3111.1.1 Wind resistance. ~~Rooftop-mounted photovoltaic~~ Photovoltaic (PV) panel systems, elevated PV support structures, and solar thermal collectors shall be designed in accordance with Section 1609.

Reason: Any PV system, including elevated PV support structures, rooftop mounted PV panel systems, and ground-mounted PV should also be designed in accordance with Section 1609, because they will also be subject to wind loads. By removing “rooftop-mounted”, these requirements will apply to any installation of PV systems, wherever they are installed.

This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency. The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner.

All recommendations from SEAC are approved by diverse stakeholders through a consensus process. For more information, please visit www.sustainableenergyaction.org

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply includes the defined term "elevated PV support structure" that was newly defined in the 2024 IBC last cycle. It does not change the requirement for wind design in IBC Chapter 16 or ASCE 7.

G184-25

G185-25

IBC: 3111.1.1, 3111.1.2, 3111.3.6

Proponents: Gwenyth Searer, Wiss, Janney, Elstner Associates, Inc., representing myself (gsearer@wje.com)

2024 International Building Code

SECTION 3111
SOLAR ENERGY SYSTEMS

Revise as follows:

3111.1.1 ~~Wind resistance~~ Structural design. ~~Rooftop-mounted photovoltaic~~ Photovoltaic (PV) panel systems and solar thermal collectors shall be designed and installed in accordance with ~~Section 1609~~ Chapter 16.

3111.1.2 ~~Roof live load~~Support structures. ~~Roof structures~~ Structures that provide support for solar energy systems shall be designed in accordance with Chapter 16~~Section 1607.15~~.

3111.3.6 Ground-mounted photovoltaic (PV) panel systems. *Ground-mounted photovoltaic panel systems* shall be designed and installed in accordance with ~~Chapter 16 and~~ the *International Fire Code*.

Reason: The provisions in Section 3111 are inconsistent with respect to solar systems and the applicability of Chapter 16 as follows:

- Section 3111.1.1 talks only about wind resistance of rooftop-mounted photovoltaic panel systems and solar thermal collectors. But dead load, snow load, and seismic loads are not mentioned. Similarly, this provision only covers "rooftop-mounted" systems, but Section 3111.3.5, which covers elevated photovoltaic (PV) support structures (which are presumably different than "rooftop-mounted systems", does not mention any structural loads, so there appears to be a hole in Section 3111.3.5.
- Section 3111.1.2 only talks about roof live load that must be applied to "roof structures" that support solar energy systems. Dead load, snow load, and seismic load are not mentioned, and this provision also does not appear to apply to elevated photovoltaic support structures because elevated PV support structures are arguably not roof structures. In addition, the specific reference to Section 1607.15 does not make sense, because that section covers crane loads not roof live loads.
- Section 3111.3.6 is the only provision that currently mentions Chapter 16 (i.e., "*designed and installed in accordance with Chapter 16*"), but if we require compliance with Chapter 16 in 3111.1.1 (which is just under Section 3111.1, General), we no longer need the reference here.

If all of these changes are made, Section 3111 will be more coordinated with Chapter 16 and several weaknesses in the current wording will be eliminated.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

I have not seen evidence that designers are relying on various provisions in Section 3111 to avoid designing for dead load, snow load, or seismic loads. Consequently, this change is editorial and only intended to clarify that the provisions in Chapter 16 apply to all PV panel systems and solar thermal collectors as well as the structures that support these systems. In the unlikely event that designers have been relying on various provisions in Section 3111 to avoid designing for dead load, snow load, or seismic loads, then that was never the intent of these provisions, and the provisions need to be modified, even if the changes result in an increase in cost.

G185-25

G186-25

IBC: 3111.3.3

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Philip Oakes, representing NASFM; Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com)

2024 International Building Code

3111.3.3 Building-integrated photovoltaic (BIPV) systems. BIPV systems installed as *roof coverings* shall be designed and installed in accordance with Section 1507. <u>BIPV systems installed as *exterior wall coverings* or fenestration shall be designed and installed in accordance with Section 1411.</u>

Reason: Requirements for BIPV systems used as exterior wall coverings or fenestration were added into the IBC last cycle. Because IBC Section 3111 provides a road map for all the requirements that apply to a solar energy system, this proposal simply adds a pointer to those new requirements.

This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency. The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner.

All recommendations from SEAC are approved by diverse stakeholders through a consensus process. For more information, please visit www.sustainableenergyaction.org

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is providing a pointer to assist the code user in finding all the applicable requirements for solar energy installations.

G186-25

G187-25

IBC: 3111.3.5

Proponents: Jenifer Gilliland, Seattle Department of Construction and Inspections, representing Washington Association of Building Officials Technical Code Development Committee (jenifer.gilliland@seattle.gov); Micah Chappell, Seattle Dept. of Construction and Inspections (SDCI), representing Washington Association of Building Officials Technical Code Development Committee (WABO TCD) (micah.chappell@seattle.gov); C Ray Allshouse, City of Shoreline, representing Washington Association of Building Officials Technical Code Development Committee (rallshouse@shorelinewa.gov)

2024 International Building Code

SECTION 3111
SOLAR ENERGY SYSTEMS

Revise as follows:

3111.3.5 Elevated photovoltaic (PV) support structures. *Elevated PV support structures* shall comply with either Section 3111.3.5.1 or 3111.3.5.2. _*Elevated PV support structures* shall be considered a roof for the purposes of establishing the number of stories and *fire separation distances*._

Exception: *Elevated PV support structures* that are installed over agricultural uses.

Reason: This proposed change addresses two issues: an elevated PV structure on top of a building that creates another story and the condition created by PV structures that are close to the lot line, similar to roof eaves that extend close to the lot line. This proposal aligns with similar changes made by RB150-22 in Section R329.7 of the 2024 IRC.

Since an accessory structure is not necessarily detached from a building, Section 3111.3.5 can be read to allow an elevated PV to be mounted on the roof of a building. This begs the question of once it is there, does it or does it not create a story? WABO members have encountered projects submitted for permit with large, elevated PV systems "shading" occupied roofs on mid-rise residential buildings. Some designers contend that these aren't a roof, and therefore, don't create an additional story or fire separation distance issues. No technical justification has been presented to demonstrate these should be treated differently than a roof, from a fire spread standpoint. Adoption of this proposed code change to the definition of elevated PV-support structures would settle the issue.

An *elevated PV support structure*, with a minimum of 7' 6 clearance below, creates a roof-like structure, as far as fire is concerned. It will contain heat and smoke just as much as a roof eave or a roof providing shade over an occupied roof. This is especially true given there are no requirements or criteria for openness of an elevated PV structure.

Once you have a usable space with a roof-like structure overhead, you clearly have created a story. If this does not create a story, then why would any other roof structure such as a 500 square foot hard roof over an occupiable roof create a story?

Where there is occupiable space below the elevated PV, and where the PV extends close to the lot line, you should be considering spread of fire to and from the adjacent property, which is the purpose of establishing fire separation distances. Because of the difficulty in trying to address all the variables of where this would be allowed, this proposal says if you put elevated PV on a roof, treat it as you would any other roof structure.

We want to emphasize that this proposal states the elevated PV gets treated as a roof for story count and fire separation distance purposes. It does not say the PV is a roof--it's just treated as such for those two issues, and those two issues only. For example, elevated PV would not be allowed by Table 504.4 on top of a Type V-A, R-2 4-story building, because that would create a 5th story. The building official can then apply their normal policies regarding roofs near the lot line, for fire separation/adjacent property protection purposes.

Elevated PV was the subject of two ICC proposals, RB150-22 and G123-21, in the 2024 code cycle. WABO submitted a public comment to disapprove G193 because it contained a definition that implies the space below the elevated PV can be used for any occupancy, which could create confusion regarding story count and fire separation distances. However, under heavy pressure from several proponents of G193 (some of whom recognized the issues we were raising), we decided to support the proposal as submitted rather than oppose the whole proposal because it dealt with some other important fire safety issues.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There has been a disagreement between building officials about whether the addition of elevated PV to a roof constitutes another story. This code proposal is meant to settle the issue and provide uniformity in enforcement across the country. It could be an increase in some parts of the country, but not in others.

G187-25

G188-25

IBC: SECTION 3113, 3113.1

Proponents: Andrew Klein, A S Klein Engineering, PLLC, representing Self Storage Association (andrew@asklein.com)

2024 International Building Code

SECTION 3113
RELOCATABLE BUILDINGS

Revise as follows:

3113.1 General. The provisions of this section shall apply to *relocatable buildings*. *Relocatable buildings* manufactured after the effective date of this code shall comply with the applicable provisions of this code.

~~**Exception**~~ **Exceptions:** This section shall not apply to:

1. ~~manufactured~~ Manufactured housing used as *dwellings.*
2. Pre-fabricated buildings that otherwise meet the provisions of this code.

Reason: Storage and utility/misc. buildings often make use of pre-fabricated buildings. It does not seem to be the intent of this section to apply to pre-fabricated buildings, but this additional exception ensures it will not be applied to such pre-fabricated buildings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is not the intent of this section to apply to pre-fabricated buildings, which are being explicitly exempted in this code change proposal.

G188-25

G189-25

IBC: 3114.1

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net); Robert Bachman, RE Bachman Consulting Structural Engineer, representing Myself (rebachmanse@aol.com); Chris Kimball, Building Code Solutions, representing Self (chris@bcscodegroup.com)

2024 International Building Code

Revise as follows:

3114.1 General. The provisions of Section 3114and other applicable sections of this code shall apply to *intermodal shipping containers* that are repurposed for use as *buildings* or *structures*, or as a part of *buildings* or *structures*.

Exceptions:

1. *Intermodal shipping containers* previously *approved* as existing *relocatable buildings* complying with Chapter 14 of the *International Existing Building Code*.
2. Stationary storage battery arrays located in *intermodal shipping containers* complying with Chapter 12 of the *International Fire Code*<u>and not assigned to Risk Category IV for reasons unrelated to hazardous materials</u>.
3. *Intermodal shipping containers* that are *listed* as equipment complying with the standard for equipment, such as air chillers, engine generators, modular *data centers*, and other similar equipment<u>, considering the risk category and occupancy-specific requirements</u>.
4. *Intermodal shipping containers* housing or supporting experimental equipment are exempt from the requirements of Section 3114, provided that they comply with all of the following:
   - 4.1. Such units shall be single stand-alone units supported at grade level and used only for occupancies as specified under *Risk Category* I in Table 1604.5.
   - 4.2. Such units are located a minimum of 8 feet (2438 mm) from adjacent *structures*, and are not connected to a fuel gas system or fuel gas utility.
   - 4.3. In *hurricane-prone regions* and *flood hazard areas*, such units are designed in accordance with the applicable provisions of Chapter 16.

Reason: This proposal corrects two overly permissive exceptions regarding the design of repurposed shipping containers.

IBC Section 3114.8, new since the 2021 edition, generally requires repurposed shipping containers to be designed as non-building structures in accordance with Chapter 16. However, Exceptions 2 and 3 to Section 3114.1 acknowledge that some repurposed shipping containers already meet the requirements of standards associated with the contents they contain, so they should not need to be specially designed.

This allowance is reasonable for most uses, but it should not apply where the contents of the container represent an essential use and are therefore assigned to Risk Category IV. Exception 2 relies on provisions in the IFC, which are great for fire safety and hazmat containment but do not address post-event functionality expected of RC IV uses. Similarly, Exception 3 relies on existing standards for the contained equipment, but those standards might or might not have considered project-specific conditions such as environmental loads, which vary by site, or occupancy-specific requirements in IBC Chapter 4.

California's Division of the State Architect makes a similar distinction. There, shipping containers are sometimes converted to school classrooms, but because of the special design expectations for schools, DSA does not adopt the exceptions in Sec 3114.1. (Ref: 2022 California Building Code Section 3115.1 and DSA IR 31-2, "Intermodal shipping container conversion to school building: 2022 CBC," available at https://www.dgs.ca.gov/dsa/publications#special_construction)

Where the use is assigned to RC IV, the container's foundation and anchorage must be designed for higher wind, seismic, and even tornado forces, and in areas of moderate or high seismicity, the contents must be anchored to the container with higher design forces and must also be certified as designated seismic systems. **If the equipment inside the container has to be designed for RC IV, and the**

container's anchorage and foundation have to be designed for RC IV, it makes no sense that the container itself should be exempt from design. The container is an obvious and essential piece of the seismic load path and is largely responsible for protecting the RC IV equipment from other environmental loads. Surely, the container's adequacy should be confirmed as part of the design.

This proposal was motivated by thinking about battery energy storage systems (BESS), which often involve battery racks and associated equipment installed within metal containers similar to standard intermodal shipping containers. Most BESS installations involve customized containers, so it's not clear that Section 3114, which applies to "repurposed" intermodal containers, is even appropriate for BESS components. Even so, the logic above – that the container itself merits design when its contents are assigned to RC IV – applies for BESS or any other use of the equipment otherwise covered by Exceptions 2 and 3.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Any cost increase should be small, probably at most a one-time manufacturer cost for pre-approval, but only a small, possibly zero, cost for construction. If the equipment standard referenced in Exception 3 already accounts for different risk categories and project-specific conditions, the proposal imposes no additional cost.

I defer to manufacturer's estimates. Note, however, that the cost increase, if any, will affect the container only. It **will not affect the cost of any contents or any foundation, anchorage, or interconnection to other structures**, which would already have to be designed as RC IV elements.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of designing or modifying a container for RC IV is almost impossible to estimate, since containers vary in size, and each application can include the cutting and reinforcing of different openings in different locations. That said, we know that many containers used for battery installations are already designed/approved for RC III as stand-alone non-building structures, and unless substantial openings are cut during customization, they are already significantly over-designed just to work for shipping, so the increase in physical material cost should be small. Even when shipping containers are blown over in high winds or shift off foundations in earthquakes, the container itself is basically unharmed.

Further, some containers have already been designed and installed for RC IV applications, so we know the proposal is feasible. With respect to seismic certification per ASCE 7 Sec 13.2.3, containers are "nonactive" components eligible for certification by analysis, so there will be no testing costs. My expectation is that if the container is not already confirmed as RC IV-ready, manufacturers will do a one-time design to confirm that typical containers already work for RC IV, and perhaps to set limits on modifications for the rare cases where they might not. This will be a **one-time manufacturer cost**, with likely no impact on actual construction cost.

Finally, Section 3114 covers only "repurposed" containers, so it's unclear whether this section and its current exceptions apply to specialty uses like those containing batteries or other life safety system equipment that might be assigned to RC IV.

Therefore, I defer to container manufacturers' estimates. That said, the question raised by this proposal is: If a shipping container would need to be significantly redesigned or rebuilt in order to satisfy typical design calcs with RC IV loads, should we really be exempting them from any design for essential facilities or critical RC IV uses, based on a blanket waiver?

G189-25

G190-25

IBC: 3114.8.4.1

Proponents: Mark DePasquale, National Portable Storage Association, representing Portable Storage Industry (mark@npsa.org)

2024 International Building Code

Revise as follows:

3114.8.4.1 Material properties. Structural material properties for existing *intermodal shipping container* steel components shall be ~~established by Section 2202~~confirmed by factory specifications and classification society factory inspection reports applicable to the intermodal shipping container proposed for use in a building or as a building component. If such reports are not available, the shipping container steel components must be established through material testing in order to identify the steel grade and composition.

Reason: This is a relatively new area in the building code and our Association felt the need to be more specific with regard to what is acceptable. The change will bring clarity to what is actually necessary to establish acceptance of a shipping container proposed for use in a building or as a building component.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Just seeking more clarity in the statement

G190-25

G191-25

IBC: SECTION 202 (New), SECTION 3115 (New), 3115.1 (New), 3115.2 (New), 3115.3 (New), 3115.4 (New), 3115.5 (New), 3115.6 (New), 3115.7 (New), 3115.8 (New), ACP (New), AWEA (New), IEC (New); IEBC: FAA (New)

Proponents: Michael Bergey, Bergey Windpower Co. LLC, representing Distributed Wind Energy Association (mbergey@bergey.com)

2024 International Building Code

Add new definition as follows:

DISTRIBUTED WIND ENERGY SYSTEM. A distributed wind energy system is a wind energy system that is connected behind-the-meter to provide energy to a structure.

Add new text as follows:

SECTION 3115
DISTRIBUTED WIND ENERGY SYSTEMS

3115.1 General. Ground-mounted distributed wind energy systems connected to an electrical service providing power to a structure shall comply with the requirements of this section.

3115.2 Certification required. Distributed wind energy system turbines shall be certified to AWEA 9.1 or ACP-101-1 by an accredited certification body or be IECRE type certified. Alternatively, systems shall be certified to IEC 61400-1 or -2, in addition too IEC 61400-11 and IEC 61400-12 by an accredited certification body.

3115.3 Electrical code. Distributed wind energy systems shall meet the requirements of the NFPA 70.

3115.4 Tower structure and foundation. Distributed wind energy system towers and foundations shall meet the requirements of TIA-222, except Section 17.12 for fatigue evaluation. The manufacturers dry PE-stamped structural analyses for conditions equal to or exceeding those of the local site shall be sufficient when the wind turbine tower is set back more than its total height from inhabited structures.

3115.5 System height. The distributed wind energy system shall comply with applicable FAA requirements in 14 CFR Part 77.

3115.6 Setback from property line. No part of the distributed wind energy system structure, including guy wire anchors, shall extend within ten (10) feet of the property boundaries of the installation site.

3115.7 Setback from inhabited structures. Distributed wind energy systems shall be set back at least a distance equal to the tower height of the wind turbine from existing inhabited structures and public roads.

3115.8 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

Add new standard(s) as follows:

IEC 61400-12:2022	Wind Energy Generation Systems - Part 12-1: Power Performance Measurements of Electricity Producing Wind Turbines

2024 International Existing Building Code

Add new standard(s) as follows:

FAA

Federal Aviation Administration
800 Independence Avenue, SW
Washington, DC 20591

14 CFR Part 77	SAFE, EFFICIENT USE, AND PRESERVATION OF THE NAVIGABLE AIRSPACE

Reason: The current IBC code includes specific sections on Solar Energy Systems (Section 3111) and Telecommunication and Broadcast Towers (Section 3108), but it does not have a specific section on wind energy systems. In fact, there is no mention of wind energy in the current code.

Distributed wind energy systems are typically installed adjacent to existing structures and connected electrically such that their energy production supplies the structure and a complement to the electrical supply from the serving electrical utility. Distributed wind energy systems are not windfarms, they primarily serve to reduce the owners consumption of utility electricity. The National Renewable Energy Laboratory (NREL) has determined that distributed wind energy systems could be installed at over 49 million locations in the U.S., and they have a technical potential, at greater than 8 TW, exceeding that of offshore wind energy systems.

Distributed wind energy systems complement solar energy systems in that they supply power at night and have their best performance (Winter and during storms) when solar energy is at its weakest. They take up substantially less space than solar and the leading products are made in America. The cost of distributed wind energy systems is coming down with more advanced technology and higher manufacturing volumes. Federal clean energy incentives apply equally to wind and solar investments and domestic manufacturing.

DWEA believes that adding a specific Distributed Wind Energy Systems section to the IBC, in Chapter 31 Special Constructions, will assist Authorities Having Jurisdiction (AHJ's) in determining appropriate requirements for ensuring the safe and effective use of this nascent emerging clean energy technology. The proposed subsections cover the requirements typically considered or imposed. Wind energy system requirements are quite rare in local and state codes so the proposed new section of the IBC will help fill a gap and result in a uniform minimum level of safety.

Substantiation:

3115.1 - The scope of the section is limited to "behind-the-meter" wind energy systems. Windfarms and roof-mounted wind energy systems are excluded. Roof-mounted wind turbines are not recommended due to structural, vibration, noise and wind sheltering and turbulence, and are therefore excluded.

3115.2 - The scope of the section is limited to "behind-the-meter" wind energy systems. There is no size limitation.

3115.3 - Historically, many smaller distributed wind energy system products have been offered for sale that have not been properly engineered or tested. Many have been sold with highly exaggerated performance claims, sometimes at high multiples of the total kinetic energy in the wind. These immature products, some of which were outright scams, have cheated consumers and posed unacceptable safety risks. In response to this phenomenon, consensus, ANSI-recognized, turbine certification standards were developed in 2009 and have been updated several times. The primary certification body for small and medium wind turbines is the Small Wind Certification Council, which is a service of ICC-ES.

Wind turbine certification is required by the Internal Revenue Service (IRS) to qualify for Section 48 Investment Tax Credits and Section 45X Advanced Manufacturing Tax Credits. The U.S. national and international standards listed are those used for the IRS for qualification. IECRE is an emerging pan-national certification program that has the goal of reducing the need to obtain separate certification for each country. Given the three year latency of the IBC, DWEA believes that including a reference to IECRE in the 2027 edition is prudent.

3115.4 - The NEC Section 694 covers electrical safety of small wind systems and requires that the wind turbine be listed. The standard to which they can be listed is UL 6142.

3115.5 - In the absence of a national structural safety standard for wind turbine towers AHJ's typically request a structural analysis demonstrating compliance with structural standard for telecommunications towers, TIA-222. This is accepted practice in the distributed wind industry but there are two issues we would like to address in the IBC.

First, TIA-222 Section 17 requires an elaborate evaluation of the wind turbine tower structure for fatigue. But DWEA is unaware of any fatigue related failures of towers for certified wind turbines so this requirement in the standard, developed by the telecom industry, is an expense without a public benefit. It has limited the number of professional engineering firms offering evaluation services due to the learning curve of this section of the code and the fact that they will seldom use it. In addition, distributed wind energy systems are seldom placed close to inhabited structures so the risk of injury from a tower collapse is extremely remote. Therefore, DWEA recommends an exemption from Section 17 so long as the tower is beyond the fall zone of the distributed wind energy system.

Second, the towers for certified wind turbines are typically designed for the structural loads determined in the turbine safety standard used for certification, IEC 61400-1 or IEC 61400-2. For a IEC Class II certification (the most common) those loads are determined for a 60 m/s (132 mph) 3-second gust and then safety factors of 1.35 – 1.5 are applied. So, when a manufacturer creates a PE-stamped analysis with those loads and wind speed, and accounting for additional ice and seismic loads, for a standard tower DWEA believes that the resulting evaluation should be accepted for that or lesser site conditions. We understand that state or local regulations may require a unique evaluation bearing an in-state PE wet stamp and supersede this section.

3115.6 - Hazards to aviation are regulated by the Federal Aviation Administration and distributed wind energy systems are subject to those regulations.

3115.7 - This provides a buffer from neighboring properties.

3115.8 - This is a safety setback that provides near absolute assurance that the distributed wind energy structure provides no risk to people.
3115.9 - This parallels language provided for solar energy systems.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Estimated to save $500-2,000 per installation. More if dry-stamp structural analyses are allowed.

Estimated Immediate Cost Impact Justification (methodology and variables):

The code change request will decrease the costs of construction for certified distributed wind energy systems and will increase the costs of construction for non-certified distributed wind energy systems. For certified distributed wind energy systems, the costs will be reduced through the exemption from Section 17 of TIA-222 and by more uniform and predictable requirements. For non-certified distributed wind energy systems, the cost will be increased by the costs of certification.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:

IBC: SECTION 202 (New), SECTION 3115 (New), 3115.1 (New)

Proponents: Jonathan Roberts, representing UL Solutions (jonathan.roberts@ul.com)

2024 International Building Code

Add new definition as follows:

MODULAR ROOM. A prefabricated structure intended for indoor use to provide privacy that has walls, a ceiling, with or without an integrated floor, and that can include integral electrical wiring, ventilation, and furniture.

Add new text as follows:

SECTION 3115 MODULAR ROOMS

3115.1 General. Where provided, m*odular rooms* shall comply with Section 323 of the *International Fire Code*.

Reason: Modular rooms are becoming increasingly popular and are showing up in a variety of different occupancies. During the Code Action Hearings held April 7-14th, 2024 The International Fire Code Committee voted 14-0 to approve F62-24 as modified. F62-24 creates a new Section 323 for Modular Rooms in Chapter 3 of the International Fire Code. The new Section 323 contains requirements for permitting, listing, locations, occupant notification and automatic fire sprinkler systems as well as requirements for modular rooms used for sleeping. This proposal will place a pointer to the applicable requirements for modular rooms where they are installed under the scope of the International Building Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost increase as this proposal only points to the requirements in the 2027 IFC.

G192-25

G193-25

IBC: SECTION 202 (New), SECTION 312, 312.1, SECTION 3115 (New), 3115.1 (New), 3115.2 (New), 3115.3 (New), 3115.3.1 (New), 3115.4 (New), 3115.5 (New), 3115.6 (New), NFPA Chapter 35 (New); IFC: SECTION 202 (New), [BG] 203.11

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, representing NYSDOS (kevin.duerr-clark@dos.ny.gov); Daniel Carroll, New York State Department of State, representing Division of Building Standards and Codes (daniel.carroll@dos.ny.gov); Brian Tollisen, representing NYS Department of State, Division of Building Standards and Codes (brian.tollisen@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Stephen Van Hoose, representing NYS DOS (stephen.vanhoose@dos.ny.gov)

2024 International Building Code

Add new definition as follows:

LIVE FIRE TRAINING STRUCTURES. A structure utilized by the fire department for conducting live fire training on a repetitive basis.

SECTION 312
UTILITY AND MISCELLANEOUS GROUP U

Revise as follows:

312.1 General. *Buildings* and *structures* of an accessory character and miscellaneous *structures* not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings

Aircraft hangars, accessory to a one- or two-family residence (see Section 412.4)

Barns

Carports

Communication equipment *structures* with a *gross floor area* of less than 1,500 square feet (139 m^2)

Fences more than 7 feet (2134 mm) in height

Grain silos, accessory to a residential occupancy

Livestock shelters

Live fire training facilities

Private garages

Retaining walls

Sheds

Stables

Tanks

Towers

Add new text as follows:

SECTION 3115
LIVE FIRE TRAINING STRUCTURES

3115.1 General. Where approved by the *building official* and the *fire code official*, *live fire training facilities* designed in accordance with Chapter 7 of NFPA 1402, or Chapters 6, 7, or 8 of NFPA 1403, and the provisions of Section 3115 shall be deemed to satisfy the requirements of this code.

3115.2 Posting. Temporary and permanent *live fire training structures* shall be provided with signs that state **"DANGER - FIREFIGHTER ACCESS ONLY. DANGEROUS BUILDING CONDITIONS WITHIN."**. Signs shall be readily visible and located near every entrance to the structure or, where the temporary or permanent *live fire training structure* is entirely surrounded by fencing, at every fence entrance.

3115.3 Structural. Temporary and permanent *live fire training structures* shall be designed in accordance with Chapter 16 and this section and supported on foundations or other supporting *structures* designed and constructed in accordance with Chapter 16 through 23.

3115.3.1 Intermodal shipping containers. Where temporary or permanent *live fire training structures* are comprised of *intermodal shipping containers* such *intermodal shipping containers* shall comply with Section 3114.2 through 3114.4 and 3114.8 through 3114.8.5.3.

3115.4 Building heights and area. *Live fire training structures* shall comply with Chapter 5.

> **Exception:** Where *approved* by the building official and *fire code official*, *live fire training structures* shall be exempt from the *building height*, number of stories and *building area limitations specified in Sections 504 through 506.*

3115.5 Fire separation distance. Temporary and permanent *live fire training structures* shall have a *fire separation distance* not less than 30 feet.

> **Exception:** Where multiple temporary and permanent *live fire training structures* exist on the same site, such structures shall shall not be required have a *fire separation distance* between them.

3115.6 Responder safety features. Temporary and permanent *live fire training structures* shall comply with Section 914 and 918.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

1402-2019	Standard on Facilities for Fire Training and Associated Props
1403-2018	Standard on Live Fire Training Evolutions

2024 International Fire Code

Add new definition as follows:

LIVE FIRE TRAINING STRUCTURES. A structure utilized by the fire department for conducting live fire training on a repetitive basis.

Revise as follows:

[BG] 203.11 Miscellaneous Group U. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings

Aircraft hangar, accessory to a one- or two-family residence (see Section 412.4 of the *International Building Code*)

Barns

Carports

Communication equipment structures with a gross floor area of less than 1,500 square feet (139 m^3)

Fences more than 7 feet (2134 mm) in height

Grain silos, accessory to a residential occupancy

Livestock shelters

Live fire training facilities

Private garages

Retaining walls

Sheds

Stables

Tanks

Towers

Reason: The IBC currently lacks clear guidelines for live fire training facilities. Previous attempts to address this have been unsuccessful, but this proposal builds on those lessons, offering building code officials a prescriptive path that ensures structural integrity while balancing life-safety with the need for realistic training scenarios.

With increased demands for these structures, and little code guidance, the path for a building code official to approve the structures becomes increasingly difficult.

This code change:

- Classifies live fire training structures within Group U Occupancies.
- Mandates signage for safety awareness and public warning.
- Ensures compliance with IBC structural standards, with specific guidance for structures made from intermodal shipping containers.
- Establishes a 30-foot minimum fire separation distance, based on T705.5.
- Requires basic responder safety features like shaftway and equipment room identification, and radio coverage.

Of note, this proposal is designed for relatively easy understanding and adoption by leveraging existing sections for structural design or integrates with current safety feature requirements, making the code more cohesive rather than adding complexity.

Bibliography: NPFA 1402-2019 may be viewed online here (https://www.nfpa.org/codes-and-standards/nfpa-1402-standard-development/1402).
NFPA 1403-2018 may be viewed online here (https://www.nfpa.org/codes-and-standards/nfpa-1403-standard-development/1403).

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0, however, this code change could lead to a decrease in immediate construction costs by providing clearer guidelines for live fire training facilities.

Estimated Immediate Cost Impact Justification (methodology and variables):

By offering specific standards, it reduces the need for custom solutions, simplifies compliance, and optimizes resource use in design and construction.

Estimated Life Cycle Cost Impact:

The lifecycle costs of these facilities might be reduced due to the strategic selection of materials and placement of required signs and systems.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Choosing durable materials for signage, locating systems like radio responder coverage externally, and selecting cost-effective products could lower maintenance and operational costs.

Staff Analysis:

- A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:
  - NFPA 1402-2019 Standard on Facilities for Fire Training and Associated Props
  - NFPA 1403-2018 Standard on Live Fire Training Evolutions

G193-25

G194-25

IBC: SECTION 3115 (New), 3115.1 (New), SECTION 202 (New), ICC Chapter 35 (New)

Proponents: Bora Gencturk, University of Southern California, representing ICC Committee 1150 (gencturk@usc.edu)

2024 International Building Code

Add new text as follows:

SECTION 3115
AUTOMATED CONSTRUCTION TECHNOLOGY FOR 3D PRINTING WALLS

3115.1 General. 3D printing materials and 3D printing walls shall be designed and constructed in accordance with ICC 1150.

Add new definition as follows:

3D AUTOMATED CONSTRCUCTION TECHNOLOGY (3D-ACT). Construction-scale 3D printing technology, also known as additive manufacturing or layer-by-layer automated construction technology, used in the construction of buildings, or building components, consisting of a computer program, *3D printer software*, and computer-controlled equipment, *3D printer*, to create three-dimensional shapes with 3D printing material.

3D PRINTING MATERIALS. A proprietary or non-proprietary cementitious material, concrete or mortar, that consists of cement, *fibers*, *supplementary cementitious materials*, fine or coarse aggregate, and *admixtures*, if applicable. *3D printing material* is extruded in layers during construction.

3D PRINTING WALLS. Walls constructed with the use of *3D automated construction technology* using 3D printing material. Walls may be printed in various configurations, including but not limited to, printing 3D printing material in layers to create two outer face shells with a *core fill grout* between the shells to form a solid wall. If applicable, structural steel reinforcing shall be placed within the *core fill grout*, or within the shell layers.

Add new standard(s) as follows:

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

1150-2026	Standard for Automated Construction Technology for 3D Printing Walls

Reason: There is growing interest for 3D printing construction. 3D printing construction is being increasingly used across the United States. Currently there is no code available for this construction approach. The purpose of this proposed code change is to establish design provisions for *3D printed walls* and their connections where the walls are built using 3D *automated construction technology* (3D-ACT) with proprietary or non-proprietary *3D printing materials*, that are in compliance with the intent of the model building codes.The proposed changes improve upon the technical requirements to reflect current industry practices related to materials testing and structural design. The proposed changes aim to eliminate any conflicts with codes and establish common terms and rigor. The resulting changes provide appropriate protections for health, safety and welfare while avoiding unnecessary restrictions on the use of new materials, technologies or designs. The referenced standard was developed following the rigorous ANSI standard development process.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a new construction methodology. It is not anticipated to increase cost of construction approach.

Staff Analysis: A review of the standard proposed for inclusion in the code, ICC 1150-2026 Standard for Automated Construction Technology for 3D Printing Walls, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

G195-25 Part I

IBC: SECTION 202 (New), SECTION 3115 (New), 3115.1 (New), 3115.2 (New), 3115.3 (New), ICC Chapter 35 (New)

Proponents: Jon Hannah-Spacagna, representing Modular Building Institute; Jay Richards, State of Ohio, representing Board of Building Standards (jay.richards@com.ohio.gov); Jonathon Paradine, State of Michigan, representing LARA/ Bureau of Construction Codes (paradinej@michigan.gov); Shane Nilles, representing American Wood Council (snilles@awc.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Kelly Kelly, Texas Department of Licensing and Regulation, representing self (kelly.kelly@tdlr.texas.gov); Crisi Cooper, Texas Dept of Licensing and Regulation, representing Industrialized Housing and Building (crisi.cooper@tdlr.texas.gov)

THIS IS AN 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-GENERAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new definition as follows:

MODULAR COMPONENT. A subassembly, subsystem or combination of elements for use as a part of a building that is not structurally independent and is a part of structural, plumbing, mechanical, electrical, fire protection or other systems affecting life safety.
MODULE. A three-dimensional, volumetric section of a building designed and constructed to be transported as a single section to a site for on-site installation with or without other sections and/or on-site construction.

Add new text as follows:

SECTION 3115
MODULES AND MODULAR COMPONENTS

3115.1 General. Planning, design, fabrication, transportation, assembly, inspection and regulatory compliance of *modules* or *modular components* shall comply with this section.

Exceptions:

1. *Modules or Modular components* not containing plumbing, mechanical, electrical, or fire protection systems that comply with the requirements of Section 1704.2.5 for *fabricated items*.
2. *Modules or Modular components*, rooms, suites, or pods manufactured, *listed*, *labeled* and installed in accordance with *approved* standards.

3115.2 Construction. In additionto other applicable requirements in this code, *modules or modular components* shall be constructed in accordance with ICC/MBI 1200

3115.3 Regulatory Compliance. In additionto other applicable requirements in this code, *modules or modular components* constructed off-site shall be inspected and regulated in accordance with ICC/MBI 1205 and ICC/MBI 1210.

Exceptions:

1. Jurisdictions where requirements for *modules or modular components* constructed off-site are established and regulated in accordance with the laws of the state or jurisdiction in which the site of the completed building will be located.
2. Inspection of *modules or modular components* manufactured in such a manner that all portions can be inspected, in accordance with this code, without disassembly, damage or destruction thereof.

Add new standard(s) as follows:

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

ICC/MBI 1200-2021	Standard for Off-Site Construction: Planning, Design, Fabrication and Assembly
ICC/MBI 1205-2021	Standard for Off-Site Construction: Inspection and Regulatory Compliance
ICC/MBI 1210-2023	Standard for Mechanical, Electrical, Plumbing Systems, Energy Efficiency and Water Conservation in Off-site Construction.

Reason: Many segments of the building industry including code officials, building owners, designers and contractors are often unfamiliar with the offsite construction processes. In some cases, the code officials have no direction or guidance on how to regulate certain construction activities that do not occur on the project site. In other cases, manufacturers are forced to deal with a myriad of regulations from local agencies where state entities are not empowered to regulate the built environment when constructed offsite.

The MBI/ICC 1200 and 1205 provides direction and guidance for offsite construction that is not covered by traditional methods and code applications. To facilitate understanding of the off-site construction process, assure off-site projects meet the requirements of construction codes; the International Code Council (ICC) and the Modular Building Institute (MBI) initiated a joint project to develop standards for the planning, design, fabrication, assembly, inspection, and regulatory compliance of off-site and modular construction in February 2019. The result of the collaboration is the MBI/ICC 1200 *Standard for Off-Site Construction: Planning, Design, Fabrication, and Assembly* and MBI/ICC1205 *Standard for Offsite Construction: Inspection and Regulatory Compliance.*

These standards include requirements for a controlled manufacturing environment, supply chain integration, structural modular vs non-structural modular, the fabrication process and on-site assembly such as: staging area for construction materials, foundations, placing modules, structural connections, utilities (PMG), weather considerations, finishing mate lines, inspections, approval and regulatory compliance of off-site construction components and their assembly. The standards also include the completion of the building at the final site such as: permitting; in-plant and on-site final inspections; third party inspections; the role of Industrialized Building Departments, state modular programs and the local Authority Having Jurisdiction.

This proposal recognizes there are different pathways to demonstrate code compliance for offsite construction. This proposal is not intended to remove or replace any existing traditional method as noted in the exceptions, but also provide the necessary guidance for code users and officials can rely on. These methods referenced in the codes and standards have been:

- Items fabricated in accordance with IBC Section 1704.2.5., including those assembled under the approved fabricator program (1704.2.5.1).
- Products, assemblies, and equipment manufactured, listed, and installed in accordance with an approved standard.
- State Industrialized or Manufactured Building programs.

A similar proposal (G102-21) was submitted and was not approved for the 2024 IBC. This proposal specifically looked at the opposing testimony in an attempt to not cast too large of a compliance net. The proposal addresses existing approval methodologies: approved structural fabrication, panelized systems, listed self-contained rooms or pods, elements that can be inspected on-site; but also allows for the recognition and coordination of state-wide programs. Furthermore, the location appears to be better suited in Chapter 33 - Special Construction vs Chapter 4 – Special Detailed Requirements Based on Occupancy and Use.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal outlines off-site construction methods that may be unfamiliar to inexperienced industry participants and offers a model regulatory
process to address state and local needs.

Staff Analysis:

- A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:

- ICC/MBI 1200-2021, Standard for Off-Site Construction: Planning, Design, Fabrication and Assembly
- ICC/MBI 1205-2021, Standard for Off-Site Construction: Inspection and Regulatory Compliance
- ICC/MBI 1210-2023, Standard for Mechanical, Electrical, Plumbing Systems, Energy Efficiency and Water Conservation in Off-site Construction

G195-25 Part I

G195-25 Part II

IRC: SECTION 202 (New), R301.1.5 (New), R301.1.5.1 (New), R301.1.5.2 (New), ICC Chapter 44 (New)

Proponents: Jon Hannah-Spacagna, representing Modular Building Institute; Jay Richards, State of Ohio, representing Board of Building Standards (jay.richards@com.ohio.gov); Jonathon Paradine, State of Michigan, representing LARA/ Bureau of Construction Codes (paradinej@michigan.gov); Shane Nilles, representing American Wood Council (snilles@awc.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Crisi Cooper, Texas Dept of Licensing and Regulation, representing Industrialized Housing and Building (crisi.cooper@tdlr.texas.gov)

2024 International Residential Code

Add new definition as follows:

MODULAR COMPONENT. A subassembly, subsystem or combination of elements, including panelized systems, building shells or bathroom pods, for use as a part of a modular building that is not structurally independent, but is a part of structural, plumbing, mechanical, electrical, fire protection or other systems affecting life safety.
MODULE. A three-dimensional, volumetric section of a building designed and constructed to be transported as a single section to a site for on-site installation with or without other sections and/or on-site construction.

SECTION R301
DESIGN CRITERIA

Add new text as follows:

R301.1.5 Modules and Modular Components. Planning, design, fabrication, transportation, assembly, inspection and regulatory compliance of *modules* or *modular components* shall comply with this section.

Exceptions:

1. *Modules or Modular components* not containing plumbing, mechanical, electrical, or fire protection systems that comply with *approved* standards or the requirements of the International Building Code for fabricated items.
2. *Modules or Modular components*, rooms, suites, or pods manufactured, *listed*, *labeled*, and installed in accordance with *approved* standards.

R301.1.5.1 Construction. In addition to other applicable requirements in this code, *modules* or *modular components* constructed off-site shall be constructed in accordance with ICC/MBI 1200.

R301.1.5.2 Regulatory Compliance. In additionto other applicable requirements in this code, *modules* or *module components* constructed off-site construction shall be inspected and regulated in accordance with ICC/MBI 1205 and ICC/MBI 1210.

Exceptions:

1. Jurisdictions where requirements for *modules or modular components* constructed off-site are established and regulated in accordance with the laws of the state or jurisdiction in which the site of the completed building will be located.
2. Inspection of *modules* or *modular components* manufactured in such a manner that all portions can be inspected, in accordance with this code, without disassembly, damage or destruction thereof.

Add new standard(s) as follows:

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

ICC/MBI 1200-2021	Standard for Off-Site Construction: Planning, Design, Fabrication and Assembly
ICC/MBI 1205-2021	Standard for Off-Site Construction: Inspection and Regulatory Compliance
ICC/MBI 1210-2023	Standard for Mechanical, Electrical, Plumbing Systems, Energy Efficiency and Water Conservation in Off-site Construction.

Reason: Many segments of the building industry including code officials, building owners, designers and contractors are often unfamiliar with the offsite construction processes. In some cases, the code officials have no direction or guidance on how to regulate certain construction activities that do not occur on the project site. In other cases, manufacturers are forced to deal with a myriad of regulations from local agencies where state entities are not empowered to regulate the built environment when constructed offsite.

The MBI/ICC 1200 and 1205 provides direction and guidance for offsite construction that is not covered by traditional methods and code applications. To facilitate understanding of the off-site construction process, assure off-site projects meet the requirements of construction codes; the International Code Council (ICC) and the Modular Building Institute (MBI) initiated a joint project to develop standards for the planning, design, fabrication, assembly, inspection, and regulatory compliance of off-site and modular construction in February 2019. The result of the collaboration is the MBI/ICC 1200 *Standard for Off-Site Construction: Planning, Design, Fabrication, and Assembly* and MBI/ICC1205 *Standard for Offsite Construction: Inspection and Regulatory Compliance.*

These standards include requirements for a controlled manufacturing environment, supply chain integration, structural modular vs non-structural modular, the fabrication process and on-site assembly such as: staging area for construction materials, foundations, placing modules, structural connections, utilities (PMG), weather considerations, finishing mate lines, inspections, approval and regulatory compliance of off-site construction components and their assembly. The standards also include the completion of the building at the final site such as: permitting; in-plant and on-site final inspections; third party inspections; the role of Industrialized Building Departments, state modular programs and the local Authority Having Jurisdiction.

This proposal recognizes there are different pathways to demonstrate code compliance for offsite construction. This proposal is not intended to remove or replace any existing traditional method as noted in the exceptions, but also provide the necessary guidance for code users and officials can rely on. These methods referenced in the codes and standards have been:

- Items fabricated in accordance with special inspection provisions of the IBC. This is addressed in Section 1704.2.5., including those assembled under the approved fabricator program (1704.2.5.1).
- Products, assemblies, and equipment manufactured, listed, and installed in accordance with an approved standard.
- State Industrialized or Manufactured Building programs.

A companion proposal has been submitted for the International Building Code that will create a new section in Chapter 33 of the IBC. Both proposals address existing approval methodologies: approved structural fabrication, panelized systems, listed self-contained rooms or pods, elements that can be inspected on-site; but also allows for the recognition and coordination of state-wide programs.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal outlines off-site construction methods that may be unfamiliar to inexperienced industry participants and offers a model regulatory
process to address state and local needs.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

IBC: SECTION 202 (New), SECTION 3115 (New), 3115.1 (New), 3115.2 (New), 3115.3 (New), FM Chapter 35 (New)

Proponents: David Campbell, TuffWrap, representing SmartSeam (tmdevit@gmail.com)

2024 International Building Code

Add new definition as follows:

TEMPORARY CEILING CONSTRUCTION BARRIER. A system utilizing seamed membrane sheets and attachments to supporting construction used to mitigate dust and debris from falling from a work area above the barrier to an area below the barrier.

Add new text as follows:

SECTION 3115
TEMPORARY CEILING CONSTRUCTION BARRIERS

3115.1 General. *Temporary ceiling construction barriers* shall be certified and labeled by an approved agency to comply with the requirements of Sections 3115.2 and 3115.3 and other applicable sections of this code.

3115.2 Transverse loads. *Temporary ceiling construction barriers* shall withstand 15 punds per square foot transverse loads in accordance with ASTM E330, Procedure A.

3115.3 Fire provisions. *Temporary ceiling construction barriers* shall be permitted to be installed below *automatic sprinkler systems* providing the *temporary ceiling construction barrier* complies with all of the following:

1. The ceiling finishes meets the requirements of Class A in accordance with Section 803.1.2.2 of the *International Fire Code*.
2. The ceiling meets the requirements of UL 723S, Section 3.3 and shown to comply with Section 3.4 for minimum and maximum distances beneath fire sprinklers.
3. Meets the satisfactory performance of FM4651 for melt-out or drop out in accordance with the following:
   - 3.1. Before sprinkler operation, within 1 min 45 seconds of flame exposure.
   - 3.2. After sprinkler operation, within 1 min 45 seconds of flame exposure.

