPANCY TEMPORARY STRUCTURE. ~~Any *building* or *structure* erected for a period of 1 year or less~~ A *temporary structure* that serves an assembly occupancy or other public use.
TEMPORARY STRUCTURE. Any *building* or *structure* erected for a ~~period of 180 days or less~~ limited period of time to support *temporary events*. *Temporary structures* include a range of *structure* types (*public-occupancy temporary structures*, temporary *special event structures*, *tents*, umbrellas and other membrane *structures*, *relocatable buildings*, temporary *bleachers*, etc.) for a range of purposes (storage, equipment protection, dining, workspace, assembly, etc.).

Reason: This proposal is being submitted to address a conflict and potential confusion in how long a temporary structure is allowed to be in place.

Under the current code, a temporary structure is defined to be one that is erected for 180 days or less. However, a public-occupancy temporary structure (hereinafter referred to as a POTS) is supposed to be a type of temporary structure, yet it is allowed to be erected for up to a year (IBC 3103.1, Exc. 1). This appears to be a direct conflict with the definition, and the proponents have received comments from people who are confused on this point. In addition, this appears to be a requirement contained in a definition.

This proposal simply deletes the requirement from the definition of temporary structure. IBC Section 3103 already contains scoping language that lays out the allowable time periods for temporary structures, so having this limitation in the definition isn't needed. (Note that a separate proposal is being submitted that makes IBC Section 108.1 on permits for temporary structures consistent with Section 3103.) However, to be clear that "temporary" is not intended to be "permanent," the definition refers to a "limited period of time," which, again, is determined in Sections 108.1 and 3103.

The definition of POTS is being simplified to indicate POTSs are a subset of temporary structures, as stated in the definition of temporary structures. The current definition also contains a requirement (the 1-year limit) that is covered in the scoping of Section 3103, so that is being deleted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal merely removes a requirement from the definition. The requirement is covered elsewhere in the code.

2024 International Building Code

SECTION 603 COMBUSTIBLE MATERIAL IN TYPES I AND II CONSTRUCTION

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in *buildings* of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* complying with Section 2303.2 shall be permitted in:
   1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less except in *shaft enclosures* within Group I-2 occupancies and *ambulatory care facilities.*

   1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.

   1.3. Roof construction, including girders, trusses, framing and decking.

   Exceptions:

   1. In *buildings* of Type IA construction exceeding two stories above grade plane, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
   2. Group I-2, roof construction containing *fire-retardant-treated wood* shall be covered by not less than a Class A _roof assembly_ ~~*roof covering* or roof assembly~~, and the roof assembly shall have a *fire-resistance rating* where required by the construction type.

   1.4. Balconies, porches, decks and exterior *stairways* not used as required exits on *buildings* three *stories* or less above *grade plane*.

2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

   Exceptions:

   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.

3. Foam plastics in accordance with Chapter 26.
4. *Roof assemblies* ~~*Roof coverings*~~ that have ~~an~~ a Class A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.6.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated* wood complying with Section 2303.2, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. *Stages* and *platforms* constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic *veneer* installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.4.4 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.1.2.
21. Sprayed fire-resistive materials and intumescent fire-resistive materials, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.15 and 1705.16, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect *joints* in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of *buildings* of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the *International Mechanical Code*.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the *building* is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
27. Wood nailers for parapet flashing and roof cants.
28. Vapor retarders as required by Section 1404.3.

APPENDIX D
FIRE DISTRICTS

SECTION D102

BUILDING RESTRICTIONS

D102.2.4 Roof covering. *Roof covering* in the fire district shall conform to the requirements of Class A or B *roof assemblies* ~~*roof coverings*~~ as defined in Section 1505.

G23-25 Part I

G23-25 Part II

IEBC: 1204.5

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Existing Building Code

SECTION 1204
CHANGE OF OCCUPANCY

Revise as follows:

1204.5 Roof covering. Regardless of occupancy or use group, *roof assemblies* ~~roof covering materials~~ not less than Class C, where tested in accordance with ASTM E108 or UL 790, shall be permitted where a fire-retardant roof covering is required.

G23-25 Part II

G23-25 Part III

IRC: R302.2.4

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Residential Code

SECTION R302
FIRE-RESISTANT CONSTRUCTION

Revise as follows:

R302.2.4 Parapets for townhouses. Parapets constructed in accordance with Section R302.2.5 shall be constructed for *townhouses* as an extension of exterior walls or common walls separating *townhouse units* in accordance with the following:

1. Where roof surfaces adjacent to the wall or walls are at the same elevation, the parapet shall extend not less than 30 inches (762 mm) above the roof decks.
2. Where roof decks adjacent to the wall or walls are at different elevations and the higher *roof deck* is not more than 30 inches (762 mm) above the lower *roof deck* , the parapet shall extend not less than 30 inches (762 mm) above the lower roof deck.

   Exception: A parapet is not required in the preceding two cases where the *roof assembly* ~~*roof covering*~~ complies with a minimum Class C rating as tested in accordance with ASTM E108 or UL 790 and the roof deck or sheathing is of *noncombustible materials* or *fire-retardant-treated wood* for a distance of 4 feet (1219 mm) on each side of the wall or walls, or one layer of $^{5}/_{8}$-inch (15.9 mm) *Type X gypsum board* is installed directly beneath the roof decking deck or sheathing, supported by not less than nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members, for a distance of not less than 4 feet (1219 mm) on each side of the wall or walls and any openings or penetrations in the roof deck are not within 4 feet (1219 mm) of the common walls. *Fire-retardant-treated wood* shall meet the requirements of Sections R302.15 and R803.2.1.2.
3. A parapet is not required where roof surfaces adjacent to the wall or walls are at different elevations and the higher *roof deck* is more than 30 inches (762 mm) above the lower *roof deck* . The common wall construction from the lower *roof deck* to the underside of the higher *roof deck* shall have not less than a 1-hour fire-resistance rating. The wall shall be rated for exposure from both sides. Openings shall not be permitted in the wall.

Reason: This proposal advances work to improve and clarify terminology associated with roofing fire tests that started during the previous code development cycle (S1-21) and has continued during the Group A portion of the 2027 I-code cycle. Proposal FS19-24 (on the PCH consent agenda) addresses the issue described below for the Group A code sections. This proposal addresses the same issue for the relevant Group B sections.

The proposal corrects instances where results of ASTM E108 or UL 790 tests are associated with a *roof covering* or roof-covering materials instead of a *roof assembly*. ASTM E108 and UL 790 tests cannot be performed on a *roof covering,* but involve a *roof covering* (and sometimes other elements, such as insulation or underlayment) installed onto a *roof deck*. These tests are always performed on a *roof assembly,* which by definition includes a *roof covering* and a *roof deck*.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies existing code provisions without making any technical changes. Therefore, it is expected to have no effect on cost of construction.

[A] REPAIR. The ~~reconstruction, replacement or~~ renewal, restoration, or reinstallation of any part of a pool or spa for ~~the purpose of~~ its maintenance or ~~to correct damage~~for its preservation after damage .

G24-25 Part II

G24-25 Part III

IRC: SECTION 202

Proponents: Stephen Van Hoose, representing NYS DOS (stephen.vanhoose@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Kevin Duerr-Clark, representing NYSDOS (kevin.duerr-clark@dos.ny.gov)

2024 International Residential Code

Revise as follows:

[RB] REPAIR. The ~~reconstruction, replacement or~~ renewal, restoration, or reinstallation of any part of an *existing building* for ~~the purpose of~~ its maintenance or ~~to correct damage~~for its preservation after damage. For the definition applicable in Chapter 11, see Section N1101.6.
[RB] ROOF REPAIR. ~~Reconstruction or~~ The renewal, restoration, or reinstallation of any part of an existing roof for ~~the purposes of~~ its maintenance or for its preservation after damage . For the definition applicable in Chapter 11, see Section N1101.6.

Reason: The current definitions of "Repair" and "Roof Repair" in the International Building Code (IBC), International Residential Code (IRC), and International Existing Building Code (IEBC) may be ambiguous and lead to inconsistent interpretations and enforcement across these related codes. This proposed change aims to clarify the scope of both terms by:

- **Explicitly including "reinstallation"**: This addition emphasizes that removing and then reinstalling an existing component or replacing that component with an identical or equivalent one still constitutes a repair when it is only a part of an assembly or a component in equipment. This aligns with common industry practices and avoids unnecessary disputes over whether replacement constitutes repair or alteration, That is particularly relevant for a partial yet substantial “roof recover” or a partial yet substantial “roof replacement” where applicants may argue that they are repairs.
- **Clarifying the purpose of repair**: By specifying that repairs are for "maintenance or preservation," the definition provides a clear objective for repair activities. This helps distinguish routine maintenance and necessary repairs from more extensive alterations.
- **Addressing damage**: The addition of "after damage" further clarifies the scope of repair by limiting it to situations where the existing building component is no longer functional or has been compromised due to damage. This helps prevent the term "repair" from encompassing routine maintenance or minor improvements not addressing a specific damage.

These revised definitions will reduce confusion about when a repair is an alteration and visa-versa. It provides greater clarity and consistency in the interpretation and application of the International Building Code (IBC), International Residential Code (IRC), and International Existing Building Code (IEBC),leading to more predictable and equitable outcomes for building owners, contractors, code officials, and the public across all three code sets. Specifically, the clarified definition of "Roof Repair" will help ensure that roof replacement projects are appropriately categorized and evaluated, ensuring that necessary safety and performance requirements are met while avoiding unnecessary regulatory burdens on homeowners and contractors.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the intent of the definition and is purely editorial.

G24-25 Part III

G25-25

IBC: SECTION 202

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

[BG] RESIDENTIAL AIRCRAFT HANGAR. An accessory *building* ~~less than 2,000 square feet (186 m^2) and 20 feet (6096 mm) in~~ ~~*building height*~~ constructed on a one- or two-family property where aircraft are stored. Such use will be considered as a residential accessory use incidental to the *dwelling*.

SECTION 412
AIRCRAFT-RELATED OCCUPANCIES

412.4 Residential aircraft hangars. *Residential aircraft hangars* shall comply with Sections 412.4.1 through 412.4.5.

412.4.5 Height and area limits. *Residential aircraft hangars* shall be not greater than 2,000 square feet (186 m^2) in area and 20 feet (6096 mm) in *building height*.

Reason: This proposal removes technical requirements from the definition. These requirements are already listed in 412.4.5 (provided in this proposal for context).
This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is removal of redundant language. There is no change to construction.

G25-25

G26-25

IBC: SECTION 202

Proponents: Andrew Klein, A S Klein Engineering, PLLC, representing Self Storage Association (andrew@asklein.com)

2024 International Building Code

Revise as follows:

[BG] SELF-SERVICE STORAGE FACILITY. Real property designed and used for the purpose of renting or leasing individual storage spaces to customers for the purpose of storing and removing personal property<u>, including the long-term storage of a vehicle,</u> on a self-service basis.

Reason: Self-service storage units designed for car and RV storage are sometimes miscategorized as a Group S-2 Occupancy, parking garage. Parking garages, where vehicles frequently come-and-go, require additional mechanical ventilation that is not needed for the long-term storage of vehicles at self-service storage facilities.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Buildings used for car and RV storage at self-service storage facilities are intended to be self-service storage facilities, not parking garages.

G26-25

G27-25

IBC: SECTION 202, SECTION 202 (New), 507.6, 507.7

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

Revise as follows:

[BG] STAGE. A space within a *building* utilized for entertainment or presentations, which includes ~~overhead hanging curtains~~, ~~drops, scenery or stage effects other than~~ lighting, ~~and~~ sound, projections, and video display and the mounting provisions for them..

Type A stage. A stage that is designed and constructed for use with stage scenery.

Type B stage . A stage that is designed and constructed for use without stage scenery.

Add new definition as follows:

STAGE SCENERY. The constructed scenes or hangings used on a stage to form a theater set.

SECTION 507 UNLIMITED AREA BUILDINGS

Revise as follows:

507.6 Group A-3 buildings of Type II construction. The area of a Group A-3 *building* not more than one *story above grade plane*, used as a *place of religious worship*, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor *swimming pool* or tennis court of Type II construction, shall not be limited provided that the following criteria are met:

1. The *building* shall not have a *Type A* *stage* ~~other than a *platform*~~.
2. The *building* shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. The *building* shall be surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

507.7 Group A-3 buildings of Type III and IV construction. The area of a Group A-3 *building* of Type III or IV construction, with not more than one *story above grade plane* and used as a *place of religious worship*, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor *swimming pool* or tennis court, shall not be limited provided that the following criteria are met:

1. The *building* shall not have a *Type A* *stage* ~~other than a *platform*~~.
2. The *building* shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. The assembly floor shall be located 21 inches (533 mm) or less from street or grade level and all *exits* are provided with *ramps* complying with Section 1012 to the street or grade level.
4. The *building* shall be surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

1. The term stage is often applied to areas which do not include “drops, scenery, and stage effects” such as recital and concert hall stages, raised floor areas in places of worship, raised areas in public places like malls and public transportation terminals and stations. The definition modification is an attempt to clarify that.

2. On the deletion of the platform definition in another proposal and introduction of type A and B stage changes, the existing platform definition alludes to a use and the contents of the space, whereas practically the only requirements in section 410 is for the construction of the raised floor area, permanent or temporary (403.3 and 403.3.1). This leaves any space used for entertainment and presentations designated as a platform with no requirements for the fire hazards of those uses, even with curtains.

3. Note also that not all stages and platforms are in fact even raised but just a floor area within a building. Further, today stages are

rarely raised above the floor but rather built at the same elevation as the adjacent floors.

4. The use of the term platform is further complicated by many uses of the term “platform” elsewhere in the IBC, regarding platform lifts, equipment platforms, transit and boarding platforms, several uses regarding accessibility (including fishing platforms among others), diving platforms, industrial steel work platforms, "platform decorative trim" (?), used as an equal for stairs to "landing", and item 37 in table 1607.1. The only uses in section 410 are 410.3 Platform construction and 410.3.1 Temporary platforms.

5. For coordination and clarity, every where the phrase "stage and platform" or more commonly "stages and platforms" appears, it should be edited to "stages".6. The revisions to 507.6 and 507.7 are for coordination with deletion of defined term "platform" and addition of Type A and Type B stages.

7. The term Stage Scenery has widely varying interpretations. We believe adding this definition will help narrow those. Furniture is not scenery. Flipcharts, tripods, podiums, lecterns, music stands, choral and band risers, musical instruments, portable projection screens, tables with objects, luggage, appliances, machines, etc. also, are not scenery. Scenery includes walls and ceilings, large three-dimensional objects, stairs and platforms creating multiple levels, and drops typically built with combustible materials for a stage setting. Hard to put in definition but we will suggest code commentary text and hope that will be sufficient.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is editorial and for clarification.

G27-25

G28-25 Part I

IBC: SECTION 202, 423.3.2; IEBC: SECTION 202; IPMC: SECTION 202

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Marc Levitan, representing National Institute of Standards and Technology (marc.levitan@nist.gov)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. PART III WILL BE HEARD BY THE IPMC/IZC COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[BG] STORM SHELTER. A *building*, *structure* or portions thereof, constructed in accordance with ICC 500 and ~~designated for use during~~ for protection from tornadoes hurricanes, ~~tornadoes or~~ and other severe windstorms.

Community storm shelter. A storm shelter not defined as a "Residential storm shelter."
This includes *storm shelters* intended for use by the general public, by building occupants or a combination of both.

Residential storm shelter. A storm shelter serving occupants of *dwelling units* and having an occupant load not exceeding 16 persons.

SECTION 423
STORM SHELTERS

423.3 Occupancy classification. The occupancy classification for a *storm shelter* shall be determined in accordance with this section.

423.3.1 Dedicated storm shelters. A *facility* designed to be occupied solely as a *storm shelter* shall be classified as Group A-3 for the determination of requirements other than those covered in ICC 500.

Exceptions:

1. The occupancy category for dedicated *storm shelters* with a design occupant capacity of less than 50 *persons* as determined in accordance with ICC 500 shall be in accordance with Section 303.
2. The occupancy category for a dedicated residential *storm shelter* shall be the Group R occupancy served.

423.3.2 Storm shelters occupied for other purposes ~~within host buildings~~. ~~Where designated *storm shelters* are constructed as a room or space within a host *building*~~ *Storm shelters* that will normally be occupied for other purposes shall comply with~~,~~ the requirements of this code for the occupancy of the *building*, or the individual rooms or spaces thereof, ~~shall apply~~ unless otherwise required by ICC 500.

2024 International Existing Building Code

Revise as follows:

[BG] STORM SHELTER. A *building*, *structure* or portions thereof, constructed in accordance with ICC 500 and~~designated for use during~~ for protection from tornadoes hurricanes,~~tornadoes or~~and other severe windstorms.

2024 International Property Maintenance Code

Revise as follows:

[BG] STORM SHELTER.
A *building*, *structure* or portions thereof, constructed in accordance with ICC 500 and~~designated for use during~~ for protection from tornadoes hurricanes,~~tornadoes or~~and other severe windstorms.

G28-25 Part II

IRC: SECTION 202

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Marc Levitan, representing National Institute of Standards and Technology (marc.levitan@nist.gov)

2024 International Residential Code

Revise as follows:

[RB] STORM SHELTER. A *building*, *structure* or portions thereof, constructed in accordance with ICC 500 and ~~designated for use during~~ for protection from tornadoes hurricanes, ~~tornadoes or~~ and other severe windstorms.

G28-25 Part II

G28-25 Part III

IPMC: , 311.3

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Marc Levitan, representing National Institute of Standards and Technology (marc.levitan@nist.gov)

2024 International Property Maintenance Code

SECTION 311 STORM SHELTERS

311.1 General. Community *storm shelters* shall be evaluated, maintained and repaired in accordance with this section and ICC 500.

311.2 Evaluation. Community *storm shelters* shall be evaluated annually and when requested by the authority having jurisdiction in accordance with ICC 500.

Revise as follows:

311.3 Maintenance and repairs. Community *storm shelters* shall be maintained in an ~~operable~~ operational condition. All structural ~~and operational~~ elements, impact-protective systems and critical support systems shall be repaired or replaced in accordance with ICC 500 where damaged or found to be inoperable.

Reason: Proposed changes to the next edition of ICC 500 include revising the definition to clarify the use of storm shelters. “Designating” a storm shelter is tied to classifying it for use after an event, which is makes what makes it an emergency shelter that needs to be classified as Risk Category IV. This change focuses on the primary purpose of an ICC 500-compliant storm shelter, which is protection from severe winds during an event.

The definition for 'storm shelter' also appears in the IEBC and IPMC. Since this is scoped to the IBC, the other codes will also be revised.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

The ICC 500 (Standard for the Design and Construction of Storm Shelters) development committee has held several virtual meetings during 2022 and 2023 to develop the 2023 edition. In addition, there were numerous virtual Working Group meetings. All meetings included members of the committee as well as interested parties. Related documents and reports are posted on the ICC 500 website at ICC 500.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial clarification for the definition and description for storm sheleters with no change to construction requirements.

G28-25 Part III

G29-25

IBC: [A] 105.2, 201.3, SECTION 202, SECTION 202 (New), 1010.2.3, 1110.18, 1111.4.14, 1808.7.3, 2406.2, 2406.4.5, 3101.1, SECTION 3109, 3109.1; IFC: [BE] 1010.2.3; IPC: SECTION 202; IFGC: SECTION 617 (IFGC), 617.1; IRC: SECTION G2441 (617), G2441.1 (617.1)

Proponents: Jeff Grove, Chair, representing Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Building Code

Revise as follows:

201.3 Terms defined in other codes. Where terms are not defined in this code and are defined in the *International Energy Conservation Code* , *International Fuel Gas Code* , *International Fire Code* , *International Mechanical Code*, ~~or~~ *International Plumbing Code*, or the *International Swimming Pool and Spa Code*, such terms shall have the meanings ascribed to them as in those codes.

[BG] SWIMMING POOL. Any *structure* or product intended for swimming, ~~recreational~~ bathing or wading; ~~that contains water over 24 inches (610 mm) deep~~ designed and manufactured to be connected to a circulation system; installed aboveground, inground, onground, or partially aboveground; and not intended to be drained and filled with each use. ~~This includes in-ground, above-ground and on-ground pools; hot tubs; spas and fixed-in-place wading pools.~~

Add new definition as follows:

SPA. Any structure or product intended for the immersion of persons in temperature-controlled water for the purpose of relaxing, exercise, therapy or treatment; designed and manufactured to be connected to a circulation system; and not intended to be drained and filled with each use.

Revise as follows:

[A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. One-story detached accessory *structures* used as tool and storage sheds, playhouses and similar uses, provided that the floor area is not greater than 120 square feet (11 m^2).
2. Fences, other than swimming pool and spa barriers, not over 7 feet (2134 mm) high.
3. Oil derricks.
4. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge or impounding Class I, II or IIIA liquids.
5. Water tanks supported directly on grade if the capacity is not greater than 5,000 gallons (18 925 L) and the ratio of height to diameter or width is not greater than 2:1.
6. Sidewalks and driveways not more than 30 inches (762 mm) above adjacent grade, and not over any *basement* or *story* below and are not part of an *accessible route*.
7. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
8. Temporary motion picture, television and theater stage sets and scenery.
9. Prefabricated *swimming pools* accessory to a Group R-3 occupancy that are less than 24 inches (610 mm) deep, are not greater than 5,000 gallons (18 925 L) and are installed entirely above ground.
10. Shade cloth *structures* constructed for nursery or agricultural purposes, not including service systems.
11. Swings and other playground equipment accessory to detached one- and two-family *dwellings*.
12. Window *awnings* in Group R-3 and U occupancies, supported by an *exterior wall* that do not project more than 54 inches (1372 mm) from the *exterior wall* and do not require additional support.
13. Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height.

Electrical:

1. ***Repairs* and maintenance:** Minor *repair* work, including the replacement of lamps or the connection of *approved* portable electrical equipment to *approved* permanently installed receptacles.
2. **Radio and television transmitting stations:** The provisions of this code shall not apply to electrical equipment used for radio and television transmissions, but do apply to equipment and wiring for a power supply and the installations of towers and antennas.
3. **Temporary testing systems:** A *permit* shall not be required for the installation of any temporary system required for the testing or servicing of electrical equipment or apparatus.

Gas:

1. Portable heating appliance.
2. Replacement of any minor part that does not alter approval of equipment or make such equipment unsafe.

Mechanical:

1. Portable heating appliance.
2. Portable ventilation equipment.
3. Portable cooling unit.
4. Steam, hot or chilled water piping within any heating or cooling equipment regulated by this code.
5. Replacement of any part that does not alter its approval or make it unsafe.
6. Portable evaporative cooler.
7. Self-contained refrigeration system containing 10 pounds (4.54 kg) or less of refrigerant and actuated by motors of 1 horsepower (0.75 kW) or less.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe, provided, however, that if any concealed trap, drain pipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures and the removal and reinstallation of water closets, provided that such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

SECTION 1010
DOORS, GATES AND TURNSTILES

1010.2.3 Hardware height. Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches (864 mm) minimum and 48 inches (1219 mm) maximum above the finished floor.

Exceptions:

1. Locks used only for security purposes and not used for normal operation are permitted at any height.
2. Where the International Swimming Pool and Spa Code requires restricting access to a swimming pool ~~,~~ or spa ~~or hot tub~~, and where door and gate latch release mechanisms are accessed from the outside of the barrier and are not of the self-locking type, such a mechanism shall be located above the finished floor or ground surface not less than 52 inches (1219 mm) and not greater than 54 inches (1370 mm), provided that the latch release mechanism is not a self-locking type such as where the lock is operated by means of a key, electronic opener or the entry of a combination into an integral combination lock.

SECTION 1110
OTHER FEATURES AND FACILITIES

1110.18 Controls, operating mechanisms and hardware. Controls, operating mechanisms and hardware intended for operation by the occupant, including switches that control lighting and ventilation and electrical convenience outlets, in accessible spaces, along *accessible routes* or as parts of accessible elements shall be accessible.

Exceptions:

1. Operable parts that are intended for use only by service or maintenance personnel shall not be required to be *accessible.*
2. Access doors or gates in barrier walls and fences protecting swimming pools ~~,~~ and spas ~~and hot tubs~~ shall be permitted to comply with Section 1010.2.3.
3. Operable parts exempted in accordance with ICC A117.1 are not required to be accessible.

SECTION 1111
RECREATIONAL FACILITIES

1111.4.14 Swimming pools~~, wading pools, cold baths, hot tubs~~ and spas. *Swimming pools*~~, wading pools, cold baths, hot tubs~~ and spas shall be *accessible* and be on an *accessible route*.

Exceptions:

1. A catch pool or a designated section of a pool used as a terminus for a water slide flume shall not be required to provide an *accessible* means of entry, provided that a portion of the catch pool edge is on an *accessible route* or, where the area at the catch pool edge is located on a raised platform restricted to use by staff and persons exiting the pool, an *accessible* route serves the gate or area where participants discharge from the activity.
2. Where spas~~, cold baths or hot tubs~~ are provided in a cluster, at least 5 percent, but not less than one of each type of spa~~, cold bath or hot tub~~ in each cluster, shall be *accessible* and be on an *accessible* route.
3. *Swimming pools*~~,~~ <u>and</u> ~~wading pools,~~ spas~~, cold baths and hot tubs~~ that are required to be *accessible* by Sections 1111.2.2 and 1111.2.3 are not required to provide *accessible* means of entry into the water.

SECTION 1808
FOUNDATIONS

1808.7.3 <u>Swimming pools</u> ~~Pools~~. The setback between <u>swimming</u> pools regulated by this code and slopes shall be equal to one-half the *building* footing setback distance required by this section. That portion of the <u>swimming</u> pool wall within a horizontal distance of 7 feet (2134 mm) from the top of the slope shall be capable of supporting the water in the <u>swimming</u> pool without soil support.

SECTION 2406
SAFETY GLAZING

2406.2 Impact test. Where required by other sections of this code, glazing shall be tested in accordance with CPSC 16 CFR Part 1201. Glazing shall comply with the test criteria for Category II, unless otherwise indicated in Table 2406.2(1).

Exception: Glazing not in doors or enclosures for ~~hot tubs, whirlpools~~ <u>spas</u>, saunas, steam rooms, bathtubs and showers shall be permitted to be tested in accordance with ANSI Z97.1. Glazing shall comply with the test criteria for Class A, unless otherwise indicated in Table 2406.2(2).

2406.4.5 Glazing and wet surfaces. Glazing in walls, enclosures or fences containing or facing ~~hot tubs,~~ spas, ~~whirlpools,~~ saunas, steam rooms, bathtubs, showers and indoor or outdoor *swimming pools* where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface shall be considered to be a hazardous location. This shall apply to single glazing and all panes in multiple glazing.

Exception: Glazing that is more than 60 inches (1524 mm), measured horizontally and in a straight line, from the water's edge of a bathtub, ~~hot tub,~~ spa~~, whirlpool~~ or *swimming pool*.

SECTION 3101
GENERAL

3101.1 Scope. The provisions of this chapter shall govern special *building* construction including membrane *structures*, *temporary structures*, *pedestrian walkways* and tunnels, *awnings* and *canopies*, *marquees*, signs, telecommunications and broadcast towers, *swimming pools*~~,~~ <u>and</u> spas ~~and hot tubs~~, automatic vehicular gates, solar energy systems, *greenhouses*, relocatable buildings and *intermodal shipping containers*.

SECTION 3109
SWIMMING POOLS~~,~~ AND SPAS ~~AND HOT TUBS~~

3109.1 General. The design and construction of *swimming pools*~~,~~ and spas ~~and hot tubs~~ shall comply with the *International Swimming Pool and Spa Code* .

2024 International Fire Code

Revise as follows:

[BE] 1010.2.3 Hardware height. Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches (864 mm) minimum and 48 inches (1219 mm) maximum above the finished floor.

Exceptions:

1. Locks used only for security purposes and not used for normal operation are permitted at any height.
2. Where the International Swimming Pool and Spa Code requires restricting access to a swimming pool ~~,~~ or spa ~~or hot tub~~, and where door and gate latch release mechanisms are accessed from the outside of the barrier and are not of the self-locking type, such a mechanism shall be located above the finished floor or ground surface, not less than 52 inches (1219 mm) and not greater than 54 inches (1370 mm), provided that the latch release mechanism is not a self-locking type such as where the lock is operated by means of a key, electronic opener or the entry of a combination into an integral combination lock.

2024 International Plumbing Code

Revise as follows:

[BG] SWIMMING POOL. ~~A permanent or temporary~~ Any structure or product ~~that is~~ intended to be used for swimming, bathing or wading; ~~and that is~~ designed and manufactured ~~or built~~ to be connected to a circulation system; installed aboveground, inground, onground, or partially aboveground; and not intended to be drained and filled with each use ~~A swimming pool can be open to the public regardless of whether a fee is charged for its use or can be accessory to a residential setting where the pool is available only to the household and guests of the household.~~

2024 International Fuel Gas Code

Revise as follows:

SECTION 617 (IFGC)
SWIMMING POOL AND SPA HEATERS

617.1 General. ~~Pool~~ Swimming Pool and spa heaters shall be *listed* in accordance with ANSI Z21.56/CSA 4.7 and shall be installed in accordance with the manufacturer's instructions.

2024 International Residential Code

Revise as follows:

SECTION G2441 (617)
SWIMMING POOL AND SPA HEATERS

G2441.1 (617.1) General. ~~Pool~~ Swimming pool and spa heaters shall be *listed* in accordance with ANSI Z21.56/CSA 4.7 and shall be installed in accordance with the manufacturer’s instructions.

Reason: This proposal is in coordination with the ISPSC new definitions for swimming pool and spa being proposed by the PMGCAC. This proposal also proposes to use the definitions consistently throughout the IBC. "Swimming pool" is already used in Section 105.2 Item 9, 303.4, 303.5, 507.6, 507.7, Table 1004.5 (in one location), 1202.3, 2609.4, 3102.8.3 and G112.5.

The definition for "spa" includes inground permanent spas and portable electric spas also known as hot tubs, as well as cold baths, all of which are connected to a circulation system and not intended to be drained and filled with each use. It does not include a whirlpool, which is a type of bathtub with jets that propel water, which is drained after each use. The proposal removes all references to “whirlpools” when addressing types of spas used in the aquatic industry. Using the definition will reduce 'laundry lists' in the code and provides consistency.

The BCAC will also be submitting coordinating proposals in Group B for the IRC, IZC and IECC.

This is also intended to be consistent with code changes proposed for the definitions in the ISPSC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 PMGCAC has held several virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is for consistent terminology for swimming pools and spas throughout the IBC. There are no technical changes.

Staff Analysis: The defintion for 'swimming pool' and 'spa' in the ISPSC was modified by SP1-24. IRC Chapter 24 is copied from the IFGC; see RB38-25.

G29-25

G30-25

IBC: SECTION 202

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

TEMPORARY STRUCTURE. Any *building* or *structure* erected ~~for a period of 180 days or less~~ to support *temporary events*. ~~*Temporary structures* include a range of *structure* types (*public-occupancy temporary structures*, temporary *special event structures*, *tents*, umbrellas and other membrane *structures*, *relocatable buildings*, temporary *bleachers*, etc.) for a range of purposes (storage, equipment protection, dining, workspace, assembly, etc.).~~

Reason: There are two issues with the defintion of temporary structure - the days and the list.
The provisions address 180 days to 365 days, but this definition sets the limit at 180 days. This is confusing and contradictory. The period of time is already addressed in Section 3103.1 - so why repeat it?

3103.1 General. The provisions of Sections 3103.1 through 3103.8 shall apply to *structures* erected for a period of less than 180 days. Temporary *special event structures*, *tents*, umbrella *structures* and other membrane *structures* erected for a period of less than 180 days shall also comply with the *International Fire Code*. *Temporary structures* erected for a longer period of time and *public-occupancy temporary structures* shall comply with applicable sections of this code.

Exceptions:

1. *Public-occupancy temporary structures* complying with Section 3103.1.1 shall be permitted to remain in service for 180 days or where *approved* by the *building official*.
2. *Public-occupancy temporary structures* within the confines of an *existing structure* are not required to comply with Section 3103

Why use 'umbrella' and not 'umbrella structures?' That is the defined term in the IFC and what is listed in 3103.1.

UMBRELLA STRUCTURE.
A structure, enclosure or shelter with or without sidewalls or drops, constructed of fabric or pliable material supported by a central pole or poles (see "*Tent*").

If these provisions are to protect the public why are we listing storage and equipment protection? Workspace?

No definition should include "etc." in a laundry list!

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a defintion. There are no changes to the construction requirements.

G30-25

G31-25

IBC: SECTION 202 (New)

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

THIS CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Add new definition as follows:

TORNADO-PRONE REGION. The area of the conterminous United States most vulnerable to tornadoes, as shown in Figure 1609.5.

Reason: ASCE 7-22 introduced Chapter 32 Tornado Loads and related provisions in Chapter 1 General, Chapter 2 Combination of Loads, and Chapter 26 Wind Loads: General Requirements. While IBC 2024 generally adopted the new ASCE 7-22 provisions, several sections of IBC 2024 do not adequately clarify the tornado design requirements. This proposal includes adding a Chapter 2 Definition for the Tornado-Prone Region.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proposed IBC code changes are generally editorial clarifications that improve the thoroughness of IBC for alignment to the introduction of tornado loads in ASCE 7-22 and IBC 2024.

Staff Analysis: The term 'tornado-prone region' is currently once used in Section 1609.5 and is the titel of Figure 1609.5.

IBC: SECTION 202; IFC: SECTION 202

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

THIS IS A 2 PART CODE CHANGE.

PART I WILL BE HEARD BY THE ADMINISTRATIVE CODE COMMITTEE.

PART II WILL BE HEARD BY THE RESIDENTIAL BUILDING CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[A] TOWNHOUSE UNIT. A single-family *dwelling* unit in a *townhouse* that extends from the foundation to the roof and has a *yard,court* or *public way* on not fewer than two sides.

2024 International Fire Code

Revise as follows:

[A] TOWNHOUSE UNIT. A single-family*dwelling*unit in a*townhouse*that extends from the foundation to the roof and has a*yard, court*or*public way*on not fewer than two sides.

G32-25 Part I

G32-25 Part II

IRC: SECTION 202

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

2024 International Residential Code

Revise as follows:

[RB] TOWNHOUSE UNIT. A single-family *dwelling unit* in a *townhouse* that extends from foundation to roof and that has a *yard*,*court* or *public way* on not less than two sides.

Reason: The current definition of townhouse unit requires that the unit have a yard or public way on two sides, and the definition of yard requires the yard to be an open space other than a court. By definition, a court is a space bounded on three or more sides by walls or buildings. Based on these definitions, townhouses that are staggered front to back create courts which are not allowed. Given that IRC Section R302.1 requires a lot line or an imaginary line between townhouse units to measure fire separation distance to, exterior walls of the units adjacent to a court will be protected based on distance to these lines, preventing fire spread from one unit to another. Therefore, there is no hazard addressed by prohibiting a court to count as an open side for a townhouse. Note that the imaginary line requirement was added in the 2024 IRC and without this there may have been a hazard in previous codes if there was no lot line and the exterior walls were not protected to prevent spread of fire from one unit to another. See figure below showing the staggered townhouse configuration with a court.

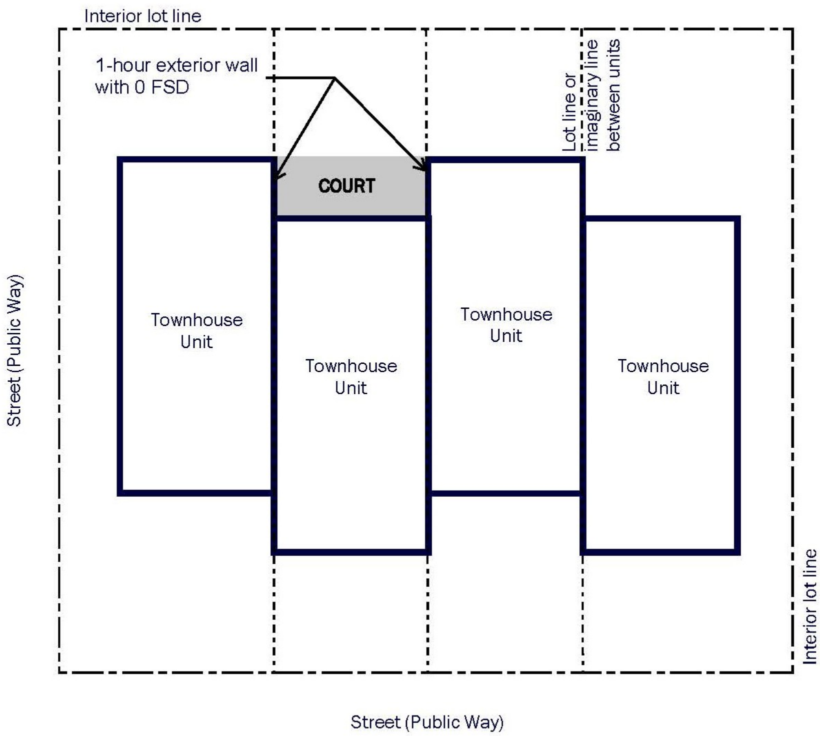
Note that if a townhouse unit has an emergency escape and rescue opening (EERO) on the court side of the unit, IRC Section R319.1 requires the court (or yard) to open to a public way, which will typically prohibit an enclosed court (i.e., all sides having a wall or building). However, if a condition exists where there are no EERO openings into the court, and exterior walls are protected based on lot lines or imaginary lines, an enclosed court would be allowed just as an enclosed yard is currently allowed.

The definitions of court and yard are included in this proposal for reference - there are no proposed changes to these definitions.

This proposal revises the definition of townhouse unit to include a court as one of the required open sides. As described above, this condition presents no hazard due to new requirements for lot lines or imaginary lines between units.

The following defintions are located here for reference:

> **[BG] COURT.** An open, uncovered space, unobstructed to the sky, bounded on three or more sides by exterior *building* walls or other enclosing devices.
>
> **[BG] YARD.** An open space, other than a *court*, unobstructed from the ground to the sky, except where specifically provided by this code, on the *lot* on which a *building* is situated.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply adds an option for an open side of a townhouse unit to be a court. This adds a design option not previously allowed but is not expected to change the cost of construction since either townhouse separation walls or fire-resistance rated exterior walls are currently required for adjacent townhouse units.

G32-25 Part II

G33-25 Part I

IBC: SECTION 202

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[BS] WINDBORNE DEBRIS REGION. Areas within *hurricane-prone regions* located:

1. Within 1 mile (1.61 km) of the mean high-water line where an Exposure D condition exists upwind at the waterline and the basic wind speed, *V*, is 130 mph (58 m/s) or greater. ~~; or~~
2. In areas where the basic wind speed, *V*, is 140 mph (63 m/s) or greater.
3. Anywhere in the State of Hawaii.

For *Risk Category* II buildings and structures and Risk Category III buildings and structures, except health care facilities, the windborne debris region shall be based on Figure 1609.3.(1). For *Risk Category* IV buildings and structures and *Risk Category* III health care facilities, the windborne debris region shall be based on Figure 1609.3(2).

Reason: This coordination code change proposal will align the IBC with requirements of existing standards required in the State of Hawaii. Additionally, the revisions to ASCE 7 are occurring simultaneously, which will result in clear requirements in both the governing standards and the code.

Technical Rationale

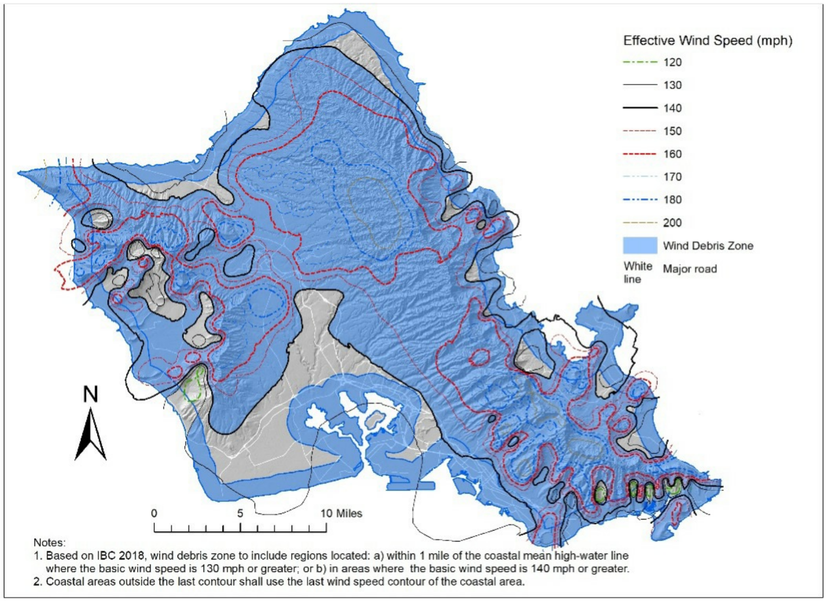
Physically implausible wind debris regions result in Hawaii when its micro-zoned Basic Wind Speed maps with complex topographic effects are used for defining the wind-borne debris region. As illustrated below, applying the wind maps with the criteria laid out in the ASCE 7-22, Section 26.12.3.1, which is also captured in the I-codes definition of a windborne debris region, results in very irregular debris zones with interspersed veins of excluded areas that have vanishing thin extents as well as small pockets of windborne debris zones.

Furthermore, on Kauai, the wind-borne debris region per ASCE 7-22 and the current I-code windborne debris region definition, excludes the town of Lihue that had photographic and video documentation of copius amounts of large wind-borne debris during Hurricane Iniki (1992). The relatively small dimensions of the islands in Hawaii generally do not result in degradation of the intensities of landfalling or near-landfalling hurricanes.

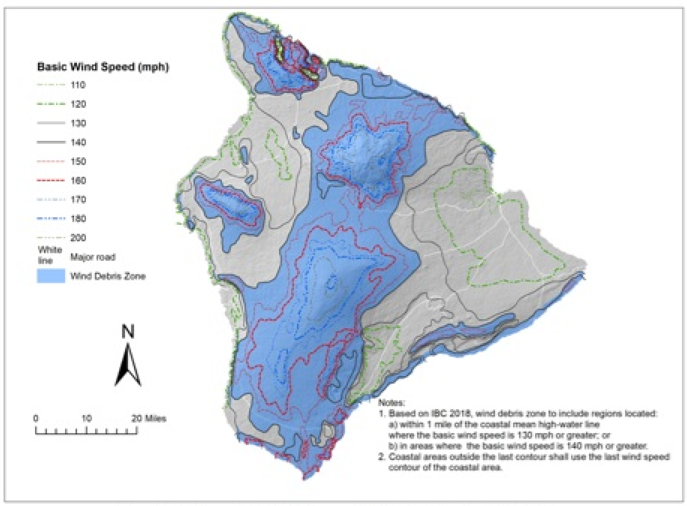
Since 2005 to the present, ASTM E1996, Standard Specification for Performance of Exterior Windows, Curtain Walls, Doors, and Impact Protective Systems Impacted by Windborne Debris in Hurricanes, has defined all of Hawaii to be in Wind Zone 1. Further, most recently, a proposal to address this issue was put forth to the ASCE 7 Subcommittee on Wind Loads, where it passed both that subcommittee and the main committee for adoption into the next edition.

To avoid contradictions and to re-establish consistency with the simple and clear definition for Hawaii that has existed in ASTM E1996, and as proposed in what will be the 2028 edition of ASCE 7, this ICC proposal follows by adding a third category that makes it clear the entire state of Hawaii is within a wind-borne debris region. This also brings consistency with the windborne debris region definition in the IRC that does list Hawaii, although a corresponding code change to that definition has also been submitted to make the language completely identical.

Additional information with pictures that illustrate the problem follows.

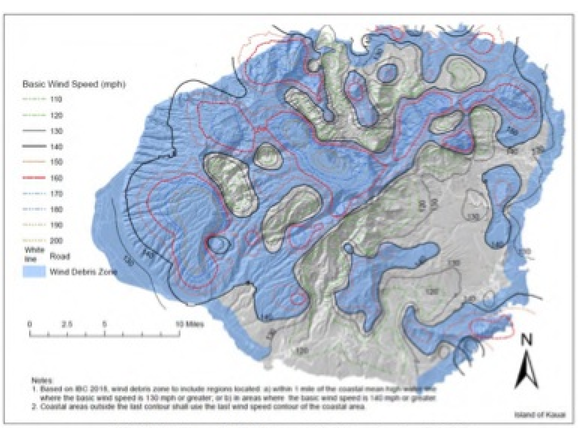


Wind Debris Zones for Risk Category II Buildings Based on IBC 2018



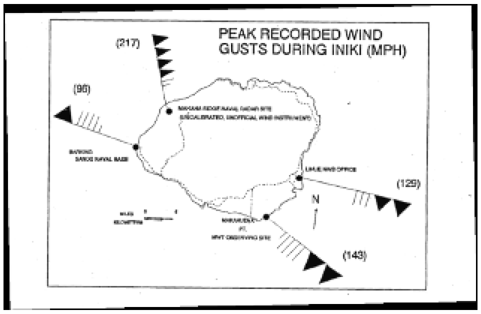
Wind Debris Zones for Risk Category II Buildings Based on IBC 2018

The above illustrates Hawaii windborne debris regions for RC II when applying the criteria of ASCE 7-16/ASCE 7-22/IBC 2018, 2021, and 2024.



Wind Debris Zones for Risk Category II Buildings Based on IBC 2018

The above illustrates the problematic Kauai windborne debris regions for RC II per ASCE 7-16/ASCE 7-22/IBC 2018, 2021, and 2024.



NOAA Natural Disaster Survey Report and NOAA Storm Data for September 1992

Wind-Borne Debris in Lihue, Kauai, during Hurricane Iniki (1992). Figure insert caption states, “Sheets of roofing iron, a pallet, broken plants and other debris fly though the air at height of Hurricane Iniki in Lihue, Kauai.”

Hurricane Iniki –Preliminary Observations of Wind Engineering Research Council Post-Disaster Team (Perry, Chiu, and Schroeder): “With few exceptions, loss of windows and roof coverings of all types was common, resulting in major water damage to building contents and interiors. Most glass breakage appeared to be due to wind borne debris.”

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no resulting cost implication from this code change proposal because these requirements are already existing and required by the State of Hawaii.

G33-25 Part I

G33-25 Part II

IRC: SECTION 202

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Residential Code

[RB] WINDBORNE DEBRIS REGION. Areas within *hurricane-prone regions* located ~~in accordance with one of the following~~:

1. Within 1 mile (1.61 km) of the mean high-water line where an Exposure D condition exists upwind at the water line and the ultimate design wind speed, V_{ult}, is 130 mph (58 m/s) or greater.

2. In areas where the ultimate design wind speed, V_{ult}, is 140 mph (63 m/s) or greater~~; or Hawaii~~.

3. <u>Anywhere in the state of Hawaii.</u>

Reason: This coordination code change proposal will align the IBC with requirements of existing standards required in the State of Hawaii. Additionally, the revisions to ASCE 7 are occurring simultaneously, which will result in clear requirements in both the governing standards and the code. This change is also being proposed in the IBC for consistency.

<u>Technical Rationale</u> Physically implausible wind debris regions result in Hawaii when its micro-zoned Basic Wind Speed maps with complex topographic effects are used for defining the windborne debris region. Applying the wind maps with the criteria laid out in the ASCE 7-22, Section 26.12.3.1, results in very irregular debris zones with interspersed veins of excluded areas that have vanishingly thin extents as well as small pockets of windborne debris zones. Furthermore, on Kauai, the 2022 edition of ASCE 7 excludes the town of Lihue that had photographic and video documentation of copius amounts of large windborne debris during Hurricane Iniki (1992). The relatively small dimensions of the islands in Hawaii generally do not result in degradation of intensities of landfalling or near-falling hurricanes.

Since 2005 to the present, ASTM E1996, Standard for Specification for Performance of Exterior Windows, Curtain Walls, Doors, and Impact Protective Systems Impacted by Windborne Debris in Hurricanes, has defined all of Hawaii to be in Wind Zone 1. Further, most recently, a proposal to address this issue was put forth to the ASCE 7 Subcommittee on Wind Loads, where it passed both that subcommittee and the main ASCE 7 committee for adoption in what will be the 2028 edition.

A corresponding proposal in the IBC, where the windborne debris region definition is completely silent on Hawaii, has been submitted based on the above reasoning and clearly adds anywhere in the State of Hawaii as the 3rd area classified a windborne debris region. The IRC is not silent about Hawaii, but this proposal aligns the IRC definition to be consistent with the IBC proposal, and make it clear that anywhere in the State of Hawaii falls within the windborne debris region.

This proposal and its corresponding IBC proposal, if adopted, would then have the I-codes align with how Hawaii will be treated in the 2028 edition of ASCE 7 as well as how the state is currently classified in the ASTM E1996 Standard.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no resulting cost implication from this code change proposal because these requirements are already existing and required by the State of Hawaii.

G33-25 Part II

G34-25

IBC: 303.1.2; IFC: [BG] 203.2.2

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

SECTION 303 ASSEMBLY GROUP A

Delete and substitute as follows:

~~**303.1.2 Small assembly spaces.** The following rooms and spaces shall not be classified as Assembly occupancies:~~

1. ~~A room or space used for assembly purposes with an *occupant load* of less than 50 *persons* and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.~~
2. ~~A room or space used for assembly purposes that is less than 750 square feet (70 m^2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.~~

<u>**303.1.2 Small assembly spaces.** Rooms or spaces used for assembly purposes that are less than 750 square feet (70 m^2) in area, or with an occupant load less than 50 persons, shall be classified as Group B or part of the main occupancy.</u>

2024 International Fire Code

Delete and substitute as follows:

~~**[BG] 203.2.2 Small assembly spaces.** The following rooms and spaces shall not be classified as Assembly occupancies:~~

1. ~~A room or space used for assembly purposes with an *occupant load* of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.~~
2. ~~A room or space used for assembly purposes that is less than 750 square feet (70 m^2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.~~

<u>**[BG] 203.2.2 Small assembly spaces.** Rooms or spaces used for assembly purposes that are less than 750 square feet (70 m^2) in area, or with an occupant load less than 50 persons, shall be classified as Group B or part of the main occupancy.</u>

Reason: The change will clarify the intent of the provision is that the assembly space is a support space for the main occupancy, such as conference rooms in office buildings and fitness rooms in residential buildings. Some jurisdictions use the 10 percent of the area of the story threshold of Section 508.2 when applying this provision because the word "accessory" is used. The misinterpretation unnecessarily limits the size of conference rooms in small office buildings.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change would not increase the cost of construction because it is clarifying that the code permits small assembly spaces in smaller buildings.

Reason: The proposed code change is intended to avoid confusion caused when an assembly area is classified as a occupancy Group B and not occupancy Group A2 or A-3. This allowance dates back to the legacy codes. The floor live load table in IBC Table 1607.1 displays live loads based on uses based and not based on occupancy and generalizes all assembly areas.

Assembly areas with fixed seating are assigned a lower live load since the seating area is better defined. When the floor live load for an assembly area using fixed seats is shown at 60 psf a logical reason is the location of the load is defined and not moveable and by defining the seating an aisle is collaterally defined.

When 7 psf per occupant is multiplied by 7 results in 700 lb per occupant it is clear that the load builds in a level of conservatism to account for occupant comfort due to floor vibrations, deflection and also the possibly of the occupants clustered in one area of the floor and not others.

Small assembly areas are similar to areas of fixed seating and when employee lunch areas, small conference rooms and small restaurants like a fast-food subway sandwich store are proposed; the small space has a floor area less than 750 sq ft in the assembly areas is self-limiting, a 25 by 30 area that includes seating, merchandizing shelving etc.

My jurisdiction during the 1990's assigned a floor live load of 75 psf similar to what a legacy code required for retail spaces.

There is limited literature on this subject however proponent is aware of proposals to ASCE 7 for a similar subject area for huddle rooms. An article "Design Live Loads for Office Gathering Spaces published in the Journal of Structural Engineering in 2023 recommends revisiting the building code requirements and using a 50 pfs floor live load for huddle rooms that are small assembly areas.

Small assembly areas include furniture like seating, conference tables etc to make the space useable and as a result the load is forced to be distributed.

Bibliography: ASCE Structural

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This code change will reduce confusion and will reduce the cost of construction since office buildings include floors designed for 70 psf LL (office live load plus partition loads). Floor live load has changed over the decades, and since the legacy Uniform Building Code, and as a result the cost reduction is zero in an existing building since the floor will most likely be compliant with the proposed 60 psf live load. With the proposed live load existing and proposed floors will certainly more compliant than if the 100 pf live load required by the 2024 IBC is implemented; the 2024 IBC will require significant strengthening of the existing floor, or heavier framing for new floors. In an existing building this could cost $300,000 or more in a steel framed building or $100,000 to $200,000 in a wood framed building. In accordance with "Building Valuation Data – FEBRUARY 2024" for a Group B occupancy Type IA construction is 38% more costly than Type VA construction. Concrete buildings tend have floors with additional capacity since a large portion of the gravity load is the dead load due to the heavy weight of reinforced concrete. In a new building the cost increase will be 20% if constructed with structural steel and less if constructed with concrete since additional reinforcing and concrete may be required with roughly the same labor costs; if prestressed concrete it can assumed to be less costly than reinforced concrete since additional pre-stressing and slightly thicker slabs may be require.

Estimated Immediate Cost Impact Justification (methodology and variables):

Lower live load requires smaller floor framing and as a result reduces cost of compliance with the 2024 IBC. The costs include after hours work to access the underside of floors if tenant spaces below are occupied, removal and replacement of ceiling finishes and HVAC if any exists below the floor. If the floor is wood framed strengthening to comply with the 2024 IBC will be simpler than strengthening floors framed with structural steel framing due to the weight of framing materials and steel plates and the need for welding equipment to field welding to weld reinforcing plates. It is assumed that the cost is $300 per square foot under the 700 sq ft room above and accounting for framing that spans to receiving columns beyond the small assembly area.

2024 International Building Code

Revise as follows:

303.4 Assembly Group A-3. Group A-3 occupancy includes assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A, including but not limited to:

Amusement arcades

Art galleries

Bowling alleys

Community halls

Courtrooms

Dance halls (not including food or drink consumption)

Exhibition halls

Funeral parlors

Greenhouses for the conservation and exhibition of plants that provide public access

Gymnasiums (without spectator seating)

<u>Classrooms having an occupant load of 50 or more and used for educational purposes above the 12th grade</u>

Indoor *swimming pools* (without spectator seating)

Indoor tennis courts (without spectator seating)

Lecture halls

Libraries

Museums

Places of religious worship

Pool and billiard parlors

Waiting areas in transportation terminals

2024 International Fire Code

Revise as follows:

[BG] 203.2.8 Assembly Group A-3. Group A-3 occupancy includes assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A, including but not limited to:

Amusement arcades

Art galleries

Bowling alleys

Community halls

Courtrooms

Dance halls (not including food or drink consumption)

Exhibition halls

Funeral parlors

Greenhouses for the conservation and exhibition of plants that provide public access

Gymnasiums (without spectator seating)

<u>Classrooms having an occupant load of 50 or more and used for educational purposes above the 12th grade</u>

Indoor swimming pools (without spectator seating)

Indoor tennis courts (without spectator seating)

Lecture halls

Libraries

Museums

Places of religious worship

Pool and billiard parlors

Waiting areas in transportation terminals

Reason: There is no clear understanding on what a lecture hall is. In speaking with many people that regulate colleges and universities, they tell me that if they have a classroom with an occupant load of 50 or more, they classify the spaces as a Group A-3 Occupancy. Some lecture halls and classrooms can have very large occupant loads and it does not seem logical to call them B occupancies. The intent of the change is to clarify how to handle a classroom in a higher education facility with an occupant load greater than 49. This is consistent with other assembly uses with larger occupant loads.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Since most jurisdictions already classify large classrooms as Group A-3 occupancies already, there should be not any increase or decrease in the cost of construction. This is intended to be a clarification to make the code read the way people are enforcing it.

Greenhouses for the conservation and exhibition of plants that provide public access

Gymnasiums (without spectator seating)

Indoor or outdoor *swimming pools* (without spectator seating)

Indoor or outdoor tennis courts (without spectator seating)

Lecture halls

Libraries

Museums

Places of religious worship

Pool and billiard parlors

Waiting areas in transportation terminals

2024 International Fire Code

Revise as follows:

[BG] 203.2.8 Assembly Group A-3. Group A-3 occupancy includes assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A, including but not limited to:

Amusement arcades

Art galleries

Bowling alleys

Community halls

Courtrooms

Dance halls (not including food or drink consumption)

Exhibition halls

Funeral parlors

Greenhouses for the conservation and exhibition of plants that provide public access

Gymnasiums (without spectator seating)

Indoor or outdoor swimming pools (without spectator seating)

Indoor or outdoor tennis courts (without spectator seating)

Lecture halls

Libraries

Museums

Places of religious worship

Pool and billiard parlors

Waiting areas in transportation terminals

Reason: Many buildings are now constructing swimming pools and tennis courts on occupiable roofs. It is our position that these spaces should have an occupancy classification. We selected Group A-3 occupancies since indoor swimming pools and indoor tennis courts are already listed in that occupancy. The hazards are the same whether the use is indoors or outdoors. By classifying the areas as an occupancy, the rest of the code can be applied consistently. For example, much of the means of egress requirements are based on the occupancy classification. This will provide the user of the code a clear understanding of the requirements to be applied to these uses.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This clarifies what occupany classification a pool falls under, whether it indoors and outdoors. This will not change how most buildings are designed and how the code is enforced.

2024 International Building Code

Add new text as follows:

SECTION 305 DATA CENTERS GROUP D

305.1 Data Centers Group D. *Data center* Group D includes the use of of a *building*, or portion thereof, for the housing of information technology equipment engaged in data processing where not classified as a *computer room*.

2024 International Fire Code

Add new text as follows:

203.4 Data Centers Group D. *Data center* Group D includes the use of of a*building*, or portion thereof, for the housing of information technology equipment engaged in data processing where not classified as a*computer room*.

Reason: Data centers are unique building uses that do not neatly fall into any other occupancy classification. AHJ currently assign various classifications (B, F-2, S-1, S-2) to these buildings which are characterized by only intermittent occupancy in the frequently very large data halls, accessory B uses, and accessory energy storage systems. Providing an occupancy classification specific to this unique use will facilitate the development of code provisions appropriate to the specific hazards. Note that data centers and computer rooms are both information technology equipment facilities with individual definitions making it possible to readily assign 'Group D', without capturing computer rooms in the occupancy classification.

This proposal is the first of several addressing data centers.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These buildings are already being constructed. Assigning a unique occupancy classification to data centers does not automatically affect costs.

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

SECTION 305
EDUCATIONAL GROUP E

305.2 Group E, day care facilities. This group includes *buildings* and *structures* or portions thereof occupied by more than five children older than 2$^1/_2$ years of age who receive educational, supervision or *personal care services* for fewer than 24 hours per day.

305.2.1 Within places of religious worship. Rooms and spaces within *places of religious worship* providing such day care during religious functions shall be classified as part of the primary occupancy.

Revise as follows:

305.2.2 Five or fewer children. A *facility* having five or fewer children receiving such day care shall be classified as part of the primary occupancy. Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or the *International Residential Code* provided such facilities are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code.*

Delete without substitution:

~~**305.2.3 Five or fewer children in a dwelling unit.** A *facility* such as the above within a *dwelling unit* and having five or fewer children receiving such day care shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code*.~~

SECTION 308
INSTITUTIONAL GROUP I

308.5 Institutional Group I-4, day care facilities. Institutional Group I-4 occupancy shall include *buildings* and *structures* occupied by more than five *persons* of any age who receive *custodial care* for fewer than 24 hours per day by *persons* other than parents or guardians; relatives by blood, marriage or adoption; and in a place other than the home of the *person* cared for. This group shall include, but not be limited to, the following:

Adult day care

Child day care

308.5.1 Classification as Group E. A child day care *facility* that provides care for more than five but not more than 100 children 2$^1/_2$ years or less of age, where the rooms in which the children are cared for are located on a *level of exit discharge* serving such rooms and each of these child care rooms has an *exit* door directly to the exterior, shall be classified as Group E.

308.5.2 Within a place of religious worship. Rooms and spaces within *places of religious worship* providing such care during religious functions shall be classified as part of the primary occupancy.

Revise as follows:

308.5.3 Five or fewer persons receiving care. A *facility* having five or fewer *persons* receiving *custodial care* shall be classified as part of the primary occupancy. Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or the *International Residential Code* provided such facilities are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code.*

Delete without substitution:

~~**308.5.4 Five or fewer persons receiving care in a dwelling unit.** A *facility* such as the above within a *dwelling unit* and having five or fewer *persons* receiving *custodial care* shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code.*~~

SECTION 310
RESIDENTIAL GROUP R

Revise as follows:

~~**310.4.1**~~ **310.1.1 Care facilities within a dwelling.** Care *facilities* for five or fewer *persons* receiving care or a day care that are located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or ~~single-family *dwelling* are permitted to comply~~ with the *International Residential Code* provided such facilities are protected by an *automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

2024 International Fire Code

Revise as follows:

[BG] 203.4.2.2 Five or fewer children. A facility having five or fewer children receiving such day care shall be classified as part of the primary occupancy. Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or the *International Residential Code* provided such facilities are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code.*

Delete without substitution:

~~**[BG] 203.4.2.3 Five or fewer children in a dwelling unit.** A facility such as the above within a *dwelling unit* and having five or fewer children receiving such day care shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code* .~~

Revise as follows:

[BG] 203.7.4.3 Five or fewer persons receiving care. A facility having five or fewer persons receiving *custodial care* shall be classified as part of the primary occupancy. Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or the *International Residential Code* provided such facilities are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code.*

Delete without substitution:

~~**[BG] 203.7.4.4 Five or fewer persons receiving care in a dwelling unit.** A facility such as the above within a *dwelling unit* and having five or fewer persons receiving *custodial care* shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code* .~~

Revise as follows:

[BG] ~~203.9.3.1~~ 203.9.1 Care facilities within a dwelling. Care *facilities* for five or fewer *persons* receiving care or a day care that are located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or ~~single-family~~ ~~*dwelling*~~ ~~are permitted to comply~~ with the *International Residential Code* provided such facilities are protected by an *automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

G39-25 Part I

G39-25 Part II

IRC: R101.2

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Residential Code

Revise as follows:

R101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, movement, enlargement, replacement, *repair*, equipment, use and occupancy, location, removal and demolition of detached one- and two-family *dwellings* and *townhouses* not more than three *stories above grade plane* in height with a separate means of egress and their *accessory structures* not more than three *stories above grade plane* in height.

Exception: The following shall be permitted to be constructed in accordance with this code where provided with an automatic sprinkler system complying with Section P2904:

1. Live/work units located in *townhouses* and complying with the requirements of Section 508.5 of the *International Building Code*.
2. *Owner*-occupied *lodging houses* with five or fewer *guestrooms*.
3. A care facility with five or fewer *persons* receiving custodial care within a *dwelling unit*.
4. A care facility with five or fewer persons receiving medical care within a *dwelling unit*.
5. A day care facility for five or fewer *persons* of any age receiving care within a *dwelling unit* <u>or *townhouse unit*</u>.

Reason: The purpose of this code change is to clarify how the occupancy classification for small child day care or adult day care facilities is determined. The proposal allows small daycare or adult care facilities serving five or fewer persons to be classified as part of the primary occupancy of a building housing such a facility, and to note that where they are contained in one- and two-family dwellings or townhouses falling within the scope of the International Residential Code they are permitted to be constructed either per the IBC or IRC.

Consolidating the requirements recognizes Group R-2 townhouses or apartments may also have contain a small day care facility and allows for such facilities serving 5 or fewer occupants to match the main occupancy. This fixes a glitch where the literal text in current Sections 305.2.3 and 308.5.4 says a day care in a dwelling unit make this an R-3 even though the building may be Group R-2.

For facilities that meet the scoping of the IRC (detached single family dwellings, duplexes, and townhouses three stories or less above grade plane), the day care facilities can continue to be constructed under the IRC.A similar BCAC proposal submitted last cycle, G34-21, was disapproved over concerns the original proposal expanded the scope of IRC to include apartment buildings, and that it could be argued a dwelling unit in an apartment building is within the scope of the IRC. Also, some felt the proposal language implied that dwelling units can be included in Group I facilities. BCAC worked with the opponents to develop a public comment to explicitly recognize the types of buildings covered in the IRC scope but was not able to overturn the committee disapproval. This new proposal reflects the clarifications requested by the opponents and committee last cycle.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) the ICC Committee for Healthcare (CHC). .

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at <u>BCAC webpage</u>.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at <u>CHC webpage</u>.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is basically a coordination item for what facilities can use IRC. This should not change construction requirements.

G39-25 Part II

G40-25 Part I

IBC: 308.2.4, 308.3.2, 310.4.1, 310.4.2; IFC: [BG] 203.7.1.4, [BG] 203.7.2.2, [BG] 203.9.3.1, [BG] 203.9.3.2

THIS IS A 2 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC-GENERAL CODE COMMITTEE.

PART II WILL BE HEARD BY THE RESIDENTIAL BUILDING CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

SECTION 305 EDUCATIONAL GROUP E

305.2.3 Five or fewer children in a dwelling unit. A *facility* such as the above within a *dwelling unit* and having five or fewer children receiving such day care shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code*.

SECTION 308 INSTITUTIONAL GROUP I

308.2 Institutional Group I-1. Institutional Group I-1 occupancy shall include *buildings*, *structures* or portions thereof for more than 16 *persons*, excluding staff, who reside on a *24-hour basis* in a supervised environment and receive *custodial care* . *Buildings* of Group I-1 shall be classified as one of the occupancy conditions specified in Section 308.2.1 or 308.2.2 and shall comply with Section 420. This group shall include, but not be limited to, the following:

Alcohol and drug centers

Assisted living *facilities*

Congregate care *facilities*

Group homes

Halfway houses

Residential board and care *facilities*

Social rehabilitation *facilities*

Revise as follows:

308.2.4 Five or fewer persons receiving custodial care. A *facility* with five or fewer *persons* receiving *custodial care* shall be classified as Group R-3 or shall comply with the *International Residential Code* ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*~~.

308.3 Institutional Group I-2. Institutional Group I-2 occupancy shall include *buildings* and *structures* used for *medical care* on a *24-hour basis* for more than five *persons* who are *incapable of self-preservation*. This group shall include, but not be limited to, the following:

Foster care facilities

Detoxification facilities

Hospitals

Nursing homes

Psychiatric hospitals

308.3.2 Five or fewer persons receiving medical care. A facility with five or fewer *persons* receiving *medical care* shall be classified as Group R-3 or shall comply with the *International Residential Code* ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*~~.

308.5 Institutional Group I-4, day care facilities. Institutional Group I-4 occupancy shall include *buildings* and *structures* occupied by more than five *persons* of any age who receive *custodial care* for fewer than 24 hours per day by *persons* other than parents or guardians; relatives by blood, marriage or adoption; and in a place other than the home of the *person* cared for. This group shall include, but not be limited to, the following:

Adult day care

Child day care

308.5.4 Five or fewer persons receiving care in a dwelling unit. A *facility* such as the above within a *dwelling unit* and having five or fewer *persons* receiving *custodial care* shall be classified as a Group R-3 occupancy or shall comply with the *International Residential Code*.

SECTION 310
RESIDENTIAL GROUP R

310.4 Residential Group R-3. Residential Group R-3 occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two *dwelling units*

Care *facilities* that provide accommodations for five or fewer *persons* receiving care

Congregate living facilities (nontransient) with 16 or fewer occupants

Boarding houses (nontransient)

Convents

Dormitories

Emergency services living quarters

Fraternities and sororities

Monasteries

Congregate living facilities (*transient*) with 10 or fewer occupants

Boarding houses (*transient*)

Lodging houses with five or fewer *guest rooms*

Hotels (nontransient) with five or fewer *guest rooms*

Motels (nontransient) with five or fewer *guest rooms*

310.4.1 Care facilities within a dwelling. Care *facilities* for five or fewer *persons* receiving care that are within a single-family *dwelling* are permitted to comply with the *International Residential Code* ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*~~.

310.4.2 Lodging houses. *Owner*-occupied *lodging houses* with five or fewer *guest rooms* shall be constructed in accordance with this code or the *International Residential Code*~~, provided that *facilities* constructed using the *International Residential Code* are protected by an *automatic sprinkler system* installed in accordance with Section P2904 of the *International Residential Code*~~.

2024 International Fire Code

Revise as follows:

[BG] 203.7.1.4 Five or fewer persons receiving custodial care. A facility with five or fewer persons receiving *custodial care* shall be classified as Group R-3 or shall comply with the *International Residential Code* ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*~~.

[BG] 203.7.2.2 Five or fewer persons receiving medical care. A facility with five or fewer persons receiving medical care shall be classified as Group R-3 or shall comply with the *International Residential Code* ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*~~.

[BG] 203.9.3.1 Care facilities within a dwelling. Care facilities for five or fewer persons receiving care that are within a single-family *dwelling* are permitted to comply with the *International Residential Code* ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*~~.

[BG] 203.9.3.2 Lodging houses. Owner-occupied *lodging houses* with five or fewer *guestrooms* shall be constructed in accordance with the *International Building Code* or the *International Residential Code*~~, provided that facilities constructed using the *International Residential Code* are protected by an *automatic sprinkler system* installed in accordance with Section P2904 of the *International Residential Code*~~.

G40-25 Part I

G40-25 Part II

IRC: R101.2

Proponents: Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com); Kota Wharton, representing Self (kwharton@grovecityohio.gov)

2024 International Residential Code

Revise as follows:

R101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, movement, enlargement, replacement, *repair*, equipment, use and occupancy, location, removal and demolition of detached one- and two-family *dwellings* and *townhouses* not more than three *stories above grade plane* in height with a separate means of egress and their *accessory structures* not more than three *stories above grade plane* in height.

Exception: The following shall be permitted to be constructed in accordance with this code ~~where provided with an automatic sprinkler system complying with Section P2904~~:

1. Live/work units located in *townhouses* and complying with the requirements of Section 508.5 of the *International Building Code*.
2. *Owner*-occupied *lodging houses* with five or fewer *guestrooms*.
3. A care facility with five or fewer *persons* receiving custodial care within a *dwelling unit*.
4. A care facility with five or fewer persons receiving medical care within a *dwelling unit*.
5. A day care facility for five or fewer *persons* of any age receiving care within a *dwelling unit* .

Reason: This code change clarifies the sprinkler trigger point between the residential and building code. The intent is to push the trigger point for sprinklers back to the International Residential Code which would allow for jurisdictional preemption to integrate seamlessly with the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is removing inconsistent and redundant language. There is no change to technical criteria.

G40-25 Part II

G41-25

IBC: 308.1; IFC: [BG] 203.7

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

SECTION 308 INSTITUTIONAL GROUP I

Revise as follows:

308.1 Institutional Group I. Institutional Group I occupancy includes, among others, the use of a *building* or *structure*, or a portion thereof, in which care or supervision is provided to *persons* who are are receiving custodial care or medical care ~~or are *incapable of self-preservation* without physical assistance~~ or in which *persons* are detained for penal or correctional purposes or in which the liberty of the occupants is restricted. Institutional occupancies shall be classified as Group I-1, I-2, I-3 or I-4.

308.2 Institutional Group I-1. Institutional Group I-1 occupancy shall include *buildings*, *structures* or portions thereof for more than 16 *persons*, excluding staff, who reside on a *24-hour basis* in a supervised environment and receive *custodial care* . *Buildings* of Group I-1 shall be classified as one of the occupancy conditions specified in Section 308.2.1 or 308.2.2 and shall comply with Section 420. This group shall include, but not be limited to, the following:

Alcohol and drug centers

Assisted living *facilities*

Congregate care *facilities*

Group homes

Halfway houses

Residential board and care *facilities*

Social rehabilitation *facilities*

308.2.1 Condition 1. This occupancy condition shall include *buildings* in which all *persons* receiving *custodial care* who, without any assistance, are capable of responding to an emergency situation to complete building evacuation.

308.2.2 Condition 2. This occupancy condition shall include *buildings* in which there are any *persons* receiving *custodial care* who require *limited verbal or physical assistance* while responding to an emergency situation to complete *building* evacuation.

308.2.3 Six to 16 persons receiving custodial care. A *facility* housing not fewer than six and not more than 16 *persons* receiving *custodial care* shall be classified as Group R-4.

308.2.4 Five or fewer persons receiving custodial care. A *facility* with five or fewer *persons* receiving *custodial care* shall be classified as Group R-3 or shall comply with the *International Residential Code* provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

308.5 Institutional Group I-4, day care facilities. Institutional Group I-4 occupancy shall include *buildings* and *structures* occupied by more than five *persons* of any age who receive *custodial care* for fewer than 24 hours per day by *persons* other than parents or guardians; relatives by blood, marriage or adoption; and in a place other than the home of the *person* cared for. This group shall include, but not be limited to, the following:

Adult day care

Child day care

2024 International Fire Code

Revise as follows:

[BG] 203.7 Institutional Group I. Institutional Group I occupancy includes, among others, the use of a *building*or*structure*, or a portion thereof, in which care or supervision is provided to *persons* who are are receiving custodial care or medical care~~or are~~~~*incapable of self-preservation*~~~~without physical assistance~~or in which *persons* are detained for penal or correctional purposes or in which the liberty of the occupants is restricted. Institutional occupancies shall be classified as Group I-1, I-2, I-3 or I-4.

Reason: The main scope of Group I is not accurate. Group I-1 are persons that are capable of self-preservation.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a correlation of Section 308.1 with Section 308.2. There are no change to construction requirements.

G41-25

G42-25 Part I

IBC: 308.2.4, 308.3.2, 310.4.1; IFC: [BG] 203.7.1.4, [BG] 203.7.2.2, [BG] 203.9.3.1

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

SECTION 308
INSTITUTIONAL GROUP I

Revise as follows:

308.2.4 Five or fewer persons receiving custodial care. A *facility* with five or fewer *persons* receiving *custodial care* shall be classified as Group R-2 or Group R-3 based on the primary occupancy of the building. ~~or shall comply~~ Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or with the *International Residential Code* provided such facilities shall be protected by an *automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

308.3.2 Five or fewer persons receiving medical care. A facility with five or fewer *persons* receiving *medical care* shall be classified as Group R-2 or Group R-3 based on the primary occupancy of the building. ~~or shall comply~~ Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or with the *International Residential Code* provided such facilities shall be protected by an *automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

SECTION 310
RESIDENTIAL GROUP R

~~310.4.1~~310.1.1 Care facilities within a dwelling. Care *facilities* for five or fewer *persons* receiving medical care or custodial care that are located within a ~~single-family *dwelling* are permitted to comply~~ detached one- or two- family dwelling or townhouse unit that is within the scope of the *International Residential Code*, shall be constructed in accordance with this code or with the *International Residential Code* provided such facilities shall be protected by an *automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

2024 International Fire Code

Revise as follows:

[BG] 203.7.1.4 Five or fewer persons receiving custodial care. A *facility* with five or fewer *persons* receiving *custodial care* shall be classified as Group R-2 or Group R-3based on the primary occupancy of the building.~~or shall comply~~Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the*International Residential Code*, shall be constructed in accordance with this code orwith the *International Residential Code*provided such facilities shall be protected by an *automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

[BG] 203.7.2.2 Five or fewer persons receiving medical care. A facility with five or fewer *persons* receiving *medical care* shall be classified as Group R-2 or Group R-3based on the primary occupancy of the building.~~or shall comply~~Such a facility, located within a detached one- or two- family dwelling or townhouse unit that is within the scope of the*International Residential Code*, shall be constructed in accordance with this code or with the *International Residential Code* providedsuch facilities shall be protected by an *automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

[BG] ~~203.9.3.1~~ 203.9.1 Care facilities within a dwelling. Care *facilities* for five or fewer *persons* receiving medical care or custodial care that are located within a ~~single-family~~*~~dwelling~~*~~are permitted to comply~~ detached one- or two- family dwelling or townhouse unit that is within the scope of the*International Residential Code*, shall be constructed in accordance with this code or with the *International Residential Code* provided such facilities shall be protected by an*automatic sprinkler system* ~~is~~ installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the*International Residential Code*.

G42-25 Part I

G42-25 Part II

IRC: R101.2

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Residential Code

Revise as follows:

R101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, movement, enlargement, replacement, *repair*, equipment, use and occupancy, location, removal and demolition of detached one- and two-family *dwellings* and *townhouses* not more than three *stories above grade plane* in height with a separate means of egress and their *accessory structures* not more than three *stories above grade plane* in height.