Add new standard(s) as follows:

FM

FM Approvals
Headquarters Office1151 Boston-Providence TurnpikeP.O. Box 9102
Norwood, MA 02062

FM4651	Approval Standard for Plastic Suspended Ceiling Panels

Reason: The Temporary Ceiling Construction Barrier market started in 1999, and has grown significantly in the last 7-10 years as building owners, retail and commercial spaces, and manufacturers want to continue normal operations during construction/ renovation, to continue operations as normal, when such remedial or improvement work is necessary. This change is needed to include the option for temporary ceiling construction barriers in the code.
Health concerns have grown in these spaces, and protecting these spaces, while allowing activities to continue, has given rise to this product/installation to negate having to shut down an area while doing roof related work. UL and FM have test protocols designed specifically to address and evaluate these product materials and installations. These products are used as barriers, on the underside of the roof during construction and above occupied space, to help reduce dust and small debris from falling from upper areas of construction to lower occupied levels. These systems are particularly useful in ceiling construction and other applications where business operations need to continue below a roof area being worked on. The inclusion of these systems into the code is important as

addressing potential safety considerations is critical for occupant safety, including falling dust and fire-safety considerations. There is no significant loading requirements on the system, as they are not intended to protect from heavy falling debris, only for dust and smaller particles that affect cleanliness and operation of the level below. The fire safety concerns are critical to the safety of the building and its occupants, as these systems are designed to open up in the event of a fire and not affect the operation of the fire sprinkler system's ability to extinguish a fire. This is particularly important as these systems are often placed between the fire sprinklers and the occupied level below.

Please use the included link below to the FM site to acquire the FM 4651 Standard referenced in this code change, and simply enter the standard number, 4651, to view the standard.

https://www.fmapprovals.com/Resources/Approval-Standards (type 4651 in the search box).

Cost Impact: Increase

Estimated Immediate Cost Impact:

There is a cost associated with the installation of this product, but compared to the use of scaffolding or a shutdown and loss of productivity in the space under the construction area, the net cost impact is favorable and positive to the owners. Abnormally high traffic on the roof in the vicinity of the construction area shakes loose dust, insects, and any accumulated debris on open format ceilings, like bar joist or open beam construction. This installation protects the inhabited space below the construction area, allowing activities normally done in this area to continue. The health safety concerns usually mandate a temporary scaffold type protection be put in place, which disrupts or prohibits normal traffic and activity to various degrees, this product is not intrusive as it never comes in contact with the area below the construction area.

Estimated Immediate Cost Impact Justification (methodology and variables):

Typical installation cost is $1.00 - $2.00/sq ft, which includes the removal of the product at the end of the construction period or the limit of the installation timing.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

FM4651 Approval Standard for Plastic Suspended Ceiling Panels

G196-25

G197-25

IBC: 3304.1.1

Proponents: John-Jozef Proczka, representing City of Phoenix Planning and Development Department (john-jozef.proczka@phoenix.gov)

2024 International Building Code

Revise as follows:

3304.1.1 Slope limits. Slopes for permanent fill shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Cut slopes for permanent excavations shall be not steeper than one unit vertical in two units horizontal (50-percent slope). Deviation from the foregoing limitations for cut slopes shall be permitted only upon the presentation of a ~~soil~~ geotechnical investigation report acceptable to the *building official*.

Reason: Geotechnical investigation report is the term used throughout the code, especially in Section 1803.6.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Terminology change only without intent change.

G197-25

G198-25

IBC: C104.1, SECTION C105 (New), C105.1 (New)

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Building Code

APPENDIX C
GROUP U—AGRICULTURAL BUILDINGS

SECTION C104
EXITS

Revise as follows:

C104.1 Exit facilities. *Exits* shall be provided in accordance with ~~Chapters~~ Chapter 10 ~~and 11~~.

Exceptions:

1. The maximum travel distance from any point in the *building* to an *approved exit* shall not exceed 300 feet (91 440 mm).
2. One *exit* is required for each 15,000 square feet (1393.5 m^2) of area or fraction thereof.

Add new text as follows:

SECTION C105
ACCESSIBLITY

C105.1 Accessibility. Agricultural buildings shall be *accessible* in accordance with Chapter 11.

Reason: From commentary, and reaffirmed here, "typically, Group U buildings are exempt from Chapter 11's accessibility requirements for person with physical disabilities. Section 1103.2.4 only mandates that access is required to paved work areas and those areas within a building or structure that are open to the general public." The proposed langage removes an unnecessary pointer to Chapter 11 in regards to exits and provides a seperate section more appropriately point to Chapter 11.

CHAPTER 11
ACCESSIBILITY

SECTION1103
SCOPING REQUIREMENTS

1103.2.4 Utility buildings. Group U occupancies are not required to comply with this chapter other than the following:

1. In agricultural *buildings*, access is required to paved work areas and areas open to the general public.
2. *Private garages* or carports that contain required accessible parking.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed langage reaffirms the the existing language.

IBC: D102.2.8

Proponents: Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

2024 International Building Code

APPENDIX D
FIRE DISTRICTS

SECTION D102
BUILDING RESTRICTIONS

Revise as follows:

D102.2.8 Permanent canopies. Permanent *canopies* are permitted to extend over adjacent open spaces provided that all of the following are met:

1. The *canopy* and its supports shall be of noncombustible material, *fire-retardant-treated wood*, Type IV construction or of 1-hour fire-resistance-rated construction.

   Exception: Any textile covering for the *canopy* shall comply with the fire propagation performance of Test Method 1 or Test Method 2, as appropriate of ~~be flame resistant as determined by tests conducted in accordance with~~ NFPA 701 after both accelerated water leaching and accelerated weathering.

2. Any canopy covering, other than textiles or *fire-retardant-treated wood*, shall comply with either one of the following, when tested in the form intended for use:

   2.1. Have a *flame spread index* not greater than 25 when tested in accordance with ASTM E84 or UL 723 ~~in the form intended for use~~.

   2.2. Meet all of the following criteria when tested in accordance with NFPA 286:

      2.2.1. During the 40 kW exposure, flames shall not spread to the ceiling.

      2.2.2. Flashover, as defined in NFPA 286, shall not occur.

      2.2.3. The flame shall not spread to the outer extremity of the sample on any wall or ceiling.

      2.2.4. The peak heat release rate throughout the test shall not exceed 800 kW.

3. The *canopy* shall have one long side open.
4. The maximum horizontal width of the *canopy* shall be not greater than 15 feet (4572 mm).
5. The *fire resistance* of *exterior walls* shall not be reduced.

Reason: This proposal makes three changes:

1. The terminology in the section for textiles is inappropriate. Use of the term "flame resistant" is not correct and misleading. Everywhere else in ICC codes the terminology relating to NFPA 701 testing has been changed to read as follows" "meet the fire propagation performance of Test Method 1 or Test Method 2", and that language is proposed here.

2. The proposal allows for testing in accordance with NFPA 286 as an alternative to testing in accordance with ASTM E84 or UL 723. Chapter 8 of the IBC is clear that any time a Class A material (meaning a material with a flame spread index not exceeding 25 in ASTM E84 or UL 723) is required, compliance by a material with all the criteria in chapter 8 for testing to NFPA 286 is equally acceptable to a Class A material. The reason for adding this is because materials may have already been tested to NFPA 286 and it is unnecessary (and wasteful) to have them retested to ASTM E84.

3. Fire-retardant-treated wood materials are required to exhibit a listed flame spread index of no more than 25 in accordance with ASTM E84 (per section 2303.2 of the IBC) so retesting to ASTM E84 per item 2 is unnecessary.

Note that neither the existing code text nor the proposed revision addresses smoke release.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Basically just a cleanup.

G199-25

G200-25

IBC: F101.5, F101.5.1

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

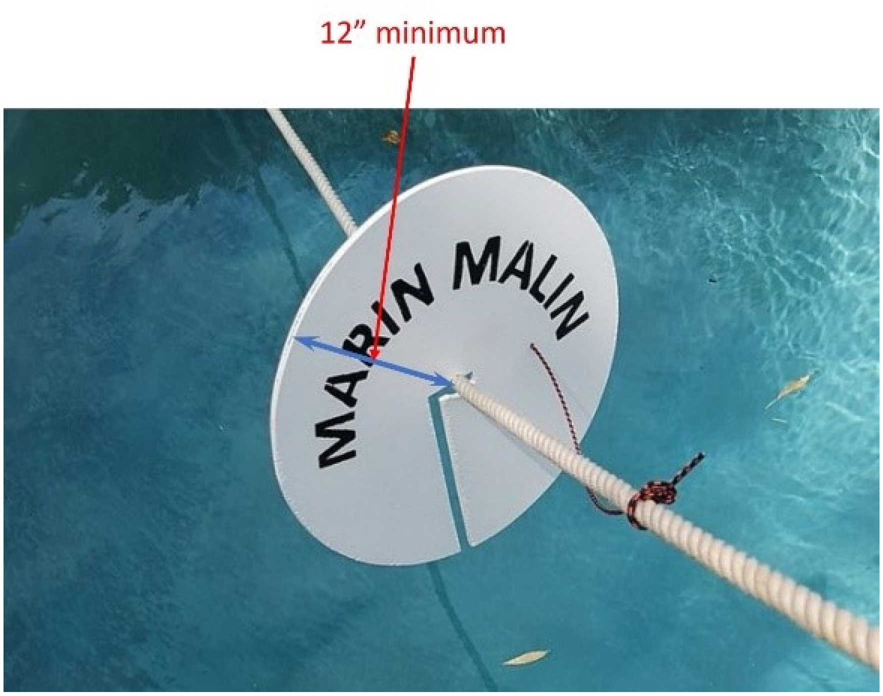
APPENDIX F
RODENTPROOFING

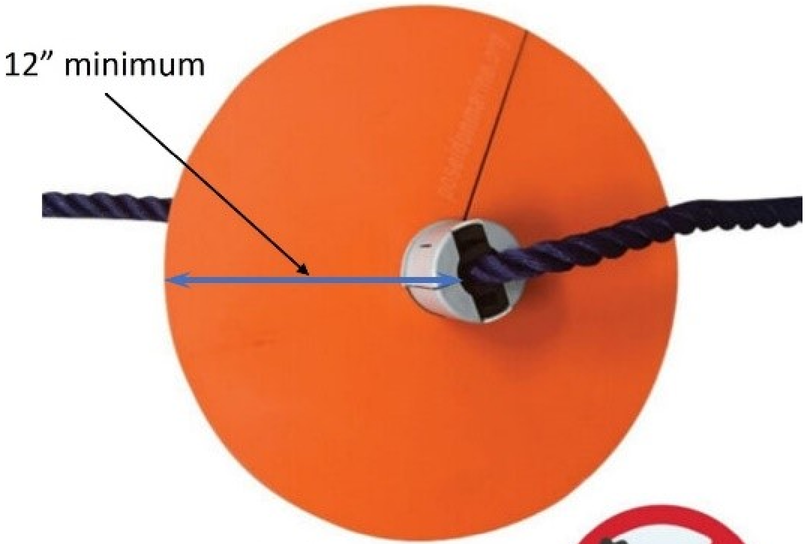
Revise as follows:

F101.5 Windows and other openings. Windows and other openings for the purpose of light or ventilation located in *exterior walls* and with the bottom of the opening ~~within~~ 2 feet (610 mm) or less above the ~~existing ground level immediately below such opening~~ finish grade shall be covered for their entire height and width, including frame, with hardware cloth of not less than 0.035-inch (0.89 mm) wire or heavier.

F101.5.1 Rodent~~-accessible~~ access to openings. Windows and other openings for the purpose of light ~~and~~ or ventilation in ~~the~~ *exterior walls* not otherwise covered in this section, ~~chapter, accessible to~~ which are susceptible to entry by rodents by way of exposed pipes, wires, conduits ~~and~~ or other appurtenances, shall be covered with ~~wire~~ hardware cloth of ~~at least~~ not less than 0.035-inch (0.89 mm) wire. In lieu of ~~wire~~ a hardware cloth covering, ~~said~~ such pipes, wires, conduits and other appurtenances shall ~~be blocked from~~ inhibit rodent ~~usage~~ entry by installing solid sheet metal ~~guards~~ barriers with a minimum thickness of 0.024 inch (0.61 mm)~~ thick or heavier~~. ~~Guards~~ Such barriers shall be fitted around pipes, wires, conduits or other appurtenances~~. In addition, they~~ and shall be fastened securely. ~~to and shall extend perpendicularly~~ The barriers shall be located a minimum of 12 inches (305mm) from the *exterior wall* ~~for not less than~~ and shall have a minimum radius of 12 inches (305 mm) beyond ~~and on either side of~~ the surface of the pipes, wires, conduits or other appurtenances.

Reason: This is a clarification and consistency in terminology of the existing requirements for rodentprooofing of openings. Something like the photos below is envisioned for the criteria in the last sentence.





This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial clarification of requirements.

G200-25

G201-25

IBC: H106.1.1

Proponents: Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

2024 International Building Code

APPENDIX H
SIGNS

SECTION H106
ELECTRICAL

Revise as follows:

H106.1.1 Internally illuminated signs. Except as provided for in Section 2611, where internally illuminated *signs* have facings of wood or of a ~~*approved*~~ plastic material complying with the requirements of Section 2606.4, the area of such facing section shall be not more than 120 square feet (11.16 m^2) and the wiring for electric lighting shall be entirely enclosed in the *sign* cabinet with a clearance of not less than 2 inches (51 mm) from the facing material. The dimensional limitation of 120 square feet (11.16 m^2) shall not apply to *sign* facing sections made from flame-resistant-coated fabric (ordinarily known as “flexible *sign* face plastic”) that weighs less than 20 ounces per square yard (678 g/m^2) and that, when tested in accordance with NFPA 701, meets the fire propagation performance requirements of both Test 1 and Test 2 or that, when tested in accordance with an *approved* test method, exhibits an average burn time of 2 seconds or less and a burning extent of 5.9 inches (150 mm) or less for 10 specimens.

Reason: The term "approved plastic" used to be in several ICC codes, and referred to "approved light-transmitting plastic, but there is no longer a definition or an explanation of what it is. In each application, certain plastic materials may be approved for that use. In the case of this section, plastic materials complying with the requirements of section 2606.4 are approved. That is clear and the word "approved" just introduces potential confusion.
Approved light transmitting plastics were ones that met the fire property requirements of section 2606.4. The section 2606.4 (shown below) simply provides a requirement for the fire properties of the plastic material. Therefore, the change proposed simply eliminates a confusing word and clarifies.

IBC section 2606.4

2606.4 Specifications. Light-transmitting plastics, including *thermoplastic*, *thermosetting* or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D1929; a *smoke-developed index* not greater than 450 where tested in the manner intended for use in accordance with ASTM E84 or UL 723, or a maximum average smoke density rating not greater than 75 where tested in the thickness intended for use in accordance with ASTM D2843 and shall conform to one of the following combustibility classifications:

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1 ASTM D635.

Class CC2: Plastic materials that have a burning rate of $2^1/_2$ inches per minute (1.06 mm/s) or less where tested at a nominal thicknes accordance with ASTM D635.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification. See reason statement.

G201-25

G202-25

IBC: H110.1, H110.2 (New)

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

APPENDIX H
SIGNS

SECTION H110
ROOF SIGNS

Revise as follows:

H110.1 General. *Roof signs* shall be constructed entirely of metal or other *approved* noncombustible material except as provided for in Sections H106.1.1 and H107.1. Provisions shall be made for electric grounding of metallic parts. Where combustible materials are permitted in letters or other ornamental features, wiring and tubing shall be kept free and insulated therefrom. ~~*Roof signs* shall be so constructed as to leave a clear space of not less than 6 feet (1829 mm) between the roof level and the lowest part of the *sign* and shall have not less than 5 feet (1524 mm) clearance between the vertical supports thereof.~~ *Roof sign structures* shall not project beyond an *exterior wall*.

~~**Exception:** *Signs* on flat roofs with every part of the roof accessible.~~

Add new text as follows:

H110.2 Clearance. Roof signs shall be so constructed as to leave a clear height of not less than 6 feet (1829 mm) between the roof surface and the lowest part of the sign and shall have not less than 5 feet (1524 mm) clearance between the vertical supports thereof.

Exception: Signs on flat roofs where there is access to the signs are not required to comply with this section.

Reason: The purpose of this change is to clarify existing requirements. The current text includes several requirements, so it is not clear which part the exception applies too. The current exception is an incomplete sentence and is too open for interpretation.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial clarification of roof sign requirements.

G202-25

G203-25

IBC: APPENDIX K, SECTION K103, K103.1, K103.2

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Building Code

APPENDIX K
ADMINISTRATIVE PROVISIONS

SECTION K103
PERMITS

K103.1 Types of permits. An *owner*, authorized agent or contractor who desires to construct, enlarge, alter, *repair*, move, demolish or change the occupancy of a *building* or *structure*, or to erect, install, enlarge, alter, *repair*, remove, convert or replace electrical systems or equipment, the installation of which is regulated by this code, or to cause such work to be done, shall first make application to the *building official* and obtain the required *permit* for the work.

Exception: Where *repair* or replacement of electrical systems or equipment must be performed in an emergency situation, the *permit* application shall be submitted within the next working business day of the department of electrical inspection.

Revise as follows:

K103.2 Work exempt from permit. Exemptions from permit requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction. Permits shall not be required for the following ~~The following work shall be exempt from the requirement for a *permit*~~:

1. Listed cord- and plug-connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles, but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Temporary wiring for experimental purposes in suitable experimental laboratories.
5. Electrical wiring, devices, appliances, apparatus or equipment operating at less than 25 volts and not capable of supplying more than 50 watts of energy.

~~Exemption from the *permit* requirements of this code shall not be deemed to grant authorization for work to be done in violation of the provisions of this code or other laws or ordinances of this *jurisdiction*.~~

Reason: The proposed language is confined to reorganization with preference to the language used in 105.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no technical change.

G203-25

G204-25

IBC: P105.1

Proponents: Robert Marshall, representing FCAC (fcac@iccsafe.org)

2024 International Building Code

APPENDIX P
SLEEPING LOFTS

SECTION P105
SMOKE ALARMS

Revise as follows:

P105.1 General. ~~Listed~~ Single- ~~*single-*~~ or *multiple-station smoke alarms* ~~complying~~ *listed* and *labeled* in accordance with UL 217 shall be installed in all *sleeping lofts* or within the room to which the sleeping loft is open, in the immediate vicinity of the sleeping loft..

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Occupants utilizing a sleeping loft should be protected with a smoke alarm. This revised language correlates with requirements in the 2024 IRC as revised by RB153-22 (AM/AMPC 1, 2 & 3) and for corresponding revisions submitted by F-CAC for the IBC and IFC Section 907.2.11 to update the 2024 editions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The Appendix is only enforceable when specifically adopted by a jurisdiction. This proposal simply makes editorial revisions to correlate with smoke alarm protection requirements for sleeping lofts currently in the 2024 IRC and those proposed for the 2027 IBC and IFC.

G204-25

G205-25

2024 International Building Code

APPENDIX P
SLEEPING LOFTS

SECTION P102
DEFINITIONS

Revise as follows:

P102.1 General. The following term shall, for the purposes of this appendix, have the meaning shown herein. Refer to Chapter 2 for general definitions.
SLEEPING LOFT. A space <u>designated for sleeping</u> on an intermediate level or levels between the floor and ceiling of a Group R occupancy dwelling or *sleeping unit*, open on one or more sides to the room in which the sleeping loft is located.

SECTION P103
MEANS OF EGRESS

Add new text as follows:

<u>**P103.6.3**</u> <u>**Emergency escape and rescue openings**</u>**.** <u>Sleeping lofts shall be permitted to be served by an EERO in the room to which the sleeping loft is open.</u>

SECTION P105
SMOKE ALARMS

Revise as follows:

P105.1 General. Listed *single-* or *multiple-station smoke alarms* complying with UL 217 shall be installed ~~in~~ <u>within the room to which a sleeping loft is open, in the immediate vicinity of the</u> ~~all~~ *sleeping lofts*.

Reason: The proposal aligns IBC Appendix P Sleeping Lofts (ICC proposal G112-21) with changes made in ICC proposal RB153-22 and associated public comments 1, 2, and 3, as well as comments made by the committee and other interested parties. The proposed changes clear up ambiguity around some key provisions.

Sleeping lofts are for sleeping. To make this perfectly clear in the code, we added “designated for sleeping” to the definition of *sleeping loft*.

Smoke alarms must be located within the vicinity of the sleeping loft. If the sleeping loft is located within a sleeping room, the required smoke alarm can’t be located in the hallway outside of the sleeping room. The smoke alarm can’t be located at the far end of the room; it must be “in the vicinity of” the sleeping loft.

EERO's required for sleeping lofts can be located in the room that contains the sleeping loft. While the EERO serving the loft can be located in the sleeping loft itself, the EERO does not have to be located in the sleeping loft to provide adequate safety. It can be impractical to locate the EERO in the loft in many dwelling unit configurations because the loft would either have to abut an exterior wall or be located just below a roof. Given the presence of good early warnings for sleeping loft occupants (the sleeping loft must be open to the space with a smoke alarm in close proximity), having an EERO in the room where the sleeping loft is located should provide adequate safety. A sleeping loft can be served by an EERO in the room it opens into (a sleeping room or another room, like a family room, den, etc.) **OR** by an EERO in the sleeping loft itself.

These changes are not intended to override the requirement for an EERO in a sleeping room or to allow a single EERO located in a sleeping loft to be the only EERO serving the sleeping room that the loft opens into. If the loft is located within a bedroom, a person sleeping on the bedroom level should not have to climb up into the sleeping loft to get to an EERO. In cases where a sleeping loft opens into a space like a family room, the family room itself wouldn't be required to have an EERO, but the sleeping loft would, and the EERO could be located in the loft or the family room.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Because sleeping lofts are an option, not a requirement, this proposal has no impact on the cost of construction. When a sleeping loft is provided, this proposal provides a uniform set of requirements. The provision of an EERO most likely would occur anyway to accommodate the sleeping room or other room that the sleeping loft opens into.

2024 International Building Code

Add new text as follows:

APPENDIX Q
EMBODIED GHG EMISSIONS REPORTING AND REDUCTION

SECTION Q101
GENERAL

Q101.1 Scope. The provisions of this appendix promote methods to measure and reduce the environmental impact of building materials and products.

SECTION Q102
DEFINITIONS

Q102.1 General. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 of this code for general definitions.

Add new definition as follows:

COVERED PROJECT. A new building or structure, or an *addition* to an existing building or structure, [INSERT 50,000 OR 100,000] gross square feet or larger, or an *alteration* that impacts a *work area* of [INSERT 50,000 OR 100,000] gross square feet or larger.

EMBODIED GREENHOUSE GAS (GHG) EMISSIONS. The greenhouse gas (GHG) emissions generated by the extraction, production, transport, manufacturing, use, and end of life of a product, as measured using a life cycle assessment. These may include the lifecycle stages A, B, and C as defined by ISO 21931—1 or ISO 21930.

ENVIRONMENTAL PRODUCT DECLARATION (EPD). An environmental claim that provides quantified environmental data using predetermined parameters and, where relevant, additional environmental information. An EPD also includes additional product and company information. An EPD reports at least the product stage, covering the cradle-to-gate phase or life cycle modules A1-A3 as defined by ISO 21931—1 or 21930.

FACILITY-SPECIFIC ENVIRONMENTAL PRODUCT DECLARATION (FACILITY-SPECIFIC EPD). An environmental claim providing quantified environmental impacts based on data from one industrial facility at which a specific product that is represented by the *EPD* is manufactured.

GLOBAL WARMING POTENTIAL (GWP). The metric for tracking *embodied GHG emissions*, which is reported in kg CO_2e/unit. GWP normalizes different gases associated with a product to an equivalent mass of carbon dioxide over a period of 100 years.

PRODUCT-SPECIFIC ENVIRONMENTAL PRODUCT DECLARATION (PRODUCT-SPECIFIC EPD). An *EPD* that represents the impacts of a single product.

SALVAGED AND REUSED PRODUCT. A product reclaimed of reusable materials from the disassembly, deconstruction, or demolition of buildings or structures, sourced from within a radius of 500 mi (800 km) of the project site, and requiring minimal to no processing for reinstallation and use on a different project.

WORK AREA. That portion or portions of a building consisting of all reconfigured spaces as indicated on the construction documents.

Work area excludes other portions of the building where incidental work entailed by the intended work must be performed and portions of the building where work not initially intended by the owner is specifically required by this code.

Add new text as follows:

SECTION Q103
REDUCTION OF EMBODIED GHG EMISSIONS

Q103.1 Embodied GHG emissions. *Covered projects* shall document *embodied GHG emissions* on *construction documents*, which shall be submitted to the *building official.*

Q103.2 Documentation of embodied GHG emissions. Documentation of *embodied GHG emissions* for *covered projects* shall meet one of the following pathways:

1. Product compliance or building compliance pathway; for a new building or structure, or an *addition* to an existing building or structure, **[INSERT 50,000 OR 100,000]** gross square feet or larger.
2. Building reuse compliance pathway; for an *alteration* that impacts a *work area* of **[INSERT 50,000 OR 100,000]** gross square feet or larger.
3. Product compliance, building compliance, or building reuse compliance pathway; for an *addition* to a building or structure that also includes an *alteration*, where the *addition* and *work area* of the *alteration* have a combined area of **[INSERT 50,000 OR 100,000]** gross square feet or larger.

Q103.3 Product compliance pathway. *Covered projects* shall submit Type III *product-specific* or *facility-specific environmental product declarations (EPDs)*, for all covered products per section Q103.3.1. The product compliance pathway shall calculate the *global warming potential (GWP)* for the total mass, volume, or area of the covered products, which shall total no more than **[INSERT 85, 90, 100, 125, OR 150]** percent of the values in Table Q103.3.1 for the same total mass, volume, or area of the covered products. This calculation shall include project-specific product quantities and *product-specific* or *facility-specific EPDs*, and be summed across the entire project based on mass, volume, or area.

Q103.3.1 Covered products. Covered products shall include no less than **[INSERT 90 OR 100]** percent of the total combined mass, volume, or area of all products used in the building project that are included in Table Q103.3.1.

TABLE Q103.3.1 COVERED PRODUCT GWP REFERENCE VALUES[a]

	COVERED PRODUCT	GLOBAL WARMING POTENTIAL (A1-A3)	UNIT OF MEASUREMENT
Ready mix concrete products[b]	Up to 2,500 psi	240	kg CO_2e/m^3
	2,501-3,000 psi	262	kg CO_2e/m^3
	3,001-4,000 psi	308	kg CO_2e/m^3
	4,001-5,000 psi	365	kg CO_2e/m^3
	5,001-6,000 psi	385	kg CO_2e/m^3
	6,001-8,000 psi	446	kg CO_2e/m^3
	Lightweight, up to 3,000 psi	492	kg CO_2e/m^3
	Lightweight, 3,001-4,000 psi	540	kg CO_2e/m^3
	Lightweight, 4,001-5,000 psi	588	kg CO_2e/m^3
Concrete masonry unit products	Normal weight, up to 3,249 psi	208	kg CO_2e/m^3
	Normal weight, 3,250-4,499 psi	232	kg CO_2e/m^3
	Normal weight, 4,500 psi and greater	241	kg CO_2e/m^3
	Medium weight, up to 3,249 psi	360	kg CO_2e/m^3

	Medium weight, 3,250 psi and greater	244	kg CO_2e/m^3
	Lightweight, up to 3,249 psi	286	kg CO_2e/m^3
	Lightweight, 3,250 psi and greater	395	kg CO_2e/m^3
Reinforcing steel products	Rebar – unfabricated	753	kg CO_2e/metric ton
	Hot-rolled sections – unfabricated	1,000	kg CO_2e/metric ton
	Hollow structural sections – unfabricated	1,710	kg CO_2e/metric ton
	Decking	2,320	kg CO_2e/metric ton
Structural steel products	Plate – unfabricated	1,480	kg CO_2e/metric ton
	Hot-dipped galvanized cold-formed steel members	2,440	kg CO_2e/metric ton
	Open web steel joists and joist girders	1,430	kg CO_2e/metric ton
	Laminated veneer lumber	361	kg CO_2e/m^3
	Laminated strand lumber	275	kg CO_2e/m^3
	Glue laminated timber	137	kg CO_2e/m^3
	Wood framing	63.1	kg CO_2e/m^3
Structural wood products	Softwood plywood	219	kg CO_2e/m^3
	Oriented strand board	243	kg CO_2e/m^3
	Cross laminated timber[c]	178	kg CO_2e/m^3
	Dowel laminated timber[c]	145.2	kg CO_2e/m^3
	Mass Ply Panel[c]	311	kg CO_2e/m^3
	Expanded polystyrene (EPS) – Type I	2.53	kg $CO_2e/1\ m^2$ @ RSI-1
	Polyiso – wall	4.10	kg $CO_2e/1\ m^2$ @ RSI-1
	Polyiso – roof – GRF facer	2.11	kg $CO_2e/1\ m^2$ @ RSI-1
	Polyiso – roof – CFG facer	2.95	kg $CO_2e/1\ m^2$ @ RSI-1
	Extruded polystyrene (XPS)[d]	41	kg $CO_2e/1\ m^2$ @ RSI-1
	Fiberglass board	5.02	kg $CO_2e/1\ m^2$ @ RSI-1
	Heavy-density mineral wool board	6.82	kg $CO_2e/1\ m^2$ @ RSI-1
	Mineral wool blanket (Light-density mineral wool board)	2.68	kg $CO_2e/1\ m^2$ @ RSI-1
Insulation products	Fiberglass blanket (Fiberglass batt) – unfaced	1.01	kg $CO_2e/1\ m^2$ @ RSI-1
	Fiberglass blanket (Fiberglass batt) – faced	1.06	kg $CO_2e/1\ m^2$ @ RSI-1
	Closed-cell spray polyurethane foam – medium density	3.47	kg $CO_2e/1\ m^2$ @ RSI-1
	Closed-cell spray polyurethane foam – roofing	4.05	kg $CO_2e/1\ m^2$ @ RSI-1
	Closed-cell spray polyurethane foam - 2K-LP	3.12	kg $CO_2e/1\ m^2$ @ RSI-1
	Open-cell spray polyurethane foam	1.05	kg $CO_2e/1\ m^2$ @ RSI-1
	Loose-fill cellulose	0.487	kg $CO_2e/1\ m^2$ @ RSI-1
	Loose-fill mineral wool	1.89	kg $CO_2e/1\ m^2$ @ RSI-1
	Loose-fill fiberglass	0.988	kg $CO_2e/1\ m^2$ @ RSI-1
Flat Glass	Flat glass (clear, tinted, and low-iron products)	1,430	kg CO2e/metric ton

a. GWP values are based on industry averages, sourced from industry-wide EPDs for all products for which there was one available.

b. AHJ to replace with regional ready mix concrete values based on NRMCA's regional benchmarks.

c. Replace with industry-wide average when available.

d. For all product types except XPS in this table, the noted GWP corresponds to A1-A3 life cycle modules (the "product stage"). An exception has been made for XPS board insulation due to the substantial contribution of blowing agent emissions to product life cycle GWP. Since insulation EPDs are required to report these impacts where applicable, the XPS value in this table includes modules A1-A3 (product stage), B1 (to account for blowing agent emissions during building life), and C4 (to account for blowing agent emissions during disposal).

Q103.3.2 Alternative Products. Covered products are permitted to be replaced with a product that is a *salvaged and reused product*. Products are permitted to be procured from onsite or from vendors. If a covered product is *salvaged and reused*, the applicable product category is permitted to assume a *GWP* of 0.

Q103.4 Building compliance pathway. *Covered projects* shall submit a building life cycle assessment (LCA) as part of the *construction documents*, which shall be submitted to the *building official*. The building LCA shall be developed in accordance with section Q103.4.1, and comply with one of the following:

1. For absolute reduction requirements, the *global warming potential (GWP)* of the proposed building shall be no more than **[INSERT 70, 80, OR 90]** percent of 1,102 lbCO$_2$e/square feet (500 kgCO$_2$e/m^2).
2. For relative reduction requirements, the *GWP* of the proposed building shall be no more than **[INSERT 70, 80, OR 90]** percent of the *GWP* of a functionally equivalent reference building. The reference building shall be of the same size, geographic location, and thermal performance as the proposed building, shall be subject to the same code requirements as the proposed building, and shall be functionally equivalent to the proposed building per ASTM E2921-22. The products and product quantities in the proposed building are permitted to vary compared to that shown in the reference building. The same LCA tool(s) or software shall be used to complete the building life cycle assessment for both the reference and proposed building designs.

Q103.4.1 Building life cycle assessment. Building LCAs shall comply with the following:

1. ISO 14040 and ISO 14044.
2. Software used to conduct a building LCA shall conform to ISO 21931—1 and/or EN 15978 and shall have a data set compliant with ISO 14044 and ISO 21930 and/or EN 15804. The software shall utilize a calculation methodology that is compliant with EN 15978, ISO 21931—1 and ISO 21929—1. Environmental impact data shall not be sourced from expired or retired data sources, unless no valid alternative data exists.
3. The life cycle scope shall cover cradle-to-grave, including all modules in life cycle stages A, B, and C, as defined by ISO 21931—1 or 21930. The life cycle scope is permitted to exclude modules B6 and B7, covering operating energy and water.
4. The building LCA shall include all of the following building elements: foundations; *exterior wall envelope; primary structural frame; secondary structural members; roof covering; roof deck; fenestration; load-bearing walls;* and insulation. The assessment is permitted to include *non-load-bearing walls;* fireproofing; insulation; interior constructions and *interior finishes.* An assessment submitted for an *addition* and/or *alteration* shall include elements within the boundary of the *addition* and/or the *work area* of the *alteration.*
5. The reference study period shall be 60 years.

6. Existing and *salvaged and reused products* shall be included or excluded at the discretion of the project team. For in-situ reused materials, it is permissible to assume the A1-A4 stages (raw material supply, raw material transport, manufacturing, and transportation to construction site) carry no impact in the proposed building's LCA to show the benefit of reusing materials, while retaining the A1-A4 estimated impacts for these materials in the LCA of the functionally equivalent reference design. For salvaged materials, it is permissible to assume the A1-A3 stages carry no impact in the proposed building's LCA to show the benefit of salvaging materials, while retaining the A1-A3 estimated impacts for these materials in the LCA of the functionally equivalent reference design.
7. Biogenic carbon and carbon sequestration shall be reported separately from fossil *GWP*.

Q103.5 Building reuse pathway. An *alteration* shall retain no less than a combined 45 percent, as calculated per section Q103.5.1, of the *existing building's primary* and *secondary structural frame* and *exterior wall envelope* as part of the *work area.* An *addition* to a building or structure that also includes an *alteration*, where the *addition* and *work area* of the *alteration* have a combined area of **[INSERT 50,000 OR 100,000]** gross square feet or larger, is permitted to use this compliance pathway.

Q103.5.1 Building reuse compliance calculation. The calculation shall include roof and floor areas, and façade area as measured in elevation, for the entire building. Façade areas are permitted to be considered retained even if the existing *exterior wall covering* is repaired, replaced, or modified to increase insulation or airtightness. *Salvaged and reused products* sourced from the project site are permitted to be counted towards the 45 percent building reuse threshold.

Exception: Buildings, or portions of buildings, that are deemed unsafe or *dangerous*, or that have *hazardous materials,* that are remediated as part of the project.

Q103.5.2 Construction documents for building reuse compliance. *Construction documents* for the building reuse compliance pathway shall clearly distinguish the square footage for existing and new elements, and include the following information:

1. Gross floor area of *existing building*(s) in square feet;
2. Gross floor area of the aggregate *addition(s)* in square feet (if applicable);
3. Gross floor area of the *alteration* in square feet;
4. Existing total floor area and retained total floor area of the *primary* and *secondary structural frame* of the *existing building*(s) in square feet; and
5. Existing total *exterior wall* and *fenestration* surface area and total retained *exterior wall* and *fenestration* surface area of the *existing building*(s) in square feet, as well as areas allowed to be excluded from the calculation.

SECTION Q104
DOCUMENTATION OF REDUCTION OF EMBODIED GHG EMISSIONS

Q104.1 Registered design professional. A r*egistered design professional* shall prepare the *construction documents* and provide signature verifying compliance with the requirements of this appendix.

Q104.2 Amended construction documents for embodied GHG emissions. Covered products shall be installed in accordance with the approved *construction documents.* Prior to the issuance of the certificate of occupancy, the r*egistered design professional* that submits documentation per Sections Q103.3, Q103.4, or Q103.5 shall ensure that as-built product selection matches the approved *construction documents.* If as-built products differ from those submitted on the approved construction documents, the r*egistered design professional* shall update the *embodied GHG emissions* calculations based on the updated procured products and attest that they are accurate to the best of the *registered design professional*'s knowledge.

SECTION Q105
REFERENCED STANDARDS

Q105.1 General. See Table Q105.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.

TABLE Q105.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ASTM E2921–2022	*Standard Practice for Minimum Criteria for Comparing Whole Building Life Cycle Assessments for Use with Building Codes, Standards, and Rating Systems*	Q103.4
EN 15804—2022	*Sustainability of construction works – Environmental product declarations – Core rules for the product category of construction products*	Q103.4.1
EN 15978—2011	*Sustainability of construction works – Assessment of environmental performance of buildings – Calculation method*	Q103.4.1
ISO 14040—2006	*Environmental management – Life cycle assessment – Principles and framework*	Q103.4.1
ISO 14044—2006	*Environmental management – Life cycle assessment – Requirements and guidelines*	Q103.4.1
ISO 21929-1—2011	*Sustainability in building construction – Sustainability indicators – Part 1: Framework for the development of indicators and a core set of indicators for buildings*	Q103.4.1
ISO 21930—2017	*Sustainability in buildings and civil engineering works – Core rules for environmental product declarations of construction products and services*	Q102.1, Q103.4.1
ISO 21931-1—2022	*Sustainability in buildings and civil engineering works – Framework for methods of assessment of the environmental, social and economic performance of construction works as a basis for sustainability assessment – Part 1: Buildings*	Q102.1, Q103.4.1

Reason: Overview of Appendix Requirements

This proposal adds a new voluntary appendix to the International Building Code (IBC), which may act as a reference for jurisdictions wishing to establish code methods to measure and reduce the embodied greenhouse gas (GHG) emissions impact of building materials. Appendix Q provides criteria for the production and submission of environmental product declarations, building life cycle assessment, and proof of building reuse for a building project.

In sum, the appendix provides a requirement for construction document submittals to include reporting on the embodied GHG emissions associated with proposed projects over a choice of 50,000 or 100,000 square feet, as determined by the AHJ. Project teams must choose one form of documentation from the following three options:

1. **Product compliance pathway:** submit product- or facility-specific environmental product declarations (EPDs) for covered products that indicate that the global warming potential (GWP) meets a certain percentage – as determined by the AHJ – of the industry-average GWP of the product;
2. **Building compliance pathway:** submit a building life cycle assessment (LCA) for the building's structure and enclosure that indicates a percent-reduction – as determined by the AHJ – in GWP from 102 $lbCO_2e$/square feet (500 $kgCO_2e/m^2$) or compared to an industry-average baseline;
3. **Building reuse pathway:** submit proof of reuse of at least 45% of an existing building's structure and enclosure.

Finally, the proposed appendix aims to provide a clear and simple path for code officials to determine compliance at two points along the project timeline: at the initial submission of construction documents and at the subsequent submission of amended construction documents. The role of the code official is to check for the submission of required documentation, confirm that requirements were met, and verify that the registered design professional has signed off on meeting these provisions. These efforts that fall on the design professional as well as the code official are anticipated to require minimal effort.

Problem and Opportunity

Building operations and building construction are responsible for 39% of today's global greenhouse gas (GHG) emissions.[1] About 11% of these emissions are embodied GHG emissions – the emissions associated with the creation of building materials and construction activities.[1] The largest contributors tend to be found in buildings' structures and envelopes due to their high embodied GHG emissions and quantity of use in projects.

The need to confront and reduce embodied GHG is urgent. The IPCC reports that limiting warming to the target set by the Paris Agreement – and avoiding the worst-case impacts of the climate crisis – is contingent on GHG emissions peaking by 2025 at the latest and reducing them by 43% by 2030.[2]

Doing justice to the urgency presented by climate change requires a focus on the embodied emissions associated with the full lifecycle, and especially the early phases of buildings' construction and materials. Unlike operational emissions, which can be improved over the lifespan of a building through deep-energy retrofits and decarbonizing the electric grid, most of a building's embodied GHG emissions occur before a building is occupied and cannot be reduced over time. A joint University of Washington and University of California, Berkeley study found that, on average, 80% of a building's embodied GHG impacts over its lifetime takes place in the phases leading up to a building's completion before occupancy.[3]

Therefore, addressing embodied GHG in the construction of buildings presents an urgent and valuable opportunity to reduce GHG emissions in the built environment. The IBC thus holds critical potential to address this bulk of emissions, as it impacts decisions made early during the design process, which directly and most substantially influence early production and construction activities. Prioritizing these immediate emissions will help to stop the accumulation of GHGs in the atmosphere, improving the likelihood that adopting jurisdictions will reach their GHG peaks sooner.

Finally, the IBC has been in place and used by the design and construction industry to ensure that materials in the built environment preserve public health and safety. This appendix is intended to do just that: to safeguard the public from the hazards associated with the creation of buildings and their materials. This entails reducing emissions in the extraction, manufacturing, and transportation of these products, which can improve air quality and public health in communities located near industrial centers and manufacturing facilities.

Methodology and Reasoning

The IBC is suitable for addressing embodied GHG emissions. First, it is intended to "preserve public health and safety that provides safeguards from hazards associated with the built environment."[4] This proposal protects the public as well as the environment from the hazards associated with the creation of building materials. Second, IBC regulations have a clear focus on materials and building elements, which is consistent with this proposal's approach to addressing the emissions associated with building products. Finally, the wide adoption of the IBC would make this appendix an easily accessible resource for jurisdictions looking to address embodied GHG in their building codes.

This is proposed as a voluntary appendix, available to jurisdictions that are interested in implementing it. For these jurisdictions, this proposal offers a standardized approach and set of requirements, saving them time and effort in potentially developing their own requirements from scratch, or piecemeal from other sources. It is also intended to save practitioners considerable trouble in trying to comply with varying requirements from one jurisdiction to the next. This matters to designers and contractors when they have to navigate these differences. In addition, it saves building department staff considerable trouble when they need to correct permit applicants on how the forms are filled out for their local requirements. Having consistency in voluntary measures benefits everyone.

This proposal is also intended to provide a level of flexibility for jurisdictions and project teams to meet these provisions in ways that are most suited to their own unique needs, goals, and circumstances. Three compliance pathways are included to provide project teams with that flexibility. These pathways are also based in precedent, drawing from California's statewide building code, CALGreen, the latest version of which is now in effect.

The proposed appendix also provides flexibility on the quantitative thresholds that jurisdictions may choose to adopt according to their unique needs and preferences. These jurisdictional options deal with the project size to which the appendix would apply; product-level GWP cap for the product compliance pathway; percentage of products required to submit EPDs for the product compliance pathway; and building-level GWP percentage reduction for the building compliance pathway.

Cost Impact: Increase

Estimated Immediate Cost Impact:

In jurisdictions in which this appendix is adopted, it is anticipated that the economic impact of each of the pathways in this proposal will increase either at an insignificant level or not at all.

A project's embodied GHG emissions can be significantly reduced at little to no additional up-front cost. There are products and solutions available today that can realize embodied GHG reductions with low to no financial burden. In the future, these costs are only anticipated to decrease, and ultimately result in additional cost savings, as the production of low embodied GHG materials, the practice of conducting a building life cycle assessment, and pursuing building reuse scale up and the cost of low embodied GHG materials goes down as a result of increased practice and demand.

As with many code changes, there is an expected short-term cost associated with an initial learning curve, which requires additional time spent on training and learning about how to implement new compliance requirements. This is expected to decrease over time, as code officials, design and development teams, and product manufacturers and suppliers become more familiar with the requirements and the processes needed to comply.

It is also worth noting that jurisdictions that choose to act on embodied GHG emissions and adopt this voluntary appendix would incur many of these costs anyway; having this code language as a resource will ultimately realize savings on needing to develop code from scratch.

In assessing the impact of this proposal, the costs described below were considered.

Estimated Immediate Cost Impact Justification (methodology and variables):

Costs to Design and Development Teams

- **Impact of product compliance pathway:** Designers and developers specifying and procuring materials covered under the first pathway option can use EPD databases to search for, filter, and compare products with GWP limits that comply with code requirements. Users can download EPD documents for code submission and verification. Building Transparency's Embodied Carbon in Construction Calculator (EC3) is a robust EPD database for construction materials that project teams can use at no cost. Requesting EPDs from manufacturers directly is another option.
- **Impact of building compliance pathway:** For developers and design professionals, option 2, requiring a building lifecycle assessment, would be the costliest path, adding an estimated cost in the range of of $15,000.[5] This cost may vary depending on the number of analyses performed throughout the project timeline, whether a baseline is modeled, and the size and complexity of the project. However, for many of the larger projects that would be subject to this appendix, this cost impact is negligible compared to total project costs. Beyond the direct costs of training and LCA software, professionals may take additional time to prepare documents for code review.
- **Building reuse pathway:** Costs will be minimal or nonexistent. The only analysis required to comply is a calculation of square footage.

Costs to Manufacturers and Suppliers

- **Impact of materials-based and building-level pathways:** Material manufacturers can face costs associated with the production of EPDs. EPDs typically expire after five years, at which point manufacturers must repeat the process. There is an expense associated with generating EPDs, but many manufacturers have already made this investment. The total cost of generating an EPD varies depending on the complexity of manufacturing processes for each material type. However, any product cost increase imposed by the manufacturer to alleviate the cost of EPDs is spread across consumers and negligible to individual project costs.[6]

- **Building reuse pathway:** There are no additional requirements placed on materials manufacturers and suppliers in this pathway.

Costs of Code Enforcement

There is no major fiscal impact on local governments to enforce the regulation: local governments would only need to verify results provided by applicants, in a standardized manner, to ensure compliance with the proposed pathways. Additionally, a study published for CALGreen's 2022 embodied GHG requirements, which includes similar materials-based, building-level, and building reuse pathway requirements as this proposal, determined that there was a minor increase of costs to local governments to review and check plans for compliance with one of the three pathways.[7]

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:

Add new text as follows:

APPENDIX Q
CONNECTED BUILDING MANAGEMENT SYSTEMS PROVISIONS

SECTION Q101
GENERAL

Q101.1 Purpose. To provide safe and effective installation and operation of fully integrated and connected building management systems.

SECTION Q102
DEFINITIONS

Q102.1 General. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 of this code for general definitions.

Add new definition as follows:

CONNECTED BUILDING. A facility equipped with advanced digital technologies to enhance its operational safety and efficiency, energy efficiency, occupant comfort, and environmental sustainability. These technologies include various interconnected systems and devices that are managed through a centralized platform, often utilizing the Internet of Things (IoT), automation, and data analytics.
CONNECTED BUILDING MANAGEMENT SYSTEMS. Equipment that monitors and controls power within an electrical system and may include an energy management system, power control system, automatic load management system, or other building management systems that are connected to the internet and fully integrated.
DATA. Unprocessed values collected from various sensors and devices within a building. These sensors can monitor building and environmental conditions that provide a real-time picture of a building's operational state.

Add new text as follows:

SECTION Q103
CONNECTED BUILDING MANAGEMENT SYSTEMS PERFORMANCE CRITERIA

Q103.1 Referenced standards. Connected building management systems shall comply with all applicable codes and standards.

Q103.2 Installation requirements. Connected building management systems shall comply product’s listing and labeling, the manufacturer’s installation instructions, and the provisions of this appendix.

Q103.3 Systems integration and communication protocols. The connect building management systems shall include the following features:

1. Utility-interactive for demand response functionality and peak load shaving.
2. Ability to facilitate distinct operating modes in accordance with Q103.4.
3. Fault detection and diagnostics (FDD).
4. Full integration with building life safety, fire safety, and emergency systems.
5. Supervision of communication protocols.
6. Cybersecurity and data privacy protocols.

Exception: Fire, life-safety, security, and emergency communication devices and systems shall not be connected to a demand response or peak load shaving controlled circuit.

Q103.4 Connected building management system operating modes. Connected building management system operating mode shall be capable of optimizing the building performance to mitigate other internal and external conditions as established by the building design team and shall comply with Q103.4.1 through Q103.4.3.

Q103.4.1 Operating modes. Connected building management systems shall be capable to be programed with distinct operating modes as follows:

1. During normal operation, all devices, equipment, and systems are fully operational.
2. During emergency operation, all devices, equipment, and systems are monitored and controlled from the fire command center.
3. For indoor pollutant mitigation, the predetermined threshold for the concentration of pollutants in the occupiable space are lowered by increasing the outdoor airflow rate, overriding supply air filter bypass, or adjusting indoor temperature set points.
4. For outdoor pollutant mitigation, the mechanical system suspends outdoor airflow and override supply air filter bypass to maximize return air filtration.
5. For utility demand response and peak load shaving, energy consumption of the building is decreased, as needed, by reducing lighting power, adjusting indoor temperature set points, shifting non-essential operational loads, discharging of energy storage systems, and suspending the charging of energy storage and electrical vehicles.
6. For reduced occupancy, energy consumption of the building is reduced by setting one or more of the following as a default condition capable of being overridden by an occupant:
   - 6.1. Non-emergency lighting is turned off.
   - 6.2. Indoor temperature set points for non-occupancy schedules are held.
   - 6.3. Ventilation rates are adjusted to minimize outdoor air.
   - 6.4. Nonessential plug loads are switched off.
7. In other operating modes, devices, equipment, and systems are operated and controlled in a distinct mode based on environmental conditions or other changes to building occupancy and use.

Q103.4.2 Password protection. All operating modes shall password protection and issue daily notification to the building owner or other designee when the system is in override.

Q103.4.3 Buildng readiness plan. Where facilities are designed to operate in various modes in response to natural or manmade threat to, and exposure of the building, the following shall be documented through an approved Building Readiness Plan (BRP). The BRP shall include the operations and maintenance (O&M) procedures involved in this operating mode, the mechanical equipment affected, final design drawings, critical asset inventory management plan, maintenance schedules, the maintenance requirements, frequencies, and establish a return to normal mode review period.

Q103.5 Maintenance requirements. Connected building management systems shall be maintained in accordance with the referenced standards and commissioned in accordance with Section Q106.

SECTION Q104
CONNECTED BUILDING MANAGEMENT SYSTEM COMPONENTS

Q104.1 General. Connected building management systems shall operate and control devices, equipment, and systems installed in buildings, including but not limited to:

1. Demand responsive lighting controls.
2. Dynamic shading and automatic glazing coverings.
3. Electric vehicle power transfer system equipment.
4. Demand control ventilation.
5. Fault detection and diagnostics (FDD).
6. Energy storage systems (ESS).
7. Onsite interconnected power production sources.

SECTION Q105
SYSTEM INTEGRATION AND COMMUNICATION PROTOCOLS

Q105.1 General. Connected building management systems shall include system integration and communication protocols in accordance with this section.

Q105.2 Directory. A directory identifying the systems, equipment, circuits, or devices that are controlled by the connected building management system shall be posted on the enclosure of the integrated building system controller, disconnecting means, or branch-circuit overcurrent device.

Q105.3 Cybersecurity. Connected building management systems that are connected to a communication network and controlling any device, appliance, or equipment shall be assessed to address its ability to withstand unauthorized updates and malicious attacks while continuing to perform its intended safety functionality set forth by the building owner or owner’s authorized agent.

Q105.4 Privacy. Connected building management systems that are connected to a communication network to store and transmit data shall include protocols for data privacy set forth by the building owner or owner’s authorized agent.

Q105.5 System malfunction. When the connected building management system controls are used to reduce the electrical load on an electrical service or feeder, the connected building management system shall use monitoring and controls to automatically deenergize non-essential systems upon malfunction of the connected building system controls.

Q105.6 Monitoring, alarming, scheduling, and trending. The connected building management system shall monitor the connected systems, receive alarms from connected systems, allow scheduling of connected systems, and store trend data from connected systems. Data collected by the connected building management system shall be backed up and stored on an enterprise server or cloud based.

SECTION Q106
MAINTENANCE INFORMATION AND SYSTEM COMMISSIONING

Q106.1 General. Maintenance information and commissioning of the connected building management systems shall comply with this section.

Q106.2 Building operations and maintenance information. The building operations and maintenance documents shall be provided to the owner and shall consist of manufacturers' information, specifications, and recommendations; programming procedures and data points; narratives; and other means of illustrating to the owner how the building, equipment and systems are intended to be installed, maintained and operated. Required regular maintenance actions for equipment and systems shall be clearly stated on a readily visible label. The label shall include the title or publication number for the operation and maintenance manual for that model and type of product.

Q106.3 Emergency and standby source load testing. Where connected building system control setpoints are bypassed for the required annual load testing for emergency and standby sources in accordance with NFPA 110, NFPA 111, NFPA 70, NFPA 855 or other applicable standard, the system controls shall be returned back to the original commissioned setpoints at the conclusion of the load testing.

Q106.4 Commissioning plan and report. A commissioning plan shall be developed by a registered design professional or approved agency and shall include a narrative description of the activities that will be accomplished during each phase of commissioning, including the personnel intended to accomplish each of the activities, a listing of the specific equipment to be tested and a description of the tests to be performed, equipment functions to be tested, conditions under which the test will be performed, and measurable criteria for performance. A report of test procedures and results identified as "Final Commissioning Report" shall be delivered to the building owner or owner's authorized agent. The report shall include the results of functional performance tests, disposition of deficiencies found during testing, including details of corrective measures used or proposed, and functional performance test procedures used during the commissioning process, including measurable criteria for test acceptance, provided herein for repeatability.

Q106.5 Records. Records shall be created and maintained for all connected building system controls inspections, operational tests, repairs, and modifications. Records shall be made available to the code official upon request. Records shall include the date of the maintenance report, identification of the servicing personnel, notation of any unsatisfactory condition and the corrective action taken, including parts replaced, and testing of any repair in the time recommended by the manufacturer. Records shall be retained for a period of time defined by the building owner, facility management, or by the code official.

SECTION Q107
REFERENCED STANDARDS

Q107.1 General. See Table Q107.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.

TABLE Q107.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
NFPA 70-23	National Electrical Code	Q106.3
NFPA 110-22	Standard for Emergency and Standby Power Systems	Q106.3
NFPA 111-22	Standard on Stored Electrical Energy Emergency and Standby Power Systems	Q106.3
NFPA 855-23	Standard for the Installation of Stationary Energy Storage Systems	Q106.3

Reason: The purpose of this appendix proposal is to consolidate and integrate isolated devices, equipment, and systems that are required or permitted by the family of I-Codes into a single connected building management system to maximize safety, efficiency and resiliency during the use and occupancy of the building. In addition to installation requirements, the appendix outlines maintenance and commissioning requirements for the connected building management system.

- **Section Q102** provides three new definitions to help users of the appendix understand the meaning and context of these terms.
- **Section Q103** outlines the performance criteria for the connected building management systems. The core requirement is that all devices, equipment, and systems are installed in accordance with their listing and manufacturer's installation instructions. Essential features of the connected building management systems are outlined. Applicable NFPA standards may include but not be limited to NFPA 3, 4, 70, and 72.
- **Section Q104** ensures that other devices, equipment, and systems that are not required, but permitted, to be installed in buildings are integrated into the connected building management systems.
- **Section Q105** outlines system integration and communication protocols to address cybersecurity, data privacy and system malfunction concerns.
- **Section Q106** outlines the system maintenance information and commissioning requirements to ensure the connected building management systems was properly installed, fully operational, and will continue to function as designed for the life of the building.

Cost Impact: Increase

Estimated Immediate Cost Impact:

As an appendix, the impact cost will be $0 since it is only optional unless adopted by the jurisdiction having authority. This proposed appendix will increase the cost of construction for those projects that elect to implement the safe and effective installation and operation of fully integrated and connected building management systems in compliance with this appendix. The additional costs may be offset by energy savings, more efficient operations, increased productivity, and reduced operational downtime.

Estimated Immediate Cost Impact Justification (methodology and variables):

Unknown - No Cost Impact Justification Study Performed

Staff Analysis: The proposed referenced standard, NFPA 855-23 Standard for the Installation of Stationary Energy Storage Systems, is currently referenced in the IFC.

G207-25

G208-25

IBC: [BS] 3301.3, 3301.3.1 (New), 3301.3.2 (New); IEBC: [BS] 1501.3, 1501.3.1 (New), 1501.3.2 (New)

Proponents: Peter Somers, Magnusson Klemencic Associates, representing self (psomers@mka.com); Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Seth Thomas, KPFF Consulting Engineers, representing Self (seth.thomas@kpff.com); Julie C. Furr, representing NCSEA Existing Building Committee (jcfurr@ssr-inc.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BS] 3301.3 ~~Roof loads~~ Loads during construction. ~~Structural roof components shall be capable of supporting the roof-covering system and the material and equipment *loads* that will be encountered during installation of the system.~~Structural loads and lateral force resisting strength during construction shall comply with sections 3301.3.1 and 3301.3.2.

Add new text as follows:

3301.3.1 Roof loads. Structural roof components shall be capable of supporting the roof-covering system and the material and equipment loads that will be encountered during installation of the system.

3301.3.2 Buildings occupied during construction. Existing buildings that remain occupied during construction shall comply with the following:

1. Gravity load supporting capacity of existing structural system shall not be reduced from their pre-construction state, unless such systems are shown to comply with the gravity loads required by the IBC for the use and occupancy during construction.
2. The lateral force resisting strength of any story in any given direction shall not be reduced by more than 10% from its pre-construction state.

Temporary or permanent measures shall be permitted to augment the strength and stiffness of the gravity or lateral system in order to comply with this section. Modification of the lateral force resisting system shall not create a Type 1 or 4 Horizontal or Type 1, 3 or 4 Vertical structural irregularity as defined in ASCE 7. Where approved by the authority having jurisdication, the duration of construction shall be permitted to be considered in evaluating element lateral forces.

2024 International Existing Building Code

Revise as follows:

[BS] 1501.3 ~~Roof loads~~ Loads during construction. ~~Structural roof components shall be capable of supporting the roof-covering system and the material and equipment loads that will be encountered during installation of the system.~~Structural loads and lateral force resisting strength during construction shall comply with sections 1501.3.1 and 1501.3.2.

Add new text as follows:

1501.3.1 Roof loads. Structural roof components shall be capable of supporting the roof-covering system and the material and equipment loads that will be encountered during installation of the system.

1501.3.2 Buildings occupied during construction. Existing buildings that remain occupied during construction shall comply with the following:

1. Gravity load supporting capacity of existing structural system shall not be reduced from their pre-construction state, unless such systems are shown to comply with the gravity loads required by the *International Building Code* for the use and occupancy during construction.
2. The lateral force resisting strength of any story in any given direction shall not be reduced by more than 10% from its pre-construction state.

Temporary or permanent measures shall be permitted to augment the strength and stiffness of the gravity or lateral system in order to comply with this section. Modification of the Lateral force resisting system shall not create a Type 1 or 4 Horizontal or Type 1, 3 or 4 Vertical structural irregularity as defined in ASCE 7. Where approved by the authority having jurisdiction, the duration of construction shall be permitted to be considered in evaluating element lateral forces.

Reason: Currently the IEBC provides no regulations on the requirements for modification of the lateral force resisting system (LFRS) during construction. Some AHJ's do have requirements for occupied buildings (e.g. City of Portland, Oregon). For certain types of buildings (Hospitals, airports, etc.) portions of these structures often remain occupied during construction. When the construction project (seismic upgrade or other) within a publicly occupied building modifies the LFRS it is important to maintain a minimum amount of resistance to gravity loads and possible environmental loads to protect the occupants. Often seismic upgrades or renovations will modify shear walls or move braces around occupied space, sometimes these construction activities take days (i.e. swapping out a brace) and some times the moves take weeks or months. This proposal aims to strike a balance between providing a minimum level of structural requirements to protect the public occupants while providing flexibility for construction projects.

The provisions specifically allow for temporary measures to be used to meet the requirements of this section. This could be a temporary header when a floor opening is being added or a temporary wall or brace to augment the LFRS so that the 10% threshold is not exceeded.

In addition to the requirement not to reduce the lateral strength by more than 10 percent there is a restriction on creating certain types of new structural irregularities. Irregularities are selected that are often triggered by modification of the lateral force resting system that increase the collapse hazard of the building. The irregularities selected are as follows;

- Type 1 horizontal irregularity: This could happen by removing a wall near the edge of a building and replacing it with a wall near the center. While the lateral strength of the story is not changed the different location can trigger a torsional irregularity which increases the collapse hazard of the building, specifically the new strength portion of the check introduced in ASCE 7-22.
- Type 4 horizontal irregularity: The condition could be created by moving a brace from one bay to another which creates a horizontal load transfer through a diaphragm that is not designed for these loads.
- Type 1 Vertical Stiffness Irregularity: This condition could be triggered by inadvertently by adding or subtracting too much temporary or permanent LFRS elements to an adjacent floor. The base provision only restricts removal of 10% of the story strength, this limit restricts the change in adjacent stiffness.
- Type 3 Vertical Irregularity: This could happen if a larger opening is put in an existing wall. While a new wall could replace the strength of the wall at that level, if the new opening triggers a Type 3 vertical irregularity for the pier/column element below and that element is not designed or detailed as required a dangerous condition is created.
- Type 4 Vertical Strength Irregularity: This condition could be triggered by inadvertently adding or subtracting to much temporary or permanent LFRS elements to an adjacent floor. The base provision only restricts removal of 10% of the story strength, this limit restricts adding too much strength to a floor above.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Ensuring structural safety of buildings that remain occupied during construction of renovation work is generally required by code and should be enforced by AHJ as part of renovation or demolition permitting. The added text is simply a clarification and standardization of standard of practice requirements.

G208-25

G209-25

IBC: [F] TABLE 509.1

Proponents: Greg Johnson, Johnson & Associates Consulting Services, representing self (gjohnsonconsulting@gmail.com); Robert Buchetto, HED, representing Self (rbuchetto@hed.design); Jay Peters, representing Codes and Standards International (peters.jay@me.com)

2024 International Building Code

Revise as follows:

[F] TABLE 509.1 INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Electrical installations and transformers	See Sections 110.26 through 110.34 and Sections 450.8 through 450.48 of NFPA 70 for protection and separation requirements.
In Group D, rooms with lithium-ion or lithium metal batteries	2 hours

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

Reason: Data centers are unique occupancies and merit their own occupancy classification, as is proposed in a companion change. It is typical in the data center industry for energy storage systems using lithium batteries to be separated by 2 hour fire separations from the data hall and accessory office spaces.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

What is proposed is consistent with current industry practices and should create no additional expense.

Staff Analysis: Provisions for the separtation of rooms containig lithium-ion and lithium metal batteries was added in the 2024 IFC Section 320.4.2.2 by F21-21; and relocated to a new Chapter 42 by F230-24.

G209-25

G210-25

IBC: SECTION 429 (New), 429.1 (New), 429.2 (New), 429.3 (New), 429.3.1 (New), 429.4 (New), 429.5 (New), NFPA Chapter 35 (New), NEMA (New), 2702.2.20 (New); IFC: 1203.2.20 (New)

Proponents: Bryan Holland, representing National Electrical Manufacturers Association (NEMA) (bryan.holland@nema.org)

2024 International Building Code

Add new text as follows:

SECTION 429
DATA CENTERS AND COMPUTER ROOMS

429.1 Applicability. The provisions of Sections 429.1 through 429.5 shall apply to all buildings and structures or parts of buildings and structures that contain data centers or computer rooms.

429.2 Power and lighting systems. Power and lighting equipment and systems installed for data centers and computer rooms shall comply with NEMA XX.

429.3 Standby power. Equipment and systems installed for data centers and computer rooms shall be provided with standby power installed in accordance with Section 1203 of the International Fire Code and Article 701 of NFPA 70. Standby power loads shall be supplied by an electrical energy storage system (ESS) installed in accordance with Section 1207 of the International Fire Code, NFPA 855, and Article 706 of NFPA 70.

429.3.1 Capacity and duration. The standby power supply shall be capable of operating the equipment and systems installed for data centers and computers rooms at 100-percent system capacity for a duration of not less than 12 hours.

429.4 Emergency power. Emergency power shall be provided for data centers and computers rooms in accordance with Section 2702 of this code, Section 1203 of the *International Fire Code*, and Article 700 of NFPA 70.

429.5 Surge protection. All services or feeders supplying data centers and computer rooms shall be provided with surge protection installed in accordance with Article 242 of NFPA 70.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

855-23	Standard for the Installation of Stationary Energy Storage Systems

NEMA

National Electrical Manufacturers Association
1300 North 17th Street, Suite 900
Arlington, VA 22209

xx-xx	Standard for Electrical Equipment in Data Centers and Computer Rooms

Add new text as follows:

2702.2.20 Data Centers and Computer Rooms. Emergency and standby power shall be provided for data centers and computer rooms as required in Section 429 of the *International Buidling Code.*

2024 International Fire Code

Add new text as follows:

1203.2.20 Data Centers and Computer Rooms. Emergency and standby power shall be provided for data centers and computer rooms as required in Section 429 of the*International Buidling Code.*

Reason: Data centers and computers rooms have and are rapidly becoming critical infrastructure requiring reliable power systems with sufficient standby and emergency power, resilient to transient energy from overvoltage and surge currents. NEMA is currently developing a standard for data center power and lighting equipment and systems that will be published in time for the 2026 Public Comment Hearings or potentially ahead of the 2025 Group B CAH #2. Additionally, this proposal adds essential power reliability by mandating standby power for the equipment and systems installed for data centers and computer rooms along with emergency power for life safety and fire responder operations. Surge protection will also be required for all services and feeders installed for the normal, standby, and emergency equipment and systems. The combination of standby power, emergency power, and surge protection will ensure data centers and computer rooms will remain energized during normal power outages and will not be damaged from transient surges.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal will increase the cost of construction of data centers and computer rooms by requiring compliance with requirements outlined in Sections 429 and 2702.2.20. However, the increased costs at time of construction will be offset operational savings achieved by reduced downtime, increased productivity, and protection against data loss and equipment damage. This return on investment will vary depending on project scale and scope.
For example, a small computer room with a single network terminal may only require the installation of a single surge-protective device and a UPS for standby power backup, whereas a 50k square foot standalone data center with thousands of network terminals may require extensive electrical infrastructure to meet the proposed requirements in Sections 429 and 2702.2.20.
Actual costs in dollars could be as low as $500 in the first example above to more than $100k in electrical upgrades in the second example above.

Estimated Immediate Cost Impact Justification (methodology and variables):

Unknown - No Cost Impact Justification Study Performed. NEMA’s proposals are developed by a member consensus process where both our bylaws and federal regulations prohibit us from discussing prices, cost, and other financial details of electrical products.
The best we can offer is a statement that we acknowledge the proposed requirements will indeed increase the cost of construction dependent on the scale and scope of the project, but that we also believe these initial costs will be offset by operational savings achieved by reduced downtime, increased productivity, and protection against data loss and equipment damage, as stated in our proposal.

Staff Analysis: The proposed referenced standard, NFPA 855-23 Standard for the Installation of Stationary Energy Storage Systems, is currently referenced in the IFC.

A review of the standard proposed for inclusion in the code, NEMA XX-XX *Standard for Electrical Equipment in Data Centers and Computer Rooms,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

TENTATIVE ORDER OF DISCUSSION
2025 PROPOSED CHANGES TO THE
INTERNATIONAL BUILDING CODE – STRUCTURAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some S code change proposals may not be included on this list, as they are being heard by another committee.

S1-25 Part I

IBC: 1502.4 (New)

Proponents: Emily Lorenz, representing International Institute of Building Enclosure Consultants (IIBEC) (emilyblorenz@gmail.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new text as follows:

1502.4 Drainage of other surfaces. Where balconies, decks, landings, exterior stairways, and similar surfaces exposed to the weather have an impervious layer, the impervious layer shall be sloped to provide positive drainage away from the structure.

S1-25 Part I

S1-25 Part II

IRC: R507.1.1 (New), R903.5 (New)

Proponents: Emily Lorenz, representing International Institute of Building Enclosure Consultants (IIBEC) (emilyblorenz@gmail.com)

2024 International Residential Code

Add new text as follows:

R507.1.1 Impervious layers. Decks with impervious layers shall comply with Section R903.5 for drainage.

R903.5 Drainage of other surfaces. Where balconies, decks, landings, exterior stairways, and similar surfaces exposed to the weather have an impervious layer, the impervious layer shall be sloped to provide positive drainage away from the structure.

Reason: The purpose of this proposal is to ensure life-safety of users of balconies in cold climates, and to promote bulk water flow away from exterior walls or assemblies that adjoin balconies, so that ponding does not occur.

Proper drainage on balconies, decks, etc., is an important performance requirement to aid in draining liquid water away from the building. In cold climates, any ponding that may occur could potentially freeze, causing a safety issue.

Section 1402.3 of the 1997 Uniform Building Code (UBC) is what most waterproofing consultants considered the gold standard for ensuring that architects and builders constructed balcony and stairways with a minimum of 2% slope. The 2% slope requirement referenced in the Section 1402.3 of the 1997 UBC does not exist at any location within any version of IBC from 2000 through 2024. Decks were also listed as an area that should be waterproofed and sloped.During the transition from the UBC to the IBC, this valuable and useful reference to require a minimum 2% surface slope for balconies, landings, and exterior stairways was omitted from the IBC and IRC. There are no referenced statements or definitions anywhere in the current codes on this issue.

This proposal adds modified code language from the 1997 UBC Chapter 14 under the roof drainage sections of IBC Chapter 15 (1502) and IRC Chapter 9 (R903.4). Section 1402.3 of the 1997 Uniform Building Code (UBC) stated:

"1402.3 Waterproofing Weather-exposed Areas. Balconies, landings, exterior stairways, occupied roofs, and similar surfaces exposed to the weather and sealed underneath shall be waterproofed and sloped a minimum of 1/4 unit vertical in 12 units horizontal (2% slope) for drainage."

Additionally, 2024 IBC Section 2304.12.2.4 states, “Wood structural members that support moisture-permeable floors or roofs that are exposed to the weather, such as concrete or masonry slabs, shall be of naturally durable or preservative-treated wood unless separated from such floors or roofs by an impervious moisture barrier. The impervious moisture barrier systems protecting the structure supporting floors shall provide positive drainage of water that infiltrates the moisture-permeable floor topping.” This proposal supports providing drainage required by Section 2304.12.2.4.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proper slope of decks and other surfaces may be accommodated in most situations with no additional materials nor labor.

S1-25 Part II

S2-25

IBC: SECTION 1503, 1503.1, 1503.2

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Building Code

SECTION 1503
WEATHER PROTECTION

1503.1 General. *Roof decks* shall be covered with *approved roof coverings* secured to the *building* or *structure* in accordance with the provisions of this chapter. *Roof coverings* shall be designed in accordance with this code, and installed in accordance with this code and the manufacturer's *approved* instructions.

Revise as follows:

1503.2 Flashing. Flashing shall be designed in accordance with this code and installed in accordance with the *roof covering* manufacturer's approved instructions in such a manner so as to prevent water from entering the wall and roof through joints in copings, through moisture-permeable materials and at intersections with *parapet walls* and other penetrations through the roof plane.

Reason: This proposed code change is intended to clarify the code's requirements regarding to roofing-related flashings by making it clear roofing-reated flashing design and installation need to be according to the roof covering manufacturer's instructions. The previous section, Section 1503.1, already provides a similar requirement for the roof covering itself. Since roofing-related flashings are integral to, but not necessarily always considered a part of the roof covering ("roof covering" is specifically defined in Section 202), this added clarification is appropriate,

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed change is clarifying in nature and will not increase or decrease the cost of construction. See reason statement.

S2-25

S3-25 Part I

IBC: 1503.2, 1503.2.1

Proponents: John Taecker, Taecker Codes & Technical Services, representing Taecker Codes & Technical Services (john@taeckercodes.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1503.2 Flashing. Flashing shall be installed in such a manner so as to prevent water from entering the wall and roof through joints in copings, through moisture-permeable materials and at intersections with *parapet walls*, *rooftop structures* and other penetrations through the roof plane.

1503.2.1 Locations. Flashing shall be installed at wall and roof intersections, at gutters, at *rooftop structures*, wherever there is a change in roof slope or direction and around roof openings. Where flashing is of metal, the metal shall be corrosion resistant with a thickness of not less than 0.019 inch (0.483 mm) (No. 26 galvanized sheet).

S3-25 Part I

S3-25 Part II

IBC: 1511.1.3 (New)

Proponents: John Taecker, Taecker Codes & Technical Services, representing Taecker Codes & Technical Services (john@taeckercodes.com)

2024 International Building Code

Add new text as follows:

1511.1.3 Flashing. Flashing shall be installed at *rooftop structures* in accordance with Section 1503.2 and 1503.2.1.

Reason: The general flashing requirements in Section 1503.2 and 1503.2.1 do not include flashing for rooftop structures. There are no flashing requirements, other than for lightning protection systems, in Section 1511. Flashing should also be required for any rooftop structure.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Good construction practices would include appropriate flashing for rooftop structures, so the increase has the potential to be minimal. There may be an increase for those installers who have not done this practice.

S3-25 Part II

S4-25 Part I

IBC: 1503.2.1 (New), UL Chapter 35 (New)

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com); Philip Oakes, representing NASFM (phil@browning.red)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new text as follows:

1503.2.1 Attachment of photovoltaic (PV) panel systems. Flashing shall be installed in a manner that prevents water from entering the roof at attachment points for rooftop-mounted *photovoltaic (PV) panel systems* in accordance with one of the following:

1. The roof covering manufacturer's instructions.
2. A metallic or nonmetallic flashing material or system that is *listed* and *labeled* in accordance with UL 2703A and installed in accordance with the flashing manufacturer's installation instructions.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

2703A-2022	Outline of Investigation for Flashing Devices and Systems for Rooftop-Mounted Photovoltaics

S4-25 Part I

S4-25 Part II

IRC: R903.2.3 (New), UL Chapter 44 (New)

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com); Philip Oakes, representing NASFM (phil@browning.red)

2024 International Residential Code

Add new text as follows:

R903.2.3 Photovoltaic (PV) panel systems. Flashing shall be installed in a manner that prevents moisture from entering the roof at attachment points for rooftop-mounted *photovoltaic (PV) panel systems* in accordance with one of the following:

1. The roof covering manufacturer's instructions.
2. A metallic or nonmetallic flashing material or system that is *listed* and *labeled* in accordance with UL 2703A and installed in accordance with the flashing manufacturer's installation instructions.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

2703A-2022	Outline of Investigation for Flashing Devices and Systems for Rooftop-Mounted Photovoltaics

Reason: While flashing is required for roofing in IBC 1503.2 and IRC R903.2 , this section is silent on specific requirements for rooftop-mounted photovoltaic (PV) panel systems. This proposal clarifies that flashing or weathersealing of rooftop attachments for PV systems can be metallic or nonmetallic, and provides a method for evaluating these alternative methods.

This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency. The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner.

All recommendations from SEAC are approved by diverse stakeholders through a consensus process. For more information, please visit www.sustainableenergyaction.org

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal will not increase or decrease the cost of construction This proposal does not change cost of construction. It provides clarity, as well as additional alternative methods. This provides an additional option for construction.

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 2703A-2022 Outline of Investigation for Flashing Devices and Systems for Rooftop-Mounted Photovoltaics, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S4-25 Part II

S5-25 Part I

IBC: 1504.2 (New), 1504.2, TABLE 1504.2, 1504.2.2 (New), 1504.2.2.1 (New), 1504.2.2.2 (New), 1504.4.3, 1504.4.4, 1507.2.5, 1507.16.8, UL Chapter 35 (New)

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new text as follows:

1504.2 Wind resistance of asphalt shingles, hip shingles, and ridge shingles. Wind resistance of asphalt shingles shall be in accordance with Section 1504.2.1. Wind resistance of hip and ridge shingles shall be in accordance with Section 1504.2.2.

Revise as follows:

~~1504.2~~ 1504.2.1 Wind resistance of asphalt shingles. Asphalt shingles shall be tested in accordance with ASTM D7158. Asphalt shingles shall meet the classification requirements of Table ~~1504.2~~ 1504.2.1 for the appropriate maximum *basic wind speed*. Asphalt shingle packaging shall bear a *label* to indicate compliance with ASTM D7158 and the required classification in Table ~~1504.2~~ 1504.2.1.

Exception: Asphalt shingles not included in the scope of ASTM D7158 shall be tested and *labeled* in accordance with ASTM D3161. Asphalt shingle packaging shall bear a *label* to indicate compliance with ASTM D3161 and the required classification in Table ~~1504.2~~ 1504.2.1.

TABLE ~~1504.2~~ 1504.2.1 CLASSIFICATION OF STEEP SLOPE ROOF SHINGLES TESTED IN ACCORDANCE WITH ASTM D3161 OR D7158

MAXIMUM BASIC WIND SPEED, *V*, FROM FIGURES 1609.3(1)– (4) OR ASCE 7(mph)	MAXIMUM ALLOWABLE STRESS DESIGN WIND SPEED, V_{asd}, FROM Table 1609.3.1 (mph)	ASTM D7158 [a] CLASSIFICATION	ASTM D3161 or UL 7103 CLASSIFICATION
110	85	D, G or H	A, D or F
116	90	D, G or H	A, D or F
129	100	G or H	A, D or F
142	110	G or H	F
155	120	G or H	F
168	130	H	F
181	140	H	F
194	150	H	F

For SI: 1 foot = 304.8 mm, 1 mph = 0.447 m/s.

a. The standard calculations contained in ASTM D7158 assume Exposure Category B or C and building height of 60 feet or less. Additional calculations are required for conditions outside of these assumptions.

Add new text as follows:

1504.2.2 Wind resistance of hip and ridge shingles. Hip and ridge shingles shall comply with Section 1504.2.2.1 or 1504.2.2.2.

1504.2.2.1 Testing of hip and ridge shingles. Hip and ridge shingles shall be tested and classified in accordance with the wind test requirements in UL 2375 modified to use a wind speed of 110 mph (177 km/hr). Hip and ridge shingle packaging shall bear a *label* to indicate compliance with the modified version of UL 2375.

1504.2.2.2 Prescriptive alternative for attaching hip and ridge shingles. Prior to installing each hip or ridge shingle, two minimum 1-inch diameter spots of roof cement complying with ASTM D3019 or ASTM D4586 shall be placed on each side of the hip or ridge. The spots shall be placed near the leading edge and fully covered by the exposed portion of the hip or ridge shingle. Each hip or ridge shingle shall be fastened in accordance with the hip or ridge shingle manufacturer's installation instructions.

Revise as follows:

1504.4.3 Metal roof shingles. *Metal roof shingles* applied to a solid or closely fitted deck shall be tested in accordance with ASTM D3161, FM 4474, UL 580 or UL 1897. *Metal roof shingles* tested in accordance with ASTM D3161 shall meet the classification requirements of Table ~~1504.2~~ 1504.2.1 for the appropriate maximum *basic wind speed* and the metal shingle packaging shall bear a *label* to indicate compliance with ASTM D3161 and the required classification in Table ~~1504.2~~ 1504.2.1.

1504.4.4 Slate shingles. Slate shingles shall be tested in accordance with ASTM D3161. Slate packaging shall bear a *label* indicating compliance with ASTM D3161 and the required classification in Table ~~1504.2~~ 1504.2.1.

1507.2.5 Fasteners. Fasteners for asphalt shingles, including hip and ridge shingles, shall be galvanized, stainless steel, aluminum or copper roofing nails, minimum 12-gage [0.105 inch (2.67 mm)] shank with a minimum $^3/_8$-inch-diameter (9.5 mm) head, complying with ASTM F1667, of a length to penetrate through the roofing materials and not less than $^3/_4$ inch (19.1 mm) into the roof sheathing. Where the roof sheathing is less than $^3/_4$ inch (19.1 mm) thick, the nails shall penetrate through the sheathing. ~~Fasteners shall comply with ASTM F1667.~~

1507.16.8 Wind resistance. BIPV shingles shall comply with the classification requirements of Table 1504.2.1 for the appropriate maximum *basic wind speed* .

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

2375-2006	Outline for Hip and Ridge Shingles

S5-25 Part I

S5-25 Part II

IRC: R905.2.4.2 (New), R905.2.4.2.1 (New), R905.2.4.2.2 (New), R905.2.5, UL Chapter 44 (New)

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Residential Code

Add new text as follows:

R905.2.4.2 **Wind resistance of hip and ridge shingles.** Hip and ridge shingles shall comply with Section R905.2.4.2.1 or R905.2.4.2.2.

R905.2.4.2.1 **Testing of hip and ridge shingles.** Hip and ridge shingles shall be tested and classified in accordance with the wind test requirements in UL 2375 modified to use a wind speed of 110 mph (177 km/hr). Hip and ridge shingle packaging shall bear a *label* to indicate compliance with the modified version of UL 2375.

R905.2.4.2.2 **Prescriptive alternative for attaching hip and ridge shingles.** Prior to installing each hip or ridge shingle, two minimum 1-inch diameter spots of roof cement complying with ASTM D3019 or ASTM D4586 shall be placed on each side of the hip or ridge. The spots shall be placed near the leading edge and fully covered by the exposed portion of the hip or ridge shingle. Each hip or ridge shingle shall be fastened in accordance with the hip or ridge shingle manufacturer's installation instructions.

Revise as follows:

R905.2.5 Fasteners. Fasteners for asphalt shingles, including hip and ridge shingles, shall be galvanized steel, stainless steel, aluminum or copper roofing nails, minimum 12-gage [0.105 inch (3 mm)] shank with a minimum $^3/_8$-inch-diameter (9.5 mm) head, complying with ASTM F1667, of a length to penetrate through the roofing materials and not less than $^3/_4$ inch (19.1 mm) into the roof sheathing. Where the roof sheathing is less than $^3/_4$ inch (19.1 mm) thick, the fasteners shall penetrate through the sheathing.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

2375-2006	Outline for Hip and Ridge Shingles

Reason: Areas of roofing systems where wind flow is diverted, such as at hips and ridges, may generate larger uplift pressures, making the products installed in these areas more vulnerable to damage in windstorms. Post-storm investigations conducted by the Federal Emergency Management Agency and other stakeholders document the vulnerability of these transition areas. Although post-storm investigations do not identify specific causes for damage to hip and ridge shingles during wind events, the associated observations that products are sometimes damaged in these areas is a reason to consider improved testing or installation options to reduce the likelihood of damage.

This proposal adds a new requirement that hip and ridge shingles used on asphalt shingle roofs either demonstrate compliance to a third-party test that evaluates wind resistance, or be installed using a prescriptive method designed to increase resistance to uplift in wind events. Also, it clarifies that fasteners used to install hip and ridge shingles are to comply with the existing asphalt shingle fastener requirements, and makes an editorial change in the IBC to position the reference to ASTM F1667 with the other fastener requirements instead of as a stand-alone sentence.

UL 2375 is a fan-induced wind resistance test which is modified from ASTM D3161 specifically for testing hip and ridge shingles. Decks are constructed to simulate a roof ridge, and tests are conducted in two orientations (i.e., with fan-induced wind perpendicular or parallel to the ridge). Like ASTM D3161, UL 2375 is conducted at a fixed wind speed for two hours. As written, UL 2375 is performed at 60 mph. Therefore, the proposal modifies the wind test speed to 110 mph to align with the Class F designation associated with ASTM D3161.

In the IBC, renumbering of Table 1504.2 to 1504.2.1 is addressed in all sections which currently reference the table.

Cost Impact: Increase

Estimated Immediate Cost Impact:

A best-case scenario would result in $0 cost impact to the consumer. This would occur if the installer (in the case of the prescriptive option) or the manufacturer (in the case of the testing option) elects not to pass any cost increase along.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal introduces new requirements applicable to hip and ridge shingles. The two compliance options may both increase cost of construction, since there will be a cost associated with either conducting the UL 2375 test and managing associated labeling or with the use of roof cement for the prescriptive installation method. However, the actual cost experienced by the consumer is directly related to unknown future behavior of the product manufacturer (in the case of the testing option) and the installer (in the case of the prescriptive option).

Estimate of Material Costs for Prescriptive Installation:

Material cost for the prescriptive installation option may be estimated as follows:

- Assume a roof cement cost of approximately $5 per 10.1 oz. tube (example, based on online search for ASTM D4586 roof cement).
- Assume four spots per shingle of exactly a one-inch diameter and exactly 1/8 inch thickness.
- Assume hip or ridge shingle exposure of five inches, which requires 2.4 shingles per linear foot.
- Estimated volume of roof cement per shingle is 0.5 in. x 0.5 in. x 3.14 x 0.125 in. x 4 spots/shingle, which calculates to 0.3925 cu.in. per shingle.
- Estimated volume of roof cement per linear foot of hip or ridge is 0.3925 cu.in. x 2.4 shingles per linear foot, which calculates as 0.942 cu.in. per linear foot.
- Estimated cost per cubic inch of sealant is $5 per 10.1-ounce tube ÷ 18.23 cu.in. per 10.1 ounces, which calculates as $0.274 per cu.in.
- Estimated cost per linear foot is 0.942 cu.in./linear foot x $0.274 per cu in., which calculates as $0.26 per linear foot.

There may be additional labor costs for this prescriptive installation, but those are not estimated.

Costs Associated with Testing Option:

Two costs are applicable—the cost of obtaining an initial listing and the cost of maintaining that listing. In many cases, hip and ridge products may already have the appropriate listing in place so there will be no additional cost for this option if this proposal is accepted. In cases where a listing does not exist, some additional cost will be incurred, but it is unknown whether those costs will be passed to the consumer.

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 2375-2006 Outline for Hip and Ridge Shingles, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S5-25 Part II

S6-25

IBC: 1504.2, TABLE 1504.2

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Building Code

1504.2 Wind resistance of asphalt shingles. Asphalt shingles shall be tested in accordance with ASTM D7158. Asphalt shingles shall meet the classification requirements of Table 1504.2 for the appropriate maximum *basic wind speed*. Asphalt shingle packaging shall bear a *label* to indicate compliance with ASTM D7158 and the required classification in Table 1504.2.

Exception: Asphalt shingles not included in the scope of ASTM D7158 shall be tested and *labeled* in accordance with ASTM D3161. Asphalt shingle packaging shall bear a *label* to indicate compliance with ASTM D3161 and the required classification in Table 1504.2.

Revise as follows:

TABLE 1504.2 CLASSIFICATION OF STEEP SLOPE ROOF SHINGLES TESTED IN ACCORDANCE WITH ASTM D3161 OR D7158

MAXIMUM BASIC WIND SPEED, *V*, FROM FIGURES 1609.3(1)– (4) OR ASCE 7(mph)	MAXIMUM ALLOWABLE STRESS DESIGN WIND SPEED, V_{asd}, FROM Table 1609.3.1 (mph)	ASTM D7158 [a] CLASSIFICATION	ASTM D3161 or UL 7103 CLASSIFICATION
110	85	D, G or H	~~A,~~ D or F
116	90	D, G or H	~~A,~~ D or F
129	100	G or H	~~A, D or~~ F
142	110	G or H	F
155	120	G or H	~~F~~ Not permitted
168	130	H	~~F~~ Not permitted
181	140	H	~~F~~ Not permitted
194	150	H	~~F~~ Not permitted

For SI: 1 foot = 304.8 mm, 1 mph = 0.447 m/s.

a. The standard calculations contained in ASTM D7158 assume Exposure Category B or C and building height of 60 feet or less. Additional calculations are required for conditions outside of these assumptions.

Reason: This proposed code change is intended to correlate maximum allowable wind speeds with the applicable test method's resistances to wind velocities.

ASTM D3161 provides for three classes, as follows:

- Class A--Pass at a test velocity of 60 mph
- Class D--Pass at a test velocity of 90 mph
- Class F--Pass at a test velocity of 110 mph

A copy of ASTM D3161-20, which is referenced in Chapter 35, is attached for reference. The classifications appear in ASTM D3161's Section 4-Classes of Steep Slope Roofing Proeducts.

IBC 2024's Table 1504.2 currently permits shingle-type roof coverings to be used at wind speeds higher than their ASTM D3161 tested classifications. This proposed code changes revises the allowable classifications in the table's ASTM D3161 column to properly correlate with tested the maximum ASD wind speed (V_{asd}).

IBC 2024 Table 1504.2's ASTM D7158 column classifications already properly correlate with ASTM D7158, so no changes are needed in this particular column.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

For asphalt shingles with self-seal strips, while this proposed code change will limit use of allowable wind resistance classifications based on the ASTM D3161 test method, other permissable classifications are already in-place using the ASTM D7158 test method addressing higher wind speeds.

Table 1504.2's ASTM D3161 or UL 7103 Classification column also applies to metal roof shingles (Section 1504.4.3), slate shingles (Section 1504.4.4) and BIPV shingles (Section 1507.16.6). While properly correlating the table with ASTM D3161's classifications will no longer permit use of these particular roof coverings in areas having a maximum basic wind speed, *V*, above 142 mph, or a maxmium allowable ASD wind speed, V_{asd}, above 110 mph, alterantive roof covering types are available at equal or lower costs. Therefore, there is no impact on the cost of construction resulting form this code change proposal.

S6-25

S7-25

IBC: 1504.4.1, SPRI Chapter 35 (New)

Proponents: Amanda Hickman, The Hickman Group, representing Single-Ply Roofing Industry (SPRI) (amanda@thehickmangroup.com)

2024 International Building Code

Revise as follows:

1504.4.1 Other roof systems. Built-up, modified bitumen, ~~fully adhered or mechanically attached~~ single-ply roof systems, metal panel roof systems applied to a solid or closely fitted deck and other types of membrane *roof coverings* shall be tested in accordance with FM 4474, UL 580 or UL 1897 and shall be bonded or mechanically attached in accordance with tested configurations that meet the requirements of this section and ANSI/SPRI WD-1. The wind uplift resistance for base sheets, insulation and membrane shall be as determined by the test methods in accordance with FM 4474, UL 580 or UL 1897.

Add new standard(s) as follows:

465 Waverly Oaks Road, Suite 421
Waltham, MA 02452

ANSI/SPRI WD-1 2025 Wind Design Standard Procedure for Roofing Assemblies

Reason: The current code requirements for wind design uplift lack the specificity and rigor needed to address the vulnerabilities of roofing assemblies. The generalized guidelines in the IBC often fall short when it comes to the demands of critical roof zones—field, perimeter, and corner (Zone 1', Zone1, Zone 2, Zone 3)—leaving gaps in installation to enforce assurance of performance. This lack of requirement can result in underperforming roof assemblies, especially in high wind events, presenting significant risks to building occupants and long-term asset protection.

Incorporating ANSI/SPRI WD-1 into the building code offers a much-needed solution to these limitations. This standard provides a mathematically engineered methodology specifically for roofing systems, ensuring compliance with wind design uplift as referenced in performance requirements of the code. Unlike the generalized guidelines in the IBC, ANSI/SPRI WD-1 delivers actionable guidance, empowering designers to achieve a greater reliability on occupancy's safety and roof assembly performance.

The standard also integrates robust testing protocols, such as FM 4474, UL 580 and UL 1897, that directly evaluate the wind uplift resistance of roofing assemblies. These protocols ensure that tested assemblies are not only compliant with the building code but also proven to perform. Furthermore, ANSI/SPRI WD-1 offering clear instructions for optimizing wind performance in the most vulnerable roof areas.

By requiring compliance with ANSI/SPRI WD-1, the building codes can bridge the gap between missing requirements and the level of safety for occupants and performance demanded by today's roofing challenges. This standard provides the clarity and precision needed to protect lives, reduce property damage, and ensure resilience in the face of increasingly severe wind events.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Although this code change mandates compliance with ANSI/SPRI WD-1, implementing this methodology will not result in additional costs. The reason compliance with ANSI/SPRI WD-1 will not lead to increased costs lies in the methodology's integration with standard construction practices and materials already in use. ANSI/SPRI WD-1 provides a set of guidelines and calculations for wind design of low-slope roofing systems, which aligns with industry norms. Since most contractors and designers are already familiar with these practices and materials required for compliance, there is no significant deviation from current procedures that would drive up costs. Additionally, the tools and resources needed to implement this standard are readily accessible, minimizing any additional investment.