Exception: The following shall be permitted to be constructed in accordance with this code where provided with an automatic sprinkler system complying with Section P2904:

1. Live/work units located in *townhouses* and complying with the requirements of Section 508.5 of the *International Building Code*.
2. *Owner*-occupied *lodging houses* with five or fewer *guestrooms*.
3. A care facility with five or fewer *persons* receiving custodial care within a *dwelling unit*<u>or *townhouse unit*</u>.
4. A care facility with five or fewer persons receiving medical care within a *dwelling unit* <u>or *townhouse unit*</u>.
5. A day care facility for five or fewer *persons* of any age receiving care within a *dwelling unit* .

Reason: The purpose of this code change is to clarify how the occupancy classification for small medical or custodial care facilities is determined. The proposal allows these small care facilities serving five or fewer persons to be classified as part of the primary occupancy of any home environment, be it a detached single-family dwelling, townhouse, apartment or condominium, housing such a facility, and to note that where they are contained in one- and two-family dwellings or townhouses falling within the scope of the International Residential Code they are permitted to be constructed either per the IBC or IRC.

The Fair Housing Act does not allow for “family” to be defined by blood or marriage. Multiple court cases have confirmed that people have the right to live in a home environment instead of an institutional facility if they so choose. If this is a business, this small group home is most likely operating as a family; and would fall below the licensure rules of most states. However, in most cases, this will be couple with foster children or someone taking care of a friend who needs assistance - not a business. The IBC does not typically go into issues on licensure or who is paying what – it looks at the use of the space.

This proposal does not change what sorts of care facilities can currently be constructed under the IRC, however, in the past there have been arguments that these care facilities should not be permitted under the IRC. This proposal clarifies that such care facilities in dwellings that meet the scoping of the IRC (detached single family dwellings, duplexes, and townhouses three stories or less above grade plane), can continue to be constructed under the IRC.A similar BCAC proposal submitted last cycle, G42-21, was disapproved over concerns the original proposal expanded the scope of IRC to include apartment buildings, and that it could be argued a dwelling unit in an apartment building is within the scope of the IRC. Also, some felt the proposal language implied that dwelling units can be included in Group I-2 facilities. BCAC worked with the opponents to develop a public comment to explicitly recognize the types of buildings covered in the IRC scope but was not able to overturn the committee disapproval. This new proposal reflects the clarifications requested by the opponents and committee last cycle.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) the ICC Committee for Healthcare (CHC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is basically a coordination item for what facilities can use the IRC. This should not change construction requirements.

G42-25 Part II

G43-25

IBC: 310.3; IFC: [BG] 203.9.2

Proponents: Scot Harris, Preston Wood & Associates, LLC. Jack Preston Wood AIBD/NCBDC, representing self (scot@jackprestonwood.com)

2024 International Building Code

Revise as follows:

310.3 Residential Group R-2. Residential Group R-2 occupancies containing *sleeping units* or more than two *dwelling units* per tract of land where the occupants are primarily permanent in nature, including:

Apartment houses

Condominiums

Townhouse dwelling units on a single tract of land as defined by metes and bounds

Congregate living facilities (nontransient) with more than 16 occupants

Boarding houses (*nontransient*)

Convents

Dormitories

Emergency services living quarters

Fraternities and sororities

Monasteries

Hotels (nontransient) with more than five *guest rooms*

Live/work units

Motels (nontransient) with more than five *guest rooms*

Vacation timeshare properties

2024 International Fire Code

Revise as follows:

[BG] 203.9.2 Residential Group R-2. Residential Group R-2 occupancies containing sleeping units or more than two *dwelling units* per tract of land where the occupants are primarily permanent in nature, including:

Apartment houses

Condominiums

Townhouse dwelling units on a single tract of land as defined by metes and bounds

Congregate living facilities (nontransient) with more than 16 occupants

Boarding houses (nontransient)

Boarding houses (nontransient)

Convents

Dormitories

Emergency services living quarters

Fraternities and sororities

Monasteries

Hotels (nontransient) with more than five guestrooms

Live/work units

Motels (nontransient) with more than five guestrooms

Vacation timeshare properties

Reason: This is one part of a multi-part proposal to further define the parameters when determining if a building can be permitted under the IRC or IBC. See proposal RB58-25.

The phrase “Townhouse” is littered throughout the IRC publication, but no attention has been addressed as to when a townhouse can be permitted as a R-2 or R-3 Building Classification. By adding the tract of land phrase, it will become clearer. It is my understanding that the IRC is inclusive to R-3 Building Classifications.

On a separate subject:

“Condominiums” is a glorified way to say separate entities can own the dwelling space inside an apartment house or other types of dwelling structures. I know of some instances where an apartment was converted to a condominium and some instances where a building was intentionally designed as a condominium. I have even seen hotels and motels converted to condominiums. This sleeping unit type shall be added to this section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is for clarification purposes only (see reason statement).

G45-25 Part I

G45-25 Part II

IFC: [A] 102.5

Proponents: Jeffrey Shapiro, P.E., FSFPE, LTFR, representing Lake Travis Fire Rescue (jeff.shapiro@intlcodeconsultants.com)

2024 International Fire Code

Revise as follows:

[A] 102.5 Application of residential code. Where structures are designed and constructed in accordance with the *International Residential Code*, the provisions of this code shall apply as follows:

1. Construction and design provisions of this code pertaining to the exterior of the structure shall apply including, but not limited to, premises identification, fire apparatus access and water supplies. Where interior or exterior systems or devices are installed, construction permits required by Section 105.6 shall apply.
2. Administrative, operational and maintenance provisions of this code shall apply.
3. Sections 1103.8 and 1103.9 of this code shall apply. For the purpose of applying these sections, buildings classified as one- and two-family dwellings and townhouses in accordance with the *International Residential Code* shall be regulated as Group R occupancies.

Reason: This proposal addresses a couple holes in the code with respect to ensuring proper protection of existing one- and two-family dwellings and townhouses with respect to providing smoke alarms and carbon monoxide alarms. It has always been the intent of the IFC to require that smoke alarms, and now CO alarms, be retrofitted into existing dwelling units, regardless of whether they are built under the IRC or IBC. IFC Chapter 11 makes this somewhat clear by including provisions for Group R-3 occupancies, and one can assign Group R-3 to IRC one- and two-family dwellings and townhouse units for purposes of applying Sections 1103.8 and 1103.9. However, that could be seen as a stretch since the IRC doesn't assign occupancy classifications and IFC Section 102.5 creates a path to arguably avoid compliance via the IRC since the IRC doesn't specifically address retrofitting of alarms into existing dwellings. The intent of this proposal is to close that apparent loophole.

In reviewing this issue, I noticed that townhouse units also need to be better addressed when it comes to occupancy classification. Townhouse units that are constructed as separate buildings, rather than as part of larger Group R-1 or Group R-2 multifamily occupancy townhouse structures, currently fall into an occupancy classification hole. In any case, three or more townhouse units will create a townhouse, but depending on the fire separations between townhouse units, the townhouse structure might be a single multifamily occupancy or an accumulation of multiple individual occupancies, presumably R-3, but the code doesn't currently state that. The proposed change to the R-3 definition should fix that.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The intent is to clarify current code provisions by eliminating ambiguities in the text. See reason statement.

G45-25 Part II

G46-25 Part I

IBC: 310.5; IFC: [BG] 203.9.4

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org); Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com); Kota Wharton, representing Self (kwharton@grovecityohio.gov)

THIS IS A 2 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC-GENERAL CODE COMMITTEE.

PART II WILL BE HEARD BY THE RESIDENTIAL BUILDING CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

SECTION 310
RESIDENTIAL GROUP R

Revise as follows:

310.5 Residential Group R-4. Residential Group R-4 occupancy shall include *buildings*, *structures* or portions thereof for more than five but not more than 16 *persons*, excluding staff, who reside on a *24-hour basis* in a supervised residential environment and receive *custodial care*. *Buildings* of Group R-4 shall be classified as one of the occupancy conditions specified in Section 310.5.1 or 310.5.2. This group shall include, but not be limited to, the following:

Alcohol and drug centers

Assisted living *facilities*

Congregate care *facilities*

Group homes

Halfway houses

Residential board and care *facilities*

Social rehabilitation *facilities*

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code.

<u>Such a facility, located within a dwelling unit that is within the scope of the I*nternational Residential Code*, shall be permitted to be constructed in accordance with this code or with the International Residential Code</u>.

2024 International Fire Code

Revise as follows:

[BG] 203.9.4 Residential Group R-4. Residential Group R-4 shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised residential environment and receive custodial care. Buildings of Group R-4 shall be classified as one of the occupancy conditions specified inSection 203.9.4.1 or 203.9.4.2. This group shall include, but not be limited to, the following:

Alcohol and drug centers

Assisted living facilities

Congregate care facilities

Group homes

Halfway houses

Residential board and care facilities

Social rehabilitation facilities

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in the *International Building Code*.
Such a facility, located within a dwelling unit that is within the scope of the I*nternational Residential Code*, shall be permitted to be constructed in accordance with this code or with the International Residential Code.

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org); Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com); Kota Wharton, representing Self (kwharton@grovecityohio.gov)

2024 International Residential Code

SECTION R101
SCOPE AND GENERAL REQUIREMENTS

Revise as follows:

R101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, movement, enlargement, replacement, *repair*, equipment, use and occupancy, location, removal and demolition of detached one- and two-family *dwellings* and *townhouses* not more than three *stories above grade plane* in height with a separate means of egress and their *accessory structures* not more than three *stories above grade plane* in height.

Exception: The following shall be permitted to be constructed in accordance with this code where provided with an automatic sprinkler system complying with Section P2904:

1. Live/work units located in *townhouses* and complying with the requirements of Section 508.5 of the *International Building Code*.
2. *Owner*-occupied *lodging houses* with five or fewer *guestrooms*.
3. A care facility with five or fewer *persons* receiving custodial care within a *dwelling unit*.
4. A care facility with five or fewer persons receiving medical care within a *dwelling unit*.
5. A day care facility for five or fewer *persons* of any age receiving care within a *dwelling unit*.
6. <u>A care facility within a dwelling unit or townhouse unit with more than five but not more than 16 *persons*, excluding staff, who reside in a supervised residential environment and receive *custodial care.*</u>

Add new definition as follows:

<u>**CUSTODIAL CARE.** Describes *persons* who receive assistance with day-to-day living tasks such as cooking, taking medication, bathing, using toilet *facilities* and other tasks of daily living. *Custodial care* includes *persons* receiving care who have the ability to respond to emergency situations and may receive *limited verbal or physical assistance*. These care recipients may evacuate at a slower rate and/or who have mental and psychiatric complications.</u>

Reason: The intent of this proposal is to restore to the codes an allowance for a Group R-4 Group home to be constructed under the IRC. This was permitted in the code from 2000 through 2009.

We would like to stress that Group R-4 is limited to 16 occupants, and residents are required to be capable of self-preservation. This was occupant limit was originally based on 1) the allowances for an NFPA13D sprinkler system, and 2) that in the national census, 98% of the homes that identified themselves as a family, were 16 or few occupants. A group home could be a home for young adults recovering from addiction, a home for batter women and their children, or a group of elderly adults. These facilities are not a Nursing home.

There is a serious issue with homelessness in the United States. Many of these individuals would benefit from the opportunity to live in a supervised environment, either on a permanent basis, or a temporary basis to help them get back on their feet. The ADA includes an 'integration mandate' that requires state and local governments the provide services in a residential setting - not just in institutions - Community Integration | ADA.gov. The Fair Housing Act specified that families cannot be determined only by 'blood or marriage', therefor, a people that live in a group home should be treated equally as a family. Fair Housing and Related Law | HUD.gov / U.S. Department of Housing and Urban Development (HUD)The Department of Justice is suing the state of Pennsylvania over discrimination that restricts community-based housing. Middle District of Pennsylvania | Justice Department Sues Pennsylvania Over Discriminatory

Code Requirements That Restrict Community-Based Housing for People with Disabilities | United States Department of Justice

There are reports from other states over similar lawsuits.

While the building code provides minimum life safety requirements for all housing, the concern is that the specific needs and capabilities of the residents in Group Homes are not being considered in the development of requirements.G20-09/10 removed the option for Group R-4 to be constructed under the IRC in Section 310.1 as part of a comprehensive overhaul for care facilities. This change was not explained in the reason statement. The reason did state that "Federal regulations and state licensing provisions were considered, but primarily in terms of avoiding conflicting requirements." There was not a similar change to the IRC because the scopes were not coordinated at that time.

The following is provided for context - Specifically Section 308.2.3 would send a user to Section 310.5 for Group R-4 requirements.

SECTION308
INSTITUTIONAL GROUP I

308.2 Institutional Group I-1. Institutional Group I-1 occupancy shall include *buildings*, *structures* or portions thereof for more than 16 *persons*, excluding staff, who reside on a *24-hour basis* in a supervised environment and receive *custodial care*. *Buildings* of Group I-1 shall be classified as one of the occupancy conditions specified in Section 308.2.1 or 308.2.2 and shall comply with Section 420. This group shall include, but not be limited to, the following:

Alcohol and drug centers

Assisted living *facilities*

Congregate care *facilities*

Group homes

Halfway houses

Residential board and care *facilities*

Social rehabilitation *facilities*

308.2.1 Condition 1. This occupancy condition shall include *buildings* in which all *persons* receiving *custodial care* who, without any assistance, are capable of responding to an emergency situation to complete building evacuation.

308.2.2 Condition 2. This occupancy condition shall include *buildings* in which there are any *persons* receiving *custodial care* who require *limited verbal or physical assistance* while responding to an emergency situation to complete *building* evacuation.

308.2.3 Six to 16 persons receiving custodial care. A *facility* housing not fewer than six and not more than 16 *persons* receiving *custodial care* shall be classified as Group R-4.

308.2.4 Five or fewer persons receiving custodial care. A *facility* with five or fewer *persons* receiving *custodial care* shall be classified as Group R-3 or shall comply with the *International Residential Code* provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 of this code or Section P2904 of the *International Residential Code*.

SECTION310
RESIDENTIAL GROUP R

310.1 Residential Group R. Residential Group R includes, among others, the use of a *building* or *structure*, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code*. Group R occupancies not constructed in accordance with the *International Residential Code* as permitted by Sections 310.4.1 and 310.4.2 shall comply with Section 420.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

This proposal is submitted by the The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is restoring an option for Group homes that is consistent with single family homes. The construction requirements should be the same.

G46-25 Part II

G47-25

IBC: 311.1.1; IFC: [BG] 203.10.1

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

SECTION 311
STORAGE GROUP S

Revise as follows:

311.1.1 Accessory storage spaces. A room or space used for storage purposes that is accessory to another occupancy, and does not exceed the square footage of the main occupancy shall be classified as part of that occupancy.

2024 International Fire Code

Revise as follows:

[BG] 203.10.1 Accessory storage spaces. A room or space used for storag, and does not exceed the square footage of the main occupancy shall be classified as part of that occupancy.

Reason: The code removed any size limitations for accessory storage spaces and then failed to define the term Accessory Storage Space. It could be argued that storage is always accessory to something – factory, retail use, business, etc. Drawn to its logical extreme conclusion, the code allows a large warehouse with a small office and a Group B classification. The removal of the size limitation effectively removes the S occupancy designation from the code.

There is no guideline to determining the significantly higher hazard of the storage activity.

This new approach to classifying storage spaces does not vary based upon the size of the storage space. There is no square footage or percentage threshold, such as 100 square feet or 10%, over which the Group S classification will be applied. Where the storage use is considered as accessory to the other uses in building, it shall be classified in accordance with those other uses. The key point is the hazard level that storage brings to the building. It is assumed that accessory storage uses pose little additional hazard above the occupancies which they serve. Where storage activities pose a significantly higher hazard than the other uses in the building, they would typically not be considered accessory and therefore classified as a Group S occupancy.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal is a clarification of the intent of the code and is not anticipated to increase or decrease the cost of construction.

G47-25

G48-25

IBC: 311.1.1; IFC: [BG] 203.10.1

Proponents: Raymond Steadward Jr, Town of Enfield CT, representing Myself (rsteadward@enfield.org)

2024 International Building Code

Delete without substitution:

~~**311.1.1 Accessory storage spaces.** A room or space used for storage purposes that is accessory to another occupancy shall be classified as part of that occupancy.~~

2024 International Fire Code

Delete without substitution:

~~**[BG] 203.10.1 Accessory storage spaces.** A room or space used for storage purposes that is accessory to another occupancy shall be classified as part of that occupancy.~~

Reason: This section has introduced confusion since it came in. The committee reasoning from the approval seemed to indicate that these accessory storage spaces were already covered in 508 and this clarification was arguably unnecessary. If the desire is to raise the allowable storage to greater than 10% and stay accessory, that should be addressed in 508. If the intent is to not call certain storage rooms a storage use, that is best to go back to 509 and spell it out specifically there with incidental. The unintended consequences of this section and the way the commentary was written for it are as follows.

If this section truly waives the accessory limits on storage uses, you can build a car dealership and call the repair garage bays accessory under this section, and not sprinkler them under the B use…With no size limit or Ch. 9 restrictions.

Bibliography: 2018 IBC code insights to section 311.1.1

2018 IBC Commentary

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

I believe this to be a clarification of what the intent was supposed to be.

IBC: 312.1; IFC: [BG] 203.11

Proponents: Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov); Stephen Van Hoose, representing NYS DOS (stephen.vanhoose@dos.ny.gov); Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Kevin Duerr-Clark, representing NYSDOS (kevin.duerr-clark@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov)

2024 International Building Code

SECTION 312
UTILITY AND MISCELLANEOUS GROUP U

Revise as follows:

312.1 General. *Buildings* and *structures*, or portions thereof, of an accessory character and miscellaneous *structures*, or portions thereof, not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings

Aircraft hangars, accessory to a one- or two-family residence (see Section 412.4)

Barns

Carports

Communication equipment *structures* with a *gross floor area* of less than 1,500 square feet (139 m^2)

Fences more than 7 feet (2134 mm) in height

Grain silos, accessory to a residential occupancy

Livestock shelters

Private garages

Retaining walls

Sheds

Stables

Tanks

Towers

2024 International Fire Code

Revise as follows:

[BG] 203.11 Miscellaneous Group U. *Buildings* and *structures*, or portions thereof, of an accessory character and miscellaneous *structures*,or portions thereof, not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings

Aircraft hangar, accessory to a one- or two-family residence (see Section 412.4 of the *International Building Code*)

Barns

Carports

Communication equipment structures with a gross floor area of less than 1,500 square feet (139 m^3)

Fences more than 7 feet (2134 mm) in height

Grain silos, accessory to a residential occupancy

Livestock shelters

Private garages

Retaining walls

Sheds

Stables

Tanks

Towers

Reason: All occupancy types except Group U make it clear that the occupancy type applies to portions of buildings that fall under that occupancy. Despite Group U lacking this language, Table 508.4 includes Group U in the occupancy fire separation provisions, which clearly implies that Group U is intended to apply to portions of a building which fall under the scope of Group U. Due to "or portions thereof" being omitted from Section 312.1, there has been confusion brought to NYS regarding whether or not Group U can apply to portions of a building, such as utility rooms. This proposal adds this language in a similar manner to all the other occupancy types, thus clarifying that Group U can apply to portions of a building.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This edit simply clarifies that portions of buildings can qualify as U occupancies.

G49-25

G50-25

IBC: 402.6.2

Proponents: Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

2024 International Building Code

SECTION 402
COVERED MALL AND OPEN MALL BUILDINGS

402.6.2 Kiosks. Kiosks and similar *structures* (temporary or permanent) located within the *mall* of a *covered mall building* or within the perimeter line of an *open mall building* shall meet the following requirements:

1. Combustible kiosks or other *structures* shall not be located within a *covered* or *open mall* unless constructed of any of the following materials:
   1.1. *Fire-retardant-treated* wood complying with Section 2303.2.
   1.2. Foam plastics having a maximum heat release rate not greater than 100 kW (105 Btu/h) when tested in accordance with the exhibit booth protocol in UL 1975 or when tested in accordance with NFPA 289 using the 20 kW ignition source.
   1.3. Aluminum composite material (ACM) meeting the requirements of Class A *interior finish* in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended.
   1.4 Laminated panels complying with the requirements for laminated products in Section 803.11, except that, when tested in accordance with ASTM E84 or UL 723, the laminated panel shall have a Class A classification.
2. Kiosks or similar *structures* located within the *mall* shall be provided with *approved automatic sprinkler system* and detection devices.
3. The horizontal separation between kiosks or groupings thereof and other *structures* within the *mall* shall be not less than 20 feet (6096 mm).
4. Each kiosk or similar *structure* or groupings thereof shall have an area not greater than 300 square feet (28 m^2).

Reason: The list of materials that are permitted in kiosks does not address materials that are commonly used in such areas, namely laminated panels. Such panels are typically composed of a factory-produced laminated product with a wood substrate and a plastic laminate. It is very rare for such panels to be made with fire-retardant treated wood (FRTW) substrates and the list does not cover laminated FRTW panels either. Therefore this addition is important to the list.

The proposal bases the requirements on what is required for laminated products in section 803.11 of the IBC, with the added requirement that the panels must exhibit a flame spread index of not more than 25 (meaning a Class A) in accordance with ASTM E84 (while 803.11 allows Class A, B, or C) or meet the chapter 8 requirements based on testing to NFPA 286. The smoke requirement is the same for Classes A, B, and C, and remains a requirement. A Class A laminated panel would be consistent with the fire safety requirements associated with other materials in the list.

Note that the proposal is specific about factory produced laminated products, meaning that it would not apply to a veneer or a facing applied on site, covered by Section 803.12.

IBC 803.11 reads as follows:

803.11 Laminated products factory produced with a wood substrate, *Laminated products factory produced with a wood substrate shall comply with one of the following:*
1. The laminated product shall meet the criteria of Section 803.1.1.1 when tested in accordance with NFPA 286 using the product-mounting system, including adhesive, as described in Section 5.8 of NFPA 286.
2. The laminated product shall have a Class A, B, or C flame spread index and smoke-developed index, based on the requirements of Table 803.13, in accordance with ASTM E84 or UL 723. Test specimen preparation and mounting shall be in accordance with ASTM E2579.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is likely that such laminated panels are actually in use now.

G50-25

G51-25

IBC: 402.8.9 (New)

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

SECTION 402
COVERED MALL AND OPEN MALL BUILDINGS

Add new text as follows:

402.8.9 Stairway door operation. Stairway doors, other than the exit discharge doors, shall be permitted to be locked from the stairway side. Stairway doors that are locked from the stairway side shall be capable of being unlocked without unlatching where any of the following conditions occur:

1. Shall be capable of being unlocked individually or simultaneously upon a signal from the fire command center, where present, or a signal by emergency personnel from a single location inside the main entrance to the building.
2. Simultaneously upon activation of a fire alarm signal in an area served by the stairway.
3. Upon failure of the power supply to the lock or locking system.

Exception: Stairway doors opening directly into tenant spaces are permitted to unlock without unlatching only upon a signal from the fire command center, where present, or a signal by emergency personnel from a single location inside the main entrance to the building.

Reason: The conditions above create a possible security and insurance risk for stairs to unlock automatically upon alarm when the access door is directly into a privately leased or owner tenant space. Tenant spaces may have only certain hours of operation and are closed during off hours leaving these spaces unprotected. These areas are at risk of intentional or unintentional alarms providing free access to their units / tenant space. A savvy criminal could pull a fire alarm and gain access to businesses and burglarize the space. Therefore, it is reasonable to allow these types of spaces to utilize only the manual function from the fire command center to unlock the associated doors to their spaces, so only trained personnel (either fire department or facility personnel) can provide this necessary access.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The power and controls for the equipment outlined in the code change proposal will be present based if the doors are elected to be locked in the non-egress direction. The modifications required as part of the code change proposal can be handled by the applicable installing contractors.

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

SECTION 403 HIGH-RISE BUILDINGS

Revise as follows:

403.6.1 Fire service access elevator. In *buildings* with an occupied floor more than 120 feet (36 576 mm) above the lowest level of fire department vehicle access, not fewer than two fire service access elevators, or all elevators, whichever is less, shall be provided in accordance with Section 3007. Each fire service access elevator shall have a capacity of not less than 3,500 pounds (1588 kg) and shall comply with Section 3002.4.

Exception: Where a building is provided with multiple ambulance stretcher-sized elevator cars in accordance with Section 3002.4 in the quantities prescribed in Table 403.6.1, fire service access elevators shall not be required.

Add new text as follows:

TABLE 403.6.1 AMBULANCE STRETCHER-SIZED ELEVATOR CAR

HIGHEST FLOOR LEVEL SERVED ABOVE THE LOWEST LEVEL OF FIRE DEPARMTNE ACCESS (feet)	NUMBER OF ELEVATOR CLARS TO ACCOMMODATE AN AMBULANCE STRETCHER[a]
120 - 599	3
600 - 899	4
900 and greater	5

For SI: 1 foot = 0.348 m

SECTION 3002 HOISTWAY ENCLOSURES

Revise as follows:

3002.4 Elevator car to accommodate ambulance stretcher. Where elevators are provided in *buildings* four or more *stories* above, or four or more *stories* below, *grade plane*, not fewer than one elevator, or the number specified in Table 403.6.1 for high-rise buildings, shall be provided for fire department emergency access to all floors. The elevator car shall be of such a size and arrangement to accommodate an ambulance stretcher 24 inches by 84 inches (610 mm by 2134 mm) with not less than 5-inch (127 mm) radius corners, in the horizontal, open position and shall be identified by the international symbol for emergency medical services (star of life). The symbol shall be not less than 3 inches (76 mm) in height and shall be placed inside on both sides of the hoistway door frame.

SECTION 3003 EMERGENCY OPERATIONS

[F] 3003.1.3 Two or more elevators. Where two or more elevators are controlled by a common operating system, all elevators shall automatically transfer to standby power within 60 seconds after failure of normal power where the standby power source is of sufficient capacity to operate all elevators at the same time. Where the standby power source is not of sufficient capacity to operate all elevators at the same time, all elevators shall transfer to standby power in sequence, return to the designated landing and disconnect from the standby power source. After all elevators have been returned to the designated level, not less than one elevator, and all elevators installed in accordance with the Exception to Section 403.6.1, shall remain operable from the standby power source.

Reason: The use of these elevators have been incorporated into every high-rise greater than 120 feet in Southern Nevada since the adoption of the 2000 IBC.

Base IBC Section 403.6.1 requires a minimum of two (2) fire service access elevators, or all elevators, whichever is less, to be provided in buildings with an occupied floor more than 120' above the lowest level of fire department access. Per the commentary to the 2021 IBC, this is based on past experience that has shown that elevators are often not available due to shutdowns for various reasons. Requiring two (2) fire service access elevators increases the likelihood there will be an elevator available for fire department use in an emergency event.

High rise elevator cores are typically located centrally within a tower, and exit stairs are typically located on either end of the tower. Depending on the size and occupant load of the tower, a tertiary (or more) stair may be located centrally within the tower; however, such stairs are typically not necessary and therefore not provided, many times resulting in a modification to the tower design to accommodate a stair and elevator adjacent to each other.

The design and economic implications of providing a minimum of two (2) fire service access elevators in high-rise buildings is significant when taking into consideration all of the required support features in addition to the elevators themselves, such as enclosed lobbies with direct access to an interior exit stair. Requiring fire service access elevators to open into an enclosed lobby with direct access to an interior exit stair could potentially eliminate a guestroom from each level, or leasable space from each level, etc., due to the footprint required for the lobby and stair. IBC Section 3007.6.4 requires fire service access elevator lobbies to have a minimum size of 150 square feet with a minimum dimension of 8 feet, and interior exit stairs are required to be sized in accordance with IBC Section 1009.2.

Further, the base code only mandates two (2) fire service access elevators for fire department use, including "supertall" buildings, which could have a negative impact on firefighter response & operations. The proposed Exception to Section 403.6.1 would require additional stretcher elevators based on floor height instead of providing only (2) fire service access elevators regardless of building height. It is important to provide tools for firefighting in large structures. It is important to maximum protection to large/tall facilities. If a major event occurs, this proposed amendment will provide multiple means of access for emergency responders beyond that which is required by base code, providing for efficient and effective response. By amending Section 403.6.1 and 3002.4 as proposed, not only would larger elevators be required, but also additional elevators would be required for the various heights of high-rise facilities.

Section 3003.1.3 would also require updates to correspond with changes to earlier part of the code and ties it back to the Exception to Section 403.6.1 to be provided with secondary power simultaneously so that all elevators are available. Simultaneous access is necessary as emergency responders utilize multiple teams performing various functions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal provides an alternative to the base code provisions that is not mandatory. It is an option to the base code provisions. The base code provisions do not change.

G52-25

G53-25

IBC: 404.5

Proponents: William Warlick, representing Self (william.warlick@slcgov.com)

2024 International Building Code

SECTION 404
ATRIUMS

Revise as follows:

404.5 Smoke control. A smoke control system shall be installed in accordance with Section 909.

Exceptions:

1. In other than Group I-2, and Group I-1, Condition 2, smoke control is not required for *atriums* that connect only two *stories.*
2. A smoke control system is not required for *atriums* connecting more than two *stories* when all of the following are met:
   2.1. Only the two lowest *stories*shall be permitted to be open to the *atrium.*
   2.2. All *stories* above the lowest two *stories*shall be separated from the *atrium* in accordance with the provisions for a *shaft* in Section 713.4.
   2.3 The *atrium* does not contain any *means of egress* component above the two lowest stories.

Reason: Starting with the 2015 IBC, components of the means of egress system have been allowed to be in an atrium: 1019.3 Exception 5, 1023.2 Exception 2 (E139-12). It is important to note that the reason statement for change proposal E139-12 assumed that an atrium would be "protected by various active systems including … smoke control features."

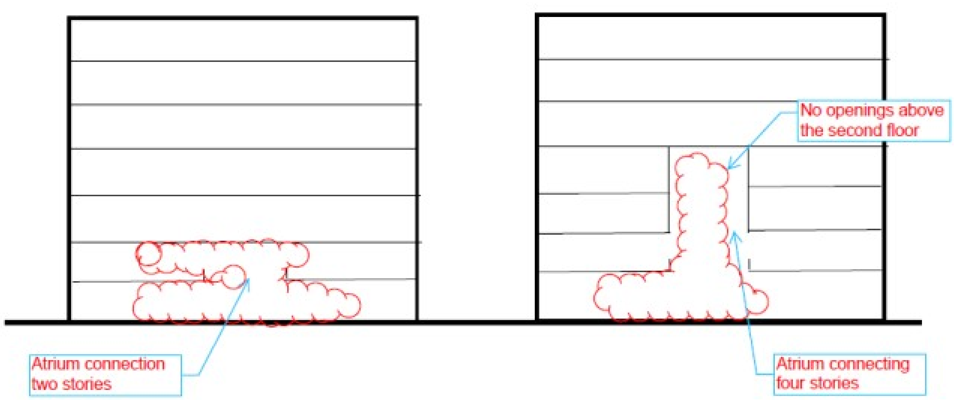
Later, the 2021 IBC introduced a revised Section 404.5 (G32-18) providing another exception allowing no smoke control for atriums taller than two stories.

The intent of the smoke control system (according to the G32-18 reason statement) is "to provide a tenable environment for the evacuation or relocation of occupants," and to maintain "the height of the lowest horizontal surface of the smoke layer interface to at least 6 feet above any walking surface that forms a portion of a required egress system within the smoke zone."

The proposed smoke control exception was envisioned to apply where "there are no walking surfaces in the atrium above the 2 lowest stories," and "there are no operable windows or doors above the 2 lowest stories in the atrium." (G32-18)

To guarantee of life safety, the proponent relied on the concept of a "smoke reservoir" according to the 2012 version of the proposal:

"In a simple 2-story atria smoke will migrate up through the atrium until it reaches the underside of the ceiling where then it will across the underside of the ceiling on the 2nd floor. By raising the "ceiling" of the atrium, a "smoke reservoir" is created where smoke will move into thus keeping the walking surfaces on the 1st, and more importantly the 2nd story, tenable for a longer period of time." (G56-12)



Drawing from G56-12

The Committee Action modifications to the proposal in the 2018 cycle focused on the shaft construction and the relationship of atrium provisions to Sections 712 and 713 (a theme in that cycle). Unfortunately in this process a problem with Section 404 was overlooked: that separate provisions put both the means of egress and the smoke hazard within the same shaft/atrium enclosure.

The intent of this change proposal is to clarify that egress components cannot be located in the portion of an atrium that is intended to be used as a smoke reservoir.

Bibliography: Change proposal E139-12, ICC Public Hearing April – May 2012.

Change proposal G56-12, 2012 ICC Final Action Agenda.

Change proposal G32-18, 2018 Group A Committee Action Hearings.

Change proposal G32-18, 2018 Group A Public Comment Agenda.

Change proposal G35-18, 2018 Group A Committee Action Hearings.

Change proposal G35-18, 2018 Group A Public Comment Agenda.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code never intended for an *interior exit stairway* to extend through a smoke reservoir. In spite of the recent code changes affecting atriums, their smoke control, their enclosure, and egress through them, this is still not allowed. Per IBC 1022.1: An *exit* shall not be used for any purpose that interferes with its function as a *means of egress*. And, an *exit access stairway* could not be used for egress through more than one adjacent story (1006.3.2) regardless of this code change.

G53-25

G54-25

IBC: 404.6

2024 International Building Code

SECTION 404 ATRIUMS

Revise as follows:

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a *smoke partition* is provided. The glass wall shall comply with all of the following:
   1.1. *Automatic* sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction.

   1.2. The glass wall shall be installed in a ~~gasketed~~ frame in a manner that limits the passage of smoke and allows the framing system ~~deflects~~ to deflect without breaking (loading) the glass before the sprinkler system operates.

   1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $^{3}/_{4}$-hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of up to three floors of the *atrium* provided that such spaces are accounted for in the design of the smoke control system.
4. In other than Group I-2 and Group I-1, Condition 2, a *fire barrier* is not required between the *atrium* and the adjoining spaces where the *atrium* is not required to be provided with a smoke control system.
5. In Group I-2 and Group I-1, Condition 2, a *fire barrier* is not required between the *atrium* and the adjoining spaces, other than care recipient sleeping or treatment rooms, for up to three *stories* of the *atrium* provided that such spaces are accounted for in the design of the smoke control system and do not provide access to care recipient sleeping or treatment rooms.
6. A *horizontal assembly* is not required between the *atrium* and openings for escalators complying with Section 712.1.3.
7. A *horizontal assembly* is not required between the *atrium* and openings for *exit access stairways* and *ramps* complying with Item 4 of Section 1019.3.

Reason: This code change proposal proposes to delete the word “gasketed”. The word gasketed does not allow for structural or wet-set glazed systems to be used. There are tested assemblies, even for rated glass, that do not have gaskets. For example, PLO/WA90-01 uses PVC tape, sealant, and angle stops. The frame is still being loaded but no gaskets are used. The current language is too restrictive on designers when there are proven technologies available that produce the same results but would address unique designs or systems not anticipated in the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not remove any existing options. It only adds options for the designer.

G54-25

G55-25

IBC: 404.6

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

SECTION 404
ATRIUMS

Revise as follows:

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a *smoke partition* is provided. The glass wall shall comply with all of the following:
   - 1.1. ~~*Automatic* sprinklers are~~ A separately zoned *automatic sprinkler system* is provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction.
   - 1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates.
   - 1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $^3/_4$-hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of up to three floors of the *atrium* provided that such spaces are accounted for in the design of the smoke control system.
4. In other than Group I-2 and Group I-1, Condition 2, a *fire barrier* is not required between the *atrium* and the adjoining spaces where the *atrium* is not required to be provided with a smoke control system.
5. In Group I-2 and Group I-1, Condition 2, a *fire barrier* is not required between the *atrium* and the adjoining spaces, other than care recipient sleeping or treatment rooms, for up to three *stories* of the *atrium* provided that such spaces are accounted for in the design of the smoke control system and do not provide access to care recipient sleeping or treatment rooms.
6. A *horizontal assembly* is not required between the *atrium* and openings for escalators complying with Section 712.1.3.
7. A *horizontal assembly* is not required between the *atrium* and openings for *exit access stairways* and *ramps* complying with Item 4 of Section 1019.3.

Reason: This code change proposal requires a separately zoned sprinkler system when the design approach described in Exception No. 1 is used. This provides correlation with NFPA 13.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The sprinklers and the sprinkler piping at the atrium enclosure are provided based upon current code language.

Increased costs could include the following:

- Additional dedicated main/line for the sprinklers (instead of sprinklers feeding from the adjacent system and branch lines)
- Additional system connection to the riser manifold.
- Additional valve for dedicated system.
- Additional testing for the dedicated system including commissioning and hydrostatic testing.

The added cost for each system would be approximately $2,500 - $5,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost estimate is based upon industry experience and interface with installing contractors.

G55-25

G56-25

IBC: 405.1

Proponents: Daniel Nichols, representing MTA Construction and Development (dnichols@mnr.org)

2024 International Building Code

SECTION 405
UNDERGROUND BUILDINGS

Revise as follows:

405.1 General. The provisions of Sections 405.2 through 405.9 apply to *building* spaces having a floor level used for human occupancy more than 30 feet (9144 mm) below the finished floor of the lowest *level of exit discharge*.

Exceptions: The provisions of Section 405 are not applicable to the following *buildings* or portions of *buildings*:

1. One- and two-family *dwellings*, sprinklered in accordance with Section 903.3.1.3.
2. Parking garages provided with *automatic sprinkler systems* in compliance with Section 405.3.
3. Fixed guideway transit and passenger rail systems.
4. *Grandstands, bleachers*, stadiums, arenas and similar *facilities*.
5. Where the lowest *story* is the only *story* that would qualify the *building* as an underground *building* and has an area not greater than 1,500 square feet (139 m^2) and has an *occupant load* less than 10.
6. Pumping stations and other similar mechanical spaces intended only for limited periodic use by service or maintenance personnel.

Reason: The term "fixed guideway transit systems" was the original name of NFPA 130, but was expanded in scope to include "passenger rail". This code change proposal matches the current title of the document that adequately reflects the same level of exemption needed in the IBC.

Bibliography: NFPA 130 - Fixed Guideway Transit and Passenger Rail Systems, 2023 edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial change to reflect the current title of the intended standard.

2024 International Building Code

SECTION 202
DEFINITIONS

Revise as follows:

[BG] ELECTRIC VEHICLE CHARGING STATION. One or more vehicle spaces served by an electric vehicle charging system equipment, electric vehicle supply equipment, electric vehicle power export equipment, or wireless power transfer equipment.

Add new definition as follows:

ELECTRIC VEHICLE POWER EXPORT EQUIPMENT (EVPE). The electrical equipment, including the outlet on the vehicle, that is used to provide electrical power at voltages equal to or greater than 30 volts AC or 60 volts DC to an external loads from the vehicle, where the vehicle is the source of supply.

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

Revise as follows:

406.2.7 Electric vehicle charging stations and systems. Where provided, *electric vehicle charging* ~~systems~~ *stations* shall ~~be installed in accordance with NFPA 70. Electric vehicle charging system equipment shall be *listed* and *labeled* in accordance with UL 2202. Electric vehicle supply equipment shall be *listed* and *labeled* in accordance with UL 2594. Accessibility to *electric vehicle charging stations* shall be provided in accordance with Section 1107~~comply with 406.2.7.1 through 406.2.7.6.

Add new text as follows:

406.2.7.1 Installation. *Electric vehicle charging stations* shall be installed in accordance with NFPA 70, the manufacturer's installation instructions, and the listing.

406.2.7.2 Equipment listings. Equipment used in electric vehicle charging stations shall be *listed* and *labeled* as applicable in accordance with the following:

1. Electric vehicle charging equipment in accordance with UL 2202.
2. Electric vehicle supply equipment in accordance with UL 2594.
3. Electric vehicle wireless power transfer equipment in accordance with UL 2750.

406.2.7.3 Electric vehicle power export equipment.. *Electric vehicle power export equipment* shall comply with Section 1208 of the *International Fire Code.*

406.2.7.4 Accessibility. Accessibility to electric vehicle charging stations shall be provided in accordance with Section 1107.

406.2.7.5 Disconnects. *Electric vehicle charging stations* shall be provided with electric vehicle disconnects and signage in accordance with Section 611 of the *International Fire Code* and NFPA 70.

406.2.7.6 Protection from vehicle impact damage. *Electric vehicle charging stations* shall be protected from vehicle impact damage in accordance with Section 312 of the *International Fire Code.*

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

2750-2023 Wireless Power Transfer Equipment for Electric Vehicles

Reason: The purpose of this proposal is to provide clarity regarding locations where electric vehicles (EVs) are being charged.

The current Section 406.2.7 is broken down into separate subsections to address installation, listings, accessibility, disconnects, and vehicle impact protection. The requirements are not new, the purpose is to provide correlation pointers.
There are four types of equipment used for charging EVs:

1. EV charging system equipment (UL 2202) – conductive charging equipment is located off board of the EV.
2. EV power export equipment (UL 9741) - can be unidirectional or bidirectional. Unidirectional EVPE equipment exports power from the vehicle to an offboard load, such as a receptacle bank. Bidirectional equipment provides power to the vehicle for charging of the onboard battery, and exports power to the grid, premise or load, but export and charging do not occur at the same time.
3. EV supply equipment (UL 2594) - provide power to a charger that is on-board the EV.
4. EV wireless power transfer equipment (UL 2750) - infrastructure equipment (off board an EV) that transfers power to an EV through a magnetic resonance coupling between the off-board equipment and the EV.

The already code-defined term "electric vehicle charging station" best describes any location where the charging of EVs takes place. The use of the term "electric vehicle charging system" does not encompass all four of the different types of equipment used.
New Section 406.2.7.1 – Equipment used in a EV charging station needs to be installed in accordance with NFPA 70, as well as with the manufacturer's installation instructions and the listing.

New Section 406.2.7.2 – Clarifies the different equipment, and the listing requirements.
New Section 406.2.7.3 - EV power export equipment (EVPE) has additional requirements established by F175-24 in Group A.
New Section 407.2.5 – A new section 611 has been established in the IFC by F86-24 in Group A.
New Section 407.2.6 – Section 312 of the IFC has been updated by F45-24 in Group A to provide clarity on different methods for vehicle impact protection.

This proposal is submitted jointly by the ***ICC Building Code Action Committee (BCAC)*** and the ***ICC Fire Code Action Committee (FCAC)***.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at **BCAC webpage**.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no increase in construction costs of buildings with this change as it is an editorial and correlation proposal. It relies on requirements addressing these issues found within this code and the International Fire Code.

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 2750-2023 Wireless Power Transfer Equipment for Electric Vehicles, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April

1, 2025.

G58-25

Proponents: Donald Monahan, Parking-Xpert.com, LLC, representing National Parking Association (don.monahan@comcast.net); mary smith, Walker consultants, representing National Parking Association (msmith@walkerconsultants.com)

2024 International Building Code

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

Revise as follows:

406.2.7 Electric vehicle <u>chargers</u> ~~charging stations and systems~~. Where provided, electric vehicle <u>chargers</u> ~~charging systems~~ shall be installed in accordance with NFPA 70. <u>DC EV chargers</u> ~~electric vehicle charging systems~~ shall be listed and labeled in accordance with UL 2202. ~~Electric vehicle supply equipment~~ <u>AC EV chargers</u> shall be listed and labeled in accordance with UL 2594. Accessibility <u>of</u> ~~to electric vehicle charging stations'~~ <u>EV charging</u> spaces shall be provided in accordance with Section 1107.

Reason: The Access Board and others define STATIONS as a group of EV charging spaces in a defined area, not specifically to the charger, i.e., the operating device. The UL listings are only for the chargers and not the entire EVSE. UL 2022 is for DC chargers and UL 2594 is for AC chargers.

Bibliography: UL EV Charging Standards:
https://www.ul.com/insights/electric-vehicle-onboard-equipment-and-charging-infrastructure-standards?
utm_mktocampaign=autobattery_autosbroad_p36d60&utm_mktoadid=694093073736&campaignid=21117929431&adgroupid=156893
lHiaznlUyKhgioF90xd471WvSY9DHuSljBKjlRnAXT7RRoCw5AQAvD_BwE

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal corrects the terminology used and does not affect the cost.

G58-25

G59-25

IBC: 406.3.1

Proponents: Steve Thomas, Shums Coda Associates, representing Colorado Chapter Code Development Committee (sthomas@coloradocode.net)

2024 International Building Code

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

Revise as follows:

406.3.1 Classification. *Private garages* and carports shall be classified as Group U occupancies. Each *private garage* shall be not greater than 1,000 square feet (93 m^2) in area. Multiple *private garages* are permitted in a *building* where each *private garage* is separated from the other *private garages* by 1-hour ~~*fire barriers*~~ *fire partitions* in accordance with Section ~~707~~ 708, or 1-hour *horizontal assemblies* in accordance with Section 711, or both.

Reason: This is a constructability issue. The current language requires fire barriers between private garages over 1,000 square feet. Fire barriers are required to extend from the foundation or floor to the underside of the floor/roof sheathing above. This becomes very difficult to do with trusses penetrating the fire barriers. There are not listed firestop systems for wood members penetrating a fire assembly. By changing the requirement to a fire partition, the wall can terminate at the bottom of a roof assembly having the same fire-resistance rating as the fire partition (one-hour). This eliminates the problems with the wood truss members penetrating the rated wall assembly. It is not that difficult to construct a one-hour fire-resistant roof assembly. The separtion between the separate spaces is still maintained but is easier to construct.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is not believed that there is any change in the cost of construction. It may actually reduce the cost since the contractor will not need to figure out how to address wood penetrations through a rated wall assembly. The cost of the firestopping is approximately the same as building the one-hour roof-ceiling assembly.

G59-25

G60-25

IBC: SECTION 202, 406.3.1, 406.3.1.1 (New)

Proponents: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2024 International Building Code

Revise as follows:

[BG] PRIVATE GARAGE. A *building* or portion of a *building* in which motor vehicles used by the *owner* or tenants of the *building* or *buildings* on the premises are stored or kept, without provisions for repairing or servicing such vehicles ~~for profit~~.

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

406.3.1 Classification. Individual ~~*Private*~~ *private garages*, or multiple private garages, and carports, shall be classified as Group U occupancies. ~~Each~~ A single *private garage* shall be not greater than ~~1,000~~ 3,000square feet (~~93~~ 279 m^2) in area and openings in fire barriers separating it from other garages shall not be permitted. Multiple *private garages* complying with Section 406.3.1.1are permitted. ~~in a *building* where each *private garage* is separated from the other *private garages* by 1-hour *fire barriers* in accordance with Section 707, or 1-hour *horizontal assemblies* in accordance with Section 711, or both~~.

Add new text as follows:

406.3.1.1 Multiple private garages. The combined building area of private garages shall not exceed the allowable area determined in in accordance with Section 506 and Section 508 as applicable. Multiple private garages are permitted in a building where all of the following requirements are satisfied.

1. Each private garage in a multiple private garage arrrangment shall have an area not greater than 1,000 square feet (93 m).
2. Each private garage shall be separated from the other private garages with1-hour fire barriers in accordance with Section 707, or 1-hour horizontal assemblies in accordance with Section 711, or both.
3. Private garages shall not be located in buildings including open or enclosed parking garages.
4. The combined building area of private garages shall not exceed the allowable area determined in in accordance with Section 506 and Section 508 as applicable.

Reason: The proposed code change is submitted to address what may have been an error in the adoption of a significant reduction to the permitted area for private garages when amendments to the 2012 IBC were debated and ultimately approved in Portland. While not apparent then, code application for projects today reveals that what seemed to be a benign code change is placing significant burdens on small residential mixed-use projects and small non-residential projects incorporating private garages for their tenants.

The General Committee considered and disapproved code change G68-21 due an error in which the separation between garages was proposed. The committee did not appear to be opposed to the concept overall and the submitted public comment did not move forward at the Public Comment Hearings.

This code change seeks to make the following changes:

1. Allow one private garage having a maximum floor area of 3,000 sq ft in a building.
2. Prohibit openings through fire barriers serving other garages in the same building.
3. Allow multiple private garages to collectively exceed 3,000 sq ft as the code presently permits if they individually do not exceed 1,000 sq ft and if the total area complies with the allowable building area based on the type of construction.
4. For consistency with the 2000 IBC the definition for Private Garage is being modified to preclude all repair and service work.

The requirement in the 2012 IBC existed for decades under the legacy Uniform Building Code and was moved over into the 2000 IBC; additionally, the FSD rules for free standing group U occupancies at 5 feet for exterior walls and openings that existed under the UBC are the same as they are in the IBC where exterior wall and wall openings limitations stop at 5 feet for standalone group U private garages.

Many urban Cities in the United States, like San Diego, are working to solve housing affordability issues and encourage infill development to eliminate blight. Frequently these projects are proposed on constrained sites and on sites that previously accommodated one or two single family dwellings with alley access from a 15 ft or 20 ft wide alley. Additionally, and to encourage walkable communities zoning regulations require some street frontage of non-residential space so a token office or small retail space are incorporated. The proposed code change seeks to permit small projects to incorporate. private garages classified as Group U that have an area up to 3,000 sq ft as was the case prior to publication of the 2015 IBC. This code change will provide the following benefit:

- Will allow small parking garages to serve a mixed-use building without classifying the garage as Group S-2 public or open garages.
- Will prevent the need to divide up a small garage with fire barriers to satisfy the 1,000 sq ft area limit and require the installation of overhead rolling fire doors that will not be maintained.

Many of the proposed private garages need to exceed 1,000 sq ft to accommodate accessible parking, spaces with required electric vehicle chargers as well as residential and non-residential parking.

When parking requirements for residential and non-residential uses are compounded with required accessible parking spaces for both residential and non-residential uses as well as spaces for electric vehicle charging systems a small project has no room for the placement of the 1-hour fire barriers and as a result another option is necessary. Vehicle stacker lifts are becoming popular to accommodate small garages however accessible and EV parking cannot be stacked and drive aisles and turning spaces are also needed to access all three types of spaces. Consistent application of the code is not possible since a garage classified as Group S-2 does not require a separation from a private garage classified as Group U so applicants have separated private garages from one another with a 1-hour fire barrier and classified the drive aisle leading to those garages as Group S-2.The main reason that a Group U parking garage is desirable is that exterior wall opening area limitations applicable to S-2 enclosed parking garage are the type of construction limitations and fire separation distance limitations.

Code Change G59-12: The proposed code change provides a necessary update to the IBC to correct inadvertent issues that resulted from the adoption of G59-12 attached which was submitted by the Building Code Action Committee. The code changes revised Section 406 to complete regulations for private garages that somehow during the drafting of the 2000 IBC omitted necessary requirements for carports and the code change added definitions for private garages. Additionally, then Section 406.3.2 was deleted to not allows area increases to the then permitted 3,000 sq ft area limit. Section 406.3.1 was also revised to require a 1-hour fire barrier to separate private garages from one-another and most likely the building configuration envisioned was exterior driveways open to the sky providing access to a series of side by side double or tandem private garages that had direct/indirect access to dwelling units.

The 2000 IBC allowed the 3,000 sq ft limit and a copy of Section 406.3 is attached and while not defining Private Garage prohibits repair and fueling in Private Garages. Repair work is different from vehicle service such as an oil change so prohibiting repair work is reasonable since it is not expected that tenants or fleet owners will perform repairs, however oil changes and other miscellaneous service work that does not involve cutting, welding and using open flame is most like so whether repairs are paid for or not should not be material to the use classification, furthermore it is not enforceable. An attachment is provided that includes a differentiation between vehicle repair and vehicle service.

The code changed lowered the area threshold to 1,000 from the 3,000 sq ft that has existed since the publication of the 1967 UBC but did not provide justification for why it was necessary to reduce the area from a fire risk perspective. The justification also discussed the area limit in the context of natural ventilation openings and cited Section 402.2 of the International Mechanical code that requires "The minimum openable area to the outdoors shall be 4 percent of the floor area being ventilated." exterior openings. Furthermore, an additional general requirement in the charging Section 401.2 to the chapter
4 requires that "Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403." If mechanical ventilation is not present the IMC requires natural ventilation for all uses and occupancies including private garages,
and as a result, there was no reason to reduce the area of garages due to ventilation concerns. The proposed code change results in an option to allow a larger private garage that has been 3,000 sq ft for more than 45 years with no known issues due CO exposure or fire hazards. Additionally, auto emissions have improved significantly over the past 50 years and the prevalence of electric vehicles and hybrid vehicles further reduces vehicle emissions. Hazards in garages due to CO occur during long term exposure and where there is a constant flow of motor vehicles like in the case for example of below ground garages in regional shopping malls. The hazards are primarily to the parking toll taker when not automated. Mixed use residential buildings are always protected at least with an NFPA 13-R system, and the garages are protected with an NFPA 13 compliant system, and this code change reasonably reinstates regulations that have existed for decades without lessening fire safety even with the increased hazards due to plastics in vehicles and difficulties in fighting fire in electric and hybrid vehicles due to batteries.

The NFPA report Fire Loss in the United States dated 10/31/24 shows a significant and steady decline of vehicle fire in structures, however when a vehicle fire spreads to a structure the data reports this with structure fires. A 40 ft by 75 ft Private Garage for example optimistically have room for 7 or 8 parking spaces *[20 ft wide drive aisle for backup, van accessible parking space and accessible EVCS space, seven 18 ft by 9 ft parking stalls]* without use of vehicle stackers. Proponent believes the 2012 IBC provided a reasonable level of safety when considering 3,000 sq ft garages include drive aisles and 1,000 sq ft ones do not.

We request that the Committee vote to approve this code change as submitted or as modified if it is deemed that the definition revision is not necessary.

Bibliography: Fire loss in the United States | NFPA Research

Cost Impact: Increase

Estimated Immediate Cost Impact:

This code change will reduce confusion and will reduce the cost of construction since office buildings include floors designed for 70 psf LL (office live load plus partition loads). Floor live load has changed over the decades, and since the legacy Uniform Building Code, and as a result the cost reduction is zero in an existing building since the floor will most likely be compliant with the proposed 60 psf live load. With the proposed live load existing and proposed floors will certainly more compliant than if the 100 pf live load required by the 2024 IBC is implemented; the 2024 IBC will require significant strengthening of the existing floor, or heavier framing for new floors. In an existing building this could cost $300,000 or more in a steel framed building or $100,000 to $200,000 in a wood framed building. In accordance with "Building Valuation Data – FEBRUARY 2024" for a Group B occupancy Type IA construction is 38% more costly than Type VA construction. Concrete buildings tend have floors with additional capacity since a large portion of the gravity load is the dead load due to the heavy weight of reinforced concrete. In a new building the cost increase will be 20% if constructed with structural steel and less if constructed with concrete since additional reinforcing and concrete may be required with roughly the same labor costs; if prestressed concrete it can assumed to be less costly than reinforced concrete since additional prestressing and slightly thicker slabs may be require.

Estimated Immediate Cost Impact Justification (methodology and variables):

Lower live load requires smaller floor framing and as a result reduces cost of compliance with the 2024 IBC. The costs include after hours work to access the underside of floors if tenant spaces below are occupied, removal and replacement of ceiling finishes and HVAC if any exists below the floor. If the floor is wood framed strengthening to comply with the 2024 IBC will be simpler than strengthening floors framed with structural steel framing due to the weight of framing materials and steel plates and the need for welding equipment to field welding to weld reinforcing plates. It is assumed that the cost is $300 per square foot under the 700 sq ft room above and accounting for framing that spans to receiving columns beyond the small assembly area.

G62-25

IBC: 406.3.1, 406.3.2

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

2024 International Building Code

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

Revise as follows:

406.3.1 Classification. *Private garages* and carports shall be classified as Group U occupancies. Each *private garage* shall be not greater than 1,000 square feet (93 m^2) in area. Multiple *private garages* are permitted in a *building* where each *private garage* is separated from the other *private garages* by 1-hour *fire barriers* in accordance with Section 707, or 1-hour *horizontal assemblies* in accordance with Section 711, or both. For other than *private garages* separated from *dwelling units* they serve per Sections 406.3.2.1 and 406.3.2.2, multiple vehicle storage spaces separated with non-rated partitions are allowed within each *private garage.*

406.3.2 Separation. For other than *private garages* adjacent to *dwelling units*, the separation of *private garages* from other occupancies shall comply with Section 508. Separation of *private garages* from *dwelling units* they serve shall comply with Sections 406.3.2.1 and 406.3.2.2. Separation of *private garages* from other *dwelling units* shall comply with Sections 420.2 and 420.3.

406.3.2.1 Dwelling unit separation. The *private garage* shall be separated from the *dwelling unit* and its *attic* area by means of *gypsum board,* not less than $^1/_2$ inch (12.7 mm) in thickness, applied to the garage side. Garages beneath habitable rooms shall be separated from all habitable rooms above by not less than a $^5/_8$-inch (15.9 mm) *Type X gypsum board* or equivalent and $^1/_2$-inch (12.7 mm) *gypsum board* applied to structures supporting the separation from habitable rooms above the garage. Door openings between a *private garage* and the *dwelling unit* shall be equipped with either solid wood doors or solid or honeycomb core steel doors not less than $1^3/_8$ inches (34.9 mm) in thickness, or doors in compliance with Section 716.2.2.1 with a *fire protection rating* of not less than 20 minutes. Doors shall be *self-closing* and self-latching.

406.3.2.2 Ducts. Ducts in a *private garage* and ducts penetrating the walls or ceilings separating the *dwelling unit* from the garage, including its *attic* area, shall be constructed of sheet steel of not less than 0.019 inch (0.48 mm) in thickness and shall not have openings into the garage.

Reason: Note that Sections 406.3.2.1 and 406.3.2.2 are provided for reference only - there are no changes proposed for these sections.

The separation requirements between a private garage and dwelling unit, given in Section 406.3.2.1 and 406.3.2.2, are identical to separation requirements between a garage and a dwelling unit in the International Residential Code. These separation requirements are less than the fire partition and horizontal assembly separations required by Sections 420.2 and 420.3 for typical separation between dwelling units and other occupancies. The lesser separation between a garage and a dwelling unit is allowed since the occupants of the dwelling unit have control over, and awareness of, what is stored in the garage. If a garage adjacent to a dwelling unit serves a different dwelling unit, this control and awareness is not provided, and separation should be as required for separation of a dwelling unit and another occupancy. We believe the current intent of the code is that the garage/dwelling unit separation requirements are for garages that serve the adjacent dwelling unit, and this proposal clarifies this. Separation of private garages adjacent to dwelling units they don't serve must still meet dwelling unit separation requirements of IBC 420.2 and 420.3, so a requirement to comply with these sections is included in this proposal.

Also, Section 406.3.1 allows private garages to be up to 1,000 SF in area, but it is not clear if this 1,000 SF can be subdivided with non-rated partitions to form separate vehicle storage spaces. Since the code doesn't prohibit these non-rated partitions, we believe the intent is to allow spaces separated with non-rated partitions within a private garage. However, when private garages serve dwelling units with the reduced separation allowed by Sections 406.3.2.1 and 406.3.2.2, it is appropriate to provide fire-resistance rated separations between garages serving different dwelling units. This is due to the control and awareness issue mentioned above. This proposal clarifies that non-rated partition separations are allowed within a private garage except where the garages serve adjacent dwelling units.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Based on discussions with several jurisdictions, it is believed that most jurisdictions feel the private garage / dwelling unit separations in 406.3.2.1 and 406.3.2 are intended for garages adjacent to the unit they serve and are enforcing this accordingly. Therefore, this proposal is in line with the current intent and enforcement of the code, and provides clarification of this intent, so there will be no cost impact.

G62-25

G63-25

IBC: 406.5.8 (New), [F] 406.6.3, 406.6.4 (New)

Proponents: Robert Davidson, Davidson Code Concepts LLC, representing Self (rjd@davidsoncodeconcepts.com); Robert Marshall, representing FCAC (fcac@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

406.4 Public parking garages. Parking garages, other than *private garages*, shall be classified as public parking garages and shall comply with the provisions of Sections 406.2 and 406.4 and shall be classified as either an *open parking garage* or an enclosed parking garage. *Open parking garages* shall also comply with Section 406.5. Enclosed parking garages shall also comply with Section 406.6. See Section 510 for special provisions for parking garages.

406.5 Open parking garages. *Open parking garages* shall comply with Sections 406.2, 406.4 and 406.5.

Add new text as follows:

<u>406.5.8</u> <u>Automatic Sprinkler system</u>. <u>An open parking garage shall be equipped with an automatic sprinkler system as required by Sections 903.2.10 through 903.2.10.3.</u>

406.6 Enclosed parking garages. Enclosed parking garages shall comply with Sections 406.2, 406.4 and 406.6.

Revise as follows:

[F] 406.6.3 Automatic sprinkler system. An enclosed parking garage shall be equipped with an *automatic sprinkler system* in accordance with Section 903.2.10 <u>through 903.2.10.3</u>.

Add new text as follows:

<u>406.6.4</u> <u>Standpipe system</u>. <u>An enclosed parking garage shall be equipped with a standpipe system as required by Section 905.3.</u>

Reason: The purpose of this proposal is to provide guidance to users of the International Building Code by adding correlation language linking to existing protection requirements.

The new Section [F] 406.5.8 was added by proposal F97-24 during the Group A hearings, however it only pointed to one of 4 separate sections containing suppression triggers. The phrase "through 903.2.10.3" has been added to pick up all of the triggers.

This proposal is submitted jointly by the ***ICC Building Code Action Committee (BCAC)*** and the ***ICC Fire Code Action Committee (FCAC)***.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at **BCAC webpage**.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no increase in construction costs of buildings with this change as it is a correlation proposal. It relies on requirements addressing these issues found within this code and the International Fire Code.

G63-25

G64-25

IBC: SECTION 202 (New), 406.2.7, UL Chapter 35 (New)

Proponents: Jonathan Roberts, representing UL Solutions (jonathan.roberts@ul.com)

2024 International Building Code

Add new definition as follows:

ELECTRIC VEHICLE POWER EXPORT EQUIPMENT (EVPE). The electrical equipment, including the outlet on the vehicle, that is used to provide electrical power at voltages equal to or greater than 30 volts AC or 60 volts DC to an external loads from the vehicle, where the vehicle is the source of supply.

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

Revise as follows:

406.2.7 Electric vehicle charging stations and systems. Where provided, electric vehicle charging systems shall be installed in accordance with NFPA 70. Electric vehicle charging system equipment shall be *listed* and *labeled* in accordance with UL 2202. Electric vehicle supply equipment shall be *listed* and *labeled* in accordance with UL 2594. *Electric vehicle power export equipment* shall be *listed* and *labeled* in accordance with UL 9741. Accessibility to *electric vehicle charging stations* shall be provided in accordance with Section 1107.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

9741-2023 Electric Vehicle Power Export Equipment (EVPE)

Reason: Electric vehicle power export equipment (EVPE) is a new trend to use an electric vehicle to provide power to the building. EVPE can be unidirectional or bidirectional. Unidirectional equipment exports power from the vehicle to an offboard load, such as a receptacle bank. Bidirectional equipment provides power to the vehicle for charging of the onboard battery, and exports power to the grid, premise or load, but export and charging do not occur at the same time. There are three manufacturers with listed equipment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost for obtaining listed EV power export equipment may or may not represent increased product costs over obtaining non-listed equipment that have not been independently investigated to applicable standards for determining product safety and performance.

Obtaining and maintaining a listing for EV power export equipment involves both product investigation costs and costs for periodic inspection of production, as required by the definition of "listed". However, the impact of any potential cost increase can be weighed by the code development committee against the user and code official safety benefits derived from requiring listed equipment, as well as the additional benefit of less effort needed to demonstrate or determine compliance.

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 9741-2023 Electric Vehicle Power Export Equipment (EVPE), with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

G64-25

G65-25

IBC: 406.3.2.1

Proponents: Tim Earl, GBH International, representing the Gypsum Association (tearl@gbhint.com)

2024 International Building Code

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

Revise as follows:

406.3.2.1 Dwelling unit separation. The *private garage* shall be separated from the *dwelling unit* and its *attic* area by means of *gypsum board,* not less than $^1/_2$ inch (12.7 mm) in thickness, applied to the garage side. Garages beneath habitable rooms shall be separated from all habitable rooms above by not less than a $^5/_8$-inch (15.9 mm) *Type X gypsum board* or other material with a 40-minute *fire-resistance rating* ~~equivalent~~ and $^1/_2$-inch (12.7 mm) *gypsum board* applied to structures supporting the separation from habitable rooms above the garage. Door openings between a *private garage* and the *dwelling unit* shall be equipped with either solid wood doors or solid or honeycomb core steel doors not less than $1^3/_8$ inches (34.9 mm) in thickness, or doors in compliance with Section 716.2.2.1 with a *fire protection rating* of not less than 20 minutes. Doors shall be *self-closing* and self-latching.

Reason: Type X gypsum board is a special type of gypsum panel product with core additives to increase fire resistance (in accordance with applicable ASTM standards). Proving equivalency to Type X is not straightforward, and there is no known alternative to it. When we conducted an informal poll of code users, many of the answers to the question “What do you consider equivalent to Type X gypsum board” were alarming.

Although nothing is exactly “equivalent” to Type X gypsum board, the primary property of interest is fire-resistance. The IBC assigns a fire-resistance rating of 40 minutes for type X board in vertical assemblies as part of the calculated method. Allowing any material with the same calculated fire-resistance rating in this application is a reasonable substitution. Beyond that, alternate materials should be approved as specified in Section 104.11, which was comprehensively revised last cycle.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

None. Anyone wishing to use an alternate material can still do so in accordance with Section 104.11.

G65-25

G66-25

IBC: 406.5.1, 406.6.1 (New), 406.6.4.1

Proponents: Bill McHugh, CM Services, Inc., representing National Fireproofing Contractors Association (bill@mc-hugh.us)

2024 International Building Code

SECTION 406
MOTOR-VEHICLE-RELATED OCCUPANCIES

406.5 Open parking garages. *Open parking garages* shall comply with Sections 406.2, 406.4 and 406.5.

Revise as follows:

406.5.1 Construction. *Open parking garages* shall be of Type I, II or IV construction. *Open parking garages* shall meet the design requirements of Chapter 16.*Open parking garage* floor assemblies shall provide a *fire-resistance rating* of not less than 4 hours. Separations from the parking garage to other occupancies and to *shaft enclosures* shall be constructed to provide a 4 hour *fire-resistance rating.*For *vehicle barriers*, see Section 406.4.2.

406.6 Enclosed parking garages. Enclosed parking garages shall comply with Sections 406.2, 406.4 and 406.6.

Add new text as follows:

406.6.1 Construction. Enclosed parking garage floor assemblies shall provide a *fire-resistance rating* of not less than 4 hours. Separations from the parking garage to other occupancies and to *shaft enclosures* shall be constructed to provide a 4 hour *fire-resistance rating.*

Revise as follows:

406.6.4.1 Separation. *Mechanical-access enclosed parking garages* shall be separated from other occupancies and accessory uses by not less than 4 ~~2~~-hour *fire barriers* constructed in accordance with Section 707 or by not less than 4~~2~~-hour *horizontal assemblies* constructed in accordance with Section 711, or both.

Reason: The purpose of this code proposal is to address the risks present in parking garages. Whether it is an internal combustion engine, or battery technology power in vehicles, all are now in structures. Most cars now have plastic gas tanks as well as much more plastics than in previous decades. There are lithium ion and other types of batteries in cars, along with a host of combustibles.

The proposal increases fire-resistance ratings to 4 hours for parking garages. The 4 hours is the highest practical fire-resistance-rating that exists for most common construction building elements. Four hours is also the fire-resistance rating that current fire-resistance-rated assembly breach / opening / penetration / joint protection items such as fire-dampers, firestopping, fire rated doors, can provide for fire-resistance continuity.

We have no idea when an electric vehicle powered by Lithium-ion or any other type of batteries, in addition to internal combustion engine, or hybrid will arrive at a parking garage.

Preventing fire spread into areas where people are located, and protecting the structure against collapse in parking garages, is critical to safety and resilience. More importantly, the people living or working upstairs from the parking garage need protection. The structure needs to withstand the longer fire-duration that internal combustion engines, Lithium ion or other type of battery fires might bring to these structures.

Fighting parking garage fires can be extremely difficult due to access, and other factors. This is especially when battery powered electric vehicles are involved. We understand the water required to keep certain types of batteries cool during thermal runaway is massive. Moving the vehicle outside the garage for burnout might not be an option in parking garages where exits can be a long way away, or on another floor.

Protect these garages with 4 hour fire-resistance ratings. It is the best the fire-resistance industry can offer for the building occupants safety.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal will increase the cost of construction of the floor assembly, horizontal assembly, wall assembly and breach protection by approximately 25% - 40% of only the assemblies required to have the increased fire-resistance rating. The cost will be absorbed into the rest of the building's cost of construction as not every floor or wall above the parking garage needs to be fire-resistance rated.

The approximate cost addition is as follows:

- Shafts for elevators, stairwells with doors - Approx. 40-50 cents per sf of floor area (Approx. 2 stairwells, elevator, 2 mechanical shafts, or trash/other purposed shafts).
- Fireproofing - Approx. $0.75-1.00 per sf of floor area.

There is a new innovation in gypsum panels reducing labor costs for a 4-hour fire-resistance-rated assembly.

Estimated Immediate Cost Impact Justification (methodology and variables):

The protection is justified because the assemblies are supporting parking garages and buildings. Offices, apartments, condos, etc. above these parking garages assume they are safe.

Estimated Life Cycle Cost Impact:

Maintaining protection of a 4 hour fire-resistance-rated assembly is no different than a 2 hour fire-resistance-rated assembly. There should be no increase in cost of maintaining protection for the building life cycle.

G66-25

G67-25

IBC: SECTION 202 (New), 406.5.2.2 (New)

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

Add new definition as follows:

VENTILATION WELL. A vertical open area bound on all sides by walls and used to provide natural ventilation with an unobstructed opening to sky at the top.

SECTION 406 MOTOR-VEHICLE-RELATED OCCUPANCIES

Add new text as follows:

406.5.2.2 Opening above grade. When *ventilation wells* are used to satisfy natural ventilation requirements for *open parking garages*, the width of the ventilation well opening to sky shall be one and one-half times the height of the adjacent structure to the bottom of the lowest required opening. The minimum required width of the *ventilation well* shall be maintained for not less than the length of the required openings.

Exception: The *ventilation well* opening width is not restricted if any of the following are met or provided:

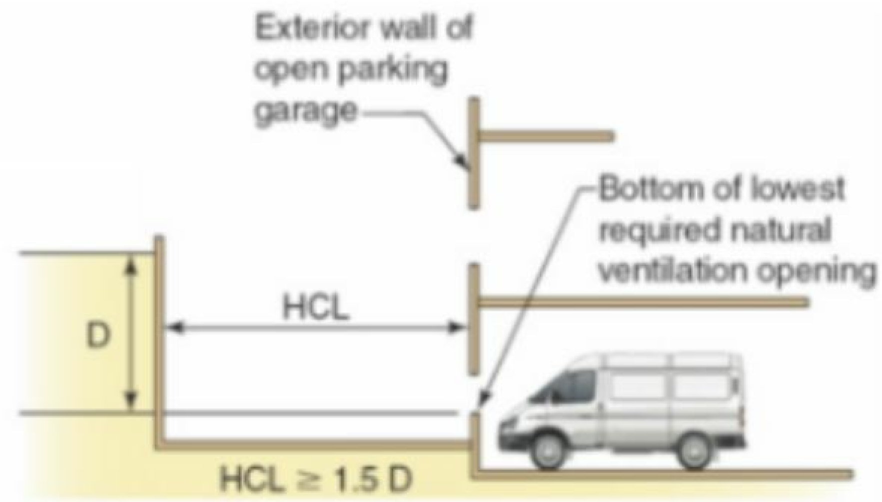
1. Supplemental mechanical ventilation meeting the requirements of Section 406.6.2 is provided for the *open parking garage*.
2. Where *approved* by the *building official*, an engineering analysis proving equivalent natural ventilation requirements are met.

Attached Files

- **ventilation well exhibit.pdf**
  https://www.cdpaccess.com/proposal/12138/35857/files/download/9439/

Reason: There is no definition in the building code for the vertical, open to air shafts used for natural ventilation. This type of a feature is being proposed with increased frequency. The definition helps alleviate wording complexity in the proposed section and allows for future use in the code.

Because permanently open exterior walls provide sufficient natural ventilation and permit the dissipation of heated gasses, open parking garages are viewed as a relatively low hazard. However, there are situations where the required openings are located within ventilation wells that are significantly below the roof levels of the parking garage and adjacent buildings, which makes it more difficult to provide the necessary openness required for good performance. A clear horizontal space as described by this section and the openings below grade section (406.5.2.1) must be provided by the ventilation well's opening to the sky. As the distance of the openings below the adjoining roof level increases, the minimum required width of the ventilation well opening also increases proportionally. The dimensional requirements are based on the provisions of Section 1202.5.1.2 for openings below grade. The extent of the required clear space allows for adequate ventilation well open space to meet the intent and dynamics of natural ventilation requirements for open parking garages.The dimensional requirements do not need to be met if sufficient mechanical ventilation is provided as required for enclosed parking garages in Section 406.6.2. This allows the garage to meet the requirements of an opening parking garage without having to comply with all the enclosed parking garage requirements. In addition, an engineering analysis can be provided to demonstrate the natural ventilation performance is sufficient.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal provides guidance on how to address ventilation of open parking garages with the usage of ventilation wells.

IBC: 407.2.1 (New), 420.9.1 (New), 420.11.2 (New), 422.7.1 (New), UL Chapter 35 (New)

Proponents: Jonathan Roberts, representing UL Solutions (jonathan.roberts@ul.com)

2024 International Building Code

SECTION 407
GROUP I-2

Add new text as follows:

407.2.1 Ignition prevention. Electric cooktops and ranges shall include heating elements that have been tested and *listed* in accordance with UL 858 to prevent ignition of cooking oil.

SECTION 420
GROUPS I-1, R-1, R-2, R-3 AND R-4

420.9.1 Ignition prevention. Electric cooktops and ranges shall include heating elements that have been tested and *listed* in accordance with UL 858 to prevent ignition of cooking oil.

420.11.2 Ignition prevention. Electric cooktops and ranges shall include heating elements that have been tested and *listed* in accordance with UL 858 to prevent ignition of cooking oil.

SECTION 422
AMBULATORY CARE FACILITIES

422.7.1 Ignition prevention. Electric cooktops and ranges shall include heating elements that have been tested and *listed* in accordance with UL 858 to prevent ignition of cooking oil.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

858-2014 Household Electric Ranges - with revisions through August 2023

Reason: This proposal correlates these IBC sections with appliance requirements approved in the IFC Group A along with the current requirements for electric cooktops and ranges in IRC M1503.2, IRC M1901.2, and IMC 917.1. The IRC and IMC already require the appliance to be listed and labeled to UL 858.

The latest edition of UL 858 includes the testing requirement for the heating elements to prevent cooking oil ignition.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial only and aligns with other changes within the body of the codes.

Staff Analysis: UL 858-2014 Household Electric Ranges is currently referenced in the IRC and IMC.

G68-25

G69-25

IBC: 408.9, SECTION 202 (New)

Proponents: Crystal Sujeski, representing CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov)

2024 International Building Code

SECTION 408 GROUP I-3

Delete and substitute as follows:

~~**408.9 Windowless buildings.** For the purposes of this section, a windowless *building* or portion of a *building* is one with nonopenable windows, windows not readily breakable or without windows. Windowless *buildings* shall be provided with an engineered smoke control system to provide a tenable environment for exiting from the *smoke compartment* in the area of fire origin in accordance with Section 909 for each windowless *smoke compartment*.~~

<u>**408.9** **Tenable Environment.** Areas occupied by residents for sleeping of Conditions 3, 4 and 5 shall be provided with a smoke control system in accordance with Section 909 to provide a tenable environment for exiting from the smoke compartment in the area of fire origin. No venting or smoke control is required when an engineering analysis in accordance with Section 909.4 shows an acceptable safe egress time compared to the onset of untenable conditions within the smoke compartment.</u>

Add new definition as follows:

<u>**TENABLE ENVIRONMENT.** An environment in which the products of combustion, toxic gases, smoke and heat are limited or otherwise restricted to maintain the impact on occupants to a level that is not life threatening.</u>

Reason: The proposed changes integrate the intent of the code.