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/SPRI WD-1 2025 Wind Design Standard Procedure for Roofing Assemblies, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

CC # S7-25 and CC # S8-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S7-25

S8-25

IBC: 1504.4.1, 1504.4.1 (New), 1504.4.1.1 (New), 1504.4.1.2 (New), 1504.4.1.2.1 (New), 1504.4.1.2.2 (New), MCA (New)

Proponents: Robert A. Zabcik, Z-tech Consulting LLC, representing Metal Construction Association (bob@ztech-consulting.com)

2024 International Building Code

Revise as follows:

~~1504.4.1~~1504.4.5 Other roof systems. Built-up, modified bitumen, fully adhered or mechanically attached single-ply roof systems~~, metal panel roof systems applied to a solid or closely fitted deck~~ and other types of membrane *roof coverings* shall be tested in accordance with FM 4474, UL 580 or UL 1897.

Add new text as follows:

1504.4.1 Metal roof panel systems over deck. *Metal roof panel* systems applied to a solid or closely fitted deck shall be tested in accordance with this section. Wind resistance shall be taken as the average result from a minimum of two tests. A minimum 2 to 1 margin of safety shall apply for *allowable stress design* and a strength reduction factor of no more than 0.7 shall apply for *load and resistance factor design*.

1504.4.1.1 Non-Hurricane-prone regions. *Metal roof panels* in non-hurricane-prone regions shall be tested in accordance with FM 4474, UL 580 or Part I of UL 1897.

1504.4.1.2 Hurricane-prone regions. *Metal roof panels* and related hip, ridge and edge systems in *hurricane-prone* regions shall be tested in accordance with Section 1504.4.1.2.1 and 1504.4.1.2.2.

1504.4.1.2.1 Metal roof panels. *Metal roof panels* shall be tested in accordance with FM 4474 or UL 580. When UL 580 is used and wind resistance in excess of that provided by Class 90 is required for design, UL 1897 Part I shall be used to determine wind resistance as follows:

1. The positive pressure applied below the assembly shall be held at 48.5 psf (240 kPa) throughout the test.
2. The negative pressure applied above the assembly shall be 63.5 psf (310 kPa) initially and increased in intervals of 15 psf (75 kPa). Each interval shall be held for at least one minute.
3. The wind resistance shall be taken as the average of the highest completed interval of no fewer than two samples subsequent to completing Phase 5 of the Class 90 test sequence of UL 580.

1504.4.1.2.2 Metal edge systems. Metal hip, ridge, and edge systems, excluding gutters, shall be tested for uplift resistance in accordance with ANSI/MCA FTS-1.

MCA

Metal Construction Association
1601 American Lane Suite 310
Schaumburg, IL 60631

ANSI/MCA FTS-1 2019	Test Method for Wind Load Resistance of Flashings Used with Metal Roof Systems

Reason: The purpose of this proposal is to clarify existing and add new requirements to determination of wind load resistance values of metal roof panel assemblies over solid or closely fitted deck, especially in hurricane-prone regions. These changes are consistent with the recommendations of FEMA P-2342 and also align with the Florida Building Code (FBC) Test Application Standard TAS-125, which is widely used in the metal roofing industry and is considered the best testing practice of these systems. However, it does NOT require any third-party listing like FBC. It also moves the other roofs section (Currently 1504.4.1) to 1504.4.5 as "other" is typically used at the end of a list, not the beginning. The technical changes fall into four general areas and are discussed in detail as shown below:

1. Stipulations for the required number of tests and applicable margin of safety for allowable stress design.
2. Providing a strength reduction coefficient (a.k.a. phi factor) needed for the application of load and resistance factor design.
3. Introduction of new test requirements for edge, hip and roof systems to address issues observed by FEMA in their Hurricane Ian investigation.
4. Provide a test methodology consistent with TAS-125, addressing limitations of UL 580, which terminates at 105 psf instead of progressing to failure.

Items 1 and 2

Item 1 is self-explanatory. Item 2 is similar to Item 1 and is needed because ASCE 7, the cited load standard in Chapter 16 if IBC, has been positioning to remove allowable stress design provisions for some time and it seems that load and resistance factor design is the future. These items apply in both hurricane prone and non-hurricane prone regions.

Item 3

Item 3 only applies within hurricane-prone regions, as defined by IBC and adds requirements for testing of ridge, hip and edge metal systems similar to those currently in place for low-slope built-up, modified bitumen and single-ply roof systems in Section 1504.6. It is being put forth to address issues observed by the Roofing Industry Committee on Weather Issues (RICOWI) through their Windstorm Investigation Program (WIP) as well as FEMA's Hurricane Ian investigation. The test standard cited, ANSI/MCA FTS-1-2019, was developed by MCA through the Single Ply Roofing Institute's (SPRI) ANSI-accredited canvassing process. The RICOWI and FEMA WIP field studies revealed instances where metal ridge, hip and/or edge system were torn from the perimeter of a building with a metal roof, exposing a longer leading edge of the incorporated roof panel and initiating a partial failure of the roof system, particularly near the corners and gable edges of the roof. Although the damage was very localized, it did allow water to enter the building and in cases, the edge metal became a wind-borne debris threat. Most commonly, this occurred in two situations:

- Where a multi-piece edge trim assembly incorporating cleats deformed enough to disengage from the cleat.
- Where the metal edge trim assembly was fastened to a non-metal substrate such as wood or masonry, leaving to question the appropriateness of the fastener used since it would often not be provided by the edge system manufacturer for non-metal substrates.

The figures in the attachment depict these conditions. These tendencies were also observed by FEMA in their Mitigation Assessment Team Report for Hurricane Ian. (https://tinyurl.com/mmrstxju.) Section 6.3 of this report includes Conclusion FL-10, recommending that FEMA support industry stakeholders in supporting code change proposals to requiring testing of hip and ridge roof coverings. (FEMA P-2342, Page 6-9 see excerpt)

Item 4

Item 4 also only applies in hurricane-prone regions and clarifies application of UL 580 and UL 1897 to determine appropriate wind load resistance values as represented by common industry practice and in a manner consistent with FBC TAS-125. UL 580 and 1897 are very different tests. UL 1897 utilizes steady-state load sequencing progressing until system failure and often takes less than 20 minutes to complete. However, UL 580 is designed to evaluate overall system integrity using a cyclic load sequence and yields a performance rating (Classification) from a fixed set of options. UL 580 involves two separate hour-long periods of cyclic loading and is generally considered the more rigorous test, but the test standard does not allow for additional testing to failure once the highest classification (Class 90) is achieved. Class 90 provides a net uplift value of 105 psf, which equates to a safe working load of 52.5 psf. With the current version of ASCE 7 Chapter 30, this result is not useful in the extreme edge or corner zones of roofs in hurricane-prone regions of the US. This issue is addressed by the proposed additions, which are based on the Florida Test Application Standard TAS-125. This standard uses UL 580 as a base qualification test but then allows the metal roof panel manufacturer to perform additional testing using a modified UL 1897 sequence until failure is observed. This process is repeated at least once more and a margin of safety of two is applied to the average result for the purposes of allowable stress design. This qualifies the panel for wind load resistance higher than the 105 psf net load given by Class 90 of UL 580 and ensures repeatability. Although TAS-125 listing is only a requirement in the High Velocity Hurricane Zone as defined by the Florida Building Code, the underlying methodology has become the de-facto way to derive allowable design loads within the metal roofing industry for all locales.

This proposal is being brought forward by The Metal Construction Association. (MCA) Founded in 1983, the MCA is a 501(c)(6) organization promoting the use of metal in the building envelope by bringing together manufacturers and suppliers of metal products used in structures throughout the world to collaborate on marketing, education and advocacy. For more information, see the MCA website at www.metalconstruction.org.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This change would increase the cost of construction indirectly as the cost of the testing would presumably be passed to the consumer for those products to be approved for use in hurricane-prone regions of the US. However, the impact is miniscule, conservatively estimated as less than 0.5% of initial building cost. This estimate ignores the benefit of any lowered operating costs, such as insurance, as well as any benefit over time, such as longer asset life.

Estimated Immediate Cost Impact Justification (methodology and variables):

ANSI/MCA FTS-1 testing is estimated to be $1,500/test and most manufacturers carry 4-8 styles of edge metal systems different enough to test separately. Thus, total cost is estimated to be $36,000. Similarly, additional UL 580/1897 testing required for wind resistance of the panel system is estimated as $2,500 per test over a product line of 8 profiles for $40,000. This is a total of $76,000 to carry both. If this cost is accrued over the life of the product lines, assumed to be at least 1,000 buildings, it results in a nominal increase of at most $76 per building. A typical building of this construction is 5,000 square feet of roof area at $6/square foot and 600 lineal feet of edge/hip/ridge materials valued at $5/lineal foot, this represents a total cost of $33,000 installed. At a total cost of $30/square foot, the building would be $150,000, making the roof 22% of the total cost, which is consistent with industry estimation practices. The increase over the total building cost is 76/150,000, or 0.5%.

Note: Cost estimates are based on general experience of industry stakeholders and are not available publicly due to antitrust restrictions.

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/MCA FTS-1 2019 Test Method for Wind Load Resistance of Flashings Used with Metal Roof Systems, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

CC # S8-25 and CC # S7-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S8-25

S9-25

IBC: 1504.4.5 (New)

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Building Code

Add new text as follows:

1504.4.5 **BIPV shingles.** BIPV shingles shall be tested for wind resistance and *listed* and *labeled* in accordance with UL 7103 and shall meet the classification requirements of Table 1504.2.

Reason: This code change proposal adds specific requirements for wind resistance of BIPV shingles to IBC 2024's Section 1504-Performance Requirements. Wind resistance testing is already included in UL7103, which is referenced in Sec. 1507.16.6. This proposed code change clarifies the code by including BIPV shingles' wind resitance in the same section as other roof covering types.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is a clarification and does not increase or decrease the stringency of the code or have an impact on the cost of construction.

S9-25

S10-25

IBC: 1504.6

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Building Code

Revise as follows:

1504.6 Metal edge ~~Edge~~ systems for low-slope roofs. Metal ~~edge systems, except gutters and counterflashing,~~ coping, fascia and gravel stop at the perimeter edges ~~installed~~ on built-up, modified bitumen and single-ply ~~roof systems on a~~ *low-slope* roofs shall be designed and installed for wind *loads* in accordance with Chapter 16 and tested for resistance in accordance with ~~Test Methods RE-1, RE-2 and RE-3 of~~ ANSI/SPRI/FM 4435/ES-1~~, except *basic wind speed , V*, shall be determined from Figures 1609.3(1)through 1609.3(4), as applicable~~. The wind *loads* shall be determined using *allowable stress design*.

Exceptions:

1. Coping, fascia and gravel stop constructed of cold-formed steel shall be designed and tested in accordance with the applicable reference structural design standard in Section 2204.1.
2. Coping, fascia and gravel stop constructed of aluminum shall be designed and tested in accordance with the applicable referenced structural design standard in Section 2002.1.

Reason: This proposed code change is intended to clarify the code. Section 1504.6, which is a requirement for the design and testing of roofs' metal edge systems, was first added to IBC 2003. Since that time, this section has been modified several times, has gotten a bit confusing and is in need of some clarity. The following changes are proposed here:

- Change the title from "Edge systems..." to "Metal edge systems...". The section's text and referenced standard apply specifically to metal edge systems and not other types of roof edge systems, such as stone or masory copings.
- In the text, instead of indicating "...edge systems, except gutters and counterflashing...", indicate the metal edge types the requirement specifically applies to--that is coping, fascia and gravel stop. Gutters are addressed in Section 1504.6.1.
- Strike the references to ANSI/SPRI ES-1's Test Methods RE-1, RE-2 and RE-3 as these are individual test applicable to specific edge metal profiles. All three test methods (i.e., the "and") do not apply to a specific metal profile. For example, Test Method RE-1 applies to fascia or gravel stop used with dependently terminated roof membranes. Test Method RE-2 applies to fascia and gravel stop used with dependently or independently terminated roof membranes. Test Method RE-1 applies to copings. In some instances, both Test Methods RE-1 and RE-2 will be apply. The ANSI/SPRI ES-1 standard indicates which test methods apply to specific specific metal profiles.
- Change the reference of the standard from "ANSI/SPRI ES-1" to "ANSI/SPRI/FM 4435/ES-1", which is consistent with the current standard designation and reference in IBC Chapter 35.
- The qualifying statement "...except *basic wind speed*...applicable." is no longer needed. Previous editions of ANSI/SPRI ES-1 included its own procedure for determined design wind loads. Design wind load determination is no longer included in the current version of ANSI/SPRI ES-1; the standard now only deals with load resistance. The determination of design wind loads in accordance with Chapter 16 is now required making this qualifying statement unnecessary.
- Add the sentence permitting the use of allowable stress design. This is consistent with Section 1504.4 and Section 1609.3.1.
- Exceptions have been added allowing for design and testing of steel and aluminum coping, fascia and gravel stop in accorance with AISI S100, or AA ASM 35 and AA ADM, respectively. These exceptions are consistent with what already appears in Section 1504.4.2 regarding structural metal panel roofs.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is clarifying in nature and does not change the stringency of the code. As a result, this code change proposal will not increase or decrease the cost of construction.

S11-25

IBC: 1504.6.1

Proponents: Amanda Hickman, The Hickman Group, representing Single-Ply Roofing Industry (SPRI) (amanda@thehickmangroup.com)

2024 International Building Code

Revise as follows:

1504.6.1 Gutters ~~securement~~ for low-slope roofs. Gutters ~~that are used to secure the perimeter edge of the roof membrane~~ on *low-slope* built-up, modified bitumen, and single-ply roofs, shall be designed, constructed and installed to resist wind loads in accordance with Section 1609 and shall be tested in accordance with ~~Test Methods G-1 and G-2 of~~ ANSI/SPRI GT-1.

Reason: Gutter failures can lead to roof damage, regardless of whether the gutters are directly securing the roof. Such failures can result in costly repairs, water intrusion, and safety hazards. Testing all systems to the GT-1 standard helps mitigate these risks, offering significant long-term savings for building owners.

While GT-1 test methods G-1 and G-2 evaluate horizontal and vertical wind loads, the inclusion of Test Method G-3 completes the performance assessment by addressing static downward forces. This comprehensive testing approach ensures gutters can withstand all critical forces they may face.

Incorporating Test Method G-3 strengthens the reliability of gutter systems, ensuring they perform effectively under the combined stresses of wind, water, snow, and ice.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

When gutters are tested per GT-1 all three tests including G-3 are performed, so there is no additional testing required, or additional expense incurred, to require all three. Requiring gutters to be tested to GT-1 overall is nominal because it's spread over the entire product line and does not result in a cost increase.

S11-25

S12-25

IBC: [BF] 1505.10, 1507.15, 1507.15.1 (New), [BF] 1507.15.1; IFC: 317.1

Proponents: Robert Marshall, representing FCAC (fcac@iccsafe.org); Jeff Grove, Chair, representing Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

[BF] 1505.10 Landscaped and vegetative roofs. Landscaped and *vegetative roofs* shall comply with Sections 1505.1 and 1507.15. ~~*Vegetative roofs* shall be installed in accordance with ANSI/SPRI VF-1.~~

1507.15 Vegetative roofs and landscaped roofs. *Vegetative roofs* and *landscaped roofs* shall comply with the requirements of this chapter~~,~~and Section 1607.14~~ and the *International Fire Code* ~~. *Vegetative roofs* shall be installed in accordance with ANSI/SPRI VF-1.

Add new text as follows:

1507.15.1 Roof drainage. *Vegetative roofs* and *landscaped roofs* shall be provided with roof drainage in accordance with Section 1502.

Revise as follows:

[BF] ~~1507.15.1~~1507.15.2 Structural fire resistance. The structural frame and roof construction supporting the load imposed on the roof by the *vegetative roof* or *landscaped roofs* shall comply with the *fire-resistance-rating* requirements of Table 601.

2024 International Fire Code

Revise as follows:

317.1 General. Vegetative roofs and landscaped roofs shall ~~comply with Sections 1505 and~~ be installed in accordance with Section 1507.15 of the International Building Code and be ~~installed and~~ maintained in accordance with Sections 317.2 through 317.4.

Reason: IBC Reason Statement: This proposal relocates the reference to the vegetative roof standard ANSI/SPRI VF-1 to the more appropriate section of the code. There is a corresponding IFC proposal that updated the pointer to this section. Additionally, a pointer to the roof drainage section is also being added to make it clear that the roof drainage requirements shall also apply.

IFC Reason Statement: Vegetative roofs are intricate systems that require effective coordination across various disciplines and codes for their proper design, installation, and maintenance. The language in this section was originally taken from a previous edition of ANSI/SPRI VF-1, however the code with respect to vegetative and landscaped roofs has undergone many revisions over the years. This proposal provides the appropriate section in the IBC which references ANSI/SPRI VF-1 (the applicable installation standard) for vegetative roofs.

Link to SPRI VF-1 Standard: https://www.spri.org/download/ansi-spri_standards_2020_restructure/vf-1/ANSI-SPRI-VF-1-2023-External-Fire-Design-Standard-for-Vegetative-Roofs.pdf

This proposal is submitted jointly by the ***ICC Building Code Action Committee (BCAC)*** and the ***ICC Fire Code Action Committee (FCAC)***.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at **BCAC webpage**.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned

International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is editorial and only adds clarity to the appropriate IBC section which address roof installation.

Staff Analysis: CC # S12-25 and CC # S13-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S12-25

S13-25

IBC: [BF] 1505.10, 1507.15, 1507.15.1 (New), [BF] 1507.15.1; IFC: 317.1

Proponents: Amanda Hickman, The Hickman Group, representing The Single-Ply Roofing Industry (SPRI) (amanda@thehickmangroup.com)

2024 International Building Code

Revise as follows:

[BF] 1505.10 Landscaped and vegetative roofs. *Landscaped* and *vegetative roofs* shall comply with Sections 1505.1 and 1507.15 . ~~*Vegetative roofs* shall be installed in accordance with ANSI/SPRI VF-1.~~

1507.15 Vegetative roofs and landscaped roofs. *Vegetative roofs* and *landscaped roofs* shall comply with the requirements of this chapter~~,~~and Section 1607.14 ~~and the *International Fire Code*~~. *Vegetative roofs* shall be installed in accordance with ANSI/SPRI VF-1.

Add new text as follows:

1507.15.1 Roof drainage. *Vegetative roofs* and *landscaped roofs* shall be provided with roof drainage in accordance with Section 1502.

Revise as follows:

[BF] ~~1507.15.1~~ 1507.15.2 Structural fire resistance. The structural frame and roof construction supporting the load imposed on the roof by the *vegetative roof* or *landscaped roofs* shall comply with the *fire-resistance-rating* requirements of Table 601.

2024 International Fire Code

Revise as follows:

317.1 General. *Vegetative roofs* and *landscaped roofs* shall comply with Section~~s~~ 1505 and be installed in accordance with Section 1507.15 of the International Building Code and be ~~installed and~~ maintained in accordance with Sections 317.2 through 317.4.

Reason: IBC Reason Statement:

The more appropriate section for the reference to ANSI/SPRI VF-1 is IBC 1507.15. This proposal relocates it to that section. The second part of this proposal addresses the IFC Section 317 to update the pointer to the IBC relocated section. Additionally, a pointer to the roof drainage section is also being added to make it clear that the roof drainage requirements shall also apply.

IFC Reason Statement:

This proposal updates the pointer to the relocated IBC section (1507.15) for ANSI/SPRI VF-1 installation standard for vegetative roofs.

Link to SPRI Standard VF-1:

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is editorial and only adds clarity and links to the appropriate IBC sections.

Staff Analysis: CC # S13-25 and CC # S12-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S14-25 Part I

IBC: TABLE 1507.1.1(2)

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

TABLE 1507.1.1(2) UNDERLAYMENT APPLICATION

ROOF COVERING	SECTION	MAXIMUM BASIC WIND SPEED, *V* < 130 MPH IN HURRICANE-PRONE REGIONS OR *V* < 140 MPH OUTSIDE HURRICANE-PRONE REGIONS	MAXIMUM BASIC WIND SPEED, *V* ≥ 130 MPH IN HURRICANE-PRONE REGIONS OR *V* ≥ 140 MPH OUTSIDE HURRICANE-PRONE REGIONS
Asphalt shingles	1507.2	Underlayment shall be one of the following: 1. For roof slopes from 2 units vertical in 12 units horizontal (2:12) to less than 4 units vertical in 12 units horizontal (4:12), underlayment shall be two layers applied in the following manner: Apply a strip of underlayment for the first course that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply a full-width sheet~~s~~ of underlayment~~,~~ for the second course. Apply the third course of underlayment, overlapping the second course by half the width of a full sheet plus a minimum of 2 inches. Overlap all successive courses by ~~sheets~~ half the width of a full sheet plus a minimum of 1 inch ~~2 inches~~. End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. 2. For roof slopes of 4 units vertical in 12 units horizontal (4:12) or greater, underlayment shall be one layer applied as follows: Underlayment shall be applied shingle fashion, parallel to and starting from the eaves and lapped a minimum of 2 inches. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's ~~manufacturers'~~ installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.	Underlayment shall be one of the following: 1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment ~~felt~~ for the first course that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply a full-width sheet~~s~~ of underlayment for the second course. Apply the third course of underlayment, overlapping the second course by half the width of a full sheet plus a minimum of 2 inches. Overlap all successive courses by ~~sheets~~ half the width of a full sheet plus a minimum of 1 inch~~2 inches~~. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 2. A strip not less than 4 inches in width of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer's installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table 1507.1.1(1) for the applicable roof covering and basic wind speed shall be applied over the entire roof over the 4-inch-wide membrane strips. Underlayment shall be applied in accordance with this table using the application requirements for where the maximum basic wind speed is less than 130 mph. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's ~~manufacurers'~~ installation instructions for the deck material, roof ventilation configuration and climate exposure of the roof covering.
Clay and concrete tile	1507.3	Underlayment shall be one of the following: 1. For roof slopes from $2^1/_2$ units vertical in 12 units horizontal ($2^1/_2$:12) to less than 4 units vertical in 12 units horizontal (4:12), underlayment shall be not fewer than two layers applied in the following manner: Apply a strip of underlayment for the first course that is half the width of a full sheet parallel to and starting at the eaves , fastened sufficiently to hold in place. Starting at the eaves, apply a full-width sheet ~~strip~~ of underlayment ~~felt~~ for the second course. Apply the third course of underlayment, ~~shall be applied,~~ overlapping the second course by half the width of a full sheet plus a minimum of 2 inches. Overlap all successive courses by ~~sheets~~ half the width of a full sheet plus a minimum of 1 inch~~2 inches~~. End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 2. For roof slopes of 4 units vertical in 12 units horizontal (4:12) or greater, underlayment shall be one layer applied as follows: Underlayment shall be applied shingle fashion, parallel to and starting from the eaves and lapped a minimum of 2 inches. End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's ~~manufacturers'~~ installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.	Underlayment shall be one of the following: 1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment for the first course that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply a full-width sheet~~s~~ of underlayment~~,~~ for the second course. Apply the third course of underlayment, overlapping the second course by half the width of a full sheet plus a minimum of 2 inches. Overlap all successive courses by ~~sheets~~ half the width of a full sheet plus a minimum of 1 inch~~2 inches~~. ~~Distortions in the underlayment shall not interfere with the ability of the shingles to seal.~~ End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 2. A strip not less than 4 inches in width of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer's installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table 1507.1.1(1) for the applicable roof covering and basic wind speed shall be applied over the entire roof over the 4-inch-wide membrane strips. Underlayment shall be applied in accordance with this table using the application requirements for where the maximum basic wind speed is less than 130 mph. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's ~~manufacurers'~~ installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.
Metal roof panels	1507.4		Underlayment shall be one of the following:
Metal roof shingles	1507.5		

Mineral-surfaced roll roofing	1507.6	Apply in accordance with the manufacturer’s installation instructions	1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment for the first course that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply a full-width sheet~~s~~ of underlayment~~,~~ for the second course. Apply the third couse of underlayment, overlapping the second course by half the width of a full sheet plus a minimum of 2 inches. Overlap all successive courses by ~~successful sheets~~ half the width of a full sheet plus a minimum of 1 inch~~2 inches~~. ~~Distortions in the underlayment shall not interfere with the ability of the shingles to seal.~~ End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 2. A strip not less than 4 inches in width of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer’s installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table 1507.1.1(1) for the applicable roof covering and basic wind speed shall be applied over the entire roof over the 4-inch-wide membrane strips. Underlayment shall be applied in accordance with this table using the application requirements for where the maximum basic wind speed is less than 130 mph. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's ~~manufacurers'~~ installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.
Slate shingles	1507.7		
Wood shingles	1507.8		
Wood shakes	1507.9		
BIPV roof coverings	1507.16	Underlayment shall be one of the following: 1. For roof slopes from 3 units vertical in 12 units horizontal (3:12) to less than 4 units vertical in 12 units horizontal (4:12), underlayment shall be two layers applied in the following manner: Apply a strip of underlayment for the first course that is half the width of a full sheet parallel to and starting at the eaves , fastened sufficiently to hold in place. Starting at the eaves, apply a full-width sheet~~s~~ of underlayment~~,~~ for the second course. Apply the third course of underlayment, overlapping the second course by half the width of a full sheet plus a minimum of 2 inches. Overlap all successive courses by~~sheets~~ half the width of a full sheet plus a minimum of 1 inch~~2 inches~~. End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. ~~Distortions in the underlayment shall not interfere with the ability of the shingles to seal.~~ 2. For roof slopes of 4 units vertical in 12 units horizontal (4:12) or greater, underlayment shall be one layer applied as follows: Underlayment shall be applied shingle fashion, parallel to and starting from the eaves and lapped a minimum of 2 inches. ~~Distortions in the underlayment shall not interfere with the ability of the shingles to seal.~~ End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's ~~manufacturers'~~ installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.	Underlayment shall be one of the following: 1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment for the first course that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply a full-width sheet~~s~~ of underlayment~~,~~ for the second course. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's installation instructions for the deck material, roof ventilation configuration and climate exposure of the roof covering.	Underlayment shall be one of the following: 1. ~~Two layers of mechanically fastened underlayment applied in the following manner:~~ Apply a strip of underlayment for the first course that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eave, apply a full width sheet~~s~~ of underlayment~~,~~ for the second course. Apply the third course of underlayment, overlapping the second course by half the width of a full sheet plus a minimum of 2 inches. Overlap all successive courses by ~~sheets~~ half the width of a full sheet plus a minimum of 1 inch~~2 inches~~. ~~Distortions in the underlayment shall not interfere with the ability of the shingles to seal.~~ End laps shall be a minimum of 4 inches and shall be offset by a minimum of 6 feet. 2. A minimum 4-inch-wide strip of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer's installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table R905.1.1(1) for the applicable roof covering shall be applied over the entire roof over the 4-inch-wide membrane strips. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment manufacturer's and roof covering manufacturer's installation instructions for the deck material, roof ventilation configuration and climate exposure of the roof covering.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s.

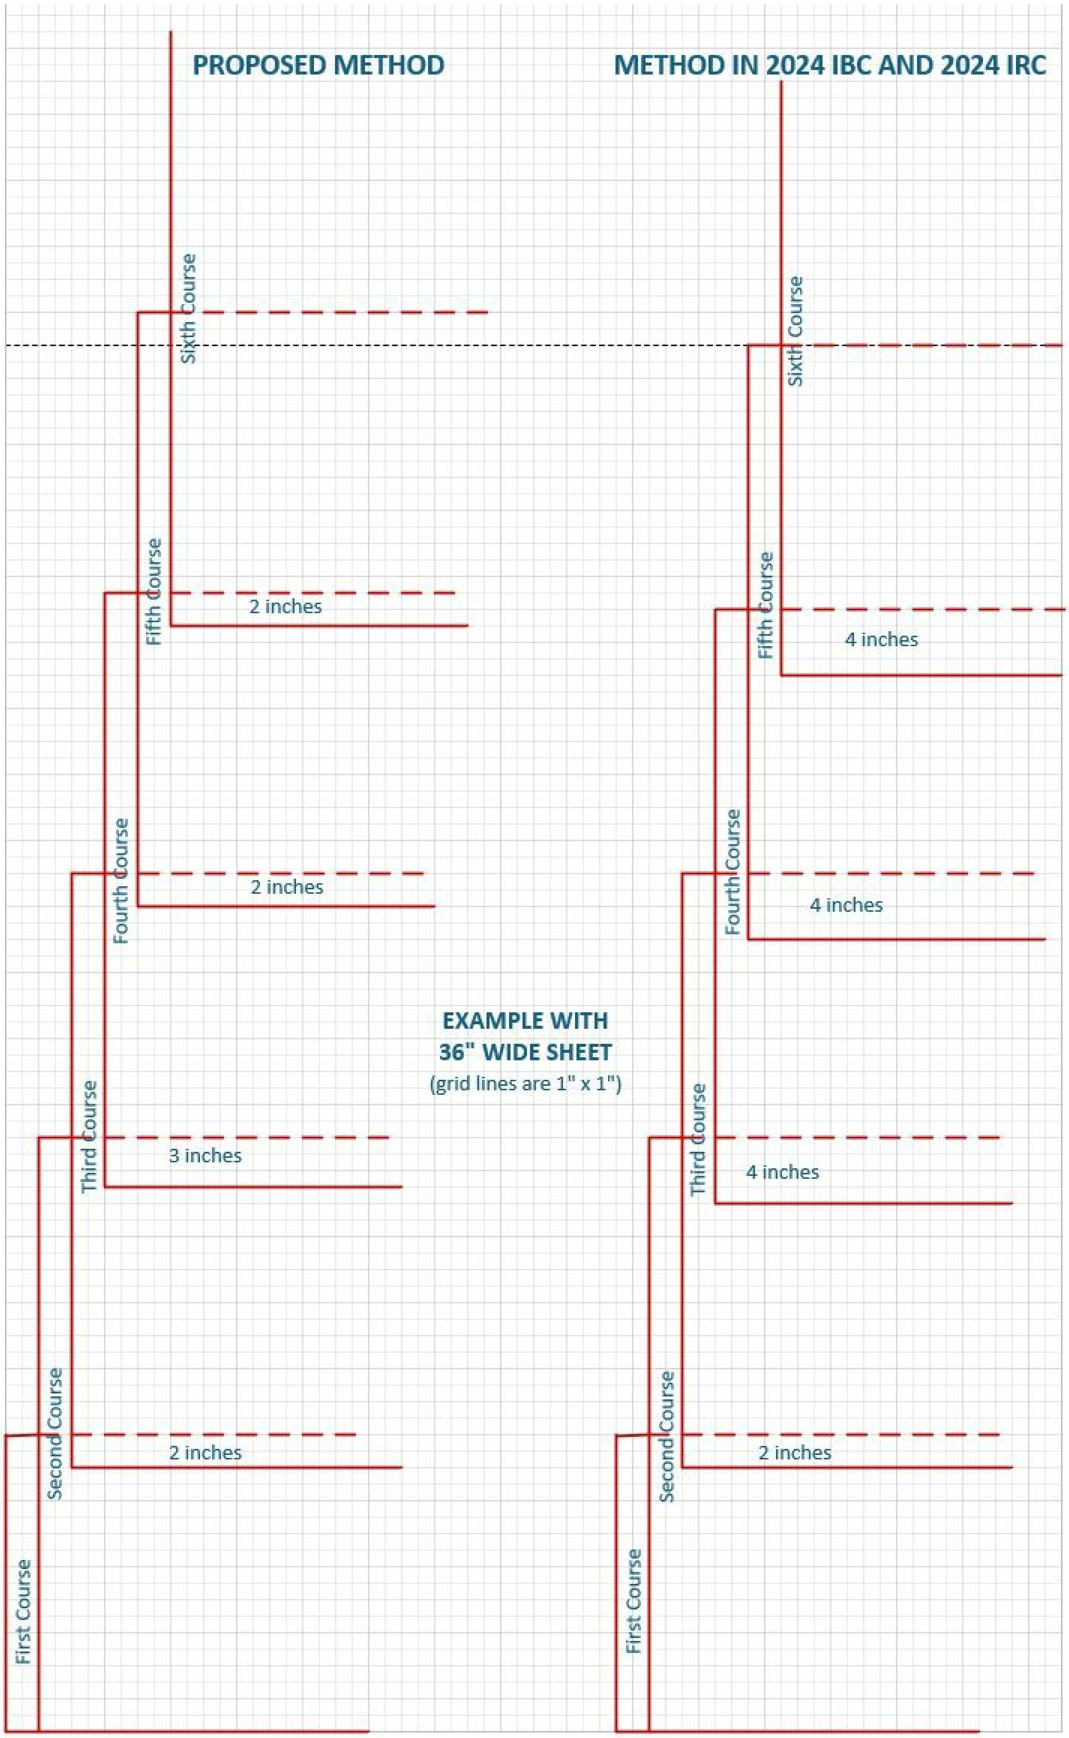
Reason: A two-layer installation of mechanically fastened underlayment has been shown to be an effective installation which helps prevent water intrusion if the primary roof covering is compromised in a wind event, thus making the roofing system more resilient. This proposal offers an improved installation method which reduces material usage, providing important stewardship and sustainability enhancements. As is illustrated in the diagram (Example.jpg, shown below and also available via the link), the current method leads to successive courses with an area of triple coverage that is 4 inches wide beginning with installation of the third full width sheet (fourth course). The proposed method ends up with 2-inch-wide triple coverage beginning with the fourth full-width sheet (fifth course). This pattern occurs regardless of the width of the underlayment sheet. Adopting the proposed method will lead to material savings which depend on the width of the underlayment sheet and the number of underlayment courses needed to complete the roof.

In addition to providing an installation method which saves material, this proposal makes several changes to standardize language and clarify requirements:

- Clarifies the requirements associated with a slope of exactly 4:12 by inserting "less than" before 4:12 in appropriate locations.
- Adds "a minimum of" in appropriate locations to clarify that the dimensions are not meant to be exact.
- For the self-adhering polymer modified underlayment options, clarifies that the instructions of both the underlayment and roof covering manufacturer are to be considered.
- Removes "Distortions in the underlayment shall not interfere with the ability of the shingles to seal" from locations where it is not applicable.



Cost Impact: Decrease

Estimated Immediate Cost Impact:

The worst-case scenario if this proposal is accepted will be a $0.00 change in the cost of construction. As is illustrated below, a material cost decrease approaching 5% is a reasonable best case estimate.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal is expected to reduce the cost of construction by using less material to create a two-layer mechanically fastened underlayment installation. The amount of material cost reduction is dependent upon the number of courses of underlayment required to cover the roof and the width of the underlayment employed.

Using a 36” wide sheet as an example, installation of the fourth course creates a 3” wide area of triple coverage compared to a 4” wide area for the current method, which amounts to a 1/36 (2.8%) reduction in material. Installation of the fifth course and each successive course creates a 2” wide area of triple coverage compared to a 4” wide area for the current method, which amounts to a 2/36 (5.5%) reduction in material.

These estimated percentage reductions in material usage demonstrate the potential material savings, but creation of an estimate of dollar savings is unrealistic, since each project will have a different combination of width of underlayment employed, number of rows of underlayment installed, size of the installed area, and cost of the material.

By covering a greater area per row of installed material than the current method, the proposed method also has the potential to lead to an incremental reduction in labor cost. The same challenges as mentioned in the paragraph immediately above prevent the calculation of a potential labor cost change estimate beyond what can be deduced using the percentages calculated for material cost reduction.

Asphalt shingles	1507.2	Underlayment shall be one of the following: 1. For roof slopes from 2 units vertical in 12 units horizontal (2:12) to 4 units vertical in 12 units horizontal (4:12), underlayment shall be two layers applied in the following manner: Apply a strip of underlayment that is half the width of a full sheet parallel to and starting at the eaves. Starting at the eaves, apply full-width sheets of underlayment, overlapping successive sheets half the width of a full sheet plus 2 inches. End laps shall be 4 inches and shall be offset by 6 feet. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. 2. For roof slopes of 4 units vertical in 12 units horizontal (4:12) or greater, underlayment shall be one layer applied as follows: Underlayment shall be applied shingle fashion, parallel to and starting from the eaves and lapped 2 inches. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be 4 inches and shall be offset by 6 feet. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment and roof covering manufacturers' installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.	Underlayment shall be one of the following: 1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment felt that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply full-width sheets of underlayment overlapping successive sheets half the width of a full sheet plus 2 inches. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be 4 inches and shall be offset by 6 feet. 2. A strip not less than 4 inches in width of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer's installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table 1507.1.1(1) for the applicable roof covering and basic wind speed shall be applied over the entire roof over the 4-inch-wide membrane strips. Underlayment shall be applied in accordance with this table using the application requirements for where the maximum basic wind speed is less than 130 mph. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment and roof covering manufacurers' installation instructions for the deck material, roof ventilation configuration and climate exposure of the roof covering.
Clay and concrete tile	1507.3	Underlayment shall be one of the following: 1. For roof slopes from 2 1/2 units vertical in 12 units horizontal (2 1/2:12) to 4 units vertical in 12 units horizontal (4:12), underlayment shall be not fewer than two layers applied in the following manner: Apply a strip of underlayment that is half the width of a full sheet parallel to and starting at the eaves. Starting at the eaves, a full-width strip of underlayment felt shall be applied, overlapping successive sheets half the width of a full sheet plus 2 inches. End laps shall be 4 inches and shall be offset by 6 feet. 2. For roof slopes of 4 units vertical in 12 units horizontal (4:12) or greater, underlayment shall be one layer applied as follows: Underlayment shall be applied shingle fashion, parallel to and starting from the eaves and lapped 2 inches. End laps shall be 4 inches and shall be offset by 6 feet. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment and roof covering manufacturers' installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.	Underlayment shall be one of the following: 1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply full-width sheets of underlayment, overlapping successive sheets half the width of a full sheet plus 2 inches. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be 4 inches and shall be offset by 6 feet. 2. A strip not less than 4 inches in width of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer's installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table 1507.1.1(1) for the applicable roof covering and basic wind speed shall be applied over the entire roof over the 4-inch-wide membrane strips. Underlayment shall be applied in accordance with this table using the application requirements for where the maximum basic wind speed is less than 130 mph. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment and roof covering manufacurers' installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.
Metal roof panels	1507.4	Apply in accordance with the manufacturer's installation instructions	Underlayment shall be one of the following: 1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply full-width sheets of underlayment, overlapping successful sheets half the width of a full sheet plus 2 inches. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be 4 inches and shall be offset by 6 feet. 2. A strip not less than 4 inches in width of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer's installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table 1507.1.1(1) for the applicable roof covering and basic wind speed shall be applied over the entire roof over the 4-inch-wide membrane strips. Underlayment shall be applied in accordance with this table using the application requirements for where the maximum basic wind speed is less than 130 mph. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment and roof covering manufacurers' installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.

For SI: 1 inch = 25.4 mm, 1 mile per hour = 0.447 m/s.

Reason: This proposal expands the requirements for improved roof covering underlayment from the 130 mph and 140 mph triggers to the Hurricane-prone Region. This effectively expands the secondary roof underlayment strategies recommended by the IBHS Fortified Home - Hurricane program (sealed roof deck) from areas where the design wind speed is 130 mph and greater to areas where the design wind speed is 115 mph and greater.

Damage due to water intrusion continues to be a significant problem for buildings impacted by hurricanes. Water entry can occur where it is able to infiltrate through the roof, walls, vents, windows, and/or doors, or at interfaces between these items. The roof deck, where the roof covering is lost or damaged, is particularly susceptible. Water intrusion can cause extensive damage to interior finishes, furnishings, and other contents, and can lead to ceiling collapse when attic insulation is saturated. When power is lost and/or a building cannot otherwise be dried out within 24–48 hours, additional issues such as mold can develop, potentially extending the period during which the property may not be available for use.

Tests performed by IBHS at the Research Center have consistently shown that a sealed roof deck as recommended by the IBHS Fortified

Home - Hurricane program consistently show significantly reduced water intrusion rates when one of these strategies was employed. A summary of the results of the demonstration can be viewed at the following link:

http://ibhstest.wpengine.com/ibhsnews- releases/ibhs-hurricane-demonstration-illustrates-importance-of-sealed-roof-deck-3/.

The wind driven rain demonstration can be viewed at the following link:

https://disastersafety.org/thunderstorms/winddriven-rain-demo/.

These underlayment strategies required reduce water entry into the attic space by 70% or more.

This expansion is being proposed primarily for 2 reasons. The adoption of ASCE 7-22 in the 2024 IBC resulted in numerous changes to the wind design requirements including changes to the wind speed maps. While some wind speeds in the hurricane-prone region are increasing, notably, the 130 mph contour, which is the Wind Design Required Region trigger in the Hurricane-prone Region, is being reduced in many areas near the Gulf coast and North Atlantic coast. The following figures overlays the ASCE 7-22 design wind speeds for Risk Category II over the ASCE 7-16 design wind speeds for Risk Category II near the Gulf and Atlantic coasts. The areas shaded in blue indicate where the 130 mph contour has shifted more towards the coast effectively reducing wind speeds in these areas. As shown, the North Atlantic coast has been completely removed from the Wind Design Required Region. Without this proposed expansion, these areas would non longer be required to use the improved underlayment strategies.

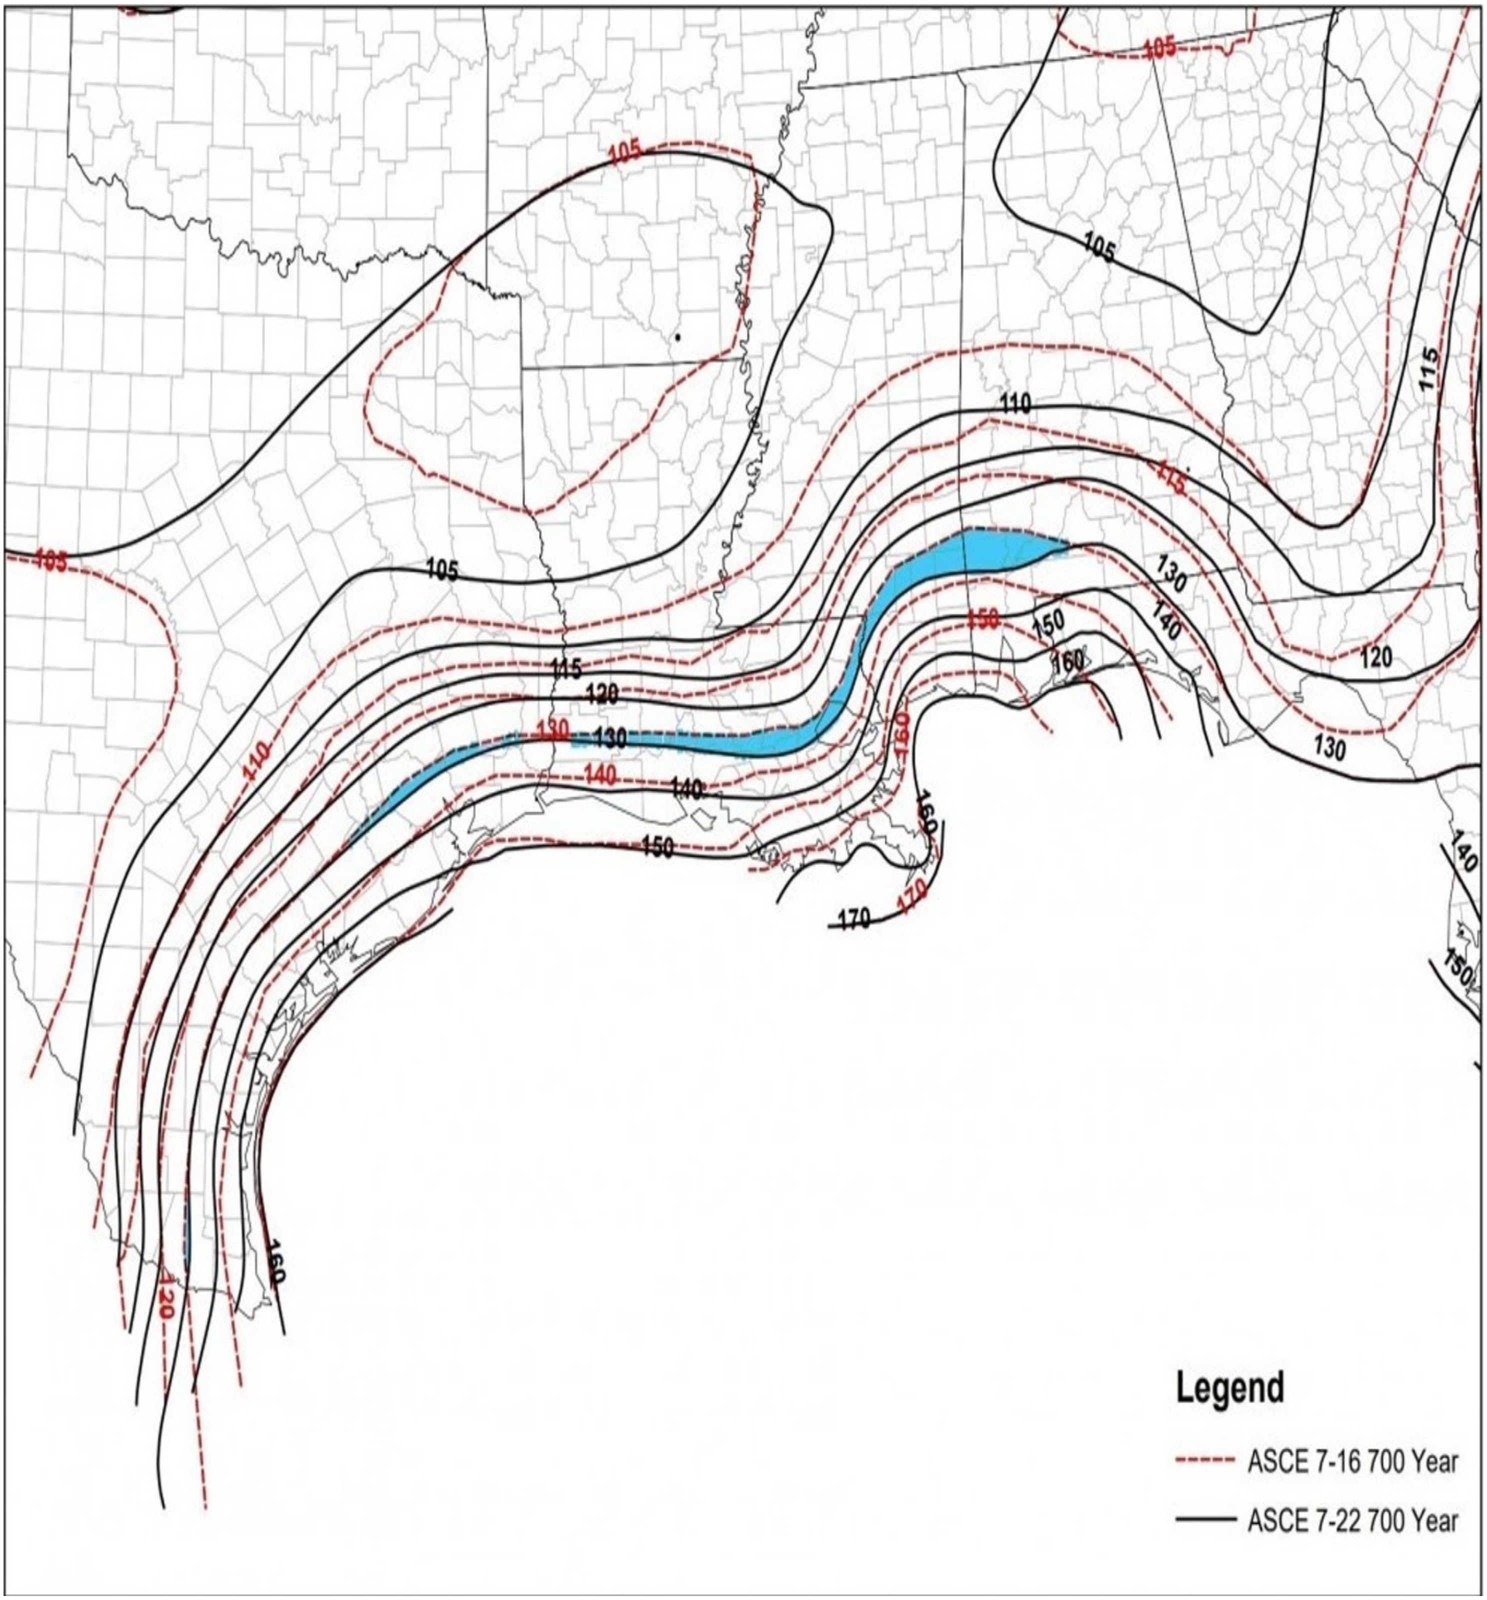

Figure 1
Loss of Wind Design Required Region in the Gulf Region Due to ASCE 7-22 Wind Speed Updates

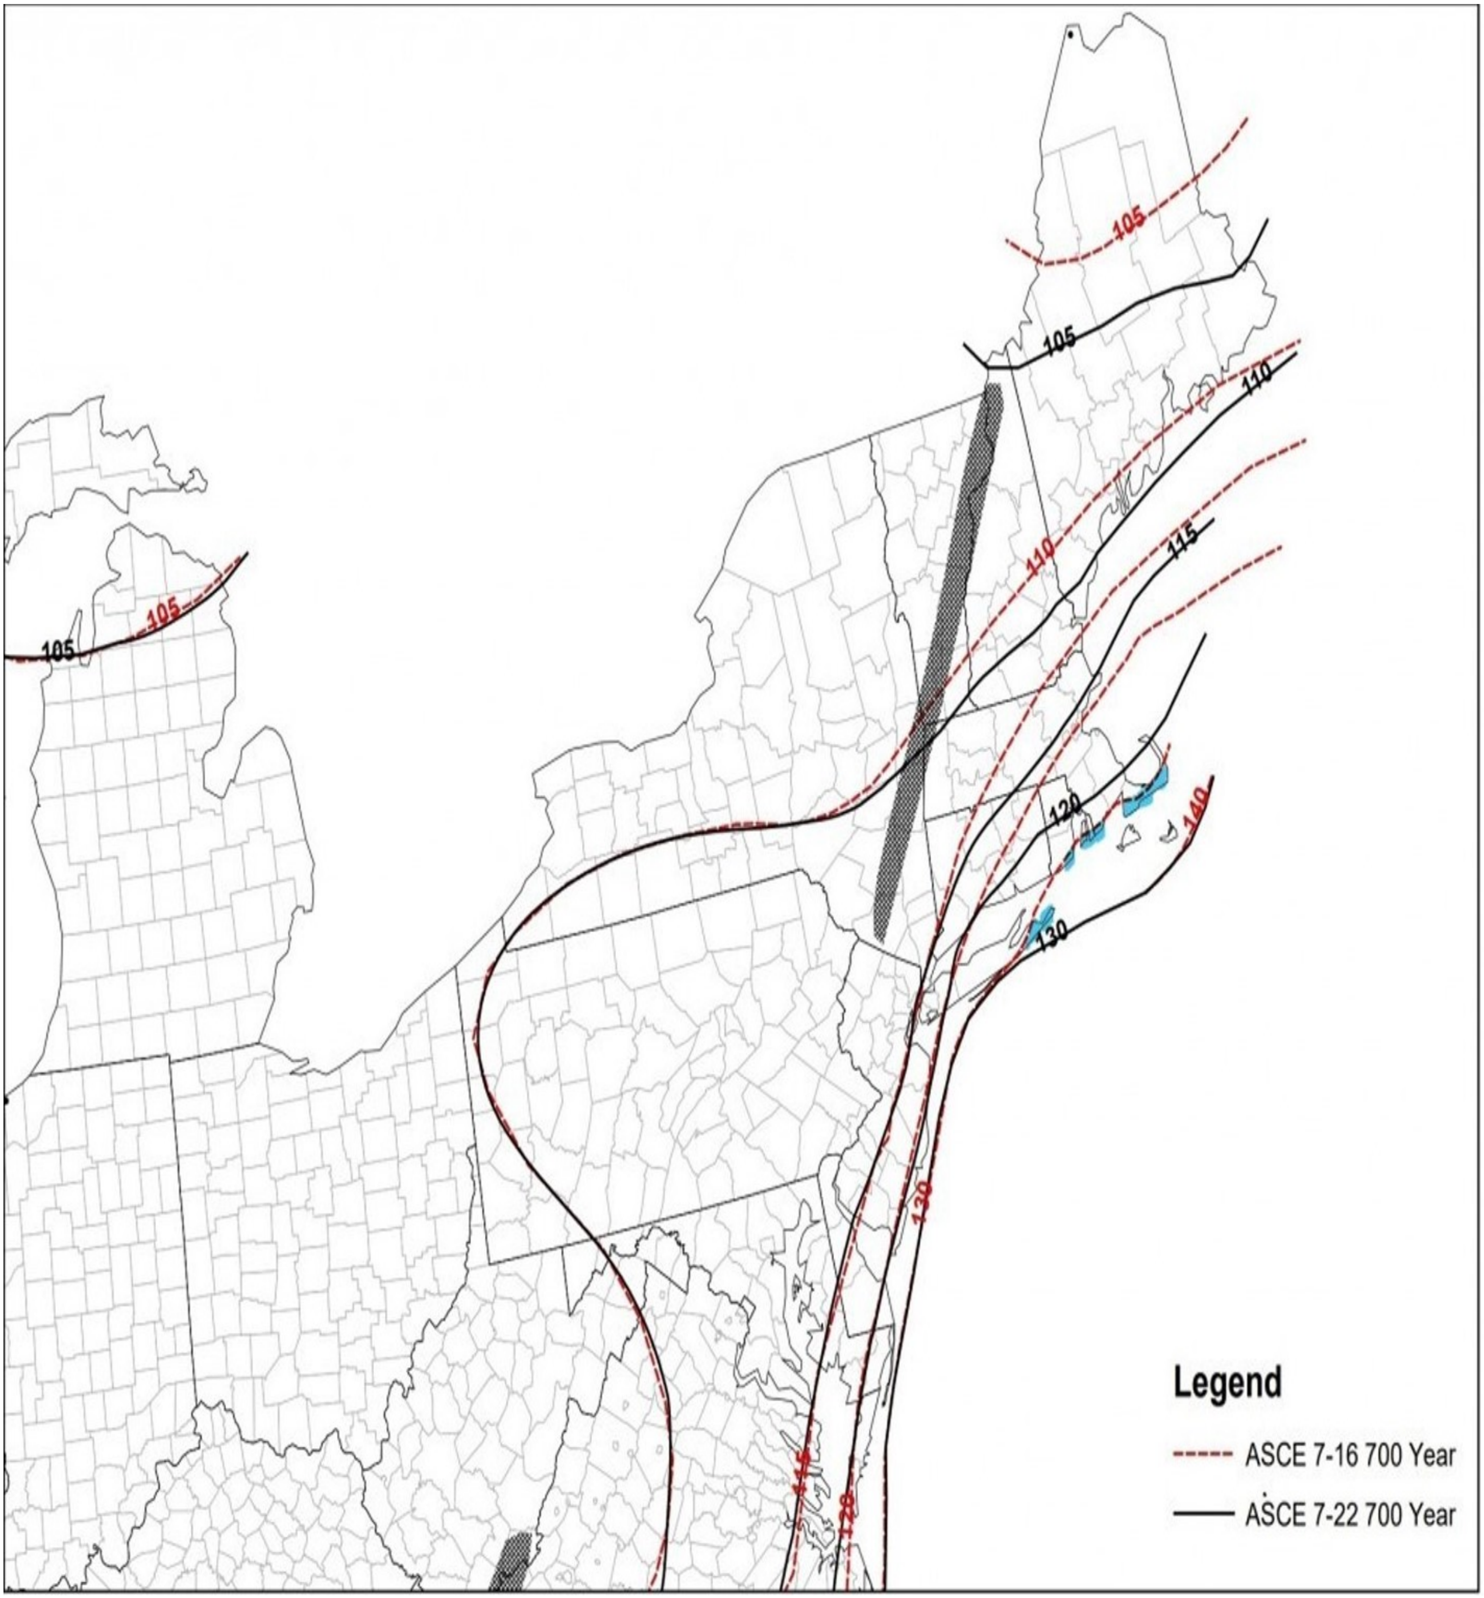

Figure 2
Loss of Wind Design Required Region in the North Atlantic Region Due to ASCE 7-22 Wind Speed Updates

Additionally, a recent report published by David Roueche with Auburn University for Home Innovation Research Labs shows that roof covering damage is by far the most common cladding damage and that even at lower wind speeds roof covering damage is frequently observed. The full report is attached to this proposal. The report is a curation of the windstorm building performance dataset collected by the StEER (Structural Extreme Events Reconnaissance) network. The dataset quantifies common wind damage patterns from recent windstorms. The following windstorm events were included in the dataset:

Joplin Tornado
Garland Tornado
Hurricane Harvey
Hurricane Irma
Hurricane Michael
Nashville/Cookeville Tornadoes
Hurricane Laura

When stratified by hazard intensity, the data shows for wind speeds between 116 mph and 140 mph the frequency of roof covering damage is near 80%. Even for wind speeds between 91 mph and 115 mph the frequency of roof covering damage is near 70%.

The report notes that “considering all hazard intensities and years of construction, 26-50% of the roof cover on a single-family home is typically damaged in an extreme windstorm.”

It should also be noted that the 7th Edition (2020) and the 8th Edition (2023) Florida Building Code adopted these underlayment strategies for the entire state. For Risk Category II buildings, design wind speeds in the state of Florida range from approximately 115 mph to 180 mph.
Installing a sealed roof deck is the most cost-effective method for reducing water intrusion through the roof deck where the primary roof covering has been damaged or lost.

Cost Impact: Increase

Estimated Immediate Cost Impact:

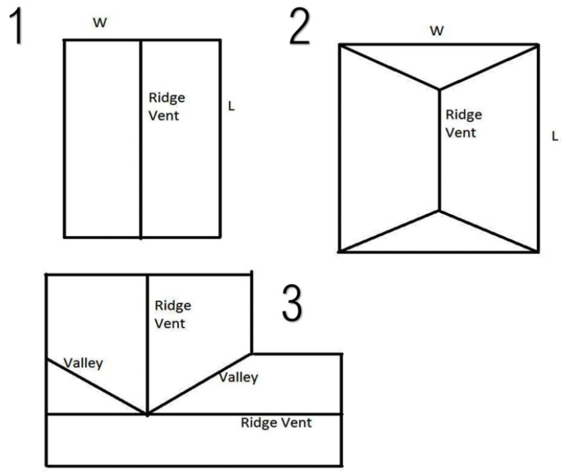
For our cost impact estimates, we used Xactimate which is a construction cost estimating software program. Select markets that would be affected by this code change were analyzed in all the hurricane-prone states.

Two sealed roof deck options were analyzed –

Option 1: Installing 4-inch-wide strips of self-adhering polymer modified bitumen over all joints in the roof deck and covering the strips with a 30# (ASTM D226 Type II, ASTM D4869 Type III or IV) felt underlayment and fastened as specified in the code.

Option 2: Installing a self-adhering polymer modified bitumen underlayment over the entire roof deck.

Three roof configurations were analyzed – 3 gable, 2 gable, and hip. Additionally, we estimated the cost impacts for large roofs (2800 square feet to 3016 square feet) and small roofs (1575 square feet to 1696 square feet). Estimated costs were developed for an asphalt shingle roof.



A copy of the Xactimate report for this analysis is attached to this code change.

The cost for either option varies according to the markets analyzed but are within close ranges.

Option 1 – (taped joints with 30# underlayment over the taped joints)

For large roofs the increased cost for Option 1 ranges from a low of $917.32 in Dothan, AL to a high of $1714.83 on Long Island, NY. For new construction, these costs represent increases of 9.5% and 9.1% respectively of the total cost of the roof (roof covering, underlayment, ventilation components, etc). For reroofing, these costs represent increases of 8.1% and 7.6% respectively of the total cost of the reroofing job.

For small roofs the increased cost for Option 1 ranges from a low of $512.29 in Dothan, AL to a high of $959.66 on Long Island, NY. For new construction, these costs represent increases of 8.9% and 8.3% respectively of the total cost of the roof (roof covering, underlayment, ventilation components, etc). For reroofing, these costs represent increases of 7.6% and 7.6% respectively of the total cost of the reroofing job.

Option 2 – (self-adhering polymer modified bitumen underlayment over the entire roof deck)

For large roofs the increased cost for Option 2 ranges from a low of $1428.39 in Florence, SC to a high of $1909.49 in Stamford, CT. For new construction, these costs represent increases of 13.4% and 10.4% respectively of the total cost of the roof (roof covering, underlayment, ventilation components, etc). For reroofing, these costs represent increases of 11.5% and 8.9% of the total cost of the reroofing job.

For small roofs the increased cost for Option 2 ranges from a low of $793.41 in Dover, DE to a high of $1065.74 in Stamford, CT. For new construction, these costs represent increases of 9.3% and 9.5% respectively of the total cost of the roof (roof covering, underlayment, ventilation components, etc). For reroofing, these costs represent increases of 8.2% and 8.2% respectively of the total cost of the reroofing job.

Estimated Immediate Cost Impact Justification (methodology and variables):

Xactimate, which is a construction cost estimating software program, was used to analyze the cost impacts of this proposal.

Metal roof shingles	1507.5		
Mineral-surfaced roll roofing	1507.6		
Slate shingles	1507.7		
Wood shingles	1507.8		
Wood shakes	1507.9		

For SI: 1 inch = 25.4 mm, 1 mile per hour = 0.447 m/s.

Reason: This code change proposal intends to clarify fastening requirements for underlayment at eave locations in areas prone to high winds and hurricanes. The code currently requires corrosion-resistant fasteners in a grid pattern no greater than 12 inches horizontally and vertically, with a 6-inch spacing at side and end laps. However, it does not specifically state how to properly fasten the underlayment at the eave edge, where wind pressures can be significantly higher than on the roof field.

The roof underlayment methods required in high wind areas (V ≥ 130 mph in hurricane-prone regions, and V ≥ 140 mph outside hurricane-prone regions) are intended to provide a secondary barrier against water infiltration through the roof deck if the primary roofing material fails. Given its importance, properly securing underlayment is vital to this function. For many roof configurations, wind pressures are highest along the eave edge, particularly the eave edge corners, due to the wind's interaction with the roof structure.

Considering that underlayment is installed shingle fashion, inadequate fastening at the edge can lead to underlayment failure at the eave during high-wind events, potentially causing a cascading failure across other rows of underlayment and compromise the entire underlayment system. This proposal addresses this vulnerability by specifically requiring the first course of underlayment to be fastened at 6 inches on center 3 inches from the eave edge.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is primarily a clarification and is not expected to add any meaningful cost to construction.

ROOF COVERING	SECTION	MAXIMUM BASIC WIND SPEED, *V* < 130 MPH IN HURRICANE-PRONE REGIONS OR *V* < 140 MPH OUTSIDE HURRICANE-PRONE REGIONS	MAXIMUM BASIC WIND SPEED, *V* ≥ 130 MPH IN HURRICANE-PRONE REGIONS OR *V* ≥ 140 MPH OUTSIDE HURRICANE-PRONE REGIONS
BIPV roof coverings	1507.16 1507.17	Underlayment shall be one of the following: 1. For roof slopes from 3 units vertical in 12 units horizontal (3:12) to 4 units vertical in 12 units horizontal (4:12), underlayment shall be two layers applied in the following manner: Apply a strip of underlayment that is half the width of a full sheet parallel to and starting at the eaves. Starting at the eaves, apply full-width sheets of underlayment, overlapping successive sheets half the width of a full sheet plus 2 inches. End laps shall be 4 inches and shall be offset by 6 feet. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. 2. For roof slopes of 4 units vertical in 12 units horizontal (4:12) or greater, underlayment shall be one layer applied as follows: Underlayment shall be applied shingle fashion, parallel to and starting from the eaves and lapped 2 inches. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be 4 inches and shall be offset by 6 feet. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment and roof covering manufacturers' installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.	Underlayment shall be one of the following: 1. Two layers of mechanically fastened underlayment applied in the following manner: Apply a strip of underlayment that is half the width of a full sheet parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eaves, apply full-width sheets of underlayment, overlapping successive sheets half the width of a full sheet plus 2 inches. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. End laps shall be 4 inches and shall be offset by 6 feet. 2. A strip not less than 4 inches in width of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the manufacturer's installation instructions for the deck material, shall be applied over all joints in the roof decking. An approved underlayment complying with Table 1507.1.1(1) for the applicable roof covering and basic wind speed shall be applied over the entire roof over the 4-inch-wide membrane strips. Underlayment shall be applied in accordance with this table using the application requirements for where the maximum basic wind speed is less than 130 mph. 3. A single layer of self-adhering polymer modified bitumen underlayment complying with ASTM D1970, installed in accordance with the underlayment and roof covering manufacturers' installation instructions for the deck material, roof ventilation configuration, and climate exposure of the roof covering.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s.

TABLE 1507.1.1(3) UNDERLAYMENTFASTENING

ROOF COVERING	SECTION	MAXIMUM BASIC WIND SPEED, *V* < 130 MPH IN HURRICANE-PRONE REGIONS OR *V* < 140 MPH OUTSIDE HURRICANE-PRONE REGIONS	MAXIMUM BASIC WIND SPEED, *V* ≥ 130 MPH IN HURRICANE-PRONE REGIONS OR *V* ≥ 140 MPH OUTSIDE HURRICANE-PRONE REGIONS
Asphalt shingles	1507.2	Fastened sufficiently to hold in place	Mechanically fastened underlayment shall be fastened with corrosion-resistant fasteners in a grid pattern of not greater than 12 inches horizontally and vertically between side laps with a 6-inch spacing at side and end laps. Mechanically fastened underlayment shall be fastened using annular ring or deformed shank nails with 1-inch diameter metal or plastic caps. Metal caps shall have a thickness of not less than 32-gage (0.0134 inch) sheet metal. Power-driven metal caps shall have a minimum thickness of 0.010 inch. Minimum thickness of the outside edge of plastic caps shall be 0.035 inch. The cap nail shank shall be not less than 0.083 inch. The cap nail shank shall have a length sufficient to penetrate through the roof sheathing or not less than $^3/_4$ inch into the roof sheathing. Self-adhering polymer modified bitumen underlayment shall be installed in accordance with the underlayment and roof covering manufacturers' installation instructions for the deck material, roof ventilation configuration and climate exposure of the roof covering.
Clay and concrete tile	1507.3		
BIPV roof coverings	1507.16 1507.17		
Metal roof panels	1507.4	Manufacturer's installation instructions	Mechanically fastened underlayment shall be fastened with corrosion-resistant fasteners in a grid pattern of not greater than 12 inches horizontally and vertically between side laps with a 6-inch spacing at side and end laps. Mechanically fastened underlayment shall be fastened using annular ring or deformed shank nails with 1-inch diameter metal or plastic caps. Metal caps shall have a thickness of not less than 32-gage sheet metal. Power-driven metal caps shall have a minimum thickness of 0.010 inch. Minimum thickness of the outside edge of plastic caps shall be 0.035 inch. The cap nail shank shall be not less than 0.083 inch. The cap nail shank shall have a length sufficient to penetrate through the roof sheathing or not less than $^3/_4$ inch into the roof sheathing. Self-adhering polymer modified bitumen underlayment shall be installed in accordance with the underlayment and roof covering manufacturers' installation instructions for the deck material, roof ventilation configuration and climate exposure of the roof covering.
Metal roof shingles	1507.5		
Mineral-surfaced roll roofing	1507.6		
Slate shingles	1507.7		
Wood shingles	1507.8		
Wood shakes	1507.9		

For SI: 1 inch = 25.4 mm, 1 mile per hour = 0.447 m/s.

1507.17.3 Underlayment. *Underlayment* shall comply with Section 1507.1.1 ~~ASTM D226, ASTM D4869 or ASTM D6757~~.

Delete without substitution:

~~**1507.17.4 Underlayment application.** *Underlayment* shall be applied *shingle fashion*, parallel to and starting from the eave, lapped 2 inches (51 mm) and fastened sufficiently to hold in place.~~

~~**1507.17.4.1 High-wind attachment.** *Underlayment* applied in areas subject to high winds [V_{asd} greater than 110 mph (49 m/s) as determined in accordance with Section 1609.3.1] shall be applied in accordance with the manufacturer's instructions. Fasteners shall be applied along the overlap at not more than 36 inches (914 mm) on center. *Underlayment* installed where V_{asd} is not less than 120 mph (54 m/s) shall comply with ASTM D226, Type III, ASTM D4869, Type IV or ASTM D6757. The *underlayment* shall be attached in a grid pattern of 12 inches (305 mm) between side laps with a 6-inch (152 mm) spacing at the side laps. The *underlayment* shall be applied in~~

~~accordance with Section 1507.1.1 except all laps shall be not less than 4 inches (102 mm). *Underlayment* shall be attached using cap nails or cap staples. Caps shall be metal or plastic with a nominal head diameter of not less than 1 inch (25.4 mm). Metal caps shall have a thickness of not less than 0.010 inch (0.25 mm). Power-driven metal caps shall have a thickness of not less than 0.010 inch (0.25 mm). Thickness of the outside edge of plastic caps shall be not less than 0.035 inch (0.89 mm). The cap nail shank shall be not less than 0.083 inch (2.11 mm) for ring shank cap nails and 0.091 inch (2.31 mm) for smooth shank cap nails. Staple gage shall be not less than 21 gage [0.0.2 inch (0.81 mm)]. Cap nail shank and cap staple legs shall have a length sufficient to penetrate through the roof sheathing or not less than $^3/_4$ inch (19.1 mm) into the roof sheathing.~~

~~**Exception:** As an alternative, adhered *underlayment* complying with ASTM D1970 shall be permitted.~~

Revise as follows:

1507.17.4.~~2~~ Ice barrier. <u>Where required, ice barriers shall comply with Section 1507.1.2.</u> ~~In areas where there has been a history of ice forming along the eaves causing a back-up of water, an ice barrier consisting of not fewer than two layers of *underlayment* cemented together or of a self-adhering polymer modified bitumen sheet shall be used instead of normal *underlayment* and extend from the lowest edges of all roof surfaces to a point not less than 24 inches (610 mm) inside the *exterior wall* line of the *building*.~~

~~**Exception:** Detached accessory *structures* that do not contain conditioned floor area.~~

Reason: This proposal integrates the underlayment requirements for Building-Integrated Photovoltaic (BIPV) roof panels into Section 1507.1.1, aligning them with the underlayment requirements specified for all other roofing materials. The 2018 IBC consolidated the underlayment requrements for roofing materials into Section 1507.1.1 and, at the same time, added specifications for BIPV roof panels. However, the underlayment requirements for BIPV roof panels was not updated to reflect this consolidation and has been overlooked since. Additionally, the current underlayment requirements for high winds areas are outdated and inconsistent with those for other roofing materials, including BIPV shingles. Updates to the wind speed triggers and the application and attachment methods have been made. This proposal seeks to update the underlayment requirements for BIPV roof panels to match those of all other roofing materials.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply consolidates the underlayment requirements for BIPV roof panels into Section 1507.1.1. Underlayment requirements for all other roof covering material is covered under Section 1507.1.1.

Wood shakes applied to a solid sheathing roof deck	1507.9	ASTM D226 Type I or II ASTM D4869 Type I, II, III or IV	ASTM D226 Type II ASTM D4869 Type III or IV
BIPV roof coverings	1507.16	ASTM D226 Type I or II ASTM D1970 ASTM D4869 Type I, II, III or IV ASTM D6757 ASTM D8257	ASTM D226 Type II ASTM D1970 ASTM D4869 Type III or IV ASTM D8257 ASTM D6757

Reason: This code change proposal adds an additional underlayment material for use in high wind areas (V ≥ 130 mph in hurricane-prone regions and V ≥ 140 mph outside hurricane-prone regions) of the IBC. Underlayment complying with ASTM D6757 has long been permitted for asphalt shingle roof coverings in the International Codes and is currently permitted to be used in areas where V < 130 mph in hurricane-prone regions and V < 140 mph outside hurricane-prone regions. In the 2024 IBC, the underlayment requirements high wind areas was updated to be consistent with the 2021 IRC and the IBHS Fortified requirements for a sealed roof deck (SRD). Fortified has been updated and now specifically permits the use of underlayment complying with ASTM D6757 to create a SRD. This proposal simply adds underlayment material complying with ASTM D6757 as an option in high wind areas. Support of this proposal will align the underlayment requirements in high wind areas in the IBC with the IBHS Fortified SRD and add an additional underlayment option to be used in these areas.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an additional underlayment material for use in high wind areas.

S19-25

IBC: 1507.1.1.1 (New)

Proponents: T. Eric Stafford, representing Insurance Institute for Business and Home Safety (testafford@charter.net); Milad Shabanian, representing Insurance Institute for Business & Home Safety (mshabanian@ibhs.org)

2024 International Building Code

Add new text as follows:

1507.1.1.1 Underlayment installation at hips and ridges. *Underlayment* shall lap over hips and ridges a minimum of 6 inches.

Exception: Hips and ridges where ventilation openings in accordance with Section 1202 are provided.

Reason: This proposal seeks to provide an additional level of water intrusion protection for minimal effort in the event part of the roof covering is blown off. If approved, this proposal will align the code with IBHS's FORTIFIED Roof™ designation regarding underlayment application at hips and ridges. The FORTIFIED Home™ program was developed to reduce avoidable suffering and financial loss caused by hurricanes, high winds, and hail. The program requirements provide a systems-based, multi tiered approach for improving the resistance of homes and their contents to damage caused by wind, wind-driven rain, and hail. There are three designation levels—FORTIFIED Roof™, FORTIFIED Silver™, and FORTIFIED Gold™—that build on each other and address different systems of the home.

Roof covering damage is typically the most observed damage in post-windstorm investigations. This has been observed in damage investigations by IBHS and FEMA Mitigation Assessment Team (MAT) deployments. While widespread roof covering damage was observed and documented in the Hurricane Ian MAT report, the report noted that the failure of hip and ridge roof coverings was the most common damage observed for all roof covering types. The following paragraph is an excerpt from Section 4.2.4 in the FEMA Hurricane Ian MAT Report (https://www.fema.gov/sites/default/files/documents/fema_rm-hurriance-ian-mat-report-12-2023.pdf):

> “Although roof covering damage was widespread at all sites visited by the MAT, the degree of roof covering damage varied across the sites. The most common damage observed by the MAT for all roof coverings was displacement of hip and ridge roof coverings.”

The FEMA Hurricane Michael in Florida MAT Report (https://www.fema.gov/sites/default/files/2020-07/mat-report_hurricane-michael_florida.pdf) also noted that the failure of hip and ridge asphalt shingles was prevalent (see Section 4.2.1.1).

Figure 4-11 (see below) from the FEMA Hurricane Ian in Florida MAT Report shows typical examples of hip and ridge failures observed in Hurricane Ian.

Figure 4-11: Hip and ridge damage on four residences with different roof types: a tile roof (top left), asphalt shingle roof (top right), metal panel roof (bottom left), and cedar shake roof (bottom right)

When hip and ridge roof coverings are blown off, the interior of the building is at risk of water intrusion due to gaps in the roof framing and decking. This water intrusion can result in costly damage to interior contents and furnishings.The observations from the FEMA Hurricane Ian in Florida MAT led to the report recommending the follwing in Recommendation FL-10c:

FEMA should consider submitting code change proposals or supporting code change proposals from other stakeholders—such as IBHS, ARMA, NRCA, and other aligned groups to the IBC, IRC, and the FBC—to require a minimum of 6 inches overlap of the roof underlayment to hip and ridges that do not have ventilation components. Wrapping underlayment over hips and ridges that don't have ventilation components will improve the roof's resistance to water intrusion in the event the hip and ridge coverings are damaged or blown off.

This proposal, if approved, would implement this recommendation by requiring roof underlayment to be lapped over hips and ridges a minimum of 6 inches from both sides and would also be consistent with IBHS requirements for a Fortified Roof designation. An exception to this required lapping is provided for hips and ridges that have ventilation components. According to discussions with the Asphalt Roofing Manufacturer's Association (ARMA), many of its members already recommend this practice in their installation instructions. This proposal would codify this requirement for asphalt shingles and expand this practice to all roof covering types.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not expected to create an increase in construction costs because it is a common practice for many roof coverings and the cost to extend underlayment at hips and ridges for the required 6" lap is negligible.

S19-25

S20-25 Part I

IBC: 1507.1.2

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1507.1.2 Ice barriers. In areas where there has been a history of ice forming along the eaves causing a backup of water, an ice barrier shall be installed for asphalt shingles, *metal roof shingles*, mineral-surfaced roll roofing, slate and slate-type shingles, wood shingles, and wood shakes. The ice barrier shall consist of not less than two layers of mechanically fastened *underlayment* cemented together, or a self-adhering polymer modified bitumen sheet complying with ASTM D1970. ~~shall be used in place of normal *underlayment* and~~ The ice barrier shall extend from the lowest edges of all roof surfaces to a point not less than 24 inches (610 mm) inside the *exterior wall* line of the *building*, measured horizontally.

Exception: Detached accessory *structures* that do not contain conditioned floor area.

S20-25 Part I

S20-25 Part II

IRC: R905.1.2

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Residential Code

Revise as follows:

R905.1.2 Ice barriers. In areas where there has been a history of ice forming along the eaves causing a backup of water as designated in Table R301.2, an ice barrier shall be installed for asphalt shingles, *metal roof shingles*, mineral-surfaced roll roofing, slate and slate-type shingles, wood shingles and wood shakes. The ice barrier shall consist of not fewer than two layers of mechanically fastened *underlayment* cemented together, or a self-adhering polymer-modified bitumen sheet complying with ASTM D1970. ~~shall be used in place of normal *underlayment* and~~ The ice barrier shall extend from the lowest edges of all roof surfaces to a point not less than 24 inches (610 mm) inside the exterior wall line of the *building*, measured horizontally.

On roofs with slope equal to or greater than 8 units vertical in 12 units horizontal (67-percent slope), the ice barrier shall be applied not less than 36 inches (914 mm) measured along the roof slope from the eave edge of the *building*.

Exception: Detached *accessory structures* not containing *conditioned floor area*.

Reason: This proposal clarifies the materials used for the two ice barrier construction options, adds the appropriate reference standard for self-adhering ice barriers, and clarifies that the measurement for ice barrier placement is meant to be horizontal, not along the roof plane.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies existing provisions without making technical changes. Therefore, no change in cost of construction will occur.

2024 International Building Code

SECTION 1507 REQUIREMENTS FOR ROOF COVERINGS

Revise as follows:

1507.1.2 Ice barriers. In areas where there has been a history of ice forming along the eaves causing a backup of water, an ice barrier shall be installed for asphalt shingles, *metal roof shingles*, mineral-surfaced roll roofing, slate and slate-type shingles, wood shingles, ~~and~~ wood shakes, and building-integrated photovoltaic (BIPV) roof coverings. The ice barrier shall consist of not less than two layers of *underlayment* cemented together, or a self-adhering polymer modified bitumen sheet shall be used in place of normal *underlayment* and extend from the lowest edges of all roof surfaces to a point not less than 24 inches (610 mm) inside the *exterior wall* line of the *building*.

Exception: Detached accessory *structures* that do not contain conditioned floor area.

1507.17.4.2 Ice barrier. Where required, ice barriers shall comply with Section 1507.1.2. ~~In areas where there has been a history of ice forming along the eaves causing a back-up of water, an ice barrier consisting of not fewer than two layers of *underlayment* cemented together or of a self-adhering polymer modified bitumen sheet shall be used instead of normal *underlayment* and extend from the lowest edges of all roof surfaces to a point not less than 24 inches (610 mm) inside the *exterior wall* line of the *building*.~~

~~**Exception:** Detached accessory *structures* that do not contain conditioned floor area.~~

S21-25 Part I

S21-25 Part II

IRC: R905.1.2, R905.16.4

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com); Philip Oakes, representing NASFM (phil@browning.red)

2024 International Residential Code

Revise as follows:

R905.1.2 Ice barriers. In areas where there has been a history of ice forming along the eaves causing a backup of water as designated in Table R301.2, an ice barrier shall be installed for asphalt shingles, *metal roof shingles*, mineral-surfaced roll roofing, slate and slate-type shingles, wood shingles, ~~and~~ wood shakes, and building-integrated photovoltaic (BIPV) roof coverings. The ice barrier shall consist of not fewer than two layers of *underlayment* cemented together, or a self-adhering polymer-modified bitumen sheet shall be used in place of normal *underlayment* and extend from the lowest edges of all roof surfaces to a point not less than 24 inches (610 mm) inside the exterior wall line of the *building*.

On roofs with slope equal to or greater than 8 units vertical in 12 units horizontal (67-percent slope), the ice barrier shall be applied not less than 36 inches (914 mm) measured along the roof slope from the eave edge of the *building*.

Exception: Detached *accessory structures* not containing *conditioned floor area*.

R905.16.4 Ice barrier. Where required, ice barriers shall comply with Section R905.1.2. ~~In areas where there has been a history of ice forming along the eaves causing a backup of water, as designated in Table R301.2, an ice barrier that consists of not less than two layers of *underlayment* cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal *underlayment* and extend from the lowest edges of all roof surfaces to a point not less than 24 inches (610 mm) inside the exterior wall line of the *building*.~~

~~**Exception:** Detached *accessory structures* that do not contain *conditioned floor area*.~~

Reason: Unlike IBC Section 1507.17.4.2 and IRC Section R905.16.4, other roof covering ice barrier sections simply point to IBC Section 1507.1.2 or IRC Section R905.1.2, respectively. This proposal redirects the ice barrier provisions for building-integrated photovoltaic (BIPV) roof panels to the general ice barrier sections. The proposal also adds "building integrated photovoltaic (BIPV) roof coverings to the list of roof covering types within the general ice barrier sections. These changes will simplify future maintenance of the ice barrier provisions.

This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency.

The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner. All recommendations from SEAC are approved by diverse stakeholders through a consensus process. For more information, please visit www.sustainableenergyaction.org

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal consolidates the ice barrier requirements in one location, instead of repeating in other locations.

IBC: 1507.2.1, 1507.3.1, 1507.4.1, 1507.5.1, 1507.6.1, 1507.7.1, 1507.8.1, 1507.8.1.1, 1507.9.1, 1507.9.1.1, 2308.11.9, 2308.11.10, TABLE 2304.8(1), TABLE 2304.8(2)

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org)

2024 International Building Code

Revise as follows:

1507.2.1 Deck requirements. Asphalt shingles shall be installed on wood structural panels or closely fitted sawn lumber sheathing ~~fastened to solidly sheathed decks~~.

1507.3.1 Deck requirements. Concrete and clay tile shall be installed ~~only over solid~~ on wood structural panels or closely fitted sawn lumber sheathing.

Exception: Spaced sawn lumber sheathing shall be permitted in *Seismic Design Categories* A, B and C.

1507.4.1 Deck requirements. *Metal roof panel roof coverings* shall be installed on wood structural panels or closely fitted sawn lumber sheathing~~applied to a solid or closely fitted deck~~, except where the *roof covering* is specifically designed to be applied to spaced supports.

1507.5.1 Deck requirements. *Metal roof shingles* shall be installed on wood structural panels or closely fitted sawn lumber sheathing ~~applied to a solid or closely fitted deck~~, except where the *roof covering* is specifically designed to be applied to spaced sawn lumber sheathing.

1507.6.1 Deck requirements. Mineral-surfaced roll roofing shall be installed on wood structural panels or closely fitted sawn lumber sheathing~~fastened to solidly sheathed roofs~~.

1507.7.1 Deck requirements. Slate shingles shall be installed on wood structural panels or closely fitted lumber sheathing~~fastened to solidly sheathed roofs~~.

1507.8.1 Deck requirements. Wood shingles shall be installed on ~~solid~~ wood structural panels, closely fitted sawn lumber sheathing or spaced sawn lumber sheathing. Where spaced sawn lumber sheathing is used, sheathing boards shall be not less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure from Table 1507.8.7 to coincide with the placement of fasteners. Where 1-inch × 4-inch (25 mm × 102 mm) spaced sawn lumber sheathing is installed at 10 inches (254 mm) on center or greater, additional 1-inch × 4-inch (25 mm × 102 mm) boards shall be installed between the sheathing boards. When wood shingles are installed over spaced sawn lumber sheathing and the underside of the shingles ~~are~~is exposed to the *attic* space, the *attic* shall be ventilated in accordance with Section 1202.2. The shingles shall not be backed with materials that will occupy the required air gap space and prevent the free movement of air on the interior side of the spaced sawn lumber sheathing.

1507.8.1.1 ~~Solid sheathing required~~ Sheathing under ice barrier. ~~Solid~~ Wood structural panel sheathing or closely fitted sawn lumber sheathing shall be provided for portions of the roof deck requiring an ice barrier in accordance with Section 1507.1.2~~is required in areas where the average daily temperature in January is 25°F (-4°C) or less or where there is a possibility of ice forming along the eaves causing a backup of water~~.

1507.9.1 Deck requirements. Wood shakes shall ~~only~~ be ~~used~~ installed on ~~solid~~wood structural panel sheathing, closely fitted sawn lumber sheathing, or spaced sawn lumber sheathing. Where spaced sawn lumber sheathing is used, sheathing boards shall be not less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure from Table 1507.9.8 to coincide with the placement of fasteners. Where 1-inch by 4-inch (25 mm by 102 mm) spaced sawn lumber sheathing is installed at 10 inches (254 mm) on center, additional 1-inch by 4-inch (25 mm by 102 mm) boards shall be installed between the sheathing boards. Where wood shakes are installed over spaced sawn lumber sheathing and the underside of the shakes ~~are~~ is exposed to the *attic* space, the *attic* shall be ventilated in accordance with Section 1202.2. The shakes shall not be backed with materials that will occupy the required air gap space and prevent the free movement of air on the interior side of the spaced sawn lumber sheathing.

1507.9.1.1 ~~Solid sheathing required~~ Sheathing under ice barrier. ~~Solid~~Wood structural panels or closely fitted sawn lumber sheathing shall be provided for portions of the roof deck requiring an ice barrier in accordance with Section 1507.1.2.~~is required in areas where the average daily temperature in January is 25°F (-4°C) or less or where there is a possibility of ice forming along the eaves causing a backup of water.~~

2308.11.9 Roof sheathing. Roof sheathing shall be in accordance with Tables 2304.8(3) and 2304.8(5) for *wood structural panels*, and Tables 2304.8(1) and 2304.8(2) for sawn lumber and shall comply with Section 2304.8.2.

2308.11.10 Joints. Joints in sawn lumber sheathing shall occur over supports unless *approved* end-matched lumber is used, in which case each piece shall bear on not fewer than two supports.

TABLE 2304.8(1) ALLOWABLE SPANS FOR SAWN LUMBER FLOOR AND ROOF SHEATHING

Portions of table not shown remain unchanged.

SPAN (inches)	MINIMUM NET THICKNESS (inches) OF SAWN LUMBER PLACED			
	Perpendicular to supports		Diagonally to supports	
	Surfaced dry[a]	Surfaced unseasoned	Surfaced dry[a]	Surfaced unseasoned

TABLE 2304.8(2) SAWN LUMBER SHEATHING ~~LUMBER~~, MINIMUM GRADE REQUIREMENTS: BOARD GRADE

Portions of table not shown remain unchanged.

~~SOLID~~ CLOSELY FITTED FLOOR OR ROOF SHEATHING	SPACED SAWN LUMBER ROOF SHEATHING	GRADING RULES

Reason: Code users have questioned if "lumber sheathing" is the same thing as "wood structural panels". This code change is intended to make a clearer distinction between the two by changing "lumber sheathing" to "sawn lumber sheathing" throughout. Sawn lumber is the appropriate terminology that refers to structural wood members that are not a composite and are rather sawn from a log.

Additionally, the phrase "solid sheathing" is misleading where sawn lumber is used as it leaves the code user to question if any gaps are permitted. The code also recognizes "closely fitted" as a phrase to indicate that sawn lumber used as sheathing is permitted to be installed with necessary gaps due to construction tolerances, provided they are closely fitted. Therefore the language has been cleaned up to only refer to "closely fitted" in the context of sawn lumber sheathing.

Lastly, a change has been made to the provisions for decking requirements of wood shakes and shingles to appropriately indicate Section 1507.1.2 for the requirement to install an ice barrier, rather than have duplicated language in that section and the decking sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no technical changes proposed in this code change.

S22-25

S23-25 Part I

IBC: 1507.2.2, 1507.3.2

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1507.2.2 Slope. Asphalt shingles shall ~~only~~ be used on roof slopes of 2 units vertical in 12 units horizontal (17-percent slope) or greater, in accordance with the *underlayment* requirements of Section 1507.1.1. ~~For roof slopes from 2 units vertical in 12 units horizontal (17-percent slope) up to 4 units vertical in 12 units horizontal (33-percent slope), double *underlayment* application is required in accordance with Section 1507.1.1.~~

1507.3.2 Deck slope. Clay and concrete roof tile shall be installed on roof slopes of 2 $^1/_2$ units vertical in 12 units horizontal (21-percent slope) or greater, in accordance with the *underlayment* requirements of Section 1507.1.1. ~~For roof slopes from 2 $^1/_2$ units vertical in 12 units horizontal (21-percent slope) to 4 units vertical in 12 units horizontal (33-percent slope), double *underlayment* application is required in accordance with Section 1507.1.1.~~

S23-25 Part I

S23-25 Part II

IRC: R905.2.2, R905.3.2

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Residential Code

Revise as follows:

R905.2.2 Slope. Asphalt shingles shall be used ~~only~~ on roof slopes of 2 units vertical in 12 units horizontal (17-percent slope) or greater, in accordance with the *underlayment* requirements of Section R905.1.1. ~~For roof slopes from 2 units vertical in 12 units horizontal (17-percent slope) up to 4 units vertical in 12 units horizontal (33-percent slope), double *underlayment* application is required in accordance with Section R905.1.1.~~

R905.3.2 Slope. Clay and concrete roof tile shall be installed on roof slopes of $2^1/_2$ units vertical in 12 units horizontal (25-percent slope) or greater, in accordance with the *underlayment* requirements of Section R905.1.1. ~~For roof slopes from 2^1/_2 units vertical in 12 units horizontal (25-percent slope) to 4 units vertical in 12 units horizontal (33-percent slope), double *underlayment* application is required in accordance with Section R905.3.3.~~

Reason: This proposal corrects errors in the underlayment requirements for asphalt shingles and clay and concrete tile in the IBC and IRC. In prior code development cycles, the underlayment provisions were consolidated into single sections (IBC 1507.1.1 and IRC R905.1.1), which contain options for underlayment installation in IBC Table 1507.1.1(2) and IRC Table R905.1.1(2). Details in the tables establish slope conditions where a double-layer installation of mechanically fastened underlayment is required, slope conditions where a single-layer mechanically fastened underlayment is permitted, and situations where a single layer of self-adhesive underlayment is acceptable. The second sentence in each section of this proposal conflicts with the provisions of the underlayment tables by indicating a double layer installation is required for all underlayment types for lower slopes. This second sentence is not necessary, and its removal is proposed to resolve the existing conflict. An editorial change removes "only" from Sections 1507.2.2 and R905.2.2 since it does not add meaning.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal resolves an internal conflict in the code, without altering existing technical requirements. Therefore, no change in the cost of construction is expected if this proposal is accepted.