The intent of 408.9 model code as described in the 2021 IBC Code and Commentary – "An engineered smoke control system through which the products of combustion can be vented is required for smoke compartments in which there are no openings. The smoke control system is to provide a tenable environment during the period it takes the occupants to egress from a smoke compartment that is the area of fire origin".

The code language uses the term of "Windowless", where a windowless building or portion of a building is one with nonopenable windows, windows not readily breakable or without windows. However, the California State Fire Marshal (SFM) task group noticed the code language for "Windowless" is only defined in 408.9 and there are no prescriptive design requirements for number, location and size of openable windows or the maximum time duration of "readily breakable" for security window/s, and/or specific documentation requirements that the openable windows or readily breakable windows will create a tenable environment within the smoke compartment.

Pending the size, volume and configuration of the smoke compartment, to include the number of housing pods within the a compartment (most housing pods are typically separated between each other with Type 1 construction materials) – no documentation or analysis has been required in the code language to show the smoke compartment complies as a tenable environment – with or without windows.

This proposed new language will mandate I-3 occupancies with sleeping areas within any smoke compartments to provide required supplemental documentation / engineering analysis (909.4) showing the smoke compartment will have a Tenable Environment **or** provide an engineered smoke control system.

The proposal can clarify design flexibility, since the design could use operable openings / vents, or no openings where there are high ceiling areas, that can bank the smoke. This proposal removes the term "Windowless" and inserts the Definition of *Tenable Environment*.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There should be no increase in building cost. However, there has been a schedule impact during agency review because the current requirements are not clear. These clarifications should streamline review of detention facilities which may result in some cost savings due to reduced plan review time.

G69-25

G70-25

IBC: 408.9

Proponents: Gabriel Levy, incandescence life safety, inc, representing Colorado Chapter Code Development Committee (glevy@incandescencels.com)

2024 International Building Code

SECTION 408
GROUP I-3

408.9 Windowless buildings. For the purposes of this section, a windowless *building* or portion of a *building* is one with nonopenable windows, windows not readily breakable or without windows. Windowless *buildings* shall be provided with an engineered smoke control system to provide a tenable environment for exiting from the *smoke compartment* in the area of fire origin in accordance with ~~Section 909~~ NFPA 92 for each windowless *smoke compartment*.

Reason: IBC 909 mandates minimum design standards for smoke control systems. However, imposing prescriptive requirements contradicts the concept of an "engineered" system. This requirement is most applicable for smoke exhaust in a multi-story prisons with large atrium-style shared cores. However, many detention facilities do not use this configuration. In a single-story facility with holding cells that have a ceiling height of only 10-12 feet, it is not feasible to provide a smoke exhaust system that meets all prescriptive requirements of IBC 909 (namely, maintaining a smoke layer 6 feet above the walking surface). Without a substantial ceiling height, turbulence and mixing will disrupt the development of a consistent smoke layer boundary.

A performance-based approach, which can account for various architectural configurations, is more suitable for designing some smoke control systems. Unfortunately, IBC 909 does not accommodate this. NFPA 92, a well-established standard already referenced in the IBC, offers a more robust framework for smoke control system design, aligning with industry best practices and engineering principles.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal is editorial in nature and has no cost impact on the cost of construction for windowless buildings or smoke control.

G70-25

G71-25

IBC: 408.9

Proponents: Gabriel Levy, incandescence life safety, inc, representing Colorado Chapter Code Development Committee (glevy@incandescencels.com)

2024 International Building Code

SECTION 408
GROUP I-3

Revise as follows:

408.9 ~~Windowless buildings~~Smoke control system. ~~For the purposes of this section, a windowless *building* or portion of a *building* is one with nonopenable windows, windows not readily breakable or without windows. Windowless *buildings*~~Detention areas without operable exterior wall openings shall be provided with an engineered smoke control system to provide a tenable environment for exiting from the *smoke compartment* in the area of fire origin in accordance with Section 909 for each ~~windowless~~ *smoke compartment*.

Reason: Sections 408.10 and 408.11 are titled 'Fire alarm system' and 'Automatic sprinkler system', respectively. To maintain consistency, Section 408.9 should be titled 'Smoke control system'.
The first sentence of this section provides a definition, which is inconsistent with IBC formatting. If provided, the definition should be in Section 202, not as an introduction to the requirement. Furthermore, the definition is entirely contradictory to common sense. According to the existing definition, a "windowless building" does not have to be a building, nor does it have to be windowless. To remove this confusion, the definition is struck entirely from this section. The requirement is only applicable in I-3 buildings, and is intended to apply to portions of a building where occupants are incapable of self preservation. Therefore, "detention areas" is used to indicate that the requirement exists where egress is restricted.

The commentary states that "the intent of this section is that staff must have some means to ventilate the products of combustion; therefore, where the window cannot be broken by items readily available to the staff, the area is considered windowless." It is undesirable to design breakable-glass in a detention facility. However, it is not uncommon to see doors from a communal day room which open to a secured exterior court. Opening such as an exterior door should be considered equivalent to breaking a window for ventilation purposes. However, because a door is not a window, it does not apply to the existing code language. Therefore "without operable exterior wall openings" is used to allow for better configurations, rather than breaking a window.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost of a door is negligible compared to the cost of a window in the scale of a prison's cost of construction.

G71-25

G72-25

IBC: 410.2.5.1 (New)

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Add new text as follows:

410.2.5.1 Activation. When provided, a proscenium curtain shall be activated by manual emergency operation, fusible link, ultra-fast rate-of-rise heat detection installed in accordance with Section 907.3, or signal of water flow from any automatic sprinkler system covering the stage as required by Section 410.6.

Reason: The 2006 IBC had an activation sub-section to Section 410.3.5. However, this and other proscenium curtain subsections were removed during the 2009 code cycle when the addition of NFPA 80 entered the main Section 410.3.5. The reference to NFPA 80 for all requirements regarding a proscenium fire curtain; however, would not directly apply to activation for the other elements of proscenium protection at the stage opening.

NFPA 80 (2022 edition), Section 20.7.3.1 states “The fire safety curtain assembly shall be activated by manual emergency operation and rate-of-rise heat detection located above the stage.” There is no guidance as to the design requirements for rate-of-rise detection in the IBC, NFPA 72, or NFPA 80 (e.g., full coverage on stage or just a line of detectors at the opening).

The proposed activation subsection seeks to detail the options for activation of the physical proscenium opening and not have designers, engineers, or AHJ having to work through separate standards. NFPA 80 discusses manual and heat detection requirements; however, does not detail fusible links or sprinkler systems in the same area. Additionally, NFPA 80 references an FM Data Sheet in the heat detectors. The addition aims to incorporate multiple activation items for the release of a curtain or horizontal sliding door providing the physical separation between the stage and audience. Any required fire suppression, fire detection, and / or smoke control systems activation would be based on further engineering determination.

The code change proposal is necessary to clarify the intent of the codes (i.e., address the lack of guidance regarding prescriptive activation devices).

It should be noted that these requirements have been implemented in multiple theaters across Southern Nevada area since the adoption of the 2012 IBC to provide acceptable requirements for the activation of the proscenium curtain.

Bibliography: NFPA 80, Standard for Fire Doors and Other Opening Protectives, 2022 Edition.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal provides additional guidance as to the means of activation of the proscenium curtain and therefore does not have an impact to the cost of construction.

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Revise as follows:

410.1 Applicability. The provisions of Sections 410.1 through 410.15 ~~410.7~~ shall apply to ~~all~~ those parts of *buildings* and *structures* that contain *stages* *and technical production areas* ~~or platforms and similar appurtenances as herein defined~~.

Add new text as follows:

410.4 Stage construction. Type A *stages* with a stage area of 5000 square feet (464 m^2) or less and a stage height of 50 feet (15.24 m) or less and all Type B *stages* shall be of the construction type as required for the occupancy. Type A *stages* with a stage area greater than 5000 square feet (464 m^2) or a stage height greater than 50 feet (15.24 m) shall be of Type I, II, or IV construction.

410.4.1 Structural framing. Beams installed only for the attachment of portable or fixed stage equipment shall be permitted to be without a fire-resistance rating in all construction types.

410.5 Stage fire area. *Stages*, contiguous audience areas, and contiguous backstage and support areas not separated from the performance area by fire-resistance-rated construction shall be separated from the rest of the building where required in Sections 410.7.1 through 410.7.3. Separation shall be by fire barriers or horizontal assemblies, or both.

410.5.1 Two hour separation at Type A stages. Fire areas with Type A stages serving an audience occupant load greater than 300 and with a stage area greater than 5000 square feet (464 m^2) or a stage height greater than 50 feet (15.24 m) shall be separated from the rest of the building by construction with a two hour fire-resistance rating.

410.5.2 One hour separation at Type A stages. Fire areas with Type A stages with a stage area greater than 2500 square feet (232.25 m^2) or a stage height greater than 30 feet (9.14 m) or serving an audience occupant load greater than 1000 shall be separated from the rest of the building by construction with a one hour fire-resistance rating.

410.5.3 One hour separation at Type B stages. Fire areas with Type B stages with a stage area greater than 2500 square feet (232.25 m^2) or serving an audience occupant load greater than 2000 shall be separated from the rest of the building by construction with a one hour fire-resistance rating.

Delete without substitution:

~~**410.2 Stages.** *Stage* construction shall comply with Sections 410.2.1 through 410.2.7.~~

~~**410.2.1 Stage construction.** *Stages* shall be constructed of materials as required for floors for the type of construction of the *building* in which such *stages* are located.~~

> ~~**Exception:** *Stages* need not be constructed of the same materials as required for the type of construction provided that the construction complies with one of the following:~~

~~1. *Stages* of Type IIB or IV construction with a nominal 2-inch (51 mm) wood deck, provided that the *stage* is separated from other areas in accordance with Section 410.2.4.~~

~~2. In *buildings* of Type IIA, IIIA and VA construction, a fire-resistance-rated floor is not required, provided that the space below the *stage* is equipped with an *automatic sprinkler system* or *fire-extinguishing system* in accordance with Section 903 or 904.~~

~~3. In all types of construction, the finished floor shall be constructed of wood or *approved* noncombustible materials. Openings through stage floors shall be equipped with tight-fitting, solid wood trap doors with *approved* safety locks.~~

~~**410.2.3 Exterior stage doors.** Where protection of openings is required, exterior *exit* doors shall be protected with *fire door assemblies* that comply with Section 716. Exterior openings that are located on the *stage* for *means of egress* or loading and unloading purposes, and that are likely to be open during occupancy of the theater, shall be constructed with vestibules to prevent air drafts into the auditorium.~~

~~**410.2.4 Proscenium wall.** Where the stage height is greater than 50 feet (15 240 mm), all portions of the *stage* shall be completely separated from the seating area by a proscenium wall with not less than a 2-hour fire-resistance rating extending contiuously from the foundation to the roof.~~

~~**Exception:** Where a *stage* is located in a *building* of Type I construction, the proscenium wall is permitted to extend continuously from a minimum 2-hour fire-resistance-rated floor slab of the space containing the *stage* to the roof or a minimum 2-hour fire-resistance-rated floor deck above.~~

~~**410.2.5 Proscenium curtain.** Where a *proscenium wall* is required to have a *fire-resistance rating*, the *stage* opening shall be provided with a fire curtain complying with NFPA 80, horizontal sliding doors complying with Section 716 having a *fire protection rating* of not less than 1 hour, or an *approved* water curtain complying with Section 903.3.1.1 or, in *facilities* not utilizing the provisions of *smoke-protected assembly seating* in accordance with Section 1030.6.2, a smoke control system complying with Section 909 or natural *ventilation* designed to maintain the smoke level not less than 6 feet (1829 mm) above the floor of the *means of egress*.~~

~~**[BG] PROSCENIUM WALL.** The wall that separates the *stage* from the auditorium or assembly seating area.~~

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

This proposal along with the related proposal on definitions recognizes the changes in design of stages and auditoriums since the 19th century, and replaces the untested and ineffective separation of the stage from the auditorium. We set out with the two main goals: (1) to clarify the types of stages and to establish clear thresholds for when various additional features for fire protection; and (2) to replace the separation between stage and audience with a separation between the stage and audience combined and the rest of the building.

The proposed definitions are in a separate closely related proposal as follows:

[BG] STAGE. A space within a building utilized for entertainment or presentations, which includes overhead hanging curtains, drops, scenery or stage effects other than lighting, and sound, projections, and video display and the mounting provisions for them.

Type A stage. A stage that is designed and constructed for use with curtains and stage scenery.

Type B stage . A stage that is designed and constructed for use without curtains and stage scenery.

STAGE SCENERY. The constructed scenes or hangings used on a stage to form a theater set.

Note that furniture is not scenery. Flipcharts, tripods, podiums, lecterns, music stands, portable projection screens, tables with objects, luggage, appliances, machines, etc. also, not scenery. Scenery are walls and ceilings and large three-dimensional objects and drops typically built with combustible materials for a stage setting. Hard to put in definition but we will suggest code commentary text and hope that will be sufficient.

SUMMARIZING PROPOSED REQUIREMENTS FOR TYPE A AND TYPE B STAGES:

For a Type A stage with a maximum stage area of 2500 sf and a maximum stage height of 30' and serving a maximum audience occupancy of 1000 seats, no additional features of fire protection are required beyond that which is required for the occupancy, probably A-1. 50 x 50 or 100 x 25 and 30' high is a pretty decent size stage for a cafeteria, gym, or a banquet hall; a flexible theatre up to 70' x 70' x 30'.

For a Type A stage with a maximum stage area of 5000 sf or a maximum stage height of 50' or serving a maximum audience occupancy of 1000, a 1-hour separation of stage and auditorium together from rest of building is required.

For a Type A stage serving an audience occupancy of over 300 and a stage area over 5000 sf or stage height over 50', a 2-hour separation of stage and auditorium together from rest of building is required and in addition it shall be of types 1, 2, or 4 construction.

In addition for a Type A Stage serving an audience occupancy of over 300 and with either a stage area over 2500 sf or a stage height over 30' shall be vented.

For a Type B with a maximum stage area of 2500 sf and serving a maximum audience occupancy of 2000, no additional features of fire protection are required beyond that which is required for the occupancy, probably A-1. Therefor, a traditional raised or not raised floor area at the front of a church or lecture hall or in a music only recital or concert hall are Type B stages.

For a Type B stage a stage area over 2500 sf or serving an audience occupancy over 2000, a 1-hour separation of stage and auditorium together from rest of building is required.

Furniture is not scenery. Flipchart stands, podiums, lecterns, music stands, portable projection screens, tables with objects, etc. also, not scenery. Scenery are walls and ceilings and large three-dimensional objects and drops typically built with combustible materials for a stage setting. Hard to put in definition but we will suggest code commentary text and hope that will be sufficient.

Fire sprinklers required on all stages, most likely because any A occupancy over 300 total building occupancy is required to be sprinklered.

WHAT HAS CHANGED FROM THE 19TH CENTURY THEATRE

1. The basis for the requirements for theatres and performing arts stages in IBC, IFC, NFPA 101 and NFPA 5000 are based on very early 1900s models and much has changed in 120 years. Significantly the amount of combustibles and the use of LED lighting and equipment has virtually eliminated the fire hazard that was so common before the electric light bulb. The efficacy of the proscenium wall and fire safety curtain is unproven.

2. Theatres in 1900 were a for profit business and generally were two stand alone buildings, one with audience and all its support spaces and one with stage with all its support spaces, in built up urban areas. Now the overwhelming majority are in schools: 40,000± K-12 and 5000± higher education versus1000± broadway, touring venues, regional producing theatres, and community theatres combined. Overwhelmingly the stage and auditorium are one part of a much larger building with many other uses and possibly other occupancies such as the contemporary high school or a performing arts center.

3. Scenery was much more plentiful and nearly all composed of combustible fabric and wood. From John R Freeman PE report on the Iroquois Theatre fire:

"On the Iroquois stage at the time of the fire there was more than ten thousand square yards of canvas, or two and one-half acres, and in addition about three thousand square yards, or half an acre, of gauze. To hang this required nearly eleven miles in length of 5/8 inch manila rope, and in the frames, battens, braces, profiles and set pieces, the stage carpenter of the Iroquois tells me, after making careful estimate, that there was about eight thousand square feet of white pine lumber. The total weight of this fuel was more than ten tons, all dry as tinder, and all set or hung in a way to give the quickest possible exposure and spread to the flames."

That is around 10 psf of combustibles. A mixture of factors including labor costs to produce that much scenery, use of wire rope and steel instead of kerosene soaked manila rope and dry pine for much of the stage equipment, much less wood and other combustibles used in the construction, and much more reliance on projections than painted cloth. A "big" play in a high school is likely to be in the 2 to 4 psf range. Compared with big box stores and factories, even residential occupancies, this is small.

4. Lighting during the "great age of theatre fires" from roughly 1850 to 1900 where the life of a theatre averaged 5 years before burning to the ground, and like at the Iroquois, was open flame or open arc lighting. It was sparks from an arc light that started the fire at the Iroquois. The Rhoads Opera House fire in Boyertown PA, January 13, 1908: "The fire started when a kerosene lamp being used for stage lighting was knocked over, starting a fire on the stage." The electric light bulb ended almost all theatre fires. Since the early 1900s

there have been a few fires where electric incandescent lighting ignited fabric on stage as was common previously. Incandescent theatre lights are hot but not like flames and open arcs lamps. Since the early 2000's LED theatre lighting has taken over and they are not hot.

5. Fire sprinklers were unheard of on stages in early 1900s, but since 1960s have been required and have been effective. The Chicago Public Library auditorium and Peace Center for the Arts in Greenville both had fires in 1990s - drapery covering incandescent lights - and a single fire sprinkler extinguished the fire. Its important to keep in mind that the lighting over stage is typically around 25' off the floor and the combustibles above that well within 50' for the roof and sprinklers, challenging the conventional thinking about sprinkler efficacy being limited to 50' above the floor.

6. Smoke ventilation reliability has improved substantially. From the The Ringtheater fire, December 8, 1881, which resulted in documenting the need for it; and the Edinburgh's Palace Empire Theatre fire, May 9,1911 where everyone in the auditorium escaped; and at the Iroquois where they did not operate. If there is a fire on a stage, ventilation to keep the audience areas relatively smoke free for at least 10 minutes is key.

7. Inward swinging doors, narrow and steep stairs, unfamiliar door hardware, and other egress restrictions all contributed to the deaths in most of not all of these historic theatre fires. What was common and permitted 50 to 100 years ago is not the same today. More egress, wider egress, higher occupant loads factors, and more requirements for maintaining the means of egress all contribute.

8. Based on records and personal experience, most stage fires occur when the there is no audience present. *Modern Opera Houses and Theatres* published in 3 volumes, by Edwin O. Sachs and Ernest A. E. Woodrow, published 1896 through 1898, documents that the average life of a theatre built between 1850 and 1900 was five years before there was a substantial loss from fire notes this. The attached "NFPA data 1990" shows this.

8. Proposed 410.4.1 is relocating text from existing 410.2.2 shown deleted below under Technical Production Areas.

Section 410 pre-print - a draft of what section 410 would look like if all ASTC proposals were accepted

"ATTAC-65" is the 1992 BCMC report which was used as the basis for the first edition of the IBC and largely unchanged in the 2024 IBC.

"nfpa data 1990" is a report from NFPA records of "Recent Fires Originating on Stages or in Projection Rooms or Areas". Note the last page is NOT and NFPA summary but one which ASTC wrote.

"NFPA 101_5000 Assembly Occupancies..." is a recent summary of fires originating on stages ffom NFPA data

"Stage Ventilation - Clearing the Heat and Smoke" 2013 article published in Protocol regarding stage ventilation.

"Fire Protection for Stages without Reliance on the Fire Safety Curtain" paper from International Theatre Architecture and Engineering conference 2002

Cost Impact: Decrease

Estimated Immediate Cost Impact:

On stages which do not currently require a proscenium wall and fire safety curtain, there is little impact as the compartmentalization is basically unchanged.

Clarifying the difference between a type A and type B stage, and the generally lesser cost for fire protection features on a type B stage, may result in savings for a few projects which have traditionally been mislabeled. The opposite may also be true, requiring a little more fire resistant rated construction for a stage that was erroneously labeled as a platform.

While the ASTC believes this will not change the total amount of money spent on a theatre to change, the immediate impact of no longer requiring a fire safety curtain and two hour wall between audience and stage will decrease the cost of that part of the building. Fire safety curtains start in the $100,000 range and can exceed $500,000. The savings in the proscenium wall construction and fire rated opening protectives is offset by the requirement to include the auditorium within the stage fire area - for over 50' stages.

Estimated Immediate Cost Impact Justification (methodology and variables):

$100,000 to over $500,000 just on costs of fire safety curtains.

G73-25

G74-25

IBC: 410.2.1

Proponents: David Bueche, representing Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Revise as follows:

410.2.1 Stage construction. *Stages* shall be constructed of materials as required for floors for the type of construction of the *building* in which such *stages* are located.

Exception: *Stages* need not be constructed of the same materials as required for the type of construction provided that the construction complies with one of the following:

1. *Stages* of Type IIB or IV construction with a nominal 2-inch (51 mm) wood deck, provided that the *stage* is separated from other areas in accordance with Section 410.2.4.
2. <u>*Stages* are permitted to be constructed of *fire-retardant-treated wood* for Types II, and IV construction, provided that the *stage* is separated from other areas in accordance with Section 410.2.4.</u>

~~2.~~ <u>3.</u> In *buildings* of Type IIA, IIIA and VA construction, a fire-resistance-rated floor is not required, provided that the space below the *stage* is equipped with an *automatic sprinkler system* or *fire-extinguishing system* in accordance with Section 903 or 904.

~~3.~~ <u>4.</u> In all types of construction, the finished floor shall be constructed of wood or *approved* noncombustible materials. Openings through stage floors shall be equipped with tight-fitting, solid wood trap doors with *approved* safety locks.

Reason: By allowing the use of fire-retardant-treated wood (FRTW) while maintaining the required separation, stages could provide improved fire resistance compared to the untreated wood currently permitted by Exception 1 for Types IIB and IV construction, for instance. Furthermore, FRTW is already allowed in permanent platforms for Types I, II, and IV construction (IBC Section 410.3).

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. The addition of fire-retardant-treated wood as an option to this section of the code may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than noncombustible materials. Because FRTW is used as an alternate to these materials in various applications, the cost may be less.

IBC: 410.2.1.1, 410.2.1 (New), 410.2.2 (New), 410.2.3 (New), 410.3 (New)

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Revise as follows:

410.2 ~~410.2.1.1~~ Stage ~~height and~~ area. Stage areas shall be measured to include the entire performance area and ~~adjacent~~ contiguous backstage and support areas not separated from the performance area~~ by fire-resistance-rated construction. Stage height shall be measured from the lowest point on the stage floor to the highest point of the underside of the roof or floor deck above the *stage*.~~

Add new text as follows:

410.2.1 Stage area boundary. Areas separated from the *stage* by fire-resistance-rated construction where required by Section 410.7 or separated from the performance area by doors and walls where fire resistance rated construction is not required shall not be included in the *stage* area.

410.2.2 Flexible stages. In spaces where the *stage* and audience areas are not defined, *stage* area be permitted to be as shown in the construction documents or to be calculated as not more than 50% of the combined *stage* and audience area.

410.2.3 Stage level. *Stage* area shall only include areas at the level of the stage floor and shall not include technical production areas above the *stage* or rooms or spaces below the stage that are open to the stage and within the same footprint.

410.3 Stage height. *Stage* height shall be measured from the lowest point on the *stage* floor to the highest point of the underside of the roof or floor deck above the *stage*. Spaces below and open to the *stage* shall not contribute to *stage* height.

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/
Since these terms were introduced, experience has indicated additional detail and clarity is beneficial. There is no change in intent from when developed in the BCMC process around 1990.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes are for clarification for stage height and areas.

G75-25

IBC: SECTION 202, [BE] 410.5.2, 410.6 (New), 410.7 (New), 410.7.1 (New), 410.7.2 (New), 410.7.3 (New), 410.7.4 (New), 410.7.5 (New), 410.7.5.1 (New), 410.7.5.2 (New), 410.2.1, 410.3, 410.3.1, 507.6, 507.7

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Add new text as follows:

410.6 Space below stage. Where fire-resistant-rated construction is required for a stage and the stage floor fire-resistance rating is less than required in Section 410.7 or where there are openings in the stage floor to the space below the stage, the space below the stage shall be included within the stage fire area and separated from the rest of the building in accrdance with Section 410.5.

410.7 Stage floors. Permanent *stage* floors shall be constructed of materials as required for floors for the type of construction of the *building* in which such *stages* are located except as indicated in Section 410.7.1 and 410.7.2.

410.7.1 Non-fire-resistant stage floors. Stage floor construction shall be a nominal 2-inch (51 mm) wood deck or other approved materials.

410.7.2 Finished stage floors assembly. In all types of construction, the finished stage floor, subfloor, sleepers, and blocking shall be constructed of wood or approved noncombustible materials.

410.7.3 Raised stage floors. Where the stage floor is raised above the building floor, the raised floor including structural support shall be constructed of fire-retardant-treated wood or other approved non-combustible materials. Where the space beneath the raised stage floor is used for storage or any purpose other than equipment, wiring or plumbing, the floor assembly shall be not less than 1-hour fire-resistance-rated construction. Where the space beneath the raised stage floor is used only for equipment, wiring or plumbing, the underside of the raised stage floor need not be protected.

410.7.4 Stage floor openings. Where there are stage floor openings, the space below the stage floor opening shall be included within the stage fire area.

410.7.5 Stage floor opening inserts. Stage floor opening inserts where provided shall be constructed of approved materials and shall support loads as required for stages.

410.7.5.1 Removable inserts. Manually removable inserts shall have gaps no greater than 1/8-inch (3.18 mm) between the insert and adjacent stage floor. Approved hardware shall secure the insert in place.

410.7.5.2 Operable inserts. Mechanized inserts shall have gaps no greater than 3/8-inch (9.53 mm) between the insert and adjacent stage floor.

Delete without substitution:

~~**410.2.1 Stage construction.** *Stages* shall be constructed of materials as required for floors for the type of construction of the *building* in which such *stages* are located.~~

~~**Exception:** *Stages* need not be constructed of the same materials as required for the type of construction provided that the construction complies with one of the following:~~

1. ~~*Stages* of Type IIB or IV construction with a nominal 2-inch (51 mm) wood deck, provided that the *stage* is separated from other areas in accordance with Section 410.2.4.~~
2. ~~In *buildings* of Type IIA, IIIA and VA construction, a fire-resistance-rated floor is not required, provided that the space below the *stage* is equipped with an *automatic sprinkler system* or *fire-extinguishing system* in accordance with Section 903 or 904.~~
3. ~~In all types of construction, the finished floor shall be constructed of wood or *approved* noncombustible materials. Openings through stage floors shall be equipped with tight-fitting, solid wood trap doors with *approved* safety locks.~~

~~**410.3 Platform construction.** Permanent *platforms* shall be constructed of materials as required for the type of construction of the *building* in which the permanent *platform* is located. Permanent *platforms* are permitted to be constructed of *fire-retardant-treated wood* for Types I, II and IV construction where the *platforms* are not more than 30 inches (762 mm) above the main floor, and not more than one-third of the room floor area and not more than 3,000 square feet (279 m^2) in area. Where the space beneath the permanent *platform* is used for storage or any purpose other than equipment, wiring or plumbing, the floor assembly shall be not less than 1-hour fire-resistance-rated construction. Where the space beneath the permanent *platform* is used only for equipment, wiring or plumbing, the underside of the permanent *platform* need not be protected.~~

~~**410.3.1 Temporary platforms.** *Platforms* installed for a period of not more than 30 days are permitted to be constructed of any materials permitted by this code. The space between the floor and the *platform* above shall only be used for plumbing and electrical wiring to *platform* equipment.~~

~~**[BG] PLATFORM.** A raised area within a *building* used for worship, the presentation of music, plays or other entertainment; the head table for special guests; the raised area for lecturers and speakers; boxing and wrestling rings; theater-in-the-round *stages*; and similar purposes wherein, other than horizontal sliding curtains, there are no overhead hanging curtains, drops, scenery or stage effects other than lighting and sound. A temporary platform is one installed for not more than 30 days.~~

Revise as follows:

[BE] 410.5.2 Stairway and ramp enclosure. *Exit access stairways* and *ramps* serving a *stage* ~~or *platform*~~ are not required to be enclosed. *Exit access stairways* and *ramps* serving *technical production areas* are not required to be enclosed.

SECTION 507
UNLIMITED AREA BUILDINGS

507.6 Group A-3 buildings of Type II construction. The area of a Group A-3 *building* not more than one *story above grade plane*, used as a *place of religious worship*, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor *swimming pool* or tennis court of Type II construction, shall not be limited provided that the following criteria are met:

1. The *building* shall not have a *Type A* *stage* ~~other than a *platform*~~.
2. The *building* shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. The *building* shall be surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

507.7 Group A-3 buildings of Type III and IV construction. The area of a Group A-3 *building* of Type III or IV construction, with not more than one *story above grade plane* and used as a *place of religious worship*, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor *swimming pool* or tennis court, shall not be limited provided that the following criteria are met:

1. The *building* shall not have a *Type A* *stage* ~~other than a *platform*~~.
2. The *building* shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. The assembly floor shall be located 21 inches (533 mm) or less from street or grade level and all *exits* are provided with *ramps* complying with Section 1012 to the street or grade level.

4. The *building* shall be surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

Summary: The existing section "410.2.1 Stage construction." was always about stage floors, not the whole stage. This proposal is to better organize and update the code for current practices.

Reason:

Note that not all stage floors are raised, as was prevalent up to the mid 20th century. Whether it was labeled a "stage" or a "platform", either could be at the same elevation as a floor level or it could be at an elevation above the floor level.

1. Fundamental is including the space below stage when not separated from the stage by fire resistive construction, that it be included in the stage fire area and thus separated from the rest of the building. Below, the specific intent is required to be protected by automatic fire protection.

2. Proposed 410.9.1 permits a traditional stage floor construction, even though not used as extensively as previously.

3. Proposed 410.9.2 permits a typical today built up stage floor of resilient pads, sleepers, sub-floor, and finished floor.

4. Proposed 410.9.3 permits the classic raised stage floor, with the same exemptions from protection, coordinated with proposed automatic fire protection in these areas.

5. Proposed 410.9.4 permits openings, typically for traps or lifts (removable inserts and mechanized inserts) in all stages.6.

6. The use of the term platform is further complicated by many uses of the term “platform” elsewhere in the IBC, regarding platform lifts, equipment platforms, transit and boarding platforms, several uses regarding accessibility (including fishing platforms among others), diving platforms, industrial steel work platforms, "platform decorative trim" (?), used as an equal for stairs to "landing", and item 37 in table 1607.1. The only uses in section 410 are 410.3 Platform construction and 410.3.1 Temporary platforms.

7. The revisions to 507.6 and 507.7 are for coordination with deletion of defined term "platform" and addition of Type A and Type B stages.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes simply clarify stage floors and assures compartmentalization appropriate to the hazards.

G76-25

G77-25

IBC: 410.2.7

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Revise as follows:

410.8 **~~410.2.7~~ Stage ventilation.** Emergency *ventilation* shall be provided for Type A *stages* larger than 2,500 ~~1,000~~ square feet (232.25 ~~93~~ m^2) in floor area, or with a *stage* height greater than 30 ~~50~~ feet (9.14 m ~~15 240 mm~~). Such *ventilation* shall comply with Section 410.8.1 ~~410.2.7.1~~ or 410.8.2 ~~410.2.7.2~~.

Exception: Type A stages serving an audience of 300 or less are not required to have emergency ventilation.

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

Summary: Coordinate with changes to stage construction and separation.

Reason: History has shown the necessity for safety of venting the stage as pointed out in an earlier proposal, noting the extensive engineering study following The Ringtheater fire, December 8, 1881; the Edinburgh's Palace Empire Theatre fire, May 9, 1911 where the fire safety curtain did not close but everyone in the auditorium escaped in a smoke free auditorium; and at he Iroquois where the vents were not complete and did not operate. If there is a fire on a stage, ventilation to keep the audience areas relatively smoke free is key.

1. Changes to 410.10 is primarily coordination with other changes, modifying the height and area thresholds as well as excluding the small space.2. Adjustment to the area and height at which ventilation is required are an attempt on better align the requirements with the hazard of combustibles on the stage. 3. The 300 spectator limit is for both the smaller studio or black box theatre or small end stage where there is less combustible scenery, and to recognize the greater efficiency and speed of egress for the audience to be outside the stage fire area.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost savings intent to these changes. There may be some savings for a small sub-set of stages where because of the lower amount of combustibles venting is not required. This is somewhat offset by clarifying the requirement for stages where venting was not installed and should have been.

G77-25

G78-25

IBC: SECTION 202, 410.1, 410.2.2, 410.9.1 (New), 410.9.2 (New)

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

Revise as follows:

[BG] TECHNICAL PRODUCTION AREA. Open elevated areas or spaces intended for entertainment technicians to walk on and occupy for servicing and operating entertainment technology systems and equipment. Galleries, including fly and lighting galleries, gridirons, catwalks, tension wire grids, technical bridges, and similar areas are designed for these purposes.

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

410.1 Applicability. The provisions of Sections 410.1 through 410.6 shall apply to all parts of *buildings* and *structures* that contain *stages* ~~or *platforms*~~ and ~~similar appurtenances as herein defined~~ technical production areas.

410.9 ~~**410.2.2**~~ **Technical production areas**~~**: galleries, gridirons and catwalks.**~~**.** ~~Beams designed only for the attachment of portable or fixed theater equipment, gridirons, galleries and catwalks~~*Technical production areas* shall be constructed of *approved* materials consistent with the requirements for the type of construction of the *building*; and a *fire-resistance rating* shall not be required. ~~These areas shall not be considered to be floors, *stories, mezzanines* or levels in applying this code.~~ ~~**Exception:** Floors of fly galleries and catwalks shall be constructed of any *approved* material.~~

Add new text as follows:

410.9.1 Technical production area floors. The walking surface of *technical production areas* shall be constructed of any *approved* material.

410.9.2 Technical production area levels. *Technical production areas* shall not be considered to be *floors, stories, mezzanines* or levels in applying this code.

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

Summary: These changes are to update the definitions and are nearly editorial for the requirements to improve the readability and more consistent interpretation.

Reason:

1. The growth in use of tension wire grids warrants its inclusion by name in the definition of Technical Production Areas. It should be noted that tension wire grids are defined in the ANSI E1.76 - 2023 Tension Wire Grids standard.

2. The increasing use of the term technical bridges in place of catwalks and galleries warrants its inclusion by name in the definition of Technical Production Areas.

3. Instead of listing each technical production area, just use the defined term.

4. The existing exemption for structural framing only for stage equipment not being protected is relocated to stage construction. For people unfamiliar with stage equipment and it mounting, much of it clamps to the structural framing and is intended to be repositioned as production needs require. in particular, note B to table 601 (below) is fundamental but this requirement permits structural framing "only for stage equipment" regardless of its elevation above a floor is still exempt, as if it were itself a piece of the stage equipment.

b.

Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below.

5. Floors changed to walking surfaces for clarity with them not being considered floors.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification and inclusion of technical bridges and tension wire grids. Also coordination with other changes, moving construction related requirement to section on construction.

IBC: 410.4, 410.4.1, 410.4.2

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Delete without substitution:

~~**410.4 Dressing and appurtenant rooms.** Dressing and appurtenant rooms shall comply with Sections 410.4.1 and 410.4.2.~~

Delete and substitute as follows:

~~**410.4.1 Separation from stage.** The *stage* shall be separated from dressing rooms, scene docks, property rooms, workshops, storerooms and compartments contiguous to the *stage* and other parts of the *building* by *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. The *fire-resistance rating* shall be not less than 2 hours for stage heights greater than 50 feet (15 240 mm) and not less than 1 hour for *stage* heights of 50 feet (15 240 mm) or less.~~

410.11 Dressing rooms. Dressing rooms serving the stage shall be separated from each other, the stage and auditorium, with not less than a 1 hour fire-resistance-rated fire barriers, horizontal assemblies or both. Multiple dressing rooms with an aggregate net area of 1000 square feet (93 m^2) or less shall not be required to be separated from each other.

~~**410.4.2 Separation from each other.** Dressing rooms, scene docks, property rooms, workshops, storerooms and compartments contiguous to the *stage* shall be separated from each other by not less than 1-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.~~

410.12 Appurtenant rooms. Workshops and storage rooms serving the stage shall be separated from each other, the stage and auditorium, and the rest of the building, by not less than a 1-hour fire-resistance-rated fire barriers, horizontal assemblies or both.

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

1. The 410.13 requirements are definitely a holdover from the 19th century theatre with the stage as a separate building from the auditorium containing the dressing rooms, often in tiers above the wings or in the trap room below the stage, along with any storage, “trunk rooms”, workshops, etc. These spaces have been and to a lesser extent remain spaces with many combustibles such as costumes and wigs, as well as some combustible products such as hair spray, and often a collection of hair dryers, curling irons, flat irons, coffee makers, and immersion heaters. In new buildings, these spaces are no longer within the stage, but separate, often not even contiguous with or on the same level as the stage. The stage fire area in the proposed changes in 410.7 assures fire resistive construction separation from the stage and auditorium. This primarily requires separation from the rest of the building, as always, but does permit some clustering of small dressing rooms within a single fire area no larger than 1000 sf.
2. 410.14 maintains the separation of work rooms and storage rooms from the rest of the building, as a reminder and possibly redundant requirement for separating work rooms and store rooms from many uses or occupancies.

3. Other proposals include changes to assure the stage along with auditorium are separated from these spaces and separated from the rest of the building in all but very small buildings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

While there could be very minor savings in a cluster of dressing rooms, this is basically clarification and recognizing the changes in over 100 years of the design and construction of theatres.

G79-25

G80-25

IBC: 410.2.4

Proponents: William Conner, Bill Conner Associates LLC, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Revise as follows:

410.2.4 Proscenium wall. Where the stage height is greater than 50 feet (15 240 mm), all portions of the *stage* shall be completely separated from the seating area by a proscenium wall with not less than a 2-hour fire-resistance rating extending contiuously from the foundation to the roof.

~~**Exception**~~ **Exceptions**:

1. No separation is required of a stage from a seating area with an aggregate occupant load of 300 or less.
2. Where a *stage* is located in a *building* of Type I construction, the proscenium wall is permitted to extend continuously from a minimum 2-hour fire-resistance-rated floor slab of the space containing the *stage* to the roof or a minimum 2-hour fire-resistance-rated floor deck above.

Reason: The time required for 300 or fewer occupants to egress does not justify this extra compartmentalization and fire safety curtain. This concept originated when all theatres with tall stages had seating for large number of people, many more than 300. Note that at this occupant load, all required exit access for the audience is permitted to be through the stage. This really allows the small spaces, typically a small flexible theatre, theatre in the round, or small recital hall, to not include some features that are not justified for the size an egress time.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The code change proposal will decrease the cost of construction. This is a marginal call - it's unlikely it will change cost much on only a few projects a year.

Estimated Immediate Cost Impact Justification (methodology and variables):

Average cost of a fire safety curtain is $25,000-50,000 or more depending on size, motorization, style, and market. Additional cost of the wall for 2 hours rating can vary from insignificant to hundreds of thousands.

Estimated Life Cycle Cost Impact:

Decrease - $1500 +/- per year for manufacturer recommended annual inspections for a estimated 40 to 50 year life of the fire safety curtain.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The impact is not spending money on a feature that has not shown its usefulness. Typically this will affect a single digit percentage of the several hundred new small community high school auditoriums and stages built each year, each typically in the $3m to $6m range.

G80-25

G81-25

IBC: 410.2.6, 410.3.1

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Delete without substitution:

~~**410.2.6 Scenery.** Combustible materials used in sets and scenery shall meet the fire propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701, in accordance with Section 806 and the *International Fire Code*. Foam plastics and materials containing foam plastics shall comply with Section 2603 and the *International Fire Code*.~~

~~**410.3.1 Temporary platforms.** *Platforms* installed for a period of not more than 30 days are permitted to be constructed of any materials permitted by this code. The space between the floor and the *platform* above shall only be used for plumbing and electrical wiring to *platform* equipment.~~

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

These are not in the construction documents and not a part a plan review or actually installed during construction. They are appropriate requirements for the IFC. ASTC intends and plans to submit proposals to the IFC for the group A hearings for the 2030 edition.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact from having these out of the building code and put into the fire code.

G81-25

G82-25

IBC: 410.2.7.1, [F] 410.2.7.2

Proponents: William Conner, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410 STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Revise as follows:

410.8.1 ~~**410.2.7.1**~~ **Roof vents.** Two or more vents constructed to open automatically by *approved* heat-activated devices and with an aggregate clear opening area of not less than 5 percent of the area of the *stage* shall be located near the center and above the highest part of the *stage area*. Supplemental means shall be provided for manual operation of the ventilator from the *stage* floor. Where *labeled* devices permitting manual operation from the *stage* floor are not available, the manual operation device is not required to be *labeled* and *listed*.~~Curbs shall be provided as required for skylights in Section 2610.2.~~ Vents shall be *labeled*.

[F] 410.8.2 ~~**410.2.7.2**~~ **Smoke control.** Smoke control in accordance with Section 909 shall be provided to maintain the smoke layer interface not less than 6 feet (1829 mm) above the highest level of the assembly seating or above the top of the proscenium opening where a *proscenium wall* is provided in compliance with Section 410.2.4.

Attached Files

- **Stage Ventilation 2024.pdf**
  https://www.cdpaccess.com/proposal/11544/35546/files/download/8853/

Reason: This proposal is submitted on behalf of the American Society of Theatre Consultants. https://theatreconsultants.org/

Summary: Clarify that manual emergency operation should be possible from the stage floor and make that possible.

Reason: See attached white paper for information to architect and engineer clients regarding stage vents.

1. Require the vents to be manually operable from the floor in an emergency. Most roof vents ship with a manual release line and handle that does not reach anywhere near the stage floor. Besides being useless except from a technical production area, they should be operable from the stage floor near an entrance to the stage.

2. Allow vents not labeled for manual operation to be modified to be able to be opened from the stage.

3. The curb requirement was deleted in deference to the listing and manufactures instructions which set mounting requirements.

4. 410.10.2 is shown for information and numbering change. In the next Group A cycle we plan to propose deleting "or above the top of the proscenium opening where a proscenium wall is provided in compliance with Section 410.2.4". This change is for coordination with the deletion of the requirement for proscenium wall, with a resulting more stringent requirement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes are for clarification of the intent of the historical intent of the requirements. In so far as roof vents which have been installed without provisions for manual operation from the floor, there will be some additional cost, estimated around $1000 to 2500 per vent, depending on methods chosen, and typically 2 to 8 vents per stage.

G83-25

IBC: 410.2.7

Proponents: William Conner, Bill Conner Associates LLC, representing American Society of Theatre Consultants (bill@bcaworld.com)

2024 International Building Code

SECTION 410
STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS

Revise as follows:

410.2.7 Stage ventilation. Emergency *ventilation* shall be provided for *stages* larger than 1,000 square feet (93 m^2) in floor area, or with a *stage* height greater than 50 feet (15 240 mm). Such *ventilation* shall comply with Section 410.2.7.1 or 410.2.7.2.

Exception: No ventilation is required for a stage serving a seating area with an aggregate occupant load of 300 or less.

Reason: The time required for 300 or fewer occupants to egress does not justify the requirement for this. Generally these are black box (flexible) theatres, arena (“in-the-round”) theatres, recital halls, or facilities with similar and often flexible and/or undefined stage and seating areas. Relative to a full working stage with larger seating areas, the potential amount of combustibles in these small spaces is very small. This is particularly necessary because these small spaces often are below other occupied spaces, unlike a large auditorium and stage where the top of the stage is almost always roof and venting is not difficult. The origin of this was in 1850s and was based on large opera houses with gas lighting, and simply was continued as the art form evolved to where small spaces were often necessary or desired.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This change will decrease cost of the small modest space with stage area open to roof $10,000-20,000 for several roof vents. For a larger stage area that is under occupiable floors, the cost for venting and shaft will be many times the low end savings. No doubt there will be additional energy savings as the typical vents are not especially well insulated or well sealed.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost is simply not justified for no demonstrated safety returns.

Estimated Life Cycle Cost Impact:

Minimal savings from occasional maintenance and replacement in 25-50 years.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The cost is simply not justified for no demonstrated safety returns.

G83-25

G84-25

IBC: 420.6 (New)

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

SECTION 420
GROUPS I-1, R-1, R-2, R-3 AND R-4

Add new text as follows:

420.6 Visual Access. The primary entry door of a dwelling unit or sleeping unit in Group R-1 and R-2 occupancies shall be provided with a means for visually identifying a visitor without opening the unit entry door. Peepholes, where used, shall provide a minimum 180-degree range of view.

Reason: This requirement essentially requires a peephole or other type of door viewer such as a doorbell camera be provided at unit entry doors as it provides an additional level of safety for interior occupants. This provision was recommended by the Las Vegas Metropolitan Police Department (LVMPD) and has been in place for all Group R-1 & R-2 occupancies in Southern Nevada for several code cycles. LVMPD originally cited studies that found this requirement lead to a decrease in the number home invasion crimes related to unforced entries (i.e. when the occupant willingly opened the door to intruders)

While this is not a base code requirement in either the IBC or the FHA for Group R-2 occupancies, the FHA does recommend peepholes or sidelights be provided at all dwelling unit entry doors. Given the FHA recommendations and the recommendations by law enforcement, it seems prudent to mandate this provision for all Group R-1 and R-2 occupancies as a cost effective way to increase public safety.

Cost Impact: Increase

Estimated Immediate Cost Impact:

UL listed fire rated peepholes can be readily obtained for less than $10 per device.

Estimated Immediate Cost Impact Justification (methodology and variables):

These devices can be readily obtained by a wide variety of vendors.

G84-25

IBC: SECTION 424 (New), 424.1 (New), 424.2 (New), 424.3 (New), 424.4 (New), 424.5 (New), 424.5.1 (New), 424.5.2 (New), UL Chapter 35 (New)

Proponents: James Lynch, Fire Solutions Group, representing Framery

2024 International Building Code

Add new text as follows:

SECTION 424 ACOUSTIC PODS

424.1 General. Acoustic pods exceeding 100 square feet (9.3 m^2) or less in floor area and 8 feet (2438 mm) or less in height shall comply with all applicable requirements in this section.

424.2 Listing. Acoustic pods shall be listed and labeled in accordance with UL 962 and installed in accordance with the listing and the manufacturer's instructions.

424.3 Locations. Acoustic pods shall only be installed in approved locations and shall not obstruct required means of egress.

424.4 Elevation change. Acoustic pods with integral floors shall be permitted to have an elevation change measured from the finished floor that is a maximum of 5 inches (127 mm) higher than the floor of the existing structure outside the modular booth.

424.5 Fire suppression. Fire suppression acoustic pods shall be installed in rooms or spaces equipped with an automatic sprinkler system in accordance with Section 903.3.1.1. Installation of pods shall not interfere with clearances of existing sprinkler heads.

Exceptions:

1. Pod installations that meet the requirements of Section 9.2.10 of NFPA 13 and the following:
   1.1. Where multiple pods are proposed, the booths are separated by a distance of 18 inches from one another.
   1.2. The clearance between the top of the pods and ceiling sprinklers is a minimum of 18 inches.
   1.3. Per Section 9.2.10.2 of NFPA 13, the area of any pod does not exceed 24 square feet. The area is to be the interior area of the booth, excluding the area of the enclosing walls.
2. Pod installations where the top of the booth has louvers that open automatically on the activation of the fire alarm or with the loss of power.
3. Where the booth has an applicable testing report accompanied by full-scale fire testing report by an approved agency showing that ceiling sprinklers control a fire originating from inside the booth.

424.5.1 Smoke detection. An automatic smoke detection system complying with Section 907 shall be provided in the rooms or spaces in which the privacy pod's are located. The system shall activate the occupant notification system in accordance with Section 907.5.

424.5.2 Smoke alarms. Audibility requirements of NFPA 72 and Section 907.5.2.1 of the *International Fire Code* apply to the acoustic pod. If these requirements are not met, an alarm shall be placed inside the pod.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

962-22 Prefabricated privacy booths and sleep capsules

Reason: This proposed addition to the code provides guidance on the installation of acoustic pods similar to section on play spaces.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes proposed to the code provide clarification to the requirements rather than additional requirements for the installers therefore there are no additional cost.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.
UL962-22 Prefabricated privacy booths and sleep capsules

2024 International Building Code

Add new definition as follows:

LIVE FIRE TRAINING BUILDING. A building in which live fire training evolutions are conducted on a repetitive basis.This shall include, but not be limited to, containerized training structures, live fire training structures, and training towers.

Revise as follows:

312.1 General. *Buildings* and *structures* of an accessory character and miscellaneous *structures* not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings
Aircraft hangars, accessory to a one- or two-family residence (see Section 412.4)
Barns
Carports
Communication equipment *structures* with a *gross floor area* of less than 1,500 square feet (139 m^2)
Fences more than 7 feet (2134 mm) in height
Grain silos, accessory to a residential occupancy
Live fire training buildings
Livestock shelters
Private garages
Retaining walls
Sheds
Stables
Tanks
Towers

Add new text as follows:

SECTION 429
LIVE FIRE TRAINING BUILDINGS

429.1 Live fire training buildings. Live fire training buildings and any appurtenances connected or attached to such buildings or structures shall be designed and constructed in accordance with the applicable provisions of NFPA 1402 and this code.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

1402-2019 Standard on Facilities for Fire Training and Associated Props

2024 International Fire Code

Add new definition as follows:

LIVE FIRE TRAINING BUILDING. A building in which live fire training evolutions are conducted on a repetitive basis.This shall include, but not be limited to, containerized training structures, live fire training structures, and training towers.

Revise as follows:

[BG] 203.11 Miscellaneous Group U. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings
Aircraft hangar, accessory to a one- or two-family residence (see Section 412.4 of the *International Building Code*)
Barns
Carports
Communication equipment structures with a gross floor area of less than 1,500 square feet (139 m^3)
Fences more than 7 feet (2134 mm) in height
Grain silos, accessory to a residential occupancy
Live fire training buildings
Livestock shelters
Private garages
Retaining walls
Sheds
Stables
Tanks
Towers

Reason: Live fire training facilities contain unique types of buildings/structures that are in some instances, purposely designed to not meet building codes and/or simulate potentially hazardous conditions. NFPA 1402, when combined with the building codes of the jurisdiction, provides for the necessary design and construction provisions of these types of buildings and gives the code enforcement community the tools necessary to properly regulate them. The scope of the standard acknowledges that building codes and gas codes do not address the unique and specific requirements for these specialized types of facilities. It is not the intent of this proposal to capture buildings that are designed, constructed, and maintained to the International Building Code and International Fire Code already, such as a B or A occupancy where instruction on fire practices takes place, rather, to capture those buildings not clearly covered by the Codes that would typically require variances or modifications of code language to be compliant.

From the previous cycle, based on committee comments, the definition of “Live Fire Training Building” was modified to ensure only buildings where live fire training exercises are conducted are captured. The “associated systems, appliances and props” was also removed from the definition and the term “appurtenances” was added to the section to ensure the intent is not to capture stand-alone props that may be co-located at the same facility such as a gas-fired car prop but to capture gas-fired props used to simulate fire in or on the structure. Furthermore the requirement that the building still had to be constructed following the applicable provisions of the IBC was added.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

According to the industry, this standard is already the standard of practice, this code change is simply codifying the standard. So no increase is anticipated.

Staff Analysis: A review of the standard proposed for inclusion in the code, NFPA 1402-2019 Standard on Facilities for Fire Training and Associated Props, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

2024 International Building Code

Add new definition as follows:

CLINICAL LABORATORY. Labs examining materials derived from the human body for the purpose of providing information for the diagnosis, prevention, or treatment of any disease or impairment of, or the assessment of the health of, human beings.

[F] HIGHER EDUCATION LABORATORY. Laboratories in Group B occupancies used for educational purposes above the 12th grade. Storage, use and *handling* of chemicals in such laboratories shall be limited to purposes related to testing, analysis, teaching, research or developmental activities on a nonproduction basis.

Revise as follows:

[F] LABORATORY SUITE. A fire-rated, enclosed laboratory area providing one or more laboratory spaces ~~within a Group B educational occupancy~~ that includes ancillary uses such as offices, bathrooms and corridors that are contiguous with the laboratory area, and are constructed in accordance with Section 428.

SECTION 304
BUSINESS GROUP B

304.1 Business Group B. Business Group B occupancy includes, among others, the use of a *building* or *structure*, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:

Airport traffic control towers

Ambulatory care facilities

Animal hospitals, kennels and pounds

Banks

Barber and beauty shops

Car wash

Civic administration

Clinic, outpatient

Clinical laboratories

Dry cleaning and laundries: pick-up and delivery stations and self-service

Educational occupancies for students above the 12th grade including *higher education laboratories*

Electronic data entry

Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining *facilities* not more than 2,500 square feet (232 m^2) in area

Laboratories: testing and research

Lithium-ion or lithium metal battery testing, research and development

Motor vehicle showrooms

Post offices

Print shops

Professional services (architects, attorneys, dentists, physicians, engineers, etc.)

Radio and television stations

Telephone exchanges

Training and skill development not in a school or academic program (this shall include, but not be limited to, tutoring centers, martial arts studios, gymnastics and similar uses regardless of the ages served, and where not classified as a Group A occupancy)

304.2 Airport traffic control towers. Airport traffic control towers shall comply with Section 412.2.

304.3 Ambulatory care facilities. *Ambulatory care facilities* shall comply with Section 422.

304.4 Higher education laboratories. *Higher education laboratories* shall comply with Section 428.

Add new text as follows:

304.5 Clinical Laboratories. *Clinical laboratories* shall comply with Section 429.

CHAPTER 4
SPECIAL DETAILED REQUIREMENTS BASED ON OCCUPANCY AND USE

SECTION 407
GROUP I-2

Revise as follows:

407.1 General. Occupancies in Group I-2 shall comply with the provisions of Sections 407.1 through ~~407.11~~ 407.12 and other applicable provisions of this code.

Add new text as follows:

407.12 Clinical laboratories. *Clinical laboratories* serving Group I-2 occupancies shall comply with Section 429.

SECTION 414
HAZARDOUS MATERIALS

Revise as follows:

[F] 414.2 Control areas. *Control areas* shall comply with Sections 414.2.1 through 414.2.5 and the *International Fire Code*.

~~**Exception**~~ **Exceptions:**

1. *Higher education laboratories* in accordance with Section 428 of this code and Chapter 38 of the *International Fire Code*.
2. *Clinical laboratories* in accordance with Section 429 of this code and Chapter 38 of the *International Fire Code.*

SECTION 422

AMBULATORY CARE FACILITIES

422.1 General. Occupancies classified as *ambulatory care facilities* shall comply with the provisions of Sections 422.1 through ~~422.7~~ 422.8 and other applicable provisions of this code.

Add new text as follows:

422.8 Clinical laboratories. *Clinical laboratories* serving *ambulatory care facilities* shall comply with Section 429.

SECTION 429
CLINICAL LABORATORIES

429.1 Scope. *Clinical laboratories* complying with the requirements of Section 429.1 through 429.3 shall be permitted to exceed the maximum allowable quantities of *hazardous materials* in *control areas* set forth in Tables 307.1(1) and 307.1(2) without requiring classification as a Group H occupancy. Except as specified in Section 429, such laboratories shall comply with all applicable provisions of this code and the *International Fire Code*.

429.2 Application. The provisions of Section 429 shall be applied as exceptions or *additions* to applicable requirements of this code. Unless specifically modified by this section, the storage, *use* and *handling* of *hazardous materials* shall comply with all other provisions in Chapters 38 and 50 through 67 of the *International Fire Code* and Section 429 of this code for quantities not exceeding the maximum allowable quantity.

429.3 Construction. Clinical laboratories shall be constructed in accordance with Sections 428.3 and 428.4.

2024 International Fire Code

Add new definition as follows:

CLINICAL LABORATORY. Labs examining materials derived from the human body for the purpose of providing information for the diagnosis, prevention, or treatment of any disease or impairment of, or the assessment of the health of, human beings.
HIGHER EDUCATION LABORATORY. Laboratories in Group B occupancies used for educational purposes above the 12th grade. Storage, use and handling of chemicals in such laboratories shall be limited to purposes related to testing, analysis, teaching, research or developmental activities on a nonproduction basis.

Revise as follows:

LABORATORY SUITE. A fire-rated enclosed laboratory area that will provide one or more laboratory spaces, ~~within a Group B educational occupancy,~~ that are permitted to include ancillary uses such as offices, bathrooms and corridors that are contiguous with the laboratory area, and are constructed in accordance with Chapter 38.

[BG] 203.3 Business Group B. Business Group B occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:

Airport traffic control towers

Ambulatory care facilities

Animal hospitals, kennels and pounds

Banks

Barber and beauty shops

Car wash

Civic administration

Clinic-outpatient

Clinical laboratories

Dry cleaning and laundries: pick-up and delivery stations and self-service

Educational occupancies for students above the 12th grade, including higher education laboratories

Electronic data entry

Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities not more than 2,500 square feet (232 m^2) in area.

Laboratories: testing and research

Lithium-ion or lithium metal battery testing, research and development

Motor vehicle showrooms

Post offices

Print shops

Professional services (architects, attorneys, dentists, physicians, engineers, etc.)

Radio and television stations

Telephone exchanges

Training and skill development not in a school or academic program (This shall include, but not be limited to, tutoring centers, martial arts studios, gymnastics and similar uses regardless of the ages served, and where not classified as a Group A occupancy.)

[BG] 203.3.1 Airport traffic control towers. Airport traffic control towers shall comply with Section 412.2 of the *International Building Code*.

[BG] 203.3.2 Ambulatory care facilities. Ambulatory care facilities shall comply with Section 422 of the *International Building Code*.

[BG] 203.3.3 Higher education laboratories. Higher education laboratories shall comply with Section 428 of the *International Building Code*.

Add new text as follows:

203.3.4 Clinical laboratories. *Clinical laboratories* serving *ambulatory care facilities*shall comply with Section 429 of the *International Building Code.*

Revise as follows:

5003.8.3 Control areas. *Control areas* shall comply with Sections 5003.8.3.1 through 5003.8.3.5.3.

~~**Exception**~~ **Exceptions:**

1. Higher education laboratories in accordance with Chapter 38 of this code and Section 428 of the *International Building Code*.
2. *Clinical laboratories* in accordance with Section 429 of the *International Building Code* and Chapter 38 of this code.

Reason: It is not the intent of this proposal to change any of the requirements for Higher Education Laboratories. Change to the IFC are correllative or pointers only. More extensive coordination will be provided for the IFC next cycle.

Laboratories in hospitals are subject to close regulatory scrutiny, and are tracked by hospital Safety Offices and its Environment of Care

(EOC) committees. This is one way in which clinical laboratories are very similar to research labs in academic settings.Quantities of hazardous material in clinical labs are very low. Clinical labs generate more infectious waste from tissue, fluid and blood samples that are tested. Issues such as quantities of hazardous material, waste handling, and integrity of rated barriers are particular issues that are documented and tracked by the EOC Committee. The EOC committee typically has direct review with a hospital or health system board of directors. This data is also tracked by the federal government, particularly the Center for Medicare and Medicaid Services (CMS), on a regular basis. Elements of this proposed code change include:

The definition for “Clinical Laboratory” is derived directly from the requirements for Clinical Laboratory Improvement Amendments (CLIA), a subset of CMS requirements. The amendments are part of the Conditions of Participation each hospital must follow to receive reimbursement for lab tests performed on patients. The number of cases receiving CMS funding is roughly 50% to 60% of all through a hospital.

The change to the defintion of 'laboratory suite' is only intended as correllative to allow for this defintion to be used for both types of laboratories.

For standby and emergency power, Section 1208.2.8 is currently referenced for the I-2 occupancies, which then reference into NFPA 99 to make the requirement consistent for the hospitals these labs are in.

Control areas are also separately referenced to Chapters 407 (for I-2, Condition 2) and 422 (For Ambulatory in B-Occupancies) to make sure the Incidental Uses table is in effect, which spell out existing requirements for Labs in I-2, Condition 2 occupancies, by way of Chapter 7 to Chapter 509 Incidental Uses.

For more information, reference links to CMS and CLIA requirements are as follows:

https://www.cms.gov/medicare/quality/clinical-laboratory-improvement-amendments

https://www.cms.gov/outreach-and-education/medicare-learning-network mln/mlnproducts/downloads/cliabrochure.pdf

Section 428 is shown here for context.

SECTION 428
HIGHER EDUCATION LABORATORIES

[F] 428.1 Scope. *Higher education laboratories* complying with the requirements of Sections 428.1 through 428.4 shall be permitted to exceed the maximum allowable quantities of *hazardous materials*in *control areas* set forth in Tables 307.1(1) and 307.1(2) without requiring classification as a Group H occupancy. Except as specified in Section 428, such laboratories shall comply with all applicable provisions of this code and the *International Fire Code*.

[F] 428.2 Application. The provisions of Section 428 shall be applied as exceptions or *additions* to applicable requirements of this code. Unless specifically modified by Section 428, the storage, *use* and *handling* of *hazardous materials* shall comply with all other provisions in Chapters 38 and 50 through 67 of the *International Fire Code* and this code for quantities not exceeding the maximum allowable quantity.

[F] 428.3 Laboratory suite construction. Where *laboratory suites* are provided, they shall be constructed in accordance with this section and Chapter 38 of the *International Fire Code*. The number of *laboratory suites* and percentage of maximum allowable quantities of *hazardous materials*in *laboratory suites* shall be in accordance with Table 428.3.

[F] TABLE 428.3 DESIGN AND NUMBER OF LABORATORY SUITES PER FLOOR

FLOOR LEVEL		PERCENTAGE OF THE MAXIMUM ALLOWABLE QUANTITY PER LAB SUITE[a]	NUMBER OF LAB SUITES PER FLOOR	FIRE-RESISTANCE RATING FOR FIRE BARRIERS IN HOURS[b]
Above Grade Plane	21+	Not allowed	Not Permitted	Not Permitted
	16-20	25	1	2[c]
	11-15	50	1	2[c]
	7-10	50	2	2[c]
	4-6	75	4	1
	3	100	4	1
	1-2	100	6	1
Below Grade Plane	1	75	4	1
	2	50	2	1
	Lower than 2	Not Allowed	Not Allowed	Not Allowed

a. Percentages shall be of the maximum allowable quantity per control area shown in Tables 307.1(1) and 307.1(2), with all increases allowed in the footnotes to those tables.

b. Fire barriers shall include walls, floors and ceilings necessary to provide separation from other portions of the building.

c. Vertical fire barriers separating laboratory suites from other spaces on the same floor shall be permitted to be 1-hour fire-resistance rated.

[F] 428.3.1 Separation from other nonlaboratory areas. *Laboratory suites* shall be separated from other portions of the *building* in accordance with the most restrictive of the following:

1. *Fire barriers* and *horizontal assemblies* as required in Table 428.3. *Fire barriers* shall be constructed in accordance with Section 707 and *horizontal assemblies* constructed in accordance with Section 711.

   Exception: Where an individual *laboratory suite* occupies more than one *story*, the *fire-resistance rating* of intermediate floors contained within the *laboratory suite* shall comply with the requirements of this code.

2. Separations as required by Section 508.

[F] 428.3.2 Separation from other laboratory suites. *Laboratory suites* shall be separated from other *laboratory suites* in accordance with Table 428.3.

[F] 428.3.3 Floor assembly fire resistance. The floor assembly supporting *laboratory suites* and the construction supporting the floor of *laboratory suites* shall have a *fire-resistance rating* of not less than 2 hours.

Exception: The floor assembly of the *laboratory suites* and the construction supporting the floor of the *laboratory suites* are allowed to be 1-hour *fire-resistance* rated in *buildings* of Types IIA, IIIA and VA construction, provided that the *building* is three or fewer *stories.*

[F] 428.3.4 Maximum number. The maximum number of *laboratory suites* shall be in accordance with Table 428.3. Where a *building* contains both *laboratory suites* and *control areas,* the total number of *laboratory suites* and *control areas* within a *building* shall not exceed the maximum number o*f laboratory suites* in accordance with Table 428.3.

[BE] 428.3.5 Means of egress. *Means of egress* shall be in accordance with Chapter 10.

[F] 428.3.6 Standby or emergency power. Standby or emergency power shall be provided in accordance with Section 414.5.2 where *laboratory suites* are located above the sixth *story above grade plane* or located in a *story* below *grade plane*.

[F] 428.3.7 Ventilation. *Ventilation* shall be in accordance with Chapter 7 of NFPA 45, and the *International Mechanical Code*.

[F] 428.3.8 Liquid-tight floor. Portions of *laboratory suites* where *hazardous materials* are present shall be provided with a liquid-tight floor.

[F] 428.3.9 Automatic sprinkler systems. *Buildings* containing *laboratory suites* shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

[F] 428.4 Percentage of maximum allowable quantity in each laboratory suite. The percentage of maximum allowable quantities of *hazardous materials* in each *laboratory suite* shall be in accordance with Table 428.3.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Operationally, costs may go down because adoption of this change proposal will result in more flexibility to place clinical laboratories in new hospitals, increasing efficiency of operations with less personnel or systems to function in the hospital setting.

Proponents: Thom Zaremba, Roetzel & Andress, representing National Glass Association (tzaremba@ralaw.com); Nicholas Resetar, representing Glazing Industry Code Committee (nresetar@ralaw.com)

2024 International Building Code

Revise as follows:

[A] 101.3 Purpose. The purpose of this code is to establish the minimum requirements to provide a reasonable level of safety, health and general welfare through structural strength, means of ingress and egress, stability, sanitation, light and *ventilation*, energy conservation, and for providing a reasonable level of life safety and property protection from the hazards of fire, *explosion* or *dangerous* conditions, and to provide a reasonable level of safety to fire fighters and emergency responders during emergency operations.

Add new text as follows:

SECTION 429
EDUCATIONAL OCCUPANCIES - FORCED ENTRY RESISTANCE

429.1 General. All Group E occupancies with an occupant load of 50 or more shall comply with Sections 429.2 through 429.5.

Exceptions:

1. Group E day care facilities.
2. Group E occupancies accessory to places of religious worship.

429.2 Main Entrances. Main entrances shall be constructed and designed to provide those inside the building with a view to areas where pedestrians and vehicles approach the entrance.

429.2.1 Windows, doors, sidelights and other glazed areas. Windows, doors, and sidelights in main entrances within the scope of Section 429.2 shall be rated assemblies in accordance with ASTM F3561-23. Other glazed areas in the main entrance with an exposed area equal to or greater than 5 square feet (0.46 m^2) and a bottom edge less than 72 inches (1828.8 mm) above the finished ground level shall be rated assemblies in accordance with ASTM F3561-23.

429.2.2 Ground floor windows, doors and sidelights in exterior walls. If warranted by a registered design professional's assessment of forced entry risk, ground floor windows, doors and sidelights in exterior walls shall be rated assemblies in accordance with ASTM F3561-23.

429.3 Classrooms. Interior classroom windows and doors shall be designed and constructed to provide a view from the classroom into corridor or other areas used to approach the classroom.

429.3.1 Interior classroom windows, doors and sidelights. If warranted by a registered design professional's assessment of forced entry risk, interior classroom windows, doors and sidelights shall be rated assemblies in accordance with ASTM F3561-23.

429.4 Locking arrangements. Locking arrangements in doors shall comply with applicable provisions of Section 1010.2.7.

429.5 Fire safety, evacuation and lockdowns. Fire safety, evacuation and lockdown plans shall comply with applicable provisions of Sections 401.2 and 404 of the *International Fire Code.*

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F3561-23	Standard Test Method for Forced-Entry-Resistance of Fenestration Systems After Simulated Active Shooter Attack

Reason: Proposed change to Section 101.3

An issue surfaced when the new Chapter 4 sections regarding forced entry resistance in E-occupancies was vetted. Is IBC Section 101.3 broad enough to include "ingress?" On the one hand, since "egress" is expressly included in Section 101.3, one might reasonably conclude that "ingress" is also impliedly included since a building cannot be exited unless it is first entered. On the other hand, one might reasonably conclude that for something to be within the purpose of the Code, it should be express, not implied. Since both interpretations appear reasonable, this proposed change to Section 101.3 is meant to allow the Technical Committee to address the issue.

The following may be helpful. A few years ago, in response to the many times that armed shooters have forced entry into occupied buildings, the ICC Board of Directors established the Ad Hoc Committee on Building Safety and Security ("Committee"). The Board tasked the Committee to "comprehensively explore and assess building safety and security."

In creating the Committee, the ICC Board understood that building safety not only includes their means of egress systems, but also their means of ingress. The Committee also understood that. In its final report, at p.3, the Committee concluded that, "Building safety and security is of the utmost importance. The design, layout and building features in both new and existing buildings can have an impact on both safety and security during targeted violent acts."

Whether the Committee concludes that "ingress" is already impliedly included in Section 101.3 - or - the term "ingress" should be added, it is clear that the life safety and security of building occupants depends both on properly constructed means of ingress and egress.

We urge you to support this proposal.

Proposed Addition of Section 429

This proposal is meant to provide school designers with a powerful new tool to assist them in making school occupants safer from active shooters. A new standard, namely, ***ASTM F3561-23 (Standard Test Method for Forced-Entry Resistance of Fenestration Systems After Simulated Active Shooter Attack)*** was specifically developed to enable school designs to incorporate building materials into ingress areas that have been tested and rated to resist forced entry by an active shooter.

The Scope of ASTM F3561, Section 1.1, explains the justification for its adoption by the IBC: "This test method sets forth the requirements and testing procedures to test forced-entry-resistant building components, construction components, and specialty security equipment. This test method is intended primarily for manufacturers to test and rate their windows, doors, modular panels, glazings, and similar products to ensure that all manufactured products meet the necessary requirements for forced-entry protection after sustaining an active shooter assault."

ASTM F3561 provides an objectively repeatable way to measure and assess whether the building components and assemblies used in a means of ingress area are, or are not, capable of resisting forced-entry attempts by an armed intruder. ASTM F3561 provides eight (8) increasingly difficult levels of testing forced-entry resistant building assemblies. This permits designers (i) to select the level of ASTM F3561 protection most appropriate for the risk associated with a particular means of ingress area and (ii) to ensure that the ingress area is constructed using materials rated to achieve that level of intruder resistance.

If adopted, the proposal would require applicable schools to construct main entrance areas so that those inside the school can see students and vehicles, including potential intruders, approaching the entrance. Additionally, it would require the windows, doors and sidelights in the main entrance to be constructed using rated assemblies, tested to ensure compliance with one of the eight levels of entry resistance established by ASTM F3561. It would also require glazed areas used in vestibule and other main entrance areas with an exposed area equal to or greater than 5 square feet and a bottom edge 72 inches or less above the finished ground level to be constructed using ASTM F3561 rated assemblies. (The square footage for required ASTM F3561 protection was borrowed from the size of the Code's emergency escape and rescue openings. *See*, IBC Section 1031.3.1. Seventy-two inches above grade was selected as a height beyond the reach of armed intruders, effectively exempting transoms and other out of reach areas of glazing from the additional cost associated with ASTM F3561 compliance.)

Beyond the main entrance area, the proposal also addresses classrooms and other potential ground floor ingress areas in exterior walls.

As in the case of main entrances, interior classroom doors and windows would be required to have a view from the classroom to corridor areas used to approach the classroom. Additionally, if warranted by a Registered Design Professional's assessment of forced entry risk, interior classroom window, door and sidelight assemblies would be required to be rated in accordance with ASTM F3561. Likewise, if warranted by a Registered Design Professional's assessment of forced entry risk, windows, doors and sidelights in ground floor exterior walls outside the main entrance would require assemblies rated in accordance with ASTM F3561.

According to the Federal Bureau of Investigation, the mean police response time to an active school shooter is about three (3) minutes. Lives can quickly be lost inside the building unless an active shooter's entry into the building can be stopped or delayed until the police arrive. We now have a consensus standard that, when judiciously used to design and construct the means of building ingress, can reliably slow or stop active shooters from entering our schools and their classrooms until the police arrive.

We urge your support for these proposals.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Proposed Change to Section 101.3

The proposed change to Section 101.3 is a clarification and has no cost impact on the cost of construction.

Proposed addition of Section 429

The cost of ASTM F3561 compliant assemblies in exterior building areas is approximately 41% more than the cost of assemblies compliant with current code. For an 850 sq. ft. main entrance area, this would be a $113,959 increase based on average cost (see cost justification). However, in a 105,000 sq. ft. school with 1,500 students, this cost of ASTM F3561 compliance would add less than 0.4% to the total construction cost of the school.

Estimated Immediate Cost Impact Justification (methodology and variables):

The infrastructure to manufacture the framing and most other components needed to construct entrance door and window assemblies for building ingress is already in place. It is modified to accommodate the varying sizes, thicknesses, weights, and energy requirements necessary for the manufacture of different types of products, for example, standard, hurricane resistant, fire rated or bullet resistant assemblies. The cost to manufacture, assemble and install means of ingress assemblies tested to ASTM F3561 in exterior building applications is comparable to the cost to produce and install tested hurricane resistant assemblies in exterior applications. Publicly available data indicates that the cost of these hurricane resistant assemblies are approximately 41% more than the cost of standard (non-hurricane resistant) assemblies. ***See***, Architectural Digest, *How Much Do Hurricane Windows Cost? (2024 Guide)*, https://www.architecturaldigest.com/reviews/windows/hurricane-windows-cost; Architectural Digest, *How Much Does Window Replacement Cost?* (2024), https://www.architecturaldigest.com/reviews/windows/windows/window-replacement-cost; Forbes, *How Much Does Window Replacement Cost in 2024?,* https://www.forbes.com/home-improvement/windows/window-replacement-cost/,

Two significant variables are:

(1) Registered Design Professional Assessments of Risk. The cost of incorporating this proposal into the construction costs of a school will depend on the total number of ground floor ingress areas the school building has and the total number of ingress areas that are determined to be at risk of armed intruder access. As the number of ground floor ingress areas are determined by a Registered Design Professional to warrant protection increases, the cost of construction will likely increase.

(2) The specific location of the school. This is an important variable since it will likely affect the total square foot cost of construction, and the total square foot size of the school which will increase as the student population of the school increases. Construction costs depend on location. Those in the Eastern and Western United States are the highest, while those in the South are the lowest, and those in the Midwest are in the middle. However, school size varies with the size of its student population, which will likely be larger in urban areas and smaller in rural, areas. The recommended square footage required per student is 59 sq. ft. for kindergarten through grade 6 and 80 sq. ft. for grades 7 and 8. **See**. CA Department of Education Sacramento, *Guide to School Site Analysis and Development* (2000 ed.), https://www.cde.ca.gov/ls/fa/sf/guideschoolsite.asp#:text=Greenee%20School%20Facilities%20Act%20of.for%20grades%20seven%20a

The average cost to build a school in the U.S. is currently $327 per sq. ft. **See**, ProEst, *Commercial Construction Costs Per Square Foot*, https::/proest.com/construction/cost-estimates/commercial-costs-per-square-foot/

Cost Justification: If the main entrance to a school is 850 sq. ft., its average costs of construction to current code is estimated to be $277,950. This proposal would increase that cost by 41% or $113,959. However, if that school has1,500 students and a total of 105,000 sq. ft., the additional cost of ASTM F3561 compliance for the main entrance area would be **less than 0.4%** of the total $34,446,180 cost to construct the school.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F3561-23 Standard Test Method for Forced-Entry-Resistance of Fenestration Systems After Simulated Active Shooter Attack, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

2024 International Building Code

Add new text as follows:

SECTION 429
BATTERY AND ESS RELATED OCCUPANCIES, EQUIPMENT AND OPERATIONS

429.1 General. Occupancies, equipment, and operations involving the following battery related uses shall comply with this code, the *International Fire Code*, the *International Mechanical Code* and NFPA 70.

1. Energy Storage Systems (ESS)
2. Battery manufacturing
3. Battery recycling
4. Battery repurposing
5. Manufacturing, charging, use, repair or storage of battery powered vehicles, mobility devices and equipment
6. Battery research and development
7. Battery storage

429.2 Energy storage systems. The installation, replacement, repair and operation of energy storage systems shall comply with Section 1207 of the *International Fire Code* and NFPA 855.

429.3 Battery manufacturing, recycling, research and development. Battery manufacturing, recycling, research and development**.** Occupancies, equipment, and operations involving battery manufacturing, recycling or research and development shall comply with Chapter 42 of the *International Fire Code.*

429.4 Vehicle and Equipment manufacturing and repair. Occupancies and operations involving the manufacturing or repair of battery powered vehicles, mobility devices and equipment shall comply with Chapter 42 of the *International Fire Code*.