S23-25 Part II

S24-25 Part I

IBC: 1507.2.4, 1507.2.6, 1507.2.6.1 (New)

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1507.2.4 Material standards ~~Asphalt shingles~~. Asphalt shingles shall comply with ASTM D3462.

1507.2.6 Fastening ~~Attachment~~. Asphalt shingles shall have the minimum number of fasteners required by the manufacturer's installation instructions, but not less than four fasteners per ~~strip~~ shingle or two fasteners per partial ~~individual~~ shingle. ~~Where the roof slope exceeds 21 units vertical in 12 units horizontal (21:12), shingles shall be installed as required by the manufacturer.~~

Exception: Interlocking asphalt shingles shall have not less than two fasteners per shingle or partial shingle.

Add new text as follows:

1507.2.6.1 Slopes exceeding 21 units vertical in 12 units horizontal. Where the roof slope exceeds 21 units vertical in 12 units horizontal (21:12), asphalt shingles shall be installed in accordance with the manufacturer's installation instructions.

S24-25 Part I

S24-25 Part II

IRC: R905.2.4, R905.2.6, R905.2.6.1 (New)

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Residential Code

Revise as follows:

R905.2.4 Material standards ~~Asphalt shingles.~~ Asphalt shingles shall comply with ASTM D3462.

R905.2.6 Fastening ~~Attachment~~. Asphalt shingles shall have the minimum number of fasteners required by the manufacturer's ~~*approved*~~ installation instructions, but not less than four fasteners per ~~strip~~ shingle or two fasteners per partial ~~individual~~ shingle. ~~Where the roof slope exceeds 21 units vertical in 12 units horizontal (21:12, 175-percent slope), shingles shall be installed in accordance with the manufacturer's *approved* installation instructions.~~

Exception: Interlocking asphalt shingles shall have not less than two fasteners per shingle or partial shingle.

Add new text as follows:

R905.2.6.1 Slopes exceeding 21 units vertical in 12 units horizontal. Where the roof slope exceeds 21 units vertical in 12 units horizontal (21:12), asphalt shingles shall be installed in accordance with the manufacturer's installation instructions.

Reason: This proposal updates the asphalt shingle attachment sections of the IBC and IRC. The existing requirement for four fasteners per strip shingle and two fasteners per individual shingle harkens back to a day when three-tab strip shingles were the primary asphalt shingle product offering and interlocking shingles, which required only two fasteners per "individual" shingle due to their different width to length proportions, were more common. Today, the dominant asphalt shingle type is a laminated shingle which requires at least four fasteners per shingle. The proposal retains guidance for interlocking shingles via an exception. The changes proposed align better with asphalt shingle products in use today.

The following additional changes are offered:

- In the IBC, installation requirements are clarified by referencing manufacturer's installation instructions rather than the manufacturer. This also makes the section consistent with the existing language of the IRC.
- In the IBC, language in the exception is changed from "as required by" to "in accordance with" to align with language in the parallel section of the IRC.
- In the IRC, the requirement that manufacturer's instructions be "approved" is removed. This makes the section consistent with existing language of the IBC.
- The section titles for 1507.2.4 and R905.2.4 are altered to align with the section content and to differentiate them from the title of Sections 1507.2 and R905.2, respectively.
- Existing provisions for slopes exceeding 21:12 are placed in new subsections 1507.2.6.1 and R905.2.6.1 to improve clarity.
- Titles of Sections 1507.2.6 and R905.2.6 are changed from "Attachment" to "Fastening" to make the titles align better with the content.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies existing provisions without making technical changes. Therefore, no change in cost of construction should occur.

S24-25 Part II

S25-25

IBC: 1507.2.8.3

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Building Code

Revise as follows:

1507.2.8.3 Drip edge. A drip edge shall be provided at eaves and rake edges of shingle roofs. Adjacent segments of the drip edge shall be lapped not less than 2 inches (51 mm). The vertical leg of drip edges shall be not less than $1^1/_2$ inches (38 mm) in width and shall extend not less than $^1/_4$ inch (6.4 mm) below sheathing. The drip edge shall extend back on the roof not less than 2 inches (51 mm). *Underlayment* shall be installed over drip edges along eaves. Drip edges shall be installed over *underlayment* along rake edges. Drip edges shall be mechanically fastened at intervals not greater than 12 inches (305 mm) on center <u>with fasteners as specified in Section 1507.2.5</u>.

Reason: The International Residential Code establishes minimum requirements for fasteners used to attach drip edge flashing (Section R905.2.8.5) via a pointer to Section R905.2.5. This proposal adds a similar pointer for the same purpose to the International Building Code. In both the IRC and as proposed here for the IBC, the pointer is to the minimum fastener requirements for asphalt shingles. Inclusion of minimum fastener requirements will help reduce the use of improper fasteners.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Some type of fastener is used to attach drip edge flashing. Use of the proper fastener may slightly decrease or increase the cost of installation, but any difference is expected to be very small.

S25-25

S26-25 Part I

IBC: 1507.2.8.3

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1507.2.8.3 Drip edge. A drip edge shall be provided at eaves and rake edges of shingle roofs. Adjacent segments of the drip edge shall be overlapped not less than 2 inches (51 mm). The vertical leg of drip edges shall ~~be not less than 1 $^{1}/_{2}$ inches (38 mm) in width and shall~~ extend not less than $^{1}/_{4}$ inch (6.4 mm) below the roof sheathing. The drip edge shall extend ~~back on~~onto the roof sheathing not less than 2 inches (51 mm). ~~*Underlayment* shall be installed over drip edges along eaves. Drip edges shall be installed over *underlayment* along rake edges.~~ Drip edges shall be mechanically fastened to the roof sheathing at intervals not greater than 12 inches (305 mm) on center. *Underlayment* shall be installed over the drip edge along eaves and under the drip edge along rake edges.

S26-25 Part I

S26-25 Part II

IRC: R905.2.8.5

Proponents: Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Residential Code

Revise as follows:

R905.2.8.5 Drip edge. A drip edge shall be provided at eaves and rake edges of shingle roofs. Adjacent segments of drip edge shall be overlapped not less than 2 inches (51 mm). The vertical leg of drip ~~Drip~~ edges shall extend not less than $^{1}/_{4}$ inch (6.4 mm) below the roof sheathing. ~~and~~The drip edge shall extend ~~up back~~ onto the roof sheathing ~~*roof deck*~~not less than 2 inches (51 mm). Drip edges shall be mechanically fastened to the roof sheathing~~*roof deck*~~ at intervals not greater ~~more~~ than 12 inches (305 mm) on center ~~o.c.~~ with fasteners as specified in Section R905.2.5. *Underlayment* shall be installed over the drip edge along eaves and under the drip edge along rake edges.

Reason: Drip edge flashing installed both at roof eaves and rake edges is an important element of the roofing system, contributing to proper water management of the roofing system in these transitional areas. This proposal aligns the drip edge provisions between the IBC and the IRC, since the drip edge requirements should not differ for asphalt shingle roof systems installed on buildings subject to the provisions of these codes. In addition to standardizing the provisions, several improvements are made:

- Removes the unnecessary minimum width requirement for the vertical leg of the drip edge from the IBC. The prescription that the vertical leg extends a minimum of 1/4" below the roof sheathing is sufficient.
- Clarifies the requirement for how far the drip edge must extend back onto the roof by standardizing terminology to "roof sheathing," which is considered a more appropriate term than "roof" in the IBC and *"roof deck"* in the IRC. It requires the drip edge to extend at least two inches onto the roof sheathing. Without this stipulation, nails used for attaching the drip edge may be unintentionally placed in the space between the fascia/sub-fascia and the edge of the roof sheathing, creating a vulnerability to wind induced forces.
- The requirement is clarified to indicate that mechanical fastening is to be into the "roof sheathing" by adding "to the roof sheathing" in the IBC and changing *"roof deck"* to "roof sheathing" in the IRC. Roof sheathing was chosen because sheathing falls within the definition of *nailable substrate,* and the intention is to ensure the drip edge is mechanically fastened into the sheathing.
- Relocates the underlayment provisions in the IBC to the end of the section to mimic the IRC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clean up of the existing drip edge provisions without technical changes. Therefore, no change in cost of construction is anticipated.

S26-25 Part II

S27-25

IBC: 1507.3.3

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net); Aaron Phillips, representing Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Building Code

Revise as follows:

1507.3.3 Underlayment. Underlayment shall comply with Section 1507.1.1.~~Unless otherwise noted, required *underlayment* shall conform to: ASTM D226, Type II; ASTM D2626 or ASTM D6380, Class M mineral-surfaced roll roofing.~~

Reason: GRAHAM: This proposed code change is intended to remove unnecessary redundancy in the code.

Section 1507.1.1 Underlayment was added to IBC 2018 and continues in IBC 2021 and IBC 2024. The concept is consolidate all underlayment requirements from each steep-slope roof covering type into a single underlayment section. This current code change proposal is a clean-up from that original effort and replaces the ASTM product standards currently indicated in Section 1507.3.3 with a pointer to Section 1507.1.1, which includes Table 1507.1.1(1)--Underlayment Types indicating the various types of acceptable underlayments.

The specific underlayment standards currently referenced in Section 1507.3.3 are already included in Table 1507.1.1(1).

PHILLIPS: This proposal removes the incomplete list of clay and concrete tile underlayment options in Section 1507.3.3 and points to the underlayment provisions in 1507.1.1, which include a complete list of options. This change will remove confusion about which underlayments are permitted with clay and concrete tile and will simplify future maintenance of underlayment provisions by relying on the consolidated list in Section 1507.1.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

GRAHAM: This code change removes redundancy from the code and does not change the code's technical requirements or stringency. As a result, there is no increase or decrease in the cost of construction.
PHILLIPS: This proposal cleans up the underlayment provisions for clay and concrete tile without removing any options. No change in cost of construction is expected if this proposal is approved.

S27-25

S28-25

IBC: 1507.4.6 (New)

Proponents: Kurt Beres, representing MA Design (kurtb@ma-architects.com)

2024 International Building Code

Add new text as follows:

1507.4.6 Snow Guards. *Structures* with snow loads equal to or greater than 15 PSF, with roofs constructed of metal panels sloped greater than four units vertical in twelve units horizontal (33% or 4:12 slope), shall be provided with permanently attached guards sufficient to prevent ice and snow slides. The snow guards shall be installed in the locations and quantity established per the manufacturers recommendations.

Exceptions.

1. On sides of the building without occupiable areas within 6' of the face of the building.
2. When the sloped metal roof has no exposed edge such as with a parapet that would contain the build up of snow and ice.
3. Where approved by the building official.

Reason: With the ICC focus on disaster preparedness codifying good design that protects property and life with minimal cost is good code. Similar code sections have already been adopted in local codes and jurisdictions that have identified the need and simple change these types of measures can have on the protection of property and life such as the state of Kentucky. This proposal widens this to regions of the country by providing language focused on the amount of annual snow fall. Below are a couple links to articles about property and injury loss.

https://www.parkrecord.com/2019/03/05/park-city-roof-sheds-ice-and-snow-smashing-into-a-car/

https://www.nbcdfw.com/news/local/several-people-injured-at-cowboys-stadium/1910289/

Bibliography: 2018mKentucky building code.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Based on the region the proposed code change codifies good design practice and should have minimal impact on cost because it is considered best practice. Any cost increase would be dependent on the means selected, area affected and geographic location. Based on parameters defined below required snow guards should cost less than .50 cents per sf of affected roof area.

Estimated Immediate Cost Impact Justification (methodology and variables):

Methodology:Using available online tools to determine quantity, a model metal roof was used based on adhered snow guards, using a potential 40PSF roof load.

https://sno-safe.com/getLayout.php

Variables:

Size and location of the metal roofing system. Including pitch and snow load.

S28-25

S29-25

IBC: 1507.8.8, 1507.9.9

Proponents: Nav Koonar, representing Cedar Shake and Shingle Bureau, Director of Operations (nav.koonar@cedarbureau.org); David Roodvoets, DLR Consultants, representing Cedar Shake and Shingle Bureau (davelee@ix.netcom.com)

2024 International Building Code

Revise as follows:

1507.8.8 Flashing. At the juncture of the roof and vertical surfaces, flashing and counterflashing shall be provided in accordance with the manufacturer's installation instructions, and where of metal, shall be not less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal. The valley flashing shall extend not less than 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch (25 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (102 mm). For roof slopes of three units vertical in 12 units horizontal (25-percent slope) and over, the valley flashing shall have a 36-inch-wide (914 mm) *underlayment* of either one layer of Type I *underlayment* running the full length of the valley or a self-adhering polymer-modified bitumen sheet bearing a *label* indicating compliance with ASTM D1970, in addition to other required *underlayment*. ~~In areas where the average daily temperature in January is 25°F (-4°C) or less or where there is a possibility of ice forming along the eaves causing a backup of water,~~ Wood structural panels or solid lumber sheathing is required on that portion of the roof deck requiring the application of an ice barrier, the metal valley flashing *underlayment* shall be solidly cemented to the roofing *underlayment* for slopes under seven units vertical in 12 units horizontal (58-percent slope) or self-adhering polymer-modified bitumen sheet shall be installed.

1507.9.9 Flashing. At the juncture of the roof and vertical surfaces, flashing and counterflashing shall be provided in accordance with the manufacturer's installation instructions, and where of metal, shall be not less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal. The valley flashing shall extend not less than 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch (25 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (102 mm). For roof slopes of three units vertical in 12 units horizontal (25-percent slope) and over, the valley flashing shall have a 36-inch-wide (914 mm) *underlayment* of either one layer of Type I *underlayment* running the full length of the valley or a self-adhering polymer-modified bitumen sheet bearing a label indicating compliance with ASTM D1970, in addition to other required *underlayment*. ~~In areas where the average daily temperature in January is 25°F (-4°C) or less or where there is a possibility of ice forming along the eaves causing a backup of water,~~ Wood structural panels or solid lumber sheathing is required on that portion of the roof deck requiring the application of an ice barrier, the metal valley flashing *underlayment* shall be solidly cemented to the roofing *underlayment* for slopes under seven units vertical in 12 units horizontal (58-percent slope) or self-adhering polymer-modified bitumen sheet shall be installed.

Reason: The IBC wood shingle and wood shake sections in this proposal contain a trigger for ice barrier provisions (i.e., average daily temperature in January is 25°F or less) which conflicts with the ice barrier trigger in 1507.1.2. This proposal resolves the conflict by removing the trigger from 1507.8.8 and 1507.9.9.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial change. See reason statement.

S29-25

S30-25 Part I

West Conshohocken, PA 19428

~~D2822/D2822M—2005(2011)e1~~	~~Specification for Asphalt Roof Cement, Asbestos Containing~~
~~D2823/D2823M—05(2011)e1~~	~~Specification for Asphalt Roof Coatings, Asbestos Containing~~

Reason: ASTM D2822 (Specification for Asphalt Roof Cement, Asbestos Containing) was withdrawn as an ASTM standard in 2016. ASTM D2823 (Specification for Asphalt Roof Coatings, Asbestos Containing) was withdrawn as an ASTM standard in 2014. No products complying with these standards are known, so the standards are proposed for removal from the IBC and the IRC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed removal of standards representing materials no longer used will have no impact on cost of construction.

S30-25 Part II

S31-25

IBC: SECTION 202, SECTION 202 (New), SECTION 1510 (New), 1510.1 (New), 1510.2 (New), 1510.3 (New), 1510.4 (New), 1510.4.1 (New)

Proponents: Mike Fischer, Kellen Company, representing Protected Membrane Roofing Institute (mfischer@kellencompany.com)

2024 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

PROTECTED MEMBRANE ROOF ASSEMBLY. A *Roof Assembly* that includes insulation that is installed above a roofing membrane.

Add new text as follows:

SECTION 1510 PROTECTED MEMBRANE ROOF ASSEMBLIES

1510.1 General. *Protected membrane roof assemblies* shall comply with this Chapter. *Roof coverings* in *protected membrane roof assemblies* shall comply with Section 1507.

1510.2 Landscaped roofs and vegetative roofs. *Landscaped roofs* and *vegetative roofs* that include *protected membrane roof assemblies* shall comply with Sections 1505.10 and 1507.15.

1510.3 Foam plastics. Foam plastic insulation in *protected membrane roof assemblies* shall comply with the applicable requirements of Chapter 26.

1510.4 Installation. *Protected membrane roof assemblies* shall be installed in accordance with the manufacturer's *approved* installation instructions.

1510.4.1 Flashing. Flashing for *protected membrane roof assemblies* shall be installed in accordance with Section 1503.2 and the manufacturers *approved* installation instructions.

Reason: Protected membrane roof assemblies (also known as inverted roofs) include insulation that is above the roofing membrane. These assemblies are becoming increasingly popular, particularly as part of landscaped roofs and vegetative roofs. The IBC does not directly address these assemblies. For example, Section 1508 includes specific provisions for roof insulation that presume the insulation is protected by an approved roof covering.

This proposal provides a simple definition for protected membrane roof assemblies (PMRAs) and adds provisions to assist with code enforcement by ensuring that PMRAs meet the requirements for roofing- including wind, fire, weather protection- as well as the provisions for landscaped and vegetative roofs.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal contains no mandatory provisions.

S31-25

S32-25

IBC: [BG] 1511.2.4

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BG] 1511.2.4 Type of construction. *Penthouses* shall be constructed of *building element* materials as required for the type of construction of the *building*. Penthouse *exterior walls* and roof construction shall have a *fire-resistance rating* as required for the type of construction of the building. Supporting construction of such *exterior walls* and roof construction shall have a *fire-resistance rating* not less than required for the *exterior wall* or roof supported.

Exceptions:

1. On *buildings* of Type I construction, the *exterior walls* and roofs of *penthouses* with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour *fire-resistance rating*. The *exterior walls* and roofs of *penthouses* with a *fire separation distance* of 20 feet (6096 mm) or greater shall not be required to have a *fire-resistance rating*.
2. On *buildings* of Type I construction two *stories* or less in height above *grade plane* or of Type II construction, the *exterior walls* and roofs of *penthouses* with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour *fire-resistance rating* or a lesser *fire-resistance rating* as required by Table 705.5 and be constructed of *fire-retardant-treated wood*. The *exterior walls* and roofs of *penthouses* with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be constructed of *fire-retardant-treated wood* and shall not be required to have a *fire-resistance rating*. Interior framing and walls shall be permitted to be constructed of *fire-retardant-treated wood*.
3. On *buildings* of Type III, IV or V construction, the *exterior walls* <u>and roofs</u> of *penthouses* with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour *fire-resistance rating* or a lesser *fire-resistance rating* as required by Table 705.5. On *buildings* of Type III, IV or VA construction, the *exterior walls* <u>and roofs</u> of *penthouses* with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be of heavy timber construction complying with Sections 602.4 and 2304.11 or noncombustible construction or *fire-retardant-treated wood* and shall not be required to have a *fire-resistance rating*.

Reason: Penthouse exterior walls and roofs are required to meet material and fire-resistance rating requirements for the type of construction of the building. Exceptions to this requirement permit different materials or lesser fire-resistance ratings, with different allowances based on construction type. Exceptions 1 and 2 are for Type I and Type II construction and apply to exterior walls and roofs of penthouses; however, Exception 3 for Type III, IV or V construction only applies to exterior walls. It is believed this is an oversight since it doesn't make sense to give exceptions to the exterior walls without giving the same exceptions to the roofs, as is done in exceptions 1 and 2.

Furthermore, this creates a conflict in the code where an exterior bearing wall could be non-rated as allowed by Exception 3, while the roof is required to have a fire-resistance rating. In this case, the structural member supporting construction requirement of Section 704.1.1 is not met. There doesn't seem to be a reason to have a rated roof supported by a non-rated exterior bearing wall, while interior bearing walls would have to be rated per Sections 1511.2.4 and 704.1.1.

This proposal simply adds roofs to Exception 3 to be consistent with Exceptions 1 and 2, and to prevent a conflict in the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal corrects what is believed to be an oversight in the code for Exception 3, making Exception 3 consistent with Exceptions 1 and 2 and the intent of the code. Since this proposal is consistent with the intent of the code, it is considered to be a clarification with no cost impact.

S32-25

S33-25

IBC: [BG] 1511.2.4, [BG] 1511.3, 2304.11

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BG] 1511.2.4 Type of construction. *Penthouses* shall be constructed of *building element* materials as required for the type of construction of the *building*. Penthouse *exterior walls* and roof construction shall have a *fire-resistance rating* as required for the type of construction of the building. Supporting construction of such *exterior walls* and roof construction shall have a *fire-resistance rating* not less than required for the *exterior wall* or roof supported.

Exceptions:

1. On *buildings* of Type I construction, the *exterior walls* and roofs of *penthouses* with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour *fire-resistance rating*. The *exterior walls* and roofs of *penthouses* with a *fire separation distance* of 20 feet (6096 mm) or greater shall not be required to have a *fire-resistance rating*.
2. On *buildings* of Type I construction two *stories* or less in height above *grade plane* or of Type II construction, the *exterior walls* and roofs of *penthouses* with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour *fire-resistance rating* or a lesser *fire-resistance rating* as required by Table 705.5 and be constructed of *fire-retardant-treated wood*. The *exterior walls* and roofs of *penthouses* with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be constructed of *fire-retardant-treated wood* and shall not be required to have a *fire-resistance rating*. Interior framing and walls shall be permitted to be constructed of *fire-retardant-treated wood*.
3. On *buildings* of Type III, IV or V construction, the *exterior walls* of *penthouses* with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour *fire-resistance rating* or a lesser *fire-resistance rating* as required by Table 705.5. On *buildings* of Type III, IV or VA construction, the *exterior walls* of *penthouses* with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be of heavy timber ~~construction~~ complying with ~~Sections 602.4 and~~ <u>the minimum dimensions and permitted materials in accordance with Section</u> 2304.11 or noncombustible construction or *fire-retardant-treated wood* and shall not be required to have a *fire-resistance rating*.

[BG] 1511.3 Tanks. Tanks having a capacity of more than 500 gallons (1893 L) located on the *roof deck* of a *building* shall be supported on *masonry*, reinforced concrete, steel or heavy timber ~~construction~~ complying with Section 2304.11 provided that, where such supports are located in the *building* above the lowest *story*, the support shall be fire-resistance rated as required for Type IA construction.

2304.11 Heavy timber ~~construction~~. Where a *structure*, portion thereof or individual structural elements are required by provisions of this code to be of heavy timber, the *building elements* therein shall comply with the applicable provisions of Sections 2304.11.1 through 2304.11.4. Minimum dimensions of heavy timber shall comply with the applicable requirements in Table 2304.11 based on roofs or floors supported and the configuration of each structural element, or in Sections 2304.11.2 through 2304.11.4. Lumber decking shall be in accordance with Section 2304.9.

Reason: "Heavy timber" refers to specific pieces of wood or wood products with large cross-sectional areas meeting the requirements of Table 2304.11. The term "heavy timber construction" refers to an architectural method utilizing heavy timber components for structural purposes. This proposal corrects three locations in the IBC where "heavy timber" more accurately describes the intent of how it's used in the section to be for wood member size requirements and not type of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no technical changes proposed in this code change. The changes are proposed for consistency in the code.

S33-25

S34-25

IBC: [BG] 1511.7.6, 2703.1

Proponents: Amanda Hickman, The Hickman Group, representing Single-Ply Roofing Industry (SPRI) (amanda@thehickmangroup.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

[BG] 1511.7.6 Lightning protection systems. Where provided, lightning ~~Lightning~~ protection system components shall be installed in accordance with Sections 1511.7.6.1, 1511.7.6.2 and 2703.

2703.1 General. Where provided, lightning protection systems shall comply with Sections 1511.7.6 through 1511.7.6.2 and Sections 2703.2 through 2703.3.

Reason: The proposal clarifies the intent of these sections concerning Lightning Protection Systems. While such systems are not mandatory, when provided, they must comply with the applicable requirements outlined in both Chapter 15 and Chapter 27.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal only clarifies the intent of the section and provides a pointer to the other applicable section.

S34-25

S35-25

IBC: [BG] 1511.8

Proponents: John Taecker, Taecker Codes & Technical Services, representing Taecker Codes & Technical Services (john@taeckercodes.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

[BG] ~~1511.8~~ 1511.1.2 Structural fire resistance. The structural frame and roof construction supporting *loads* imposed upon the roof by any *rooftop structure* shall comply with the requirements of Table 601. The fire-resistance reduction permitted by Table 601, Note a, shall not apply to roofs containing *rooftop structures*.

Reason: The structural fire resistance requirements in Section 1511.8 applies to any rooftop structure. Thus, it should be relocated as a subsection to Section 1511.1 so that these requirements are not missed.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is already a requirement. This is an editorial relocation.

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Add new text as follows:

SECTION 1512 ROOFTOP MOUNTED EQUIPMENT AND SYSTEMS

1512.1 General. Rooftop-mounted equipment and systems shall be installed in accordance with this section and the code applicable to the equipment or system. The installation shall not impact the integrity of the roof assembly or roof covering.

1512.1.1 Structural loads. The structural frame and roof construction supporting loads imposed upon the roof by any rooftop mounted equipment or system shall comply with Chapter 16.

1512.1.2 Flashing. Flashing shall be installed for rooftop-mounted equipment in accordance with Section 1503.2 and 1503.2.1.

Revise as follows:

[BG] ~~1511.3~~ 1512.2 Tanks. Tanks having a capacity of more than 500 gallons (1893 L) located on the *roof deck* of a *building* shall be supported on *masonry*, reinforced concrete, steel or heavy timber construction complying with Section 2304.11 provided that, where such supports are located in the *building* above the lowest *story*, the support shall be fire-resistance rated as required for Type IA construction.

[BG] ~~1511.3.1~~ 1512.2.1 Valve and drain. In the bottom or on the side near the bottom of the tank, a pipe or outlet, fitted with a suitable quick-opening valve for discharging the contents into a drain in an emergency shall be provided.

[BG] ~~1511.3.2~~ 1512.2.2 Location. Tanks shall not be placed over or near a *stairway* or an elevator *shaft*, unless there is a solid roof or floor underneath the tank.

[BG] ~~1511.3.3~~ 1512.2.3 Tank cover. Unenclosed roof tanks shall have covers sloping toward the perimeter of the tanks.

[BG] ~~1511.4~~ 1512.3 Cooling towers. Cooling towers located on the *roof deck* of a *building* and greater than 250 square feet (23.2 m^2) in base area or greater than 15 feet (4572 mm) in height above the *roof deck*, as measured to the highest point on the cooling tower, where the roof is greater than 50 feet (15 240 mm) in height above *grade plane* shall be constructed of noncombustible materials. The base area of cooling towers shall not exceed one-third the area of the supporting *roof deck*.

> **Exception:** Drip boards and the enclosing construction shall be permitted to be of wood not less than 1 inch (25 mm) nominal thickness, provided that the wood is covered on the exterior of the tower with noncombustible material.

[BG] ~~1511.7.6~~ 1512.4 Lightning protection systems. Lightning protection system components shall be installed in accordance with Sections ~~1511.7.6.1, 1511.7.6.2~~ 1512.4.1, 1512.4.2 and 2703.

[BG] ~~1511.7.6.1~~ 1512.4.1 Installation on metal edge systems or gutters. Lightning protection system components attached to

ANSI/SPRI/FM 4435/ES-1 or ANSI/SPRI GT-1 tested metal edge systems or gutters shall be installed with compatible brackets, fasteners or adhesives, in accordance with the metal edge systems or gutter manufacturer's installation instructions. Where the metal edge system or gutter manufacturer is unknown, installation shall be as directed by a *registered design professional*.

[BG] ~~1511.7.6.2~~ 1512.4.2 Installation on roof coverings. Lightning protection system components directly attached to or through the *roof covering* shall be installed in accordance with this chapter and the *roof covering* manufacturer's installation instructions. Flashing shall be installed in accordance with the *roof assembly* manufacturer's installation instructions and Sections 1503.2 and 1507 where the lightning protection system installation results in a penetration through the *roof covering*. Where the *roof covering* manufacturer is unknown, installation shall be as directed by a *registered design professional*.

Add new text as follows:

1512.5 Solar energy systems.. Rooftop-mounted photovoltaic panel systems and solar thermal systems shall be installed in accordance with Section 3111.

1512.6 Mechanical equipment.. Rooftop mounted mechanical equipment shall be mounted on curbs raised a minimum of 8 inches (203 mm) above the roof surface, or where roofing materials extend beneath the equipment, on raised equipment supports providing a minimum clearance height in accordance with Table 1512.6.

Exception: Where the existing rooftop equipment provides sufficient clearance to repair, recover, replace or maintain the roofing system or any of its components, and where approved, such existing equipment need not comply with Table 1512.6.

TABLE 1512.6 CLEARNCE BELOW RAISED ROOFTOP-MOUNTED MECHANICAL EQUIPMENT

Width of Mechanical Equipment	Minimum clearance above roof surface
< 24 inches (610 mm)	14 inches (356 mm)
24 inches (610 mm) < 36 inches (914 mm)	18 inches (457 mm)
36 inches (914 mm) < 48 inches (1219 mm)	24 inches (610 mm)
48 inches (1219 mm) < 60 inches (1525 mm)	30 inches (762 mm)
> 60 inches (1525 mm)	48 inches (1219 mm)

1512.7 Electrical, plumbing and mechanical systems. Electrical, plumbing and mechanical systems shall be installed in accordance with Sections 1512.7.1 through 1512.7.3, and this code.

1512.7.1 Electrical wiring methods. Electrical wiring methods installed on rooftops and not encased in structural concrete shall be installed above the roof system in accordance with all of the following:

1. Electrical wiring methods installed in locations under metal-corrugated sheet roof decking shall be supported so there is not less than 1 ½ inch (38 mm) clearance measured from the lowest surface of the roof covering to the top of the cable or raceway.
2. A cable or raceway shall not be installed in concealed locations in roofs with metal-corrugated sheet roof decks.
3. Support systems for electrical wiring shall not diminish the fire classification of the roofassembly
4. A minimum of 1 ½ inch (38 mm) of clearance shall be provided between the roofassembly and the cable or raceway, or other clearance as required by other sections of this code and NFPA 70.
5. All penetrations of the roof covering shall be flashed in accordance with one of the following methods:
   - 5.1. The roof covering manufacturer's installation instructions.
   - 5.2. Where the roof covering manufacturer is unknown, installation shall be as directed by a registered design professional.
   - 5.3. Listed and labeled flashing materials or systems specific for what is penetrating the roof covering.

1512.7.2 Mechanical and plumbing systems. Mechanical and plumbing system piping and tubing installed on rooftops and not encased in structural concrete shall be supported above the roof system and covering, in accordance with the following:

1. A pipe or tube shall not be installed in concealed locations in roofs with metal-corrugated sheet roof decks.
2 Support systems for piping and tubing shall not diminish the fire classification of the roof assembly
3 A minimum of 1 ½ inch (38 mm) of clearance shall be provided between the roof assembly and the pipe or tube or other clearance as required by other sections of this code and the *International Mechanical Code*, *International Plumbing Code*, or *International Fuel Gas Code*, as applicable.
4 All penetrations of the roof covering shall be flashed in accordance with one of the following methods:
   4.1. The roof covering manufacturer's installation instructions.
   4.2. Where the roof covering manufacturer is unknown, installation shall be as directed by a registered design professional.
   4.3. Listed and labeled flashing materials or systems specific for what is penetrating the roof covering.

1512.7.3 Line sets, piping, tubing, raceways and cables under roof decks. Line sets, piping, tubing, raceways and cables installed below the roof deck shall have a minimum clearance of 1 ½ inch (38 mm) from the lowest surface of the roof deck except where they penetrate the roof deck.

Exception: Line sets, pipes, conduit and cables installed under structural concrete decks.

Reason: A new dedicated section is proposed to address the ever-increasing installation of rooftop-mounted electrical, mechanical and plumbing equipment and systems.

There are no specific requirements in the code to:

1. Ensure that these installations do not impact the integrity of the roof,
2. Provide clearance of obstacles above the finished roof for maintenance or replacement of the roofing materials,
3. Address the potential impact of these installations on firefighting operations, or
4. Address the potential damage to the fire classification of the roof assemblies and roof coverings.

Requirements for clearance of rooftop mounted electrical wiring exist in NFPA 70, however, these requirements are related to temperature and heating of the conductors. There are requirements for some equipment and systems (tanks, cooling towers and lightning protection systems) that are currently located under the section for rooftop structures (Section 1511), even though they are not structures.

This proposal does the following:

- Relocate sections for equipment and systems that are currently within Section 1511, Rooftop Structures
- Use requirements taken from the current edition of the Florida Building code which has had this wording for several code cycles and has been field-proven to be effective and usable.
- Provide additional direction for other equipment and systems mounted on the rooftop not covered by the Florida Building Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Good construction practices would address proper installation of rooftop-mounted equipment and systems to not impact the integrity of the roof, so the increase has the potential to be minimal, if at all. There may be a slight increase for those installers who have not done this practice. Calculating what, if any, additional cost is very difficult due to the location and the environment. For most of the country the cost would be minimal, if at all. Where there might be an increase in cost would be in high wind areas for the additional engineering involved, however engineering is already required in those situations, so the increase in cost would be negligible.

S36-25

IBC: 1512.1; IEBC: [BS] 705.1

Proponents: Daniel Cupit, Professional Construction Services, representing Colorado Chapter International Code Council (dan.c@pcsden.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1512.1 General. Materials and methods of application used for recovering or replacing an existing *roof covering* shall comply with the requirements of Chapter 15 <u>and Section 1202.2.</u>

Exceptions:

1. *Roof replacement* or *roof recover* of existing *low-slope roof coverings* shall not be required to meet the minimum design slope requirement of $^{1}/_{4}$ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2.
2. Recovering or replacing an existing *roof covering* shall not be required to meet the requirement for secondary (emergency overflow) drains or *scuppers* in Section 1502.2 for roofs that provide for *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2. For the purposes of this exception, existing secondary drainage or *scupper* systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or *scuppers* designed and installed in accordance with Section 1502.2.

2024 International Existing Building Code

Revise as follows:

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 <u>and Section 1202.2</u> of the *International Building Code*.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of $^{1}/_{4}$ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the *International Building Code* for roofs that provide positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code* .
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the *International Building Code* for roofs that provide for positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code* . For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the *International Building Code*.

S37-25 Part II

IRC: R908.1

Proponents: Daniel Cupit, Professional Construction Services, representing Colorado Chapter International Code Council (dan.c@pcsden.com)

2024 International Residential Code

Revise as follows:

R908.1 General. Materials and methods of application used for recovering or replacing an existing *roof covering* shall comply with the requirements of this chapter <u>and Section R806.</u>

Exceptions:

1. *Reroofing* shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section R905 for roofs that provide *positive roof drainage*.
2. For roofs that provide positive drainage, recovering or replacing an existing *roof covering* shall not require the secondary (emergency overflow) drains or *scuppers* of Section R903.4.1 to be added to an existing roof.

Reason: Roof Ventilation Requirement for Reroofs

There is a strong need for adequate through roof ventilation on new roof structures and even more so on reroofs. Inadequate roof ventilation can lead to condensation at the sheathing and within the roof cavities. It can also lead to ice dams, and premature aging of the roof covering as with asphalt shingles.

Property damage due to inadequate steep slope roof ventilation has increased in recent years as construction materials have changed. This includes reflective "cool roofs", air barriers, and synthetic felt underlayments. The unintended consequences of these changes in construction have caused a considerable amount of property damage in recent years.

The condensation issue occurs In cold climates when the warm moist air inside structures comes into contact with the cool dry air outside. This warm moist air often occurs in the form of vapor drive in and around kitchen and bathroom areas. It also occurs around breaks in air barriers at penetrations, walls and framing structures due to imperfect construction. The condensation issue in under vented steep slope roof systems is not limited to cold climates in the winter as the opposite occurs in warm moist climates in the warm summer months when cool dry conditioned air in the interior of the structure comes into contact with the warm moist air outside.

The problem with reroofing is that less than 5% of all reroofs are designed by experienced design professionals. Most are replaced as is with similar or new materials with no accounting for existing conditions and no dew point calculations being performed as with new construction.

The roofing industry is well informed on the roof condensation issues and there are many types of ventilation materials to allow for the adequate intake and exhaust ventilation of any roof system or other means of moisture mitigation. Most contractors already know how to install new or additional intake and exhaust ventilation as inadequate roof ventilation is a common cause for roof repairs. Manufacturers have made it easy for contractors by providing education literature and online roof venting calculators. Installing the vents themselves is often easier than some roof flashing details.

The roofing industry has been active in dealing with the steep slope roof ventilation issue for many years, however the building codes have lagged behind in dealing with this issue. There are numerous articles and publications by industry professionals on this subject.

Passage of this proposed roof ventilation code change, as will significantly reduce the number of property damage claims from roof condensation.<u> Which is currently the number one cause of steep slope roofing-related defect claims. Once an issue with inadequate steep slope roof ventilation is corrected, there is no need to do so again. Adequate roof ventilation also increases the functional life of the roof system which far outweighs the minimal costs involved.</u>

Most AHJ’s already enforce the roof ventilation requirements for new construction and others also do so for reroofs. These AHJ’s have methods in place verify compliance. For those that do not, contractors already agree to meet the building code requirements when they pull their permit. There are also building guides available to assist with the installation and verification of roof intake and exhaust ventilation.

<u>This proposed code change is being introduced by the Colorado Chapter of the International Code Council.</u>

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The proposed code change would result in a minor increase in the cost of construction that would diminish over time as there is only a need to correct the inadequate ventilation issue once. The cost to bring steep slope roof ventilation to meet the referenced code in section R806 is roughly $810 to install on average 6 additional intake and/or exhaust vents on an average sized 25 square residential roof. Or roughly 5.4% of the average $15,000 cost for that 25 square roof. This cost is reduced with each roof replacement as the correction only needs to be installed once. The average addition of 6 additional roof vents per 25 square roof and the associated cost is based on my experience as a Roofing Consultant and Expert having designed, specified, managed, or supervised the installation of over 2,300 reroof projects over the last 24 years. I also put multiple roofing projects out to bid each year and am a roofing cost expert on roof construction, defect claims, and insurance damage claims.

There is no additional cost to the authority having jurisdiction (AHJ) if they rely in the contractors licensing, experience, and guarantee to follow the building codes adopted by the AHJ. There is a minimal cost the AHJ if they choose to verify installation of the required roof ventilation. There are multiple roof ventilation calculators available to the contractor and/or building official to assist with the required ventilation should the AHJ choose to require this. As a member of the Colorado Chapter of the ICC (CCICC) Standardization Committee we publish building guides including one for reroofing. The 2024 edit is to include a diagram for roof ventilation that will allow for the contractor to calculate and fill in the existing and additional roof intake and exhaust vents required to meet section R806. There are jurisdictions already have something similar to this.

Estimated Immediate Cost Impact Justification (methodology and variables):

This code change will correct roof ventilation issues with current single family residential structures that do not meet the requirements for new construction in R806. It will increase the service life of the roofs being adequately vented while reducing the risk of damage to existing structures from condensation, ice dams, and excessive heat and moisture in the roof cavity. This incidence of this type of damage has greatly increased in frequency and cost with recent iterations of the energy code and the use of synthetic felt underlayments. The cost to replace the damage caused to the roof sheathing, structural members, and interior surfaces due to condensation and/or ice dams can range from $1,200 on the low end to over $24,000 for the 25 square roof example. The cost to replace an average 25 square roof with damaged asphalt shingles due to excessive heat and moisture within the roof cavity or attic space from inadequate roof ventilation is the $15,000 for an average reroof.

This increase in the cost of construction is offset by a decrease in the annualized cost of the roof system as the useful or functional life of the roof covering is increased by 10% or more with adequate roof ventilation. This value is greater for asphalt shingles which are negatively affected more by excessive heat and moisture within the roof cavity.

Estimated Life Cycle Cost Impact:

The average useful or functional life of a steep slope roof system varies by region and type of roof covering. This life cycle ranges from as low as 7.8 years in severe hail regions to up to 30years in kore moderate climates for asphalt shingles with an average of roughly 15-years on average which is less than the standard shingle warranty periods currently available. The $810 average cost to bring the roof ventilation to meet the code requirement for new construction is roughly $54 per year. However, this cost also increases the service life of the roof system resulting in no cost or actual savings. An increase of the life of the roof covering by 10% due to adequate roof ventilation would result in a savings of $1,500 which exceeds that of the cost for the added ventilation.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The methods used to determine the life cycle of a steep slope roof system are based on average values as observed in the extreme climate of Colorado where I have assessed over 1,400 roof systems over the last 24-years. The variables associated with the values provided are as follows: geographic and climatic conditions of the local region, local market conditions, type of roof covering installed, type of construction of the existing structure, existence of an air barrier, insulation inside or the roof cavity or attached to the bottom of the sheathing, internal mechanical systems and airflow, average relative humidity inside the structure, dew point relative to the roof deck, exhaust ventilation in bathrooms and kitchens.

Staff Analysis: Section 1512 or the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC CC # S37-25 Part I and CC # S46-25 addresses requirements in a different or contradicting manner related to Section 1512. The committee is urged to make their intensions clear with their actions on these proposals.

S37-25 Part II

S38-25

IBC: 1512.1; IEBC: [BS] 705.1

Proponents: Daniel Cupit, Professional Construction Services, representing Colorado Chapter International Code Council (dan.c@pcsden.com); Stephen Patterson, representing Rooftech (spatterson@rooftechusa.com)

2024 International Building Code

Revise as follows:

1512.1 General. Materials and methods of application used for recovering or replacing an existing *roof covering* shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement* or *roof recover* of existing *low-slope roof coverings* shall not be required to meet the minimum design slope requirement of $^1/_4$ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2.
2. Recovering ~~or replacing~~ an existing *roof covering* shall not be required to meet the requirement for secondary (emergency overflow) drains or *scuppers* in Section 1502.2 for roofs that provide for *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2. For the purposes of this exception, existing secondary drainage or *scupper* systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or *scuppers* designed and installed in accordance with Section 1502.2.

2024 International Existing Building Code

Revise as follows:

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the *International Building Code*.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of $^1/_4$ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the *International Building Code* for roofs that provide positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code* .
2. Recovering ~~or replacing~~ an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the *International Building Code* for roofs that provide for positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code* . For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the *International Building Code*.

Reason: There is often a need for overflow drains on reroofs as many existing structures do not have adequate roof drainage. The lack of overflow drains possesses a life safety risk from roof collapse especially on older roofs constructed prior to the adoption of the 2009 IBC that required roof overflow drains of structures without adequate roof drainage and the 2015 IPC that greatly increased the roof drainage requirement by increasing drain sizing. These changes were made to better account for actual roof runoff calculations and prevent the buildup of water on roof sections surrounded by parapet walls or other structures.

Water weighs 62.4 lbs. per cubic foot. A low slope roof with just 12-inch parapet walls and curbs can accumulate water up to 1-foot deep before flowing over the edges or through curbs if the existing drains are backed up or clogged. That load is equivalent to 62.4 psf and is more than double the amount of a common 30-lb snow load or a 20-lb rain load on an older building. This does not account for the dead load of the roof system and roof structure itself. Roofs with perimeter walls higher than 12-inches are common and pose an even greater risk of collapse if undersized roof drains become backed up or clogged.

Replacing a roof membrane requires compliance with the IECC and other energy codes in a large percentage of jurisdictions. The additional insulation and cover board required to meet the energy codes increases the weight of the roof system even if by only a few lbs. per square foot (psf). The requirement to add additional roof insulation is not a life safety issue while inadequate roof drainage and/or the lack of overflow drains is. If the building codes are going to require additional roof insulation it does not make sense to ignore the roof drainage required to ensure a roof system allows for proper drainage to avoid the risk of accumulation that can pose a safety hazard. Especially when this risk is greater on older buildings that were constructed prior to the roof drainage requirements. What is the value of human life put at risk because an existing roof structure does not have adequate roof drainage?

Cost Impact: Increase

Estimated Immediate Cost Impact:

The average cost for installation of a roof overflow drain is roughly $1,500. The cost to install an overflow scupper is significantly less. For an average 100 Square roof requiring 3 to 4 overflow drains or scuppers that cost would be approximately $4,500 to $6,000 or $5,250 0n average. Whereas the cost for an average reroof is anywhere from $800 to over $1,600 per square or more depending on the region, the existing structure, and other circumstances. That averages out to approximately $1,200 per square which is a fair price to reroof an existing low slope roof with 1 or 2-inches of existing insulation to meet the current energy code requirements. At $1,200 per square the cost to replace a 100 Square roof is $120,000. $5,250 to install overflow drains is equal to only 34.4 % of the cost of the reroof.

Estimated Immediate Cost Impact Justification (methodology and variables):

Many roofs only require existing drains or scuppers to be enlarged or for a smaller portion of additional drains to be added if there are already existing overflow drains in place. The previous example assumes all new overflow drains ae required. Even so at 4.4 % of the cost of the reroof that cost is fairly reasonable compared to the reduction in risk achieved by meeting the drainage requirements in the 2024 IBC. In contrast the portion of the reroof cost to bring this sample roof into compliance with the 2021 IECC energy codes is roughly 35% of the reroof costs or $35,000.

Estimated Life Cycle Cost Impact:

If the typical lifecycle of a commercial building is 60 years and the average life of a low slope membrane is 20-years then the roof would be replaced at least twice before the building is fully remodeled or replaced. If you extend the cost of the additional drains over 2 lifecycles that is roughly 40-years at a cost of $131.25 per year or $262.50 per year over one roof lifecycle of 20-years.