429.5 Powered equipment and mobility device charging. Occupancies, equipment, and operations involving the charging of batteries for powered equipment and mobility devices shall comply with Chapter 42 of the *International Fire Code.*

429.6 Battery storage. Occupancies and operations involving battery storage shall comply with Chapters 32 and 42 of the *International Fire Code*.

429.7 Seismic protection. Where this code or the *International Fire Code* requirements provide for seismic protection for equipment and structural elements the protection shall comply with Chapter 16.

429.8 Structure. The structural loads for parking structures to accommodate EV's, and structural loads for buildings or structures to accommodate stationary energy storage systems, shall be designed in accordance with Chapter 16.

429.9 Fire-resistance-rated separations. Where this code or the *International Fire Code* requires operations or activities to be separated from adjoining areas by fire-resistance-rated construction the fire barriers shall be constructed in accordance with Section 707 and the horizontal assemblies constructed in accordance with Section 711, as applicable.

429.9.1 Penetrations and openings. Penetrations of fire-resistance-rated separations shall comply with Section 714. Openings in fire-resistance-rated separations shall comply with Section 716.

429.10 Fire protection. Where this code or the *International Fire Code* requires smoke detection, fire detection or fire suppression to be provided, the fire protection systems shall be installed in accordance with Chapter 9 and Chapter 27 of this code and the *International Fire Code* as applicable.

429.11 Gas detection systems. Where this code or the *International Fire Code* require gas detection systems to be provided, they shall be installed in accordance with Section 916 and Chapter 27 of this code.

429.12 Explosion control. Where this code or the *International Fire Code* requires explosion control to be provided it shall be installed in accordance with Section 414.5.1 of this code and Section 911 of *the International Fire Code.*

429.13 Mechanical exhaust ventilation. Where this code or the *International Fire Code* requires mechanical exhaust to be provided, it shall be installed in accordance with the *International Fire Code*, the *International Mechanical Code* and NFPA 70.

Reason: The purpose of this proposal is to provide guidance to users of the *International Building Code* that there are important construction requirements to apply from other sections of this code and from the *International Fire Code* relevant to battery R&D, manufacturing, recycling, storage and energy storage systems. The proposed language provides correlation language and where appropriate linkage to other sections of the *International Building Code.*

The International Fire Code Sections 320, 322, 911, 1201, 1206, 1207 and Chapter 32 contain requirements relative to the construction and occupancy of buildings and structures. Some examples are fire detection systems, gas detection systems mechanical exhaust systems, explosion control, fire-resistance-rated separations, and seismic requirements.

This proposal does not present new requirements, it is simply correlation guidance so the user of the building code is made aware that when it comes to activities dealing with batteries the fire code must be applied also.

This proposal is submitted jointly by the ***ICC Building Code Action Committee (BCAC)*** and the ***ICC Fire Code Action Committee (FCAC)***.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at **BCAC webpage**.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no increase in construction costs of buildings with this change as it is a correlation proposal. It relies on requirements addressing these issues found within the *International Building Code* and the *International Fire Code currently.*

G90-25

IBC: SECTION 430 (New), 430.1 (New), 430.2 (New), 430.2.1 (New), 430.2.1.1 (New), 430.2.1.2 (New), 430.2.1.3 (New), 430.2.1.4 (New), 430.2.1.4.1 (New), 430.2.1.4.2 (New), 430.2.1.4.3 (New), 430.2.1.4.3.1 (New), 430.2.2 (New), 430.2.2.1 (New), 430.2.2.2 (New), 430.2.2.3 (New), 430.2.3 (New), 430.2.3.1 (New), 430.2.3.1.1 (New), 430.2.3.1.2 (New), 430.2.3.1.3 (New), 430.2.3.1.4 (New), 430.2.4 (New), 430.2.4.1 (New), 430.2.4.2 (New), 430.2.4.3 (New), 430.2.4.4 (New), 430.2.4.5 (New), 430.2.4.6 (New), SECTION 202 (New)

Proponents: Tristen Magallanes, representing DPR Construction (tristenm@dpr.com)

2024 International Building Code

Add new text as follows:

SECTION 430 INFORMATION TECHNOLOGY EQUIPMENT (ITE) AISLE CONTAINMENT ENCLOSURE

430.1 Applicability. The provisions of Sections 430.2 through 430.2.4.6 shall apply to all parts of *ITE aisles containment enclosure* structures, both *ITE hot ailses* and *ITE cold aisles*, that contain information technologyand equipment and associate appurtenances as herein defined.

430.2 ITE Containment Enclosure. *ITE aisle containment enclosure* and *ITE hot air enclosure* construction shall comply with Sections 430.2 through 430.2.1.4.3.1.

430.2.1 ITE containment enclosure construction. *ITE aisle containment enclosure* shall be constructed of materials as required for support and design for the type of equipment required to provide air-movement from the information technology equipment racks.

430.2.1.1 Hot and cold aisle application. *ITE aise containment enclosure* shall be applied to *ITE hot aisles* or *ITE cold aisles* of information technology equipment.

430.2.1.2 Containment enclosure type. *ITE aisle containment enclosure* and *ITE hot air enclosure* systems shall be one of the following types:

1. Factory-packaged and aftermarket systems designed, provided, and installed in accordance with the manufacturer's instructions.
2. Field-constructed systems designed and constructed using common construction materials.

430.2.1.3 Containment enclosure design. *ITE aisle containment enclosure* and *ITE hot air enclosure* systems shall not be considered to be plenums.

430.2.1.4 ITE aisle containment enclosure finishes. Finishes of the *ITE aisle containment enclosure* shall comply with Section 430.2.1.4.1 through 430.2.4.3.1.

430.2.1.4.1 Classification of containment enclosure finishes. Wall and ceiling finishes of the *ITE aisle containment enclosure* shall have a minimum of a Class A rating in accordance with Section 803 and classified in accordance with ASTM E84 or UL 723. Such *interior finish* materials shall be grouped in classes outlined in Ssection 803.1.2 in accordance with their flame spread and *smoke-developed indices*.

430.2.1.4.2 Class of interior finish. Walls and ceiling finishes of the *ITE aisle containment enclosure* in spaces that are fully protected by an *automatic sprinkler system*, or an *automatic fire-extinguishing system* shall be permitted to be Class B or better than in accordance with Section 803 and ASTM E84 or UL 723. Such *interior finish* materials shall be grouped in classes outlined in Section 803.1.2 in accordance with their flame spread and *smoke-developed indices*.

430.2.1.4.3 Floor finish. Interior floor finishes used in *ITE aisle containment enclosure* areas shall be Class I in accordance with Section 804.

430.2.1.4.3.1 Floor Classification. *Interior floor finish* and floor covering materials required by Section 804.4.2 to be of Class I materials shall be classified in accordance with ASTM E648 or NFPA 253. The classification referred to herein corresponds to the classifications determined by ASTM E648 or NFPA 253 as a Class I, 0.45 watts/cm^2 or greater.

430.2.2 Protection systems. Protection systems shall comply with this Sections 430.2.2.1 through 430.2.2.3.

430.2.2.1 Automatic sprinkler system. Information technology equipment areas with *ITE aisle containment enclosures* shall be equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1. Where the application of *ITE aisle containment enclosure* or *ITE hot air enclosure* systems creates obstructions to proper operation of sprinkler systems, the sprinkler system shall be modified as necessary to comply with Section 903.

430.2.2.2 Alternative protection. Alternative *automatic fire-extinguishing systems* complying with Section 904 shall be permitted instead of automatic sprinkler protection were recognized by the applicable standard and *approved* by the fire code official.

430.2.2.3 Automatic water mist systems. *Automatic water mist system* shall be designed and installed in accordance with Section 904.11, and the manufacturer's instructions. *Automatic water mist systems* shall be automatically actuated.

430.2.3 Automatic fire detection. *Automatic fire detection* shall be provided for all *ITE aisle containment enclosure* systems. Detection and suppression components within *ITE aisle containment enclosure* shall be rated for the intended temperatures of *ITE hot aisles* when installed in those locations.

430.2.3.1 New system installations in existing ITE areas. Where a newly installed *ITE aisle containment enclosure* systems are installed in an existing information technology equipment area, the existing suppression and detection systems shall be evaluated, modified, and tested as necessary to maintain compliance with the applicable codes and standards.

430.2.3.1.1 Early warning detection. Automatic detection equipment shall be installed to provide early warning of fire.

430.2.3.1.2 Smoke detection listing. The equipment used shall be a listed smoke detection–type system installed and maintained in accordance with Section 907.

430.2.3.1.3 Evaluation of detection system effectiveness. Each of the information technology equipment areas and *ITE aisle containment enclosure* automatic detection systems shall be evaluated to determine the hazards and ambient conditions that are present and the corresponding performance level of the detection system.

430.2.3.1.4 Monitoring of detection system. The alarms and trouble signals of automatic detection or extinguishing systems shall be arranged to annunciate a signal at a constantly attended location.

430.2.4 Means of egress. Means of egress shall comply with Sections 430.2.4.1 through 430.2.4.6.

430.2.4.1 ITE Containment enclosure doors. Where *ITE aisle containment enclosures* are provided with doors for openings, the doors shall be side-hinged swinging doors.

430.2.4.2 Arrangement. Where two or more *exits* or *exit access doorways* from the *ITE aisle containment enclosures* are required in accordance with Section 1006.2, not fewer than one *exit* or *exit access doorway* shall be provided on each side of an *ITE aisle containment enclosure*.

430.2.4.3 Number of means of egress. Not fewer than one *means of egress* shall be provided from *ITE aisle containment enclosures.*

430.2.4.4 Exit access travel distance. The *exit access* travel distance shall be not greater than 300 feet (91 440 mm) for *ITE aisle containment enclosures* without a sprinkler system and 400 feet (122 mm) for buildings equipped throughout with an *automatic sprinkler system*in accordance with Section 903.3.1.1.

430.2.4.5 Two means of egress. Where two *means of egress* are required, the *common path of travel* shall be not greater than 100 feet (30 480 mm).

430.2.4.6 Width. The path of egress travel within and from the *ITE aisle containment enclosures* shall be not less than 22 inches (559 mm).

Add new definition as follows:

INFORMATION TECHNOLOGY EQUIPMENT (ITE) AISLE. The passageway between information technology equipment or between information technology equipment and the room wall that allows personnel access to the information technology equipment for service or operation of the equipment.

INFORMATION TECHNOLOGY EQUIPEMENT (ITE) AISLE CONTAINMENT ENCLOSURE. An enclosure design for connection to HVAC equipment or cooling equipment design method deployed in the occupied area of an air-cooled information technology equipment space utilizing physical separation of hot exhaust air from cooler intake air between equipment cabinets, rows of information technology equipment, or associated power and cooling infrastructure; containment is typically above and at both ends of a hot aisle or a cold aisle, in whole or part.

INFORMATION TECHNOLOGY EQUIPEMENT (ITE) COLD AISLE . The aisle on the front side of the airflow intakes on the information technology equipment where HVAC cooling airflow is controlled to cool the information technology equipment.

INFORMATION TECHOLOGY EQUIPEMENT (ITE) HOT AIR ENCLOSURE. An air conveyance assembly used to direct heated exhaust air from information technology equipment cabinets, enclosures, or racks area directly to a removal air path.

INFORMATION TECHNOLOGY EQUIPMENT (ITE) HOT AISLE. The aisle at the rear side of the information technology equipment where heated exhaust air is controlled and directed into the aisle for return to the HVAC equipment.

Reason: This new section is proposed to be added to Chapter 4 to provide specific regulations for an Information Technology Equipment (ITE) Aisle Containment Enclosure which are used in data centers hall.

The proposed new section introduces definitions and construction requirements for Information Technology Equipment (ITE) aisle containment enclosures, addressing a gap in the International Building Code (IBC). These enclosures are critical components in modern data centers, providing enhanced control over airflow while improving energy efficiency and enhance cooling performance.

This proposal seeks to standardize the terminology, materials, and safety measures related to ITE aisle containment systems. By defining key terms, specifying construction materials, and incorporating fire protection and egress standards, the proposed language ensures that these systems meet safety requirements while optimizing performance.

The development of these new sections reflects the industry's transition towards sustainable solutions. Our team has introduced a sustainable aisle containment offering designed to reduce carbon emissions and expand available options for data center operators. By codifying these solutions, the proposed section aligns with environmental goals and offers a clear framework for adoption and compliance, ultimately benefiting the industry by providing consistency and promoting innovation.

This addition is driven by the needed for specific code language and the introduction of a sustainable aisle containment solution that expands industry options, enabling compliance with evolving environmental standards, and contributing to carbon footprint reduction. By codifying these containment enclosures, the proposed language seeks to provide consistency in application, enhance safety and functionality, and encourage sustainable practices within the industry.

These enclosures are currently being installed at a later date once the occupancy certification and service racks are installed. Many aisle containment enclosures may not be reviewed and inspected until much later in the construction or during the annual inspection. This new language is designed to work with and allow current containment enclosures systems to continue to be used while allowing safety and sustainable alternative designs to be considered.

Proposed New Definition. These new definitions are required to ensure that the new terms proposed in this new Chapter 4 section for

ITE containment enclosures are properly defined, identified, and used for the installation of this equipment and enforcement is applied consistently.

The definition of an *ITE Aisle* is as that the ITE Aisle has key elements including passageway between equipment intended for movement of people and/or equipment; typically located between opposing rows of ITE enclosures or racks but could be between two free-standing pieces or racks of ITE; and are intended for routine human activity such as service or operation (therefore not a plenum space).

The definition of an *ITE Aisle Containment Enclosure* has key elements for defining the housing or construction of the containment enclosure and includes an occupied area for service of the ITE equipment, the area for the capture of the air movement from the ITE equipment, and is connected to the HVAC equipment (excluding areas above a ceiling or below a raised floor); utilizing physical separation between hot and cold air (excluding structural or construction methods such as fire-rated walls); and can be either a hot aisle or a cold aisle or a mix of both at select portions of the aisle.

The definition of a *ITE Cold Aisle* is defined as the area of the containment enclosure that is part of the airflow controlled having intake air cold, implying an aisle normally intended for operation and services of the ITE, and cool air from the output of the HVAC system.

The definition of the *ITE Hot Air Enclosure* is defined as an air conveyance assembly, sometimes referred to as a collar, duct, or chimney which is typically from specific equipment rather that from larger areas such as room or data hall; the hot air enclosure is not required to be physically connected to a duct or plenum, but can be so the heated air can be exhausted, cooled and recirculated, or removed from the space.

The definition of the *ITE Hot Aisle* is defined as the heated airflow that is contained and controlled to exhaust air hot generated by the ITE equipment, implying an aisle normally intended for access to service of the ITE, and is part of the heated air returning to the input of the HVAC system that can be exhausted, cooled and recirculated, or removed from the space.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed code addition has no cost impact on the current installation of ITE aisle containment systems. The new section does not introduce additional requirements that would increase the cost of compliance for existing installations or commonly used products.

Our specific sustainable aisle containment product is designed to be cost-neutral in comparison to traditional systems. While it may result in a 3-5% increase in material costs for some installations, this is offset by the potential operational cost savings through improved energy efficiency and sustainability. These savings can contribute to a lower total cost of ownership over the lifecycle of the installation and result in overall cost savings.

Overall, the proposed language provides clear guidance for the industry without imposing undue financial burdens, while fostering opportunities for adopting innovative and sustainable solutions.

G90-25

G91-25

IBC: CHAPTER 6, CHAPTER 5

Proponents: Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com)

2024 International Building Code

Revise as follows:

CHAPTER ~~6~~5
TYPES OF CONSTRUCTION

CHAPTER ~~5~~6
GENERAL BUILDING HEIGHTS AND AREAS

Reason: For most designers, the flow of the IBC presents occupancy, then the allowable building size based on occupancy, but construction type, which follows the allowable size is part of the building sizing. Wouldn't it make more sense to have the construction types first then have the allowable building size after both occupancy and construction types have been presented?

All this code change does is more Chapter 6, Construction Types, to be before Chapter 5, General Building Heights and Area.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is only moving current code text.

G91-25

G92-25

IBC: SECTION 503, 503.1, FIGURE 503.1 (New)

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Philip Oakes, representing NASFM; Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com)

2024 International Building Code

SECTION 503
GENERAL BUILDING HEIGHT AND AREA LIMITATIONS

Revise as follows:

503.1 General. Unless otherwise specifically modified in Chapter 4 and this chapter, *building height*, number of *stories* and *building area* shall not exceed the limits specified in Sections 504 and 506 based on the type of construction as determined by Section 602 and the occupancies as determined by Section 302 except as modified hereafter. *Building height*, number of *stories* and *building area* provisions shall be applied independently. For the purposes of determining area limitations, height limitations and type of construction, each portion of a building separated by one or more *fire walls* complying with Section 706 shall be considered to be a separate building.

<u>**Exceptions:**</u>

<u>1. Other than structural requirements, rooftop-mounted *photovoltaic (PV) panel systems* with no use underneath shall not constitute an additional story or additional floor area and shall be permitted to exceed the height limit of a building where one of the following conditions are met:</u>

<u>1.1. For all occupancies, the highest point of the *rooftop-mounted PV panel system* shall meet the lower of the following values:</u>

<u>1.1.1. 3 feet (915 mm) above the allowable building height.</u>

<u>1.1.2. 3 feet (915 mm) above the roof of the building immediately below.</u>

<u>1.2. For installations on low-slope roofs (roof slope < 2:12) in other than Group R-3 and R-4 occupancies, the highest point of the rooftop-mounted *PV panel system* shall meet the lower of the following values:</u>

<u>1.2.1. 10 feet (3050 mm) above the allowable building height.</u>

<u>1.2.2. 10 feet (3050 mm) above the roof of the building immediately below.</u>

<u>2. Other than structural requirements, *elevated photovoltaic (PV) support structures* installed on the roof of an open parking structure or the roof of an enclosed parking garage shall not constitute an additional story or additional floor area and shall be permitted to exceed the height limit of a building where all the following conditions are met (see Figure 503.1):</u>

<u>2.1. The area within the perimeter of *elevated PV support structures* has maximum rectangular dimension of 40 feet by 150 feet (12 195 mm by 45 720 mm).</u>

<u>2.2. The distance between *elevated PV support structures* is a minimum of 10 feet (3050 mm) clear.</u>

<u>2.3. The driveway aisle separating *elevated PV support structures* has a minimum width of 25 feet (7620 mm) clear.</u>

<u>2.4. *Elevated PV support structures* are used only for parking purposes with no storage.</u>

<u>2.5. *Elevated PV support structures* are completely open on all sides, other than necessary structural supports, with no interior partitions.</u>

Add new text as follows:

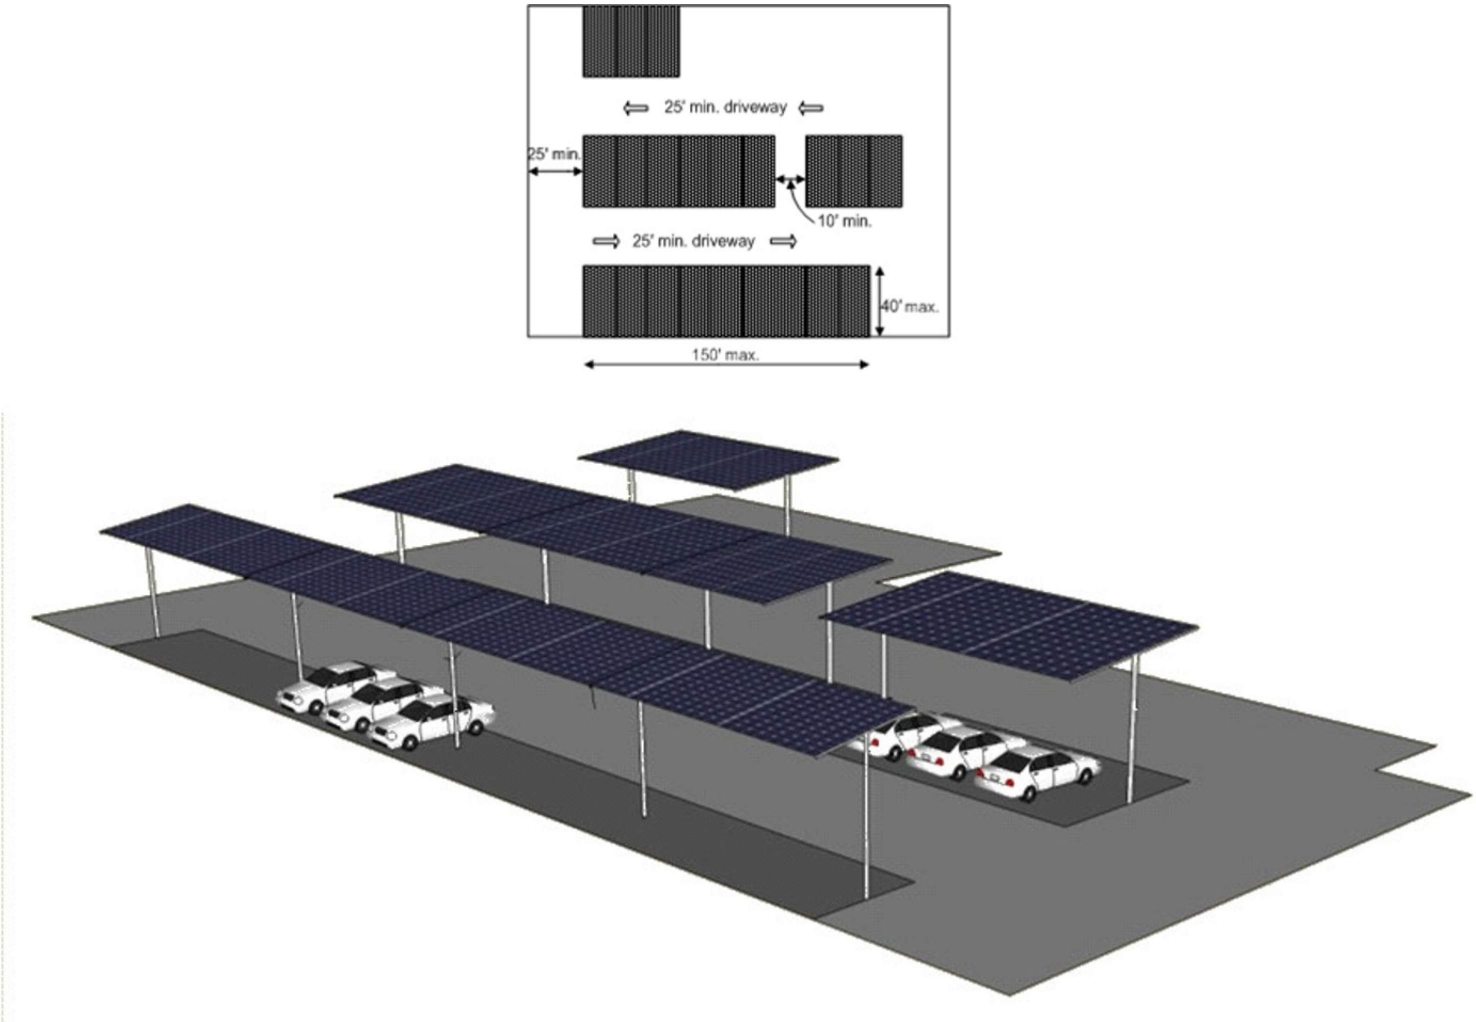

FIGURE 503.1 LOCATION OF *ELEVATED PV SUPPORT STRUCTURES* ON OPEN PARKING STRUCTURES

Reason: The primary objective of this proposal is to provide exceptions to clarify that elevated PV support structures can be installed on top of a multi-story parking garage under certain conditions without impacting restrictions on number of stories, height or area. Likewise, under certain conditions, rooftop-mounted PV systems do not cause a building to be noncompliant with these provisions. The exceptions in this proposal are similar to exceptions that have existed in the California Building Code for several cycles, with support of the fire service and without any compromises in safety to the building or fire fighters. These exceptions will not impact the ability to fight fires on top of buildings.

Without the exceptions proposed here, rooftop solar structures can be interpreted to constitute an additional story of the building, increase the overall building height or where there is a use underneath such as elevated PV support structures, increase the floor area of the building. As a result, solar installations may not be allowed in buildings that are built to the maximum height, story or floor area. The proposed code revision provides an exemption for photovoltaic systems from these code restrictions.

Exception 1: This amendment allows solar PV systems to be installed above the maximum building height specified by code with limitation. This amendment will make it feasible to install rooftop solar PV systems on top of buildings that are built to the maximum height which is especially common in existing buildings. It will also make it practical for PV panels to be installed above the roof with the required tilt angle and be at a height that avoids interference with vents and equipment on the roof.

Exception 2: The amendment allows solar PV panel installations over parking stalls to be installed without being considered a story or floor area, these restrictions may prevent solar PV systems from being installed in buildings that have the maximum number of stories or floor area which is especially common in existing buildings. The exception requires minimum spacing between solar PV panel structures to allow fire access and provide a fire break.

These exceptions have existed in the California Building Code for several cycles. These provisions have been used by California cities and counties by industry, building owners, building departments, and fire departments, without questions or concerns that have come to the attention of the co-proponents. All stakeholders have been able to utilize these technical requirements without issues, and without any proposed modifications to the language for multiple cycles.

This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency. The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner. All recommendations from SEAC are approved by diverse stakeholders through a consensus process.

This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency. The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner.

All recommendations from SEAC are approved by diverse stakeholders through a consensus process. For more information, please visit www.sustainableenergyaction.org

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It encourages the use of solar without adversely impacting safety.

G92-25

G93-25

IBC: 503.1.4.1

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

2024 International Building Code

503.1.4 Occupiable roofs. A roof level or portion thereof shall not be used as an occupiable roof unless the occupancy of the roof is an occupancy that is permitted by Table 504.4 for the *story* immediately below the roof. The area of the occupiable roofs shall not be included in the *building area* as regulated by Section 506. An *occupiable roof* shall not be included in the *building height* or number of *stories* as regulated by Section 504, provided that the *penthouses* and other enclosed *rooftop structures* comply with Section 1511.

Exceptions:

1. The occupancy located on an *occupiable roof* shall not be limited to the occupancies allowed on the *story* immediately below the roof where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and occupant notification in accordance with Sections 907.5.2.1 and 907.5.2.3 is provided in the area of the *occupiable roof* . *Emergency voice/alarm communication* system notification per Section 907.5.2.2 shall also be provided in the area of the *occupiable roof* where such system is required elsewhere in the building.
2. Assembly occupancies shall be permitted on roofs of open parking spaces of Type I or Type II construction, in accordance with the exception to Section 903.2.1.6.

Revise as follows:

503.1.4.1 Enclosures ~~over~~around occupiable roof areas. Elements or *structures* enclosing the *occupiable roof* areas shall not extend more than 48 inches (1220 mm) above the surface of the *occupiable roof*.

Exceptions :

1. *Penthouses* constructed in accordance with Section 1511.2 and towers, domes, spires and cupolas constructed in accordance with Section 1511.5.
2. Elements or *structures* enclosing the *occupiable roof* areas where the *roof deck* is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.
3. Elements or *structures* enclosing *occupiable roof* areas located on the same level as a *story*.

Reason: The enclosure height limitation for occupiable roofs is written for occupiable roofs that are the highest level of the building; however, there are many instances where occupiable roofs are lower on the building and are located on a level that is already classified as a story. For this case, the current requirements do not allow the exterior wall of the building that continues up from the occupiable roof to enclose the occupiable roof. This is obviously not the intent as this would prohibit low roofs on buildings. This requirement is also not needed since the level is already regulated as a story. This proposal corrects this oversight in the code by exempting occupiable roofs that are on the same level as a story.

Note that Section 503.1.4 is included for reference only - there are no changes proposed for this section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is clearly not the intent of the code to prohibit low occupiable roofs; therefore, this proposal is simply an editorial change to clarify the intent of the code with no cost impact.

G94-25 Part I

IBC: 503.1.4.1

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE EXISTING BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

503.1.4.1 Enclosures over occupiable roof areas. Elements or *structures* enclosing the occupiable roof areas shall not extend more than 48 inches (1220 mm) above the surface of the occupiable roof.

Exceptions:

1. *Penthouses* constructed in accordance with Section 1511.2 and towers, domes, spires and cupolas constructed in accordance with Section 1511.5.
2. Elements or *structures* enclosing the *occupiable roof* areas where the *roof deck* is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.
3. <u>In Group I-1 and I-2 facilities, required guards enclosing the occupiable roof areas shall be permitted to be greater than 48 inches (1219 mm) above the surface of the occupiable roof to prevent elopement or self-harm.</u>

G94-25 Part I

G94-25 Part II

IEBC: 1011.5.1, 1011.5.2

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

1011.5.1 Means of egress for change to a higher-hazard category. Where a change of occupancy classification is made to a higher-hazard category (lower number) as shown in Table 1011.5, the means of egress shall comply with the requirements of Chapter 10 of the *International Building Code*.

Exceptions:

1. Stairways shall be enclosed in compliance with the applicable provisions of Section 903.1.
2. Existing stairways including handrails and guards complying with the requirements of Chapter 9 shall be permitted for continued use subject to approval of the *code official*.
3. Any stairway replacing an existing stairway within a space where the pitch or slope cannot be reduced because of existing construction shall not be required to comply with the maximum riser height and minimum tread depth requirements.
4. Existing corridor walls constructed on both sides of wood lath and plaster in good condition or $^1/_2$-inch-thick (12.7 mm) gypsum wallboard shall be permitted. Such walls shall either terminate at the underside of a ceiling of equivalent construction or extend to the underside of the floor or roof next above.
5. Existing corridor doorways, transoms and other corridor openings shall comply with the requirements in Sections 804.7.1, 804.7.2 and 804.7.3.
6. Existing dead-end corridors shall comply with the requirements in Section 804.8.
7. An operable window complying with Section 1011.5.6 shall be accepted as an *emergency escape and rescue opening*.
8. In Group I-1 and I-2 facilities, required guards enclosing the *occupiable roof* areas shall be permitted to be greater than 48 inches (1219 mm) above the surface of the *occupiable roof* ~~where the occupants, because of clinical needs, require restraint or containment as part of a function of a psychiatric or cognitive treatment area~~ to prevent elopement or self-harm.

1011.5.2 Means of egress for change of use to an equal or lower-hazard category. Where a change of occupancy classification is made to an equal or lesser-hazard category (higher number) as shown in Table 1011.5, existing elements of the means of egress shall comply with the requirements of Section 905 for the new occupancy classification. Newly constructed or configured means of egress shall comply with the requirements of Chapter 10 of the *International Building Code*.

Exceptions:

1. Any stairway replacing an existing stairway within a space where the pitch or slope cannot be reduced because of existing construction shall not be required to comply with the maximum riser height and minimum tread depth requirements.
2. In Group I-1 and I-2 facilities, required guards enclosing the *occupiable roof* areas shall be permitted to be greater than 48 inches (1219 mm) above the surface of the *occupiable roof* ~~where the occupants, because of clinical needs, require restraint or containment as part of a function of a psychiatric or cognitive treatment area~~ to prevent elopement or self-harm.

Reason: The intent of this proposal is to allow higher guards for patient safety around outdoor patient garden/exercise areas on the roof.

The Healthcare committee understands the guard height limitation for low rise buildings was to allow for fire department access to the roof. However, we feel that this change is desperately needed to the routine safety of residents.

Access to fresh air and getting outside is incredibly important for the well-being of older adults who live in Group I-1 & I-2 care facilities. Outdoor areas are also important for patient mental health and wellness in hospitals. g care recipients spend up to 90% of their time indoors and if the only choice of outdoor space requires staff or volunteers to take them downstairs, via an elevator, to get outside, care recipients never get the opportunity to be outside. Hospitals and nursing homes in a urban environment often don't have property that would allow for outdoor patient areas. If a garden space or other outdoor area can be created on a roof adjacent to sleeping areas, this can make getting outside much easier.

These types of facilities have extensive fire and safety evacuation plans and staff that is trained in assisting care recipients and guests for evacuation/defend-in-place during an emergency. Fire departments perform regular inspections of these buildings, so they would be very familiar with the layouts. In addition, these facilities have exceptionally good records for a small number of fire events. All I-1 and I-2 occupancies already require automatic sprinkler systems. Unfortunately, while we want care recipients to get outside, we also need to keep them safe. We know that exit seeking behavior is prevalent and a 48" barrier is not enough to protect from elopement or self harm.

There was a similar change in Group A, G105-21 that had an original intention of allowing for guards to exceed the height limitation required by IBC Section 503.1.4.1. The modification to broaden this allowance for "walls, parapets, rooftop structures (some of which are exempted in Exception 1), and wind screens" on roofs above the reach of fire departments (>75') was appropriate. However, there is still the issue with existing buildings that want to expand or add an occupied roof with the result being:

- If any structure or guard is above 48" high, this is now being considered an additional story so they could violate height limitations for the type of construction.
- If the building is less than 75' in height, you cannot have guards high enough to discourage people from jumping off the roof.

Below are pictures of a roof garden on a memory care facility. There are glass panels between the columns. The overhead trellis system is made from aluminum or steel, and prevents people from climbing up and over the glass.

Regarding the change to the IEBC - It has been brought to our attention that there are many folks, in healthcare settings, that seek to commit suicide. These could be care recipients with depression or cognitive challenges (who would have a clinical need), but it could also include care recipients that receive an unfavorable diagnosis or even family members, friends or medical staff. The proposed change would broaden the scope of where higher guards would be permitted to prevent self-harm to all users of these spaces. As noted previously, these I-1 and I-2 facilities have staff that are trained to assist in the event of an emergency and fire departments are familiar with the layout and conditions.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an optional allowance for certain facilities so will provide design flexibility. It will cost more if such barriers are constructed but that is an option for the building owner.

G94-25 Part II

G95-25

IBC: 504.3

Proponents: Matt Archer, City of Lone Tree, representing Code Change Committee of ICC Colorado Chapter (matt.archer@cityoflonetree.com)

2024 International Building Code

Revise as follows:

504.3 Height in feet. The maximum height, in feet above grade plane, of a *building* shall not exceed the limits specified in Table 504.3.

Exception: Towers, spires, steeples and other *rooftop structures* shall be constructed of materials consistent with the required type of construction of the *building* except where other construction is permitted by Section 1511.2.4. Such *structures* shall not be used for habitation or storage. The *structures* shall be unlimited in height where of noncombustible materials and shall not extend more than 20 feet (6096 mm) above the allowable *building height* where of combustible materials (see Chapter 15 for additional requirements).

Reason: This proposal is editorial in nature, the words 'in feet' provide no real definitive understanding of where or how to measure. Adding the defined term 'grade plane' provides clarity for how to measure. While the term grade plane is in the title of table, it is best practice to have the defining term in the charging language of the code and let the table clarify the heights.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal should not have any cost impacts as it is editorial in nature. Adding the defined term 'grade plane' provides clarity for how to measure.

	S13R	4	4									4	4
	S	UL	12	5	5	5	5	18	12	5	5	4	4

Reason: Although I serve as a consultant to the National Fire Sprinkler Association, this proposal has not been reviewed or endorsed by NFSA, and I am not representing NFSA on this issue.

Recommended changes are supported on the basis of:

1. Improved correlation between the IRC and IBC with respect to limits on Type V-B construction,
2. Empirical evidence supporting the effectiveness of NFPA 13D sprinkler systems in controlling and extinguishing dwelling fires that was not available when the IBC originally considered story/height credit for Group R3 more than 25 years ago.

1. IRC Correlation: Following approval of Proposal RB17-07/08, which added an allowance for habitable attics to the 2009 IRC, the IRC has continued to expand the habitable attic concept to the point where it essentially constitutes a 4th story, even though the code is technically limited to 3-story construction. Proposal RB166-16 eliminated a prior restriction requiring the ceiling of a habitable attic to be limited to rafters/roof framing, so lacking restrictions on the height of surrounding knee walls or dormer size, the 2018 and 2021 IRC editions essentially equate habitable attics and stories. Proposal RB152-19 called attention to the IRC 4th story habitable attic loophole, with the intent of pushing such construction back to the IBC, but that proposal was later modified to instead place a size limit on habitable attics and require NFPA 13D fire sprinklers when a habitable attic is placed above the third story. Today, standing outside of a newly constructed dwelling with a habitable attic above the third story, you'd be looking at what appears to be an 4-story unlimited height (in feet) Type V-B building, protected by a NFPA 13D sprinkler system, that meets the IRC. It makes no sense for the IBC to not allow Type V construction or require changing to a NFPA 13R sprinkler system to construct a similarly configured Group R-3 building.

2. Performance of residential sprinkler systems: Since the question of NFPA 13D performance was previously considered in the code arena, a considerable number of NFPA 13D sprinkler systems have been installed throughout the U.S., and there have been a considerable number of fires in structures protected by NFPA 13D systems, enough to provide meaningful data regarding the effectiveness of these systems in controlling and extinguishing dwelling fires. An analysis of data captured by the National Fire Incident Reporting System shows that in more than 2,500 fire incidents in the period 2000-2022 where sprinklers operated and were effective, presumably NFPA 13D systems considering that the data is associated with one-and two-family dwelling fires, fire spread was limited to the object or room of origin in 87% of fires, and up to the story of origin in a total of 92% of fires. This seems sufficiently equivalent to the effectiveness of NFPA 13 and NFPA 13R systems to justify receiving similar height/story incentive for one- and two-family dwellings and townhouses.

It is noteworthy that the ICC has already rendered favorable consideration on a variety of incentives for NFPA 13D sprinkler systems for dwelling unit protection, so this proposal is not plowing entirely new ground. For example, IBC Section 1031.2, Exception 5 (which recognizes NFPA 13D for a means of escape incentive); IFC Section 1205.2.1.3 (which allows a reduction of required setbacks for PV systems on roofs); IFC Appendix Table B105.1(1) (which allows a reduction in required fire flow); IFC Appendix Section D107.1 (which allows a reduction in the required number of fire apparatus access roads); IRC Section R317.5 (which per reference to Table R302.1(2) equates sprinkler protection to a 1-hour exterior wall and property line separation or wall penetrations and openings); among others.

It is also important to point out that the additional story will not trigger requirements in Section 1023.2 for additional fire-resistive protection of the 4-story stairway because stairways within dwelling and townhouse units are *exit access stairways,* not interior exit stairways (to which Section 1023.2 applies).

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Since similar construction is already permitted under the IRC, the estimated impact is $0, and adding the recommended provisions to the IBC is not a significant change with respect to the ICC code family.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal would allow a larger area of the habitable attic under the IRC as a full 4th story in the IBC. Allowing a larger area of what is essentially already permitted by code adds design freedom and only impacts cost when someone would chose to take advantage of the proposed allowance. It could also be viewed as a cost reduction for cases where the larger area of the upper story would otherwise require changing from a NFPA 13D system (under the IRC) to a NFPA 13R system (under the IBC), or changing from Type V to Type I, Type II, Type III or Type IV construction to exceed IRC habitable attic area limits that were added in the 2021 IRC. Regardless of which code is used, IBC or IRC, dwellings affected by this proposal will require fire sprinklers, even in jurisdictions where IRC Section 313 has not been adopted, because IRC Section 326 requires sprinklers per NFPA 13D or IRC P2904 to extend a habitable attic above the third story of an IRC dwelling.

b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.

c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.

d. The NS value is only for use in evaluation of existing building height in accordance with the *International Existing Building Code*.

e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.

f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code*.

g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.

h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Reason: Data centers are unique uses and should have their own occupancy classification to remove confusion in the field, as is proposed in a companion proposal. Data centers are frequently assigned an F-1 or S-1 occupancy classification. The values proposed in this proposal are consistent with a S-1 occupancy classification.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Data centers are currently and frequently being constructed with these height limits so no additional costs accrue.

G97-25

G98-25

IBC: 504.4

Proponents: William Koffel, Koffel Associates, Inc., representing Semiconductor Industry Association (wkoffel@koffel.com)

2024 International Building Code

Revise as follows:

504.4 Number of stories. The maximum number of *stories above grade plane* of a *building* shall not exceed the limits specified in Table 504.4.

Exception: In a Group H-5 mixed-occupancy building of Type IA construction, the number of stories shall be permitted to be 8 where all of the following are met:

1. The Group H-2 occupancies are located no more than 3 stories above grade.
2. The Group H-3 occupancies are located no more than 6 stories above grade.
3. The Group H-2 and H-3 occupancies are separated by a minimum of 80 feet (24 384 mm) in accordance with Section 415.6.5.

Reason: Group H-5 occupancies in buildings of Type IA construction are currently restricted to 4 stories even though the height limit in feet is unlimited. The four stories was based upon the design and construction of semiconductor facilities at the time, which did not include fabrication areas located above another fabrication area. However, the NFPA 318 Technical Committee is developing criteria for stacked fabs and semiconductor facilities are currently being design using the concept of stacked fabs.

Increasing the number of stories to 8 may be more restrictive than the provisions being developed by the NFPA 318 Technical Committee. However, this is considered to be the initial step which can be re-evaluated once the criteria for stacked fabs has been fully developed.

Recognizing that Section 415.6.5 has been revised to increase the quantities permitted in Group H-2 and H-3 areas in a mixed-occupancy Group H-5 building, the location of these areas should be restricted. Since Table 504 does not restrict the number of stories for Group H-2 and Group H-3 occupancies in buildings of Type IA construction, the proposal incorporates the number of story limits for Type 1B construction as a condition for allowing more stories of Group H-5 occupancies.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

By allowing an increase in the number of stories for Group H-5 occupancies, the cost of construction will be decreased when the option is used.

G98-25

G99-25

IBC: 505.2

Proponents: Jeffrey Grove, representing Southern Nevada ICC Chapter (jeff.grove@coffman.com); Allen Burris, Clark County Nevada, representing Southern Nevada Chapter (allen.burris@clarkcountynv.gov)

2024 International Building Code

Revise as follows:

505.2 Mezzanines. A *mezzanine* or *mezzanines* in compliance with Section 505.2 shall be considered a portion of the *story* below. Such *mezzanines* shall not contribute to either the *building area* or number of *stories* as regulated by Section 503.1. The area of the *mezzanine* shall be included in determining the *fire area*. The clear height above and below the *mezzanine* floor construction shall be not less than 7 feet 6 inches (~~2134~~ 2286 mm).

> **Exception:** The clear height above and below the mezzanine shall not be less than 7 feet for spaces with one exit in accordance with Table 1006.2.1.

Reason: Section 1208.2 dictates a minimum ceiling height of 7’-6” for occupiable spaces, habitable spaces, and corridors. The charging statement for Section 1003.2 states “The means of egress shall have a ceiling height of not less than 7 feet 6 inches (2286 mm) above the finished floor.” With some exceptions for sloped ceilings, projections, stairs, and parking garages. Both Sections defer to Section 505.2 for mezzanines in the exceptions.
Mezzanines are grouped with equipment platforms in the code.

In fact, Section 505 is entitled: **MEZZANINES AND EQUIPMENT PLATFORMS**. This is consistent with the thought that mezzanines are primarily small areas for equipment or storage. However, the size of the mezzanine is only limited by the area of the floor below under 505.2.1.; larger floor plates allow larger mezzanines. From a design standpoint the code encourages the use of large mezzanines since they do not count as stories and do not contribute to building area under 503.1. The occupancy group of mezzanines is also not limited. Because of these two conditions the code allows large occupancy loads in mezzanines. Mezzanines are also intended to be open to the floor below. The charging statement in **Section 505.2.3 Openness.** Requires these areas be “open and unobstructed to the room in which… except for walls not more than 42 inches in height (1067) in height, columns, and posts.” It is understood that this is for smoke buildup in the low ceiling areas compromising the means of egress path. However, the code allows enclosure of these spaces in the Exceptions if either the occupant load is under 10 or two or more exits or access to exits are provided.

The proposed code change proposal would coordinate these various requirements, by using the same two exit requirement in the exceptions to trigger the height requirements mentioned elsewhere in the code. Lastly, greater occupancy loads increases evacuation times, and there will usually be a stair component in the exit access further increasing evacuation times. Limiting the occupant loads for these low ceiling heights to the exiting requirements shown in Table 1006.2.1 would reduce any potential risk of endangering occupants in a fire event.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is a clarification only and has no impact to the cost of construction. See reason statement.

G99-25

G100-25

IBC: 505.2.3

Proponents: Jeffrey Grove, representing Coffman Engineers (jeff.grove@coffman.com)

2024 International Building Code

Revise as follows:

505.2.3 Openness. A *mezzanine* shall be open and unobstructed to the room in which such *mezzanine* is located except for walls not more than 42 inches (1067 mm) in height, columns and posts.

Exceptions:

1. *Mezzanines* or portions thereof are not required to be open to the room in which the *mezzanines* are located, provided that the *occupant load* of the aggregate area of the enclosed space is not greater than 10.
2. A *mezzanine* having two or more exits or access to exits is not required to be open to the room in which the *mezzanine* is located.
3. *Mezzanines* or portions thereof are not required to be open to the room in which the *mezzanines* are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the *mezzanine* area.
4. In industrial *facilities*, *mezzanines* used for control equipment are permitted to be glazed on all sides.
5. ~~In occupancies other than Groups H and I, which are no more than two *stories above grade plane* and equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, a *mezzanine* having two or more *exits* or access to exits shall not be required to be open to the room in which the *mezzanine* is located.~~

Reason: This change proposes to remove Exception 5 as it is redundant when compared to the conditions of Exception 2. Exception 5 has all the same requirements as Exception 2 plus additional requirements. As such, there is no scenario in which a mezzanine would comply with Exception 5 but not Exception 2. As a result, there is no need to include Exception 5 in the code.

Section 505.2.3 was most recently revised for the 2015 IBC. The 2015 revision simplified Exception 2 by eliminating the requirement that, “at least one of the means of egress provides direct access to an exit from the mezzanine level.” This language was eliminated after it was determined that allowing exit access stairways to serve as mezzanine exits is consistent with the allowances of Section 1019.3 (at that time Section 1018.3). The language deleted for the 2015 edition had previously been the only condition of Exception 2 that was not included with Exception 5. With its elimination, Exceptions 2 and 5 became redundant.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proposal removes redundancy. See reason statement.

G100-25

G101-25

IBC: 505.3.4 (New)

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

2024 International Building Code

Add new text as follows:

505.3.4 Equipment platform construction. *Equipment platforms* and their structural framing members shall be built of materials consistent with the types permitted for the type of construction of the *building*. Where structural framing members of *equipment platforms* provide bracing for the *building* columns or bearing walls, such framing members shall have a *fire-resistance rating* as required for the type of construction of the *building*.

Reason: The code is currently silent on construction requirements of equipment platforms. Since these are unoccupied platforms that are often constructed with open steel grating, it is not appropriate to consider the platforms to be "floors" (with associated framing members) that would have to meet fire-resistance rating requirements for type of construction. However, due to the large size allowed for equipment platforms (up to two-thirds of the area of the room in which they are located), and the associated fuel load of these platforms, it seems appropriate that these platforms be constructed of materials consistent with the type of construction of the building. For example, in a non-combustible Type I or II construction, equipment platforms should be constructed of non-combustible materials.

To address the issue above, this proposal adds a requirement for the types of materials allowed for equipment platforms. Also, there are cases where the framing of an equipment platform is used to brace the building columns or bearing walls, which is beneficial to the structural design of the columns or walls. In these cases, it is appropriate to also provide a fire-resistance rating as required for type of construction, which is addressed in this proposal as well.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Since IBC Section 603.1 doesn't list equipment platforms as an item that can be constructed of combustible materials in a Type I or II building, it is believed that most designers and jurisdictions are currently requiring equipment platform materials to be consistent with those permitted for the type of construction. This is consistent with the current intent of the code to limit combustible materials in non-combustible construction types. Therefore, this proposal will have no cost impact relative to current design and enforcement practices.

G101-25

G102-25

IBC: 506.2.1

Proponents: Brendan Smith, representing CannonDesign (bsmith@cannondesign.com); Scott C Whitehead, representing CannonDesign (swhitehead@cannondesign.com); David Przeklasa, representing CannonDesign (dprzeklasa@cannondesign.com); David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

2024 International Building Code

SECTION 506
BUILDING AREA

Revise as follows:

506.2.1 Single-occupancy buildings. The allowable area of each *story* of a single-occupancy *building* shall be determined in accordance with Equation 5-1:

$$A_a = A_t + (NS \times I_f) \qquad \textbf{(Equation 5-1)}$$

where:

A_a = Allowable area (square feet).

A_t = Tabular allowable area factor (NS, S1, S13R~~, or~~ S13D or SM value, as applicable) in accordance with Table 506.2.

NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered *building* (regardless of whether the *building* is sprinklered).

I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

The allowable area per *story* of a single-occupancy *building* with a maximum of three *stories* above grade plane shall be determined by Equation 5-1. The total allowable area of a single-occupancy building more than three *stories above grade plane* shall be determined in accordance with Equation 5-2:

$$A_a = [A_t + (NS \times I_f)] \times S_a \qquad \textbf{(Equation 5-2)}$$

where:

A_a = Allowable area (square feet).

A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.

NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered *building* (regardless of whether the *building* is sprinklered).

I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

S_a = 3 where the actual number of *stories above grade plane* exceeds three, or

S_a = 4 where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.2.

The actual area of any individual floor shall not exceed the allowable area per Equation 5-1.

Reason: SMITH/WHITEHEAD/PRZEKLASA: Equation 5-1 is for establishing allowed area per story. If "SM" is not included here, there is no other way to determine the per story allowable area of a building classified as "SM" by Table 506.2. It appears to have been omitted by mistake.

RENN: There was a code change in the 2021 IBC, based on proposal G85-18, that was intended to be "an editorial reorganization of text". The change requires buildings three stories maximum to use Eq. 5-1 for allowable area of each story, which results in the allowable area of a two-story building being twice the value from Eq. 5-1 and the allowable area of a three-story building being three times the value from Eq. 5-1. However, Eq. 5.1 includes a tabular allowable area factor, A_t, that does not include an SM (sprinklered multi-story) value for Table 506.2. Since SM is not included, it is unclear how you would calculate the allowable area for a two- or three-story building. If designers use the S1 (sprinklered single-story) values for a two- or three-story building, there is a significant increase in allowable area from what was allowed before, which was not the intent of G85-18.

This proposal addresses the issue above by simply adding SM into the definition of A_t for Eq. 5-1, which results in the same allowable building area as allowed prior to the 2021 IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

SMITH/WHITEHEAD/PRZEKLASA: It is simply a clarification to correct what appears to be an error in the current text. It will have no impact on the quality of any constructed area, and therefore no impact on the cost of any such constructed area.

RENN: This proposal is intended to fix an unintentional editorial error that was made in a code change for the 2021 IBC. Since Table 506.2 requires the use of NS, S1, S13R, S13D or SM, as applicable, it is believed that the SM values are currently being used as intended, so this change should not result in a change in construction cost.

G102-25

G103-25

IBC: SECTION 506, 506.2.1, 506.2.2, 506.2.3 (New), 506.2.4 (New)

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

SECTION 506
BUILDING AREA

Revise as follows:

506.2.1 Single-occupancy buildings. The allowable area ~~of each~~ ~~*story*~~ of a single-occupancy *building* with no more than one story above grade plane shall be determined in accordance with Equation 5-1:

$$A_a = A_t + (NS \times I_f) \qquad \textbf{(Equation 5-1)}$$

where:
A_a = Allowable area (square feet).
A_t = Tabular allowable area factor (NS, S1, S13R or S13D value, as applicable) in accordance with Table 506.2.
NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered *building* (regardless of whether the *building* is sprinklered).
I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

~~The allowable area per *story* of a single-occupancy *building* with a maximum of three *stories* above grade plane shall be determined by Equation 5-1. The total allowable area of a single-occupancy building more than three *stories above grade plane* shall be determined in accordance with Equation 5-2:~~

$$\cancel{A_a = [A_t + (NS \times I_f)] \times S_a} \qquad \cancel{\textbf{(Equation 5-2)}}$$

~~where:~~
~~A_a = Allowable area (square feet).~~
~~A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.~~
~~*NS* = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered *building* (regardless of whether the *building* is sprinklered).~~
~~I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.~~
~~S_a = 3 where the actual number of *stories above grade plane* exceeds three, or~~
~~S_a = 4 where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.2.~~

~~The actual area of any individual floor shall not exceed the allowable area per Equation 5-1.~~

506.2.2 Mixed-occupancy buildings. The allowable area of ~~each *story* of~~ a mixed-occupancy *building* with not more than one story above grade plane shall be determined in accordance with the applicable provisions of Section 508.1 based upon Equation 5-1 for each applicable occupancy.~~, Section 508.3.2 for nonseparated occupancies and Section 508.4.2 for separated occupancies.~~

~~For *buildings* with more than three *stories above grade plane,* the total *building area* shall be such that the aggregate sum of the ratios of the actual area of each *story* divided by the allowable area of such *stories*, determined in accordance with Equation 5-3 based on the applicable provisions of Section 508.1, shall not exceed three.~~

~~**(Equation 5-3)**~~

$$A_a = [A_t + (NS \times I_f)]$$

~~where:~~
~~A_a = Allowable area (square feet).~~
~~A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.~~
~~*NS* = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered *building*, regardless of whether the building is sprinklered.~~

~~I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.~~

> ~~**Exception:** For *buildings* designed as separated occupancies under Section 508.4 and equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.2, the total *building area* shall be such that the aggregate sum of the ratios of the actual area of each *story* divided by the allowable area of such *stories* determined in accordance with Equation 5-3 based on the applicable provisions of Section 508.1, shall not exceed four.~~

Add new text as follows:

506.2.3 Single-occupancy, multistory buildings.. The allowable area of a single-occupancy building with more than one *story above grade plane* shall be determined in accordance with Equation 5-2:

$$A_a = [A_t + (NS \times I_f)] \times S_a$$ **(Equation 5-2)**

where:
A_a = Allowable area (square feet).
A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.
NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered *building* (regardless of whether the *building* is sprinklered).
I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.
S_a = Actual number of building *stories* above grade plane, not to exceed three. For buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.2, use the actual number of building *stories above grade plane*, not to exceed four.

506.2.4 Mixed-occupancy, multistory buildings.. Each story of a mixed occupancy building with more than one *story above grade plane* shall individually comply with the applicable requirements of Section 508.1. For buildings with more than three *stories above grade plane*, the total building area shall be such that the aggregate sum of the ratios of the actual area of each *story* divided by the allowable area of such stories, determined in accordance with Equation 5-3 based on the applicable provisions of Section 508.1, shall not exceed three.

$$A_a = [A_t + (NS \times I_f)]$$ **(Equation 5-3)**

where:
A_a = Allowable area (square feet).
A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.
NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered *building* (regardless of whether the *building* is sprinklered).
I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

> **Exception:** For buildings designed as separated occupancies under Section 508.4 and equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.2, the total building area shall be such that the aggregate sum of the ratios of the actual area of each *story* divided by the allowable area of such stories determined in accordance with Equation 5-3 based on the applicable provisions of Section 508.1, shall not exceed four.

Reason: This proposal addresses the unintended consequence of a modification made by G85-18 AM. G85-18 AM states that “this change because it is simply an editorial reorganization of existing text”, However, there are unintended consequences to this proposal that we are addressing.

The sections equations as written result in two different results for the allowable area per story and total allowable area for a 2 and 3 story sprinklered buildings, between the 2018 and 2021 Editions. If the intent was to keep the results the same and only simplify organization of the formulas, there is an error

In the 2018 Edition of the IBC, for multistory buildings, no story can exceed SM + If X NS. This is consistent with 2018 IBC Equation 5-2.

However, in 2021 IBC, no individual story in a multistory building shall exceed S1 + If X NS, since Equation 1 does not have SM as one of the allowable area factors. Assuming there was no change to the results of the formulas, just their organization between 2018 and 2021 IBC.

See example below:

If we follow IBC 2018, Aa = [At + (NS X If) X Sa] = [69,000 (SM) + 23,000 X 0] X 3 = 207,000. And no individual story shall exceed Aa using Sa = 1, then the calculation is Aa = [At + (NS X If) X Sa] = [69,000 (SM) + 23,000 X 0] X 1 = 69,000.

If we follow IBC 2021, Equation 5-1 (which does not have SM) says Aa = At + (NS X If) = 92,000 + (23,000 X 0) = 92,000 is the maximum area per story. Equation 5-2 technically does not apply because it is only for “buildings more than three stories above grade plane.”

Assuming this wording is correct, then we only have Equation 5-1 for our 3 story Business building, which is permitted to have 92,000 sf per story and by extension, if each story were built to its maximum 92,000 sf, it would be permitted to be 276,000 sf total. These are drastically different results, and it would seem the 2018 calculation is correct since it is using the SM value, not S1, since the single-story buildings get an area increase compared to their multistory counterparts and applying S1 to a multistory building does not follow logic. It would seem that these results are incorrect due to the modification to Equation 5-2 in the 2021 Edition.

BCAC proposal correct this unintended consequence by overturning the changes from G85-18 and go back to the 2018 code text

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impact - reverts to original indented equations in 2018 IBC

2024 International Building Code

TABLE 506.2 ALLOWABLE AREA FACTOR (A_t = NS, S1, S13R, S13D or SM, as applicable) IN SQUARE FEET[a, b]

Portions of table not shown remain unchanged.

OCCUPANCY CLASSIFICATION	SEE FOOTNOTES	TYPE OF CONSTRUCTION											
		Type I		Type II		Type III		Type IV				Type V	
		A	B	A	B	A	B	A	B	C	HT	A	B
	NS	UL	48,000	26,000	17,500	26,000	17,500	76,500	51,000	31,875	25,500	14,000	9,000
D	S1	UL	192,000	104,000	70,000	104,000	70,000	306,000	204,000	127,500	102,000	56,000	36,000
	SM	UL	144,000	78,000	52,500	78,000	52,500	229,500	153,000	95,625	76,500	42,000	27,000

For SI: 1 square foot = 0.0929 m^2.

UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

a. See Chapters 4 and 5 for specific exceptions to the allowable area in this chapter.

b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.

c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.

d. The NS value is only for use in evaluation of existing building area in accordance with the *International Existing Building Code*.

e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.

f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and with Section 1103.5 of the *International Fire Code*.

g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.

h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

i. The maximum allowable area for a single-story nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

Reason: Data centers are unique occupancies and need their own occupancy classification to better inform designers and AHJs. Currently data centers are frequently classified as Group S-1 occupancies. The values proposed for Group D occupancies matches those allowed for Group S-1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Data centers are currently being constructed with these provisions. Assigning a newly named occupancy classification will not impact costs.

2024 International Building Code

SECTION 506
BUILDING AREA

Revise as follows:

506.3.2 Minimum frontage distance. To qualify for an area factor increase based on frontage, the *public way* or open space adjacent to the *building* perimeter shall have a minimum distance of <u>(W)</u> 20 feet (6096 mm) measured at right angles from the *building* face to any of the following:

1. The closest interior *lot line*.
2. The entire width of a street, alley or *public way*.
3. The exterior face of an adjacent *building* on the same property.

~~The frontage increase shall be based on the smallest *public way* or open space that is 20 feet (6096 mm) or greater, and the percentage of *building* perimeter having a minimum 20 feet (6096 mm) *public way* or open space.~~

<u>Where the value of W is greater than 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the building area increase based on frontage, regardless of the actual width of the *public way* or open space. Where the value of W varies along the perimeter of the building, the calculation performed in accordance with Equation 5-5 shall be based on the weighted average calculated in accordance with Equation 5-4.</u>

<u>$W = (L_1 \times w_1 + L_2 \times w_2 + L_3 \times w_3 \ldots)/F$</u> **<u>(Equation 5-4)</u>**

<u>where: W (Width: weighted average = Calculated width of *public way* or open space (feet).</u>

<u>L_n = Length of a portion of the exterior perimeter wall.</u>

<u>w_n = Width (≥ 20 feet (6096mm)) of *public way* or open space associated with that portion of the exterior perimeter wall.</u>

<u>F = Building perimeter that fronts on a *public way* or open space having a width of 20 feet (6096 mm) or more.</u>

<u>Exception:</u> <u>Where a building space meets the requirements of Section 507, as applicable, except for compliance with minimum 60 foot (18288 mm) public way or yard requirement, and the value of W is greater than 30 feet (9144 mm), the value of W shall not exceed 60 feet (18,288 mm)</u>

506.3.3 Amount of increase. The area factor increase based on frontage shall be determined in accordance with ~~Table 506.3.3~~ <u>Equation 5-5</u>.

<u>$I_f = [F/P - 0.25]W/30$</u> **<u>(Equation 5-5)</u>**

<u>where: I_f = Area factor increase due to frontage.</u>

<u>F = Building perimeter that fronts on a public way or open space having minimum distance of 20 feet (6096 mm).</u>

<u>P = Perimeter of entire building (feet).</u>

<u>W = Width of public way or open space (feet) in accordance with Section 506.3.2.</u>

- **Frontage Code Change Proposal Attachment.pdf**
  https://www.cdpaccess.com/proposal/11775/35718/files/download/8994/

Reason: This proposal addresses the unintended consequence of a modification made by G86-18 during the 2021 IBC Code Development Process. G86-18 states that the values in the new frontage factor table (2021 and 2024 IBC Editions) are based on the calculation using Equation 5-5 of the 2018 IBC. However, as you will read below, the frontage factors that are determined using the 2018 IBC vs. the 2021/2024 IBC method are not the same.

In the 2018 Edition of the IBC, the frontage factor (I_f) was determined using an equation that would calculate a value based on a weighted average of the available width of the public way along the building perimeter. In the revision cycle for the 2021 IBC, a code change proposal was approved to simplify the process of determining the frontage factor by providing values in a table format. Per the code change proposal, the proponent argued that “values in the table are based on the calculations using Equation 5-5” of the 2018 IBC. The code change was approved and included in the 2021 and 2024 IBC. The following examples will demonstrate that the 2021/2024 IBC tabular method produces results that are inconsistent with the 2018 IBC calculation method. The main difference between the two methods is that the 2018 IBC method utilizes a weighted average of the available frontage along the building perimeter that fronts on a public way of at least 20 feet; whereas the 2021/2024 IBC method is based on the smallest public way that is 20 feet or greater. This approach can be restrictive for buildings that have a majority of their building perimeter fronting public ways well over 20 feet in width, but have a small portion with a frontage width of only 20 feet. By limiting the frontage factor to the smallest public way, rather than allowing for a weighted average, building configurations will be limited. This disparity is the reason that we believe that the area factor should be calculated using the previous weighted average width calculation method provided in the 2018 IBC.

Additionally, the G86-18 proposal states the frontage increase is easier to determine in the table format because previously, readers were using the wrong value from the area table (Table 506.2). The proponent argues that code users often confused the NS value with the S1 or SM value and that the new frontage factor table will eliminate this confusion. IBC Table 506.2 is not used in determining the frontage factor in either the 2018 or 2021/2024 IBC methods. Once the frontage factor (I_f) is determined, the code user still has to insert the factor into Equation 5-1, 5-2, or 5-3 and select the appropriate NS value from Table 506.2, regardless of which method is used.

Attached to this document are example buildings in various configurations to demonstrate the discrepancies that result in calculating the frontage factor with the 2018 IBC and 2021/2024 IBC methods. Results are outlined below. Below, we present exemplary cases of the various building configurations we studied and their frontage factor results:

1. This building has three sides which can be included in the frontage factor calculation (public way ≥ 20 feet). Using the 2021/2024 IBC tabular method, a frontage factor of 0.33 is produced. If interpolation is performed, as allowed by the Table 506.3.3 footnote, the result is 0.35. Using the 2018 IBC equation method, a result of 0.48 is calculated.
2. This Type IB building meets the requirements for unlimited area buildings of IBC 507, with the exception of the minimum 60-foot public way requirement. Using the 2021/2024 IBC tabular method, a frontage factor of 1.00 is produced. If interpolation is performed, as allowed by the Table 506.3.3 footnote, the result is 1.03. Using the 2018 IBC equation method, a result of 1.16 is calculated.
3. This building was designed as a perfect square, but one side fronts on a public way of only 19 feet. Using the 2021/2024 IBC tabular method, a frontage factor of 0.75 is produced. Using the 2018 IBC equation method, a result of 0.50 is calculated.

As demonstrated in the examples above, the 2021/2024 IBC tabular method does not provide results consistent with the previous 2018 IBC calculation. Therefore, the 2021 IBC code change proponent's statement that values in the 2021/2024 IBC tables are based on the calculations using 2018 IBC Equation 5-5 is inaccurate. We propose that the code language revert back to the previous method of determining the frontage factor, as this approach does not restrict buildings to their smallest public way width. Rather it is balanced by providing greater area increases for buildings with larger frontage widths and smaller area increases for buildings with minimal frontage widths.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is submitted to address unintended errors when calculating the allowable building area. Therefore, this is a code clarification and no impact to the cost of construction.

G105-25

G106-25

IBC: 507.2.1, 507.2.1.1 (New), 506.3.3.1, TABLE 506.3.3.1

Proponents: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2024 International Building Code

Revise as follows:

507.2.1 Reduced open space. The *public ways* or *yards* of 60 feet (18 288 mm) in width required in Sections 507.3, 507.4, 507.5, 507.6 and 507.12 shall be permitted to be reduced per Section 507.2.1.1 or 507.2.1.2 ~~to not less than 40 feet (12 192 mm) in width, provided that the following requirements are met:~~

1. ~~The reduced width shall not be allowed for more than 75 percent of the perimeter of the *building*.~~
2. ~~The *exterior walls* facing the reduced width shall have a *fire-resistance rating* of not less than 3 hours.~~
3. ~~Openings in the *exterior walls* facing the reduced width shall have opening protectives with a *fire protection rating* of not less than 3 hours.~~

Add new text as follows:

507.2.1.1 Obstructed open space. *Public ways* or *yards* of 60 feet (18 288 mm) in width required in Sections 507.3, 507.4, 507.5, 507.6 and 507.12 shall be permitted to be reduced to not less than 40 feet (12 192 mm) in width, provided that the following requirements are met:

1. The reduced width shall not be allowed for more than 75 percent of the perimeter of the *building*.
2. The *exterior walls* facing the reduced width shall have a *fire-resistance rating* of not less than 3 hours.
3. Openings in the *exterior walls* facing the reduced width shall have opening protectives with a *fire protection rating* of not less than 3 hours.

Revise as follows:

~~506.3.3.1~~ 507.2.1.2 ~~Section 507 buildings~~ Reduced frontage increase. Where a *building* meets the requirements of Section 507, as applicable, except for compliance with the minimum 60-foot (18 288 mm) *public way* or *yard* requirement, the area factor increase based on frontage shall be determined in accordance with Table ~~506.3.3.1.~~ 507.2.1.2.The frontage increase shall be based on the smallest *public way* or open space that is 30 feet (9144 mm) or greater, and the percentage of *building* perimeter having a minimum 30 feet (9144 mm) *public way* or open space.

TABLE ~~506.3.3.1~~ 507.2.1.2 ~~SECTION 507 BUILDINGS~~[a] ALTERNATIVE REDUCED OPEN SPACE ~~Reduced open space~~

PERCENTAGE OF BUILDING PERIMETER	OPEN SPACE (feet)					
	30 to less than 35	35 to less than 40	40 to less than 45	45 to less than 50	50 to less than 55	55 or greater
0 to less than 25	0	0	0	0	0	0
25 to less than 50	0.29	0.33	0.38	0.42	0.46	0.50
50 to less than 75	0.58	0.67	0.75	0.83	0.92	1.00
75 to 100	0.88	1.00	1.13	1.25	1.38	1.50

For SI: 1 foot = 304.8 mm.

a. Interpolation is permitted.

Reason: The proposed code change is editorial in nature and proposes to relocate reduce frontage requirements for unlimited area buildings to be located in Section 507 where the regulations appropriately belong. It is not intuitive to go to Section 506 to look for the requirements where they exist, and it is not clear whether you use either the Section 506 rules or the Section 507 rules. The code change that resulted in the revisions shown in Section 506 was a part of a multi-part code change. It was not clear the reason why the building standard was not included in the unlimited area section. G86-18 appears to have been the code change and is attached.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change relocates a requirement.

G106-25

G107-25

IBC: 506.3.3.1, TABLE 506.3.3.1

Proponents: Ali Fattah, City of San Diego Development Services Department, representing San Diego Area Chapter of ICC (afattah@sandiego.gov)

2024 International Building Code

507.2.1 Reduced open space. The *public ways* or *yards* of 60 feet (18 288 mm) in width required in Sections 507.3, 507.4, 507.5, 507.6 and 507.12 shall be permitted to be reduced to not less than 40 feet (12 192 mm) in width, provided that the following requirements are met:

1. The reduced width shall not be allowed for more than 75 percent of the perimeter of the *building*.
2. The *exterior walls* facing the reduced width shall have a *fire-resistance rating* of not less than 3 hours.
3. Openings in the *exterior walls* facing the reduced width shall have opening protectives with a *fire protection rating* of not less than 3 hours.

Revise as follows:

~~506.3.3.1~~ 507.2.1.1 Section 507 buildings. Where a *building* meets the requirements of Section 507, as applicable, except for compliance with the minimum 60-foot (18 288 mm) *public way* or *yard* requirement, the area factor increase based on frontage shall be determined in accordance with Table 507.2.1.1 ~~506.3.3.1~~. The frontage increase shall be based on the smallest *public way* or open space that is 30 feet (9144 mm) or greater, and the percentage of *building* perimeter having a minimum 30 feet (9144 mm) *public way* or open space.

TABLE ~~506.3.3.1~~ 507.2.1.1 SECTION 507 BUILDINGS[a]

PERCENTAGE OF BUILDING PERIMETER	OPEN SPACE (feet)					
	30 to less than 35	35 to less than 40	40 to less than 45	45 to less than 50	50 to less than 55	55 or greater
0 to less than 25	0	0	0	0	0	0
25 to less than 50	0.29	0.33	0.38	0.42	0.46	0.50
50 to less than 75	0.58	0.67	0.75	0.83	0.92	1.00
75 to 100	0.88	1.00	1.13	1.25	1.38	1.50

For SI: 1 foot = 304.8 mm.

a. Interpolation is permitted.

Reason: The proposed code change is editorial and co-locates requirements allowing reduced frontage for unlimited area buildings with the remainder of the requirements. Code users will go to the unlimited area building Section 507 and would not think to go back to Section 506 that discusses determination of allowable building area and that also includes area increases due to frontage. Interesting the relocated Section and associated table actually reduce the area of unlimited area buildings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is not change in regulatory effect proposed.

G107-25

G108-25

IBC: 507.4

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

SECTION 507
UNLIMITED AREA BUILDINGS

Revise as follows:

507.4 Sprinklered, one-story buildings. The area of a Group A-4 *building* not more than one *story above grade plane* of other than Type V construction, or the area of a Group B, F, M or S *building* no more than one *story above grade plane* of any construction type, shall not be limited where the *building* is provided with an *automatic sprinkler system* throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Exceptions:

1. *Buildings* and *structures* of Type I or II construction for rack storage *facilities* that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.4 and 903.3.1.1 and Chapter 32 of the *International Fire Code*.
2. The *automatic sprinkler system* shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that all of the following criteria are met:
   2.1. *Exit* doors directly to the outside are provided for occupants of the participant sports areas.

   2.2. The *building* is equipped with a *fire alarm system* with *manual fire alarm boxes* installed in accordance with Section 907.

   2.3. An *automatic sprinkler system* is provided in enclosed spaces ancillary to the sport activity space, such as storage rooms, press boxes, or concession booths ~~or other spaces ancillary to the sport activity space~~.

   2.4. Sprinklers are not required over the bench or bleachers seating providing all the following criteria are met:

   2.4.1. Every part of the roof construction over the seating is 20 feet or more above the highest foot board of the seating.

   2.4.2. The highest foot board of the bleacher is at 30 inches or less above the floor.

   2.4.3. The seating is adjacent to the participant sports areas.

Reason: G146-15 added Item 2.3. The revisions to this item are intended as a clarification.

With the addition of Exception 2.3, there is a question about if sprinklers are required over seating to view the events. G146-15, which was approved as submitted, required automatic sprinkler protection to “storage rooms, press boxes, concession booths or other spaces ancillary to the sport activity space”. The reason statement for this previous code change outlined that “it is appropriate to eliminate fire sprinklers in the large open spaces of these facilities”.

The current code commentary states the following:

“The spectator seating is usually situated around the perimeter of the sports field or area. These types of indoor recreation areas often require very large, open areas with such high ceilings that the installation of an automatic sprinkler system in the immediate participant sport area would be ineffective. The potential for significant fire involvement in such an area is generally quite low because of the low fuel load; therefore, sprinkler coverage is unnecessary for the playing field in most of these buildings. These areas are, therefore, exempt from the suppression requirement of this section, provided that the conditions regarding exiting and the required fire alarm system are met”.

For the uses listed in Exception No. 2, the limited hazard presented by the spectator seating areas is no greater than that of the participant sports areas.   Hence, this code change proposal provides clarification as to where automatic sprinkler protection is not required.

The intent of item 2.4 is to limit the size of the seating so a sprinkler exception is not over seating in arenas type arrangements with large crowds, but rather the many sports facilities where the seating is for participants or limited viewers. This would allow for telescopic, permanent or temporary bleachers – typically of 2 or 3 rows. This is not addressing the combustibility of the bleachers. There was a code change proposal for the IBC/IFC (E107-21 D) and the ICC 300 last cycle to require non-combustible bleachers. This was disapproved for both documents. The bleachers would not be a significant fuel load. The 20’ above the seating is based on Section Table 601 footnote b where the roof is not required to be rated.

The following are recommended ceiling height for common indoor sports:

Sport	Height
Tennis	30’
Pickle ball	18’
Basketball	17’
Indoor soccer	24’
Standard school gym	25’
Volleyball	23’

Example 1

Example 2

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is clarification for the exceptions for sprinklers over sports areas with bleachers. This is not a change in requirements for sprinklers.

G108-25

G109-25

IBC: 507.4, 507.5

Proponents: Greg Johnson, Johnson & Associates Consulting Services, representing self (gjohnsonconsulting@gmail.com); Robert Buchetto, HED, representing Self (rbuchetto@hed.design); Jay Peters, representing Codes and Standards International (peters.jay@me.com)

2024 International Building Code

Revise as follows:

507.4 Sprinklered, one-story buildings. The area of a Group A-4 *building* not more than one *story above grade plane* of other than Type V construction, or the area of a Group B, D, F, M or S *building* no more than one *story above grade plane* of any construction type, shall not be limited where the *building* is provided with an *automatic sprinkler system* throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Exceptions:

1. *Buildings* and *structures* of Type I or II construction for rack storage *facilities* that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.4 and 903.3.1.1 and Chapter 32 of the *International Fire Code*.
2. The *automatic sprinkler system* shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that the following criteria are met:
   - 2.1. *Exit* doors directly to the outside are provided for occupants of the participant sports areas.
   - 2.2. The *building* is equipped with a *fire alarm system* with *manual fire alarm boxes* installed in accordance with Section 907.
   - 2.3. An *automatic sprinkler system* is provided in storage rooms, press boxes, concession booths or other spaces ancillary to the sport activity space.

507.5 Two-story buildings. The area of a Group B, D, F, M or S *building* not more than two *stories above grade plane* shall not be limited where the *building* is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason: Data centers are unique building uses and are being proposed to be added to the code under their own occupancy classification (Group D). As such, the code must provide requirements for this new classification. Group D buildings are generally proposed to meet the criteria of F or S uses which is consistent with the occupancies currently being assigned to these buildings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The assignment of an occupancy classification to data centers does not automatically increase any costs as these buildings are currently being constructed (typically assigned as an F or S use) with these same technical requirements.

G109-25

G110-25

IBC: 507.11

Proponents: David Bueche, representing Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

Revise as follows:

507.11 Group E buildings. The area of a Group E building not more than one *story above grade plane*, of Type II, ~~IIIA~~III or IV construction, shall not be limited provided that the following criteria are met:

1. Each classroom shall have not less than two *means of egress*, with one of the *means of egress* being a direct exit to the outside of the *building* complying with Section 1022.
2. The building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. The building is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason: In Table 601, the hourly fire-resistance rating for bearing walls, both exterior and interior, in Type IIB construction is 0 hours. In Type IIIB construction, the hourly fire-resistance rating for exterior bearing walls is 2 hours and 0 hours for interior bearing walls. In Table 602, for Group E (Educational) occupancies, the most restrictive categories for exterior nonbearing walls and partitions have a 1-hour rating, based on fire separation distance. Yet, Type IIB allows for a 0-hour rating when the fire-separation distance is at least 10 feet but less than 30 feet.