Staff Analysis: Section 1512 or the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

CC # S38-25 and CC #S46-25 addresses requirements in a different or contradicting manner related to Section 1512. The committee is urged to make their intensions clear with their actions on these proposals.

2024 International Building Code

Revise as follows:

SECTION 1512 REROOFING

1512.1 General. Materials and methods of application used for recovering or replacing an existing *roof covering* shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement* or *roof recover* of existing ~~low-slope~~ asphalt built-up, modified bitumen, single-ply, sprayed polyurethane foam or liquid-applied *roof coverings* shall not be required to meet the minimum design slope requirement of ¼ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2.
2. Recovering or replacing an existing *roof covering* shall not be required to meet the requirement for secondary (emergency overflow) drains or *scuppers* in Section 1502.2 for roofs that provide for *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2. For the purposes of this exception, existing secondary drainage or *scupper* systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or *scuppers* designed and installed in accordance with Section 1502.2.

2024 International Existing Building Code

Revise as follows:

SECTION 705 REROOFING

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the *International Building Code*.

Exceptions:

1. *Roof replacement* or *roof recover* of existing ~~low-slope~~ asphalt built-up, modified bitumen, single-ply, sprayed polyurethane foam or liquid-applied roof coverings shall not be required to meet the minimum design slope requirement of ¼ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the *International Building Code* for roofs that provide positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code* .
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the *International Building Code* for roofs that provide for positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code*. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the *International Building Code*.

Reason: This proposed code change is intended to clarify the code's existing requirements by specifically indicating those roof covering types that have a prescriptive minimum ¼ unit vertical in 12 units horizontal (2-percent) slope in new construciton, where IBC Section

1512-Reroofing's and IEBC Section 705-Reroofing's positve roof drainage exception can apply in reroofing with the indicated additional requirements.

This proposed code change is intended to be clarifying in nature and not change the code's technical requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed code change is intended to be clarifying in nature and not change the code's technical requirements. Therefore, the cost of construction is not increased or decreased.

Staff Analysis: Section 1512 of the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

S39-25

S40-25

IBC: SECTION 1512, 1512.1; IEBC: SECTION 705, [BS] 705.1

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Building Code

Revise as follows:

SECTION 1512
REROOFING

1512.1 General. Materials and methods of application used for recovering or replacing an existing *roof covering* shall comply with the requirements of Chapter 15.

Exceptions:

1. *Roof replacement* or *roof recover* of existing *low-slope roof coverings* shall not be required to meet the minimum design slope requirement of ¼ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2.
2. Recovering or replacing an existing *roof covering* shall not be required to meet the requirement for secondary (emergency overflow) drains or *scuppers* in Section 1502.2 for roofs <u>that meet the minimum design slope requirement in Section 1507 or for roofs </u>that provide for *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2. For the purposes of this exception, existing secondary drainage or *scupper* systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or *scuppers* designed and installed in accordance with Section 1502.2.

2024 International Existing Building Code

Revise as follows:

SECTION 705
REROOFING

[BS] 705.1 General. Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the *International Building Code*.

Exceptions:

1. *Roof replacement* or *roof recover* of existing low-slope roof coverings shall not be required to meet the minimum design slope requirement of ¼ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the *International Building Code* for roofs that provide positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code* .
2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1502 of the *International Building Code* for roofs <u>that meet the minimum design slope requirement in Section 1507 of the *International Building Code* or for roofs </u>that provide for positive roof drainage and meet the requirements of Sections 1608.3 and 1611.2 of the *International Building Code*. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1502 of the *International Building Code*.

Reason: This proposed code change is intended to clarify existing langauge in the IBC and IEBC relateing to reroofing.

IBC Section 1512.1, Exception 2, and similalry IEBC Section 705, Exception 2, address an exception where the codes' existing secondary drainage provisions are permitted to be re-used. As currently worded, Exception 2 could be interepreted to only apply to reroofing of low-slope roofs with *postive roof drainage* (as defined in IBC Sec. 202)--that is when Exception 1 specificly applies. Exception 2 can also apply when Excpetion 1 is not applicable--that is for existing roofs where roof slope greater than the minimium design roof slope from Section 1507 is provided.

The added language in IBC Section 1512.1, Exception 2, and IEBC Section 705.1, Exception 2 clarifies this.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed code clarifies the codes' existing requirements and does not increase or decrease the stringency of the codes. As a result, there is no cost impact associated with this proposed code change.

Staff Analysis: Section 1512 of the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

IBC: 1512.3; IEBC: [BS] 705.3

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Building Code

Revise as follows:

1512.3 Roof recover. The installation of a new *roof covering* over an existing *roof covering* shall be permitted where any of the following conditions occur:

1. Where the new *roof covering* is installed in accordance with the *roof covering* manufacturer's approved instructions.
2. Complete and separate roofing systems, such as standing-seam *metal roof panel* systems, that are designed to transmit the roof *loads* directly to the *building*'s structural system and that do not rely on existing roofs and *roof coverings* for support, shall not require the removal of existing *roof coverings*.
3. Metal panel, metal shingle and concrete and clay tile *roof coverings* shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1512.3.1.
4. The application of a new ~~protective~~ *roof coating* over an existing ~~protective~~ *roof coating*, *metal roof panel*, built-up roof, spray polyurethane foam roofing system, *metal roof shingles*, mineral-surfaced roll roofing, modified bitumen roofing or *thermoset* and *thermoplastic* single-ply roofing shall be permitted without tear off of existing *roof coverings*.

Exception: A roof recover shall not be permitted where any of the following conditions occur:

1. The existing roof or *roof covering* is water-soaked or has deteriorated to the point that the existing roof or *roof covering* is not adequate as a base for additional roofing.
2. The existing *roof covering* is slate, clay, cement or asbestos-cement tile.
3. The existing roof has two or more applications of any type of *roof covering*.

2024 International Existing Building Code

Revise as follows:

[BS] 705.3 Roof recover. The installation of a new roof covering over an existing roof covering shall be permitted where any of the following conditions occur:

1. The new roof covering is installed in accordance with the roof covering manufacturer's *approved* instructions.
2. Complete and separate roofing systems, such as standing-seam metal roof panel systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
3. Metal panel, metal shingle and concrete and clay tile roof coverings shall be peritted to be installed over existing wood shake roofs when applied in accordance with Section 705.3.1.
4. The application of a new ~~protective~~ roof coating over an existing ~~protective~~ *roof coating*, a metal roof panel, built-up roof, spray polyurethane foam roofing system, metal roof shingles, mineral-surfaced roll roofing, modified bitumen roofing or thermoset and thermoplastic single-ply roofing shall be permitted without tear off of existing roof coverings.

Exception: A *roof recover* shall not be permitted where any of the following conditions occur:

1. Where the existing roof or roof covering is water-soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Reason: This code change proposal is intended to clarify the existing code.

This code change proposal strikes the word "protective" from references to the term "roof coating" in Section 1512.3.4. The word "protective" is unnecessary as the term "roof coating" is already defined in Section 202-Definitions and specific requirements for roof coatings are provided in Section 1509-Roof Coatings. This change will not have an impact on the stringency of the building code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is editorial in nature and will not increase or decrease the cost of cosnstruction.

Staff Analysis: Section 1512 of the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

2024 International Building Code

Revise as follows:

1512.3 Roof recover. The installation of a new *roof covering* over an existing *roof covering*,exposed insulation or roof deck shall be permitted where any of the following conditions occur:

1. Where the new *roof covering* is installed in accordance with the *roof covering* manufacturer's approved instructions.
2. Complete and separate roofing systems, such as standing-seam *metal roof panel* systems, that are designed to transmit the roof *loads* directly to the *building*'s structural system and that do not rely on existing roofs and *roof coverings* for support, shall not require the removal of existing *roof coverings*.
3. Metal panel, metal shingle and concrete and clay tile *roof coverings* shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1512.3.1.
4. The application of a new protective *roof coating* over an existing protective *roof coating*, *metal roof panel*, built-up roof, spray polyurethane foam roofing system, *metal roof shingles*, mineral-surfaced roll roofing, modified bitumen roofing or *thermoset* and *thermoplastic* single-ply roofing shall be permitted without tear off of existing *roof coverings*.

Exception: A roof recover shall not be permitted where any of the following conditions occur:

1. The existing roof or *roof covering* is water-soaked or has deteriorated to the point that the existing roof or *roof covering* is not adequate as a base for additional roofing.
2. The existing *roof covering* is slate, clay, cement or asbestos-cement tile.
3. The existing roof has two or more applications of any type of *roof covering*.

2024 International Existing Building Code

Revise as follows:

[BS] 705.3 Roof recover. The installation of a new roof covering over an existing roof covering, exposed insulation or roof deck shall be permitted where any of the following conditions occur:

1. The new roof covering is installed in accordance with the roof covering manufacturer's *approved* instructions.
2. Complete and separate roofing systems, such as standing-seam metal roof panel systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
3. Metal panel, metal shingle and concrete and clay tile roof coverings shall be peritted to be installed over existing wood shake roofs when applied in accordance with Section 705.3.1.
4. The application of a new protective roof coating over an existing protective *roof coating*, a metal roof panel, built-up roof, spray polyurethane foam roofing system, metal roof shingles, mineral-surfaced roll roofing, modified bitumen roofing or thermoset and thermoplastic single-ply roofing shall be permitted without tear off of existing roof coverings.

Exception: A *roof recover* shall not be permitted where any of the following conditions occur:

1. Where the existing roof or roof covering is water-soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Reason: The reason for this proposal is to provide code officials crystal clear language for what is an important operation for reroofing applications. This roof recover operation takes place frequently, and should be included in the roof recover.

As can be seen from the definition, *roof replacement* indicates the complete *roof covering* is removed down to the roof deck. This assumes the roof vapor retarder, roof insulation, roofing and insulation adhesives or fasteners, roof membrane and roof overburdens such as ballast, pavers or vegetative covering are removed entirely.

The *roof recover* operation assumes the insulation is not wet, a suitable substrate, and not have two or more roofs on the building. See below for full definitions when working on existing buildings.

[BS] ROOF COVERING. The covering applied to the roof deck for weather resistance, fire classification or appearance.
[BS] ROOF REPLACEMENT. The process of removing the existing roof covering, repairing any damaged substrate and installing a new roof covering.

[BS] ROOF RECOVER. The process of installing an additional roof covering over a prepared existing roof covering without removing the existing roof covering.

In a roof recover, there is surface preparation performed prior to application of a recover board, or application of a membrane directly to the existing roof membrane. Gravel and loose debris is swept, vacuumed and removed. Blisters are cut, possibly removed, and repaired.

The operation described in this proposal does exactly what a roof recover intends -- removes the existing membrane completely, prepares the underlying insulation surface to receive a new roof membrane just like a roof recover operation. This might include removing any wet insulation, then reinstalling insulation thickness to match, and then recover with the roof membrane over the prepared insulation surface.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This type of language does not increase or decrease the cost of a roof recover application.

Staff Analysis: Section 1512 or the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

CC # S42-25 and CC # S46-25 addresses requirements in a different or contradicting manner related to Section 1512. The committee is urged to make their intensions clear with their actions on these proposals.

2024 International Building Code

Revise as follows:

1512.3 Roof recover. The installation of a new *roof covering* over an existing *roof covering* shall be permitted where any of the following conditions occur:

1. Where the new *roof covering* is installed in accordance with the *roof covering* manufacturer's approved instructions.
2. Complete and separate roofing systems, such as standing-seam *metal roof panel* systems, that are designed to transmit the roof *loads* directly to the *building*'s structural system and that do not rely on existing roofs and *roof coverings* for support, shall not require the removal of existing *roof coverings*.
3. Metal panel, metal shingle and concrete and clay tile *roof coverings* shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1512.3.1.
4. The application of a new protective *roof coating* over an existing protective *roof coating*, *metal roof panel*, built-up roof, spray polyurethane foam roofing system, *metal roof shingles*, mineral-surfaced roll roofing, modified bitumen roofing or *thermoset* and *thermoplastic* single-ply roofing shall be permitted without tear off of existing *roof coverings*.

Exception: A roof recover shall not be permitted where any of the following conditions occur:

1. The existing roof or *roof covering* has been ~~is~~ water damaged ~~soaked~~ or has deteriorated to the point that the existing roof or *roof covering* is not adequate as a base for additional roofing. Where required by the manufacturer of the proposed new roof system used for a *roof recovering*, the existing conditions shall comply with the manufacturer's *approved* instructions.
2. The existing *roof covering* is slate, clay, cement or asbestos-cement tile.
3. The existing roof has two or more applications of any type of *roof covering*.

2024 International Existing Building Code

Revise as follows:

[BS] 705.3 Roof recover. The installation of a new roof covering over an existing roof covering shall be permitted where any of the following conditions occur:

1. The new roof covering is installed in accordance with the roof covering manufacturer's *approved* instructions.
2. Complete and separate roofing systems, such as standing-seam metal roof panel systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
3. Metal panel, metal shingle and concrete and clay tile roof coverings shall be peritted to be installed over existing wood shake roofs when applied in accordance with Section 705.3.1.
4. The application of a new protective roof coating over an existing protective *roof coating*, a metal roof panel, built-up roof, spray polyurethane foam roofing system, metal roof shingles, mineral-surfaced roll roofing, modified bitumen roofing or thermoset and thermoplastic single-ply roofing shall be permitted without tear off of existing roof coverings.

Exception: A *roof recover* shall not be permitted where any of the following conditions occur:

1. Where the existing roof or roof covering has been ~~is~~ water damaged ~~soaked~~ or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing. Where required by the manufacturer of the proposed new roof system used for a *roof recovering*, the existing conditions shall comply with the manufacturer's *approved* instructions.
2. Where the existing roof covering is slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Reason: The term "water soaked" is not clearly defined. If the roof or roof covering has been water damaged or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing, roof recover shall not be allowed.

Existing roof coverings such as wood shake, slate, clay, cement or asbestos-cement tile historically do not provide an adequate base for new roof coverings and could prevent the new covering from achieving a weather-tight seal. They could also allow penetration of waste, snow, etc. These types of existing coverings must always be removed.

When the existing roof has two or more layers of any type of covering system, all layers need to be removed to enable the inspector and contractor to verify that the existing roof deck or sheathing is not water damaged and still capable of providing an adequate support or basis for fastening new material.

Potential revision to commentary on Section 1512.2.1.1: This section identifies the conditions where a recover is not permitted, and all layers of previously installed roof covering systems must be removed prior to the installation of the new roof covering system. When the existing roof or roof covering ~~is water soaked, it must be allowed to dry completely so as not to trap moisture beneath the new layer of covering. This could cause a rapid deterioration of the new covering material, as well as the existing sheathing. The existing covering is required to be removed if it cannot adequately dry out~~ has been water damaged or deteriorated to the apoint that the existing roof or roof covering is not adequate as a base for additional roofing. If it is still wet or if its physical properties have been permanently altered. Existing roof coverings such as wood shake, slate, clay, cement or asbestos-cement tile historically do not provide an adequate base for new roof coverings and could prevent the new covering from achieving a weather-tight seal. They could also allow penetration of water, snow, etc. These types of existing coverings must always be removed. When the existing roof has two or more layers of any type of covering system, all layers need to be removed to enable the inspector and contractor to verify that the existing sheathing is not water damaged and still capable of providing an adequate nailing base. Guidance on determining substrate material suitability and the physical properties condition can be found in the following consensus standards as follows:

For substrate conditions:

- Infrared testing in accordance with ASTM C1153
- Electrical impedance testing in accordance with ASTM D7954/D7954M-21
- Nuclear testing in accordance with ANSI/SPRI/IIBEC NT-1 2012 (R2022)

For physical properties:

- ANSI/SPRI IA-1 2021 - Standard Field Test Procedure for Verifying the Suitability of Roof Substrates and Adhesives
- ANSI/SPRI FX-1 2021 - Standard Field Test Procedure for Determining the Withdrawal Resistance of Roofing Fasteners

Bibliography: ASTM International. 2015. *Standard Practice for Location of Wet Insulation in Roofing Systems Using Infrared Imaging*. ASTM C1153-10(2015), West Conshohocken, PA: ASTM International.

Single Ply Roofing Industry (SPRI). 2006 (R2021). *Standard Field Test Procedure for Verifying the Suitability of Roof Substrates and Adhesives.* ANSI/SPRI IA-1 2021, Waltham, MA: SPRI.

Single Ply Roofing Industry (SPRI). 2010 (R2021). *Standard Field Test Procedure for Determining the Withdrawal Resistance of Roofing Fasteners.* ANSI/SPRI FX-1 2021, Waltham, MA: SPRI.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal will not increase the cost of construction. The approval of roof recover project is already required in writing by manufacturers and, while not specific to system or installation, by the National Roof Contractors Association (NRCA).

Staff Analysis: Section 1512 or the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

CC # S43-25 and CC # S46-25 addresses requirements in a different or contradicting manner related to Section 1512. The committee is urged to make their intensions clear with their actions on these proposals.

S43-25

S44-25

IBC: 1512.4, 1512.4.1 (New); IEBC: [BS] 705.4, 705.4.1 (New)

Proponents: Mark S. Graham, representing National Roofing Contractors Association (NRCA) (mgraham@nrca.net)

2024 International Building Code

1512.4 Reinstallation of materials. Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. Existing vent flashing, metal edgings, drain outlets, collars and metal counterflashings shall not be reinstalled where rusted, damaged or deteriorated. Existing *ballast* that is damaged, cracked or broken shall not be reinstalled. Existing aggregate surfacing materials from built-up roofs shall not be reinstalled.

Add new text as follows:

<u>**1512.4.1** **Above-deck roof insulation.** Above-deck thermal roof insulation shall be permitted to be re-used provided it is *approved*, in accordance with Section 1508, not water-soaked and not deteriorated to the point it is not adequate as a base for additional roofing.</u>

2024 International Existing Building Code

[BS] 705.4 Reinstallation of materials. Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. Existing vent flashing, metal edgings, drain outlets, collars and metal counterflashings shall not be reinstalled where rusted, damaged or deteriorated. Existing ballast that is damaged, cracked or broken shall not be reinstalled. Existing aggregate surfacing materials from built-up roofs shall not be reinstalled.

Add new text as follows:

<u>**705.4.1** **Above-deck roof insulation.** Above-deck thermal roof insulation shall be permitted to be re-used provided it is *approved*, in accordance with Section 1508 of the *International Building Code*, not water-soaked and not deteriorated to the point it is not adequate as a base for additional roofing.</u>

Reason: This proposed code change adds a provision to Section 1512.4-Reinstallation of Materials allowing above-deck thermal roof insulation to be re-used when it meets certain specific conditions.

Large amounts of above-deck roof insulation are currently disposed of unnecessarily because of strict interpretation of IBC Section 1512.2 and IEBC Section 705.4. Allowing the building official to approve insulation re-use can prevent re-usable insulation material from unnecessarily ending up in landfills.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposed code change can result in construction cost savings on specific reroofing projects where all or a portion of the existing above-deck roof insulation can be re-used. Actual savings will vary greatly based on specific project conditions, insulation type and thickness, and the amount of insulation that can be re-used. See cost impact justification for decrease $ amount.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost savings in the range of $0.25 per square foot to about $1 per square foot of roof area are possible for specific reroofing projects where all or a portion of the existing above-deck roof insulation can be re-used. Savings in material cost only is calculated in this estimate. The cost savings figures are based on manufacturers' published cost lists for various above-deck roof insulation products applicable at the time of submission. Some minimal labor savings may also be realized on specific projects but are not inlcuded in this estimate range.

Estimated Life Cycle Cost Impact:

NA

Estimated Life Cycle Cost Impact Justification (methodology and variables):

NA

Staff Analysis: Section 1512 or the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

IBC: 1512.5 (New); IEBC: 705.5 (New)

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com); Philip Oakes, representing NASFM (phil@browning.red)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new text as follows:

1512.5 Reinstallation of PV panel systems. Existing installations of rooftop-mounted *PV panel systems approved* under previous code requirements shall be permitted to be reinstalled after *roof repair* or *roof replacement*, provided all of the following conditions are met:

1. Existing rooftop-mounted *PV panel system*s shall be reinstalled in accordance with the manufacturer's installation instructions and the minimum requirements of the edition of the codes to which it was originally installed.
2. The system shall be reinstalled in the previous location or in an *approved* location.
3. Components of the rooftop mounted *PV panel system* shall not be reused unless such components are in good working condition and *approved*.
4. All single-use components of the PV mounting system shall be replaced in accordance with the manufacturer's installation instructions.

2024 International Existing Building Code

Add new text as follows:

705.5 Reinstallation of PV panel systems. Existing installations of rooftop-mounted *PV panel systems approved* under previous code requirements shall be permitted to be reinstalled after *roof repair* or *roof replacement*, provided all of the following conditions are met:

1. Existing rooftop-mounted *PV panel system*s shall be reinstalled in accordance with the manufacturer's installation instructions and the minimum requirements of the edition of the codes to which it was originally installed.
2. The system shall be reinstalled in the previous location or in an *approved* location
3. Components of the rooftop mounted *PV panel system* shall not be reused unless such components are in good working condition and *approved*.
4. All single-use components of the rack mounting system shall be replaced in accordance with the manufacturer's installation instructions.

S45-25 Part II

IRC: R908.6 (New)

Proponents: Larry Sherwood, Sustainable Energy Action Committee, representing IREC (larry@irecusa.org); Dara Yung, representing California Solar & Storage Association (CALSSA) (dara@calssa.org); Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com); Philip Oakes, representing NASFM (phil@browning.red)

2024 International Residential Code

Add new text as follows:

R908.6 Reinstallation of PV panel systems. Existing installations of rooftop-mounted *PV panel systems approved* under previous code requirements shall be permitted to be reinstalled after *roof repair* or *roof replacement*, provided all of the following conditions are met:

1. Existing rooftop-mounted *PV panel system*s shall be reinstalled in accordance with the manufacturer's installation instructions and the minimum requirements of the edition of the codes to which it was originally installed.
2. The system shall be reinstalled in the previous location or in an *approved* location.
3. Components of the rooftop mounted *PV panel system* shall not be reused unless such components are in good working condition and *approved*.
4. All single-use components of the PV mounting system shall be replaced in accordance with the manufacturer's installation instructions.

Reason: The growing number of re-roofing projects on buildings that have rooftop-mounted photovoltaic panel systems previously installed is prompting code officials to search for sensible guidelines to ensure safety codes are followed. These PV systems often continue to have a useful life after the time that a roof covering or roof assembly is in need of repair or replacement.

This proposal provides direction and reasonable guardrails for the safe reinstallation of the rooftop-mounted PV panel system after reroofing is completed.

1. Condition 1 - If the existing installation of the rooftop mounted PV panel system is considered acceptable, then the system should be able to be returned to the rooftop after the reroofing is completed.
2. Condition 2 – If the system is not reinstalled in its original position, then the code official should determine if the change in location is acceptable.
3. Condition 3 – This correlates with Section 104.9.1 regarding the reuse of materials, equipment and devices.
4. Condition 4 – There are components within some rooftop mounted PV panel systems which can only be used once. Typically, those components are in the rack mounting system, which could include a flashing system or a ground clamp.

The Sustainable Energy Action Committee (SEAC) has prepared a guidance document to address this concern. The following is a link to the document for jurisdictions to use: https://sustainableenergyaction.org/resources/reinstallation-of-pv-system/

This document provides permitting and inspection guidelines in an effort to support the inspection community and the growing number of re-roofing projects that involve an existing photovoltaic panel system. This proposal was prepared by the Sustainable Energy Action Committee (SEAC), a forum for all stakeholders (including, but not limited to, AHJs, designers, engineers, contractors, first responders, manufacturers, suppliers, utilities, and testing labs) to collaboratively identify and find solutions for issues that affect the installation and use of solar energy systems, energy storage systems, demand response, and energy efficiency. The purpose is to facilitate the deployment and use of affordable, clean and renewable energy in a safe, efficient, and sustainable manner.

All recommendations from SEAC are approved by diverse stakeholders through a consensus process. For more information, please visit www.sustainableenergyaction.org

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal simply clarifies the ongoing use of previously approved equipment after roof repair or replacement, so it does not impact the cost of construction.

Staff Analysis: Section 1512 or the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC CC # S45-25 Part I and CC # S46-25 addresses requirements in a different or contradicting manner related to Section 1512. The committee is urged to make their intensions clear with their actions on these proposals.

2024 International Building Code

SECTION 1512
REROOFING

Revise as follows:

1512.1 General. Materials and methods of application used for recovering or replacing an existing *roof covering* shall comply with ~~the requirements of Chapter 15~~ Chapter 7 of the *International Existing Building Code*.

~~**Exceptions:**~~

1. ~~*Roof replacement* or *roof recover* of existing *low-slope roof coverings* shall not be required to meet the minimum design slope requirement of $^1/_4$ unit vertical in 12 units horizontal (2-percent slope) in Section 1507 for roofs that provide *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2.~~
2. ~~Recovering or replacing an existing *roof covering* shall not be required to meet the requirement for secondary (emergency overflow) drains or *scuppers* in Section 1502.2 for roofs that provide for *positive roof drainage* and meet the requirements of Sections 1608.3 and 1611.2. For the purposes of this exception, existing secondary drainage or *scupper* systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or *scuppers* designed and installed in accordance with Section 1502.2.~~

Delete without substitution:

~~**1512.2 Roof replacement.** *Roof replacement* shall include the removal of all existing layers of *roof assembly* materials down to the *roof deck*.~~

~~**Exceptions:**~~

1. ~~Where the existing *roof assembly* includes an ice barrier membrane that is adhered to the *roof deck* and the existing sheathing is not water-soaked or deteriorated to the point that it is not adequate as a base for additional roofing, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507 where permitted by the *roof covering* manufacturer and new ice barrier *underlayment* manufacturer.~~
2. ~~Where the existing roof includes a self-adhered *underlayment* and the existing sheathing is not water-soaked or deteriorated to the point that it is not adequate as a base for additional roofing, the existing self-adhered *underlayment* shall be permitted to remain in place and covered with an *underlayment* complying with Tables 1507.1.1(1), 1507.1.1(2) and 1507.1.1(3).~~
3. ~~Where the existing roof includes one layer of self-adhered *underlayment* and the existing layer cannot be removed without damaging the *roof deck*, a second layer of self-adhered *underlayment* is permitted to be installed over the existing self-adhered *underlayment* provided that the following conditions are met:~~
   - ~~3.1. It is permitted by the *roof covering* manufacturer and self-adhered *underlayment* manufacturer.~~
   - ~~3.2. The existing sheathing is not water-soaked or deteriorated to the point that it is not adequate as a base for additional roofing.~~
   - ~~3.3. The second layer of self-adhered *underlayment* is installed such that buildup of material at walls, valleys, roof edges, end laps and side laps does not exceed two layers.~~

~~**1512.3 Roof recover.** The installation of a new *roof covering* over an existing *roof covering* shall be permitted where any of the following conditions occur:~~

1. ~~Where the new *roof covering* is installed in accordance with the *roof covering* manufacturer's approved instructions.~~
2. ~~Complete and separate roofing systems, such as standing-seam *metal roof panel* systems, that are designed to transmit the roof *loads* directly to the *building*'s structural system and that do not rely on existing roofs and *roof coverings* for support, shall not require the removal of existing *roof coverings*.~~
3. ~~Metal panel, metal shingle and concrete and clay tile *roof coverings* shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1512.3.1.~~
4. ~~The application of a new protective *roof coating* over an existing protective *roof coating*, *metal roof panel*, built-up roof, spray polyurethane foam roofing system, *metal roof shingles*, mineral-surfaced roll roofing, modified bitumen roofing or *thermoset* and *thermoplastic* single-ply roofing shall be permitted without tear off of existing *roof coverings*.~~

~~**Exception:** A roof recover shall not be permitted where any of the following conditions occur:~~

1. ~~The existing roof or *roof covering* is water-soaked or has deteriorated to the point that the existing roof or *roof covering* is not adequate as a base for additional roofing.~~
2. ~~The existing *roof covering* is slate, clay, cement or asbestos-cement tile.~~
3. ~~The existing roof has two or more applications of any type of *roof covering*.~~

~~**1512.3.1 Roof recovering over wood shingles or shakes.** Where the application of a new *roof covering* over wood shingle or shake roofs creates a combustible concealed space, the entire existing surface shall be covered with *gypsum panel products* , *mineral fiber*, glass fiber or other *approved* materials securely fastened in place.~~

~~**1512.4 Reinstallation of materials.** Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. Existing vent flashing, metal edgings, drain outlets, collars and metal counterflashings shall not be reinstalled where rusted, damaged or deteriorated. Existing *ballast* that is damaged, cracked or broken shall not be reinstalled. Existing aggregate surfacing materials from built-up roofs shall not be reinstalled.~~

~~**1512.5 Flashings**. Flashings shall be reconstructed in accordance with *approved* manufacturer's installation instructions. Metal flashing to which bituminous materials are to be adhered shall be primed prior to installation.~~

Reason: IBC Section 1512-Reroofing is identical to IEBC Section 705-Reroofing. In the IEBC, reroofing operations, including re-covering or replacing an existing roof covering, are considered Level 1 alterations.

This proposed code change strikes the specific reroofing requirements from IBC Section 1512-Reroofing and replaces these with a pointer to the identical requirements in IEBC Section 705-Reroofing. This proposed change eliminates redundancy in the I-codes and does not change the codes' technical requirements for reroofing.

Similar uses of pointers, instead of redundant requirements, already occur in IBC Chapter 15 in Section 1502.1, where Chapter 11 of the *International Plumbing Code* is referenced and in Section 1507.15 where the *International Fire Code* is referenced.

NOTE: Modifications made by this proponent for 4 other code change proposals related to IBC Section 1512.1 Exception 1, 1512.1 Exception 2, 1512.3, & 1512.4.1, are not required if this proposal is accepted (modifications to the IEBC Section 705.1 Exception 1, 705.1 Exception 2, 705.3, & 705.4.1 are still applicable if this proposal is accepted).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal strikes redundant text and requirements in the I-codes; it does not change technical requirements. As a result, there is no increase or decrease in the cost of construction as a result of this change.

Staff Analysis: Section 1512 of the IBC and Section 705 of the IEBC are currently specifically duplicated and maintained as such between the IBC and IEBC

CC # S46-25 and CC # S45-25 Part I/ CC # S42-25/CC #S43-25/CC #S38-25/CC #S37-25 Part I addresses requirements in a different or contradicting manner related to Section 1512. The committee is urged to make their intensions clear with their actions on these proposals.

S46-25

S47-25

IBC: CHAPTER 15, SECTION 1501, 1501.1, SECTION 1805, 1805.1, 1805.1.1, 1805.1.2, 1805.1.2.1, 1805.2, 1805.2.1, 1805.2.2, 1805.2.2.1, 1805.3, 1805.3.1, 1805.3.2, 1805.3.2.1, 1805.3.3, 1805.4, 1805.4.1, 1805.4.2, 1805.4.3, 1805.1.3, SECTION 1513 (New), 1513.1 (New), 1513.2 (New), 1513.2.1 (New), 1513.2.2 (New), 1513.2.2.1 (New), 1513.3 (New), 1513.3.1 (New), 1513.3.2 (New), 1513.3.2.1 (New), 1513.3.3 (New)

Proponents: Bill McHugh, CM Services, Inc., representing Chicago Roofing Contractors Association (bill@mc-hugh.us)

2024 International Building Code

Revise as follows:

CHAPTER 15
ROOF ASSEMBLIES~~,~~ ~~AND~~ ROOFTOP STRUCTURES AND BELOW GRADE WATERPROOFING AND DAMPPROOFING

SECTION 1501
GENERAL

1501.1 Scope. The provisions of this chapter shall govern the design, materials, construction and quality of *roof assemblies*, ~~and~~ *rooftop structures* *and below grade waterproofing and dampproofing.*

SECTION 1805
~~DAMPPROOFING AND WATERPROOFING~~ DRAINAGE SYSTEMS

1805.1 General. Walls or portions thereof that retain earth and enclose interior spaces and floors below grade shall ~~be waterproofed and dampproofed~~ be provided with drainage systems in accordance with this section, with the exception of those spaces containing groups other than residential and institutional where such omission is not detrimental to the *building* or occupancy.

Ventilation for crawl spaces shall comply with Section 1202.4.

1805.1.1 Story above grade plane. Where a *basement* is considered a *story above grade plane* and the finished ground level adjacent to the basement wall is below the basement floor elevation for 25 percent or more of the perimeter, ~~the floor and walls shall be dampproofed in accordance with Section 1805.2 and~~ a foundation drain shall be installed in accordance with Section 1805.4.2. The foundation drain shall be installed around the portion of the perimeter where the basement floor is below ground level. The provisions of Sections 1803.5.4, 1805.3 and 1805.4.1 shall not apply in this case.

1805.1.2 Under-floor space. The finished ground level of an under-floor space such as a crawl space shall not be located below the bottom of the footings. Where there is evidence that the ground-water table rises to within 6 inches (152 mm) of the ground level at the outside *building* perimeter, or that the surface water does not readily drain from the *building* site, the ground level of the under-floor space shall be as high as the outside finished ground level, unless an *approved* drainage system is provided. The provisions of Sections 1803.5.4, 1805.2, 1805.3 and 1805.4 shall not apply in this case.

1805.1.2.1 Flood hazard areas. For *buildings* and *structures* in *flood hazard areas* as established in Section 1612.3, the finished ground level of an under-floor space such as a crawl space shall be equal to or higher than the outside finished ground level on one side or more.

Exception: Under-floor spaces of Group R-3 *buildings* that meet the requirements of FEMA TB 11.

Delete without substitution:

~~**1805.2 Dampproofing.** Where hydrostatic pressure will not occur as determined by Section 1803.5.4, floors and walls for other than~~

~~**1805.2 Dampproofing.** Where hydrostatic pressure will not occur as determined by Section 1805.1.1, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AWC PWF.~~

~~**1805.2.1 Floors.** Dampproofing materials for floors shall be installed between the floor and the base course required by Section 1805.4.1, except where a separate floor is provided above a concrete slab.~~

~~Where installed beneath the slab, dampproofing shall consist of not less than 6-mil (0.006 inch; 0.152 mm) polyethylene with joints lapped not less than 6 inches (152 mm), or other *approved* methods or materials. Where permitted to be installed on top of the slab, dampproofing shall consist of mopped-on bitumen, not less than 4-mil (0.004 inch; 0.102 mm) polyethylene, or other *approved* methods or materials. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.~~

~~**1805.2.2 Walls.** Dampproofing materials for walls shall be installed on the exterior surface of the wall, and shall extend from the top of the footing to above ground level.~~

~~Dampproofing shall consist of a bituminous material, 3 pounds per square *yard* (16 N/m^2) of acrylic modified cement, $^1/_8$ inch (3.2 mm) coat of *surface-bonding mortar* complying with ASTM C887, any of the materials permitted for waterproofing by Section 1805.3.2 or other *approved* methods or materials.~~

~~**1805.2.2.1 Surface preparation of walls.** Prior to application of dampproofing materials on concrete walls, holes and recesses resulting from the removal of form ties shall be sealed with a bituminous material or other *approved* methods or materials. Unit *masonry* walls shall be parged on the exterior surface below ground level with not less than $^3/_8$ inch (9.5 mm) of Portland cement *mortar*. The parging shall be coved at the footing.~~

~~**Exception:** Parging of unit *masonry* walls is not required where a material is *approved* for direct application to the *masonry*.~~

~~**1805.3 Waterproofing.** Where the ground-water investigation required by Section 1803.5.4 indicates that a hydrostatic pressure condition exists, and the design does not include a ground-water control system as described in Section 1805.1.3, walls and floors shall be waterproofed in accordance with this section.~~

~~**1805.3.1 Floors.** Floors required to be waterproofed shall be of concrete and designed and constructed to withstand the hydrostatic pressures to which the floors will be subjected.~~

~~Waterproofing shall be accomplished by placing a membrane of rubberized asphalt, butyl rubber, fully adhered/fully bonded HDPE or polyolefin composite membrane or not less than 6-mil [0.006 inch (0.152 mm)] polyvinyl chloride with joints lapped not less than 6 inches (152 mm) or other *approved* materials under the slab. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.~~

~~**1805.3.2 Walls.** Walls required to be waterproofed shall be of concrete or *masonry* and shall be designed and constructed to withstand the hydrostatic pressures and other lateral *loads* to which the walls will be subjected.~~

~~Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (305 mm) above the maximum elevation of the ground-water table. The remainder of the wall shall be dampproofed in accordance with Section 1805.2.2. Waterproofing shall consist of two-ply hot-mopped felts, not less than 6-mil (0.006 inch; 0.152 mm) polyvinyl chloride, 40-mil (0.040 inch; 1.02 mm) polymer-modified asphalt, 6-mil (0.006 inch; 0.152 mm) polyethylene or other *approved* methods or materials capable of bridging nonstructural cracks. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.~~

~~**1805.3.2.1 Surface preparation of walls.** Prior to the application of waterproofing materials on concrete or *masonry* walls, the walls shall be prepared in accordance with Section 1805.2.2.1.~~

~~**1805.3.3 Joints and penetrations.** *Joints* in walls and floors, *joints* between the wall and floor and penetrations of the wall and floor~~

~~shall be made watertight utilizing *approved* methods and materials.~~

Revise as follows:

~~**1805.4**~~ **1805.1.3** **Subsoil drainage system.** Where a hydrostatic pressure condition does not exist, dampproofing shall be provided and a base shall be installed under the floor and a drain installed around the foundation perimeter. A subsoil drainage system designed and constructed in accordance with Section 1805.1.4.3 ~~1805.1.3~~ shall be deemed adequate for lowering the ground-water table.

~~**1805.4.1**~~ **1805.1.4** **Floor base course.** Floors of basements, except as provided for in Section 1513.1.1 ~~1805.1.1,~~ shall be placed over a floor base course not less than 4 inches (102 mm) in thickness that consists of gravel or crushed stone containing not more than 10 percent of material that passes through a No. 4 (4.75 mm) sieve.

Exception: Where a site is located in well-drained gravel or sand/gravel mixture soils, a floor base course is not required.

~~**1805.4.2**~~ **1805.1.4.1** **Foundation drain.** A drain shall be placed around the perimeter of a foundation that consists of gravel or crushed stone containing not more than 10-percent material that passes through a No. 4 (4.75 mm) sieve. The drain shall extend not less than 12 inches (305 mm) beyond the outside edge of the footing. The thickness shall be such that the bottom of the drain is not higher than the bottom of the base under the floor, and that the top of the drain is not less than 6 inches (152 mm) above the top of the footing. The top of the drain shall be covered with an *approved* filter membrane material. Where a drain tile or perforated pipe is used, the invert of the pipe or tile shall not be higher than the floor elevation. The top of joints or the top of perforations shall be protected with an *approved* filter membrane material. The pipe or tile shall be placed on not less than 2 inches (51 mm) of gravel or crushed stone complying with Section 1805.4.1, and shall be covered with not less than 6 inches (152 mm) of the same material.

~~**1805.4.3**~~ **1805.1.4.2** **Drainage discharge.** The floor base and foundation perimeter drain shall discharge by gravity or mechanical means into an *approved* drainage system that complies with the *International Plumbing Code*.

Exception: Where a site is located in well-drained gravel or sand/gravel mixture soils, a dedicated drainage system is not required.

~~**1805.1.3**~~ **1805.1.4.3** **Ground-water control.** Where the ground-water table is lowered and maintained at an elevation not less than 6 inches (152 mm) below the bottom of the *lowest floor*, the floor and walls shall be dampproofed in accordance with Section 1513.2 ~~1805.2~~. The design of the system to lower the ground-water table shall be based on accepted principles of engineering that shall consider, but not necessarily be limited to, permeability of the soil, rate at which water enters the drainage system, rated capacity of pumps, head against which pumps are to operate and the rated capacity of the disposal area of the system.

Add new text as follows:

SECTION 1513
DAMPPROOFING AND WATERPROOFING

1513.1 General. Walls or portions thereof that retain earth and enclose interior spaces and floors below grade shall be waterproofed and dampproofed in accordance with this section, with the exception of those spaces containing groups other than residential and institutional where such omission is not detrimental to the building or occupancy. Wind and fire rating requirements referenced in this chapter do not apply to dampproofing and waterproofing unless part of a *roof assembly*. Ventilation for crawl spaces shall comply with Section 1202.4.

1513.2 Dampproofing. Where hydrostatic pressure will not occur as determined by Section 1803.5.4, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AWC PWF.

1513.2.1 Floors. Dampproofing materials for floors shall be installed between the floor and the base course required by Section 1805.1.4, except where a separate floor is provided above a concrete slab.
Where installed beneath the slab, dampproofing shall consist of not less than 6-mil (0.006 inch; 0.152 mm) polyethylene with joints lapped not less than 6 inches (152 mm), or other approved methods or materials. Where permitted to be installed on top of the slab,

dampproofing shall consist of mopped-on bitumen, not less than 4-mil (0.004 inch; 0.102 mm) polyethylene, or other approved methods or materials. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

1513.2.2 Walls. Dampproofing materials for walls shall be installed on the exterior surface of the wall, and shall extend from the top of the footing to above ground level. Dampproofing shall consist of a bituminous material, 3 pounds per square yard (16 N/m2) of acrylic modified cement, 1/8 inch (3.2 mm) coat of surface-bonding mortar complying with ASTM C887, any of the materials permitted for waterproofing by Section 1513 or other approved methods or materials.

1513.2.2.1 Surface preparation of walls. Prior to application of dampproofing materials on concrete walls, holes and recesses resulting from the removal of form ties shall be sealed with a bituminous material or other approved methods or materials. Unit masonry walls shall be parged on the exterior surface below ground level with not less than 3/8 inch (9.5 mm) of Portland cement mortar. The parging shall be coved at the footing.

Exception: Parging of unit masonry walls is not required where a material is approved for direct application to the masonry.

1513.3 Waterproofing.. Where the ground-water investigation required by Section 1803.5.4 indicates that a hydrostatic pressure condition exists, and the design does not include a ground-water control system as described in Section 1805.1.3, walls and floors shall be waterproofed in accordance with this section.

1513.3.1 Floors. Floors required to be waterproofed shall be of concrete and designed and constructed to withstand the hydrostatic pressures to which the floors will be subjected. Waterproofing shall be accomplished by placing a membrane of rubberized asphalt, butyl rubber, fully adhered/fully bonded HDPE or polyolefin composite membrane or not less than 6-mil [0.006 inch (0.152 mm)] polyvinyl chloride with joints lapped not less than 6 inches (152 mm) or other approved materials under the slab. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

1513.3.2 Walls.. Walls required to be waterproofed shall be of concrete or masonry and shall be designed and constructed to withstand the hydrostatic pressures and other lateral loads to which the walls will be subjected. Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (305 mm) above the maximum elevation of the ground-water table. The remainder of the wall shall be dampproofed in accordance with Section 1513.2.2. Waterproofing shall consist of two-ply hot-mopped felts, not less than 6-mil (0.006 inch; 0.152 mm) polyvinyl chloride, 40-mil (0.040 inch; 1.02 mm) polymer-modified asphalt, 6-mil (0.006 inch; 0.152 mm) polyethylene or other approved methods or materials capable of bridging nonstructural cracks. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

1513.3.2.1 Surface preparation of walls.. Prior to the application of waterproofing materials on concrete or masonry walls, the walls shall be prepared in accordance with Section 1513.2.2.1.

1513.3.3 Joints and penetrations.. *Joints* in walls and floors, *joints* between the wall and floor and penetrations of the wall and floor shall be made watertight utilizing *approved* methods and materials.

Reason: The purpose of this proposal is to separate Chapter 18's wall and foundation drainage systems from the dampproofing and waterproofing sections of Chapter 19, and move it to Chapter 15. Since dampproofing and waterproofing materials are described in detail in Chapter 15, the location of these disciplines belongs with in Chapter 15. Also, roofing, waterproofing and dampproofing are very similar disciplines. The materials, contractors, inspection agencies, manufacturers, distribution are all similar.

This proposal leaves important foundation wall drainage design in Ch. 18, and intact in the code. The only change is to separate the two disciplines - waterproofing and dampproofing from drainage design in the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not increase the use of dampproofing or waterproofing in buildings, nor does it reduce usage. It is reorganizing the IBC to recognize the correct location of dampproofing and waterproofing.

S48-25

IBC: SECTION 202, 1602.1

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

[BS] WIND DESIGN GEODATABASE. The ASCE database (version 2022-1.0) of geocoded wind speed design data. The ASCE Wind Design Geodatabase of geocoded wind speed design data is available at ~~https://asce7hazardtool.online/~~ https://ascehazardtool.org/.

[BS] WINDBORNE DEBRIS REGION. Areas within *hurricane-prone regions* located:

1. Within 1 mile (1.61 km) of the mean high-water line where an Exposure D condition exists upwind at the waterline and the basic wind speed, *V*, is 130 mph (58 m/s) or greater; or
2. In areas where the basic wind speed, *V*, is 140 mph (63 m/s) or greater.

For *Risk Category* II buildings and other structures and Risk Category III buildings and other structures, except health care facilities, the windborne debris region shall be based on ~~Figure 1609.3.(1)~~ Figure 1609.3(2). For *Risk Category* III health care facilities, the windborne debris region shall be based on Figure 1609.3(3). For *Risk Category* IV buildings and other structures ~~and *Risk Category* III health care facilities~~ , the windborne debris region shall be based on ~~Figure 1609.3(2)~~ Figure 1609.3(4).