In other words, the hourly fire-resistance rating requirements for Type IIIB construction is just as, and in some cases, more restrictive when compared to Type IIB construction (i.e., 2 hours for exterior bearing walls in Type IIIB vs. 0 hours for Type IIB). However, Type IIB is allowed in this code provision, and Type IIIB is not.

Finally, note that for Group A-3 buildings, Types II (507.6) and III (507.7) construction have essentially the same requirements with nearly identical language except that Type III has an additional requirement for ramps (507.7#3).

Removing the “A” in this proposal will allow Type IIIB construction with its stronger hourly fire-resistance requirements, thus improving building and life safety for educational buildings and their occupants.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 impact, however, adding Type IIIB construction to this section of the code may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change will provide users with more options. Usually wood-frame construction materials and techniques are less expensive than comparable noncombustible types of construction with the same fire-resistance requirements.

G110-25

G111-25

IBC: 507.12

Proponents: David Bueche, representing Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

Revise as follows:

507.12 Motion picture theaters. In *buildings* of Type II and III construction, the area of a motion picture theater located on the first *story above grade plane* shall not be limited where the *building* is provided with an *automatic sprinkler system* throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Reason: In Table 601, the most restrictive rating for bearing walls in Type II construction is 1 hour (Type IIA, exterior and interior). In Type III construction, the most restrictive rating for exterior bearing walls is 2 hours (in both Types IIIA and IIIB). In Table 602, for Group A (Assembly) occupancies, the most restrictive categories for exterior nonbearing walls and partitions have a 1-hour rating, based on fire separation distance.

In other words, the hourly fire-resistance rating requirements for Type III construction are just as, and in some cases, more restrictive compared to Type II construction (i.e., 2 hours for Type III vs. 1 hour for Type II).

Finally, note that for Group A-3 buildings, Types II (507.6) and III (507.7) construction have essentially the same requirements with nearly identical language except for Type III has an additional requirement for ramps (507.7#3).

Adding "Type III" to this exception will allow for exterior walls with higher hourly requirements, thus improving building and life safety for motion picture theaters and their occupants.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 immediate impact. The addition of another use of fire-retardant-treated wood is simply an option to this section of the code that may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change will provide users with more options. Usually Type III construction is less expensive than Type II construction with the same fire-resistance requirements.

G111-25

G112-25

IBC: 508.1, 508.4.2

Proponents: William Koffel, Koffel Associates, Inc., representing Semiconductor Industry Association (wkoffel@koffel.com)

2024 International Building Code

SECTION 508
MIXED USE AND OCCUPANCY

Revise as follows:

508.1 General. Each portion of a *building* shall be individually classified in accordance with Section 302.1. Where a *building* contains more than one occupancy group, the *building* or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3, 508.4 or 508.5, or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section 510.
2. Where required by ~~Table~~ Section 415.6.5, areas of Group H-1, H-2 and H-3 occupancies shall be located in a *detached building* or *structure*.

508.4.2 Allowable building area. In each *story*, the *building area* shall be such that the sum of the ratios of the actual *building area* of each separated occupancy divided by the allowable *building* area of each separated occupancy shall not exceed 1.

Exception: Where a minimum of 80 feet separates each Group H-2 and H-3 occupancy in a Group H-5 mixed-occupancy building of Type I construction, the allowable area of each Group H-2 and H-3 occupancy shall be permitted to determined in accordance with Section 506.2.

Reason: The proposal coordinates with the changes made to Section 415.6.5 during the Group A hearings. The requirements for a detached building are determined using Table 415.6.5 as directed by Section 415.6.5. As such, "Table" is revised to say "Section."

The change made to Section 415.6.5 applies the detached building requirements to Group H-2 and H-3 areas in a Group H-5 mixed occupancy building where the Group H-2 and H-3 areas are separated by a distance of at least 80 ft. In order to make these provisions work, the allowable area for such a building needs to increase. Using the current provisions, the ratio of the areas will exceed one for the Group H-2 and H-3 occupancies, even though the building area for a Group H-5 occupancy in a Type I building is unlimited.

Whereas the revisions to Section 415.6.5 "equate" an 80 foot separation to being comparable to a detached building, the proposal uses the same concept for determining allowable areas. The allowable area for each Group H-2 and H-3 area would be calculated the same as the allowable area for a detached building. It is understood that Section 508.2 is used to calculate building area but in this instance the same procedure would be used to calculate the area of each Group H-2 and H-3 area.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The ability to construct larger semiconductor facilities without going through an alternative compliance method will decrease the cost of construction.

G112-25

G113-25

IBC: TABLE 508.4

Proponents: Greg Johnson, Johnson & Associates Consulting Services, representing self (gjohnsonconsulting@gmail.com); Robert Buchetto, HED, representing Self (rbuchetto@hed.design); Jay Peters, representing Codes and Standards International (peters.jay@me.com)

2024 International Building Code

Revise as follows:

TABLE 508.4 REQUIRED SEPARATION OF OCCUPANCIES (HOURS)[f]

Portions of table not shown remain unchanged.

OCCUPANCY	A, E		I-1[a], I-3, I-4		I-2		R[a]		F-2, S-2[b], U		B[e], D[g], F-1, M,S-1		H-1		H-2		H-3, H-4		H-5	
	S	NS	S	NS	S	NS	S	NS	S	NS	S	NS	S	NS	S	NS	S	NS	S	NS
B[e], D[g], F-1, M, S-1	1	2	1	2	2	NP	1	2	1	2	N	N	NP	NP	2	3	1	2	1	NP

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.N = No separation requirement.NP = Not Permitted.

a. See Section 420.

b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but not to less than 1 hour.

c. See Sections 406.3.2 and 406.6.4.

d. Separation is not required between occupancies of the same classification.

e. See Section 422.2 for ambulatory care facilities.

f. Occupancy separations that serve to define fire area limits established in Chapter 9 for requiring fire protection systems shall also comply with Section 707.3.10 and Table 707.3.10 in accordance with Section 901.7.

g. See Table 509.1 for separations for rooms with energy storage systems using lithium-ion or lithium metal batteries.

Reason: Data centers are being proposed to be assigned a Group D occupancy classification. As such, provisions for separated uses must be provided. Current field practice often assigns and S-1 classification so proposed new Group D is added to the row containing S-1. A footnote is provided to reference incidental use Table 509.1 where a new row for lithium ion batteries will be added requiring sprinklers and a 2-hour fire separation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Data centers are typically be constructed currently with a 2 hour separation between the data hall and any accessory office spaces. This proposal mirrors current industry practices and should add no cost.

G113-25

G114-25

IBC: 509.4.2

Proponents: Ronald Geren, RLGA Technical Services, LLC, representing Self (ron@specsandcodes.com)

2024 International Building Code

SECTION 509
INCIDENTAL USES

Revise as follows:

509.4.2 Protection. Where Table 509.1 permits an *automatic sprinkler system* without a *fire barrier*, the incidental uses shall be separated from the remainder of the *building* by *smoke partitions* constructed in accordance with Section 710 with doors installed in accordance with Section 710.5.2.2 and 710.5.2.3~~construction capable of resisting the passage of smoke. The walls shall extend from the top of the foundation or floor assembly below to the underside of the ceiling that is a component of a fire-resistance-rated floor assembly or roof assembly above or to the underside of the floor or roof sheathing, deck or slab above. Doors shall be self- or automatic-closing upon detection of smoke in accordance with Section 716.2.6.6. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80. Walls surrounding the incidental use shall not have air transfer openings unless provided with *smoke dampers* in accordance with Section 710.8~~.

Reason: This just simplifies the paragraph. The requirements deleted are essentially the same requirements for smoke partitions. Since a smoke partition exists as an assembly, it makes sense to take advantage of that assembly. As a comparison, here are the requirements per Section 509.4.2 compared to the requirements for smoke partitions:

- Section 509.4.2: "[C]onstruction capable of resisting the passage of smoke. The walls shall extend from the top of the foundation or floor assembly below to the underside of the ceiling that is a component of a fire-resistance-rated floor assembly or roof assembly above or to the underside of the floor or roof sheathing, deck or slab above."
  - Smoke Partition, Definition per Section 202: "A wall assembly that extends from the top of the foundation or floor below to the underside of the floor or roof sheathing, deck or slab above or to the underside of the ceiling above where the ceiling membrane is constructed to limit the transfer of smoke."

    Commentary: These are nearly identical.
- Section 509.4.2: "Doors shall be self- or automatic-closing upon detection of smoke in accordance with Section 716.2.6.6."
  - Smoke Partition, Section 710.5.2.3: "Where required elsewhere in the code, doors in smoke partitions shall be self- or automatic-closing by smoke detection in accordance with Section 716.2.6.6."

    Commentary: Both sections refer to Section 716.2.6.6 for smoke-activated doors. Since the smoke partition requirement states, "Where required elsewhere in the code," this section is specifically mentioned in the proposed Section 509.4.2.
- Section 509.4.2: "Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80."
  - Smoke Partition, Section 710.5.2: "Doors in smoke partitions shall comply with Sections 710.5.2.1 through 710.5.2.3."

    Section 710.5.2.1: "Doors in smoke partitions shall not include louvers.

    "Exception: Where permitted in accordance with Section 407.3.1.1."

    Section 710.5.2.2: " Where required elsewhere in the code, doors in smoke partitions shall meet the requirements for a smoke and draft control door assembly tested in accordance with UL 1784. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot [0.015424 m3/(s × m2)] of door opening at 0.10 inch of water (25 Pa) for both the ambient temperature test and the elevated temperature exposure test. Installation of smoke doors shall be in accordance with NFPA 105."

    Section 710.5.2.2.1: "Smoke and draft control doors complying only with UL 1784 shall be permitted to show the letter 'S' on the manufacturer's labeling."

    Section 710.5.2.3: Already covered in the comparison above.

Commentary: The original requirement only mentions the restriction on transfer openings and clearances per NFPA 80. NFPA 105, as referenced for smoke partitions, requires clearances complying with NFPA 80 (NFPA 105-22, Section 6.3.3). However, the smoke partition requirements take a step further by establishing specific air leakage performance "[w]here required elsewhere in the code." Thus, this section is specifically mentioned in Section 509.4.2.

- Section 509.4.2: "Walls surrounding the incidental use shall not have air transfer openings unless provided with smoke dampers in accordance with Section 710.8."
  - Smoke Partition, Section 710.8: "The space around a duct penetrating a smoke partition shall be filled with an approved material to limit the free passage of smoke. Air transfer openings in smoke partitions shall be provided with a smoke damper complying with Section 717.3.2.2.

    "**Exception:** Where the installation of a smoke damper will interfere with the operation of a required smoke control system in accordance with Section 909, approved alternative protection shall be utilized."

    Commentary: Since the original provision mentions Section 710.8, the proposed text does not need to make such a reference since it is required for smoke partitions.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Costs will be minimal since the original prescriptive requirements are nearly identical to the requirements for smoke partitions. The only cost increase will be for the "S" label (on doors and frames) and the smoke seals to comply with the leakage requirements that have been added.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost per door assembly for the label and the requisite seals around the perimeter will add $65 to $100 per opening. All other costs will remain the same. The majority of the cost will be for the "S" labels (about $40 for the door and frame) and $25 for the seals for a standard 3' by 7' door. Double doors will be at the higher end for the additional label and extra length of perimeter to seal.

G115-25

IBC: 510.5

Proponents: Gabriel Levy, incandescence life safety, inc, representing Colorado Chapter Code Development Committee (glevy@incandescencels.com)

2024 International Building Code

SECTION 510
SPECIAL PROVISIONS

Revise as follows:

510.5 Group R-1 and R-2 buildings of Type IIIA construction. For *buildings* of Type IIIA construction in Groups R-1 and R-2, the maximum allowable height in Table 504.3 shall be increased by 10 feet (3048 mm) and the maximum allowable number of *stories* in Table 504.4 shall be increased by one where the ~~first~~ floor assembly above the *basement*, where provided, has a *fire-resistance rating* of not less than 3 hours and the floor area is subdivided by 2-hour fire-resistance-rated *fire walls* into areas of not more than 3,000 square feet (279 m^2).

Reason: This height increase should be allowed for buildings which are slab on grade, without a basement.
"First-floor" is language that is inconsistent with the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal is a clarification and has no cost impact on the cost of construction for this option for special provisions.

G115-25

G116-25

IBC: 510.4, 510.7.1

Proponents: Bill McHugh, CM Services, Inc., representing National Fireproofing Contractors Association (bill@mc-hugh.us)

2024 International Building Code

SECTION 510 SPECIAL PROVISIONS

Revise as follows:

510.4 Parking beneath Group R. Where a maximum one *story above grade plane* Group S-2 parking garage, enclosed or open, or combination thereof, of Type I construction or open of Type IV construction, with grade entrance, is provided under a *building* of Group R, the number of *stories* to be used in determining the minimum type of construction shall be measured from the floor above such a parking area. The floor assembly between the parking garage and the Group R above shall comply with the type of construction required for the parking garage and shall also provide a *fire-resistance rating* not less than 4-hours or the mixed occupancy separation required in Section 508.4, whichever is greater.

510.7.1 Fire separation. *Fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711 between the parking occupancy and the upper occupancy shall correspond to the required *fire-resistance rating* prescribed in Table 508.4 for the uses involved or 4-hours, whichever is greater. The type of construction shall apply to each occupancy individually, except that structural members, including main bracing within the open parking *structure*, which is necessary to support the upper occupancy, shall be protected with the more restrictive fire-resistance-rated assemblies of the groups involved as shown in Table 601 or 4 hours, whichever is greater.*Means of egress* for the upper occupancy shall conform to Chapter 10 and shall be separated from the parking occupancy by *fire barriers* having not less than a 4- ~~2~~ hour *fire-resistance rating* as required by Section 707 with *self-closing* doors complying with Section 716 or *horizontal assemblies* having not less than a 4-~~2~~ hour *fire-resistance rating* as required by Section 711, with *self-closing* doors complying with Section 716. *Means of egress* from the *open parking garage* shall comply with Section 406.5.

Reason: The purpose of this code proposal is to address the items, risks present in parking garages below Group R occupancies. Whether it is an internal combustion engine, or battery technology powering vehicles or other devices, there is a risk in parking structures where these items are stored.

Most cars now have plastic gas tanks along with lots of plastics, used where metal was once used for bumpers, fender skirts, grilles, etc. The purpose of this proposal is to increase fire-resistance ratings from 2 hours to 4 hours for the parking garage structure, the floor above it, and the separating fire barriers, located in Group R buildings.

We have no idea when an or many electric vehicle(s) powered by lithium-ion or other type of batteries - or even an internal combustible engine will arrive and catch fire at a parking garage. Many apartment complexes with wood or other type of building element(s) on top of a parking structure - have this risk. How do I know? I just spent a year living in a Group R structure with the situation described above, 2 stories of parking, one at grade, one underground, topped by 5 stories of wood structure containing apartments.

The structure needs to withstand threats inside the building. The fire intensity and duration that lithium ion battery, other battery type, and internal combustion engine and plastic fires bring to these structures is amazing. The structures, and havens of safety need to survive and protect people. The floors above a parking garage(s) need to protect life as well, because people could be sleeping above the garage when these fires take place.

Fighting parking garage fires can be difficult. This is especially true when electric and internal combustion engine vehicles - and other items - are involved. We understand the water required to keep the batteries cool during thermal runaway is massive. Moving the vehicle outside the garage for burnout might not be an option in parking garages where exits can be a long way away, or on another floor.

The big question to ask; is the 2 hour fire-resistance-rating safe enough to protect people sleeping just above a parked vehicle or items stored that have erupted into flames with super intense heat located just under the horizontal assembly? What about the vehicle or items located next to a fire barrier shaft enclosure protecting the elevator and stairwell(s)?

The 4 hour fire-resistance rating is the highest practical fire-resistance rating that exists for most common construction building elements. The 4 hours is also the rating that current fire-resistance-rated assembly breach / opening / penetration / joint protection items such as fire-dampers, firestopping, fire rated doors, provide as well. With this rating the most stringent there is, it is fitting to be used to protect where risks and fuel loads are high.

Preventing fire spread with 4 hour fire barriers, 4 hour floors, horizontal assemblies, and protecting the structure with a 4 hour fire-resistance rating against collapse in parking garages is critical to safety and resilience. More importantly, this protects people from huge risks.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal will increase the cost of construction of the horizontal assembly, floor assembly, wall assembly by approximately 25% - 40% of only the assemblies required to have the increased fire-resistance rating. The cost will be absorbed into the rest of the building's cost of construction that is not required to be 4 hour fire-resistance rated.

The approximate cost addition is as follows:

- Shafts for elevators, stairwells with doors - Approx. 40-50 cents per sf of floor area (Approx. 2 stairwells, elevator, 2 mechanical shafts, or trash/other purposed shafts).
- Fireproofing - Approx. $0.75-1.00 per sf of floor area.

There is a new innovation in gypsum panels reducing labor costs for a 4-hour fire-resistance-rated assembly.

Estimated Immediate Cost Impact Justification (methodology and variables):

The protection is justified...because the assemblies are supporting people's homes. Apartments, condos, above these parking garages assume they are safe. The Lithium ion or other type of battery, internal combustion engine fire resulting from thermal runaway or other reason, is intense. The lithium ion battery fire has an immediate heat release, lasting a long time. The 4 hour fire-resistance-rated assembly is the closest cellulosic fire test we can get to provide longer protection to the horizontal assembly and walls in the garages - that also has listings for breach protection items. This meets the risk, in our opinion.

Estimated Life Cycle Cost Impact:

Maintaining protection of a 4 hour fire-resistance-rated assembly is no different than a 2 hour fire-resistance-rated assembly. There should be no increase in cost of maintaining protection.

Proponents: Gabriel Levy, incandescence life safety, inc, representing Colorado Chapter Code Development Committee (glevy@incandescencels.com)

2024 International Building Code

SECTION 510
SPECIAL PROVISIONS

Revise as follows:

510.2 Horizontal building separation allowance. A *building* shall be considered as separate and distinct *buildings* for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where the following conditions are met:

1. The *buildings* are separated with a *horizontal assembly* without unconcealed vertical openings and having a *fire-resistance rating* of not less than 3 hours. Where a *horizontal assembly* contains vertical offsets, the vertical offset shall be constructed as a fire barrier in accordance with Section 707 and shall have a *fire-resistance rating* of not less than 3 hours.
2. The *building* below, including the *horizontal assembly* and any associated vertical offsets, is of Type IA construction.
3. *Shaft*, *stairway, ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.

   Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided that the following conditions are met:

   1. The *building* above the *horizontal assembly* is not required to be of Type I construction.
   2. The enclosure connects fewer than four *stories*.
   3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.

4. *Interior exit stairways* located within the Type IA *building* are permitted to be of combustible materials where the following requirements are met:

   4.1. The *building* above the Type IA *building* is of Type III, IV, or V construction.

   4.2. The *stairway* located in the Type IA building is enclosed by 3-hour fire-resistance-rated construction with opening protectives in accordance with Section 716.

5. The *building* or buildings above the *horizontal assembly* shall be Group A, B, M, R or S occupancies.
6. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.

7, The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

Reason: The code currently lacks explicit provisions prohibiting openings, including unenclosed exit access stairs, atria, escalators, or other similar elements, from going through podium assemblies. This oversight appears unintentional. Similar to fire walls, podium horizontal assemblies should only have rated or protected openings between construction types to prevent fire and smoke spread.

The term "unconcealed" vertical openings is used to align with the language for other types of vertical openings (IBC 712.1.2). The terms "unenclosed" or "unprotected" are not suitable for this requirement. Rated penetrations and protected ducts, while technically "unenclosed", are permissible through a podium. Similarly, exit access stairs with draft curtains and closely spaced sprinklers are considered "protected" but should not be allowed through podium assemblies.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal is a clarification and has no cost impact on the cost of construction for horizontal assemblies.

Primary structural frame[f] (see Section 202)	3[a, b]	2[a, b, c]	1[b, c]	0[c]	1[b, c]	0	3[a]	2[a]	2[a]	HT	1[b, c]	0
Bearing walls												
Exterior[e, f]	3[a]	2[a]	1	0	2[a]	2[a]	3[a]	2[a]	2[a]	2[a]	1	0
Interior	3[a]	2[a]	1	0	1	0	3[a]	2[a]	2[a]	1/HT[g]	1	0
Nonbearing walls and partitionsExterior	See Table 705.5											
Nonbearing walls and partitionsInterior[d]	0	0	0	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	1$^1/_2$[b]	1[b, c]	1[b, c]	0[c]	1[b, c]	0	1$^1/_2$	1	1	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below. Fire-retardant-treated *wood* members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 705.5).

f. Not less than the fire-resistance rating as referenced in Section 704.9.

g. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire-resistance rating of not less than 1 hour.

Reason: Have had a few projects of Type I-B construction with both primary structural frames and exterior load-bearing walls. In these situations the fire rating of the columns can be reduced by 1-hr when supporting a roof only, but exterior load-bearing walls do not offer this reduction. These situations creates a constructability issue since you have a 2 or 3-hr exterior wall and the roof construction that is bears on these walls is 1-hr rated.

This proposal is to offer the same 1-hr reduction for load-bearing walls as it does for primary structural frames.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Range from $10k to several $100k, depending on the size and complexity of the structure.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will simplify the constructability of roofs resting on load-bearing walls.

Estimated Life Cycle Cost Impact:

this is primarily for during construction. However, over the life of the structure the potential cost for window and door replacements would reduced

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Depending on the method of the wall construction the windows and doors may be required to be fire-resistant rated and the adoption of this proposal would reduce the fire-resistant requirements for windows and doors, thus reducing the cost of future alterations/renovations.

G119-25

IBC: TABLE 601

Proponents: Richard Walke, Creative Technology Inc. and CM Services, representing National Fireproofing Contractors Association (richwalke61@gmail.com)

2024 International Building Code

Revise as follows:

TABLE 601 FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV				TYPE V	
	A	B	A	B	A	B	A	B	C	HT	A	B
Primary structural frame[f] (see Section 202)	3[a, b]	2[a, b, c]	1[b, c]	0[c]	1[b, c]	0	3[a]	2[a]	2[a]	HT	1[b, c]	0
Bearing walls												
Exterior[e, f]	3	2	1	0	2	2	3	2	2	2	1	0
Interior	3[a]	2[a]	1	0	1	0	3	2	2	1/HT[g]	1	0
Nonbearing walls and partitionsExterior	See Table 705.5											
Nonbearing walls and partitionsInterior[d]	0	0	0	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	1 1/2[b]	1[b, c]	1[b, c]	0[c]	1[b, c]	0	1 1/2	1	1	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. ~~Except in Group F-1, H, M and S-1 occupancies,~~ Where every part of the roof construction is 20 feet or more above the floor or mezzanine immediately below, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking ~~where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below.~~ except where any of the following conditions apply:

   1. In Group F-1, H, M and S-1 occupancies.

   2. Where the roof is occupiable.

   Fire-retardant-treated *wood* members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 705.5).

f. Not less than the fire-resistance rating as referenced in Section 704.9.

g. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire-resistance rating of not less than 1 hour.

Reason: The intent of this proposal is to prohibit the use of the “20 ft rule” stated in Exception b of Table 601 for occupiable roofs.

Footnote b as currently written reflects the facts that a roof is typically not occupied and that if sufficient distance exists between the floor below and the bottom side of the roof assembly there is little potential for the ignition of the roofing materials on top of the roof assembly. However, if the roof is occupiable, there is a need to protect those occupants through fire-resistance-rated construction just as if they were occupying the floor beneath the roof. As such, this proposal creates an exception to the use of the “20 ft rule” for occupiable roofs.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Based on industry and manufacturer input, this code proposal will increase the cost of construction by approximately $1 to $3 per square foot of roof assembly protected.

Estimated Immediate Cost Impact Justification (methodology and variables):

This includes materials and labor costs for a typical roof assembly. The total cost in any given building will depend upon the area of the roof assembly and whether or not the "20 ft rule" even applied.

Nonbearing walls and partitions Exterior	See Table 705.5											
Nonbearing walls and partitions Interior[~~d~~e]	0	0	0	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	1 1/2[b, c]	1[b, c, d]	1[~~b,~~ c, d]	0[~~c~~d]	1[~~b,~~ c, d]	0	1 1/2[b]	1[b]	1[b]	HT	1[~~b,~~ c, d]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. The *fire-resistance rating* of an *occupiable roof* shall be equal to or greater than the required *fire-resistance rating* of the floor construction below.

~~b~~ c. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below. Fire-retardant-treated *wood* members shall be allowed to be used for such unprotected members.

~~c~~ d. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.

~~d~~ e. Not less than the fire-resistance rating required by other sections of this code.

~~e~~ f. Not less than the fire-resistance rating based on fire separation distance (see Table 705.5).

~~f~~ g. Not less than the fire-resistance rating as referenced in Section 704.9.

~~g~~ h. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire-resistance rating of not less than 1 hour.

Reason: The purpose of this code proposal is two-fold. First, it provides protection to the occupants of the occupiable roof. Second, it provides clarity that the entire occupiable roof must be rated.

The first purpose is achieved by requiring an occupiable roof to have a fire-resistance rating equal to the required fire-resistance rating of the floor below. This provides the same degree of fire-resistance for occupants of the occupiable roof as the occupants on the floor below. The second purpose is achieved by reference to an occupiable roof instead of an occupiable space. It is not permitted to rate just that portion of the roof beneath the occupiable space. This proposal recognizes that the size of the occupied space can change after certificate of occupancy is granted. By rating the entire occupiable roof, changes can be made in the size of the occupiable space without the need to address fire-resistance again when the cost of fire-resistance is increased due to obstructed access from the underside of the roof assembly. Ducts, piping, ceiling grid hangers, all cause production to massively slow down when in the way of fireproofing operations regardless of protection material type.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Based on industry and manufacturer input, this code proposal will increase the cost of construction by approximately $1 to $3 per square foot of roof assembly protected.

Estimated Immediate Cost Impact Justification (methodology and variables):

This includes materials and labor costs for a typical roof assembly. The total cost in any given building will depend upon the area of the roof assembly.

Nonbearing walls and partitions Exterior	See Table 705.5											
Nonbearing walls and partitions Interior[~~d~~e]	0	0	0	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	$1^1/_2$[~~b~~c]	1[~~b,~~ c, d]	1[~~b,~~ c, d]	0[~~c~~b,d]	1[~~b,~~ c, d]	0[b]	$1^1/_2$	1	1	HT	1[~~b,~~ c, d]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. *Occupiable roofs* of single-story buildings without a required *fire-resistance ratings* on the floor construction of the first floor shall have a *fire-resistance rating* of 1 hr on the *occupiable roof.*

~~b~~ c. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below. Fire-retardant-treated *wood* members shall be allowed to be used for such unprotected members.

~~c~~ d. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.

~~d~~ e. Not less than the fire-resistance rating required by other sections of this code.

~~e~~ f. Not less than the fire-resistance rating based on fire separation distance (see Table 705.5).

~~f~~ g. Not less than the fire-resistance rating as referenced in Section 704.9.

~~g~~ h. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire-resistance rating of not less than 1 hour.

Reason: The purpose of this code proposal is three-fold. First, it provides protection to the occupants of the occupiable roof. Second, it provides clarity that the entire occupiable roof must be rated.

The first purpose is achieved by requiring an occupiable roof to have a fire-resistance rating of 1 hr. This provides a reasonable period of time for the occupants of the occupiable roof to egress the building in the case of fire. The second purpose is achieved by reference to an occupiable roof instead of an occupiable space. It is not permitted to rate just that portion of the roof beneath the occupiable space. This proposal recognizes that the size of the occupied space can change after certificate of occupancy is granted. By rating the entire occupiable roof, changes can be made in the size of the occupiable space without the need to address fire-resistance again when the cost of fire-resistance is increased due to obstructed access from the underside of the roof assembly. Ducts, piping, ceiling grid hangers, all cause production to massively slow down when in the way of fireproofing operations regardless of protection material type.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Based on industry and manufacturer input, this code proposal will increase the cost of construction by approximately $1 to $3 per square foot of roof assembly protected.

Estimated Immediate Cost Impact Justification (methodology and variables):

This includes materials and labor costs for a typical roof assembly. The total cost in any given building will depend upon the area of the roof assembly.

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV				TYPE V	
	A	B	A	B	A	B	A	B	C	HT	A	B
Primary structural frame[f] (see Section 202)	3[a, b]	2[a, b, c]	1[b, c]	0[c]	1[b, c]	0	3[a]	2[a]	2[a]	HT	1[b, c]	0
Bearing walls												
Exterior[e, f]	3	2	1	0	2	2	3	2	2	2	1	0
Interior	3[a]	2[a]	1	0	1	0	3	2	2	1/HT[g]	1	0
Nonbearing walls and partitionsExterior	See Table 705.5											
Nonbearing walls and partitionsInterior[d]	0	0	0	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	$1^1/_2$[b]	1[b, c]	1[b, c]	0[c]	1[b, c]	0	$1^1/_2$	1	1	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below. ~~Fire-retardant-treated *wood* members shall be allowed to be used for such unprotected members.~~

c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 705.5).

f. Not less than the fire-resistance rating as referenced in Section 704.9.

g. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire-resistance rating of not less than 1 hour.

Reason: IBC 603.1 Item 1.3 permits fire-retardant treated wood in roof construction of Type I or II buildings. The final sentence of Table 601 footnote b creates redundancy and potential misinterpretation regarding FRT wood use. The current wording could incorrectly suggest FRT wood is limited to unprotected roof members above 20 feet, when it can be used in any Type I or II construction roof assembly meeting Table 601's fire-resistance requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal addresses the unintended redundancy and potential misinterpretation regarding FRT wood use. This code change proposal therefore has no impact to the cost of construction.

Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	1 1/2[b]	1[b, c]	1[b, c]	0[c]	1[b, c]	0	1 1/2	1	1	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing, ~~and~~ decking , and portions of columns above 20 feet where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below. Fire-retardant-treated *wood* members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 705.5).

f. Not less than the fire-resistance rating as referenced in Section 704.9.

g. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire-resistance rating of not less than 1 hour.

Reason: For columns that support roofs greater than 20 feet above any floor or mezzanine immediately below, Table 601 Footnote b is understood to primarily be enforced in two ways:

- Columns are required to be encased with fireproofing the full height of the column, including the area of the column 20 feet or more above any floor or mezzanine immediately below, or
- Columns are encased for the first 20 feet above any floor or mezzanine immediately below, with the height of the column above 20 feet permitted to be exposed. This interpretation is recognized by other standards (such as NFPA 101) but not explicit in the IBC codified language. This proposal helps to reinforce this interpretation.

This code modification proposes that fireproofing not be required for the column height above 20 feet, and retains the requirement for fireproofing less than or equal to 20 feet above the floor or mezzanine immediately below.

Encasement is intended to protect structural stability by delaying heating and weakening of structural framing elements due to fire exposure. Encasement is effective where structural members are exposed to high temperatures near to a fire with high fire exposure, with no substantial benefit to life safety and structural stability where encased members are remote from a fire with reduced fire exposure.

The prescriptive building code acknowledges this behavior in the current Table 601 Footnote b, by permitting primary structural frame members, roof framing and decking and every part of roof construction 20 feet or more above the floor or mezzanine immediately below to be exempt from fireproofing. The exemption of fireproofing greater than 20 feet above the floor or mezzanine acknowledges the lesser severity at higher elevations.

As heat transfer is a function of structural framing size and roof framing members are considerably smaller than columns, for an equivalent fire severity and exposed structural framing, roof framing members will be the limiting factor for structural stability compared to columns.

Given applied protection for roof framing is permitted to be exempt and structural framing for roof framing is considered to be the limiting factor for structural stability, portions of columns greater than 20 feet above the floor or mezzanine immediately below should also be permitted to be exempt for fireproofing, as the level of safety and structural stability is considered to be maintained for this condition.

Bibliography: NFPA 101, Life Safety Code

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal will result in a cost decrease for fire-proofing columns above 20 feet in this scenario. The cost can vary significantly depending upon the fireproofing strategy, but a lower estimate is approximately $5 per square foot for cementitious coatings. For buildings with multiple tall columns which support the roof this can present significant savings.

Estimated Immediate Cost Impact Justification (methodology and variables):

Costing information was gathered with the assistance of installing contractors and vendors.

Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	1 1/2[b]	1[b, c]	1[b, c]	0[c]	1[b, c]	0	1 1/2	1	1	HT	1[b, c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor or mezzanine immediately below. Fire-retardant-treated *wood* members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 705.5).

f. Not less than the fire-resistance rating as referenced in Section 704.9.

g. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire-resistance rating of not less than 1 hour.

Reason: Under the UBC, the only legacy code I am familiar with, type III construction required exterior walls to be of non-combustible construction. This generally meant masonry or poured concrete construction. Bearing walls were required to be 4-hr rated and non-bearing walls were rated based on occupancy classification and Fire Separate Distance. Where FSD was 5 feet or less 4-hr rating was required. Where FSD was more than 5 feet and less than 20 feet were 2-hr rating was required. There was an allowance for fire retardant treated wood to be included in walls with a 2-hr or less required rating.

Under the UBC all exterior walls of most type III construction had a significant fire resistive rating.

With the introduction of the IBC in 2000 this changed significantly. The fire resistive rating for exterior bearing walls was reduced from 4-hr to 2-hr. Exterior non-bearing walls were reduced to 1-hr for any walls with a FSD less than 30'. The exception that allows FRT in walls with a 2-hr rating or less was maintained. It did not take designers long to recognize the significance of this change.

The entire exterior wall of type III construction can now be entirely of combustible construction. FRT lumber is still considered combustible construction. Given the higher allowable floor area and height type III construction buildings can, in many urban environments encompass entire blocks. Therefore the non-bearing walls have a FSD in excess of 30 feet so are permitted to have no fire resistive rating. In these cases there is very little difference between type III and V construction: The difference being the use of FRT and a smattering of 2-hr rated bearing walls.

This proposed change is an attempt to have the code catch up to the current construction practices and perhaps address some unintended results of the changes to the type III construction type in the very first IBC.

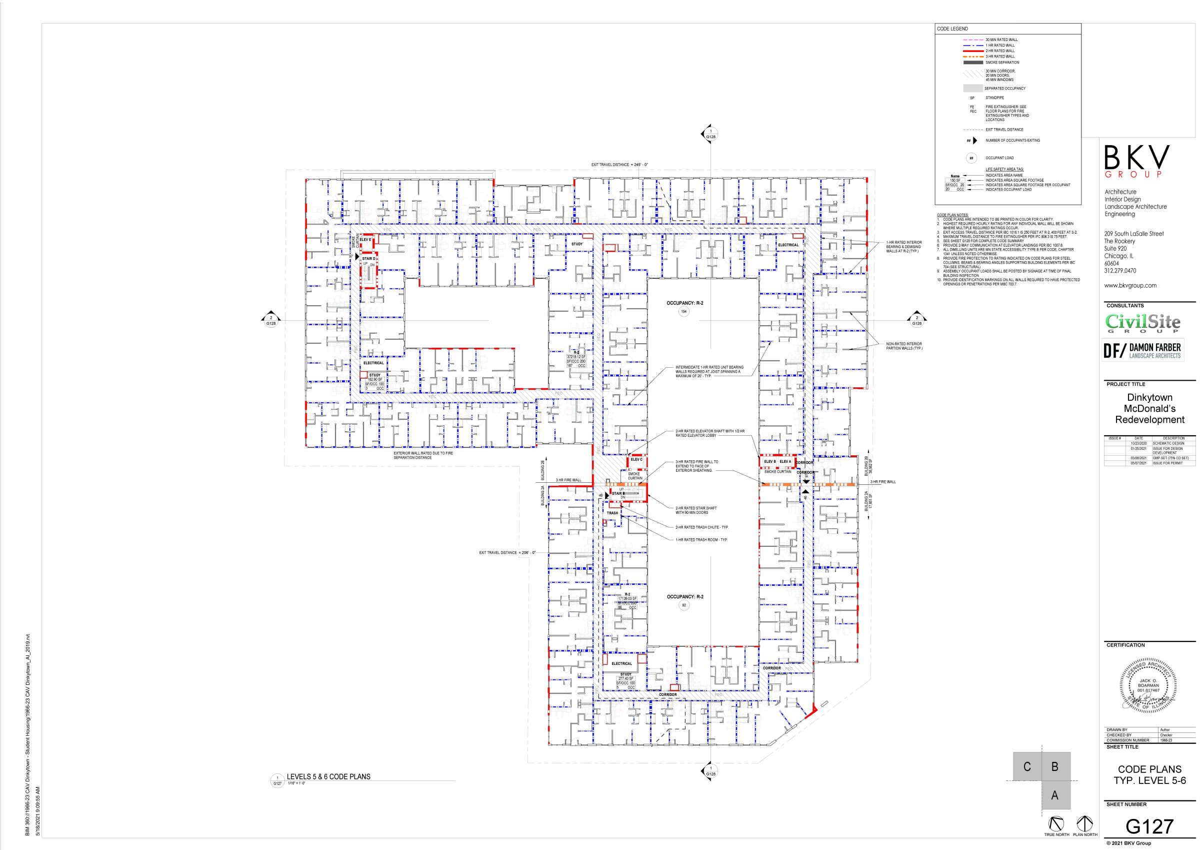
Type III construction is used extensively in the construction of R-2 dwelling units. The current construction practice is to run the floor and roof faming members parallel to the long dimension of the building. Limiting the amount of exterior bearing wall to the greatest extent possible. In a simple rectangular building this is not a significant issue. However most of these structures have numerous recesses in the exterior walls, due either to meeting zoning requirements for articulated facades or to provide for private decks and balconies. These articulations result is numerous short sections of exterior bearing walls. Many as short as 3-5 feet. The code requires that exterior bearing walls have a 2-hr fire resistive rating, designers, contractors and code officials spend an enormous amount of time and energy tracking all of these isolated wall assemblies through the building. This can get even more difficult when on upper levels the building steps back to create a smaller footprint on the upper levels. Again often in response to zoning requirements. Now not only the exterior bearing wall on this upper level is required to be 2-hr rated but all the supporting construction down through the interior of the building must also be 2-hr rated. Often the upper floor will have a different framing arrangement than the lower floor with a larger footprint. So the exterior bearing wall on floor 4 may in fact be above but back from an exterior non bearing wall on the floor 3.

The end result of applying these 2-hr rating requirements to all combustible construction is a great deal of work designing and maintaining isolated fire resistive elements. There is no practical or effective protection of the building construction. But at least we meet the code.

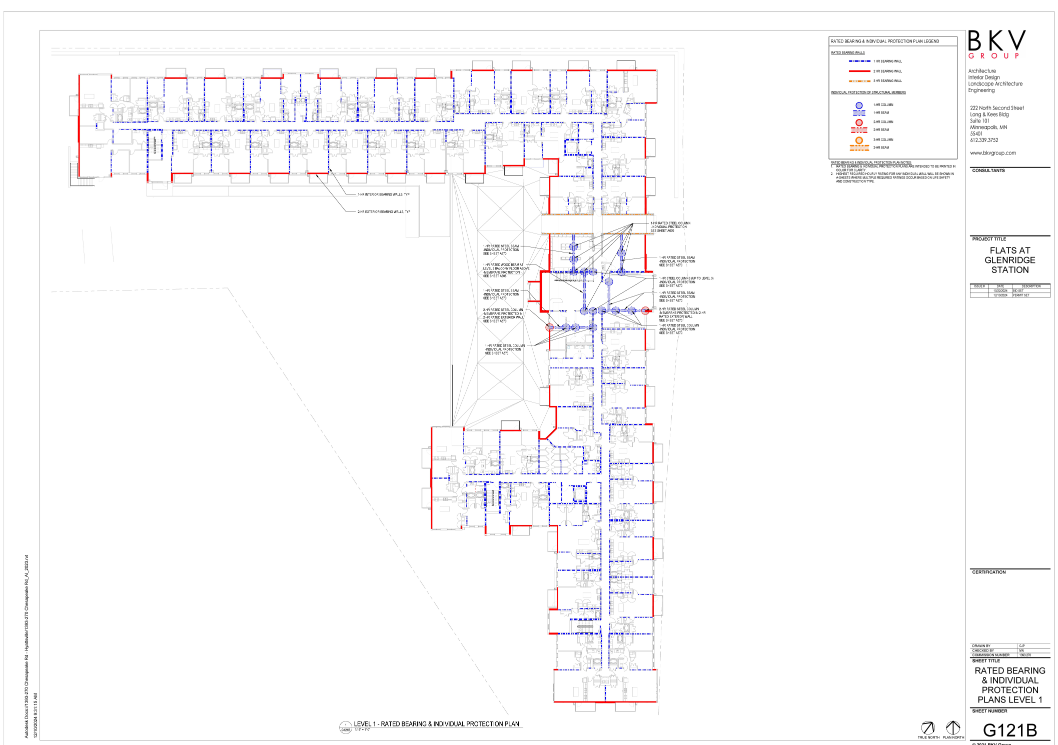
In lieu of this exercise in code compliance I am proposing we go back to the basic premise of type III construction. That is, that all exterior walls be provided with a fire resistive rating. Given the current construction practices most floor and wall assemblies in R-2 construction will have a minimum fire resistive rating of 1-hr. Yes there is an allowance to reduce it to 30 min when sprinkler system is being provided, but in practical terms the assemblies still meet the 1-hr rating.

Type III construction should as a requirement of the construction type have all exterior walls with a minimum 1-hr fire resistive rating. This may be increased based on FSD and is so noted in the footnote. This universal minimum 1-hr rating is more consistent with the historic type III construction and provides a better justification for the increased allowable floor area and height of type III vs type V construction. Further it makes more logical sense to have rated floor and roof assemblies supported by rated wall assemblies then non-rated assemblies which is currently permitted.

Attached example 1 shows a typical large scale type III apartment building. The exterior 2-hr rated walls are shown in red. Note that the entire north wall is non-rated construction. Note that in the middle of the north wall there are two 4 foot long walls perpendicular to the lot line that are 2- hr rated. The east and west walls have 2-hr rated assemblies for approx. 46% of the exterior wall and those rated assemblies are located at the extreme ends of the walls. The building walls facing the courtyard are also exterior walls and therefore include some 2-hr ratings.



Attached example 2 shows another typical type III apartment building. This one has balconies. Because of the definition of bearing walls these balconies create a series of exterior walls that qualify as bearing walls. The entire exterior wall design is a running pattern of non rated wall next to 2-hr rated wall next to non-rated wall next to 2-hr rated wall and on and on.



The point of these two examples is to show that, while it is possible to meet the letter of the code, it does not meet the original intent of the code sections. This alternating protected / non-protected pattern does not provide any realized protection of the structure, occupants, or first responders.

This proposed change at least restores the intent of type III construction in that it provides a minimum fire resistive rating for all exterior walls.

Bibliography: 1997 UBC

2000 IBC

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The reduction in detailing 2-hr rated combustible construction should ultimately balance any increase in construction cost to provide 1-hr construction in the non-bearing walls.

G124-25

G125-25

IBC: 602.1

Proponents: Ardel Jala, representing Seattle Department of Construction & Inspections (ardel.jala@seattle.gov); Jenifer Gilliland, representing Seattle Department of Construction & Inspections (jenifer.gilliland@seattle.gov)

2024 International Building Code

Revise as follows:

602.1 General. *Buildings* and *structures* erected or to be erected, altered or extended in height or area shall be classified in one of the five *construction types* defined in Sections 602.2 through 602.5. The *building elements* shall have a *fire-resistance rating* not less than that specified in Table 601 and *exterior walls* shall have a *fire-resistance rating* not less than that specified in Table 705.5. Where required to have a *fire-resistance rating* by Table 601, *building elements* shall comply with the applicable provisions of Section 703.2. The protection of penetrations, openings, ducts and air transfer openings in *building elements* shall not be required unless required by other provisions of this code.

Reason: This code change proposal adds penetrations to the list of elements not required to be protected unless required by other provisions of the code. Where an opening is permitted without protection in fire-resistance rated building elements as per this provision, a through penetration or membrane penetration should also be permitted without protection.

Approval of this code change is consistent with the Fire Safety Committee approval of FS18-24 at the ICC Group A Committee Action Hearings #1 in Orlando, Florida. FS18-24 clarifies that exterior walls permitted to have unprotected openings based on Section 705.9 are not required to have penetration protection. FS18-24 did not receive comment at CAH #2 and has moved onto the consent agenda for 2026.

Approval of this code change is also consistent Fire Safety Committee disapproval of FS45-24 at the ICC Group A Committee Action Hearings #1 in Orlando, Florida. The FS45-24 proposal added penetration protection at fire-resistance rated bearings walls required to be rated based on construction type.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is not cost impact because there is no requirement for protection.

G125-25

G126-25

IBC: 602.1

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Philip Oakes, representing NASFM; Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com)

2024 International Building Code

Revise as follows:

602.1 General. *Buildings* and *structures* erected or to be erected, altered or extended in height or area shall be classified in one of the five *construction types* defined in Sections 602.2 through 602.5. The *building elements* shall have a *fire-resistance rating* not less than that specified in Table 601 and *exterior walls* shall have a *fire-resistance rating* not less than that specified in Table 705.5. Where required to have a *fire-resistance rating* by Table 601, *building elements* shall comply with the applicable provisions of Section 703.2. The protection of openings, ducts and air transfer openings in *building elements* shall not be required unless required by other provisions of this code.

Exception: Noncombustible structural members supporting *photovoltaic panels* are not required to meet the fire resistance rating for any of the following conditions:

1. Rooftop-mounted *photovoltaic (PV) panel systems* supported by a structure and having no use underneath.
2. *Elevated photovoltaic (PV) support structures* with noncombustible framing that have sufficient uniformly distributed and unobstructed openings throughout the top of the array to allow heat and gases to escape, as determined by the *building official.*
3. *Elevated photovoltaic (PV) support structures* installed on the roof of an open parking structure where all the following conditions are met (see Figure 503.1):
   - 3.1. *Elevated photovoltaic (PV) support structures* installed on the roof of an open parking structure where all the following conditions are met (see Figure 503.1):
   - 3.2. The area within the perimeter of PV support structures has maximum rectangular dimension of 40 feet by 150 feet (12 195 mm by 45 720 mm).
   - 3.3. The driveway aisle separating PV support structures has a minimum width of 25 feet (7620 mm) clear.
   - 3.4. *Elevated PV support structures* are used only for parking purposes with no storage.
   - 3.5. *Elevated PV support structures* are completely open on all sides, other than necessary structural supports, with no interior partitions.
   - 3.6. *Elevated PV support structures* comply with Section 3111.3.5.2.

Reason: This proposal addresses the concern as to whether the structural elements supporting a rooftop mounted PV panel system or an elevated PV support structure is required to be protected with the same fire-resistive construction as the building below.

The proposal provides clarity for exceptions to fire-resistance for those structural elements.

These new exceptions to IBC Section 602.1 correlate with exceptions found in California Building Code Section 602.1 for several cycles. Although this language is not identical to language found in the California Building Code, the technical requirements are the same. The exceptions are edited to use IBC defined terms and to be appropriate for a nationwide use, rather than just in California.

This proposal maintains fire safety for the building as well as for firefighters.

This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency. The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner.

All recommendations from SEAC are approved by diverse stakeholders through a consensus process. For more information, please visit www.sustainableenergyaction.org

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It encourages solar energy without adversely impacting safety.

G126-25

G127-25

IBC: 602.4

Proponents: David Bueche, representing Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

Revise as follows:

602.4 Type IV. Type IV construction is that type of construction in which the *building elements* are *mass timber* or noncombustible materials and have *fire-resistance ratings* in accordance with Table 601. *Mass timber* elements shall meet the *fire-resistance-rating* requirements of this section based on either the *fire-resistance rating* of the *noncombustible protection*, the *mass timber*, or a combination of both and shall be determined in accordance with Section 703.2. The minimum dimensions and permitted materials for *building elements* shall comply with the provisions of this section and Section 2304.11. *Mass timber* elements of Types IV-A, IV-B and IV-C construction shall be protected with *noncombustible protection* applied directly to the *mass timber* in accordance with Sections 602.4.1 through 602.4.3. The time assigned to the *noncombustible protection* shall be determined in accordance with Section 703.6 and comply with Section 722.7.*Cross-laminated timber* shall be *labeled* as conforming to ANSI/APA PRG 320 as referenced in Section 2303.1.4.Exterior *load-bearing walls* and *nonload-bearing walls* shall be *mass timber* construction, or shall be of noncombustible construction.

Exception: Exterior *load-bearing walls* and *nonload-bearing walls* of Type IV-HT Construction in accordance with Section 602.4.4.

The interior *building elements*, including *nonload-bearing walls* and partitions, shall be of *mass timber* construction or of noncombustible construction.

~~Exception~~ Exceptions:

1. Interior *building elements* and *nonload-bearing walls* and partitions of Type IV-HT construction in accordance with Section 602.4.4.
2. *Fire-retardant-treated wood* complying with Section 2303.2 shall be permitted for interior *nonload-bearing walls* and partitions for Types IV-A, IV-B and IV-C construction.

Combustible concealed spaces are not permitted except as otherwise indicated in Sections 602.4.1 through 602.4.4. Combustible stud spaces within light frame walls of Type IV-HT construction shall not be considered concealed spaces, but shall comply with Section 718.In *buildings* of Type IV-A, IV-B, and IV-C construction with an occupied floor located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, up to and including 12 *stories* or 180 feet (54 864 mm) above *grade plane*, *mass timber* interior exit and elevator hoistway enclosures shall be protected in accordance with Section 602.4.1.2. In *buildings* greater than 12 *stories* or 180 feet (54 864 mm) above *grade plane*, interior exit and elevator hoistway enclosures shall be constructed of noncombustible materials.

Reason: In Table 601, the hourly fire-resistance ratings for interior nonbearing walls and partitions in Types IV-A, IV-B, and IV-C, are the same for the other construction types where fire-retardant-treated wood (FRTW) is permitted (ex. Type IA and IIA are also 0 hour.)

603.1.1 recognizes that FRTW can be used for nonload-bearing partitions in Type I and II construction where the required fire-resistance rating is 2 hours or less. By allowing this exception, there will be no decrease in the minimum hourly fire-resistance rating by including FRTW for Types IV-A, IV-B, and IV-C construction for interior nonbearing walls and partitions, nor will there be any adverse impact to building or life safety.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. This provides another option by adding Type III construction to this section of the code which may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than mass timber or noncombustible materials. Because FRTW is used as an alternative to these materials in this application, the cost may be less.

G128-25

IBC: 602.4.2.2.2, 602.4.2.2.4

Proponents: Shamim Rashid-Sumar, representing National Ready Mixed Concrete Association (ssumar@nrmca.org); Tim Earl, GBH International, representing the Gypsum Association (tearl@gbhint.com); Stephen Skalko, Stephen V. Skalko, P.E. & Associates LLC, representing Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com)

2024 International Building Code

602.4.2.2 Interior protection. Interior faces of all *mass timber* elements, including the inside face of exterior *mass timber* walls and *mass timber* roofs, shall be protected, as required by this section, with materials complying with Section 703.3.

602.4.2.2.1 Protection time. *Noncombustible protection* shall contribute a time equal to or greater than times assigned in Table 722.7.1(1), but not less than 80 minutes. The use of materials and their respective protection contributions specified in Table 722.7.1(2) shall be permitted to be used for compliance with Section 722.7.1.

Revise as follows:

602.4.2.2.2 Protected area. Interior faces of *mass timber* elements, including the inside face of exterior *mass timber walls* and *mass timber roofs*, shall be protected in accordance with Section 602.4.2.2.1.

Exceptions: Unprotected portions of *mass timber* ceilings and walls complying with Section 602.4.2.2.4 and the following:

1. Unprotected portions of *mass timber* ceilings and walls complying with one of the following:
   1.1. Unprotected portions of *mass timber* ceilings, including attached beams, limited to an area less than or equal to ~~100~~ 20 percent of the floor area in any *dwelling unit* within a *story* or fire area within a *story* .

   1.2. Unprotected portions of *mass timber* walls, including attached columns, limited to an area less than or equal to 40 percent of the floor area in any *dwelling unit* within a *story* or fire area within a *story* .

   1.3. Unprotected portions of both walls and ceilings of *mass timber*, including attached columns and beams, in any *dwelling unit* or fire area and in compliance with Section 602.4.2.2.3.
2. *Mass timber* columns and beams that are not an integral portion of walls or ceilings, respectively, without restriction of either aggregate area or separation from one another.

602.4.2.2.3 Mixed unprotected areas. In each *dwelling unit* or *fire area* , where both portions of ceilings and portions of walls are unprotected, the total allowable unprotected area shall be determined in accordance with Equation 6-1.

$$(U_{tc}/U_{ac}) + (U_{tw}/U_{aw}) \leq 1 \qquad \textbf{(Equation 6-1)}$$

where:

U_{tc} = Total unprotected *mass timber* ceiling areas.

U_{ac} = Allowable unprotected *mass timber* ceiling area conforming to Exception 1.1 of Section 602.4.2.2.2.

U_{tw} = Total unprotected *mass timber* wall areas.

U_{aw} = Allowable unprotected *mass timber* wall area conforming to Exception 1.2 of Section 602.4.2.2.2.

602.4.2.2.4 Separation distance between unprotected mass timber elements. In each *dwelling unit*or *fire area*, unprotected portions of *mass timber* walls and ceilings shall be not less than 15 feet (4572 mm) from unprotected portions of other walls and ceilings, measured horizontally along the ceiling and from other unprotected portions of walls measured horizontally along the floor.

Reason: This code change proposal reinstates the provisions of IBC 602.4.2.2.2 (Protected area) and 602.4.2.2.4 (Separation distance between unprotected mass timber elements) back to the original 2021 IBC provisions recommended by the Ad-Hoc Committee on Tall Wood Buildings.

The Ad-Hoc Committee on Tall Wood Buildings (TWB) developed provisions for Type IVA, B, and C construction in the 2021 edition of the IBC. These provisions were based on the ATF fire test program.

In the 2024 edition of the International Building Code, the provisions established by TWB were relaxed to allow fully exposed mass timber ceilings for Type IVB (partially encapsulated) mass timber construction.

The 2024 changes to the TWB recommended provisions were based on a series of fire tests conducted at the Research Institute of Sweden (RISE). The experiments were limited to a compartment size of 23 ft x 22.5 ft x 9 ft, representative of residential units or an office for about 8 persons. The tests were considered by the code change proponents to perform satisfactorily, based on no significant fire re-growth being observed and temperatures within the compartment decreasing continuously from the time of the fully-developed phase until the end of the fire test.

However, tests on compartments of this size do not capture the fire dynamics of large compartments. Exposed timber alters the fire dynamics within a compartment, resulting in more intense temperatures, longer fire durations, and a slower decay phase of the fire when compared to rooms without exposed timber (Rackauskaite et al., 2021).

In 2021 a new series of tests, the “Code Red” tests, were conducted by Arup and Imperial College London at the CERIB facility in France. The main driver of these tests was to investigate how fires form and develop in larger CLT spaces, such as those more typical to office buildings and occupancies other than residential apartments. The tests were carried out in a large open-plan compartment with a floor area of 352 m^2 (approximately 3800 ft^2) with a fully exposed, unloaded, cross-laminated timber (CLT) ceiling and glue laminated timber (glulam) columns.

In the first of this series of experiments, significant external flaming was observed through the openings. Analysis of the experimental results showed the presence of the timber structure approximately doubled the heat released compared to the value expected from the fuel source alone. Smoldering combustion of the timber elements continued for hours following the extinction of visible flaming, burning in several hotspots, resulting in holes through the CLT slab (Kotsovinos et al. 4 November 2021). These results are not considered satisfactory or consistent with the performance criteria outlined by TWB in the original provisions for tall wood buildings in the IBC.

The fourth experiment in the series was identical to the first experiment, however 50% of the CLT at the ceiling was encapsulated. The results of this experiment showed that partial encapsulation resulted in delay of ignition of the CLT ceilings. Based on delayed CLT ignition, the fire initially spread more slowly, and resulted in a less severe fire when compared to the first experiment with no encapsulation (100% exposed CLT ceiling). Lower peak temperatures were also measured in the compartment with the partially encapsulated ceiling as compared to the fully exposed CLT ceiling. Flames outside the door opening in the compartment with the partially encapsulated ceiling were also smaller in extent and height compared to those observed in the fully exposed ceiling experiment. The CLT encapsulation was described as effectively protecting the majority of the CLT from fire ignition as well as “a multi-layer system providing better resilience” (Kotsovinos et al. 7 October 2022).

The results of the Code Red tests are consistent with concurrent research at other institutions. A case study was conducted by Ni and Gernay to investigate the impact of exposed timber surface on the severity of a mass timber compartment fire and its corresponding demand on fire suppression. When timber elements are not protected from the fire by encapsulation, these timber elements contribute to the fuel load of the fire, altering the fire dynamics by increasing the duration and intensity of the fire. This is noted as particularly significant for compartment surface areas such as CLT ceilings, floors and walls (Ni and Gernay, 2002). Ni and Gernay quantified the additional heat contributed by exposed timber in a fire. Part of the heat will remain in the compartment, increasing the severity of thermal exposure conditions for the structure, while part of the heat will be released outside the building, which may put adjacent structures at a greater risk of ignition. In the case study, the duration and severity of compartment fire increased with increasing proportion of exposed CLT surfaces. This is consistent with what was observed in the results of the Code Red experiments.

Based on current and ongoing research, the changes to the 2024 IBC to permit 100% exposed mass timber ceilings in Type IVB construction is not justified in other than small compartments limited to 84 m^2 or roughly 900 square feet (Rackauskaite et al., 2021). The approaches to fully exposed mass timber ceilings cannot be considered accurate when applied to large open plan or well- ventilated compartments where fuel controlled fires may be more likely. The controls for these conditions currently do not exist in the 2024 IBC code provisions. Reinstatement of the 2021 IBC code provisions will ensure a level of fire safety consistent with that intended by the TWB.

Rackauskaite E, Kotsovinos P, Barber D (2021) Letter to the editor : design fires for open-plan buildings with exposed mass-timber. Fire Technol 57:487–495. https://doi.org/10.1007/s10694-020-01047-0

Cost Impact: Increase

- **fpl_2020_gu001.pdf**
  https://www.cdpaccess.com/proposal/9811/30380/documentation/145436/attachments/download/4257/
- **Cross_Laminated_Timber_Feasibility_Study_Feb-2018.pdf**
  https://www.cdpaccess.com/proposal/9811/30380/documentation/145436/attachments/download/4256/

Estimated Immediate Cost Impact:

Acoustical and fire protection costs for cross laminated timber are expected to range from $2 to $6 per square foot (Cary Kopczynski & Company 2018). Addition costs for acoustical dampening in comparable structures of other than CLT construction are anticipated to be $1 to $2 per square foot (Gu et al. 2020). The cost increase for initial construction cost would therefore be expected to range from $1 to $4 per square foot.

Estimated Immediate Cost Impact Justification (methodology and variables):

Data regarding immediate cost impact is based on feasibility (Cary Kopczynski & Company 2018) and cost impact (Gu et al. 2020) studies, which are noted and attached.

Estimated Life Cycle Cost Impact:

The code change proposal will decrease Life Cycle Cost Impact. A major component of life cycle cost is associated with fire suppression costs, in particular required fire flow and water supply.

In addition to quantifying the additional heat contributed by exposed timber in a fire, Ni and Gernay considered the increased requirements for fire flow and water supply for fire suppression by fire service personnel based on the increased energy released in the compartment by burning of exposed timber. In the case study, as the exposed timber surface increases from 0% to 100%, the required fire flow increases by 47% and the required water supply increases by 91% to balance the heat contributed by the burning timber (Ni and Gernay 2022). This will translate to an increased life cycle cost for buildings with exposed timber ceilings.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The case study developed by Ni and Gernay is referenced and attached.

2024 International Building Code

Revise as follows:

602.4.1.1 Exterior protection. The outside face of *exterior walls* of *mass timber* construction shall be protected with *noncombustible protection* with a minimum assigned time of 40 minutes in accordance with Section 722.7.1~~, as specified in Table 722.7.1(1)~~. Components of the *exterior wall covering* shall be of noncombustible material except *water-resistive barriers* having a peak heat release rate of less than 150kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354 and having a *flame spread index* of 25 or less and a *smoke-developed index* of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.

602.4.2.1 Exterior protection. The outside face of *exterior walls* of *mass timber* construction shall be protected with *noncombustible protection* with a minimum assigned time of 40 minutes in accordance with Section 722.7.1~~, as specified in Table 722.7.1(1)~~. Components of the *exterior wall covering* shall be of noncombustible material except *water-resistive barriers* having a peak heat release rate of less than 150kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354, and having a *flame spread index* of 25 or less and a *smoke-developed index* of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.

602.4.3.1 Exterior protection. The exterior side of walls of combustible construction shall be protected with *noncombustible protection* with a minimum assigned time of 40 minutes in accordance with Section 722.7.1~~, as determined in Table 722.7.1(1)~~. Components of the *exterior wall covering* shall be of noncombustible material except *water-resistive barriers* having a peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and having a *flame spread index* of 25 or less and a *smoke-developed index* of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.

Reason: Sections 602.4.1.1, 602.4.2.1, and 602.4.3.1 require 40 minutes of noncombustible protection for the outside face of exterior walls constructed of mass timber. Those sections directly reference Table 722.7.1(1) which is incorrect as it specifies the general noncombustible protection ratings for mass timber based on the fire resistance rating requirements of Table 601 and Table 705.5, but does not contain the provisions for how to achieve the required level of protection. This code change corrects that issue by referencing Section 722.7.1 instead, which allows for a calculated rating in accordance with Section 703.6, or prescriptive compliance per Table 722.7.1(2) and Section 722.7.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no technical changes proposed in this code change. This code change is a clarification only.

G129-25

G130-25

IBC: 602.4.4.3

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org)

2024 International Building Code

Revise as follows:

602.4.4.3 Concealed spaces. Concealed spaces shall not contain combustible materials other than *building elements* and electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the *International Mechanical Code*. Concealed spaces shall comply with applicable provisions of Section 718. Concealed spaces with combustible *building elements* shall be protected in accordance with one or more of the following:

1. The building shall be sprinklered throughout in accordance with Section 903.3.1.1 and automatic sprinklers shall also be provided in the concealed space.
2. The concealed space shall be completely filled with noncombustible insulation.
3. Combustible surfaces within the concealed space shall be fully sheathed with not less than $^5/_8$-inch *Type X gypsum board* or covered with concrete or gypsum concrete topping not less than 3/4 inch (19.1 mm) in thickness.

Exception: Concealed spaces within interior walls and partitions with a 1-hour or greater *fire-resistance rating* complying with Section 2304.11.2.2 shall not require additional protection.

Reason: This proposal has two changes. 1) The proposal adds “with combustible building elements” as a corollary to the first sentence to clarify applicability of the three enumerated requirements to concealed spaces with combustible building elements (e.g., the building element surfaces that enclose the concealed space). Without the addition of “with combustible building elements” it could be interpreted that the three enumerated requirements apply to concealed spaces that do not have any combustible surfaces. 2) The proposal expands item 3 to provide an option for floor plenums in Type IV-HT construction where the concealed space may be above the mass timber in a raised floor assembly. Materials commonly used on heavy timber floor surfaces include concrete and gypsum concrete toppings. The minimum ¾-inch thickness requirement is taken from ANSI/AWC *2024 Fire Design Specification (FDS) for Wood Construction* for heavy timber construction. The use of 3/4" thickness for concrete or gypsum concrete is specific to Type IV-HT construction and does not have impact on the 1-inch thick non-combustible material requirement for Type IV-A (Section 602.4.1.3) or Type IV-B (Section 602.4.2.3) construction for floors.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal adds an additional option for protection of combustible building elements in concealed spaces. It cannot increase the cost of construction because the existing compliance options are still available. However, this proposal is not considered editorial. Therefore, the only option available is to say it will decrease construction costs. This proposal could potentially decrease costs if this option is used, but will have no effect on construction costs if it is not used.

G130-25

G131-25

IBC: 602.5

Proponents: Scot Harris, Preston Wood & Associates, LLC. Jack Preston Wood AIBD/NCBDC, representing self (scot@jackprestonwood.com)

2024 International Building Code

Revise as follows:

602.5 Type V. Type V construction is that type of construction in which the structural elements, *exterior walls* and interior walls are of any materials permitted by this code.<u>Type V-A is a construction type that is protected throughout with 5/8-inch (15.875 mm) Type X gypsum board or an equivalent prescriptive method. Type V-B is a construction type that is unprotected.</u>

Reason: No wording is present which defines the meanings of "-A" and "-B" for Type V.
If there is, then please replicate or redirect to this section.

When we design a building that will exceed the maximum parameters established in the IRC publication, we must make reference the IBC for our product and that product may have a construction type of "protected combustible" where we might be able to avoid employing a NFPA sprinkler system.

It would appear as if this section 602.5 shall also contain subsections as shown in the previous "Type" sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a definition that shall be added to the publication that will minimize misinterpretation.

IBC: SECTION 202 (New), 602.3, 603.1, SECTION 2515 (New), 2515.1 (New), 2515.2 (New), 2515.3 (New), 2515.4 (New), ICC Chapter 35 (New)

Proponents: Keith P Nelson, representing DuPont (keith.nelson@dupont.com)

THIS CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Add new definition as follows:

MAGNESIUM-OXIDE-CEMENT PANEL PRODUCT. The general name for a family of panel, board, and sheet products having a core consisting essentially of magnesium-oxide-cement and reinforced with organic or inorganic fibers.

SECTION 602
CONSTRUCTION CLASSIFICATION

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the *exterior walls* are of noncombustible materials and the interior *building elements* are of any material permitted by this code. ~~*Fire-retardant-treated wood* framing and sheathing complying with Section 2303.2~~ The following materials shall be permitted within *exterior wall* assemblies of a 2-hour rating or less:~~.~~

1. *Fire-retardant-treated wood* framing and sheathing complying with Section 2303.2.
2. *Magnesium-oxide-cement panel product* complying with Section 2515.

SECTION 603
COMBUSTIBLE MATERIAL IN TYPES I AND II CONSTRUCTION

603.1 Allowable materials. Combustible materials shall be permitted in *buildings* of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* complying with Section 2303.2 shall be permitted in:
   - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less except in *shaft enclosures* within Group I-2 occupancies and *ambulatory care facilities.*
   - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
   - 1.3. Roof construction, including girders, trusses, framing and decking.

     Exceptions:

     1. In *buildings* of Type IA construction exceeding two stories above grade plane, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
     2. Group I-2, roof construction containing *fire-retardant-treated wood* shall be covered by not less than a Class A *roof covering* or roof assembly, and the roof assembly shall have a *fire-resistance rating* where required by the construction type.

   - 1.4. Balconies, porches, decks and exterior *stairways* not used as required exits on *buildings* three *stories* or less above *grade plane*.

2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

   Exceptions:

   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.

3. Foam plastics in accordance with Chapter 26.
4. *Roof coverings* that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.6.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated* wood complying with Section 2303.2, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. *Stages* and *platforms* constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic *veneer* installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.4.4 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.1.2.
21. Sprayed fire-resistive materials and intumescent fire-resistive materials, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.15 and 1705.16, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect *joints* in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of *buildings* of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the *International Mechanical Code*.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the *building* is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
27. Wood nailers for parapet flashing and roof cants.

28. Vapor retarders as required by Section 1404.3.

29. *Magnesium-oxide-cement panel products* complying with Section 2515.

Add new text as follows:

SECTION 2515
MAGNESIUM-OXIDE-CEMENT PANEL PRODUCT

2515.1 General. *Magnesium-oxide-cement panel products* shall comply with Section 2515.2 through 2515.4.

2515.2 Listing and labeling. The *magnesium-oxide-cement panel products* shall be *listed* and *labeled* for compliance with ICC 1125 and an End Use Severity Rating of 1, 2, or 3.

2515.3 Installation. The *magnesium-oxide-cement panel products* shall be designed and installed in accordance with the listing and manufacturer's installation instructions, or an approved design.

2515.4 Testing. The *magnesium-oxide-cement panel products* shall comply with either of the following:

1. Where tested in accordance with ASTM E84 or UL 723, panels shall have a *listed* and *labeled flame spread index* of not more than 10 and a *smoke-developed index* of not more than 25. The ASTM E84 or UL 723 test shall be continued for an additional 20-minute period and the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.Enter text
2. When tested in accordance with ASTM E2768, panels shall have a *listed* and *labeled flame spread index* of not more than 10 and a *smoke-developed index* of not more than 25and where the flame front does not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

Add new standard(s) as follows:

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

1125-XXXX Standard for Specification of Magnesium Oxide Board and Construction (IS-MGOB)

Reason:
The code change recognizes the use of magnesium-oxide panels in Type I, II & III exterior wall construction as qualified through compliance with the ICC-1125 performance standard under development. The MgO industry desires to add these requirements to the IBC given the import of offshore materials, the scaling of North American production capacity, and the use of all these materials in commercial construction. The surface burning characteristics limitation is more stringent than the existing exterior sheathing material in Section 2303.2. Applicable code requirements such as assembly fire performance tests still apply. Installation is to be in accordance with the manufacturer's instructions or an approved design.

The product is currently evaluated under ICC-ES Acceptance Criteria AC-386 for Fiber-Reinforced Magnesium-Oxide-Based Sheets and AC-530 for Fiber-Reinforced Magnesium-Oxide-Based Sheets with a Factory-Bonded Water-Resistive Overlay Membrane. The requirements of ICC 1125 are based upon the contents of AC386.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal provides another sheathing product alternative and as such does not raise or decrease the cost of construction. The designer is free to choose which sheathing product is most effective for the application. The cost to the manufacturer is neutral as the testing requirements are similar for ICC-1125 and the ICC-ES Acceptance Criteria.

Staff Analysis: A review of the standard proposed for inclusion in the code, ICC 1125-XXXX Standard for Specification of Magnesium Oxide Board and Construction (IS-MGOB), with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

G133-25

IBC: 603.1

Proponents: John Mengedoht, representing NBBJ

2024 International Building Code

SECTION 603
COMBUSTIBLE MATERIAL IN TYPES I AND II CONSTRUCTION

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in *buildings* of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* complying with Section 2303.2 shall be permitted in:
   - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less except in *shaft enclosures* within Group I-2 occupancies and *ambulatory care facilities.*
   - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
   - 1.3. Roof construction, including girders, trusses, framing and decking.

     Exceptions:

     1. In *buildings* of Type IA construction exceeding two stories above grade plane, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
     2. Group I-2, roof construction containing *fire-retardant-treated wood* shall be covered by not less than a Class A *roof covering* or roof assembly, and the roof assembly shall have a *fire-resistance rating* where required by the construction type.

   - 1.4. Balconies, porches, decks and exterior *stairways* not used as required exits on *buildings* three *stories* or less above *grade plane*.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

   Exceptions:

   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.

3. Foam plastics in accordance with Chapter 26.
4. *Roof coverings* that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.6.

9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated* wood complying with Section 2303.2 , 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. *Stages* and *platforms* constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic *veneer* installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.4.4 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.1.2.
21. Sprayed fire-resistive materials and intumescent fire-resistive materials, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.15 and 1705.16, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect *joints* in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of *buildings* of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the *International Mechanical Code*.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the *building* is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
27. Wood nailers for parapet flashing and roof cants.
28. Vapor retarders as required by Section 1404.3.
29. <u>Exterior soffit materials with a flame spread index of 25 or less and a smoke-developed index of 450 or less when tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723.</u>

Reason: The IBC does not directly address exterior soffit materials other than at roof overhangs in combustible construction (Section 1412). This proposal would allow combustible materials at exterior soffits in Type I and II construction that meet Class A criteria for flame spread and smoke development. This is the same criteria as the most restrictive applications for interior ceiling finishes in all occupancy groups.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Many code officials permit Class A materials at exterior soffits in Type I and II construction, perhaps due to the similarity to interior ceiling finishes. This proposal will not change that, nor will it have any impact on other construction types.

G133-25

G134-25

IBC: 603.1

Proponents: David Bueche, representing Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in *buildings* of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* complying with Section 2303.2 shall be permitted in:
   - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less except in *shaft enclosures* within Group I-2 occupancies and *ambulatory care facilities.*
   - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
   - 1.3. Roof construction, including girders, trusses, framing and decking.

     Exceptions:

     1. In *buildings* of Type IA construction exceeding two stories above grade plane, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
     2. Group I-2, roof construction containing*fire-retardant-treated wood* shall be covered by not less than a Class A *roof covering* or roof assembly, and the roof assembly shall have a *fire-resistance rating* where required by the construction type.

   - 1.4. Balconies, porches, decks and exterior *stairways* not used as required exits on *buildings* three *stories* or less above *grade plane*.
   - <u>1.5 Floors, including trusses, framing and sheathing, of Type IIB construction where fire-resistance-rated construction is not required.</u>
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

   Exceptions:

   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.

3. Foam plastics in accordance with Chapter 26.
4. *Roof coverings* that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.6.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.

10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated* wood complying with Section 2303.2 , 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. *Stages* and *platforms* constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic *veneer* installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.4.4 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.1.2.
21. Sprayed fire-resistive materials and intumescent fire-resistive materials, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.15 and 1705.16, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect *joints* in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of *buildings* of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the *building* is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
27. Wood nailers for parapet flashing and roof cants.
28. Vapor retarders as required by Section 1404.3.

Reason: In Table 601, Type IIB floors have a “0” fire resistance rating. Fire-retardant-treated wood is allowed in Section 603 in several areas. The height limitations for many sprinklered occupancy groups for Type IIB are the same as IIIB, where untreated wood floors are allowed. Many floor systems are designed for diaphragm action, and fire-retardant-treated floor joists, fire-retardant-treated floor trusses, and fire-retardant-treated plywood is used for this application but requires approval as an alternate by the AHJ. This code provision will provide design professionals with an additional option.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 immediate impact. The addition of another use of fire-retardant-treated wood is simply option to this section of the code that may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than noncombustible materials. Because FRTW may be used as an alternate to these materials, the cost may be less.

G134-25

G135-25

IBC: 603.1

Proponents: David Bueche, representing Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in *buildings* of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* complying with Section 2303.2 shall be permitted in:
   - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less except in *shaft enclosures* within Group I-2 occupancies and *ambulatory care facilities.*
   - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
   - 1.3. Roof construction, including girders, trusses, framing and decking.

     Exceptions:

     1. In *buildings* of Type IA construction exceeding two stories above grade plane, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
     2. Group I-2, roof construction containing *fire-retardant-treated wood* shall be covered by not less than a Class A *roof covering* or roof assembly, and the roof assembly shall have a *fire-resistance rating* where required by the construction type.

   - 1.4. Balconies, porches, decks and exterior *stairways* not used as required exits on *buildings* three *stories* or less above *grade plane*.
   - <u>1.5 Mezzanine floor construction and associated secondary members where the fire-resistance-rated floor assembly has the fire resistance of that required by the type of construction and is solidly filled with insulation or is constructed with *fireblocking* of *fire-retardant-treated wood*.</u>
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

   Exceptions:

   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.

3. Foam plastics in accordance with Chapter 26.
4. *Roof coverings* that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.6.

9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated* wood complying with Section 2303.2 , 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. *Stages* and *platforms* constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic *veneer* installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.4.4 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.1.2.
21. Sprayed fire-resistive materials and intumescent fire-resistive materials, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.15 and 1705.16, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect *joints* in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of *buildings* of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the *building* is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
27. Wood nailers for parapet flashing and roof cants.
28. Vapor retarders as required by Section 1404.3.

Reason: Many mezzanine floors are designed to carry heavy loads and as diaphragms to resist lateral forces. Plywood is ideally suited for these applications, and designers frequently want to use plywood in their mezzanine floor designs. Currently, in Types I and II construction, design professionals must seek approval from the AHJ through Section 104.2.3 and the alternative materials process.

Mezzanine floors do not contribute to either the building area or number of stories as regulated by Section 503.1. This is also the case for kiosks. Kiosks are allowed to be constructed of fire-retardant-treated wood in malls of any type of construction (see Section 402.6.2). By logical extension, mezzanine floors should be allowed to be constructed of fire-retardant-treated wood in Types I and II construction.

This code proposal does not alter any of the requirements in Section 505.2 for Mezzanines or the fire-resistance requirements for floor construction per Table 601. For example, in addition to being constructed of fire-retardant-treated wood elements (lumber framing, plywood sheathing, and fireblocking), a mezzanine floor in a Type IIA building would be required to have a 1-hour fire-resistance rating.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. The addition of fire-retardant-treated wood as an option to this section of the code may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than noncombustible materials. Because FRTW may be used as an alternate to these materials, the cost may be less.

G135-25

G136-25

IBC: 1202.2.1

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Building Code

SECTION 1202
VENTILATION

Revise as follows:

1202.2.1 Ventilated attics and rafter spaces. Enclosed *attics* and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof framing members shall have cross ventilation for each separate space by ventilation openings protected against the entrance of rain and snow. Blocking, ~~and~~ bridging, and insulation shall be arranged so as not to interfere with the movement of air. An airspace of not less than 1 inch (25 mm) shall be provided between the insulation and the roof sheathing. The net free ventilating area shall be not less than $^{1}/_{150}$ of the area of the space ventilated. Ventilators shall be installed in accordance with manufacturer's installation instructions.

Exception: The net free cross-ventilation area shall be permitted to be reduced to $^{1}/_{300}$ provided both of the following conditions are met:

1. In Climate Zones 6, 7 and 8, a Class I or II vapor retarder is installed on the warm-in-winter side of the ceiling.
2. At least 40 percent and not more than 50 percent of the required venting area is provided by ventilators located in the upper portion of the *attic* or rafter space. Upper ventilators shall be located not more than 3 feet (914 mm) below the ridge or highest point of the space, measured vertically, with the balance of the *ventilation* provided by eave or cornice vents. Where the location of wall or roof framing members conflicts with the installation of upper ventilators, installation more than 3 feet (914 mm) below the ridge or highest point of the space shall be permitted.

Reason: This proposal makes a small but important addition to the ventilated attic section. The code correctly recognizes that ventilation openings are to permit free movement of air. Current language addresses blocking and bridging but fails to acknowledge insulation as another element which can interfere with air flow. This proposal addresses that oversight.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The additional requirement that insulation not block ventilation openings should not have a significant impact on cost in most instances. In cases where attic baffles are needed and were not included in the project specifications, there may be an increase related to the cost of the baffles.

G136-25

G137-25

IBC: 1202.2.1

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Building Code

Revise as follows:

1202.2.1 Ventilated attics and rafter spaces. Enclosed *attics* and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof framing members shall have cross ventilation for each separate space by ventilation openings protected against the entrance of rain and snow. Blocking and bridging shall be arranged so as not to interfere with the movement of air. An airspace of not less than 1 inch (25 mm) shall be provided between the insulation and the roof sheathing. The net free ventilating area shall be not less than $^{1}/_{150}$ of the area of the space ventilated. Ventilators shall be installed in accordance with manufacturer's installation instructions.

Exception: The net free cross-ventilation area shall be permitted to be reduced to $^{1}/_{300}$ provided both of the following conditions are met:

1. In Climate Zones 6, 7 and 8, a Class I or II vapor retarder is installed on the warm-in-winter side of the ceiling.
2. At least 40 percent and not more than 50 percent of the required venting area is provided by ventilators located in the upper portion of the *attic* or rafter space. Upper ventilators shall be located not more than 3 feet (914 mm) below the ridge or highest point of the space, measured vertically, with the balance of the required *ventilation* provided in the bottom one-third of the attic space. ~~by eave or cornice vents.~~ Where the location of wall or roof framing members conflicts with the installation of upper ventilators, installation more than 3 feet (914 mm) below the ridge or highest point of the space shall be permitted.

Reason: As presently written, the location of inlet vent openings is restricted to eaves and cornices when taking the 1/300 reduction in net free ventilation area. The proposed change removes this unnecessary limitation and permits intake vents to be placed in the bottom one-third of the attic space. This aligns with existing language in the IRC, making the provisions consistent between the two codes.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0, but this proposal is expected to provide an opportunity for lower construction costs by providing additional options.

Estimated Immediate Cost Impact Justification (methodology and variables):

The methodology used to support an expectation of lower costs is logic. As available options increase, the opportunity to optimize cost and function improves.

G137-25

G138-25

IBC: 1202.3

Proponents: Benyamin Madani, representing self (benyamin@poisearch.com)

2024 International Building Code

Revise as follows:

1202.3 Unvented attic and unvented enclosed rafter assemblies. Unvented *attics* and unvented enclosed roof framing assemblies created by ceilings applied directly to the underside of the roof framing members/rafters and the structural roof sheathing at the top of the roof framing members shall be permitted where all of the following conditions are met:

1. The unvented *attic* space is completely within the *building thermal envelope*.
2. No interior Class I vapor retarders are installed on the ceiling side (*attic* floor) of the unvented *attic* assembly or on the ceiling side of the unvented enclosed roof framing assembly.
3. Where wood shingles or shakes are used, not less than a $^{1}/_{4}$-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing *underlayment* above the structural sheathing.
4. In Climate Zones 5, 6, 7 and 8, any *air-impermeable insulation* shall be a Class II vapor retarder or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. Insulation shall comply with either Item 5.1 or 5.2, and additionally Item 5.3.

5.1. Item 5.1.1, 5.1.2, 5.1.3 or 5.1.4 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.

5.1.1. Where only *air-impermeable insulation* is provided, it shall be applied in direct contact with the underside of the structural roof sheathing.

5.1.2. Where air-permeable insulation is provided inside the *building* thermal envelope, it shall be installed in accordance with Item 5.1.1. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing in accordance with the *R*-value percentages in Table 1202.3 for condensation control.

5.1.3. Where both air-impermeable and air-permeable insulation are provided, the *air-impermeable insulation* shall be applied in direct contact with the underside of the structural roof sheathing in accordance with Item 5.1.1 and shall be in accordance with the *R*-value percentages in Table 1202.3 for condensation control. The *air-permeable insulation* shall be installed directly under the *air-impermeable insulation*.

5.1.4. Alternatively, sufficient rigid board or sheet insulation shall be installed directly above the structural roof sheathing to maintain the monthly average temperature of the underside of the structural roof sheathing above 45°F (7°C). For calculation purposes, an interior air temperature of 68°F (20°C) is assumed and the exterior air temperature is assumed to be the monthly average outside air temperature of the three coldest months. The average temperature of sheathing shall be determined in accordance with Equation 12-1:

$$ATS = T_i - ((T_i - T_o) \times (A_p / (A_i + A_p))) \quad \textbf{(Equation 12-1)}$$

where:

ATS = Average temperature of sheathing

T_i = Indoor air temperature

T_o = Outdoor air temperature (the monthly average outside air temperature of the three coldest months)

A_p = Air permeable insulation

A_i = Air impermeable insulation

5.2. In Climate Zones 1, 2 and 3, air-permeable insulation installed in unvented *attics* shall meet the following requirements:

5.2.1. A *vapor diffusion port* shall be installed not more than 12 inches (305 mm) from the highest point of the roof, measured vertically from the highest point of the roof to the lower edge of the port.

5.2.2. The port area shall be greater than or equal to $^{1}/_{150}$ of the ceiling area. Where there are multiple ports in the *attic*, the sum of the port areas shall be greater than or equal to the area requirement.

5.2.3. The *vapor permeable* membrane in the *vapor diffusion port* shall have a vapor permeance rating of greater than or equal to 20 perms when tested in accordance with Procedure A of ASTM E96.

5.2.4. The *vapor diffusion port* shall serve as an air barrier between the *attic* and the exterior of the building.

5.2.5. The *vapor diffusion port* shall protect the *attic* against the entrance of rain and snow.

5.2.6. Framing members and blocking shall not block the free flow of water vapor to the port. Not less than a 2-inch (50 mm) space shall be provided between any blocking and the roof sheathing. Air-permeable insulation shall be permitted within that space.

5.2.7. The roof slope shall be greater than or equal to 3 units vertical in 12 units horizontal (3:12).

5.2.8. Where only air-permeable insulation is used, it shall be installed directly below the structural roof sheathing, on top the attic floor, or on top of the ceiling.

5.2.9. Where only air-permeable insulation is used and is installed directly below the structural roof sheathing, air shall be supplied at a flow rate greater than or equal to 50 cubic feet per minute (23.6 L/s) per 1,000 square feet ($93 m^2$) of ceiling.

5.3. The air shall be supplied from ductwork providing supply air to the *occupiable space* when the conditioning system is operating. Alternatively, the air shall be supplied by a supply fan when the conditioning system is operating. Where preformed insulation board is used as the *air-impermeable insulation* layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

Exceptions:

1. Section 1202.3 does not apply to special use *structures* or enclosures such as swimming pool enclosures, data processing centers, *hospitals* or art galleries.
2. Section 1202.3 does not apply to enclosures in Climate Zones 5 through 8 that are humidified beyond 35 percent during the three coldest months.

Reason: Most third party plan checkers to municipalities are asking to proof the proposed roof insulation will meet this code section as city inspectors have no measuring tools to calculate it at the site, for that, I am proposing this equation to be added to the code section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed equation provides clarity on how to measure average temperature at roof sheathing.

2024 International Building Code

Add new text as follows:

1202.5 Natural ventilation for all occupancy groups. Natural ventilation for all occupancy groups shall be in accordance with Sections 1202.5.1 through 1202.5.2.4.

1202.5.1 Natural ventilation for occupancy groups other than Group R . Natural ventilation for occupancy groups other than Group R shall comply with the natural ventilation procedure provisions of ASHRAE 62.1.

1202.5.2 Natural Ventilation for use in Group R . Natural ventilation for Group R shall comply with Sections 1205.5.2.1 through 1205.5.2.4

Revise as follows:

~~1202.5~~ **1202.5.2.1 Natural ventilation.** Natural *ventilation* of an occupied space shall be through windows, doors, louvers or other openings to the outdoors. The operating mechanism for such openings shall be provided with ready access so that the openings are readily controllable by the *building* occupants.

~~1202.5.1~~ **1202.5.2.2 Ventilation area required.** The openable area of the openings to the outdoors shall be not less than 4 percent of the floor area being ventilated.

~~1202.5.1.1~~ **1202.5.2.3 Adjoining spaces.** Where rooms and spaces without openings to the outdoors are ventilated through an adjoining room, the opening to the adjoining room shall be unobstructed and shall have an area of not less than 8 percent of the floor area of the interior room or space, but not less than 25 square feet (2.3 m^2). The openable area of the openings to the outdoors shall be based on the total floor area being ventilated.

> **Exception:** Exterior openings required for *ventilation* shall be allowed to open into a *sunroom* with *thermal isolation* or a patio cover provided that the openable area between the sunroom *addition* or patio cover and the interior room shall have an area of not less than 8 percent of the floor area of the interior room or space, but not less than 20 square feet (1.86 m^2). The openable area of the openings to the outdoors shall be based on the total floor area being ventilated.

~~1202.5.1.2~~ **1202.5.2.4 Openings below grade.** Where openings below grade provide required natural *ventilation*, the outside horizontal clear space measured perpendicular to the opening shall be one and one-half times the depth of the opening. The depth of the opening shall be measured from the average adjoining ground level to the bottom of the opening.

Add new standard(s) as follows:

ASHRAE

ASHRAE
180 Technology Parkway
Peachtree Corners, GA 30092

62.1-2022	Ventilation for Acceptable Indoor Air Quality

2024 International Mechanical Code

Add new text as follows:

__**402.1**__ __**Natural ventilation for occupancy groups other than Group R**__**.** __Natural ventilation for occupancy groups other than Group R shall comply with the natural ventilation procedure provisions of ASHRAE 62.1.__

__**402.2**__ __**Natural ventilation for use in Group R**__ **.** __Natural ventilation for Group R shall comply with Sections 402.2.1 through 402.2.4__

Revise as follows:

[BG] ~~402.1~~ __402.2.1__ Natural ventilation. *Natural ventilation* of an occupied space shall be through windows, doors, louvers or other openings to the outdoors. The operating mechanism for such openings shall be provided with *ready access* so that the openings are readily controllable by the *building* occupants.

[BG] ~~402.2~~ __402.2.2__ Ventilation area required. The minimum openable area to the outdoors shall be 4 percent of the floor area being ventilated.

[BG] ~~402.3~~ __402.2.3__ Adjoining spaces. Where rooms and spaces without openings to the outdoors are ventilated through an adjoining room, the opening to the adjoining rooms shall be unobstructed and shall have an area not less than 8 percent of the floor area of the interior room or space, but not less than 25 square feet (2.3 m^2). The minimum openable area to the outdoors shall be based on the total floor area being ventilated.

Exception: Exterior openings required for ventilation shall be permitted to open into a thermally isolated sunroom addition or patio cover, provided that the openable area between the sunroom addition or patio cover and the interior room has an area of not less than 8 percent of the floor area of the interior room or space, but not less than 20 square feet (1.86 m^2). The minimum openable area to the outdoors shall be based on the total floor area being ventilated.

[BG] ~~402.4~~ __402.2.4__ Openings below grade. Where openings below grade provide required *natural ventilation*, the outdoor horizontal clear space measured perpendicular to the opening shall be one and one-half times the depth of the opening. The depth of the opening shall be measured from the average adjoining ground level to the bottom of the opening.

Reason: In climate zones with outdoor ambient temperature extremes, where the design professional has elected to employ natural ventilation, although in compliance with existing code language in theory, practical application and utilization of openable doors and windows as the sole source of ventilation air, is not consistently employed in practice, during months when either a heating or cooling system is conditioning an occupied space. ASHRAE 62.1, Section 6.4.1 Prescriptive Compliance Path, requires a mechanical ventilation system in conjunction with the natural ventilation. This mechanical ventilation system must comply with either section 6.2 Ventilation Rate Procedure and/or section 6.3 Indoor Air Quality Procedure of ASHRAE 62.1-2022. Under the exceptions provided to 6.4.1, IF a design professional wanted to delete the redundant mechanical system required, they must provide controls that ensure the openings are either open during times of occupancy OR are fixed as permanently open.

Consequently, 62.1-2022 section 6.4 (Natural Ventilation Procedure) provides both engineered (6.4.2) and prescriptive (6.4.1) options for compliance, which ensures proper natural ventilation despite outdoor ambient temperature and without sole reliance on openable doors and windows, absent extensive design calculations employed in the engineered method.

With the challenges faced in terms of indoor air quality, highlighted during the COVID pandemic, deficiencies in both existing and new HVAC systems became apparent. These challenges created a conflict between HVAC systems and the organic need to ventilate areas, leading to inconsistent temperature control and the decreased energy efficiency of HVAC systems. ASHRAE 62.1-2022 provides clear methods for the utilization of natural ventilation, accounting for the challenges faced during this crisis.

The PMGCAC and the BCAC recommends that the Code Correlation Committee assign a [BG] scoping to new IMC Sections 402.1 and 402.2.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held numerous virtual meetings open to any interested party. Related documents and reports are posted on the PMGCAC website at PMGCAC webpage.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Bibliography: For reference, the IBC definitions for various Group R occupancies are:

Group R-1 is multifamily (transient) such as hotels and motels.

Group R-2 is multifamily (nontransient) such as apartment buildings.

Group R-3 is for one- and two-family homes and townhouses outside the scope of the IRC, for example 4-story townhouses.

Group R-4 are assisted living facilities, group homes, etc.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$200 to $10,000

Estimated Immediate Cost Impact Justification (methodology and variables):

Due to the unlimited variations in building design, placing a predetermined dollar amount on the net cost increase of this proposal is impossible. The increase in the cost of construction is due to additional openings for the conveyance of outdoor air, meant for ventilation, required to comply with ASHRAE 62.1 2022. Smaller buildings may only need a simple mechanical ventilation system for bringing in outdoor air. As part of a planned HVAC system, the cost should be minimal. Much larger buildings would require more complex systems for bringing in outdoor air and as such the cost would be be much greater.

Estimated Life Cycle Cost Impact:

When considering the annual financial impact of Sick Building Syndrome, the COVID pandemic, annual influenza infections and other airborne illnesses which directly impacts individuals, municipalities, and corporations alike, though undefinable, the financial savings would exponentially outweigh the initial cost increase for construction.
Example 1: According to the World Economic Forum the COVID pandemic alone cost the world 11 trillion dollars for the pandemic response with an additional 10 trillion in lost earnings.

Example 2: According to the Elsevier publication *Building and Environment Journal Vol. 188* dated 1-15-21 in the US alone, the annual cost attributed to sick building syndrome in commercial workplaces is estimated at between 10 and 70 billion dollars. On average workers spend 90 percent of their time indoors while on the job.

Example 3: According to the Elsevier article dated June 22, 2018, and titled: *Economic Burden of seasonal influenza in the United States;* the total annual cost burden of seasonal influenza in the US stands at 11.2 billion dollars.

Staff Analysis: The proposed referenced standard, ASHRAE 62.1-2022 Ventilation for Acceptable Indoor Air Quality, is currently referenced in the IMC.

G140-25

IBC: 1203.1, 1203.2 (New)

Proponents: Clayton Trevillyan, representing City of Tucson (clayton.trevillyan@tucsonaz.gov); Jane Gilbert, Miami Dade County, representing Miami-Dade County (jane.gilbert@miamidade.gov); Mary Wright, Office of Heat Response and Mitigation, City of Phoenix, representing self (mary.wright@phoenix.gov); Ali Frazzini, representing Los Angeles County Chief Sustainability Office (afrazzini@cso.lacounty.gov); Pedro Quintela, Miami Dade County, representing RER (pq2@miamidade.gov)

2024 International Building Code

Revise as follows:

1203.1 ~~Equipment and systems~~ Heating systems. Interior spaces intended for human occupancy shall be provided with active or passive space heating systems capable of maintaining an indoor temperature of not less than 68°F (20°C) at a point 3 feet (914 mm) above the floor on the design heating day.

Exceptions: Space heating systems are not required for:

1. Interior spaces where the primary purpose of the space is not associated with human comfort.
2. Group F, H, S or U occupancies.

Add new text as follows:

1203.2 Cooling systems. Dwelling units and sleeping units located in Climate Zones 0, 1, 2, 3, 4, 5A, and 5B, shall be provided with cooling systems capable of maintaining an indoor temperature at or below 80°F (26.7°C) in the habitable space. Where permanently installed fans are capable of generating 120 fpm (0.6 m/s) air speed inside the habitable space, the required cooling system shall be capable of maintaining an indoor temperature at or below 85°F (29.4°C). The installation of one or more portable systems shall not be used to achieve compliance with this section.

Exceptions:

1. Cooling systems are not required for interior spaces where the primary purpose of the space is not associated with human comfort.
2. In Climate Zone 5A or 5B, where site-specific climate conditions warrant, as *approved* by the *building official.*

Reason: The building code requires minimum heating of spaces for the safety of the occupants. The code is silent on requirements for cooling, despite the negative impacts of elevated exterior thermal conditions on humans. The built environment is a safe haven from the effects of weather and climatic conditions, heat not being an exception for people to seek shelter from the elements. Media attention to heat-related health emergencies on the elderly and people in underserved communities demonstrates the need for improvements in the built environment[1]. As a result of increased summer temperatures, nearly half of heat-related deaths happen inside a person's home[3] and some jurisdictions have already mandated cooling be provided in new buildings while many others are considering extreme heat related ordinances. A coordinated application of the codes that can be consistently applied to new construction is warranted due to the trend in local agencies with differing requirements throughout the country.

This proposal is a performance specification to ensure life safety in the built environment due to higher expected summer thermal conditions. The solution can either be active or passive systems, or a combination of these systems to provide relief from elevated thermal conditions. The active systems may include traditional central mechanical air conditioning systems that are provided in most modern homes and do not represent a significant change to how most buildings are constructed. Passive cooling systems utilize unique design features of the building that prevent heat from entering the building and/or removing heat from the building. Passive design applications include building orientation, insulation, solar control (shading and landscaping), ventilation and other methods that naturally, and without input energy, would provide and maintain thermal comfort. Passive systems could be more cost effective in both the short term and the long term as compared to active mechanical systems for circumstances where a few design changes could comply with specified interior temperature. The interior temperature of 80°F was selected as the maximum temperature for the thermal comfort of the interior environment based on ANSI/ASHRAE Standard 55-2023[2] and generally at, or above the temperature in most local ordinances.

The second sentence recognizes that air movement provides a cooling effect as experienced by the occupants of the building. ASHRAE Standard 55-2023[3] states that air movement of only 120 feet per minute results in a 5°F cooling effect on the occupants within this temperature range. Where permanent fans are installed, the resulting interior maximum temperature can be increased 5°F above the baseline temperature of 80°F that would be required for either the active or passive systems installed in accordance with the first sentence of the code change proposal. This is an additional cost-effective method to provide the minimum cooling effect on human bodies where thermal comfort and safety is provided in the built environment. Permanently installed fans can include ceiling fans, wall-mounted fans, bladeless ceiling fans, or any permanently installed fan that can be verified at the time of final inspection that the equipment is installed.

The third sentence is a carryover from the heating requirement in 1203.1, where the expectation for compliance is permanently installed equipment that can be utilized by the occupant as needed for thermal comfort and lifesaving opportunities from dangerous heat related health considerations.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 - $31+ per square foot of new or renovated habitable buildings.

The immediate cost impact to construction is for newly constructed or renovated buildings. There is no immediate cost to existing buildings. This value ranges greatly depending on variables that include but are not limited to:

- If the proposed construction would include cooling regardless of this code change. Zero cost impact will apply to many regions and project scopes for new permits.
- If the project includes a system that can be further supplemented at relatively low cost due to other air handling equipment that would have otherwise been included in the project scope.
- The method of proposed cooling and quality of equipment.
- Level of efficiency and sustainability of system design.
- The climate zone of project area.

Estimated Immediate Cost Impact Justification (methodology and variables):

1. Estimation from major HVAC contractor (Watsco)

“There are a lot of variables (i.e. size of the building, type of system, region, needs, installation costs). Below are some rough estimates"

- For commercial buildings the average cost can range from $15 to $30 per sq ft for a basic system but can go up to $40+ for more complex or high efficiency systems.
- For multi-family buildings the average cost can range from $2,500-$5,000 per unit for a basic system increasing in price for high efficiency units. ($40 pf @ 2 units for 4000 sf)

Comparison necessary to isolate cost of heating systems alone (e.g. furnace/boiler systems) to identify cost differential.

2. RSMeans Data (remeansonline.com)

$8-30 per sf

IBC: 1203.1

Proponents: Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov)

2024 International Building Code

Revise as follows:

1203.1 Equipment and systems. Interior spaces intended for human occupancy shall be provided with active or passive space heating systems capable of maintaining an indoor temperature of not less than 68°F (20°C) at a point 3 feet (914 mm) above the floor on the design heating day. <u>The installation of portable space heaters shall not be used to achieve compliance with this section.</u>

Exceptions: Space heating systems are not required for:

1. Interior spaces where the primary purpose of the space is not associated with human comfort.
2. Group F, H, S or U occupancies.

Reason: ICC provision regarding internal temperature limits does not specifically prohibit use of portable space heaters, which some could misconstrue as being allowed to be used in lieu of HVAC equipment, or at the very least undersized or incorrect HVAC equipment. Reliance on portable space heaters presents fire safety, energy efficiency, internal comfort, and thermal environment issues.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact as this proposal was only adding language for cooling systems, as well as clarifying that portable equipment cannot be used to achieve temperature limits. The intent of the building code was already requiring the use of built in heating and cooling systems to achieve temperature limits, making clarification to prohibit use of portable equipment irrelevant to cost of construction.

IBC: 1204.1

Proponents: Michele Mihelic, American Institute of Architects, representing American Institute of Architects (AIA) (michelemihelic@aia.org); Dee Leclair, SSOE Group, representing AIA National Codes & Standards Committee (dleclair@ssoe.com); Robert Margarella, Mason and Hanger, representing AIA - American Institute of Architects (jonah.margarella@masonandhanger.com)

2024 International Building Code

Revise as follows:

1204.1 General. Every space intended for human occupancy shall be provided with natural light by means of exterior glazed openings in accordance with Section 1204.2 or shall be provided with artificial light in accordance with Section 1204.3. Exterior glazed openings shall open directly onto a *public way* or onto a *yard* or *court* in accordance with Section 1205.

Exception: The lighting requirements for sleeping units and sleeping rooms within dormitories shall be limited to natural light in accordance with Section 1204.2.

Attached Files

- **AIA_Proposal_IBC-Lighting-Windowless_Attach.pdf**
  https://www.cdpaccess.com/proposal/12008/35439/files/download/9250/

Reason: The proposed changes aim to ensure that all spaces intended for human occupancy, including sleeping units and dormitories, are provided with natural light. Natural light has numerous benefits, including improving occupants' health and well-being, reducing energy consumption, and enhancing the overall quality of indoor environments. By specifying the requirements for natural light and exterior glazed openings, the proposal ensures consistency and clarity in the code.

Justification: The justification for this proposal is based on the following key points:

1. **Health and Well-being:**
   - **Mental Health and Well-being:** Access to natural light has been shown to improve mental health, boost mood, and regulate circadian rhythms. This is particularly crucial in sleeping units and dormitories, where individuals spend extended periods.
   - **Physical Health:** Natural light exposure supports vitamin D synthesis, which is essential for bone health and immune function.
2. **Safety**:
   - **Enhanced Visibility:** Natural light enhances visibility in indoor spaces, reducing the risk of accidents and injuries caused by inadequate lighting.
   - **Emergency Situations:** In case of power outages or emergencies, natural light provides a reliable source of illumination, aiding in safe evacuation and reducing panic.
3. **Welfare**:
   - **Quality of Life:** Natural light contributes to a more pleasant and inviting environment, improving the overall quality of life for occupants.
   - **Productivity and Comfort:** Adequate natural lighting has been linked to increased productivity and comfort, benefiting both residential and commercial spaces.
4. **Energy Efficiency:** Natural light reduces the reliance on artificial lighting, leading to lower energy consumption and reduced carbon footprint. This aligns with sustainability goals and supports energy-efficient building practices.
5. **Code Consistency:** The proposal clarifies and standardizes the requirements for natural light in various types of spaces, ensuring that the code is easy to understand and apply. This reduces ambiguity and helps designers and builders comply with the code more effectively.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The cost impact of the proposed changes is anticipated to be minimal to moderate. While there may be initial costs associated with incorporating larger glazed areas or additional windows in new constructions or renovations, these costs are offset by the long-term benefits of improved occupant health and reduced energy consumption. Additionally, the proposal does not mandate specific types of glazing or construction methods, allowing for flexibility in achieving compliance in a cost-effective manner. About $1400, see justification below.

Estimated Immediate Cost Impact Justification (methodology and variables):

Estimated cost: 2. X 4 1/2" YES 45 TU with 1" Low E glass runs about $80.00 per sq ft installed, preliminary pricing.

Estimated sleeping unit within dormitories (larger), 250 SF, code requires min. 8% of the floor area = 20 SF x $80/SF = $1,600

Estimated sleeping unit within dormitories (smaller), 180 SF, code requires min. 8% of the floor area = 14.4 SF x $80/SF = $1,152

2024 International Building Code

SECTION 1204
LIGHTING

Revise as follows:

1204.1 General. Every space intended for human occupancy shall be provided with natural light by means of exterior glazed openings in accordance with Section 1204.2 or shall be provided with artificial light in accordance with Section 1204.3.~~ Exterior glazed openings shall open directly onto a *public way* or onto a *yard* or *court* in accordance with Section 1205.~~

Exceptions:

1. In dwelling units and sleeping units in Group R, I-1, I-2 occupancies, all living, dining, and sleeping rooms with a floor area of 70 square feet (6.5 m^2) or more shall be provided with natural light in accordance with Section 1204.2 and artificial light in accordance with Section 1204.3.
2. In Group I-4 occupancies all living and sleeping rooms for persons receiving custodial care shall be provided with natural light in accordance with Section 1204.2 and artificial light in accordance with Section 1204.3.
3. In Group E occupancies, all regular classrooms shall be provided with natural light in accordance with Section 1204.2 and artificial light in accordance with Section 1204.3.

Add new text as follows:

1204.2 Natural Light . Where required, natural light shall be provided in accordance with Section 1204.2.1, 1204.2.2, 1204.2.3, 1204.2.4, 1204.2.5 or 1204.2.6. Openings shall comply with Sections 1204.2.5 and 1204.2.6.

Revise as follows:

1204.2.1~~1204.2~~ Direct Natural light. The room shall be provided with exterior openings with a ~~minimum~~ net glazed area ~~shall be~~ of not less than 8 percent of the floor area of the room ~~served~~.

1204.2.2~~1204.2.1~~ Adjoining spaces. For the purpose of natural lighting, any room is permitted to be considered as a portion of an adjoining room where one-half of the area of the common wall is open and unobstructed and provides an opening of not less than one-tenth of the floor area of the interior room or 25 square feet (2.32 m^2), whichever is greater. The net glazed area of exterior openings shall be at least 8 percent of the aggregate floor area.

Exception: Openings required for natural light shall be permitted to open into a *sunroom* with *thermal isolation* or a patio cover where the common wall provides a glazed area of not less than one-tenth of the floor area of the interior room or 20 square feet (1.86 m^2), whichever is greater.

Add new text as follows:

1204.2.3 Remote rooms. A room without sufficient exterior openings is permitted to borrow natural lighting from an adjoining room that meets the requirements of Section 1204.2.1 if the remote room, adjoining room and exterior openings meet all of the following criteria:

1. The ceiling height in both the remote room and adjoining room shall be no less than 9 feet 4 inches (2844 mm) at the lowest point.

2. The top of the exterior glazing shall be no less than 9 feet (2743 mm) above the finished floor.
3. The opening between the remote room and the adjoining room shall be parallel to the plane of the exterior glazed openings, as near as possible to the ceiling and either:
   3.1. If open and unobstructed, shall have an area at least 8 percent of the floor area of the remote room or 25 square feet (2.32 m^2), whichever is greater.
   3.2 If equipped with transparent or translucent glazing, shall have a net glazed area at least 10 percent of the floor area of the remote room or 30 square feet (2.8 m^2), whichever is greater.
4. The remote room shall be immediately adjacent to the adjoining room.
5. The net glazed area of exterior openings shall be at least 8 percent of the aggregate floor area of the adjoining room and remote room.

1204.2.4 Residential basements. Where at least 40 percent of the net floor area of a Group R *dwelling unit*, not used as *congregate living facilities*, is located entirely above grade and provided with natural light in accordance with Section 1204.2.1 or 1204.2.2, *basement* spaces shall be provided with natural light as follows:

1. Bedrooms shall have exterior openings with a net glazed area of at least 6 percent of the floor area of the room.
2. For *habitable* spaces other than bedrooms, the *basement* level, as a whole, shall be provided with exterior openings with a net glazed area of at least 4 percent of the aggregate floor area of all *habitable* spaces in the basement.

1204.2.5 Exterior openings. Exterior openings required by Section 1204.2 for natural light shall open directly onto a *public way*, *yard* or *court*, as set forth in Section 1205.

Exceptions:

1. Required exterior openings are permitted to open into a roofed porch or exterior balcony where the roofed porch or exterior balcony meets all of the following criteria:
   1.1. Abuts a *public way*, *yard* or *court* complying with Section 1205.
   1.2. Has a ceiling height of not less than 7 feet (2134 mm).
   1.3. Has a longer side, parallel to the plane of the openings, at least 65 percent open and unobstructed from finished floor to underside of surface above.
2. Skylights are not required to open directly onto a *public way*, *yard* or *court*.

1204.2.6 Openings below grade. Where openings below grade are used to provide required natural light, the outside horizontal clear space measured perpendicular to the opening shall be one and one-half times the depth of the opening. The depth of the opening shall be measured from the average adjoining ground level to the bottom of the opening.

1204.3 Artificial light. Artificial light shall be provided that is adequate to provide an average illumination of 10 footcandles (107 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.

1204.4 Stairway illumination. *Stairways* within *dwelling units* and *exterior stairways* serving a *dwelling unit* shall have an illumination level on tread runs of not less than 1 footcandle (11 lux). *Stairways* in other occupancies shall be governed by Chapter 10.

  https://www.cdpaccess.com/proposal/11447/35152/files/download/8825/

Reason: The surprising allowance of windowless rooms in the IBC (International Building Code) is indefensible, considering the decades of informative empirical and scientific studies by medical, neuroscience and psychology experts that prove the importance of windows for daylight and outside views for occupants, particularly in small, confined spaces.

Lisa Heschong, a renowned specialist and author on the importance of daylight in our lives, emphasizes "that access to natural light, outdoor or indoor, should be a human right." As a result of the surmounting supporting evidence, she is advocating for the World Health Organization (WHO) to include daylight as a key component of human health along with *clean air, clean water, nutritious food and safe shelter.*

Whether it is the effect of daylight throughout the day, long term observation or casual occasional glances to nature, the sky, the urban environment, or simply the sense of spatial extension from confined rooms, the application of a window has sufficient scientific support to confirm that it provides essential ingredients for mental, physical health, social and economic benefits for occupants.

The reasons to advocate for the redefinition of the code are based on empirical and scientific evidence gathered over several decades. The reasons are summarized as follows:

1. Health and Wellbeing:

- **Physical Health**: Daylight assists in regulating circadian rhythms, developing better sleep patterns and overall health. It also aids in Vitamin D synthesis, which is crucial for immune function, bone health, and preventing diseases such as cardiovascular issues and certain cancers.
- **Mental Health**: Exposure to natural light reduces the risk of depression, anxiety, and Seasonal Affective Disorder (SAD). It enhances the mood and provides a strong sense of well-being.

2. Psychological Benefits:

- **Restorative Effects**: Views of nature and daylight have been proven to reduce stress and mental fatigue. The psychological benefits show dramatic increases in alertness, mood and perception of quality of life.

- **Connection to Nature**: Windows that provide views of the outside world allow for a connection with nature, which in turn creates a sense of escape and minimizes feelings of confinement and claustrophobia. “It's not what comes in the window, it’s what goes out the window. Windows provides access to external reality, but they also provide escape from the inescapable reality of confinement. Inhabitants of enclosed spaces need that opportunity.”[1]

3. Cognitive and Productivity Benefits:

- **Enhanced Performance**: Natural light boosts cognitive function and productivity. It improves concentration, decision-making, and overall performance in work and study environments.
- **Improved Sleep Quality**: Proper exposure to daylight helps regulate sleep cycles, leading to better sleep quality and morning alertness, which in turn enhances daytime productivity and cognitive functions.

4. Economic Benefits:

- **Increased Productivity**: Occupants in well-lit environments, especially when accompanied by natural views reveal higher levels of productivity, positivity and engagement, hence improving overall performance.

5. Sustainability Benefits:

- **Energy Savings**: Utilizing natural light reduces the need for artificial lighting, resulting in significant energy savings and accumulatively reduces burden on the national power grids.
- **Reduction of the carbon footprint**: On a national level, the accumulative effect of reducing energy consumption across all these windowless bedrooms will have a profound effect in the fight against climate change.

6. Social and Community Impact:

- **Urban Sustainability**: Implementing a compact city model should not come at any cost. Sustainable compact and energy efficient development will create a new set of social and health related problems if minimum standards for quality of life in our buildings and neighborhoods are not upheld. Incorporating daylight into building designs promotes urban sustainability by enhancing the quality of life and supporting energy-efficient practices.
- **Inclusive Design**: Generally, windowless bedrooms affect lower income citizens due to the cost saving, low-rent and high profit benefits for developers. Ensuring access to natural light in bedroom spaces supports social inclusivity, contributing to healthier, more equitable communities.

7. Relevant Precedents:

- **Existing US Precedents:** Chicago, Washington DC and Austin have amended the IBC in their jurisdiction to prevent the construction of windowless rooms. New York City, the densest city in the country, has its own code that does not allow windowless rooms based on historical empirical evidence. This requested change will change the base code nationally, so other cities will not need to do it individually.
- **Existing International Precedent:** Windowless rooms are banned in city codes from dense cities like Madrid, Barcelona, Mumbai, and Mexico City and in codes that regulate the construction industry in entire countries as diverse as China to Paraguay. The requested change will align the IBC with codes worldwide on this requirement.

Please refer to Appendix A attached to this statement to review all articles authored by Juan Miro and additionally citations of the articles in other publications.

Please refer to Appendix B attached to this statement to see the impact of the minimum glazed area requirements between cities that have banned windowless rooms in comparison to the current IBC code.

Please refer to Appendix C attached to this statement to observe few selected samples of existing windowless rooms for privately developed student housing near the University of Texas in Austin, TX.

Please refer to Appendix D attached to this statement for reference to testimonials from various students and citizens who have discovered the existence of windowless rooms.

Please refer to Appendix E attached to this statement for reference to letters from organizations, students and professors addressing the issue of windowless rooms.

The submitted code change for IBC is for Chapter 12- Interior Environment, Section 1204 – Lighting. The proposed language for the code change matches the code change text used in the '*2019 Chicago Building Code with revised April 2022 Supplement*'. This Chicago version of the amendments applies to the following occupancies that is recommended to be applied to the IBC:

- Group R occupancies: includes sub-groups R-1, R-2, R-3
- Group I-1 occupancies
- Group I-2 occupancies
- Group I-4 occupancies
- Group E occupancies

We have an opportunity to correct disastrous loopholes in our building codes to provide healthy living conditions for everyone of all classes and age groups. It is at the core of our responsibilities as architects to consider and provide the minimum essential quality of space for individuals and families to have the opportunity to have a dignified quality of life in their living and working environments.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Changing building codes to cancel windowless bedrooms would have several varied tangible and intangible cost impacts in construction, real estate development and socio-economic factors as outlined below:

Economic and Social Impacts:

1. **Improved Health and Wellbeing**: Access to natural light is scientifically proven to improve mental and physical health, potentially reducing healthcare costs as per the many supporting empirical and scientific evidence.

   The case study of the most recent code change in Austin to end the application of windowless rooms for student housing is the latest example of a city trying to protect it citizens. There are several supporting documentations included in this change request that highlight the importance of this issue in Austin.

2. **Enhanced Productivity**: Better-lit living and working spaces will enhance productivity and quality of life, that will have an indirect yet sizeable improvement to economic growth.
3. **Sustainability Benefits**: Increased use of natural light reduces reliance on artificial lighting, which will reduce energy savings, enhance environmental sustainability (reduce carbon footprint) via the building life cycle, and overall assist in fight against climate change.
4. **Social benefit of protection**: Protection of the most vulnerable citizens of society who are most likely to endure windowless rooms: low-income citizens, single mothers, students in dorms of higher education, children in schools, senior citizens, refugees and people with mental health issues.

Real Estate Development Costs:

1. **Higher Development Costs**: A bulky building with rooms without windows costs less that a building where all living spaces have windows. The reason is that with interior rooms away from the facade, a building can capture more interior space with a smaller ratio of exterior walls, which are more expensive to build than interior walls. So, when given the chance, developers have been quietly building bulky buildings for student's housing in Austin for as long as they have been able to because student housing is very profitable. Developers are cutting corners to save money where it should not be permitted in the first place. In the case of Austin, these construction cost savings have not resulted in rent reductions for students compared to buildings outside West Campus.

   In Austin's council meetings where the issue of windowless rooms has been discussed, no developer has defended the construction of windowless rooms. They simply have quietly taken advantage of building these types of rooms for as long as the code has allowed. The reason there is minimal support in favor of such in-humane conditions is that having windows in all living spaces is common sense.

2. **Market Value Impact:** Home and apartments with natural light and views are more desirable, increasing market value.
3. **Long-Term Savings**: While bulky buildings with windowless rooms may be cheaper to build than 'normal' buildings with windows, the occupant's health benefits will lead to more desirable buildings and therefore, long-term value for tenants and/or homeowners.

G143-25

G144-25

IBC: 1204.1.1 (New), 1204.3

Proponents: Nicholas Resetar, representing Glazing Industry Code Committee (nresetar@ralaw.com); Thom Zaremba, Roetzel & Andress, representing National Glass Association (tzaremba@ralaw.com); Thomas Culp, Birch Point Consulting LLC, representing Aluminum Extruders Council (culp@birchpointconsulting.com)

2024 International Building Code

1204.1 General. Every space intended for human occupancy shall be provided with natural light by means of exterior glazed openings in accordance with Section 1204.2 or shall be provided with artificial light in accordance with Section 1204.3. Exterior glazed openings shall open directly onto a *public way* or onto a *yard* or *court* in accordance with Section 1205.

Add new text as follows:

1204.1.1 Classrooms. In Group E occupancies, not less than 50 percent of all classrooms shall be provided with both natural light in accordance with Section 1204.2 and artificial light in accordance with Section 1204.3.

Exceptions:

1. Day care facilities within a different primary occupancy are not required to comply with this section.

2. Existing buildings undergoing *alterations* or a change of occupancy are not required to comply with this section.

Revise as follows:

1204.3 Artificial light. Artificial light shall be provided that is adequate to provide an average illumination of not less than 10 footcandles (107 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.

Reason: The lighting requirements of Section 1204.1 are acceptable for most occupancies. However, classrooms in Group E-Occupancies are
different from any other Occupancy type. Classrooms in E-Occupancies are used primarily for teaching children. During the long hours they spend
in classrooms, children are not only learning, but their brains and psychological makeups are developing. To maximize their learning and growth
potentials, children need natural daylight in classrooms where they are growing and being taught. For example, one study conducted over a one year
period found that both testing and behavioral outcomes are markedly improved when classrooms use natural light. It found that children in
classrooms with natural daylighting progressed 20% faster on math testing and 26% faster on reading testing. The research also found that
classrooms that provided students with greater amounts of natural light correlated to a 15% to 23% overall improvement in academic outcomes.
Research clearly shows that children in classrooms need natural daylight for optimal development and performance. The adoption of this proposal
will ensure that children attending class in our schools will have the best possible opportunity to grow and develop in classrooms lit by the natural
light of the sun.

In the 2019 Group A and 2022 Group B development cycles, similar proposals was brought forward. While the committees and governmental vote were supportive of the concept, the proposals
were ultimately unsuccessful. This proposal is different from these proposals. First and foremost, since it is unlikely that all
classrooms can be located on exterior walls where natural daylight is easily accessed, this proposal limits its natural daylighting mandate to 50% of
classrooms. Second, this proposal does not include I-4 Occupancies. Third, this proposal clarifies that this proposal only applies to newly constructed educational buildings and does not seek and/or intend to displace
the use of artificial light.

Finally, the modified code language clarifies that it does not apply to daycare facilities within other building types such an office building, and that it
would not apply to existing buildings or reconfigured spaces. As shown in the table below, the intended application is for new stand-alone
educational buildings. Furthermore, only requiring compliance for 50% of classrooms provides the necessary flexibility for spaces such as music rooms, shops, and gyms.

Example - **Covered?**

New stand-alone school building - Yes
New stand-alone daycare building - Yes
Existing buildings and reconfigurations - No
Training center / tutoring center in an office building or strip mall (classified as Group B) - No
Classroom in church (classified as Group A-3) - No
Daycare in church (classified as Group A-3) - No
Daycare in office building (primary occupancy is Group B) - No
Daycare in home or apartment complex (primary occupancy is Group R) - No

Benefit, and Mercury Emissions Reduction Using Heliodon for Physical Modeling" - https://repository.rit.edu/theses/9699/

Cost Impact: Increase

Estimated Immediate Cost Impact:

The net effect of the public comment and code change proposal will increase the cost of construction. Classrooms already in compliance would cost $0.00. To add one window in order to bring to compliance would cost approximately $500.00 per unit.

Estimated Immediate Cost Impact Justification (methodology and variables):

The code change proposal will nominally increase the cost of construction in the event glazing and/or glass construction materials are more costly than the alternative.

Estimated Life Cycle Cost Impact:

School operating costs will decrease with decreased teacher and employee absenteeism, decreased employee health care costs, and increased teacher retention. Societal and community costs will decrease with increased student performance and outcomes.

G144-25

G145-25

IBC: 1206.1

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Building Code

SECTION 1206
SOUND TRANSMISSION

1206.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent *dwelling units* and *sleeping units* or between *dwelling units* and *sleeping units* and adjacent public areas.

Exception: *Sleeping units* in Group I-2 are not required to comply with this section.

Reason: For Group R and I-1, there are separation requirements in Section 420 that have the walls extend to the roof deck above. Group I-2, nursing homes and hospitals do not have rated corridors or unit separations. So asking them to extend the separate wall to the ceiling for sound transmission would be additional costs.

There are FGI and privacy concerns that will address sound transmission/masking in patient care area, including the sleeping units, in hospitals and nursing homes. To avoid conflicts, these facilities should not be held to the same criteria as apartment buildings.

FGI provides a higher standard for sound isolation between 35 and 60 STC, and is adopted in over 44 states (ranging from 1996 to 2022 editions). https://fgiguidelines.org/guidelines/adoption-map/#:~:text=The%20data%20on%20state%20adoption,adopted%20only%20the%20HVAC%20requirements.

However, this standard is not in mandatory language or developed through the ANSI process, so it cannot be referenced in the codes as a requirement.

This proposal is submitted by the ICC Committee for Healthcare (CHC).

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is to avoid conflicts. Since this is already required for licensure, there will be no increase in the cost of construction.

G145-25

G146-25

IBC: SECTION 1206, 1206.1, 1206.2, 1206.2.1 (New), 1206.2.2 (New)

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

SECTION 1206
SOUND TRANSMISSION

1206.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent *dwelling units* and *sleeping units* or between *dwelling units* and *sleeping units* and adjacent public areas.

Revise as follows:

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50 where tested in accordance with ASTM E90, or have a Normalized Noise Isolation Class (NNIC) rating of not less than 45 if field tested, in accordance with ASTM E336 for airborne noise. ~~Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Engineering analysis shall be performed by a *registered design professional*. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.~~

Exception: Entrance doors that are tight fitting to the frame and sill are not required to comply with this section.

Add new text as follows:

1206.2.1 Engineering basis. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Engineering analysis shall be performed by a *registered design professional*.

1206.2.2 Penetrations. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings.

Reason: There are no technical change. The current text has too much information in one section. This proposal separates the requirements. The last sentence is an exception, so it is stated as such.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is editorial. There are no changes in requirements.

G147-25

IBC: 1206.3 (New)

Proponents: Oleg Bulshteyn, representing a resident of a multifamily building with poor sound insulation (olegbulshteyn@hotmail.com)

2021 International Building Code

SECTION 1206
SOUND TRANSMISSION

1206.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent *dwelling units* and *sleeping units* or between *dwelling units* and *sleeping units* and adjacent public areas.

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50 where tested in accordance with ASTM E90, or have a Normalized Noise Isolation Class (NNIC) rating of not less than 45 if field tested, in accordance with ASTM E336 for airborne noise. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

Add new text as follows:

1206.3 Structure-borne sound. The impact insulation class of floor-ceiling assemblies shall be field tested after the building is constructed to make sure that the building meets the code impact sound insulation requirement.

Reason: According to National Multifamily Housing Council (www.nmhc.org), noise has been identified as a major issue by residents of multifamily residential buildings. In addition, according to Alexandria, VA Office of Housing, noise transmission is one of the biggest issues for renters in multifamily buildings. The problem is worst in buildings constructed of wood above concrete podiums, and better in steel and concrete high rises. Finally, thousands of resident reviews are available on the internet citing poor sound insulation of multifamily residential buildings including those recently constructed. Some of these reviews have been included as the attachments.It might increase cost in the form of testing somewhat, but we are talking about the quality of life issue here. The existing building codes/construction techniques do not seem to result in the adequate level of the sound insulation in multifamily buildings, which is evident by the thousands of noise-related complaints.

Bibliography: 9_2_2 Rawlings_S_Magee_J.pdf (veneklasenresearchfoundation.org)
Soundproofing Techniques (nhcsi.org)
NMHC | Innovation Challenge Finalists Selected
How to Complain About Apartment Noise Successfully - Noise Free America: A Coalition to Promote Quiet
Microsoft Word - Noise and Sound Control at Your Home.docx (inceusa.org)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The field testing will have no impact directly on the cost of construction since the test is after construction is completed.

G147-25

G148-25

IBC: 1208.2

Proponents: Charles Moore, representing Framery (charles.moore@frameryacoustics.com)

2024 International Building Code

Revise as follows:

1208.2 Minimum ceiling heights. *Occupiable spaces*, *habitable spaces* and corridors shall have a ceiling height of not less than 7 feet 6 inches (2286 mm) above the finished floor. Bathrooms, toilet rooms, kitchens, storage rooms and laundry rooms shall have a ceiling height of not less than 7 feet (2134 mm) above the finished floor.

Exceptions:

1. In one- and two-family *dwellings*, beams or girders spaced not less than 4 feet (1219 mm) on center shall be permitted to project not more than 6 inches (152 mm) below the required ceiling height.
2. If any room in a *building* has a sloped ceiling, the prescribed ceiling height for the room is required in one-half the area thereof. Any portion of the room measuring less than 5 feet (1524 mm) from the finished floor to the ceiling shall not be included in any computation of the minimum area thereof.
3. The height of *mezzanines* and spaces below *mezzanines* shall be in accordance with Section 505.2.
4. Corridors contained within a *dwelling unit* or *sleeping unit* in a Group R occupancy shall have a ceiling height of not less than 7 feet (2134 mm) above the finished floor.
5. Modular rooms, acoustic pods, enclosed furniture, lactation rooms and other temporarily occupied spaces used in Group B Occupancy.

Reason:

Modular Rooms, Acoustic Pods, Enclosed Furniture, Location Rooms and other temporarily occupied spaces used in Group B Occupancy should be exempt from the Interior Heights of 1208.2.

With the rise of open-office environments and the growing popularity of phone and video conferences, it becomes increasingly important to provide acoustically isolated spaces for employees to use. These can be part of the built environment as small rooms, but most often these have very problematic HVAC and ventilation issues and the sound isolation is very poor. Modular pre-built structures can be purpose built to address these issues and offer a much better working environment with improved lighting and ventilation over the Interior Space that it is located within.

The current IBC doesn't have an ideal way to handle these modular pre-built temporarily occupied spaces. When you try to apply the building code to these unique spaces, there are conflicting requirements. These should not extend to the ceiling, and the tops of these must be 18in below sprinklers to allow for proper sprinkler deployment. While at the same time if they must meet interior height requirements, you now must have a very tall interior space in order to satisfy both requirements.

I believe that these meet the intent of the code by providing a quiet and comfortable space for a defined function. The spaces are also completely voluntary, meaning that if anyone would be uncomfortable using this space, they can simply exit the "temporarily occupied space" This is quite different from a bathroom or kitchen or other Occupiable space which is necessary and required in the office environment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This would have no impact on the cost of construction. This would allow the use of Acoustic Pods and other modular pre-built "utility spaces" or "temporarily occupied spaces" to be used without being restricted by the interior height requirements of 1208.2 which is not applicable to these voluntarily used spaces.

G149-25

IBC: 1211.1

Proponents: Jonathan Roberts, representing UL Solutions (jonathan.roberts@ul.com)

2024 International Building Code

SECTION 1211
UV GERMICIDAL IRRADIATION SYSTEMS

Revise as follows:

1211.1 General. ~~Where~~ ~~ultraviolet~~ Ultraviolet (UV) germicidal irradiation systems and equipment shall comply with one of the following:

1. ~~are~~ Where provided in rooms, they shall be *listed* and *labeled* in accordance with UL 8802 and installed in accordance with their listing and the manufacturer's instructions.
2. Where installed in air ducts, plenums, or within the enclosures of heating and cooling equipment, they shall be installed in accordance with the *International Mechanical Code*.

Reason: The product standards and installation requirements are different for HVAC-related UV germicidal systems and equipment. UL 8802 is for both systems and equipment which are within an occupiable space where there is the potential for exposure to occupants. Germicidal systems and equipment that are part of the HVAC system or HVAC equipment are not within the scope of UL 8802 and are installed in mechanical spaces and have requirements focused on exposure during servicing or maintenance, thus users are directed to the IMC for the appropriate standard (UL 60335-2-40) and other requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal does not introduce new requirements, but merely clarifies the requirements that are applicable to both types of ultraviolet (UV) germicidal irradiation systems.

G149-25

G150-25

2024 International Building Code

SECTION 2703
LIGHTNING PROTECTION SYSTEMS

Revise as follows:

2703.1 General. ~~Where provided, lightning~~ Lightning protection systems shall comply with Sections 2703.2 through 2703.3.

2703.2 Installation. Lightning protection systems shall be installed in accordance with NFPA 780 or UL 96A. UL 96A shall not be utilized for *buildings* used for the production, handling or storage of ammunition, *explosives*, *flammable liquids, flammable gases* or other *explosive* ingredients including dust.

2703.2.1 Surge protection. Where lightning protection systems are installed, surge protection ~~protective devices~~ shall also be installed in accordance with NFPA 70 and either NFPA 780 or UL 96A, as applicable.

Add new text as follows:

2703.2.2 Where required. Lightning protection systems shall be installed on each building and structure assigned a risk category III or IV in accordance with Table 1604.5.

> **Exception:** Lightning protection systems shall not be required for any building or structure where determined to be unnecessary by evaluation using the Lightning Risk Assessment in NFPA 780 or an *approved* alternative method.

2703.3 Interconnection of systems. All lightning protection systems on a *building* or *structure* shall be interconnected in accordance with NFPA 780 or UL 96A, as applicable.

Reason: This proposal has two objectives. The first is to make two editorial revisions to the existing language for clarity and technical accuracy. The qualifier “where provided” in 2703.1 is unnecessary. In 2703.2, “surge protective device” is changed to just “surge protection” as both NFPA 70 and NFPA 780 require or permit surge protection in the form of surge arrestors, surge-protective devices, and surge protectors. All three may be required depending on the voltage classes present at the building or structure being protected:

- Type 1 or Type 2 listed surge-protective devices (SPDs) are required to be permanently installed on premises wiring systems operating at 1,000 volts or less
- Surge arresters are required to be permanently installed on circuits, equipment, or systems operating over 1,000 volts
- Listed surge protectors are required to be permanently installed for signal, data, and communication systems

The second objective, in a new 2703.2.2, is to mandate the installation of lightning and surge protection systems on buildings or structures that:

1. represent a substantial hazard to human life in the event of failure
2. have been designated as essential facilities and buildings where loss of function represents a substantial hazard to occupants or users

Lightning is one the largest contributors to building fire in the US and abroad. During the five-year-period of 2007-2011, NFPA estimates that U.S. local fire departments responded to an estimated average of 22,600 fires started by lightning per year. These fires caused an estimated average of nine civilian deaths, 53 civilian injuries and $451 million in direct property damage per year. These estimates are based on data from the U.S. Fire Administration (USFA) National Fire Incident Reporting System (NFIRS) and the National Fire Protection Association (NFPA) annual fire department experience survey. Lightning-caused fires, structural damage, and other losses are one of the most common troubles faced by American business today. A Carnegie-Mellon study showed that 33% of U.S. businesses are affected by lightning and that more businesses are negatively impacted by lightning storms than by floods, fires, explosions, hurricanes, earthquakes, and violence. Insured losses on property in the U.S. can exceed $5 billion dollars annually from lightning alone. According to the Insurance Information Institute, lightning fires in non-residential properties caused an average of $108 million in direct property damage each year from 2007 to 2011. The average annual damage in non-residential properties includes: $28 million in storage facilities, $22 million in places of assembly, such as houses of worship and restaurants, $19 million in nonhome residential properties such as hotels and motels, $15 million in mercantile and business properties such as offices, specialty shops and department stores, $15 million in industrial and manufacturing facilities, $3 million in outside properties, $3 million in educational and healthcare facilities, and $3 million in miscellaneous properties. These stats only take into account the insured losses reported and do not include uninsured losses, lost productivity, lost sales, lost inventory, and other considerable factors.

4. “Facts + Statistics: Lightning”, Insurance Information Group

Cost Impact: Increase

Estimated Immediate Cost Impact:

The code change proposal will increase the cost of construction for risk category III and IV buildings and structures where the NFPA 780 lightning risk assessment recommends protection. The average cost of a complete lightning protection system, including design, materials, installation, and maintenance is less than 1% up to 3% of total construction cost of a building, whereas the average cost to renovate a building with lightning protection after completion of construction is approximately 10 times that of a new building under construction. The cost of the lightning protection system can be off set as much as 80% by insurance premium rate deductions and rebates. Lightning risk assessment calculations are readily available online, for free, and takes approximately 15-25 minutes to complete.

Based on the installation cost study link below, the national average 2015 costs for lightning protection on a low rise building would be $0.65/sf of roof area using aluminum, and a 5 story building would be $1.44/sf of roof area (slightly higher cost for copper)

Estimated Immediate Cost Impact Justification (methodology and variables):

A comprehensive lightning protection installation cost study can be reviewed here: https://ecle.biz/coststudy/.

Estimated Life Cycle Cost Impact:

2024 International Building Code

SECTION 2703
LIGHTNING PROTECTION SYSTEMS

2703.1 General. Where provided, lightning protection systems shall comply with Sections 2703.2 through 2703.3.

Revise as follows:

2703.2 Installation. Lightning protection systems shall be installed <u>by one of the following methods:</u>

1. <u>In</u> ~~in~~ accordance with NFPA 780 or UL 96A. UL 96A shall not be utilized for *buildings* used for the production, handling or storage of ammunition, *explosives*, *flammable liquids, flammable gases* or other *explosive* ingredients including dust.
2. <u>Listed and labeled in accordance with NF C 17-102 and the manufacturers installation instructions.</u>

2703.2.1 Surge protection. Where lightning protection systems are installed, surge protective devices shall also be installed in accordance with NFPA 70<u>, or</u> ~~and~~ either NFPA 780 or UL 96A, as applicable.

2703.3 Interconnection of systems. All lightning protection systems on a *building* or *structure* shall be interconnected in accordance with <u>NFPA 70, or either</u> NFPA 780 or UL 96A, as applicable.

Add new standard(s) as follows:

AFNOR

French Standardization Association (AFNOR Group)
11 rue Francis de Pressense
Saint-Denis, 93210
France

<u>NF C 17-102 - 2011 (Reaffirmed 2016)</u> <u>Early Streamer Emission Lightning Protection Systems Standard</u>

Reason: Last code cycle, a new section on lightning protection systems were added to the IBC. There was a proposal (G175-21) to require said systems that was disapproved whereas a proposal (G176-21) to not require them, but to provide criteria if one wants to add a lightning system was approved. In the committee reasoning for the disapproval of G175-21, "the committee felt that this system should be applied by choice, and not as a building requirement". Whereas the committees reasoning for the approval of G176-21 stated that they "felt that this provided direction and criteria if you wanted to add a lightning protection system."

Unfortunately, what the committee did not hear was that there are different types of lightning protection systems and the language adopted in Section 2703 could be inferred as only allowing certain types of systems. There are different types of lightning protection systems available, each with their own standards, and a consumer should be able to choose which type they want installed. That occurs today, where both a Franklin Rod system and an Early Streamer Emission (ESE) system can be installed.

These two lightning protection systems are not totally different. Both use the same specifications for conductors, earthing terminations, equipotential bonding and surge protection devices. Where they differ is the type of rods used. It is also not unusual to mix both systems on a site or large building.

ESE systems have been installed in the United States and around the world for over forty years, with more than a million installed worldwide, including thousands in the United States with high profile projects. ESE systems are installed on hotels, college and professional sports venues, manufacturing facilities and office buildings, among other types of buildings and facilities, across the country and worldwide.

Each lightning protection system method provides solutions for unique applications around the world. One or the other may be more suitable for a specific project. For example, ESE rods might be more suitable for large premises whereas some highly electromagnetic sensitive premises may require a Franklin Rod system to provide a maximum number of conductors and earthing terminations.

In many countries it is up to the engineers and installers to choose the lighting protection system technology that is appropriate for the project. The type chosen, leads the engineer/installer to the appropriate standard that must be followed. For example, in many countries the Franklin Rod Systems must follow the IEC 62 305 series 1 to 4 (identical to NFPA 780) and Early Streamer Emission Systems must follow the NF C 17-102 standard.

The IBC should also allow engineers and installers to determine which system is more suitable for their projects, depending on its specification. Then, based on what type of system is installed, the code should require it to follow the appropriate standard. This proposal aims to make it clear that a choice remains, and like proposal G176-21, is intended to ensure whichever system is installed, it must follow installation guidelines.

Specifically, this proposal provides for the use of the NF C 17-102 Standard that provides guidelines for the design and installation of early streamer emission lightning protection systems. This standard was developed by AFNOR, which is the French Standards Development Organization similar to ANSI here in the United States. Like ANSI, AFNOR has various technical committees that develop standards with a consensus based approach. NF C 17-102 was first published in 1995 and then updated and replaced by the 2011 edition. AFNOR reaffirmed the NF C 17-102 Standard in 2016.

Many of the ESE systems installed in the United States and that use the NF C 17-102 standard have also been certified by a nationally recognized testing laboratory. This proposal ensures that all systems that use the NF C 17-102 be listed and labeled so to ensure certification occurs.

The proposal also provides clarity that when addressing surge protection and interconnection of systems, one can use NFPA 70, NFPA 780 or UL96A, as all three provide proper installation guidelines.

In summary, the proposal ensures all types of lightning systems can be used if they follow a set of guidelines; thereby clarifying and improving the language as it was originally adopted in the IBC. This will ensure the I-codes do not box out a type of lightning protection system that has been in the marketplace for decades. The original intent of the language, to not require lightning protection systems, but when one is installed, ensure it meets certain requirements, remains intact.

Bibliography: NF C 17-102-2011, Early Streamer Emission Lightning Protection Standard, AFNOR Group

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply clarifies all the methods available if installing a lightning protection system.

Staff Analysis: A review of the standard proposed for inclusion in the code, NFC 17-102:2011 Early Streamer Emission Lightning Protection Systems, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

G151-25

G152-25

IBC: 2703.4 (New)

Proponents: Jonathan Roberts, representing UL Solutions (jonathan.roberts@ul.com)

2024 International Building Code

SECTION 2703
LIGHTNING PROTECTION SYSTEMS

Add new text as follows:

2703.4 Inspection of system. Where required by the building official, compliance of the completed installation with NFPA 780 or UL 96A shall be documented by a certificate of inspection furnished by an approved agency based on a physical on-site inspection.

Reason: This proposal is consistent with NFPA 780, 1.5.3 which requires the completed lightning protection system to be certified through a physical on-site inspection by a qualified and impartial organization acceptable to the authority having jurisdiction. The phrase “certificate of inspection furnished by an approved agency” is used in several other locations in the IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These inspections are already taking place at the request of building officials this proposal provides verification of the inspection process and compliance with the standards.

G152-25

G153-25

IBC: SECTION 2703 (New), 2703.1 (New), 2703.2 (New)

Proponents: Michael Anthony, Standards Michigan, LLC, representing IEEE Education & Healthcare Facilities Committee (maanthon@umich.edu)

2024 International Building Code

Add new text as follows:

SECTION 2703 PERFORMANCE-BASED BUILDING PREMISE WIRING DESIGN FOR NON-EMERGENCY FEEDER CIRCUITS.

2703.1 Genaral. Feeder circuits identified in the NFPA 70 shall be permitted to be sized based on demonstrated load provided that sizing calculations are performed by a qualified person, as determined by the regulatory authority having jurisdiction.

2703.2 Demonstrated load. The demonstrated load shall be the historical maximum demand watt information recorded over at least a 24-month period for the same type of facility as the one in question, equated to watts per m^2.

Reason: We present this concept to the ICC community fully aware that it may be perceived as 'outside ICC jurisdiction' and will receive a smart rejection.. Our intent is to raise awareness of an ongoing discussion that began at the University of Michigan as far back as 1999. Electrical professionals there observed that at least half of our building's interior distribution transformers (numbering in the thousands across nearly 50 million square feet) were seldom loaded above 20 percent of their kVA rating throughout their lifecycle. The application of LED illumination and variable speed drives accelerated the downward trend.

We have authored multiple IEEE technical papers on this subject. We maintain collaboration with fellow design engineers (experts at NFPA and in the consulting industry) to narrow the gap between design load and observed load. More detail is found in the link below:

[Additional information: https://standardsmichigan.com/ibc-chapter-27-proposal/]

The proposed text is intended to be a placeholder. It closely mirrors the Canadian Electrical Code, which allows performance-based design discretion in sizing building interior power chains. By contrast, NEC wiring design is prescriptive, aligning with NFPA's primary mission of advancing fire safety.

Oversized power chains contribute to waste in customer-owned transformers, service panels, enclosure metal, architectural space for service rooms and switchgear, ventilation systems, sheet metal in ceiling plenums, air flow motors, illumination, egress entrance design, and more.

NFPA's own electrical experts acknowledge this issue. Despite research projects sponsored by its Research Foundation to inform technical committee members, proposals to reduce material and energy waste are routinely rejected by 'vertical incumbents'— manufacturers, testing labs, insurance, inspection entities— who benefit economically from oversized building power chains.

In summary, while NFPA has been supportive and respectful of user interests (building owners), the link provided presents more significant technical substantiation, and is respectful of the balance NFPA must maintain with other constituencies .

This proposal, at the very least, aims to broaden awareness of this obvious cost-saving opportunity. We want to find a home for it in any of the dominant standards catalogs that inform safe and sustainable building construction (e,g, ICC, NFPA, ASHRAE, IEEE, NECA, NEMA, etc.)

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Since the electrical power chain typically accounts for about 20% of a building's initial cost, this proposal enables the electrical engineer to design a power chain that has the practical effect of reducing those costs by an additional 20%. It also provides energy savings through reduced material usage and heat losses over the building's entire lifecycle. For billion dollar projects, this could be a potential cost savings of $900,000 to $1,750,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal will reduce immediate cost and life cycle cost of a building by permitting designers to specify electrical closets, wires, conduit, transformers, cooling networks and related power chain elements between **load** side of the electric service and the receptacle and lighting branch circuit networks according to historical, observed and projected electrical demand profile of nearly every occupancy class typically found on an educational settlement.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

3001.2 Elevator emergency communication systems. An elevator emergency two-way communication system that includes both visual and audible communication modes complying with the requirements in ASME A17.1/CSA B44 <u>or ISO 8100-1</u> shall be provided in each elevator car. The system shall provide a means to enable authorized personnel to verify:

1. The presence of someone in the car.
2. That the person(s) is trapped.

Once an entrapment is verified, the system shall enable authorized personnel to:

1. Determine if assistance is needed.
2. Communicate when help is on the way.
3. Communicate when help arrives on site.

Exception: If the elevator standard used does not include a requirement for two-way visual communication, then the interior of the elevator cabin shall include a sign with a phone number that can accept text messages, along with a unique identifier for occupants to identify their elevator car.

TABLE 3001.3 ELEVATORS AND CONVEYING SYSTEMS AND COMPONENTS

TYPE	STANDARD
Automotive lifts	ALI ALCTV
Belt manlifts	ASME A90.1
Conveyors and related equipment	ASME B20.1
Elevators, escalators, dumbwaiters, moving walks, material lifts	ASME A17.1/CSA B44, ASME A17.7/CSA B44.7; <u>or ISO 8100-1, ISO 8100-2</u>
Industrial scissor lifts	ANSI MH29.1
Platform lifts, stairway chairlifts, wheelchair lifts	ASME A18.1

3001.5 Change in use. A change in use of an elevator from freight to passenger, passenger to freight, or from one freight class to another freight class shall comply with Section 8.7 of ASME A17.1/CSA B44 <u>or both ISO 8100-1: Annex C and ISO 8100-1: 7.3.2 (b)</u>.

3002.5 Emergency doors. Where an elevator is installed in a single blind hoistway or on the outside of a *building*, there shall be installed in the blind portion of the hoistway or blank face of the *building*, an emergency door in accordance with ASME A17.1/CSA B44 <u>or ISO 8100-1</u>.

[F] 3003.2 Fire fighters' emergency operation. Elevators shall be provided with Phase I emergency recall operation and Phase II emergency in-car operation in accordance with ASME A17.1/CSA B44 <u>or EN81-72</u>.

3007.1 General. Where required by Section 403.6.1, every floor above and including the lowest level of fire department vehicle access of the *building* shall be served by fire service access elevators complying with Sections 3007.1 through 3007.9. Except as modified in this section, fire service access elevators shall be installed in accordance with this chapter and ASME A17.1/CSA B44 <u>or EN81-72</u>.

Exceptions:

1. Elevators that only service an open or enclosed parking garage and the lobby of the *building* shall not be required to serve as fire service access elevators.

2. The elevator shall not be required to serve the top floor of a *building* where that floor is utilized only for equipment for *building* systems.

3008.7.1 Elevator recall. The *fire command center* or an alternate location *approved* by the fire department shall be provided with the means to manually initiate a Phase I Emergency Recall of the occupant evacuation elevators in accordance with ASME A17.1/CSA B44 or EN81-72.

Add new standard(s) as follows:

G154-25 Part II

IBC: 1607.12.1, 1613.5, EN Chapter 35 (New), ISO Chapter 35 (New)

Proponents: Stephen Smith, representing Center for Building in North America (stephen@centerforbuilding.org)

2024 International Building Code

Revise as follows:

1607.12.1 Elevators. Members, elements and components subject to dynamic *loads* from elevators shall be designed for *impact loads* and deflection limits prescribed by ASME A17.1/CSA B44 or both ISO 8100-1 and ISO 8100-2.

1613.5 Elevators, escalators and other conveying systems. Elevators, escalators and other conveying systems and their components shall satisfy the seismic requirements of ASCE 7, ~~and~~ ASME A17.1/CSA B44 and EN81-77, as applicable.

Add new standard(s) as follows:

EN

European Committee for Standardization
Rue de la Science 23 B
Brussels, Belgium 1040
Belgium

EN81-77:2022	Lifts subject to seismic condition
ISO 8100-1:2019	Safety rules for the construction and installation of passenger and goods passenge
ISO 8100-2:2019	Design rules, calculations, examinations and tests of lift components

Reason: In 1957, elevator regulators, inspectors, and manufacturers from around Europe met in Milan to discuss harmonizing safety standards. “It was learned,” wrote Finland's longtime representative to the European elevator standard's technical committee, “that differing opinions concerning safety existed, though risks connected to elevators should be the same in all countries.” Each country in Europe at the time had its own elevator safety standard, but as part of a project of European unification, their rules were gradually consolidated into what would become Europe’s EN 81 family of elevator standards.[1] In North America, a similar process took place a few decades later as the United States and Canada harmonized their standards into a unified ASME/CSA set of standards, with A17.1/B44 as the flagship text.[2] A battle between the European and North American standards played out around the world, and Europe won. Virtually every country in the world now either accepts or is working towards convergence with European elevator standards, which were inscribed as global standards standards in the form of ISO 8100-1 and ISO 8100-2, as China – which now has far and away the world’s largest fleet of elevators, and the majority of new installations globally – finally sided with the Europeans.[3]

The global harmonization of elevator rules around the ISO 8100 standards and related EN 81 family of standards has marooned the United States and Canada on a technological and market island. Americans have access to a narrower range of models built by a small and shrinking pool of manufacturers. We are left to pick through slimmer catalogs of components than our counterparts outside of North America, who can buy parts conforming to the global standard on the more competitive global market. For a few concrete examples, compare the number of landing and car doors and lift machines that Wittur is able to sell in North America compared to their offerings in Europe, or the number of elevator door detectors that WECO – the world’s largest manufacturer of the devices – has available in the two markets.[4]

We lag behind the rest of the world in practices – the machine room less elevator came late to America, and hydraulic models that have mostly fallen out of fashion abroad still make up a significant share of new installations in the U.S. We have the world’s highest elevator costs, with devices in similarly sized buildings costing three to four times what they do in high-income countries in Western Europe, even after adjusting for cost-of-living differences. New walk-up apartment buildings are commonplace across the United States, up to three stories in garden apartments throughout the country and up to six stories in places that have made small-lot multifamily buildings easier to build through amendments to Section 1006. In Western Europe, on the other hand, with its much more affordable elevators, walk-ups are nearly extinct in even low-rise new construction.[5]

The primary goal of referenced elevator standards is safety, but there is no solid evidence that the ASME standards provide more safety for workers within the elevator industry (who are disproportionately at risk from elevators) than global standards. What limited evidence there is hints at the opposite. Beyond risks to elevator workers from installed devices, the walk-up buildings that continue to proliferate in America pose significant risk to residents and other construction workers. Over 1 million Americans are treated in emergency rooms each year for injuries incurred while using stairs, and thousands lose their lives.[6]

Referencing the ISO and EN global standards in addition to ASME’s North American ones would be a big shift for the elevator industry and regulators, but it is a well-trod path that hundreds of other countries around the world have already gone down. The A17.1 standard is more prescriptive than the ISO standards, but even ASME has recognized the benefits of performance-based design, with its A17.7 performance-based elevator standard, as has the ICC with its own Performance Code for Buildings and Facilities. Lawmakers' rising interest in affordability and infill urban development may push the industry to accept the global elevator standards outside of the model code process, with bills introduced in the 2025 legislative session in Washington State to force adoption of the ISO's elevator standards, with the support of the state AARP chapter.[7]

My proposal takes a step towards opening the North American market up to global standards by offering owners the option of choosing elevators that conform to the status quo ASME standard, or the global ISO and related EN standards. The ISO 8100-1 and ISO 8100-2 standards contain the bulk of what is addressed in the ASME A17.1 standard, but there remain a few items referenced in the IBC that are outside of their scope. For these items, I have found the relevant EN standards (EN standards, written by CEN-CENELEC, form the basis of the ISO 8100 standards as well). I believe these European standards are the most appropriate to reference, since Europe is the home of most global elevator manufacturers and of the global regulatory system for elevators, and is by far the largest high-income market for elevators in the world, with many times as many installed devices as in North America.

EN 81-72 contains Phase I emergency recall operation and Phase II emergency in-car operation instructions (in 5.8, "Control systems") that are similar to those in ASME A17.1. EN 81-73 contains rules for the behavior of elevators during fires. Seismic requirements found in ASME 17.1 have parallels in EN 81-77, written to address the many seismically active places in Europe (like Turkey or Italy) where this standard is adopted.

There are two IBC sections where I was not able to find a clean parallel to an ISO or EN standard: behavior during floods, and two-way visual communications.

For the latter, the reference to ASME A17.1 in IBC 1612, "Flood Loads," is simply left in place – building owners in flood hazard areas would need to either demonstrate an equivalence to the AHJ if they wanted to use devices not certified to ASME A17.1, or use equipment fully conforming to ASME A17.1.

The two-way visual communication requirement is trickier, since it applies to all devices, not just in special areas. Leaving the requirement in place as-is would therefore render the allowance in other sections for ISO/EN-conforming devices unusable. There is no ISO or EN equivalent to this new requirement, so my proposed solution is that equipment meeting ISO standards would, unless or until the standard is rewritten to include a visual communication requirement, require a sign with a phone number to text for people who cannot otherwise use the audio equipment provided. This is in line with common practice abroad, where most elevator cabs are provided with phone numbers. This would have the ancillary benefit of giving trapped riders another means to reach the proper authorities (that is, the elevator service company) rather than calling 911, which often leads firefighters to damage equipment while trying to disentrap riders, leaving elevators out of service while they wait for repairs and often leaving building inaccessible in the meantime. While a visual communication system that relies on the user to have a charged cell phone and cell service is not foolproof (no system is – even the current code requirements may leave the 8 percent of the U.S. population unable to speak English very well unserved), the anecdote provided by the proponent of EB 94-15 in support of one of the original proposals leading to this code section involved trapped riders with access to working phones with cell service.[8] I realize that the exception I have inserted into this section may not meet the intent of prior cycles' committees, and I am open to other solutions here (such as requiring that communications devices meet the standards laid out in a specific ASME A17.1 section).

Elevator standards are referenced in multiple chapters of the IBC, making any proposal to add an additional referenced standard option challenging. While the main references are in Chapter 30 with some additional references in Chapter 16, both heard during Group B this year, there are some ancillary references in chapters 9 and 10, which were heard last year during Group A. While these references are more important than what is usually considered correlative, the elevator standard is referenced in so many different places that it would not otherwise be possible to introduce a new set of referenced standards in a single year, and any proposal adhering strictly to the separation of groups would end up disjointed and confusing. Given that the heart of the matter belongs in Chapter 30, I believe this proposal is best addressed during Group B.

If this proposal is successful, the following will be proposed in Group A.

1009.4.1 Standby power. The elevator shall meet the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1/CSA B44 <u>or ISO 8100-1</u>. Standby power shall be provided in accordance with Chapter 27 and Section 3003.

[F] 907.3.3 Elevator emergency operation. *Automatic fire detectors* installed for elevator emergency operation shall be installed in accordance with the provisions of ASME A17.1/CSA B44 <u>or both EN81-72 and EN81-73</u> and NFPA 72.

[F] 911.1.6 Required features. The *fire command center* shall comply with NFPA 72 and shall contain all of the following features: (portions not shown remain unchanged)17. Elevator fire recall switch in accordance with ASME A17.1/CSA B44 <u>or both EN81-72 and EN81-73</u>

Cost Impact: Decrease

Estimated Immediate Cost Impact:

It is difficult to quantify exactly the cost decrease. Based on a review of dozens of proposals across the two continents, elevators in high-income countries in Western Europe are roughly a third the cost of those in the U.S., however some of this cost decrease comes from small cabin sizes, some comes from labor inefficiencies that may or may not change with the a new standard, and some comes from factors external to codes and standards (like America's more difficult product liability environment, or its stricter immigration policies). My rough estimate based on dozens of interviews and overall evaluation of the market is that harmonizing with global standards will decrease the cost of an elevator for a mid-rise building by the low to mid-five figures. Very roughly, one-quarter of the $150,000 cost for a mid-rise multifamily elevator.

Estimated Immediate Cost Impact Justification (methodology and variables):

See above.

Estimated Life Cycle Cost Impact:

I expect lower costs due to increased availability of parts and testing procedures (for example, lower-cost alternative electronic testing). The magnitude is difficult to estimate, but I would guess that the percentage decrease in costs would be at least in the low double digits. In general, annual operating costs for mid-rise elevators in the U.S. are in the range of $7,500, compared to a third or quarter of that in Western Europe after adjustment for purchasing power parity in Western Europe (see pgs. 37-39 of my report for more details). However, like the immediate cost differential, this gap has more contributing factors beyond ASME vs. ISO/EN standards.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

See above.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:

EN 81-72:2020 Firefighters lifts
ISO 8100-1:2019 Safety rules for the construction and installation of passenger and goods passenger lifts
ISO 8100-2:2019 Design rules, calculations, examinations and tests of lift components

2024 International Building Code

CHAPTER 30
ELEVATORS AND CONVEYING SYSTEMS

SECTION 3002
HOISTWAY ENCLOSURES

Revise as follows:

3002.1.1 Opening protectives. Openings in fire-resistance-rated hoistway enclosures shall be protected as required in Chapter 7.

~~**Exception**~~ **Exceptions**:

1. The elevator car doors and the associated hoistway doors at the floor level designated for recall in accordance with Section 3003.2 shall be permitted to remain open during Phase I Emergency Recall Operation.
2. Elevator hoistway door located in the wall of a *corridor* required to be fire-resistance rated in accordance with Section 1020.1 is not required to be smoke protected in accordance with Section 716.2.2.1.1.

SECTION 3006
ELEVATOR LOBBIES AND HOISTWAY OPENING PROTECTION

3006.2 Elevator hoistway door protection required. Elevator hoistway doors shall be protected in accordance with Section 3006.3 where an elevatorserves an occupied floor more than 120 feet (36 576 mm) above the lowest level of fire department vehicle access and ~~hoistway connects more than three *stories*,~~ is required to be enclosed within a *shaft enclosure* in accordance with Section 712.1.1; and any of the following conditions apply:

1. The *building* is not protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 ~~or 903.3.1.2~~.
2. The *building* contains a Group I-1, Condition 2 occupancy.
3. The *building* contains a Group I-2 occupancy.
4. The *building* contains a Group I-3 occupancy.
5. ~~The elevator hoistway door is located in the wall of a *corridor* required to be fire-resistance rated in accordance with Section 1020.1.~~

Exceptions:

1. Protection of elevator hoistway doors is not required where the elevator serves only *open parking garages* in accordance with Section 406.5.
2. Protection of elevator hoistway doors is not required at the levels of exit discharge, provided that the levels of exit discharge is equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. Protection of elevator hoistway doors is not required on levels where the elevator hoistway doors open to the exterior.

Delete without substitution:

~~**3006.2.1 Rated corridors.** Where *corridors* are required to be fire-resistance rated in accordance with Section 1020.2, elevator hoistway openings shall be protected in accordance with Section 3006.3.~~

Reason: Elevator hoistway opening protection was the topic of a number of earlier proposals and changes. Now that those have had time to take effect, we can see the cost impact of the ultimate changes, allowing us to weigh the costs and benefits more clearly. The costs appear to be very high, while the benefits are low to nonexistent. In addition to clarity on costs, an update to the IBC removing the hoistway ventilation requirement has eliminated a major source of the stack effect.

Quotes obtained in two U.S. cities show significant costs to these requirements, which were not documented in the 2015 code change proposal that was ultimately adopted – $5,700 per landing in a Pacific Northwest city in 2023, and $10,400 per landing in New York City (to put this into perspective, the *full cost* of an installed elevator in Western Europe lies somewhere within this range). On top of these base prices, there are additional charges for many types of elevators and for contractor markup. Maintenance and repair costs are also likely to be significant given the monopolistic nature of the market for such specialized devices not used in other countries. The extremely high cost and low availability of elevators in the United States has come under scrutiny recently. As of this writing on Jan. 10, 2025, legislators have already introduced bills to change codes and standards related to elevators, and it is likely that hoistway protection requirements will attract their attention as well, given their high costs and questionable benefits. The ICC has a chance to get in front of this issue.

Generations of real-world experience has shown us that the benefits of these requirements are low to nonexistent. Earlier versions of building codes were interpreted to require elevator hoistway opening protection in some jurisdictions in the wake of the MGM Grand fire in 1980, but interviews suggest that most jurisdictions (especially those in the Northeast with many high-rises) either did not contain these provisions or were not interpreted in such a way as to require the protection. As the ICC Code Technology Committee (CTC) noted in 2012, the generations of experience without the protection were good – "code officials participating in the study group stated that lobbies have traditionally not been required in these type buildings in their jurisdictions and their experience has been good." The MGM Grand fire was multifactorial, and if the same fire had broken out in a building built to today's code but without elevator hoistway opening protection, nobody would have died or been seriously injured, especially above the ground floor, due to revised elevator recall operations, modified HVAC design, requirements for protecting building joints, and increased sprinkler requirements in today's codes.

New York City property data allows us to quantify the experience with multistory elevator buildings without hoistway opening protection. City property data suggests that there are nearly 31,000 elevator buildings of at least four stories in the city (roughly the current threshold for required hoistway opening protection in the IBC), which contain a total of 1.75 million apartments and roughly half of New York City's population. Together, these multifamily buildings have 275 million life-years of experience (that is, the number of occupants times the age of the building). The CTC in 2012 was not able to identify any fatalities due to a lack of hoistway opening protection in these buildings, and I have not been able to either.

Elevator hoistway opening protection has, since the IBC was updated to explicitly require it, not been adopted by all jurisdictions. New York City, with by far the largest stock of high-rise elevator buildings in the country, continues to not require it on floors with R-2 occupancies (NYC BC 3006.1.1, exception 5). Chicago has stricken Section 3006 from its IBC adoption entirely (Chicago BC 3006).

Updates to the ASME A17.1 standard and then later to the IBC to eliminate the required ventilation opening at the top of the shaft have also lessened the stack effect that might occur, drawing smoke upwards through the shaft and creating a need for opening protection.

Regarding the international nature of the IBC, I was unable to find a single jurisdiction outside of the United States that requires elevator hoistway protection (lobbies, smoke curtains, pressurization, or hold-open doors) for ordinary multistory buildings. Even Canada, which often adopts U.S. building code requirements and which has been experiencing a high-rise apartment boom across the country in recent years, has not adopted these requirements.

Elevator hoistway protection opening requirements in the IBC have become an example of what Margaret Law and Paula Beever described in their seminal 1994 lecture "Magic Numbers and Golden Rules", where major fires lead to an exhaustive enumeration of layered failures, all of which are then addressed in prescriptive codes, leading to overkill:

> *The outcome of [studies of major fires] is generally to identify the major contributory factors which led to the incident becoming as serious as it did. The investigation is likely to be conducted on several levels concerned with details...The results of all of these studies are likely to emerge as a set of recommendations for improvements in an attempt to ensure that such an incident could not be repeated. The problem is that the results are unlikely to be formulated as a series of alternatives, the implementation of any of one of which would have avoided the tragedy, but rather as a set of measures which must be adopted as a whole. This approach, whilst very well intentioned, leads to new sets of golden rules because of a failure of rational analysis.*

In 2012, the CTC recommended limiting elevator hoistway protection requirements to buildings exceeding 420 ft. in height, based on "the many fire safety features required by the building code, including automatic sprinklers, that mitigate the hazard of the spread of smoke via elevator hoistways." Since that proposal was disapproved, my proposal compromises with a much more conservative height limit: 120 ft. This threshold aligns elevator hoistway protection requirements with other requirements in the code, such as fire service access elevators (IBC 403.6.1).

If this committee indicates an openness, however, I do believe that the CTC's 2012 recommendation to eliminate the requirement for buildings up to 420 ft. in height was sound, and I would be happy to return in the fall with an updated proposal in line with their 420-ft. recommendation, or somewhere in between my proposal and theirs.

Smith, Stephen. *Elevators*. Center for Building in North America: 2024. https://bit.ly/3XRH4Ij.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Two quotes for smoke curtains (a commonly used form of elevator hoistway opening protection for low- and mid-rise buildings) obtained in the Pacific Northwest and New York City, respectively, show that the devices cost cost $5,700 to $10,400 per car, per landing. The devices are required on every story above the ground floor. Eliminating the requirement would save this amount of money per car per landing above the ground floor, plus contractor markup, markup applied for special devices (for example, one manufacturer charged more for common brands of elevators), ongoing maintenance and repair costs, and replacement costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

See above.

2024 International Building Code

3002.3 Emergency signs. A pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the exit stairways and not to use the elevators in case of fire. Where elevators are not a component of the *accessible means of egress*, the sign shall read: IN CASE OF FIRE~~, ELEVATORS ARE OUT OF SERVICE. USE EXIT~~. DO NOT USE ELEVATOR. USE EXIT STAIRS. Where the elevator is a component of the *accessible means of egress*, a sign complying with Section 1009.11 shall be provided.

Exception: The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008.

Reason: The purpose of this proposal is to change the Elevator sign language to indicate: USE EXIT STAIRS" instead of "USE EXIT". This is an additional proposal to the proposal ID # 11305 to change the sign verbiage to indicate: "DO NOT USE ELEVATOR" instead of "ELEVATORS ARE OUT OF SERVICE". The reasons for this proposed change are:

1. Most of the current signs posted in buildings today are not conforming to IBC Section 3002.3 (See attached 7 examples from different buildings in different states and cities) - Instead of indicating "Elevators are out of Service" as required by 3002.3, Most actual signs posted in buildings, indicate "In Case of Fire - Do Not Use Elevator" - In my opinion, the main reason for this other (and very common) sign language is that the code required language is confusing and is not clear and does not provide clear guidance and instructions to occupants compared to the actual posted signs clearly instructing buildings' occupants: "Do Not Use Elevator" in case of Fire emergencies regardless if the elevators are still operational and running (which is considered as Normal Service Operation). In many fires, as long as the fire/smoke is remote from elevator spaces (lobbies, landings, machine/control rooms) - The elevator/s are still operating in Normal Service and they are not recalled upon smoke or fire detection activation (Phase I Emergency Recall Operation) and they are not taken out of service. This means that potentially, occupants of the building can use the running/operational elevator/s during a fire emergency and this situation can result in entrapment and a life safety risk to the passengers using the elevator/s.

2. This proposal is intended to revert the 2024 language "USE EXIT" to the previous IBC language: "USE EXIT STAIRS". I have provided reference attachments from the 2018 and 2021 IBC same section 3002.3 showing the sign verbiage: "USE EXIT STAIRS" - in my opinion, this verbiage should not change to only indicate: "USE EXIT" since the intent of this sign is for elevators on all floors of the building. Only on the Egress/ground level - there is an EXIT to the outside of the building which does not require the use of EXIT STAIRS. In all other floors/levels served by Elevator/s - Occupants should be instructed to specifically use the "EXIT STAIRS" since they are instructed to NOT use the elevators.

3. The main reason that it is unsafe to use elevator/s anywhere in the building during a fire emergency is loss of building power, which can cause the elevator/s to stop inside the hoistway with potential passengers entrapped inside the elevator car while there is a fire in the building which may cause harm to the entrapped passengers. The building power system can be lost due to the fire hazard itself (high heat, sprinklers activation and water conditions, etc.) which can harm the building electrical service and/or electrical power cables, electrical rooms, power panels, etc. which are feeding the elevator controls and driving machines. This could happen even if the elevator/s are remote from the fire and are not affected by smoke and are not yet recalled and taken out of Normal Service operation. Therefore, the sign per Section 3002.3 indicating "Elevators are out of Service" can be confusing and misleading for building occupants who are instructed to EXIT the building by using the exit stairways. This sign can also create confusion with voice Fire Alarm systems generating pre-recorded messages instructing building occupants to evacuate the building using the stairways and to not use the elevators. "IN CASE OF FIRE, DO NOT USE ELEVATOR. USE EXIT STAIRS" is the safest verbiage with the specific clear instructions to occupants.

4. The intent of the sign as indicated in Section 3002.3 is: "....**INSTRUCTING** occupants to use the exit stairways and **NOT TO USE THE ELEVATORS IN CASE OF FIRE**" - However, the specific required sign verbiage indicating "Elevators are Out of Service" is not consistent with the intent of this section which is "INSTRUCTING OCCUPANTS". When the sign indicates: "Elevators are out of Service" - It does not provide clear instruction to occupants what to do as intended by this section. Occupants may wonder: What does it mean "Elevators are Out of Service" ? Does it mean that we should NOT use the elevators even if they are still operational in Normal Service ? Or maybe, we should use the elevator/s since they are NOT out of service and they are still running. This may create confusion since the required code verbiage does not provide clear instructions to occupants what they should do or should not do in case of fire. 5. The actual reality situation in many buildings is that there are many actual posted signs for elevators which are currently in

violation of the building code section 3002.3 - These non-compliant signs indicate clear instruction to occupants but they do not comply with the specific code language which creates code violation. This violation can potentially cause building inspectors and/or other AHJs who are enforcing the building code to require the removal of the non-compliant signs and to require them to be replaced with code compliant signs which may trigger high cost for building owners (if correction to this code violation is enforced) . Therefore - Changing the wording per this proposal may provide a retroactive acceptance for existing signs indicating "Do Not Use Elevator" to remain as-is and to not be replaced on a code-violation basis. 6. The Elevator code ASME A17.1 (current 2022 edition) and also in many previous ASME A17.1 code cycles includes an "Elevator Corridor Call Station Pictograph" based on Section and Figure 2.27.9 (See attachment). However, since this pictograph/sign is NOT considered as an elevator equipment - The elevator code refers to the building code in section 2.27.9 indicating: "**When the building code requires a sign be posted** .....**instructing occupants not to use the elevator in case of fire**". This means that the governing code for the sign is the **building code** and not the elevator code. If the wording of the sign will be changed in the building code based on this proposal, it will not create a conflict with the elevator code since the elevator code recognizes the building code as the governing code for this sign with the intent of SAFE Egress for occupants of the building by "Instructing Occupants" to use stairs during fire and to not use the elevators. The elevator code has other safety requirements for PASSENGERS using elevators during normal elevator operation but NOT during fire emergencies. Therefore, the elevator code clearly refers to the building code addressing the building's **OCCUPANTS** during fire emergencies who should be **instructed** not to use the elevators. Therefore, If the building code is changed per this proposal, only the pictograph in the elevator code figure 2.27.9 will have to be changed but nothing will need to be changed in section 2.27.9 itself.

Codes / I-Codes / 2021 International Building Code (IBC)

Chapter 30 Elevators and Conveying Systems

3002.2 Number of elevator cars in a hoistway. INSIGHTS

Where four or more elevator cars serve all or the same portion of a building, the elevators shall be located in not fewer than two separate hoistways. Not more than four elevator cars shall be located in any single hoistway enclosure.

INSIGHTS (1)

3002.3 Emergency signs. INSIGHTS

An *approved* pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the exit stairways and not to use the elevators in case of fire. The sign shall read: IN CASE OF FIRE, ELEVATORS ARE OUT OF SERVICE. USE EXIT STAIRS.

Exceptions:

1. The emergency sign shall not be required for elevators that are part of an *accessible* means of egress complying with Section 1009.4.
2. The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008.

Codes / I-Codes / 2018 International Building Code (IBC)

Chapter 30 Elevators and Conveying Systems

3002.3 Emergency signs. INSIGHTS

An *approved* pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the *exit stairways* and not to use the elevators in case of fire. The sign shall read: IN CASE OF FIRE, ELEVATORS ARE OUT OF SERVICE. USE EXIT STAIRS.

Exceptions:

1. The emergency sign shall not be required for elevators that are part of an *accessible means of egress* complying with Section 1009.4.
2. The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008.

❖ Elevators may be unsafe during a fire because:

- Persons may push a corridor button and then wait for an elevator that may never respond. Note that the button will not illuminate if the elevator is in fire fighter emergency operation. Valuable time in which to leave the building safely is lost.
- Elevators cannot start until the car and hoistway doors are closed. A panic could lead to over-crowding of an elevator and blockage of the doors, thus preventing closing.
- Power failure during a fire can happen at any time and thus lead to entrapment.
- Elevators respond to car and corridor calls. One of these calls may be at the fire floor.

Dangerous delivery of the elevator to the fire floor can be caused by:

- An elevator passenger pressing the car button for the fire floor.
- One or both of the corridor call buttons being pushed on the fire floor.
- Heat melting or deforming the corridor push button or its wiring at the fire floor.

Justification for no cost impact:

No cost impact. Changing sign verbiage only.

G156-25

G157-25

IBC: 3002.4

Proponents: Daniel Nichols, representing MTA Construction and Development (dnichols@mnr.org)

2024 International Building Code

Revise as follows:

3002.4 Elevator car to accommodate ambulance stretcher. Where elevators are provided in *buildings* four or more *stories* above grade plane, ~~or~~ four or more *stories* below~~,~~ *grade plane*, or more than 60 feet above or below grade plane, not fewer than one elevator shall be provided for fire department emergency access to all floors. The elevator car shall be of such a size and arrangement to accommodate an ambulance stretcher 24 inches by 84 inches (610 mm by 2134 mm) with not less than 5-inch (127 mm) radius corners, in the horizontal, open position and shall be identified by the international symbol for emergency medical services (star of life). The symbol shall be not less than 3 inches (76 mm) in height and shall be placed inside on both sides of the hoistway door frame.

Reason: The need for the increased elevator size is to accommodate first responders carrying patients up or down stairways. In buildings with high-bay areas or stories that are above the typical 10-15 feet story height, the code allows for increased heights for carrying without the intended baseline of stretcher accommodation for first responders. This code change aligns the intent of the requirement of four stories with an absolute measurement criteria to assure the same level of accomodation is provided.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change reflects the intent of the original proposal and is not an increase to the cost of an elevator, but generally just a change to the door orientation in spaces with limited footprints.

G157-25

G158-25

IBC: 3002.4

Proponents: Stephen Smith, representing Center for Building in North America (stephen@centerforbuilding.org)

2024 International Building Code

Revise as follows:

3002.4 Elevator car to accommodate ambulance stretcher. Where elevators are provided in *buildings* four or more *stories* above, or four or more *stories* below, *grade plane*, not fewer than one elevator shall be provided for fire department emergency access to all floors. The elevator car shall be of such a size and arrangement to accommodate an ambulance stretcher 24 inches by 84 inches (610 mm by 2134 mm) with not less than 5-inch (127 mm) radius corners, in the horizontal, open position and shall be identified by the international symbol for emergency medical services (star of life). The symbol shall be not less than 3 inches (76 mm) in height and shall be placed inside on both sides of the hoistway door frame.

Exception: Elevator cars are not required to accommodate ambulance stretchers in buildings complying with the following:

1. Only Group R-2 occupancies located above the level of exit discharge.
2. Not more than six stories in hieght above grade plane.
3. Each story above the level of exit discharge is not more than 4,000 net square feet (371.6 m^2).
4. Not a high-rise building.

Reason: The IBC currently contains a perverse incentive around elevators: there is no requirement in any part of the code to install an elevator in an R-2 building, but if one is voluntarily provided, requirements become increasingly stringent as buildings get taller, acting as a disincentive to install an elevator. This is a particular problem in the United States, as elevators cost around three times as much to install as they do in peer high-income countries, and can cost even more to maintain, even after adjusting for cost-of-living differences. There are also significantly higher opportunity costs of the floor area used, due to the significantly larger cabins that we require.The result is that the United States has fewer elevators per capita than any high-income country that I could find. The lack of elevators in America is unbecoming of our aging population and our self-conception as a country that is inclusive towards people with disabilities, whether temporary or permanent.Rules requiring two remote exits in multifamily buildings over three stories result in relatively large floor plates, making the very high cost of elevators more affordable. As a result, new four-story walk-ups in the United States are rare, but they are likely to become more common. Reforms to Chapter 1006 considered for the 2027 IBC and approved by the Egress Committee in 2024 would make single-exit four-story buildings with small floor plates more common. Evidence from New York City and Seattle, where locally adopted versions of Chapter 1006 have long allowed single-exit buildings of four to six stories, suggests that many of these buildings would be built as walk-ups. New York City is one of the few jurisdictions in America to contain a building code requirement to install an elevator starting at five stories, and developers bend over backwards to seek loopholes to it – whether it's creating bilevel apartments on the top two stories to skirt the requirement, or filing for vertical alterations of older structures under an older code that does not contain an elevator requirement. My own building in Brooklyn is five stories tall with two apartments per story, and does not have an elevator despite being built in 2015, thanks to the latter loophole. None of the above is true in America's peer high-income countries. Elevators are a standard feature of small three-story buildings in Western Europe, and are often provided even when not required, because the costs are low enough and cabin sizes are small enough that the benefits outweigh the costs.Code requirements come with costs and benefits that must be weighed against each other. A cabin that can accommodate a fully flat 84-in. stretcher has life safety benefits in certain emergency situations, but also costs. These costs come in dollars and square feet, but also in life safety and accessibility. If an elevator becomes too onerous to install, then there are much more severe life safety costs, both to occupants whose evacuation will be delayed by having to take the stairs, and to emergency responders who will have to carry them down the stairs. The building also becomes inaccessible to the 12 percent of the U.S. adult population that struggles with stairs. Occupants of walk-ups are more likely to become one of the 1 million Americans treated in emergency rooms every year for stair-related injuries. There is no data on the number of Americans who die using stairs every year, but data from the UK extrapolated to our population suggests that it is in the thousands, exceeding the number of American who die in fires.

There are countless situations where an elevator that can accommodate a wheelchair and a few people standing is useful, and many fewer situations where a patient must be evacuated in a fully flat stretcher. Cardiac arrest is the most commonly cited situation in which evacuation in a fully flat stretcher is helpful, but the survival rate for out-of-hospital cardiac arrest is already exceedingly low (and likely even lower when it occurs in a non-public space like an apartment) – and even lower in the U.S. than in countries which do not require stretcher accommodation for mid-rise multifamily elevators. The increased availability of automated external defibrillators since this provision was put into the code has also lessened its need.

Developers can avoid installing elevators of any size by building walk-up apartment buildings, but they can also – and often do – avoid building elevators by opting out of apartment buildings entirely and instead building townhouses, which never have elevators that can accommodate stretchers (and rarely have any elevator at all).

My analysis of buildings constructed in New York City since 2000 shows that the likelihood of installing an elevator in an apartment building exceeds 50 percent only when the building exceeds 24,000 sq. ft. of floor area. In order words, buildings below this size are at high risk of not having an elevator at all, and reasonable costs (both in dollars and square feet consumed) are especially important to ensuring that one is provided. This number forms the basis of this code proposal: 24,000 sq. ft. of total floor area in a six-story building equates to roughly 20,000 sq. ft. above the ground floor. Conveniently, this assumed floor plate also aligns with the maximum floor area of a story in a single-stair building according to the modification of E24-24 that was approved in Long Beach in 2024, allowing taller single-exit apartment buildings in Chapter 1006. It also roughly aligns with limits found in other high-income countries.

Beyond the accessibility benefits of elevators themselves, the installation of an elevator in a building that would otherwise be a walk-up or a series of townhouses also triggers further accessibility within units themselves, given how the Fair Housing Amendments Act guidelines treat elevatored buildings as compared to walk-ups.

My exception applies only to multifamily buildings up to six stories (above that I have never seen a walk-up built in modern times). It also excludes high-rise buildings, to avoid applying to buildings with very tall ceilings or mezzanines.

Lawmakers are growing concerned about the large cost premium for elevators in the United States, and legislators in Washington State have introduced bills to remove the stretcher requirement for multifamily buildings of roughly the size covered by my exception, supported by the state AARP chapter. This proposal is a chance for the ICC to get ahead of legislation, and show lawmakers that it is addressing the issue without legislative intervention.

Bibliography: The support for my reason statement comes from my 122-page comparative report on elevators in North America and high-income peer countries, found here: https://bit.ly/3XRH4Ij

The issues discussed in the reason statement are addressed on the following pages:

- 15: Per-capita elevator stock by country
- 16-18: Rarity of new walk-up apartment buildings in Western Europe
- 19-23: Ubiquity of new walk-up buildings in the United States
- 35-36: Installation costs for elevators in new buildings in the U.S. vs. Western Europe
- 42: Life safety considerations in buildings without elevators
- 43-55: In-depth discussion of cabin sizes (history, U.S. and foreign practices, cost implications)

Bills introduced in Washington State and Connecticut

- 1183.pdf
- 5156.pdf
- C G A - Connecticut General Assembly

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Uncertain, but substantial in instances where developers opt for a smaller elevator (at least $10,000). In other cases, an elevator will be provided where it was not previously, which will raise costs, but at the developer's discretion.

Estimated Immediate Cost Impact Justification (methodology and variables):

Interviews with those in the elevator industry and review of dozens of proposals for installation.

Estimated Life Cycle Cost Impact:

Decrease, with an uncertain magnitude (larger equipment costs more to maintain).

G158-25

G159-25

IBC: 3003.4 (New), 3003.4.1 (New), 3003.4.2 (New), 3003.4.3 (New), 3003.4.4 (New)

Proponents: Sagiv Weiss-Ishai, San Francisco Fire Department, representing SFFD (sagiv.weiss-ishai@sfgov.org)

2024 International Building Code

SECTION 3003 EMERGENCY OPERATIONS

Add new text as follows:

3003.4 Emergency hoistway venting. Elevator hoistways containing the driving machine shall be provided with a means for venting smoke and hot gases to the outer air in case of fire.

3003.4.1 Location of vents. Vents shall be located at the top of the hoistway and shall open either directly to the outer air or through noncombustible ducts to the outer air.

3003.4.2 Area of vents. Except as provided for in Section 3003.4.4, the area of the vents shall be not less than 3 $^{1}/_{2}$ percent of the area of the hoistway nor less than 3 square feet (0.28 m^2) for each elevator car.

3003.4.3 Operation of vents. Vent openings shall automatically open upon detection of smoke in the elevator hoistway and upon activation of a manual override control. The manual override control shall be capable of opening and closing the vents and shall be located in an approved location. Smoke detectors provided in elevator hoistways to activate the hoistway ventilation system, shall also be required to activate the elevator Phase I emergency recall operation function in accordance with ASME A17.1/CSA B44

3003.4.4 Reduced vent area. Where mechanical ventilation conforming to the *International Mechanical Code* is provided, a reduction in the required vent area is allowed provided that all of the following conditions are met:

1. The vent required by Section 3003.4.1 does not have outside exposure.
2. The hoistway does not extend to the top of the building.
3. The hoistway exhaust fan is automatically reactivated by thermostatic means.
4. Equivalent venting of the hoistway is accomplished.

Reason: The reason for this proposal is to make the IBC consistent with the CA Building Code Section 3003.4 regarding safety for Machine-Room-Less elevators (MRL)

1. The IBC past editions such as the 2012 and previous editions had a hoistway venting requirement (Section 3004) which was based on occupancy types (Elevators inside residential occupancies) but it was not based on the Elevator type. This section was removed from IBC in the recent editions and it did not address the specific risk associated with MRL Elevators having the driving machine located inside the hoistway.

2. Passenger MRL Elevators became very common throughout the US in the last years and there are known cases and actual data where sometimes, the driving machine within the hoistway got overheated or malfunctioned and generated large quantities of smoke within the hoistway.

3. If there is no hoistway vent allowing to vent the smoke to the exterior of the building, the smoke within the hoistway may spread within the hoistway and harm potential passengers whom may be entrapped inside the stopped elevator car/s within the hoistway (Since when typically the driving machine overheats or malfunctions, the elevator car is stopped inside the hoistway and cannot move until the driving machine in repaired)

4. Since this is an actual risk (known actual cases) and it is not just a hypothetical risk - The CA state Fire Marshal had form an Elevator Task- Force after the 2018-IBC was published to make amendments to the 2019 CA Building and Fire Codes. The CSFM Elevator-Task-Force had included all stake holders and the MRL Hoistway potential smoke risk was discussed. Based on the discussion between all stake holders, there was a consensus recommendation to amend the CA Building Code by adding Section 3003.4 to increase safety for passengers using ALL MRL Elevators containing the driving machine within the hoistway, regardless the type of building occupancy. Passenger MRL Elevators are located in all types of occupancies and are frequently used by passengers while the driving machine is located within the hoistway and potentially could be the source for the risk.5. NFPA 72 has also recognized the use of MRL elevators in un sprinklered hoistways where the driving machine is located inside the hoistway: Section 21.3.6.2 indicates that if the smoke relief equipment is activated by a smoke detector located within the hoistway - The smoke detector shall also generate Phase I Emergency Recall Operation.

21.3.6.2

Smoke detectors or other automatic fire detection as permitted in **21.3.10** shall be permitted to be installed in unsprinklered elevator hoistways if required by other governing codes or standards for the actuation of the elevator hoistway smoke relief equipment.

5. Since the hoistway venting was previously required by IBC Section 3004, based on occupancy type, this proposal is only based on equipment type (MRL Elevators with driving machine within the hoistway) - which will increase life-safety for potential entrapped passengers while the hoistway is filled with smoke that could not be vented to the exterior. If this proposal is accepted, as was done in CA, the potential smoke will be vented to the exterior of the building and will not harm the entrapped passengers.

6. Many MRL elevators have their top of hoistway located above the roof level and in that case, the vent could be done by a simple louver open to the exterior of the buildings. In some other cases where the MRL Hoistway is located within the building, a mechanical ventilation for smoke relief may be provided.

SECTION 3003
EMERGENCY OPERATIONS

[F] 3003.1 Standby power. In buildings and structures where standby power is required or furnished to operate an elevator, the operation shall be in accordance with *Section 1203 of the California Fire Code and* Sections 3003.1.1 through 3003.1.*5 of this code.*

[F] 3003.1.1 Manual transfer. Standby power shall be manually transferable to all elevators in each bank.

[F] 3003.1.2 One elevator. Where only one elevator is installed, the elevator shall automatically transfer to standby power within 60 seconds after failure of normal power.

[F] 3003.1.3 Two or more elevators. Where two or more elevators are controlled by a common operating system, all elevators shall automatically transfer to standby power within 60 seconds after failure of normal power where the standby power source is of sufficient capacity to operate all elevators at the same time. Where the standby power source is not of sufficient capacity to operate all elevators at the same time, all elevators shall transfer to standby power in sequence, return to the designated landing and disconnect from the standby power source. After all elevators have been returned to the designated level, not less

[F] 3003.3 Standardized fire service elevator keys. All elevators shall be equipped to operate with a standardized fire service elevator key in accordance with the *California Fire Code.*

3003.4 Emergency hoistway venting. *Elevator hoistways containing the driving machine shall be provided with a means for venting smoke and hot gases to the outer air in case of fire.*

3003.4.1 Location of vents. *Vents shall be located at the top of the hoistway and shall open either directly to the outer air or through noncombustible ducts to the outer air.*

3003.4.2 Area of vents. *Except as provided for in Section 3003.1.4.4, the area of the vents shall be not less than $3^1/_2$ percent of the area of the hoistway nor less than 3 square feet (0.28 m^2) for each elevator car.*

3003.4.3 Operation of vents. *Vent openings shall automatically open upon detection of smoke in the elevator hoistway and upon activation of a manual override control. The manual override control shall be capable of opening and closing the vents and shall be located in an approved location. Smoke detectors provided in elevator hoistways to activate the hoistway ventilation system, shall also be required to activate the elevator Phase I emergency recall operation function in accordance with Cali-*

2022 CALIFORNIA BUILDING CODE **30-5**

Cost Impact: Increase

Estimated Immediate Cost Impact:

Minimal cost where the MRL top-of-hoistway is located above the roof level - This could be done with a simple louver open to the outer air. (up to$3000 for a simple louver).

Estimated Immediate Cost Impact Justification (methodology and variables):

Only for MRL elevators having the top of the hoistway located within the building - This will require an emergency vent which could relief the smoke to the exterior of the building (estimated up to $10,000 if it is required to provide an emergency vent and duct to relief the smoke to the exterior of the building.

Estimated Life Cycle Cost Impact:

This is a one-time provision - Once the vent is provided - this will serve for the life of the MRL elevator.

G159-25

G160-25

IBC: 3004.2.3 (New), FIGURE 3004.2.3 (New)

Proponents: Kevin Brinkman, representing NEII (klbrinkman@neii.org)

2024 International Building Code

SECTION 3004
CONVEYING SYSTEMS

3004.2 Escalators and moving walks. Escalators and moving walks shall be constructed of *approved* noncombustible and fire-retardant materials. This requirement shall not apply to electrical equipment, wiring, wheels, handrails and the use of $^{1}/_{28}$-inch (0.9 mm) wood *veneers* on balustrades backed up with noncombustible materials.

3004.2.1 Enclosure. Escalator floor openings shall be enclosed with *shaft enclosures* complying with Section 713.

3004.2.2 Escalators. Where provided in below-grade transportation stations, escalators shall have a clear width of not less than 32 inches (815 mm).

Add new text as follows:

3004.2.3 Balustrades required. Where escalators or moving walks are installed with one or both sides open and the escalator step or moving walk treadway is more than 30 inches above the adjacent floor, the balustrades shall be not less than 42 inches (1067 mm) in height or the side or sides shall be guarded to comply with ASME 17.1/CSA B44, Appendix ZZ. See Figure 3004.2.3.

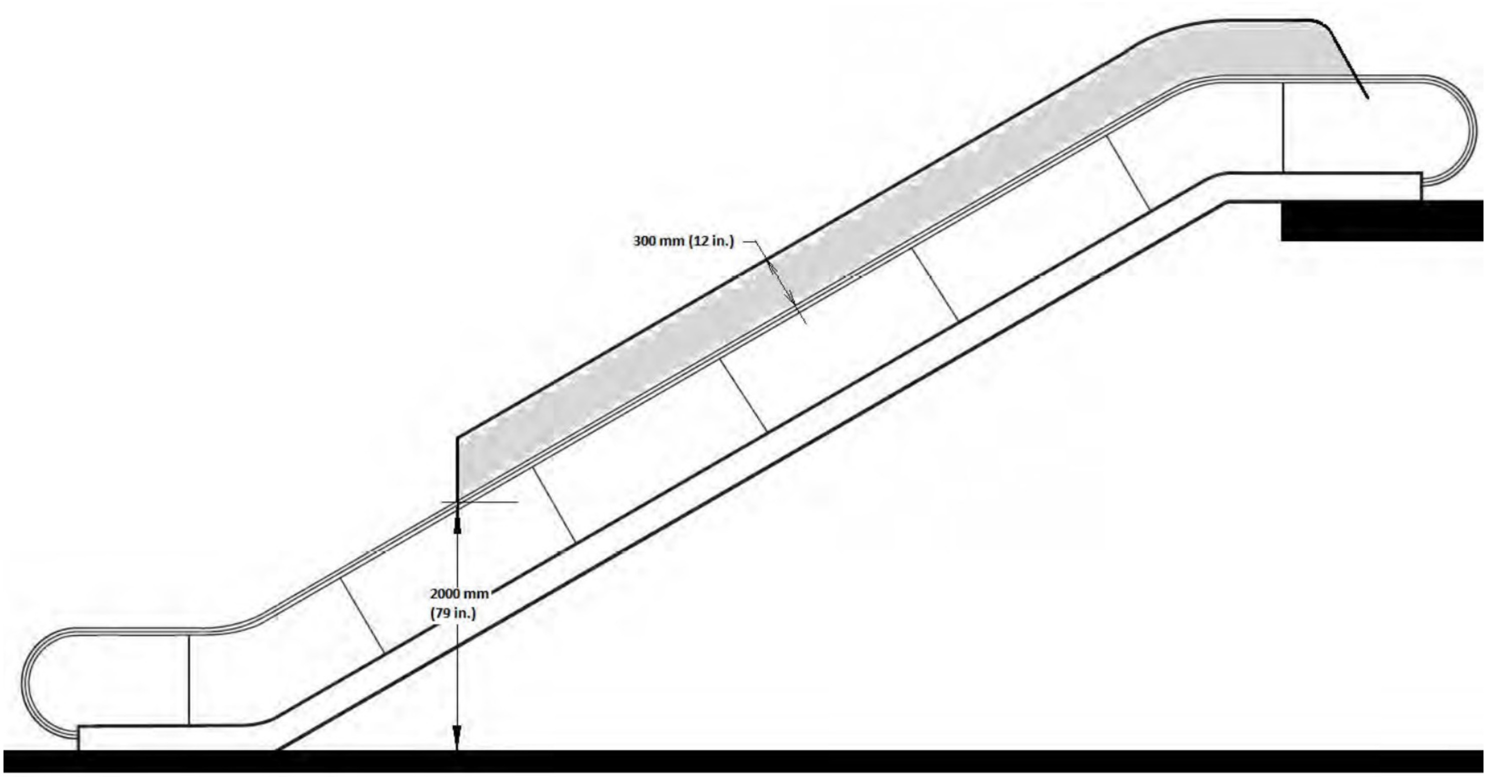

FIGURE 3004.2.3 ESCALATOR GUARD

Reason: Provide height requirements for balustrades or additional guarding for open-sided escalators and moving walks to align with guard height requirements in section 1015.3. This addresses a potential fall hazard for installations without full enclosures that are open on either side in Atrium or Mezzanine applications. ASME A17.1/CSA B44 provides two methods to address compliance with guard height requirements in section 1015.3. The escalator or moving walk balustrade height can be not more than 1100mm (43 in) or additional guards as described within ASME A17.1/CSA B44, Appendix ZZ can be provided.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Cost will vary depending on which method is chosen, length of escalator or moving walk, number of escalators or moving walks, and number of open sides. The estimated cost increase for taller balustrades would be between $500 and $750 per escalator depending on the travel length.

Estimated Immediate Cost Impact Justification (methodology and variables):

This estimate includes potential material and installation costs.

G160-25

G161-25

IBC: 3005.2

Proponents: Kevin Brinkman, representing NEII (klbrinkman@neii.org)

2024 International Building Code

Revise as follows:

3005.2 Temperature control. Elevator machine rooms, machinery spaces that contain the driving machine, and control rooms or spaces that contain the operation or motion controller for elevator operation shall be provided with an independent ~~*ventilation* or air-conditioning~~ system to maintain the ambient temperature and humidity in the range established for the elevator equipment ~~protect against the overheating of the electrical equipment. The system shall be capable of maintaining temperatures within the range established for the elevator equipment.~~

Reason: The current language does not include heating of the hoistway in cold applications. The purpose is to maintain the temperature and humidity in the appropriate range (10 to 40 deg C/50 to 104 deg F as specified in CSA B44.1/ASME A17.5 Elevator and escalator electrical equipment to ensure proper operation of the elevator. If the temperature and humidity in the equipment rooms and spaces are allowed to exceed or to drop below acceptable levels, the elevator may not function properly. Therefore, the temperature control means needs to be capable of heating, cooling, and humidity control depending on the application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact because this change is intended to clarify the requirements for the temperature control system.

G161-25

G162-25

IBC: 3006.2

Proponents: Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com)

2024 International Building Code

Revise as follows:

3006.2 Elevator hoistway door protection required. ~~Elevator hoistway doors shall be protected in accordance with Section 3006.3 where~~ Where an elevator hoistway connects more than three *stories* or~~,~~ is required to be enclosed within a *shaft enclosure* in accordance with Section 712.1.1, the hoistway door openings shall be protected in accordance with Section 3006.3 where ~~and~~ any of the following conditions apply:

1. The *building* is not protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. The *building* contains a Group I-1, Condition 2 occupancy.
3. The *building* contains a Group I-2 occupancy.
4. The *building* contains a Group I-3 occupancy.
5. The *building* is a high rise and the elevator hoistway is more than 75 feet (22 860 mm) in height. The height of the hoistway shall be measured from the *lowest floor* to the highest floor of the floors served by the hoistway.
6. The elevator hoistway door is located in the wall of a *corridor* required to be fire-resistance rated in accordance with Section 1020.1.

Exceptions:

1. Protection of elevator hoistway doors is not required where the elevator serves only *open parking garages* in accordance with Section 406.5.
2. Protection of elevator hoistway doors is not required at the levels of exit discharge, provided that the levels of exit discharge is equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. Protection of elevator hoistway doors is not required on levels where the elevator hoistway doors open to the exterior.

Reason: The proposed language is intended to be editorial in nature. It is intended to provide clarity for the requirement of the hoistway door protection by starting with the connecting more than three stories, then adding in the pointer to 712.1.1, then noting the six required applications. The current language can create confusion where this may provide more clarity.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is rearranging current language to read easier for better understanding of the code requirement.

G162-25

G163-25

IBC: SECTION 3006, 3006.2, 3006.2.1, 3006.3, 3006.4, 1020.2.1

Proponents: Steve Thomas, Shums Coda Associates, representing Colorado Chapter Code Development Committee (sthomas@coloradocode.net)

2024 International Building Code

SECTION 3006
ELEVATOR LOBBIES AND HOISTWAY OPENING PROTECTION

Revise as follows:

3006.2 Elevator hoistway door protection required. Elevator hoistway doors shall be protected in accordance with Section 3006.3 where an elevator hoistway connects more than three *stories*, is required to be enclosed within a *shaft enclosure* in accordance with Section 712.1.1 and any of the following conditions apply:

1. The *building* is not protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. The *building* contains a Group I-1, Condition 2 occupancy.
3. The *building* contains a Group I-2 occupancy.
4. The *building* contains a Group I-3 occupancy.
5. The *building* is a high rise and the elevator hoistway is more than 75 feet (22 860 mm) in height. The height of the hoistway shall be measured from the *lowest floor* to the highest floor of the floors served by the hoistway.
6. ~~The elevator hoistway door is located in the wall of a *corridor* required to be fire-resistance rated in accordance with Section 1020.1.~~

Exceptions:

1. Protection of elevator hoistway doors is not required where the elevator serves only *open parking garages* in accordance with Section 406.5.
2. Protection of elevator hoistway doors is not required at the levels of exit discharge, provided that the levels of exit discharge is equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. Protection of elevator hoistway doors is not required on levels where the elevator hoistway doors open to the exterior.

~~**3006.2.1**~~ **3006.3 Rated corridors.** Where *corridors* are required to be fire-resistance rated in accordance with Section 1020.2, elevator hoistway openings that open into such corridors shall be protected in accordance with Section ~~3006.3~~ 3006.4.

~~**3006.3**~~ **3006.4 Elevator hoistway door protection.** Where Section 3006.2 requires protection of the elevator hoistway doors, the protection shall be provided by one of the following:

1. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor with *fire partitions* in accordance with Section 708. In addition, doors protecting openings in the fire partitions shall comply with Section 716.2.2.1. Penetrations of the fire partitions by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.
2. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor by *smoke partitions* in accordance with Section 710. In addition, doors protecting openings in the *smoke partitions* shall comply with Sections 710.5.2.2, 710.5.2.3 and 716.2.6.1. Penetrations of the *smoke partitions* by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.

3. Additional doors or other devices shall be provided at each elevator hoistway door in accordance with Section 3002.6. Such doors or other devices shall comply with the smoke and draft control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal.
4. The elevator hoistway shall be pressurized in accordance with Section 909.21.
5. A *smoke-protective curtain assembly for hoistways* shall be provided at each elevator hoistway door opening in accordance with Section 3002.6. Such curtain assemblies shall comply with the smoke and draft control requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal. Such curtain assemblies shall be equipped with a control unit *listed* to UL 864. Such curtain assemblies shall comply with Section 2.11.6.3 of ASME A17.1/CSA B44. Installation and maintenance shall be in accordance with NFPA 105.

~~3006.4~~ <u>3006.5</u> **Means of egress.** Elevator lobbies shall be provided with not less than one *means of egress* complying with Chapter 10 and other provisions in this code. Egress through an enclosed elevator lobby shall be permitted in accordance with Item 1 of Section 1016.2. Electrically locked exit access doors providing egress from elevator lobbies shall be permitted in accordance with Section 1010.2.14.

1020.2.1 Hoistway protection. Elevator hoistway doors in elevators hoistway enclosures required to be fire-resistance rated shall be protected in accordance with Section 716. Elevator hoistway doors shall also be protected in accordance with Section ~~3006.2~~ <u>3006.3</u>.

Reason: The original proposal G182-21 deleted Section 3006.2.1 and relocated the requirement into Section 3006.2 as item 6. However, the committee modified the proposal by retaining the language in Section 3006.2.1. The committe reason stated, "This modification was presented as needed because the provisions in the FS proposals related to elevator hoistway doors have not been decided yet". However, the fire safety committee did not go back and fix the issue afterwards. So, this is an attempt to remove any conflicts between the two sections. We are proposing that Item 6 be removed from Section 3006.2. The charging language requires that the hoistway doors be protected when the hoistway connects more than three stories. Therefore, elevator hoistway openings in residential buildings that are three stories or less, for example, would not require the hoistway protection. Therefore, we are deleting that out of Section 3006.2 to eliminate the conflict. We are also renumbering Section 3006.2.1 to 3006.3 to clarify that this is a stand alone section and not a subsiderary section to Section 3006.2. We also cleaned up the language to provide better clarity. Subsequent Sections numbers have also been revised.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is intended to remove a conflict so the cost of constructions should not change.

G163-25

G164-25

IBC: 3006.3

Proponents: Dave Bauer, Smoke Guard, Inc., representing Smoke Guard (dave.bauer@smokeguard.com)

2024 International Building Code

Revise as follows:

3006.3 Elevator hoistway door protection. Where Section 3006.2 requires protection of the elevator hoistway doors, the protection shall be provided by one of the following:

1. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor with *fire partitions* in accordance with Section 708. In addition, doors protecting openings in the fire partitions shall comply with Section 716.2.2.1. Penetrations of the fire partitions by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.
2. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor by *smoke partitions* in accordance with Section 710. In addition, doors protecting openings in the *smoke partitions* shall comply with Sections 710.5.2.2, 710.5.2.3 and 716.2.6.1. Penetrations of the *smoke partitions* by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.
3. Additional doors or other devices shall be provided at each elevator hoistway door in accordance with Section 3002.6. Such doors or other devices shall comply with the smoke and draft control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal.
4. ~~The~~ <u>For occupancies other than Group I-1 Condition 2 or Group I-2, the</u> elevator hoistway shall be pressurized in accordance with Section 909.21.
5. A *smoke-protective curtain assembly for hoistways* shall be provided at each elevator hoistway door opening in accordance with Section 3002.6. Such curtain assemblies shall comply with the smoke and draft control requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal. Such curtain assemblies shall be equipped with a control unit *listed* to UL 864. Such curtain assemblies shall comply with Section 2.11.6.3 of ASME A17.1/CSA B44. Installation and maintenance shall be in accordance with NFPA 105.

Reason: There is concern regarding the safety of the use of shaft pressurization system in hospitals and assisted living facilities amongst hospital risk management specialists and infection control clinicians, when those health care professionals are educated regarding the means that construction professionals may use for smoke protection at the elevator hoistway. Hospitals are designed with spaces that include both positive and negative pressure rooms, both for the safety of occupants and patients. Negative pressure rooms are those with airflow designed to flow into the room, such that infectious agents and pathogens cannot leave that designated space (example: a tuberculosis patient. Positive pressure rooms are designed such that airflow is out of a room such that it rejects infectious agents such as staff and virus' causing the common cold (example: a burn patient or other immunocompromised patient). In these instances, the balance between air pressure in those rooms and the corridor is critical. The surcharge of pressure into an elevator shaft upon activation of an elevator shaft pressurization system is inherently designed such that air flows out through the elevator doors into the corridor, which unavoidably will increase air pressure in the corridor, altering the balance of pressures between that corridor and any positive pressure rooms to some degree. The degree of severity would be dependent on the particular layout of that hospital.

Secondly, pathogens such as legionella are present in normally inaccessible spaces such as elevator shafts. The activation of an elevator shaft pressurization system will agitate any pathogens and combined with the outward flow of air from the shaft through the elevator doors, introduce those pathogens into the general population of the hospital.

Senior Living facilities in the International Building Code are divided into to subcategories, Condition 1 and Condition 2. I-1 Condition 1 occupancies are constructed much like residential occupancies and are not considered relevant to this proposed change. However, I-1 Condition 2 facilities are constructed much like I-2 occupancies. The vulnerable nature of I-1 Condition 2 building occupants is nearly analogous to those of I-2 facilities.

Last, it's important to consider that this condition would not only occur during a fire event, since testing would occur perhaps monthly, and false alarms can happen at any time. Pressurization of an elevator shaft, arguably the dirtiest space in any building, would promote the movement of particles from the elevator shaft into the occupied building volume, greatly increasing the chance of infection. Simultaneously, the resultant increase in corridor air pressure will inherently diminish the effectiveness of positive pressure room.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change proposal only affects one of several long established options, and the proposed restriction affects only two occupancy types: I-2 and I-1 Condition 2. It is not anticipated that this would have any cost impact.

G164-25

G165-25

IBC: 3006.3

Proponents: Jeffrey Blain, representing Edgett Williams Consulting Group (jeffrey.w.blain@gmail.com)

2024 International Building Code

Revise as follows:

3006.3 Elevator hoistway door protection. Where Section 3006.2 requires protection of the elevator hoistway doors, the protection shall be provided by one of the following:

1. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor with *fire partitions* in accordance with Section 708. In addition, doors protecting openings in the fire partitions shall comply with Section 716.2.2.1. Penetrations of the fire partitions by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.
2. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor by *smoke partitions* in accordance with Section 710. In addition, doors protecting openings in the *smoke partitions* shall comply with Sections 710.5.2.2, 710.5.2.3 and 716.2.6.1. Penetrations of the *smoke partitions* by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.
3. Additional doors or other devices shall be provided at each elevator hoistway door in accordance with Section 3002.6. Such doors or other devices shall comply with the smoke and draft control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal.
4. The elevator hoistway shall be pressurized in accordance with Section 909.21.
5. A *smoke-protective curtain assembly for hoistways* shall be provided at each elevator hoistway door opening in accordance with Section 3002.6. Such curtain assemblies shall comply with the smoke and draft control requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal. Such curtain assemblies shall be equipped with a control unit *listed* to UL 864. Such curtain assemblies shall comply with Section 2.11.6.3 of ASME A17.1/CSA B44. Installation and maintenance shall be in accordance with NFPA 105.

6 Each elevator entrance assembly shall comply with the smoke and draft control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal.

Reason: Provides an additional option to meet the smoke and draft control requirements which will also provide the following advantages:

1. We feel this proposal enhances safety as compared with zero-clearance doors provided at the hoistway openings by eliminating any gap between the zero clearance door and the elevator hoistway door.
2. We feel this proposal enhances reliability by having each elevator entrance assembly be UL 1784 compliant rather than one or two door assemblies at the entrance(s) to the elevator lobby. In addition, these elevator entrances are not dependent on a signal from the fire alarm system to initiate door closing.
3. Relevant safety requirements for gasketing of hoistway entrances are included in A17.1 (see requirement 2.11.19).
4. Long term reliability would be enhanced because the entrances would be regularly checked and maintained as part of the elevator maintenance program and would also be subject to the code required periodic inspections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change proposal provide another option for compliance and therefore does not increase nor decrease the cost of construction.

G165-25

G167-25

IBC: 3007.8, 3008.8

Proponents: Kevin Brinkman, representing NEII (klbrinkman@neii.org)

2024 International Building Code

SECTION 3007
FIRE SERVICE ACCESS ELEVATOR

Revise as follows:

3007.8 Electrical power. The following features serving each fire service access elevator shall be supplied by both normal power and Type 60/Class 2/Level 1 standby power:

1. Elevator equipment.
2. Elevator hoistway lighting.
3. ~~*Ventilation* and cooling~~ Temperature control equipment for elevator machine rooms, control rooms, machine spaces and control spaces.
4. Elevator car lighting.
5. Pit sump pump

SECTION 3008
OCCUPANT EVACUATION ELEVATORS

3008.8 Electrical power. The following features serving each occupant evacuation elevator shall be supplied by both normal power and Type 60/Class 2/Level 1 standby power:

1. Elevator equipment.
2. ~~*Ventilation* and cooling~~ Temperature control equipment for elevator machine rooms, control rooms, machinery spaces and control spaces.
3. Elevator car lighting.
4. Pit sump pump

Reason: The sump pump should be included on standby power because elevators are required to continue to run on standby power and accumulation of water in the pit could shut down the elevator prematurely. The standby power should also include all temperature control equipment, including heat, to maintain temperatures in the established range to protect the equipment and ensure proper operation. This also aligns with the title of 3005.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change does not impact the cost of construction because it is a clarification to align with what is already in place.

G167-25

G168-25

IBC: 3008.1

Proponents: Kevin Brinkman, representing NEII (klbrinkman@neii.org)

2024 International Building Code

SECTION 3008
OCCUPANT EVACUATION ELEVATORS

Revise as follows:

3008.1 General. ~~Elevators~~ Where elevators are to be used for occupant self-evacuation during ~~fires~~ emergencies, all electric passenger elevators, including Fire Service Access Elevators in accordance with section 3007, shall comply with Sections 3008.1 through 3008.10.

Exceptions:

1. All freight and hydraulic elevators shall be prohibited from being used for occupant self-evacuation.
2. Elevators that serve three contiguous floors or less shall not be required to be used for occupant self-evacuation when approved by the authority having jurisdiction.

Reason: Adding “including FSAEs in accordance with 3007” to prevent confusion regarding whether FSAEs should or shouldn’t be used as OEEs. This language ensures that FSAEs should be used as OEEs and should comply with Section 3008 since they can help evacuate occupants during emergencies before the firefighters arrive at the building and even after firefighters arrive. The firefighters could override the OEO for the FSAEs if they choose to use them for firefighter’s emergency operation at any time. Changing the language from “during fire” to “during emergencies” will allow for non-Fire emergencies as well. Delete the term “for general public use” because it is unnecessary and confusing since even if we have a service passenger elevator that typically is not used by the general public, it should be used as OEE during emergencies since it can contribute to evacuate occupants out of the building. Delete the last sentence: “where other elevators are used for occupant self-evacuation, those elevators shall comply with these sections” because this is unnecessary and confusing language (it is unclear which potential “other elevators” could be used as OEEs)*To be consistent with the A17.1 code language section 2.27.10 for FSAEs which prohibits all freight and hydraulic elevators for use as OEEs. This is due to the construction of freight elevators and conflicts between the NFPA 13 (Sprinkler code) and the building and elevator codes regarding sprinkler protection and shunt trip for freight and hydraulic elevators. NFPA 13 requires sprinklers in hydraulic elevators machine rooms and top of freight elevators hoistways, the elevator code requires shunt trip when sprinklers are located in machine rooms and top of hoistways, however, IBC Section 3008.2.1 prohibits sprinklers in all OEEs associated locations and section 3008.4 prohibits shunt trip for all OEEs.*

To clarify that 2-3 stops passenger elevators, typically used as parking or shuttle elevators, are not required to be OEEs if they do not contribute to evacuation of occupants out of the building. This language is permissive and will need specific AHJ approval after evaluation of each specific elevator.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change will not impact the cost of construction because use of elevators for self-evacuation is permissible but not required.

G168-25

G169-25

IBC: 3008.1, 3008.1.1

Proponents: Sagiv Weiss-Ishai, San Francisco Fire Department, representing SFFD (sagiv.weiss-ishai@sfgov.org)

2024 International Building Code

Revise as follows:

3008.1 General. ~~Elevators used for occupant self-evacuation during fires~~ Where elevators are to be used for occupant self-evacuation during emergencies, all passenger elevators, including fire service access elevators in accordance with Section 3007, shall comply with Sections 3008.1 through 3008.10.

3008.1.1 ~~**Number of occupant evacuation elevators**~~ **Elevator restrictions for occupant self-evacuation.** ~~The number of elevators available for occupant evacuation shall be determined based on an egress analysis that addresses one of the following scenarios:~~ Elevators that are prohibited or not required to be used for occupant self-evacuation shall be as follows:

1. ~~Full *building* evacuation where the analysis demonstrates that the number of elevators provided for evacuation results in an evacuation time less than 1 hour.~~ Elevators with 2 or 3 stops only, shall not be required to be used for occupant self-evacuation when approved by the authority having jurisdiction.
2. ~~Evacuation of the five consecutive floors with the highest cumulative *occupant load* where the analysis demonstrates that the number of elevators provided for evacuation results in an evacuation time less than 15 minutes.~~ All freight elevators shall be prohibited to be used for occupant self-evacuation.
3. All hydraulic elevators shall be prohibited to be used for occupant self-evacuation.

~~Not less than one elevator in each bank shall be designated for occupant evacuation. Not less than two shall be provided in each occupant evacuation elevator lobby where more than one elevator opens into the lobby. Signage shall be provided to denote which elevators are available for occupant evacuation.~~

Reason: 1. The standards for the evaluation of the evacuation of building occupants are not robust enough for states and areas which are prone to earthquakes (such as California). Having all passenger elevators used as OEE provides the maximum opportunity for building occupants – especially those persons with disabilities or mobility impairment - to use elevators for evacuation during emergencies.

2.Following 9/11, the Building Code adopted provisions to allow elevators to serve as an additional form of egress and to assist emergency personnel during emergencies. It was never intended for Occupant Evacuation Elevators (OEE) to be installed in lieu of a required additional stairwell. In states and areas prone to earthquakes, which could shut down an elevator's operation, there is a concern that removing the additional stairwell and reducing the number of OEEs could increase risk to a building's occupants - especially persons with disabilities or mobility impairments – and hinder rescue personnel's efforts during emergencies. Therefore, the state of CA has modified the CA Building code section 3008 to require all passenger elevators to serve as OEEs. (See attached 2022 CA Building Code image)

Also, the egress analysis described in section 3008.1.1 is not feasible. Elevators companies refuse to provide such egress/traffic analysis due to liability issues. Other professionals such as Architects and Civil/Electrical/Fire-Protection, etc. Engineers do not have the required tools/means to provide such an analysis. Fire and Building AHJs are not qualified to review and approve egress analysis which is outside of their expertise and therefore they refuse to accept OEE/OEO design base on egress analysis not requiring all passenger elevators to serve as OEEs. Also, elevator companies refuse to provide this egress/traffic analysis since they cannot predict the behavior and occupancy changes of the building and its occupants after the construction is completed. For example: If a group A-2 occupancy (large restaurant with large occupant load) will be added to an office building (B occupancy) or a hotel (R-1) Occupancy after the building construction was completed with a specific egress analysis - the new occupancy and additional potential occupant load will change the egress analysis and may require additional OEE elevators to be provided - but at this point it will not be feasible to change the entire design of the OEE/OEO system. The potential changes of the building behavior could also be caused due to change of building use/occupancy.

In states/areas prone to earthquakes (such as CA) - elevators AHJs and inspectors refuse to allow the reduction of exit stairways if not all passenger elevators are used as OEE since an earthquake can compromise many elevators during one event. Therefore, the state of CA did not adopt the IBC Section 3008.1.1 and does not allow for egress analysis.

OEEs (Section 3008) were first included in IBC 2009 edition - the following editions 2012 and 2015 they all required all passenger elevators to serve as OEEs when the number of stairs is reduced per Section 403.5.2. The change for number of OEEs based on egress analysis was first included in the 2018 edition of IBC due to potential large generator size that is required to supply backup power to all OEEs in case the building normal power is lost and since all OEEs are required to run simultanesouly on backup generator power. However, this change in the IBC did not clarify how the OEE/OEO design will be implemented and it created major design issues and conflicts in addition to all the other issues mentioned before.

Therefore, this proposal is intended to revert the IBC language to what it was in the 2009, 2012 and 2015 editions and also be consistent with the state of CA building code. This change will increase safety for the building occupants and first responders especially in states/areas prone to earthquakes and for all other buildings where reduction in interior egress stairwell is desired.

3. Adding the language: “including FSAEs in accordance with 3007” is intended to prevent confusion regarding if FSAEs should or shouldn’t be used as OEEs. This language ensures that FSAEs (which must be passenger elevators) should be used as OEEs and should comply with Section 3008 since they can help evacuate occupants during emergencies before the firefighters arrive to the building and even after firefighters arrive. The firefighters could override the OEO for the FSAEs if they choose to use them (one or both FSAEs) for fire operation at any time. Typically, in a fire emergency operation in a high-rise building with two FSAEs - the firefighters are using only one FSAE for the emergency operation while the other FSAE could serve as an OEE to help evacuate occupants in the most efficient way.

4. Changing the language from “during fire” to “during emergencies” will allow the use of the OEEs for all types of emergencies (fire and non-fire).

5.Delete the last sentence: “where other elevators are used for occupant self-evacuation, those elevators shall comply with these sections” – this is unnecessary and confusing language (it is unclear which potential “other elevators” could be used as OEEs)

6. Rationale for the proposed change for Section 3008.1.1 (1)

3008.1.1 Elevators with 2 or 3 stops only, shall not be required to be used for occupant self-evacuation when approved by the authority having jurisdiction.

Rationale: To clarify that 2-3 stops passenger elevators, typically used as parking or shuttle elevators, are not required to be OEEs if they do not contribute to evacuate occupants out of the building – This language is permissive and will need specific AHJ approval after evaluation of each specific elevator. All other passenger elevators with 4 or more stops will contribute to the evacuation of occupants nd should serve as OEEs without the need for specific AHJ approval

7. Rationale for the proposed change for Section 3008.1.1 (2) and (3)

Rationale: To be consistent with the A17.1 code language section 2.27.10 for FSAEs which prohibits all freight and hydraulic elevators to be used as OEEs. This is due to the construction of freight elevators and conflicts between the NFPA 13 (Sprinkler code) and the building and elevator codes regarding sprinkler protection and shunt trip for freight and hydraulic elevators. NFPA 13 requires sprinklers in hydraulic elevators machine rooms, the elevator code requires shunt trip when sprinklers are located in machine rooms and top of hoistways, however, IBC Section 3008.2.1 prohibits sprinklers in all OEEs associated locations and section 3008.4 prohibits shunt trip for all OEEs. Also Section 3008.1 specifically require "Passenger" elevators to be used as OEEs and this prohibits "Freight" elevators to be used as OEEs and this proposal clarify the specific difference between passenger and freight elevators regardless if the freight elevator is hydraulic or traction (electric) type.

Bibliography: IBC 2009, 2012, 2015 Section 3008

CBC -2022 Section 3008

Cost Impact: Increase

Estimated Immediate Cost Impact:

It is not clear how to calculate the potential cost increase since it is based on an egress analysis and other design factors of the OEE/OEO system. A rough estimate might be $100,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost for the potential larger generator will be increased in order to run all OEEs on backup power at the same time when the building normal power is lost

However - the increase in cost is not clear due to the complexity of the OEE/OEO design if not all the passenger elevator are used based on an egress analysis

G169-25

G170-25

IBC: 3008.6.3.1

Proponents: Kevin Brinkman, representing NEII (klbrinkman@neii.org)

2024 International Building Code

Revise as follows:

3008.6.3.1 ~~Vision panel~~ Visibility Means. ~~A vision panel~~ Visibility means shall be installed in each *fire door assembly* in the *smoke barrier*. The ~~vision panel~~ visibility means shall consist of fire-protection-rated glazing, shall comply with the requirements of Section 716 and shall be located to furnish clear vision of the occupant evacuation elevator lobby.

Reason: To assure the intent of the requirement is clear while not using a common elevator term to avoid confusion. A vision panel is defined in A17.1/B44 as part of the manually operatedor self-closing hoistway doors, using the term here in a different context creates confusion.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is a clarification for seeing though rated doors serving elevator lobbies therefore there is no cost impact

G170-25

2024 International Building Code

SECTION 3102
MEMBRANE STRUCTURES

Revise as follows:

3102.1 General. The provisions of Sections 3102.1 through 3102.8 shall apply to *air-supported*, *air-inflated*, *membrane-covered cable*, *membrane-covered frame* and *tensile membrane structures*, collectively known as *membrane structures*, erected for a period of 180 days or longer. Those erected for a shorter period of time shall comply with the *International Fire Code*. Membrane *structures* covering water storage *facilities*, water clarifiers, water treatment plants, sewage treatment plants, *greenhouses* and similar *facilities* not used for human occupancy are required to meet only the requirements of Sections 3102.3.1 and 3102.7. Membrane *structures* erected on a *building*, balcony, deck or other *structure* for any period of time shall comply with this section.

<u>**Exception:** A temporary membrane structure exclusively used for recreational camping purposes which is erected on a detached deck that is not more than 30-inches above grade at any point shall comply with the *International Fire Code*.</u>

3103.1 General. The provisions of Sections 3103.1 through 3103.8 shall apply to *structures* erected for a period of less than 180 days. Temporary *special event structures*, *tents*, umbrella *structures* and other membrane *structures* erected for a period of less than 180 days shall also comply with the *International Fire Code*. *Temporary structures* erected for a longer period of time and *public-occupancy temporary structures* shall comply with applicable sections of this code.

Exceptions:

1. *Public-occupancy temporary structures* complying with Section 3103.1.1 shall be permitted to remain in service for 180 days or more but not more than 1 year where *approved* by the *building official*.
2. *Public-occupancy temporary structures* within the confines of an *existing structure* are not required to comply with Section 3103.6.
3. <u>Temporary tents used exclusively for camping purposes on the ground or on a detached platform that is not more than 30-inches above grade at any point shall comply with the *International Fire Code*.</u>

2024 International Fire Code

SECTION 105
PERMITS

105.5.51 Temporary membrane structures, special event structures and tents. An operational permit is required to operate an air-supported temporary membrane structure, a temporary *special event structure* or a tent having an area in excess of 400 square feet (37 m^2).

Exceptions:

1. Tents used exclusively for recreational camping purposes and that are placed either on the ground or on detached platforms that are not more than 30-inches above grade at any point.
2. Tents, curtains and extensions attached thereto, when used for funeral services.
3. Tents open on all sides, which comply with all of the following:
   - 3.1. Individual tents having a maximum size of 700 square feet (65 m^2).
   - 3.2. The aggregate area of multiple tents placed side by side without a fire break clearance of not less than 12 feet (3658 mm) shall not exceed 700 square feet (65 m^2) total.
   - 3.3. A minimum clearance of 12 feet (3658 mm) to structures and other tents shall be provided.

Reason: Camping tents usually qualify for Exception #1 in Section 105.5.51 of the 2024 IFC, which provides relief from permitting requirements. Yet that exception doesn't apply to any camping tent that is on any structure for any length of time according to last sentence in Section 3102.1 of the 2024 IBC and Section 3103.7.4 of the 2024 IFC. They cause any camping tent on any deck to comply with Sections 105 and 3102 of the IBC. That is good when they are either inside of or on top of buildings. But that isn't necessary for camping tents that are placed on low detached decks.

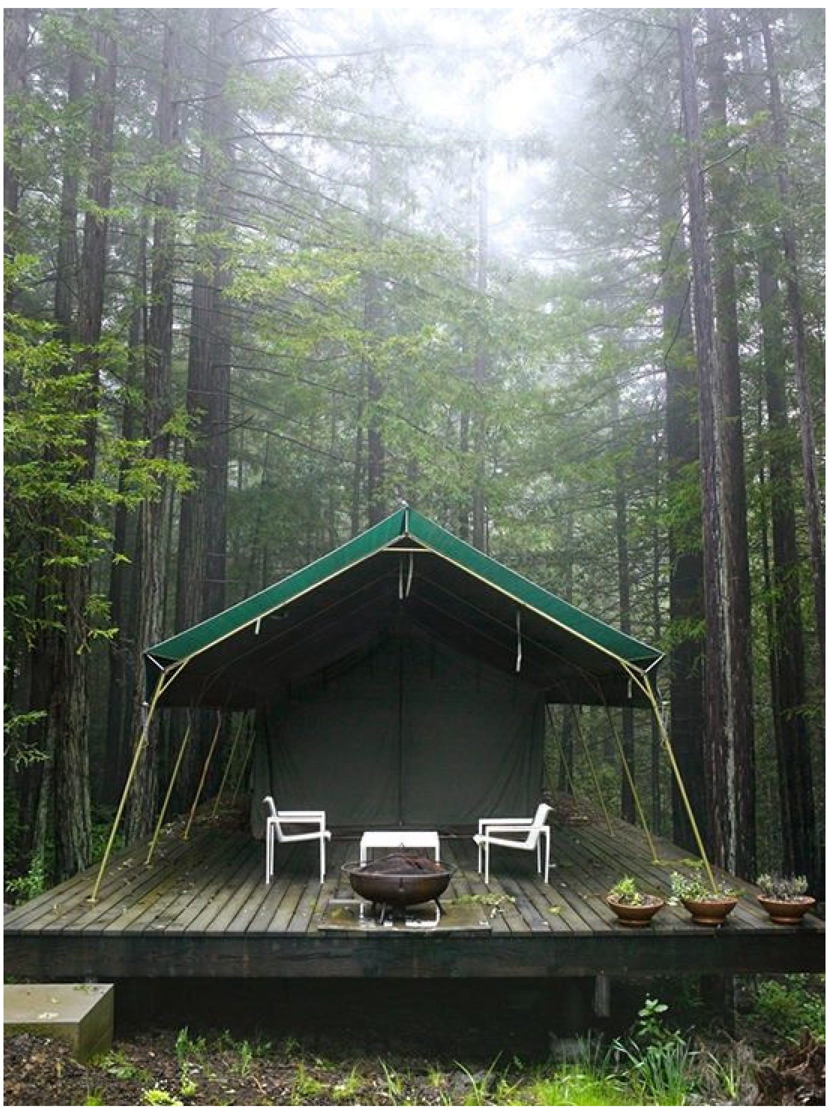
Elevated camping platforms provide a convenient way for campgrounds to eliminate a camper's need to cut roots and disturb soil as they try to find a flat dry surface within their campsite on which to pitch their tent. Those platforms are often slightly raised detached wooden decks especially at more remote camping locations where dumping loads of imported fill isn't practical. For compliance with the 2024 International Codes, a new building permit is required each time a camping tent is set up on one of those elevated detached camping platforms and they must comply with the 2024 IBC's provisions for permanent structures. That's regardless of their size, so even 1-person puptents need to be permitted and comply with Section 3102 of the 2024 IBC.

This proposal provides a safe way to for temporary camping tents on small, slightly elevated, detached decks to access Exception #1 of Section 105.5.51 of the 2024 IFC. It limits the height of elevated camping platforms for tents to avoid the need for guards and to minimize the consequences of deck failure.

The elevated camping platforms, like other free-standing decks, are not affected by this proposal. Their compliance with the International Code's construction and other applicable provisions would continue to be required including the permitting requirements.

Note: This proposal for the IBC needs to be coordinated with Section 3103.7.4 of the IFC, perhaps as follows:

3103.7.4 Membrane structures on buildings. *Membrane structures* that are erected on buildings, balconies, decks or other structures shall be regulated as permanent *membrane structures* in accordance with Section 3102 of the *International Building Code*.
Exception: A temporary *membrane structure* exclusively used for recreational camping purposes which is erected on a detached deck that is not more than 30-inches above grade at any point shall comply with the provisions in this code for recreational camping tents.
Here are photographs representing the camping tents on elevated platforms for which this proposal intends to provide relief:



Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. This does not affect construction cost. Relief is provided from the costs that are associated with the permitting process without affecting the safety and sustainability that the permitting process offers for more significant construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

The removal of the administrative requirement includes the costs associated with that requirement. The benefit of the permitting process is negligible for camping tents being erected temporarily on detached camping platforms that are not more than 30-inches above grade at any point. The costs that are associated with the permitting process are comparatively much greater than the benefit of that process for this particular situation.

Estimated Life Cycle Cost Impact:

The life cycle cost impact, which is for the period of time that a temporary camping tent would be erected on a detached low deck, is permanent in regards to the costs of the permitting process and negligible for the costs to safety and sustainiblitiy.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The costs savings from the permitting process is permanent while any costs that may be associated with the lack of oversight that happens without the permitting process are temporary.

G171-25

G172-25

IBC: 3102.1, 3102.7

Proponents: Jonathan Siu, Jon Siu Consulting, LLC, representing Washington Association of Building Officials Technical Code Development Committee; Julius Carreon, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee (jcarreon@bellevuewa.gov); Micah Chappell, Seattle Dept. of Construction and Inspections (SDCI), representing Washington Association of Building Officials Technical Code Development Committee (WABO TCD) (micah.chappell@seattle.gov)

2024 International Building Code

Revise as follows:

3102.1 General. The provisions of Sections 3102.1 through 3102.8 shall apply to *air-supported*, *air-inflated*, *membrane-covered cable*, *membrane-covered frame* and *tensile membrane structures*, collectively known as *membrane structures*, erected for a period of longer than 180 days~~ or longer~~. Those erected for a shorter period of time shall comply with the *International Fire Code*. Membrane *structures* covering water storage *facilities*, water clarifiers, water treatment plants, sewage treatment plants, *greenhouses* and similar *facilities* not used for human occupancy are required to meet only the requirements of Sections 3102.3.1 and 3102.7. Membrane *structures* erected on a *building*, balcony, deck or other *structure* for any period of time shall comply with this section.

3102.7 Engineering design. The *structure* shall be designed and constructed to sustain~~*dead loads*;~~ *loads* due to tension or inflation~~; *live loads* including wind, snow or *flood* and seismic loads~~ and *loads* in accordance with Chapter 16.

Reason: This proposal is intended to align the timeframe and design loads for membrane structures with other parts of the code. Section 3102 is intended to apply to permanent membrane structures, since it points to the IFC for temporary membrane structures. However, in the IFC and in most parts of the IBC (including the definitions), a temporary structure is a structure that is in place for 180 days or less. The current language in 3102.1 says membrane structures must comply with provisions for permanent structures when the timeframe is exactly 180 days, which conflicts with the rest of the code. This proposal eliminates the overlap at 180 days, consistent with the definitions and other provisions. (Note that there is a separate proposal to align timeframes for temporary structures in IBC 108 and 3103.)

Regarding design loads, the current language in Section 3102.7 requires membrane structures to be designed for dead loads, tension/inflation loads, and "*live loads* **including** wind, snow, flood, and seismic loads [emphasis added]." Aside from erroneously identifying wind, snow, flood, and seismic loads as live loads, Chapter 16 contains loading criteria for soil/hydrostatic, rain, ice, and tsunami conditions that should be considered in the design of these structures, similar to all other permanent structures. Rather than naming all the load cases, this proposal reduces the list to a pointer to Chapter 16. Note that the requirement to design for membrane tension/inflation loads is retained here, as that loading condition is not explicitly covered in Chapter 16.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification that eliminates a conflict and aligns the provisions for permanent membrane structures with other sections in the code pertinent to permanent structures.

2024 International Fire Code

SECTION 107 TEMPORARY STRUCTURES, USES, EQUIPMENT AND SYSTEMS

Revise as follows:

[A] 107.1 General. The *fire code official* is authorized to issue a permit for temporary structures, uses, equipment or systems as required in Sections 105.5 and 105.6. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. *Public-occupancy temporary structures* shall be permitted for a period not to exceed one year. The *fire code official* is authorized to grant extensions for demonstrated cause.

2024 International Building Code

SECTION 108 TEMPORARY STRUCTURES, EQUIPMENT AND SYSTEMS

Revise as follows:

[A] 108.1 General. The *building official* is authorized to issue a *permit* for temporary *structures* , equipment or systems. Such *permits* shall be limited as to time of service, but shall not be permitted for more than 180 days. *Public-occupancy temporary structures* shall be permitted for a period not to exceed one year. The *building official* is authorized to grant extensions for demonstrated cause or in accordance with Section 3103. ~~Structures designed to comply with Section 3103.6 shall not be in service for a period of more than 1 year unless an extension of time is granted.~~
Detached *tents* and other *membrane structures* erected for a period of 180 days or less shall comply with the International Fire Code.

SERVICE LIFE. The period of time that a *structure* serves its intended purpose. For *temporary structures*, this shall be the cumulative time of service for sequential *temporary events* that may occur in multiple locations. ~~For *public occupancy temporary structures* , this is assumed to be a minimum of 10 years.~~
TEMPORARY EVENT. A single use during the *service life* of a ~~*public occupancy*~~ *temporary structure* at a given location that includes its installation, inspection, use and occupancy, and dismantling.

SECTION 3103 TEMPORARY STRUCTURES

3103.1 General. The provisions of ~~Sections 3103.1 through 3103.8~~ this section shall apply to *structures* erected for a period of ~~less than~~ 180 days or less. Temporary *special event structures*, *tents*, umbrella *structures* and other membrane *structures* erected for a period of ~~less than~~ 180 days or less shall also comply with the *International Fire Code*. *Temporary structures* erected for a longer period of time ~~and *public occupancy temporary structures*~~ shall comply with applicable sections of this code for permanent structures.

Exceptions~~.~~:

~~1.~~ ~~*Public-occupancy temporary structures* complying with Section 3103.1.1 shall be permitted to remain in service for 180 days or more but not more than 1 year where *approved* by the *building official*.~~

~~2.~~ *Public-occupancy temporary structures* within the confines of an enclosed *existing structure* are not required to comply with Section 3103.6.

3103.1.1 Extended period of service time. ~~Public-occupancy temporary~~ *Temporary structures* shall be permitted to remain in service for 180 days or more without complying with requirements in this code for new *building* or structures where extensions for up to 1 year are granted by the *Building* Official in accordance with Section 108.1 and where the following conditions are satisfied:

1. Additional inspections as determined by the building official shall be performed by a qualified *person* to verify that site conditions and the *approved* installation comply with the conditions of approval at the time of final inspection.
2. A qualified *person* shall perform follow-up inspections after initial occupancy at intervals not exceeding 180 days to verify the site conditions and the installation conform to the *approved* site conditions and installation requirements. Inspection records shall be kept and shall be made available for verification by the *building official*.
3. An examination shall be performed by a *registered design professional* to determine the adequacy of the temporary structure to resist the structural loads required in Section 3103.6.
4. Relocation of the ~~*public-occupancy*~~*temporary structure* shall require a new *permit* application.
5. The use or occupancy *approved* at the time of final inspection shall remain unchanged.
6. A request for an extension is submitted to the *building official*. The request shall include records of the inspections and examination in Items 1 and 3.

3103.6 Structural requirements. *Temporary structures* ~~shall comply with the structural requirements of this code.~~ ~~*Public-occupancy temporary structures*~~ shall be designed and erected to comply with the structural requirements of this code and Sections 3103.6.1 through 3103.6.4. For the purposes of this section, the *service life* of *public-occupancy temporary structures* shall be assumed to be 10 years.

Exception: Where *approved*, *live loads* less than those prescribed by Table 1607.1 shall be permitted provided that a *registered design professional* demonstrates that a rational approach has been used and that such reductions are warranted.

Temporary non-*building structures* ancillary to public assemblies or temporary *special event structures* whose structural failure or collapse would endanger assembled public shall be assigned a *risk category* corresponding to the ~~*risk category* of the~~ public assembly occupant load in accordance with Section 1604.5. For the purposes of establishing an *occupant load* for the assembled public endangered by structural failure or collapse, the applicable *occupant load* determination in Section 1004.5 or 1004.6 shall be applied over the assembly area within a radius equal to 1.5 times the height of the temporary non-*building structure*

3103.6.1 Structural loads. ~~*Public-occupancy temporary*~~ *Temporary structures* shall be designed in accordance with Chapter 16, except as modified by Sections 3103.6.1.1 through 3103.6.1.6.

3103.6.1.1 Snow loads. Snow loads on ~~public-occupancy~~ *temporary structures* shall be determined in accordance with Section 1608. The ground snow loads, p_g, in Section 1608 shall be permitted to be modified according to Table 3103.6.1.1.

Exception: Ground snow loads, p_g, for *public-occupancy temporary structures* that employ controlled-occupancy procedures per Section 3103.8 shall be permitted to be modified using a ground snow load reduction factor of 0.65 instead of the ground snow load reduction factors in Table 3103.6.1.1.

Where the ~~*public-occupancy*~~ *temporary structure* is not subject to snow loads or not constructed and occupied during times when snow is to be expected, snow loads need not be considered, provided that where the period of time when the ~~*public-occupancy*~~ *temporary structure* is in service shifts to include times when snow is to be expected, one of the following conditions is met:

1. The design is reviewed and modified, as appropriate, to account for snow loads.
2. ~~Controlled~~ For a *public-occupancy temporary structure*, controlled occupancy procedures in accordance with Section 3103.8 are implemented.

TABLE 3103.6.1.1 REDUCTION FACTORS FOR GROUND SNOW LOADS FOR ~~PUBLIC-OCCUPANCY~~ TEMPORARY STRUCTURES

RISK CATEGORY	SERVICE LIFE	
	≤ 10 yr	>10 yr
II	0.7	1.0
III	0.8	1.0
IV	1.0	1.0

3103.6.1.2 Wind loads. The design wind load on ~~*public-occupancy*~~ *temporary structures* shall be permitted to be modified in accordance with the wind load reduction factors in Table 3103.6.1.2.

Exceptions:

1. Design wind loads for *public-occupancy temporary structures* that implement controlled occupancy procedures per Section 3103.8 shall be permitted to be modified using a wind load reduction factor of 0.65.
2. For ~~*public-occupancy*~~ *temporary structures* erected in a *hurricane-prone region* outside of hurricane season, the *basic wind speed*, *V*, shall be permitted to be set as follows, depending on *risk category*:

   2.1. *Risk Category* II: 115 mph.

   2.2. Risk Category III: 120 mph.

   2.3. Risk Category IV: 125 mph.

TABLE 3103.6.1.2 REDUCTION FACTORS FOR WIND LOADS FOR ~~PUBLIC-OCCUPANCY~~ TEMPORARY STRUCTURES

RISK CATEGORY	SERVICE LIFE	
	≤ 10 yr	>10 yr
II	0.8	1.0
III	0.9	1.0
IV	1.0	1.0

3103.6.1.3 Flood loads. ~~*Public-occupancy temporary*~~ *Temporary* *structures* need not be designed for flood loads specified in Section 1612. Controlled occupancy procedures in accordance with Section 3103.8 shall be implemented for *public-occupancy temporary structures* located in areas prone to flooding as defined on a flood hazard map.

3103.6.1.4 Seismic loads. Seismic loads on ~~*public-occupancy*~~ *temporary structures* assigned to *Seismic Design Categories* C through F shall be permitted to be taken as 75 percent of those determined by Section 1613. ~~*Public-occupancy temporary*~~ *Temporary* *structures* assigned to *Seismic Design Categories* A and B are not required to be designed for seismic loads.

3103.6.1.5 Ice loads. Ice loads on ~~public-occupancy~~ *temporary structures* shall be permitted to be determined with a maximum nominal thickness of 0.5 inch (13 mm), for all risk categories. Where the ~~*public-occupancy*~~ *temporary structure* is not subject to ice loads or not constructed and occupied during times when ice is to be expected, ice loads need not be considered, provided that where the period of time when the ~~*public-occupancy*~~ *temporary structure* is in service shifts to include times when ice is to be expected, one of the following conditions is met:

1. The design is reviewed and modified, as appropriate, to account for ice loads.
2. ~~Controlled~~ For a *public-occupancy temporary structure*, controlled occupancy procedures in accordance with Section 3103.8 are implemented.

3103.6.1.6 Tsunami loads. *Public-occupancy temporary structures* in a *tsunami design zone* are not required to be designed for tsunami loads specified in Section 1615. Controlled occupancy procedures in accordance with Section 3103.8 shall be implemented for *public-occupancy temporary structures* located in a tsunami design zone.

3103.6.2 Foundations. ~~Public-occupancy temporary~~ *Temporary* *structures* shall be permitted to be supported on the ground with temporary foundations where *approved* by the *building official*. Consideration shall be given for the impacts of differential settlement where foundations do not extend below the ground or where foundations are supported on compressible materials. The presumptive load-bearing value for ~~*public-occupancy*~~ *temporary structures* supported on a pavement, slab on grade or on other collapsible or controlled low-strength substrate soils such as beach sand or grass shall be assumed not to exceed 1,000 pounds per square foot (47.88 kPa) unless determined through testing and evaluation by a *registered design professional*. The presumptive load-bearing values listed in Table 1806.2 shall be permitted to be used for other supporting soil conditions.

3103.6.4 Durability. Reusable components used in the erection and the installation of ~~*public-occupancy*~~ *temporary structures* shall be manufactured of durable materials necessary to withstand environmental conditions at the service location. Components damaged during transportation or installation or due to the effects of weathering shall be replaced or repaired.

3103.7 Serviceability. The effects of structural loads or conditions shall not adversely affect the serviceability or performance of the ~~*public-occupancy*~~ *temporary structure*.

Reason: This proposal is being submitted to correct errors in the code, correlate the IBC and the IFC, make other clarifications, and addresses what appears to be a logical inconsistency in the 2024 IBC provisions for loads on temporary structures versus public-occupancy temporary structures, as described below. The change to IFC 107.1 is to coordinate the permit timeframe for public-occupancy temporary structures with the change to IBC 108.1. Although "public-occupancy temporary structures" is not used anywhere in the IFC, the IBC definition would govern (see IFC 201.3) and this would prevent any conflicts with what is allowed in the IBC.

BACKGROUND:

Prior to the 2024 IBC, there was confusion in the design and enforcement communities regarding the structural design of temporary structures--what loads should be required? Technically, the IBC required temporary structures to be designed for the same loads as permanent structures, but this seemed unreasonable. Lacking guidance in the IBC and ASCE 7, many design professionals and jurisdictions turned to ASCE 37, which contains load provisions for buildings under construction. Past attempts to codify ASCE 37 for temporary structures were defeated because ASCE 37 is not appropriate for buildings that are occupied by the public. In the last cycle, ASCE/SEI organized an ad-hoc committee of experts to develop code change proposal S116-22, which defined loads and special procedures, mostly focused on public-occupancy temporary structures. Ultimately, S116-22 was revised in the Public Comment Hearing and approved through the Online Governmental Consensus Vote process, and its provisions are in Section 3103 of the 2024 IBC.

As part of the effort to develop the next version of ASCE 7 (ASCE 7-28), a new chapter dealing with loads on temporary structures is currently under development. The subcommittee responsible for developing the new chapter used 2024 IBC Section 3103 as a starting point and is making improvements to the provisions. Also, recognizing that the changes to the 2024 IBC necessitated correlating changes to the IFC, the ASCE/SEI ad hoc committee was tasked with developing code change proposals for Group A. In the process of all this development, some errors and inconsistencies in the current 2024 IBC and 2024 IFC were identified. In Group A last year, the IFC Committee approved code change proposals F198-24 and F199-24 which correct some of the errors and aligns the IFC with the new IBC requirements. (Note that with the new ICC code development process, we will not know if public comments have been submitted on these Group A proposals until March, 2026.)

ERRORS AND INCONSISTENCIES:

- Section 108.1 (temporary structures).
  - S116-22 inserted an allowance for public-occupancy temporary structures to be permitted for up to 1 year and allows other extensions in Section 3103. However, Section 108.1 limits permits for temporary structures to 180 days. This proposal inserts the 1-year allowance for public-occupancy temporary structures and adds a pointer to Section 3103 for consistency.
  - As currently written, the IBC regulates temporary detached tents and other membrane structures, since they are not exempted from compliance. However, IFC Section 3103.1 also clearly regulates them. In Group A, F199-24 attempted to change the IFC to require these tents and membrane structures to comply with both the IFC and IBC. However, the IFC Committee and other testifiers clearly indicated that they wanted <u>only</u> the IFC to govern, and that requirement was removed for CAH 2. This proposal adds a pointer to the IFC for consistency.
- Temporary Event (definition). S116-22 inserted new definitions for Temporary Structure, Temporary Event, and Public-Occupancy Temporary Structure (hereinafter referred to as a POTS). A Temporary Structure is there to support a Temporary Event. POTSs are a subset of temporary structures that are there to serve assembly occupancies or other public uses. However, the current definition of Temporary Event is a "single use...of a <u>public-occupancy</u> temporary structure at a given location..." [emphasis added]. Putting everything together, by these definitions, only POTSs meet the definition of Temporary Structure. This is clearly a mistake made in

the drafting of S116-22, since it would exclude all temporary structures that are not POTSs, such as a temporary air-supported membrane structure used as an aircraft hangar. This proposal addresses the issue by revising the definition of Temporary Event such that it applies to all temporary structures.

- Section 3103.1 (general/scoping).
  - By definition, a Temporary Structure is one that is erected for 180 days or less. However, Section 3103.1 conflicts with that definition, stating that this section applies to structures erected for a "period of less than 180 days," and that certain structures erected for "less than 180 days" must comply with the IFC. Comparing this to other references to the 180 days in the IBC and IFC Section 3103, temporary structures are allowed up to and including the 180 days, so this proposal changes IBC 3103.1 to match.
  - The last sentence requires temporary structures that are erected for more than 180 days and POTSs to comply with "this code." The intent is that structures that are not temporary should comply with the code for new construction (see also "Clarifications" below). However, as written, all POTSs would need to comply with new construction code. This proposal removes POTSs to deal with this inconsistency, as well as to deal with the substantive change described below.
- Section 3103.6.1.1 (snow loads). As currently written, snow loads must be reduced using the factors in Table 3103.6.1.1. This was an error in the drafting of S116-22, in that there should be no issue if the design professional wants to design for full snow loads, without the reductions. This proposal modifies the second sentence of Section 3103.6.1.1 to make the reduction factors an option.
- Sections 3103.6.3 (flood) and 3103.6.1.6 (tsunami). As currently written, controlled occupancy procedures per Section 3103.8 are required to address both flood and tsunami hazards, whether or not the structure is located in a flood or tsunami hazard areas. This was an oversight in the drafting of S116-22, and this proposal addresses the issue by triggering the controlled occupancy procedures only if the structure is located in the associated hazard area.

CLARIFICATIONS:

- Service Life (definition) and Section 3103.6 (structural requirements). The definition of Service Life states that 10 years is to be assumed for the service life of a POTS. This was felt to be a requirement contained in the definition, so this proposal moves that requirement to 3103.6.
- Section 3103.1 (general/scoping). This proposal clarifies that the intent is that compliance with "this code" is intended to mean that structures that are erected for periods longer than the temporary structure limits are required to be designed as permanent structures, which would include full structural loads.
- Section 3103.1, exceptions.
  - Exception 1 is deleted because it is covered in Section 108.1.
  - Exception 2 has been revised to apply only where the POTS is erected within an enclosed structure. The original thinking behind this exception was that if the temporary structure is inside a building, it is not subject to environmental loading (snow, wind, etc.) However, there was concern that a temporary structure located underneath a roof structure with open sides could interpreted as being "within the confines of an existing structure," which would then expose these structures to those loads.
- Section 3103.6 (structural requirements--risk category). Concerns have been raised that the risk category language regarding ancillary non-building structures (etc.) is unclear when it refers to the "risk category of the public assembly." The requirement has been modified to refer to the "public assembly occupant load" instead, as a clarification.

LOADS ON TEMPORARY STRUCTURES vs POTSs:

The remaining changes in this proposal address what is seen as a logical inconsistency in the current 2024 IBC Section 3103.6. That is, why are POTSs allowed to be designed for lower structural loads than other temporary structures, such as a temporary shelter for cement bags? If a POTS (which involves a public assembly) is allowed to have reduced loading, it seems logical that the same load reductions should also be allowed for other temporary structures. This is the approach that is being taken with this proposal and is consistent with the approach being taken by the subcommittee that is developing the new chapter for ASCE 7-28.

S116-22 focused on reducing loads for POTSs. This proposal extends the load reductions to all temporary structures, with some exceptions. Because controlled occupancy procedures are not enforceable on temporary structures that are not POTSs, additional load reductions that are dependent on those controlled occupancy procedures are only allowed for POTSs (see the exceptions for snow and wind loads). In addition, for load conditions where the structure is erected outside of the season for those loads (hurricane, ice, snow), only POTSs are allowed to use controlled occupancy procedures in lieu of redesigning/strengthening the structure for those loads if the structure remains during the hazard season.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed code change will reduce the loads for temporary structures other than public-occupancy temporary structures, since it proposes to extend the load reductions now only applicable to POTSs to all temporary structures. There will be no change in the cost of construction for POTSs.

Staff Analysis: F199-24 added references to IBC for tempoaray structures.

2024 International Building Code

Revise as follows:

3103.8 ~~Controlled occupancy procedures~~ Operations management plan. ~~Where controlled occupancy procedures are required to be implemented for~~ For *public-occupancy temporary structures* ~~in Section 3103.6.1, the procedures shall comply with this section and ANSI ES1.7. An~~ an operations management plan ~~in accordance with ANSI E1.21~~ shall be submitted to the *building official* for approval as a part of the *permit* documents. ~~In addition, the operations management plan shall include an emergency action plan that documents the following information, where applicable:~~

1. ~~Surfaces on which snow or ice accumulates shall be monitored before and during occupancy of the *public-occupancy temporary structure*. Any loads in excess of the design snow or ice load shall be removed prior to its occupancy, or the *public-occupancy temporary structure* shall be vacated in the event that either the design snow or ice load is exceeded during its occupancy.~~
2. ~~Wind speeds associated with the design wind loads shall be monitored before and during occupancy of the *public-occupancy temporary structure*. The *public-occupancy temporary structure* shall be vacated in the event that the design wind speed is expected to be exceeded during its occupancy.~~
3. ~~Criteria for initiating occupant evacuation procedures for *flood* and tsunami events.~~
4. ~~Occupant evacuation procedures shall be specified for each environmental hazard where the occupant management plan specifies the *public-occupancy temporary structure* is to be evacuated.~~
5. ~~Procedures for anchoring or removal of the *public-occupancy temporary structure*, or other additional measures or procedures to be implemented to mitigate hazards in snow, wind, *flood*, ice or tsunami events.~~

3103.6.1.3 Flood loads. *Public-occupancy temporary structures* need not be designed for flood loads specified in Section 1612. ~~Controlled occupancy procedures~~ Operation management plans in accordance with Section 3103.8 shall be implemented.

3103.6.1.6 Tsunami loads. *Public-occupancy temporary structures* in a *tsunami design zone* are not required to be designed for tsunami loads specified in Section 1615. ~~Controlled occupancy procedures~~ Operation management plans in accordance with Section 3103.8 shall be implemented.

3103.6.1.1 Snow loads. Snow loads on public-occupancy temporary structures shall be determined in accordance with Section 1608. The ground snow loads, p_g, in Section 1608 shall be modified according to Table 3103.6.1.1.

Exception: Ground snow loads, p_g, for *public-occupancy temporary structures* that employ ~~controlled-occupancy procedures~~ operation management plans per Section 3103.8 shall be permitted to be modified using a ground snow load reduction factor of 0.65 instead of the ground snow load reduction factors in Table 3103.6.1.1.

Where the *public-occupancy temporary structure* is not subject to snow loads or not constructed and occupied during times when snow is to be expected, snow loads need not be considered, provided that where the period of time when the *public-occupancy temporary structure* is in service shifts to include times when snow is to be expected, one of the following conditions is met:

1. The design is reviewed and modified, as appropriate, to account for snow loads.
2. ~~Controlled occupancy procedures~~ Operation management plans in accordance with Section 3103.8 are implemented.

3103.6.1.2 Wind loads. The design wind load on *public-occupancy temporary structures* shall be permitted to be modified in accordance with the wind load reduction factors in Table 3103.6.1.2.

Exceptions:

1. Design wind loads for *public-occupancy temporary structures* that implement ~~controlled occupancy procedures~~ operation management plans per Section 3103.8 shall be permitted to be modified using a wind load reduction factor of 0.65.
2. For *public-occupancy temporary structures* erected in a *hurricane-prone region* outside of hurricane season, the *basic wind speed*, *V*, shall be permitted to be set as follows, depending on *risk category*:
   - 2.1. *Risk Category* II: 115 mph.
   - 2.2. Risk Category III: 120 mph.
   - 2.3. Risk Category IV: 125 mph.

3103.6.1.5 Ice loads. Ice loads on public-occupancy temporary structures shall be permitted to be determined with a maximum nominal thickness of 0.5 inch (13 mm), for all risk categories. Where the *public-occupancy temporary structure* is not subject to ice loads or not constructed and occupied during times when ice is to be expected, ice loads need not be considered, provided that where the period of time when the *public-occupancy temporary structure* is in service shifts to include times when ice is to be expected, one of the following conditions is met:

1. The design is reviewed and modified, as appropriate, to account for ice loads.
2. ~~Controlled occupancy procedures~~ Operation management plans in accordance with Section 3103.8 are implemented.

New York, NY 10036

~~ES1.7 - 2021~~ ~~Event Safety Requirements - Weather Preparedness~~

Reason: This removes reference to a standard that is not appropriate scope and allows for the operational plan to be developed where it is appropriate in the IFC, then the code official can approve what is shown.
"Operations maintenance plan" will be used in this section and ANSI E1.21. While this is not the applicable standard (it is for special event structures') the commonly recognized term should be used rather than introducing a new term and potentially different regulatory action. Fire and safety evacuation plans and lock down plans are addressed in the IFC and worked out with the emergency responders and should be the same for this operations plan. Items 1 and 2 require weather monitoring by someone at the temporary structure, that is not described or addressed. Many times a temporary structure is erected and left empty between performances. Is this monitoring required to be continuous? Item 3 is redundant with Item 4. Item 5 - is a regulatory challenge based on climate conditions and the ability to respond in a timely manner. The occurrence of any weather related events may not happen allowing enough time to secure or dismantle a structure. The criteria for permitting is subject to performance standards in accordance with the environment.

ANSI ES1.7 purpose is to provide guidance on identifying weather-related hazards, monitoring technologies, and the basic requirements necessary to develop and implement risk mitigation actions associated with weather. This should be referenced in the IFC and not here.

The changes to the other sections are just to change the name of the plan to match what is in 3103.8.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an operational requirement, not a construction requirement.

G174-25

G175-25

IBC: 3103.6.4, 3103.7

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

3103.6.4 ~~Durability~~ Maintenance and repair. ~~Reusable components used in the erection and the installation of *public-occupancy temporary structures* shall be manufactured of durable materials necessary to withstand environmental conditions at the service location. Components damaged during transportation or installation or due to the effects of weathering~~ Damaged components shall be replaced or repaired.

Delete without substitution:

~~**3103.7 Serviceability.** The effects of structural loads or conditions shall not adversely affect the serviceability or performance of the *public-occupancy temporary structure*.~~

Reason: 3103.6.4 Durability
The public occupancy structure is designed and permitted based on the loads expected. Durable materials are not defined or described resulting in an individual judgement call on acceptable or unacceptable components that may not be called to question until injury or loss of life. Determination of acceptable material durability is not further defined to meet a minimum consistent standard. The expectation of performance necessary to withstand environmental conditions at the service location is directly tied to the structural criteria. Where components are damaged they should be replaced and not only dependent on weather, installation or transportation. S166-22 did not explain this in their reason. The revised text provides direct language regarding maintenance and repair.

3103.7 - Serviceability
Public-occupancy temporary structures are expected to meet all performance criteria at the time of permitting through the duration of use. The statement regarding structural loads not adversely affecting the serviceability or performance is unnecessary. Any potential failure or defect in a public-occupancy temporary structure is not compliant with the applicable regulatory sections. This section is redundant This section needs to be deleted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a repair requirement. There are not changes for construction.

G175-25

G176-25

IBC: 3103.1

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

3103.1 General. The provisions of Sections 3103.1 through 3103.8 shall apply to *structures* erected for a period of less than 180 days. Temporary *special event structures*, *tents*, umbrella *structures* and other membrane *structures* erected for a period of less than 180 days shall also comply with the *International Fire Code*. *Temporary structures* erected for a longer period of time and *public-occupancy temporary structures* shall comply with applicable sections of this code.

Exceptions:

1. *Public-occupancy temporary structures* complying with Section 3103.1.1 shall be permitted to remain in service for 180 days or more but not more than 1 year where *approved* by the *building official*.
2. *Public-occupancy temporary structures* within the confines of an *existing structure* are not required to comply with Section 3103.6.
3. Temporary structures associated with health care providers or declared emergencies shall be permitted to remain in service for 180 days or more where approved by the building official.

Reason: The exception specific to temporary structures associated with health care providers or declared emergencies recognizes the unique and regulated conditions associated with specific emergency related conditions and response. Unlike public-occupancy temporary structures and special event structures, temporary structures associated with response to health or physical emergency operations are coupled with inherent health, safety and performance expectations. Temporary structures associated with response to health or physical emergency operations may exceed the 180 day or even a 1 year timeline. This was realized during the recent pandemic. In contract to public-occupancy temporary structures or special event structures, temporary structures associated with response to health or physical emergency operations are used and scrutinized daily based on health, safety and performance expectations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The temporary structure would have the same requirements regardless of how long it needs to be erected to address the needs of the emergency.

G176-25

2024 International Building Code

SECTION 108
TEMPORARY STRUCTURES, EQUIPMENT AND SYSTEMS

Revise as follows:

[A] 108.1 General. The *building official* is authorized to issue a *permit* for temporary *structures* , equipment or systems. Such *permits* shall be limited as to time of service, but shall not be permitted for more than 180 days. The *building official* is authorized to grant extensions for demonstrated cause.

Exception: Permits for structures ~~Structures~~ designed to comply with Section 3103.6 shall ~~not~~ be limited to a time of ~~in~~ service, but shall not be permitted for a ~~period of~~ more than 1 year ~~unless an extension of time is granted~~.

SECTION 3103
TEMPORARY STRUCTURES

3103.1 General. The provisions of Sections 3103.1 through ~~3103.8~~ 3103.5 shall apply to *structures* erected for a period of less than 180 days. Temporary *special event structures*, *tents*, umbrella *structures* and other membrane *structures* erected for a period of less than 180 days shall also comply with the *International Fire Code*. *Temporary structures* erected for ~~a longer period of time~~ longer than 180 days and *public-occupancy temporary structures* erected for any period of time shall also comply with ~~applicable sections of this code~~ Section 3103.6 through 3103.8.

Exceptions:

1. *Public-occupancy temporary structures* complying with Section 3103.1.1 shall be permitted to be erected for a period of ~~remain in service for 180 days or more but not more~~ less than 1 year ~~where *approved* by the *building official*~~.
2. *Public-occupancy temporary structures* within the confines of an *existing structure* are not required to comply with Section 3103.6.

3103.1.1 Extended period of service time. Public-occupancy temporary structures in service ~~shall be permitted to remain in service for~~ 180 days or more ~~without complying with requirements in this code for new *building* or structures where extensions for up to 1 year are granted by the *Building* Official in accordance with Section 108.1 and where the following conditions are satisfied~~ shall comply with the following:

1. Additional inspections as determined by the building official shall be performed by a qualified *person* to verify that site conditions and the *approved* installation comply with the conditions of approval at the time of final inspection.
2. A qualified *person* shall perform follow-up inspections after initial occupancy at intervals not exceeding 180 days to verify the site conditions and the installation conform to the *approved* site conditions and installation requirements. Inspection records shall be kept and shall be made available for verification by the *building official*.
3. An examination shall be performed by a *registered design professional* to determine the adequacy of the temporary structure to resist the structural loads required in Section 3103.6.
4. Relocation of the public-occupancy *temporary structure* shall require a new *permit* application.
5. The use or occupancy *approved* at the time of final inspection shall remain unchanged.

6. A request for an extension is submitted to the *building official*. The request shall include records of the inspections and examination in Items 1 and 3.

2024 International Fire Code

SECTION 107
TEMPORARY STRUCTURES, USES, EQUIPMENT AND SYSTEMS

Revise as follows:

[A] 107.1 General. The *fire code official*is authorized to issue a permit for temporary structures, uses, equipment or systems as required in Sections 105.5 and 105.6. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The *fire code official*is authorized to grant extensions for demonstrated cause.

Exception: Permits for structures designed to comply with Section 3103.6 of the *International Building Code* shall be limited to a time of service, but shall not be permitted for more than 1 year.

Reason: The intent of this proposal is for clarification, consistency and removal of redudant language.

The languge for the period of time of less than 180 days and less than 1 year is inconsistent and confusing. The rewording just makes them consistent and match.

108.1 - This section is only about permits. The revision to the text limits this the permit,. By putting this in an exception, 108.1 is consistent with 3103.1.

3103.1 - Sections added last cycle by S116-22 - 3103.6 through 3103.8 - deal with the new requirements for temporary structures staying up more than 180 days and public-occupancy temporary structures all the time. Therefore, 3103.6 through 3103.8 should not be applied to temporary structures that are up for very short periods of time. This revision makes that clear.

3103.1.1 - The deleted language is a repeat of the language in 3103.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification only. There are no changes to construction.

G177-25

G178-25

IBC: 3103.1.1

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

3103.1.1 Extended period of service time. Public-occupancy temporary structures shall be permitted to remain in service for 180 days or more ~~without complying with requirements in this code for new *building* or structures where extensions for~~ and up to 1 year where the extension is *approved* and ~~are granted by the *Building* Official in accordance with Section 108.1 and~~ where the following conditions are satisfied:

1. ~~6.~~ A request for an extension is submitted to the *building official*. ~~The request shall include records of the inspections and examination in Items 1 and 3.~~
~~1.~~ 2. ~~Additional inspections as determined by the building official~~ At the time of the request of the permit extension, an inspection shall be performed by a qualified *person* to verify that site conditions and the *approved* installation comply with the conditions of approval at the time of ~~final inspection~~ the first permit.
~~2.~~ 3. ~~A qualified *person* shall perform follow-up inspections after initial occupancy at intervals not exceeding 180 days to verify the site conditions and the installation conform to the *approved* site conditions and installation requirements.~~ Inspection records shall be kept and shall be made available for verification by the *building official*.
~~3.~~ ~~An examination shall be performed by a *registered design professional* to determine the adequacy of the temporary structure to resist the structural loads required in Section 3103.6.~~
~~4.~~ ~~Relocation of the public-occupancy *temporary structure* shall require a new *permit* application.~~
~~5.~~ 4. The use or occupancy ~~*approved* at the time of final inspection~~ shall remain unchanged.

Reason: The intent of this proposal is to remove redundant language and requirements.

Main paragraph - Section 108.1 addresses permiting. This section is specific to the approval of the extension, so this revision simplifies this without going back to Chapter 1. Section 3103 and all the exceptions in the load sections (1608.1, 1609.1.1, 1612.2, 1613.1, 1615.1) already state that the loads can be reduced below new construction. The request for the extension should come first. The extension should include an inspection to make sure the structure is currently complaint. There would be no "Additional inspections" if the temporary structure is only allowed for 1 year, there would only be one additional inspection.

The public-occupancy structures have to be designed for the additional loading, so this information was provided before the structure was erected.

Relocation of a temporary strucuture is required to have a new permit in accordance with 108.

Which inspection is the final inspection? This implies that the use and occupancy can change, if that happens, a change of occupancy would require another permit.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements in a request for an extension. This does not change construction requirements.

G178-25

G179-25

IBC: SECTION 202, TABLE 3103.6.1.1, TABLE 3103.6.1.2

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

~~**SERVICE LIFE.** The period of time that a *structure* serves its intended purpose. For *temporary structures*, this shall be the cumulative time of service for sequential *temporary events* that may occur in multiple locations. For *public-occupancy temporary structures* , this is assumed to be a minimum of 10 years.~~

TEMPORARY EVENT. A single use ~~during the *service life*~~ of a *public-occupancy temporary structure* at a given location that includes ~~its~~ the amount of time for the installation, inspection, use and occupancy, and dismantling.

SECTION 3103
TEMPORARY STRUCTURES

3103.6.1.1 Snow loads. Snow loads on public-occupancy temporary structures shall be determined in accordance with Section 1608. The ground snow loads, p_g, in Section 1608 shall be modified according to Table 3103.6.1.1.

Exception: Ground snow loads, p_g, for *public-occupancy temporary structures* that employ controlled-occupancy procedures per Section 3103.8 shall be permitted to be modified using a ground snow load reduction factor of 0.65 instead of the ground snow load reduction factors in Table 3103.6.1.1.

Where the *public-occupancy temporary structure* is not subject to snow loads or not constructed and occupied during times when snow is to be expected, snow loads need not be considered, provided that where the period of time when the *public-occupancy temporary structure* is in service shifts to include times when snow is to be expected, one of the following conditions is met:

1. The design is reviewed and modified, as appropriate, to account for snow loads.
2. Controlled occupancy procedures in accordance with Section 3103.8 are implemented.

TABLE 3103.6.1.1 REDUCTION FACTORS FOR GROUND SNOW LOADS FOR PUBLIC-OCCUPANCY TEMPORARY STRUCTURES

RISK CATEGORY	~~SERVICE LIFE~~ REDUCTION FACTOR	
	~~≤ 10 yr~~	~~> 10 yr~~
II	0.7	~~1.0~~
III	0.8	~~1.0~~
IV	1.0	~~1.0~~

3103.6.1.2 Wind loads. The design wind load on *public-occupancy temporary structures* shall be permitted to be modified in accordance with the wind load reduction factors in Table 3103.6.1.2.

Exceptions:

1. Design wind loads for *public-occupancy temporary structures* that implement controlled occupancy procedures per Section 3103.8 shall be permitted to be modified using a wind load reduction factor of 0.65.
2. For *public-occupancy temporary structures* erected in a *hurricane-prone region* outside of hurricane season, the *basic wind speed*, *V*, shall be permitted to be set as follows, depending on *risk category*:
   - 2.1. *Risk Category* II: 115 mph.
   - 2.2. Risk Category III: 120 mph.
   - 2.3. Risk Category IV: 125 mph.

TABLE 3103.6.1.2 REDUCTION FACTORS FOR WIND LOADS FOR PUBLIC-OCCUPANCY TEMPORARY STRUCTURES

RISK CATEGORY	~~SERVICE LIFE~~ REDUCTION FACTOR	
	~~≤ 10 yr~~	~~> 10 yr~~
II	0.8	~~1.0~~
III	0.9	~~1.0~~
IV	1.0	~~1.0~~

Reason: The proposed language specific to "service life" creates a regulatory challenge where a code official is not able to verify or determine service life. Service life as currently proposed is based on a running clock with regards to time in use. Failure of any temporary structure or component is based on any number of factors more significant than service life. Manufactured flaws, environmental conditions will in use, erection methods and storage are all factors that can contribute to any collapse. Investigations associated with any injury or loss of life associated with a temporary structure failure will address all associated factors. This section would incorrectly place the burden of performance on the permitting authority without full understanding of the temporary structure condition. Even if the permitting authority knew when it was manufactured, the process would not be definitive in determining how many times and under what conditions the temporary structure was used. A temporary shelter for emergency operations may have only been deployed at practice drills for a couple of day a year. The charging language does not address how to record or document the use of the structure? Assuming the public-occupancy temporary structure service life is a minimum of 10 years and those days are cumulative; a tent used for temporary events in the summer could by 40 years old.

The concept of service life should be removed from these options as unenforceable.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will allow for the reduced loads related to the time the structure will be erected.

G179-25

G180-25

IBC: 3103.6.1.1, 3103.6.1.2, 3103.6.1.5

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

3103.6.1.1 Snow loads. Snow loads on public-occupancy temporary structures shall be determined in accordance with Section 1608. The ground snow loads, p_g, in Section 1608 shall be modified according to Table 3103.6.1.1.

Exception: Ground snow loads, p_g, for *public-occupancy temporary structures* that employ controlled-occupancy procedures per Section 3103.8 shall be permitted to be modified using a ground snow load reduction factor of 0.65 instead of the ground snow load reduction factors in Table 3103.6.1.1.

Where the *public-occupancy temporary structure* is not subject to snow loads ~~or not constructed and occupied during times when snow is to be expected~~, snow loads need not be considered, ~~provided that where the period of time when the *public-occupancy temporary structure* is in service shifts to include times when snow is to be expected, one of the following conditions is met:~~

1. ~~The design is reviewed and modified, as appropriate, to account for snow loads.~~
2. ~~Controlled occupancy procedures in accordance with Section 3103.8 are implemented.~~

3103.6.1.2 Wind loads. The design wind load on *public-occupancy temporary structures* shall be permitted to be modified in accordance with the wind load reduction factors in Table 3103.6.1.2.

Exceptions:

1. Design wind loads for *public-occupancy temporary structures* that implement controlled occupancy procedures per Section 3103.8 shall be permitted to be modified using a wind load reduction factor of 0.65.
2. For *public-occupancy temporary structures* erected in a *hurricane-prone region* ~~outside of hurricane season,~~ the *basic wind speed*, *V*, shall be permitted to be set as follows, depending on *risk category*:
   2.1. *Risk Category* II: 115 mph.
   2.2. Risk Category III: 120 mph.
   2.3. Risk Category IV: 125 mph.

3103.6.1.5 Ice loads. Ice loads on public-occupancy temporary structures shall be permitted to be determined with a maximum nominal thickness of 0.5 inch (13 mm), for all risk categories. Where the *public-occupancy temporary structure* is not subject to ice loads ~~or not constructed and occupied during times when ice is to be expected~~, ice loads need not be considered. ~~, provided that where the period of time when the *public-occupancy temporary structure* is in service shifts to include times when ice is to be expected, one of the following conditions is met:~~

1. ~~The design is reviewed and modified, as appropriate, to account for ice loads.~~
2. ~~Controlled occupancy procedures in accordance with Section 3103.8 are implemented.~~

Reason: We are well aware that the climate is changing in many ways from timeline to types of weather events. To allow a temporary structure in Florida to not consider snow and ice is one thing, but there is no way for someone to predict a early or late snow or ice storm. Early or late snowstorms can happen at any time, a code official or designer can not predict the weather over the time. Therefore, the 2nd paragraph is not universally enforceable.

The hurricane season is extending, so not designing for hurricanes should only be for locations not subject to hurricanes. We can not base temporary structure performance expectations on calendar dates. An owner or designer will not know ahead of time when the structure is installed to design for an unknown weather event.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is removing unenforaceable language. There are no changes to construction requirements.

G180-25

G181-25

IBC: 3103.6.3

Proponents: Henry Kosarzycki, representing Self (hkosarzycki@flad.com)

2024 International Building Code

Revise as follows:

3103.6.3 ~~Installation and maintenance inspections~~ <u>Temporary special event structures</u>. ~~A qualified *person* shall inspect *public-occupancy temporary structures* that are assembled using transportable and reusable materials. Components shall be inspected when purchased or acquired and at least once per year. The inspection shall evaluate individual components, and the fully assembled *structure*, to determine suitability for use based on the requirements in~~ <u>Temporary *special event structures* associated with *public-occupancy temporary structures* shall comply with the *International Fire Code* and</u> ESTA ANSI E1.21. ~~Inspection records shall be kept and shall be made available for verification by the *building official*. Additionally, *public-occupancy temporary structures* shall be inspected at regular intervals when in service to ensure that the structure continues to perform as designed and initially erected.~~

Reason: This section is applying a standard for temporary special event structures to a temporary public-occupancy structure. ANSI E1.21 standard is limited to technical production structures. Those structures are addressed in the IFC and limited to 6 weeks erection time. This section creates a regulatory administrative and legal challenge for an adopting and enforcing agency. This section will be central to any legal action following a event resulting in injury or loss of life. The first challenge is the definitive understanding of a qualified person. What credential, certification or professional background will determine an acceptable qualified person. The requirment for inspection at the time of purchase and subsequently once per year may result in shifting liability from the manufacturer to the owner. The requirement for the inspection to evaluate individual components without further direction results in significant materials analysis. Beyond the visual recognition of potentially worn or damaged components the charging language may include a higher level of fatigue, stress and strain testing that is tied to specific ASTM standards. Only the owner would know when a piece was 'purchased or acquired'; how would a code official enforce this? Verification of inspection records by the regulatory agency would be an action preceding permitting. Regarding inspection at regular intervals the charging language does not address who is responsible to conduct the inspection, what is the acceptable interval and the subsequent enforcement action. Inspections is addressed under the IFC. Maintenance should be addressed under the IEBC and not under the IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an operational requirement. There is no change in construction.

IBC: 3105.1, 3105.1.1 (New), 3105.1.2 (New), 3105.1.3 (New), 3105.2, 3105.4 (New), 3105.4.1 (New), 3105.4.2 (New), 3105.4.3 (New), 3105.5 (New), 3105.6 (New), 3102.1

Proponents: Ronald Geren, RLGA Technical Services, LLC, representing Self (ron@specsandcodes.com)

2024 International Building Code

Revise as follows:

3105.1 General. *Awnings* and *canopies* shall comply with the requirements of Sections 3105.2 through 3105.6. *Canopies* constructed as *tensile membrane structures* shall comply with Section 3102. *Awnings* and *canopies* with membrane coverings that do not comply with the requirements of this Section shall comply with the requirements of *membrane-covered frame structures* in accordance with Section 3102.~~and 3105.3 and other applicable sections of this code.~~

Add new text as follows:

3105.1.1 Carports. Canopies used for covered parking shall also comply with the requirements for carports in Section 406.2.

3105.1.2 Motor fuel dispensing canopies. Canopies under which fuels are dispensed shall also comply with Section 406.7.2.

3105.1.3 Pedestrian walkways. Canopies used for *pedestrian walkways* shall also comply with the requirements in Section 3104.

Revise as follows:

3105.2 Design and construction. *Awnings* and *canopies* shall be designed and constructed to withstand wind or other lateral *loads* and *live loads* as required by Chapter 16 with due allowance for shape, open construction and similar features that relieve the pressures or loads. Structural members shall be protected to prevent deterioration. *Awnings* shall have frames of noncombustible material, *fire-retardant-treated wood*, heavy timber complying with Section 2304.11 or 1-hour construction, and shall be fixed, retractable, folding or collapsible. *Canopies* shall have frame materials consistent with the required type of construction of the *building*.

Add new text as follows:

3105.4 Allowable area. *Awnings* and *canopies* shall not contribute to *building area*. The aggregate area of canopies shall comply with Section 3105.4.1 through 3105.4.3.

3105.4.1 Canopies above the level of exit discharge. The aggregate allowable area of *canopies* located above *the level of exit discharge* shall be limited to 10 percent of the floor area of the *story* and occupied roof area on which they are located and shall not exceed 25 percent of the tabular values for nonsprinklered buildings in Table 506.2 for each occupancy covered by *canopies*.

3105.4.2 Canopies at the level of exit discharge or at grade. The aggregate allowable area of *canopies* at the *level of exit discharge* or at grade, attached to or less than 30 feet (9144 mm) from the *building*, shall not exceed the tabular values for nonsprinklered buildings in Table 506.2 for each occupancy covered by the *canopies*, and the allowable area of any single canopy shall not exceed 10 percent of the aggregate allowable area.

3105.4.3 Canopies away from the building. The aggregate area of *canopies* located 30 feet (9144 mm) or more from the *building* shall not be limited, and the area of a single *canopy* shall not exceed the tabular values for nonsprinklered buildings in Table 506.2 for each occupancy covered by the *canopies*.

3105.5 Allowable height in stories. *Canopies* shall be permitted on stories and occupied roofs as specified for the type of construction and occupancy of the *building* in accordance with Sections 503 and 504.

3105.6 Separation distance. Individual *canopies* or groups of *canopies* not exceeding 10 percent of the allowable aggregate area shall be separated by a minimum distance of 10 feet (3048 mm). Canopies shall have a *fire separation distance* of 10 feet (3048 mm) measured at right angles from the canopy to adjacent lot lines.

Revise as follows:

3102.1 General. The provisions of Sections 3102.1 through 3102.8 shall apply to *air-supported*, *air-inflated*, *membrane-covered cable*, *membrane-covered frame* and *tensile membrane structures*, collectively known as *membrane structures*, erected for a period of 180 days or longer. Those erected for a shorter period of time shall comply with the *International Fire Code* . Membrane *structures* covering water storage *facilities*, water clarifiers, water treatment plants, sewage treatment plants, *greenhouses* and similar *facilities* not used for human occupancy are required to meet only the requirements of Sections 3102.3.1 and 3102.7. Membrane *structures* erected on a *building*, balcony, deck or other *structure* for any period of time shall comply with this section.

Exception: Membrane *structures* complying with the requirements for *awnings* or *canopies* in accordance with Section 3105.

Reason: Schools, hotels, motels, businesses, restaurants, fuel stations, and many other building types provide awnings and canopies to protect occupants, equipment, vehicles, and materials from the sun or inclement weather. Awnings are attached to a building by definition. Canopies, on the other hand, can be attached or structurally independent. Many times, plans examiners try to include canopies within the allowable area of the building or as a separate structure (when structurally independent), forcing the designer to conform to fire-separation distances and opening protection for both the building and canopy. The proposed changes presented here are intended to minimize the gray area inherent in the current provisions.

The final statement of Section 3105.1 is very open-ended with no indication as to which sections are applicable. Thus, any section that is remotely applicable to awnings or canopies could be enforced. Thus, this proposal intends to eliminate the open-ended aspect and provide some prescriptive requirements specifically targeted for these types of building features.

In Section 3105.1, the open-ended statement is deleted and replaced with references to subsequent sections. Further, a distinction is made between some membrane structures, covered in Section 3102, and awnings and canopies covered in this section. First, this proposal requires all tensile membrane structures to comply with Section 3102, mainly because tensile structures do not meet the definitions for awnings and canopies. Second, awnings and canopies could be considered "membrane-covered frame structures" by definition; thus, enforcement of either requirements set could be applied. Thus, this proposal places a threshold by requiring compliance with the requirements of Section 3102 if an awning or canopy cannot conform to the requirements of Section 3105. To address this from the other direction, an exception is proposed for Section 3102.1 that allows membrane structures complying with Section 3105 to be exempted from the requirements for membrane structures.

The two subparagraphs of Section 3105.1 identify additional requirements applicable to canopies used for specific applications.

Section 3105.2 has limitations on the frame construction for awnings, but nothing for canopies. The proposed change for this section adds the requirement that frame materials for canopies be consistent with the type of construction for the building.

According to the definition of building area, the area of awnings and canopies should not be included in determining building area since they are not "within the horizontal projection of the roof or floor above." However, awnings and canopies are mistakenly added to building area either because designers do not know the definition or consider the canopy or awning covering a "roof" extension. Thus, the first sentence of Section 3105.4 clearly states that awnings and canopies do not contribute to building area, similar to that stipulated for mezzanines in Section 505.2.1.

Section 3105.4 further intends to place limitations on the size of canopies. This requirement is divided into two types of canopy applications: those on stories above the level of exit discharge and those at the level of exit discharge or at grade within 30 feet of the building. If the canopies exceed the allowable limits, the requirements for membrane structures come into play per the proposed text of 3105.1, and the membrane structure must be included in the building area per Section 3102.6.1.

For canopies located above the level of exist discharge, such as patios, terraces, decks, or occupied roofs, Section 3105.4.1 limits the aggregate area to 10% of the story and occupied roof area on which the canopy is located. For example, if a story has 3,000 square feet and an occupied roof area of 2,000 square feet on that same level, then the canopy can have an area of 500 square feet (0.10 x 5,000 sq. ft.). As another example, if a 5,000 square foot roof only has 3,000 square feet of occupied area, then a canopy of 300 square feet is permitted (0.10 x 3,000 sq. ft.). More than one canopy can be provided as long as the aggregate area of all canopies do not exceed the area limitations. Although the aggregate area of all canopies is limited to the stipulated 10%, if the 10% exceeds 25% of the nonsprinklered allowable area permitted by Table 506.2 for the building's type of construction and occupancy under the canopy, then the area of the canopies is limited by Table 506.2. For example, if a restaurant located on the second story of a Type VB building has a floor area of 12,000 square feet and an outdoor terrace area of 5,000 square feet, 10% of the area would be 1,700 square feet (0.10 x 17,000 sq. ft.). However, 25% of the allowable area for a nonsprinklered Group A-2 in a Type VB building is 1,500 square feet (0.25 x 6,000 sq. ft.). Thus, the canopy would be limited to the smaller area.

For canopies located at the level of exit discharge or at grade within 30 feet of the building, Section 3105.4.2 limits the aggregate area to the nonsprinklered values in Table 506.2 for the construction type of the building, but no single canopy can exceed 10% of the aggregate area. For example, a 20,000 square foot office building of Type IIB construction is permitted up to 23,000 square feet of canopies; however, no single canopy can exceed 10% of the aggregate allowable area, or 2,300 square feet (this would allow a parking canopy for up to 12 cars). This minimizes the potential fire risk from large areas of canopies that attached to, or within close proximity of, the building.

The exception to Section 3105.4.2 recognizes that canopies located a distance away from the building would pose little threat of exposure to the building. Since most canopies would likely be considered Type IIB or VB construction, a fire-separation distance of 10 feet is permitted. However, buildings could be constructed of a type that would require at least a 30-foot fire separation distance, or a minimum 40-foot distance between the building and canopy. Since canopies have limited fire loads, this distance is reduced to 30 feet.

Per Section 3105.5, canopies would be permitted on any story provided the construction type of the building and occupancy for the canopy is permitted at that story height. For example, a three-story Type VA office building (Group B) has a restaurant on the second story (Group A-2) and is separated from the third-story Group B. The restaurant would not be permitted to have a rooftop dining area with a canopy since a Group A-2 occupancy is limited to two stories and the A-2 occupancy on the roof would not comply with Section 503.1.4.

Section 3105.6 is added to minimize the large continuous canopies even if they are constructed as a series of independent canopies, which would defeat the purpose of regulating the size of an individual canopy.

The exception to Section 3102.1 is added to show that an alternate path of compliance is available for membrane-covered awnings and canopies that is not as restrictive as the requirements for membrane structures.

Fire sprinkler requirements are intentionally not provided in this section for a couple of reasons:

1. Section 3102 for membrane structures does not include any sprinkler provisions.
2. NFPA 13 and the IFC address sprinkler requirements for canopies.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Due to the many variables involved (size, design, complexity, and materials), the cost increase would likely be based on the materials. For buildings of noncombustible construction, designers would be required to construct canopy frames of noncombustible materials, which may increase the cost. For custom-constructed canopies, a typical wood-framed canopy may cost between $20 and $40 per square foot. Similar canopies constructed of steel framing may cost between $30 and $50 per square foot. The cost of a premium grade 4x4 wood post is approximately $21 per 12-foot length. A 4x4x0.125 steel tube is approximately $120 per 12-foot length; however, one benefit of steel is longer spans requiring fewer supports. The cost of roof coverings would remain the same since roof covering materials are not restricted by this section.

Estimated Immediate Cost Impact Justification (methodology and variables):

There are too many variables involved to provide explicit cost information. Variables include the size, number, and materials used. Almost all awnings and most canopies are of a limited size to begin with, so exceeding the areas stipulated would require an extensive number of individual canopies.

G182-25

G183-25 Part I

IBC: SECTION 105, [A] 105.2, SECTION 3110, 3110.1, 3110.2 (New), 3110.3 (New), 3110.2, 3110.3, ASTM Chapter 35 (New)

Proponents: Catherine Mills-Reynolds, American Fence Association, representing AFA (catherine@americanfenceassociation.com); Dave Monsour, THOMAS ASSOCIATES, INC. (DASMA), representing DASMA (Door & Access Systems Manufacturers Assoc.) (dmonsour@thomasamc.com); Ben Shirley, Ameristar Perimeter Security, representing ASTM F14 (ben.shirley@assaabloy.com); Don Jeppson, representing City of San Rafael (don.jeppson@cityofsanrafael.org); Richard Sedivy, DoorKing, Inc., representing DASMA (rsedivy@doorking.com); Kevin Ward, Miller Edge Inc, representing American Fence Association (kward@milleredge.com); Scott Kinney, D&D Technologies, representing ASTM F14.15 Gates (skinney@ddtechusa.com); Eric Quanbeck, representing The Hummingbird Alliance (eric.m.quanbeck@gmail.com); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

THIS IS A 3 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE.

PART II WILL BE HEARD BY THE RESIDENTIAL BUILDING CODE COMMITTEE.

PART III WILL BE HEARD BY THE EXISTING BUILDING CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

SECTION 105
PERMITS

Revise as follows:

[A] 105.2 Work exempt from permit. Exemptions from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. One-story detached accessory *structures* used as tool and storage sheds, playhouses and similar uses, provided that the floor area is not greater than 120 square feet (11 m^2).
2. Fences, other than swimming pool barriers, ~~not over~~ less than ~~7 feet~~ 84 inches (2134 mm) high.
3. Gates, other than swimming pool barriers or components in the *means of egress*, installed in a n opening 48 inches (1219 mm) or less measured horizontally or less than 84 inches (2134 mm) measured vertically.

~~3~~ 4. Oil derricks.

~~4~~ 5. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge or impounding Class I, II or IIIA liquids.

~~5~~ 6. Water tanks supported directly on grade if the capacity is not greater than 5,000 gallons (18 925 L) and the ratio of height to diameter or width is not greater than 2:1.

~~6~~ 7. Sidewalks and driveways not more than 30 inches (762 mm) above adjacent grade, and not over any *basement* or *story* below and are not part of an *accessible route*.

~~7~~ 8. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.

~~8~~ 9. Temporary motion picture, television and theater stage sets and scenery.

~~9~~ 10. Prefabricated *swimming pools* accessory to a Group R-3 occupancy that are less than 24 inches (610 mm) deep, are not greater than 5,000 gallons (18 925 L) and are installed entirely above ground.

~~10~~ 11. Shade cloth *structures* constructed for nursery or agricultural purposes, not including service systems.

~~11~~ 12. Swings and other playground equipment accessory to detached one- and two-family *dwellings*.

~~12~~ 13. Window *awnings* in Group R-3 and U occupancies, supported by an *exterior wall* that do not project more than 54 inches (1372 mm) from the *exterior wall* and do not require additional support.

~~13~~ 14. Nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height.

Electrical:

1. ***Repairs* and maintenance:** Minor *repair* work, including the replacement of lamps or the connection of *approved* portable electrical equipment to *approved* permanently installed receptacles.
2. **Radio and television transmitting stations:** The provisions of this code shall not apply to electrical equipment used for radio and television transmissions, but do apply to equipment and wiring for a power supply and the installations of towers and antennas.
3. **Temporary testing systems:** A *permit* shall not be required for the installation of any temporary system required for the testing or servicing of electrical equipment or apparatus.

Gas:

1. Portable heating appliance.
2. Replacement of any minor part that does not alter approval of equipment or make such equipment unsafe.

Mechanical:

1. Portable heating appliance.
2. Portable ventilation equipment.
3. Portable cooling unit.
4. Steam, hot or chilled water piping within any heating or cooling equipment regulated by this code.
5. Replacement of any part that does not alter its approval or make it unsafe.
6. Portable evaporative cooler.
7. Self-contained refrigeration system containing 10 pounds (4.54 kg) or less of refrigerant and actuated by motors of 1 horsepower (0.75 kW) or less.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe, provided, however, that if any concealed trap, drain pipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures and the removal and reinstallation of water closets, provided that such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

SECTION 3110
HORIZONTAL SLIDE, SWING AND ~~AUTOMATIC~~ VEHICULAR GATES

3110.1 General. A horizontal slide gate or a swing gate installed in an opening more than 48 inches (1219 mm) measured horizontally or 84 inches (2134 mm) or greater measured vertically shall comply with this section and other applicable sections of this code. ~~*Automatic*~~ Vehicular gates of any size shall also comply with the requirements of Sections ~~3110.2 and 3110.3~~ 3110.4 and 3110.5 and other applicable sections of this code.

Add new text as follows:

3110.2 Slide gates. A gate that slides in the plane of the gate shall be designed, constructed, and installed in accordance with ASTM F1184.

3110.3 Swing gates. A hinged or swing gate shall be designed, constructed, and installed in accordance with ASTM F900.

Revise as follows:

3110.4 ~~3110.2~~ Vehicular gates intended for automation. *Vehicular gates* intended for automation shall be designed, constructed and installed to comply with the requirements of ASTM F2200.

3110.5 ~~3110.3~~ Vehicular gate openers. *Vehicular gate* openers, where provided, shall be *listed* in accordance with UL 325.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F900-24	Standard Specification for Industrial and Commercial Swing Gates
F1184-23	Standard Specification for Industrial and Commerical Horizontal Slide Gates

Reason: Gates are used, and depended on for our safety and security, throughout our society. Be it for residential use, at a sports arena, on schoolgrounds, a public park, in a parking garage, at a factory, in a multi-family dwelling or countless other applications, people are potentially in contact with a gate every day. Gates are so commonplace that most people don’t think twice about their ability to operate safely until something goes wrong. This is why it is of paramount importance that gates are designed and installed to the highest safety standard.

The need for safe, functioning gates has been underscored in recent years with stories like that of, Alex Quanbeck, the 7-year-old child who was killed by a poorly maintained gate in his school yard at recess in San Rafael, California. Under deeper review, it has been discovered that numerous fatalities and life-altering injuries have occurred in the United States because of these gate issues. A map of known gate fatalities and serious injuries from gates is provided from the Hummingbird Alliance (www.thehummingbirdalliance.com).

Having knowledge of the scope of this problem, ASTM International’s F14 Committee on Fences, (which also holds jurisdiction for gate standards) updated their manual gate standards to reflect new safety requirements on slide gates (ASTM F1184) and swing gates (ASTM F900). ASTM had already updated its electric gate standard (ASTM F2200) to meet new requirements in 2002.

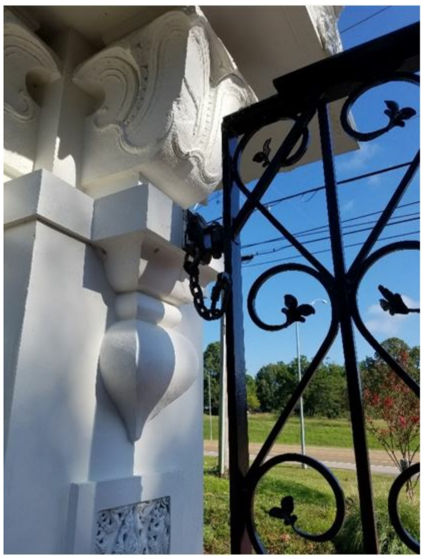
Cal/OSHA is currently reviewing these standards as well, to potentially include them in their own rules. While they do have a rule on gates, (Title 8 section 3324) it does not currently contain the provisions laid out in our proposal. In assessing these potential new standards, they reviewed some of their own accident data and found that their data from 1990 through 2005, showed that 15 out of 31 incidents (48%) involved failed or missing end stops/positive stops of gates. They then compared this data from data collected from 2014 through 2024 and found that 13 out of 16 incidents (81%) involved failed or missing end-stops/positive-stops of gates.

Because of these factors, they determined that, “The relatively low decrease in serious injuries and fatalities per year of only 8.2 percent after the promulgation of section 3324 in 2007 illustrates the need to amend and improve section 3324 to better protect California workers” (DOSH Evaluation, 2024).

The standards we are requesting be adopted would in no way impede first responders in accessing a property, in fact ensuring a gate is functioning properly would only provide them with safer and easier ingress and/or egress. It is when these gates go without the proper safety requirements, they are likely to fail to operate as intended or run the risk of injuring those who use them.

The ICC/AFA Gate Safety Code Development Work Group consists of a wide range of gate and security experts, consumers and code enforcement officials, who have diligently reviewed ASTM standards, current safety standards and the I-Codes to confirm that this addition to the I-Codes is needed and non-duplicative. The work group decided to alter the existing section 3110 to include all gates as well as maintaining the provision currently in place for automatic vehicular gates. The new provision would only apply to gates that are 7’ (84 inches) in height or greater OR 4’ (48”) in length or greater. The code change references industry approved national standards for gate design and construction ASTM F900 for Swing Gates and ASTM F1184 for Slide Gates. The code also includes two new standards to be referenced in Chapter 35 that are necessary for the code change. The group also looked at where gates are required for permitting and inspection and discovered that gates are not specifically referenced in the permit exemption list in Section 105. The group decided to clarify that fences and gates are unique in their own application and as such both need specific permit exceptions.

The general requirements for Swing Gates require a keeper in accordance with ASTM F900. The gate keeper is a mechanical device for securing the free end of the gate when in the fully open position. The compliance for swing gates could be a chain connected to both the gate frame and the end post (or column/structure to which the gate is attached), see the pictures below.



The general requirements for slide gates in accordance with ASTM F1184 include:

A performance statement that gates that are installed shall not fall over more than 45 degrees from the vertical plane;

Positive stops to limit travel;

Weight bearing rollers are covered;

Gap no greater then 2-1/4”;

Gates designed for lateral stability; and

Gates design that will not move under the force of gravity.

Please see pictures below of ASTM 1184 compatible gates. Two options for fall post are shown. The first is the standard post cemented in the ground; it is the post with the yellow cap. The second is of an upside-down J bracket that has been welded on.

(Receiver Guide/ Gate Stop Below)

These standards and the code change proposal only address swing and slide gates. Overhead roll down (or up) doors, roll down security type doors (like those at the tenant space and the mall circulation areas), and parking garage entry, exit or point of sale barrier arms are not within the scope of the proposed code change or within the scope of the two reference standards. In addition, we believe that these requirements in no way negatively impact building egress required by Chapter 10 of this code. Any swing or slide gate installed within the means of egress should be in compliance with chapter 10, as well as any other technical provision of the code and compliance with any other code application is referenced in 3110.1, as proposed. Compliance with the ASTM standards will greatly improve safety in and around the built environment by incorporating these simple changes, (like adding fall over protection and gate stops) lives like Alex's, can be saved. Alex's father, Eric Quanbeck was an active participant in this work group, as well as the local building official from the city where the tragedy occurred, along with representatives from the American Fence Association, ASTM International, DASMA and UL. After thorough review, we see a need to incorporate these standards through adoption into the I-Codes.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Compared to the overall cost of these large gates, which can run anywhere from a couple thousand dollars to tens of thousands of dollars, depending on the size, material used, and whether they have an electric operator, the safety requirement costs are negligible. The material costs for the safety parts mentioned average $50.00, with many being less than that amount. For instance, a metal gate stop can be just a few dollars. Items like a Gate Keeper and the safety chain for swing gates can be found at several retailers, including on

Amazon, both for under $50.00. Labor would depend on geographical area, but overall, it would average somewhere between $150.00 to $250.00.

Estimated Immediate Cost Impact Justification (methodology and variables):

Posts for this type of application typically run $50.00 a piece or less.

Example of some product costs on Amazon.

Amazon.com: OKG Heavy Duty Security Chain, 3.9ft x 5/16" Thick Outdoor Gate Chain, Cut Proof Chain Made of Hardened Alloy Steel Chain, Ideal for Fence Gates, Bicycles, Moped, Trailers, Generator, etc : Sports & Outdoors

Amazon.com: Chain Link Fence GATE HOLD BACK: Duck Bill Gate Holdback (1-5/8" to 2-3/8"). Holds The gate open for You while You work! : Tools & Home Improvement

2024 International Residential Code

Revise as follows:

R105.2 Work exempt from permit. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction.Permits* shall not be required for the following:

Building:

1. Other than *storm shelters*, one-*story* detached *accessory structures,* provided that the floor area does not exceed 200 square feet (18.58 m^2).
2. Fences<u>, other than swimming pool barriers,</u> ~~not over~~ <u>less than 84 inches</u> ~~7 feet~~ (2134 mm) high.
3. <u>Gates, other than swimming pool barriers, installed in an opening less than 48 inches (1219 mm) measured horizontally, or less than 84 inches (2134 mm) measured vertically.</u>
3. *Retaining walls* that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge
4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
5. Sidewalks and driveways.
6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
8. Swings and other playground equipment.
9. Window awnings supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
10. Decks not exceeding 200 square feet (18.58 m^2) in area, that are not more than 30 inches (762 mm) above *grade* at any point, are not attached to a *dwelling* or *townhouse* and do not serve the exit door required by Section R318.4.

Electrical:

1. *Listed* cord-and-plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Electrical wiring, devices, *appliances,* apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
5. Minor *repair* work, including the replacement of lamps or the connection of *approved* portable electrical equipment to *approved* permanently installed receptacles.

Gas:

1. Portable heating, cooking or clothes drying *appliances*.
2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Mechanical:

1. Portable heating *appliances*.
2. Portable ventilation *appliances*.
3. Portable cooling units.
4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.
5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
6. Portable evaporative coolers.
7. Self-contained refrigeration systems containing 10 pounds (4.54 kg) or less of refrigerant or that are actuated by motors of 1 horsepower (746 W) or less.
8. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Add new definition as follows:

VEHICULAR GATE. A gate that is intended for use at a vehicular entrance or exit to the *lot* of a one- or two-family dwelling, and that is not intended for use by pedestrian traffic.

Add new text as follows:

SECTION R329
GATES

R329.1 General. The design, installation, and construction of horizontal slide and swing gates, and automatic vehicular gates installed on the lot of a one- or two-family dwelling or a *townhouse* shall comply with this section. Gates installed on community property associated with one- or two-family dwellings or *townhouses* shall comply with the *International Building Code*. A horizontal slide or a swing gate installed in an opening more than 48 inches (1219 mm) measured horizontally or 84 inches (2134 mm) or greater measured vertically shall comply with this section and other applicable sections of this code. *Vehicular gates* of any size shall also comply with the requirements of this section.

R329.2 Slide Gates. A gate that slides in the plane of the gate shall be designed, constructed, and installed in accordance with ASTM F1184.

R329.3 Swing gates. A hinged or swing gate shall be designed, constructed, and installed in accordance with ASTM F900.

R329.4 Vehicular gates intended for automation. *Vehicular gates* intended for automation shall be designed, constructed and installed to comply with the requirements of ASTM F2200.

R329.5 Vehicular gate openers. *Vehicular gate* openers, where provided, shall be *listed* in accordance with UL 325.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F900-24	Standard Specification for Industrial and Commercial Swing Gates
F1184-23	Standard Specification for Industrial and Commercial Horizontal Slide Gates
F2200-20	Standard Specification for Automated Vehicular Gate Construction

Delete without substitution:

~~APPENDIX BH~~
~~AUTOMATIC VEHICULAR GATES~~

~~SECTION BH101~~
~~GENERAL~~

~~**BH101.1 General.** The provisions of this appendix shall control the design and construction of automatic *vehicular gates* installed on the *lot* of a one- or two-family dwelling.~~

~~**VEHICULAR GATE.** A gate that is intended for use at a vehicular entrance or exit to the *lot* of a one- or two-family dwelling, and that is not intended for use by pedestrian traffic.~~

~~SECTION BH102~~
~~DEFINITION~~

~~**BH102.1 General.** The following term shall, for the purposes of this appendix, have the meaning shown herein.~~

~~SECTION BH103~~
~~AUTOMATIC VEHICULAR GATES~~

~~**BH103.1 Vehicular gates intended for automation.** *Vehicular gates* intended for automation shall be designed, constructed and installed to comply with the requirements of ASTM F2200.~~

~~**BH103.2 Vehicular gate openers.** *Vehicular gate* openers, where provided, shall be *listed* in accordance with UL 325.~~

~~SECTION BH104~~
~~REFERENCED STANDARDS~~

~~**BH104.1 General.** See Table BH104.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, the standard title, and the section or sections of this appendix that reference the standard.~~

~~TABLE BH104.1 REFERENCED STANDARDS~~

Reason: Gates are used, and depended on for our safety and security, throughout our society. Be it for residential use, at a sports arena, on schoolgrounds, a public park, in a parking garage, at a factory, in a multi-family dwelling or countless other applications, people are potentially in contact with a gate every day. Gates are so commonplace that most people don't think twice about their ability to operate safely until something goes wrong. This is why it is of paramount importance that gates are designed and installed to the highest safety standard.

The need for safe, functioning gates has been underscored in recent years with stories like that of, Alex Quanbeck, the 7-year-old child who was killed by a poorly maintained gate in his school yard at recess in San Rafael, California. Under deeper review, it has been discovered that numerous fatalities and life-altering injuries have occurred in the United States because of these gate issues. A map of known gate fatalities and serious injuries from gates is provided from the Hummingbird Alliance (www.thehummingbirdalliance.com).

Having knowledge of the scope of this problem, ASTM International's F14 Committee on Fences, (which also holds jurisdiction for gate standards) updated their manual gate standards to reflect new safety requirements on slide gates (ASTM F1184) and swing gates (ASTM F900). ASTM had already updated its electric gate standard (ASTM F2200) to meet new requirements in 2002.

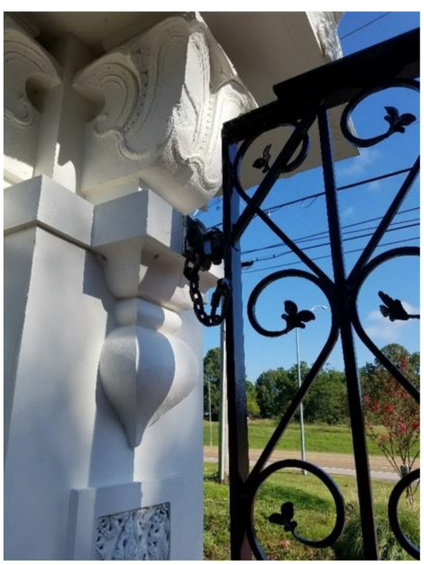
Cal/OSHA is currently reviewing these standards as well, to potentially include them in their own rules. While they do have a rule on gates, (Title 8 section 3324) it does not currently contain the provisions laid out in our proposal. In assessing these potential new standards, they reviewed some of their own accident data and found that their data from 1990 through 2005, showed that 15 out of 31 incidents (48%) involved failed or missing end stops/positive stops of gates. They then compared this data from data collected from 2014 through 2024 and found that 13 out of 16 incidents (81%) involved failed or missing end-stops/positive-stops of gates.

Because of these factors, they determined that, "The relatively low decrease in serious injuries and fatalities per year of only 8.2 percent after the promulgation of section 3324 in 2007 illustrates the need to amend and improve section 3324 to better protect California workers" (DOSH Evaluation, 2024).

The standards we are requesting be adopted would in no way impede first responders in accessing a property, in fact ensuring a gate is functioning properly would only provide them with safer and easier ingress and/or egress. It is when these gates go without the proper safety requirements, they are likely to fail to operate as intended or run the risk of injuring those who use them.

The ICC/AFA Gate Safety Code Development Work Group consists of a wide range of gate and security experts, consumers and code enforcement officials, who have diligently reviewed ASTM standards, current safety standards and the I-Codes to confirm that this addition to the I-Codes is needed and non-duplicative. The work group decided to alter the existing section 3110 to include all gates as well as maintaining the provision currently in place for automatic vehicular gates. The new provision would only apply to gates that are 7' (84 inches) in height or greater OR 4' (48") in length or greater. The code change references industry approved national standards for gate design and construction ASTM F900 for Swing Gates and ASTM F1184 for Slide Gates. The code also includes two new standards to be referenced in Chapter 35 that are necessary for the code change. The group also looked at where gates are required for permitting and inspection and discovered that gates are not specifically referenced in the permit exemption list in Section 105. The group decided to clarify that fences and gates are unique in their own application and as such both need specific permit exceptions. This proposal moves the exiting vehicular gate requirements from the appendix to the body of the code, without substantive modification.

The general requirements for Swing Gates require a keeper in accordance with ASTM F900. The gate keeper is a mechanical device for securing the free end of the gate when in the fully open position. The compliance for swing gates could be a chain connected to both the gate frame and the end post (or column/structure to which the gate is attached), see the pictures below.



The general requirements for slide gates in accordance with ASTM F1184 include:

A performance statement that gates that are installed shall not fall over more than 45 degrees from the vertical plane;

Positive stops to limit travel;

Weight bearing rollers are covered;

Gap no greater then 2-1/4”;

Gates designed for lateral stability; and

Gates design that will not move under the force of gravity.

Please see pictures below of ASTM 1184 compatible gates. Two options for fall post are shown. The first is the standard post cemented in the ground; it is the post with the yellow cap. The second is of an upside-down J bracket that has been welded on.

(Receiver Guide/ Gate Stop Below)

These standards and the code change proposal only address swing and slide gates. Overhead roll down (or up) doors, roll down security type doors (like those at the tenant space and the mall circulation areas), and parking garage entry, exit or point of sale barrier arms are not within the scope of the proposed code change or within the scope of the two reference standards. In addition, we believe that these requirements in no way negatively impact building egress required by Chapter 10 of this code. Any swing or slide gate installed within the means of egress should be in compliance with chapter 10, as well as any other technical provision of the code and compliance with any other code application is referenced in 3110.1, as proposed. Compliance with the ASTM standards will greatly improve safety in and around the built environment by incorporating these simple changes, (like adding fall over protection and gate stops) lives like Alex's, can be saved. Alex's father, Eric Quanbeck was an active participant in this work group, as well as the local building official from the city where the tragedy occurred, along with representatives from the American Fence Association, ASTM International, DASMA and UL. After thorough review, we see a need to incorporate these standards through adoption into the I-Codes.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Compared to the overall cost of these large gates, which can run anywhere from a couple thousand dollars to tens of thousands of dollars, depending on the size, material used, and whether they have an electric operator, the safety requirement costs are negligible. The material costs for the safety parts mentioned average $50.00, with many being less than that amount. For instance, a metal gate stop can be just a few dollars. Items like a Gate Keeper and the safety chain for swing gates can be found at several retailers, including on Amazon, both for under $50.00. Labor would depend on geographical area, but overall, it would average somewhere between $150.00 to $250.00.

Estimated Immediate Cost Impact Justification (methodology and variables):

Posts for this type of application typically run $50.00 a piece or less.

Example of some product costs on Amazon:

Amazon.com: OKG Heavy Duty Security Chain, 3.9ft x 5/16" Thick Outdoor Gate Chain, Cut Proof Chain Made of Hardened Alloy Steel Chain, Ideal for Fence Gates, Bicycles, Moped, Trailers, Generator, etc : Sports & Outdoors

Amazon.com: Chain Link Fence GATE HOLD BACK: Duck Bill Gate Holdback (1-5/8" to 2-3/8"). Holds The gate open for You while You work! : Tools & Home Improvement

IEBC: SECTION 310 (New), 310.1 (New)

Proponents: Catherine Mills-Reynolds, American Fence Association, representing AFA (catherine@americanfenceassociation.com); Ben Shirley, Ameristar Perimeter Security, representing ASTM F14 (ben.shirley@assaabloy.com); Dave Monsour, THOMAS ASSOCIATES, INC. (DASMA), representing DASMA (Door & Access Systems Manufacturers Assoc.) (dmonsour@thomasamc.com); Richard Sedivy, DoorKing, Inc., representing DASMA (rsedivy@doorking.com); Kevin Ward, Miller Edge Inc, representing American Fence Association (kward@milleredge.com); Don Jeppson, representing City of San Rafael (don.jeppson@cityofsanrafael.org); Scott Kinney, D&D Technologies, representing ASTM F14.15 Gates (skinney@ddtechusa.com); Eric Quanbeck, representing The Hummingbird Alliance (eric.m.quanbeck@gmail.com); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Add new text as follows:

SECTION 310
ALTERATION, REPAIR, AND REPLACEMENT OF GATES

310.1 General. Gates installed in an opening more than 48 inches (1219 mm) measured horizontally or 84 inches (2134 mm) or greater measured vertically,shall be in accordance with *International Building Code* or the *International Residential Code*, as applicable, where an *alteration*, *repair*, or replacement of the gate, gate operator, or gate hardware occurs.

Reason: This is a complimentary proposal to the ones we are proposing in the IRC and IBC, to require gates to comply with industry standards ASTM F1184-23, ASTM F900-24, and ASTM F2200-20 and UL325, where gate operators or gate hardware are being modified, altered, repaired or replaced.

The need for safe, functioning gates has been underscored in recent years with stories like that of, Alex Quanbeck, the 7-year-old child who was killed by a poorly maintained gate in his school yard at recess in San Rafael, California. Under deeper review, it has been discovered that numerous fatalities and life-altering injuries have occurred in the United States because of these gate issues. These updates will alleviate those life threatening issues.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Compared to the overall cost of these large gates, which can run anywhere from a couple thousand dollars to tens of thousands of dollars, depending on the size, material used, and whether they have an electric operator, the safety requirement costs are negligible. The material costs for the safety parts mentioned average $50.00, with many being less than that amount. For instance, a metal gate stop can be just a few dollars. Items like a Gate Keeper and the safety chain for swing gates can be found at several retailers, including on Amazon, both for under $50.00. Labor would depend on geographical area, but overall, it would average somewhere between $150.00 to $250.00.

Estimated Immediate Cost Impact Justification (methodology and variables):

Posts for this type of application typically run $50.00 a piece or less.

Example of some product costs on Amazon.