1602.1 Notations. The following notations are used in this chapter:

D	=	*Dead load.*
D_i	=	Weight of ice in accordance with Chapter 10 of ASCE 7.
E	=	Combined effect of horizontal and vertical earthquake induced forces as defined in Section 12.4 of ASCE 7.
F	=	Load due to fluids with well-defined pressures and maximum heights.
F_a	=	Flood load in accordance with Chapter 5 of ASCE 7.
H	=	Load due to lateral earth pressures, ground water pressure or pressure of bulk materials.
L	=	*Live load.*
L_r	=	*Roof live load.*
$p_{g(asd)}$	=	*Allowable stress design* ground snow load.
p_g	=	Ground snow load determined from Figures 1608.2(1) through 1608.2(4) and Table 1608.2.
R	=	Rain load.
S	=	Snow load.
T	=	Cumulative effects of self-straining load forces and effects.
V_{asd}	=	*Allowable stress design wind speed*, mph (m/s) where applicable.
V	=	Basic wind speed, V, mph (m/s) determined from Figures 1609.3(1) through 1609.3(4) or ~~ASCE 7~~ the *Wind Design Geodatabase*.
V_T	=	Tornado speed, mph (m/s) determined from Chapter 32 of ASCE 7.
W	=	Load due to wind pressure.
W_i	=	Wind-on-ice in accordance with Chapter 10 of ASCE 7.

Reason: The proposal includes two changes: i) revises the URL for the ASCE Hazard Tool website; and ii) revises the definition of windborne debris region to align with ASCE/SEI 7-22 Section 26.12.3.1. Further reasoning is below:

For item (i), the ASCE Hazard Tool URL changed from https://asce7hazardtool.online to https://ascehazardtool.org/.

For item (ii), the proposed change revises the windborne debris definition to align with ASCE/SEI 7-22 Section 26.12.3.1. ASCE/SEI 7 Section 26.12.3.1 changed in ASCE/SEI 7-16 and was not incorporated in prior versions of IBC. The changes also include the word "other" in front of the word "structures" to align with the scope and standard title for ASCE/SEI 7.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proposed IBC code changes are editorial clarifications that improve the conciseness of IBC for alignment to ASCE/SEI 7.

S49-25 Part I

IBC: 1603.1, 1608.3 (New)

Proponents: John Grenier, representing National Council of Structural Engineers Associations (NCSEA) (jgrenier@greniereng.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE ADMINISTRATIVE (IADMIN) CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1603.1 General. *Construction documents* shall show the material, size, section and relative locations of structural members with floor levels, column centers and offsets dimensioned. The design *loads* and other information pertinent to the structural design required by Sections 1603.1.1 through 1603.1.9 shall be indicated on the *construction documents*.

Exception: *Construction documents* for *buildings* constructed in accordance with the *conventional light-frame construction* provisions of Section 2308 shall indicate the following structural design information:

1. Floor and roof dead and *live loads*.
2. Ground snow load, p_g , and *allowable stress design* ground snow load, $p_{g(asd)}$.
3. Basic *wind speed* , *V*, mph (m/s), and *allowable stress design* wind speed, V_{asd}, as determined in accordance with Section 1609.3.1 and wind exposure.
4. *Seismic design category* and *site class*.
5. Flood design data, if located in *flood hazard areas* established in Section 1612.3.
6. Design load-bearing values of soils.
7. Rain load data.
8. Designated snow storage area locations, design loads, and maximum design stored snow height.

Add new text as follows:

1608.4 Posting designated snow storage areas. For designated snow storage areas, maximum design loads and maximum design stored snow height shall be posted by the owner or owner's authorized agent in accordance with Section 106.1.

S49-25 Part I

S49-25 Part II

IBC: [A] 106.1

Proponents: John Grenier, representing National Council of Structural Engineers Associations (NCSEA) (jgrenier@greniereng.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

Revise as follows:

[A] 106.1 ~~Live loads posted~~ Posting of loads. ~~In commercial or industrial *buildings*, for each floor or portion thereof designed for *live loads* exceeding 50 psf (2.40 kN/m^2), such design *live loads* shall be conspicuously posted by the *owner* or the *owner's* authorized agent in that part of each story in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.~~The following live loading conditions shall have the loading conditions posted. Loads shall be conspicuously posted by the owner or owner's authorized agent , using durable signs. It shall be unlawful to remove or deface such notices.

1. *Live Loads* in commercial or industrial buildings, for each floor or portion thereof designed for live loads exceeding 50 psf (2.40 kN/m2)
2. At designated snow storage areas, the snow storage area shall be clearly demarcated, and signs shall indicate the allowed maximum stored snow height within the designated snow storage area.

Reason: Large snow loads in excess of roof snow load requirements have resulted in catastrophic collapses. Especially in parking structures in cold climates, where snow removal is required for occupancy during winter months, snow is often moved to a small portion of the structure. Parapet walls can make removing the snow from the elevated portion of the structure challenging and time consuming. Providing a methodology for communicating snow storage area designs and posting requirements in the building code can improve the maintenance operations of structures requiring snow removal and improve public safety where designers elect to consider these additional design load conditions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not require that snow storage areas be provided, it only provides a methodology for documenting and communicating the design loads if snow storage is elected by the owner. Therefore, there is no cost impact.

Staff Analysis: S49-25 Part II and ADM41-25 Part I address requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S49-25 Part II

S50-25

IBC: 1603.1.5, 1603.1.6

Proponents: Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Seth Thomas, KPFF Consulting Engineers, representing Self (seth.thomas@kpff.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

Revise as follows:

1603.1.5 Earthquake design data. The following information related to seismic *loads* shall be shown, regardless of whether seismic *loads* govern the design of the lateral force-resisting system of the *structure*:

1. Project location (latitude/ longitude)

~~1.~~ 2. *Risk category*.

~~2.~~ 3. Seismic importance factor, I_e.

~~3.~~ 4. Spectral response acceleration parameters, S_S and S_1.

~~4.~~ 5. *Site class*.

~~5.~~ 6. Design spectral response acceleration parameters, S_{DS} and S_{D1}, MPRS spectrum or Site-specific response spectrum.

7. Design spectral response acceleration, S_{DS}, for non-structural component bracing.

~~6.~~ 8. *Seismic design category*.

~~7.~~ 9. Basic seismic force-resisting system~~(s).~~ in each direction.

~~8. Design base shear(s).~~

~~9. Seismic response coefficient(s), *CS*.~~

10. ~~Response modification coefficient(s), *R*.~~ Seismic force-resisting system factors R, C_d, and Ω_0 in each direction.

11. Seismic response coefficient, C_s, in each direction.

12. Design base shear, V, in each direction.

13. Design earthquake displacement, δ_{DE}, in each direction.

14. Redundancy factor, ρ, in each direction.

~~11.~~ 15. Analysis procedure used.

16. Fundamental period, T, in each direction.

17. Approximate fundamental period, T_a, in each direction.

1603.1.6 Geotechnical information. ~~The design load-bearing values of soils shall be shown on the *construction documents*.~~ The construction documents shall provide a description of the foundation system and the design load-bearing values of soils and/or deep foundations elements. In *Seismic Design Categories* C through F, the capacity of the soil/foundation for seismic load cases shall be included..

Reason: ASCE 7-22 updated the non-structural bracing provisions for equipment and other non-structural components (ASCE 7-22 Equation 13.3-1 though 13.3-6). This equation now requires the building fundamental period of the structure to determine the non-structural component forces. The non-structural equipment designer (either at the time of construction or after) should not have to determine the period of the building, thus this information should be included in the drawings and has been added as item #17. The engineer or record (EOR) will already have this information when they design the structure so there is no additional effort. While reviewing this list several other items were determined to be missing that would be important to document for both future use in an evaluation or renovation or by review of a peer reviewer or plans examiner/building official. A summary of all items and the rationale is provided below.

Item 1: Project location – the exact location of the project is helpful in comparing design forces to those listed on the drawings. This could be an address, but common practice is to list latitude and longitude

Item 2: Risk Category – [Existing requirement #1] and is important item to understand the initial occupancy of the building and influences the seismic design forces selected.

Item 3: Seismic importance factor – [Existing code requirement #2]

Item 4: Site class – [existing requirement #4]

Item 5: Spectral response parameters Ss and S1 [Existing requirement #3]

Item 6: Design spectral response parameters – the existing code requirement notes the SDS and SD1 values used to generate the historical 2-point spectra [Existing requirement #5], however ASCE 7-22 now provides the option for the Multi period response spectra which would be more appropriate to provide in the drawings if used. Additionally, some projects have site specific response spectra which would also be relevant to provide if that is what was used for design.

Item 7: Design spectral response parameters for non-structural bracing. If the multi period or site specific response spectra is used it is not obvious what the SDs value that should be used for non-structural bracing is. This is important for historical documentation and for the delegated designers use.

Item 8: Seismic Design Category [Existing requirement #6]

Item 9: Description of seismic force resisting system – this is an existing requirement, however it has been clarified that it should be listed for each direction as it is common to have different SFRS in each primary direction [Existing requirement #7]

Item 10: Seismic force resisting system factors. This requires the designer to provide the R, Cd, and Ω for each system in each direction used for design. This an expansion of item 10 and Existing requirement #10.

Item 11: Seismic response coefficients [Existing requirement #9] with the clarification to provide in each direction.

Item 12: Design base shear [Existing requirement # 8] with the clarification to provide in each direction.

Item 13: Design earthquake displacement is a new requirement to provide the displacement which is often used for the design of non-structural components. This is also valuable information if a new structure is built adjacent and a building separation joint needs to be sized.

Item 14: Redundancy factor used. This adds a new requirement to provide if the system in each direction was designed using a r = 1.3 or not.

Item 15: Description of analysis procedure used [Existing requirement #11]

Item 16: Fundamental Period of structure in each direction. This is a new requirement providing the fundamental period of the building.

Item 17: Approximate fundamental period of structure in each direction. This value is used by engineers to determine the seismic forces for non-structural anchorage of equipment based on the revisions of ASCE 7-22.
It should be noted that the existing requirements have also been reorganized to a more logical order as well as minor editorial cleanup to use more consistent language as well as matching the symbols used in ASCE 7-22. This change proposals makes zero changes to the design of structures and only expands the required information put on the drawings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal does not result in any changes to what is constructed.

S50-25

S51-25

IBC: 1603.1.10 (New)

Proponents: Bonnie Manley, representing AISC (manley@aisc.org); Emily Dunham, Gresham Smith, representing NCSEA Code Advisory Committee Special Inspections/Quality Assurance Subcommittee (emily.dunham@greshamsmith.com)

2024 International Building Code

Add new text as follows:

1603.1.10 Identification and requirements for the design of systems or components by others. Where the *registered design professional* delegates portions of the project design for systems or components to others, the following information shall be shown, as applicable:

1. Identification of the system or component to be designed by others.
2. Design criteria applicable to the system or component to be designed by others, including design standards, special loads, serviceability, and other performance criteria.
3. Configurations and dimensions related to the system or component to be designed by others.
4. Identification of limitations, requirements, and constraints for the system or component to be designed by others, including, but not limited to, supports, anchors, and connections.
5. Requirements for the submission of drawings and calculations.

Reason: This proposal recommends a new subsection in IBC Section 1603.1. This proposal is intended to stand independently; however, it complements our proposal related to IBC Section 1604.1.

This new Section 1603.1.10 is intended to capture the necessary information on construction documents for designs delegated to others. Delegated design is a long-standing practice by which a building's systems and components are designed by the producers of those systems and components and not by the project's registered design professional(s). If the RDP specifies any system or component in the construction documents to be designed by others, then the pertinent information, listed in 1603.1.10, related to the delegated design of these systems or components must be shown in the construction documents along with the information already required in Sections 1603.1.1 through 1603.1.9.

Delegated designs may or may not be "deferred submittals," and vice versa; in fact, delegated designs may even be included in the initial permit package. The documentation for these systems and components can be deferred submittals and, accordingly, would need to meet the requirements of Section 107.3.4. While provisions for deferred submittals have been in IBC for many editions, the additional requirements in this proposal are intended to clarify and strengthen the roles and responsibilities of all those involved in the design process, including those involved in delegated design. (Example: A modification to an existing curtain wall can be deferred and not be delegated. The same modification could be both delegated and deferred.)

Why is this necessary?

The delegation of design work is common in structural engineering practice. In fact, almost all structural materials currently have some elements of work that are delegated by an Engineer of Record (EOR) to a Specialty Structural Engineer (SSE) as directed in the model building code (e.g., IBC) and its reference standards.

From the structural steel perspective, the most common design work delegated is connection design. It is addressed comprehensively in AISC 360, Specification for Structural Steel Buildings, and the AISC 303, Code of Standard Practice for Steel Buildings and Bridges. The requirements in those documents are consistent with those recommended by CASE, NCSEA, and SEI on design responsibility. Additionally, the AISC provisions dovetail with the model building code requirements on deferred submittals.

However, recent real-world examples continue to demonstrate that improper practices still exist because the delegation of design work specified in the model building code is not as clear and robust as it could be and, as a result, does not safeguard the basic intent for life safety in the process.

Example of a Better Way – Missouri

We recently became aware of current Missouri law, which provides straightforward and concise language on delegated design and deferred submittals in 20 CSR 2030-21.020 Engineer of Record and Specialty Engineers. (Available at: https://www.sos.mo.gov/cmsimages/adrules/csr/current/20csr/20c2030-21.pdf) It describes a transparent process for delegating design work to ensure the protection of life safety.

Development of the ICC Proposals

The concepts presented in the MO statute have been distilled down and transitioned into requirements appropriate for adoption in a model building code. This includes utilizing IBC terminology, substituting EOR with registered design professional, and, instead of introducing a defined term for SSE, we've used the general phrase "designed by others." This proposal and its companion proposal clarify the following three fundamental concepts for delegation practice in the IBC:

1. The delegating RDP must state the criteria that the others performing the delegated design work must meet.
2. The others performing the delegated design work must meet those stated criteria and submit their work to the RDP.
3. The RDP must review that submission for conformance to the stated criteria.

AISC (2022), *Code of Standard Practice for Steel Buildings and Bridges,* ANSI/AISC 303-22, American Institute of Steel Construction, Chicago, Ill., May 9, 2022. Available at: https://www.aisc.org/publications/steel-standards/.
Rules of Department of Commerce and Insurance, Division 2030—Missouri Board for Architects, Professional Engineers, Professional Land Surveyors, and Professional Landscape Architects, Chapter 21—Professional Engineering, 20 CSR 2030-21.020 *Engineer of Record and Specialty Engineers*. Available at: https://www.sos.mo.gov/cmsimages/adrules/csr/current/20csr/20c2030-21.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification. Should design be delegated to others, then the information recommended in this proposal must be specified in the construction documents.

S51-25

S52-25

IBC: 1604.1, 1604.1.1 (New)

Proponents: Bonnie Manley, representing AISC (manley@aisc.org); Emily Dunham, Gresham Smith, representing NCSEA Code Advisory Committee Special Inspections/Quality Assurance Subcommittee (emily.dunham@greshamsmith.com)

2024 International Building Code

1604.1 General. *Building*, *structures* and parts thereof shall be designed and constructed in accordance with *strength* design, *load and resistance factor* design, *allowable stress design*, empirical design or conventional construction methods, as permitted by the applicable material chapters and referenced standards.

Add new text as follows:

1604.1.1 Delegated design. Delegation of portions of the project design to others by the *registered design professional* shall be in accordance with this section.

1. The *registered design professional* shall show the design and other applicable requirements for the delegated designs on the *construction documents.*
2. The delegated designs shall comply with the requirements of the building code and the requirements specified by the *registered design professional* and shall be submitted to the *registered design professional* for review.
3. The *registered design professional* shall review the delegated designs for general conformance with the *construction documents.*

Reason: This proposal recommends a new subsection in IBC Section 1604.1. This proposal is intended to stand independently; however, it complements our proposal related to IBC Section 1603.1.

This proposal is motivated by our belief that the provisions relating to the role and responsibilities of the registered design professional should be clarified and strengthened as they pertain to the delegated design. Delegated design is a long-standing practice by which a building's systems and components are designed by the producers of those systems and components and not by the project's registered design professional(s). Examples of these components include but are not limited to, hollow-core precast slabs and other precast elements, mass timber systems and elements, structural steel systems and elements, metal plate-connected wood roof trusses, curtain walls, and sprinkler systems.

To ensure proper delegation practice, this proposal distills the role and responsibility of the RDP into the following three fundamental concepts:

1. The delegating RDP must state the criteria that the others performing the delegated design work must meet.
2. The others performing the delegated design work must meet those stated criteria and submit their work to the RDP.
3. The RDP must review that submission for conformance to the stated criteria.

By further clarifying and strengthening the role and responsibilities of the registered design professional, we believe that the chances that some essential design or construction requirement might be overlooked or a responsibility might be unheeded will be significantly reduced and that life safety will be enhanced.

Delegated designs may or may not be “deferred submittals,” and vice versa; in fact, delegated designs may even be included in the initial permit package. If the documentation for these systems and components is deferred, the additional requirements of Section 107.3.4 would also need to be met. While provisions for deferred submittals have been in IBC for many editions, the additional requirements in this proposal are intended to clarify and strengthen the roles and responsibilities of all those involved in the design process, including those involved in delegated design. (Example: A modification to an existing curtain wall can be deferred and not be delegated. The same modification could be both delegated and deferred.)

Why is this necessary?
The delegation of design work is common in structural engineering practice. In fact, almost all structural materials currently have some elements of work that are delegated by an Engineer of Record (EOR) to a Specialty Structural Engineer (SSE) as directed in the model building code (e.g., IBC) and its reference standards.

From the structural steel perspective, the most common design work delegated is connection design. It is addressed comprehensively in AISC 360, *Specification for Structural Steel Buildings*, and the AISC 303, *Code of Standard Practice for Steel Buildings and Bridges*. The requirements in those documents are consistent with those recommended by CASE, NCSEA, and SEI on design responsibility. Additionally, the AISC provisions dovetail with the model building code requirements on deferred submittals.

However, recent real-world examples continue to demonstrate that improper practices still exist because the delegation of design work specified in the model building code is not as clear and robust as it could be and, as a result, does not safeguard the basic intent for life safety in the process.

Example of a Better Way – Missouri
We recently became aware of current Missouri law, which provides straightforward and concise language on delegated design and deferred submittals in 20 CSR 2030-21.020 Engineer of Record and Specialty Engineers. (Available at: https://www.sos.mo.gov/cmsimages/adrules/csr/current/20csr/20c2030-21.pdf) It describes a transparent process for delegating design work to ensure the protection of life safety.

Development of the ICC Proposals

The concepts presented in the MO statute have been distilled down and transitioned into requirements appropriate for adoption in a model building code. This includes utilizing IBC terminology, substituting EOR with *registered design professional*, and, instead of introducing a defined term for SSE, we've used the general phrase "designed by others." This proposal and its companion proposal clarify in the IBC the previously mentioned three fundamental concepts for delegation practice:

1. The delegating RDP must state the criteria that the others performing the delegated design work must meet.
2. The others performing the delegated design work must meet those stated criteria and submit their work to the RDP.
3. The RDP must review that submission for conformance to the stated criteria.

Bibliography: AISC (2022), *Specification for Structural Steel Buildings*, ANSI/AISC 360-22, American Institute of Steel Construction, Chicago, Ill., August 1, 2022. Available at: https://www.aisc.org/publications/steel-standards/.
AISC (2022), *Code of Standard Practice for Steel Buildings and Bridges,* ANSI/AISC 303-22, American Institute of Steel Construction, Chicago, Ill., May 9, 2022. Available at: https://www.aisc.org/publications/steel-standards/.
Rules of Department of Commerce and Insurance, Division 2030—Missouri Board for Architects, Professional Engineers, Professional Land Surveyors, and Professional Landscape Architects, Chapter 21—Professional Engineering, 20 CSR 2030-21.020 *Engineer of Record and Specialty Engineers*. Available at: https://www.sos.mo.gov/cmsimages/adrules/csr/current/20csr/20c2030-21.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the existing role and responsibilities of the RDP for delegated design in the IBC by reflecting requirements consistent with current industry guidelines promulgated by CASE, NCSEA, and SEI for design responsibility.

S52-25

S53-25 Part I

IBC: SECTION 202 (New), TABLE 1604.3

Proponents: Jennifer Hatfield, J. Hatfield & Associates, representing Fenestration & Glazing Industry Alliance (formerly AAMA) (jen@jhatfieldandassociates.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new definition as follows:

PATIO COVER. A structure with open or glazed walls that is used for recreational, outdoor living purposes associated with a *dwelling unit.*

Revise as follows:

TABLE 1604.3 DEFLECTION LIMITS[a, b, c, h, i]

CONSTRUCTION	*L or L_r*	*S^j or W^f*	*D + L*[d, g]
Roof members:[e]			
Supporting plaster or stucco ceiling	*l*/360	*l*/360	*l*/240
Supporting nonplaster ceiling	*l*/240	*l*/240	*l*/180
Not supporting ceiling	*l*/180	*l*/180	*l*/120
Floor members	*l*/360	—	*l*/240
Exterior walls:			
With plaster or stucco finishes	—	*l*/360	—
With other brittle finishes	—	*l*/240	—
With flexible finishes	—	*l*/120	—
Interior partitions:[b]			
With plaster or stucco finishes	*l*/360	—	—
With other brittle finishes	*l*/240	—	—
With flexible finishes	*l*/120	—	—
Farm buildings	—	—	*l*/180
Greenhouses	—	—	*l*/120

For SI: 1 foot = 304.8 mm.

a. For structural roofing and siding made of formed metal sheets, the total load deflection shall not exceed *l*/60. For secondary roof structural members supporting formed metal roofing, the live load deflection shall not exceed *l*/150. For secondary wall members supporting formed metal siding, the design wind load deflection shall not exceed *l*/90. For roofs, this exception only applies when the metal sheets have no roof covering.

b. Flexible, folding and portable partitions are not governed by the provisions of this section. The deflection criterion for interior partitions is based on the horizontal load defined in Section 1607.16.

c. See Section 2403 for glass supports.

d. The deflection limit for the $D + (L$ or $L_r)$ load combination only applies to the deflection due to the creep component of long-term dead load deflection plus the short-term live load deflection. For lumber, structural glued laminated timber, prefabricated wood I-joists and structural composite lumber members that are dry at time of installation and used under dry conditions in accordance with the ANSI/AWC NDS, the creep component of the long-term deflection shall be permitted to be estimated as the immediate dead load deflection resulting from 0.5*D*. For lumber and glued laminated timber members installed or used at all other moisture conditions or cross laminated timber and wood structural panels that are dry at time of installation and used under dry conditions in accordance with the ANSI/AWC NDS, the creep component of the long-term deflection is permitted to be estimated as the immediate dead load deflection resulting from *D*. The value of 0.5*D* shall not be used in combination with ANSI/AWC NDS provisions for long-term loading.

e. The preceding deflections do not ensure against ponding. Roofs that do not have sufficient slope or camber to ensure adequate drainage shall be investigated for ponding. See Chapter 8 of ASCE 7.

f. The wind load shall be permitted to be taken as 0.42 times the “component and cladding” loads or directly calculated using the 10-year mean return interval basic wind speed, *V*, for the purpose of determining deflection limits in Table 1604.3. Where framing members support glass, the deflection limit therein shall not exceed that specified in Section 1604.3.7

g. For steel structural members, the deflection due to creep component of long-term dead load shall be permitted to be taken as zero.

h. For aluminum structural members or aluminum panels used in skylights and sloped glazing framing, roofs or walls of sunroom *additions* or patio covers, and not supporting edge of glass or ~~aluminum~~ sandwich panels, the total load deflection shall not exceed *l*/60. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed the lesser of 3/4 in (19 mm) or *l*/175 for each glass lite or, *l*/60 for the entire length of the member, whichever is more stringent. For ~~aluminum~~ sandwich panels used in roofs or walls of sunroom *additions* or patio covers, the total load deflection shall not exceed *l*/120.

i. *l* = Length of the member between supports. For cantilever members, *l* shall be taken as twice the length of the cantilever.

j. The snow load shall be permitted to be taken as 0.7 times the design snow load determined in accordance with Section 1608.1 for the purpose of determining deflection limits in Table 1604.3.

Reason: The term "patio cover" is currently used in the main content of the IBC, in Sections 1202.5.1.1, 1204.2.1, 2606.10 and Table 1604.3. It therefore needs a definition in Section 202. The proposed definition is consistent with the one currently in Appendix I.

This proposal then provides edits to Footnote h of Table 1604.3, for the following reasons:

- The insertion of the word "and" is to clarify that "not supporting edge of glass or sandwich panels" applies to "aluminum structural members of aluminum panels".
- Removes the word "aluminum" in front of "sandwich panels" as they can be constructed of materials other than aluminum. This is also consistent with the same wording in Footnote c of the IRC.
- Insertion of "the lesser of 3/4 in (19 mm) or..." is to provide clarification that aligns with the industry standard, AAMA/NSA 2100-22, Specifications for Sunrooms, as to what is needed when a glass lite span exceeds 11 feet.
- The L/60, L/120, and L/175 are just to correct the capitalization, as it is supposed to be a capital L, which is also reflected in Footnote c of the IRC.

This proposal and its corresponding IRC proposal is editorial in nature by aligning the wording of the footnotes in both codes, as well as making it clear in the definitions what is a "patio cover" versus a "sunroom", the latter already found in Section 202.

Bibliography: Section 6.3.2 of AAMA/NSA 2100-22, Specifications for Sunrooms

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes are editorial and clarifying in nature, and meant to align language in both the IRC and IBC. Therefore, the proposal will not increase or decrease the cost of construction.

S53-25 Part II

IRC: SECTION 202 (New), TABLE R301.7

Proponents: Jennifer Hatfield, J. Hatfield & Associates, representing Fenestration & Glazing Industry Alliance (formerly AAMA) (jen@jhatfieldandassociates.com)

2024 International Residential Code

Add new definition as follows:

PATIO COVER. A structure with open or glazed walls that is used for recreational, outdoor living purposes associated with a *dwelling unit.*

SECTION R301
DESIGN CRITERIA

Revise as follows:

TABLE R301.7 ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS[b, c]

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
Rafters having slopes greater than 3:12 with finished ceiling not attached to rafters	*L*/180
Interior walls and partitions	*H*/180
Floors	*L*/360
Ceilings with brittle finishes (including plaster and stucco)	*L*/360
Ceilings with flexible finishes (including gypsum board)	*L*/240
All other structural members excluding guards and handrails	*L*/240
Exterior walls—wind loads[a] with plaster or stucco finish	*H*/360
Exterior walls—wind loads[a] with other brittle finishes	*H*/240
Exterior walls—wind loads[a] with flexible finishes	*H*/120[d]
Lintels supporting masonry veneer walls[e]	*L*/600

Note: *L* = span length, *H* = span height.

a. For the purpose of the determining deflection limits herein, the wind load shall be permitted to be taken as 0.7 times the component and cladding (ASD) loads obtained from Table R301.2.1(1).

b. For cantilever members, *L* shall be taken as twice the length of the cantilever.

c. For aluminum structural members or aluminum panels used in skylights and sloped glazing framing, roofs or walls of sunroom *additions* or patio covers, and not supporting edge of glass or sandwich panels, the total load deflection shall not exceed *L*/60. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed the lesser of 3/4 in (19 mm) or *L*/175 for each glass lite, or *L*/60 for the entire length of the member, whichever is more stringent. For sandwich panels used in roofs or walls of sunroom *additions* or patio covers, the total load deflection shall not exceed *L*/120.

d. Deflection for exterior walls with interior gypsum board finish shall be limited to an allowable deflection of *H*/180.

e. Refer to Section R703.8.2. The *dead load* of supported materials shall be included when calculating the deflection of these members.

Reason: The term "patio cover" is currently used in the main content of the IRC, in Table R301.7, and needs a definition in Section R202. The proposed definition is consistent with the one currently in Appendix BF.

This proposal then provides edits to Footnote c of Table R301.7, for the following reasons:

- The reference to "aluminum" panels and "skylights and sloped glazing" is editorial and is for consistency with the verbiage used in the same footnote found in the IBC.
- The insertion of the word "and" is to clarify that "not supporting edge of glass or sandwich panels" applies to "aluminum structural

members or aluminum panels."

- Insertion of "the lesser of 3/4 in (19 mm) or..." is to provide clarification that aligns with the industry standard, AAMA/NSA 2100-22, Specifications for Sunrooms, as to what is needed when a glass lite span exceeds 11 feet. Per R301.2.1.1.1, Sunrooms currently must comply with this Standard.

This proposal and its corresponding IBC proposal is editorial in nature by aligning the wording of the footnotes in both codes, as well as making it clear in the definitions what is a "patio cover" versus a "sunroom", the latter already found in Section R202.

Bibliography: Section 6.3.2 of AAMA/NSA 2100-22, Specifications for Sunrooms

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes are editorial and clarifying in nature, and meant to align language in both the IRC and IBC. Therefore, the proposal will not increase or decrease the cost of construction.

2024 International Building Code

Revise as follows:

TABLE 1604.3 DEFLECTION LIMITS[a, b, c, h, i]

CONSTRUCTION	*L* or L_r	S^j or W^f	$D + L^{d, g}$
Roof members:[e]			
Supporting plaster or stucco ceiling	*l*/360	*l*/360	*l*/240
Supporting nonplaster ceiling	*l*/240	*l*/240	*l*/180
Not supporting ceiling	*l*/180	*l*/180	*l*/120
Floor members	*l*/360	—	*l*/240
Exterior walls:			
With plaster or stucco finishes	—	*l*/360	—
With other brittle finishes	—	*l*/240	—
With flexible finishes	—	*l*/120	—
Interior partitions:[b]			
With plaster or stucco finishes	*l*/360	—	—
With other brittle finishes	*l*/240	—	—
With flexible finishes	*l*/120	—	—
Farm buildings	—	—	*l*/180
Greenhouses	—	—	*l*/120

For SI: 1 foot = 304.8 mm.

a. For structural roofing and siding made of formed metal sheets, the total load deflection shall not exceed *l*/60. For secondary roof structural members supporting formed metal roofing, the live load deflection shall not exceed *l*/150. For secondary wall members supporting formed metal siding, the design wind load deflection shall not exceed *l*/90. For roofs, this exception only applies when the metal sheets have no roof covering.

b. Flexible, folding and portable partitions are not governed by the provisions of this section. The deflection criterion for interior partitions is based on the horizontal load defined in Section 1607.16.

c. See Section 2403 for glass supports.

d. The deflection limit for the D + (L or L_r) load combination only applies to the deflection due to the creep component of long-term dead load deflection plus the short-term live load deflection. For lumber, structural glued laminated timber, prefabricated wood I-joists and structural composite lumber members that are dry at time of installation and used under dry conditions in accordance with the ANSI/AWC NDS, the creep component of the long-term deflection shall be permitted to be estimated as the immediate dead load deflection resulting from 0.5D. For lumber and glued laminated timber members installed or used at all other moisture conditions or cross laminated timber and wood structural panels that are dry at time of installation and used under dry conditions in accordance with the ANSI/AWC NDS, the creep component of the long-term deflection is permitted to be estimated as the immediate dead load deflection resulting from D. The value of 0.5D shall not be used in combination with ANSI/AWC NDS provisions for long-term loading.

e. The preceding deflections do not ensure against ponding. Roofs that do not have sufficient slope or camber to ensure adequate drainage shall be investigated for ponding. See Chapter 8 of ASCE 7.

f. The wind load shall be permitted to be taken as 0.42 times the "component and cladding" loads ~~or directly calculated using the 10-year mean return interval basic wind speed, *V*,~~ for the purpose of determining deflection limits in Table 1604.3. Where framing members support glass, the deflection limit therein shall not exceed that specified in Section 1604.3.7

g. For steel structural members, the deflection due to creep component of long-term dead load shall be permitted to be taken as zero.

h. For aluminum structural members or aluminum panels used in skylights and sloped glazing framing, roofs or walls of sunroom *additions* or patio covers not supporting edge of glass or aluminum sandwich panels, the total load deflection shall not exceed l/60. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed l/175 for each glass lite or l/60 for the entire length of the member, whichever is more stringent. For aluminum sandwich panels used in roofs or walls of sunroom *additions* or patio covers, the total load deflection shall not exceed l/120.

i. l = Length of the member between supports. For cantilever members, l shall be taken as twice the length of the cantilever.

j. The snow load shall be permitted to be taken as 0.7 times the design snow load determined in accordance with Section 1608.1 for the purpose of determining deflection limits in Table 1604.3.

Reason: **Code history:**

The current ratio of 0.42 for serviceability deflections due to wind loads in footnote f was based on an approximate ratio of 10-year mean recurrence interval (MRI) wind pressures to risk category II wind pressures in non-hurricane regions (ASCE 7-05, Equation CC-3 and Table C6-7; ASCE 7-22, Commentary Section CC.2.2). For hurricane regions, the 0.42 ratio was understood to be conservative for 10-year winds, and unconservative for some locations such as Anchorage, Alaska. Using the same ratio for all risk categories resulted in longer serviceability return periods for higher risk categories, but not specific or uniform ones.

In the 2018 IBC, the option was added to use 10-year MRI wind speeds for all locations and all risk categories.

Problems with current requirements:

There are several problems with the current wind load serviceability deflection windspeed requirements, the most notable of which pertains to the use of the 10-year wind speed for all risk categories.   that can be seen in the table in Exhibit 1. Unlike the historic 0.42 reduction factor (IBC 2012 and 2015 for strength-based wind loads) and the 0.7 reduction factor (IBC 2009 and earlier editions), the 10-year MRI wind speed alternative does not increase deflection serviceability wind pressures and achieve the higher performance intended for higher risk categories. This is illustrated in Exhibit 1.

Recommended code change proposal:

This code change proposes to delete the option to utilize the 10-year MRI wind speeds while retaining the historic 0.42 reduction factor.

Potential future considerations:

In 2019 ASCE published the *Prestandard for Performance-Based Wind Design* which addressed the serviceability issue from a performance perspective. The Prestandard recommends that, to remain operational (i.e., serviceable) with the performance objective that the building envelope remain attached to the structure and maintain wind-driven rain resistance, the following MRI’s be utilized:

- Risk Category II 10-year MRI
- Risk Category III 25-year MRI
- Risk Category IV 50-year MRI

As this is only a Prestandard at this time, it could be considered premature to incorporate these deflection limitations in the IBC. As the performance-based standard evolves, the IBC deflection limitations can be reassessed.

2024 IBC - Table 1604.3 - Deflection Limits

Anchorage, AK	128	133	139	90	0.49	18%	0.46	9%	0.42	0%

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

In practice, most designers are defaulting to the 0.42 factor for determining component and cladding deflection. The 10-year mean return period option does not appear to be widely adopted by the industry. Thus, there is no change in practice and construction cost.

IBC: 1604.5, TABLE 1604.5

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net); Robert Bachman, RE Bachman Consulting Structural Engineer, representing Myself (rebachmanse@aol.com); Chris Kimball, Building Code Solutions, representing Self (chris@bcscodegroup.com)

2024 International Building Code

Revise as follows:

1604.5 Risk category. Each *building* and *structure* shall be assigned a *risk category* in accordance with Table 1604.5. Where a referenced standard specifies an occupancy category, the *risk category* shall not be taken as lower than the occupancy category specified therein. Where a referenced standard specifies that the assignment of a *risk category* be in accordance with ASCE 7, Table 1.5-1, Table 1604.5 shall be used in lieu of ASCE 7, Table 1.5-1.

Exceptions:

1. The assignment of *buildings* and *structures* to Tsunami *Risk Categories* III and IV is permitted to be in accordance with Section 6.4 of ASCE 7.
2. Freestanding parking garages not used for the storage of emergency services vehicles or not providing means of egress for *buildings* or *structures* assigned to a higher risk category shall be assigned to Risk Category II.
3. Battery energy storage systems are permitted to be assigned to Risk Category II where the *owner* has submitted and the *building official* has approved a plan to provide an alternative equivalent source of stored energy to the same energy consumers within one hour of the system's failure due to a design level wind, earthquake, snow, flood, or tornado event, considering the regional effects of any such event.

TABLE 1604.5 RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Risk Categories I, III and IV.

III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:
	• Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
	• Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of these public assembly spaces of greater than 2,500.
	• Buildings and other structures containing Group E or Group I-4 occupancies or combination thereof, with an occupant load greater than 250.
	• Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.
	• Group I-3, Condition 1 occupancies.
	• Any other occupancy with an occupant load greater than 5,000.[a]
	• Power-generating stations with individual power units rated 75 MW_{AC} (megawatts, alternating current) or greater, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.
	• Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code*; and
	  • Are sufficient to pose a threat to the public if released.[b]

RISK CATEGORY	NATURE OF OCCUPANCY

IV	Buildings and other structures designated as essential facilities and buildings or structures where loss of function represents a substantial hazard to occupants or users, including but not limited to:
	• Group I-2 occupancies.
	• Ambulatory care facilities having emergency surgery or emergency treatment facilities.
	• Group I-3 occupancies other than Condition 1.
	• Fire, rescue, ambulance and police stations and emergency vehicle garages
	• Designated earthquake, hurricane or other emergency shelters.
	• Designated emergency preparedness, communications and operations centers and other facilities required for emergency response.
	• Public utility facilities providing power generation, potable water treatment, or wastewater treatment.
	• Power-generating stations and other public utility facilities required as emergency backup facilities for *Risk Category* IV structures.
	Battery energy storage systems providing ancillary services to a power plant, power-generating station or power generation facility that has a total capacity of 20 MW or more or is assigned to Risk Category IV.
	Battery energy storage systems for which the system's total energy capable of being stored is 80 MWh or more.
	Battery energy storage system components, cabinets, containers, enclosures, equipment platforms, foundations, shelters, and sheltering buildings for dedicated-use or nondedicated-use, where the battery energy storage system is assigned to Risk Category IV.
	• Buildings and other structures containing quantities of highly toxic materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]
	• Aviation control towers, air traffic control centers and emergency aircraft hangars.
	• Buildings and other structures having critical national defense functions.
	• Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use *gross floor area* calculations shall be permitted to use *net floor areas* to determine the total occupant load. The floor area for vehicular drive aisles shall be permitted to be excluded in the determination of net floor area in parking garages.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: This proposal fills a hole in Table 1604.5 related to a relatively new, and increasingly common and newly essential, energy installation: **large-scale battery energy storage systems, or BESS** (see the Terminology section below for precedent definitions).

As illustrated below, BESS installations involve modular units that combine nonstructural components with a non-building structure. BESS are often built as customized containers or equipment frames, filled with batteries and related electrical and HVAC equipment, and mounted on a platform, a slab on ground, or a set of isolated footings. From the structural perspective, a BESS installation is basically a bunch of boxes anchored to a foundation, but these new features of our built environment are as important to our energy future as any piece of high tech public-serving infrastructure.

The proposal does three basic things:

- It adds three line items to Table 1604.5 for two categories of BESS and for their support structures: one item for "ancillary" BESS, paired or co-located with a generator; one for standalone BESS facilities; and one for the support or shelter structures that go with either of the first two.
- It assigns large-scale BESS to Risk Category IV as essential facilities and as structures where loss of function would represent a substantial hazard.
- It allows an alternative means of maintaining BESS' essential functionality through planning, recognizing the interconnectedness and redundancy of large, networked energy grids. This is consistent in principle with footnote b to the current Table 1604.5.

The proposal derives from the following three points. (Details and supplemental information on each of these points is available in the "BESS" pdf in the "2027 I-codes Bonowitz" dropbox link):
https://www.dropbox.com/scl/fo/bsmcosw9sr4bgrxapeg8h/AB5Y1Wb8KbMpz2BUhmPpAT4?rlkey=mj232e5p1nmnpfrqgrw7apd29&dl=0.)

1. Current Table 1604.5 does not give clear guidance about BESS, so current practice is inconsistent. Consider current Table 1604.5:

- BESS is definitely energy infrastructure, but it's not a "power-generating station." It's also not power transmission and distribution, which is explicitly outside the scope of some IBC provisions, including Sec 1613.

- Some BESS (usually on-site) provides direct "emergency backup" to distinct Risk Category IV facilities, in which case it should be clearly designed as RC IV. BESS that supports the grid might indirectly support RC IV facilities in the community, but for these cases, Table 1604.5 is unclear, since off-site BESS is not obviously "required for emergency response." Even where BESS is meant to assist the "black start" of a downed power station, not all power stations are public utilities currently assigned to RC IV.
- Some BESS facilities are owned, operated, or co-located with a public utility, but many are not.
- Depending on the battery type, BESS can involve toxic or hazardous materials, but not always at RC III or IV levels. Even so, IFC provisions for energy storage focus on fire safety and hazmat containment, not on structural performance or functionality.

Thus, the derivation of proper design criteria, which depends on the Risk Category assignment, is prone to inconsistency. Our review of seven recent BESS installations in California found three that designed for RC IV, each co-located with a gas peaker plant; two assigned to RC III, but using different importance factors; one assigned to RC II; and one that did not report a risk category but used an importance factor of 1.0. (Kimball, 2024). The cases we reviewed were all designed with the 2019 or 2022 *California Building Code*, neither of which included the 2024 IBC's new provision assigning public utility power generation to RC IV. (For details, see the file at the dropbox link above.)

As new, specialized buildings and structures become common within the built environment, or where the code's broad categories need more nuance, it is entirely appropriate to add new line items to Table 1604.5. New items have been added, split, and moved in each of the last two code cycles.

Beyond Section 1604.5, I-codes provisions for energy storage systems are found primarily in IFC Section 1207 and IECC Appendix CJ, but those provisions are primarily for "behind-the-meter" systems at residential or commercial scale (discussed in point 2), and they focus primarily on fire and hazmat safety, not on loss of function due to damage from environmental loads. For example, 2024 IFC Section 1207.4.4, regarding seismic and structural design, says only, "Stationary ESS shall comply with the seismic design requirements in Chapter 16 of the *International Building Code*, and shall not exceed the floor loading limitation of the building."

2. BESS installations have various characteristics and functions, some of which deserve special attention in the code.

BESS facilities can serve multiple functions; typically, the different functions are related to the facility's size and ownership. (See the examples in photos below.)

Residential and commercial scale BESS are relatively small (storing around 10 kWh for residential, up to about 8 MWh for large commercial) and "behind the meter," or dedicated to just one or a few buildings. They mostly provide backup power, performing the same role as a traditional battery rack, but they have become more common as a means of managing a facility's rooftop solar output, allowing energy to be stored during the day and discharged at night. Because of their size and use by specific consumers, residential and commercial-scale BESS are NOT the subject of this proposal.

<u>Large-scale BESS, also called grid-scale or utility-scale, is the subject of this proposal.</u> A large-scale BESS facility is a grouping of modular BESS containers or frames covering an area from a few thousand square feet to several acres. A large-scale BESS facility can store and discharge tens or hundreds of MWh of energy.

The large-scale BESS of interest here are "front of the meter" and have a larger role to play with respect to the regional electricity grid or a community's micro-grid. Large-scale BESS can be stand-alone facilities connected to the grid, or they can be linked directly, i.e. co-located with, a power generator itself. Over the last few years, the combination of "solar + storage," meaning a large PV farm combined with a yard of BESS containers and inverters, has become a common project type for independent power producers (IPPs), who then sell the power they generate and store to public utilities, municipal utilities (cities and towns), and sometimes to especially large private power consumers (though customers can switch from private to public and back over time).

Where BESS is part of a larger electricity grid, it has a broader role and importance, beyond merely providing backup power – whether or not the BESS facility or its co-located generator is regulated as a public utility. This is discussed in point 3.

Thus, BESS installations can be categorized by their ownership, by their consumers, by how they are connected to power generators, by their capacity, or in other ways. Current Table 1604.5 distinguishes between power generators that are or are not regulated as public utilities. This distinction indicates a heightened importance for power delivered to and consumed by the general public. But the energy market is far more complex now than it was when the IBC first used the term "public utility." Now, utilities of many types and sizes can be connected to each other in a variety of ways that change over time (independent BESS facilities can be both energy customers and providers), and in which new technologies at new scales, such as large-scale BESS, can create interdependencies that require designation primarily by size and metering. (EIA stats, 2022; Colthorpe, 2022)

In other words, the importance of reliable power for the general public is now indicated more by the capacity and grid connectivity of generators and BESS, not by public utility status. Therefore, this proposal makes distinctions by BESS size, with an exception that recognizes a well-planned whole-grid response to an unexpected outage.

<u>How large is large?</u> Nearly every week now brings reports of a new large-scale BESS facility that can store 10, 20, 50, or more MW of power, though only the largest ones usually make the news. Some precedents are worth considering.

- The Department of Energy's (DOE) U.S. Energy Information Administration (EIA) defines "large-scale solar" as "solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt" (EIA, 2024). DOE also uses this threshold in its study of siting issues for PV installations (DOE, 2025). A 1 MW solar power plant typically covers 5 to 10 acres and can power 100 to 200 homes (SEIA, 2024). Typically, a BESS co-located with a generator would discharge the full generator capacity over about four hours (consistent with IECC Section CJ101.1.1), so at this scale, the BESS would have a capacity of 1 MW or 4 MWh.

- The Federal Energy Regulatory Commission (FERC, an independent agency within DOE) sets different rules for generators of different sizes, drawing a line at 20 MW capacity (FERC, 2024b). The associated BESS would have a capacity of about 80 MWh.
- FERC also sets certain fees based on generator size, drawing lines at 20 MW, 80 MW, and 200 MW. Regional system operators are sometimes allowed to modify these rules; Southwest Power Pool, for example, draws lines at 2 MW, 20 MW, and 75 MW. (FERC, 2024a)
- The benchmark cost study by DOE's National Renewable Energy Laboratory (NREL), cited in our cost impact statement below, assumes a BESS facility of 60 MW or 240 MWh (NREL, 2024).
- While all public utility generators are assigned to RC IV, current Table 1604.5 assigns other generators to RC III if they have a capacity of 75 MW or more (though it dubiously associates that threshold with individual power "units," a separate issue).

These precedents are useful in drawing the kinds of lines the building code needs to draw. Here, there are obvious precedents at 20 MW and 75 MW. The DOE definition set at 1 MW is probably too low to reflect the code's emphasis on public risk. But 75 MW is probably too high, as it would miss an enormous portion of public-serving BESS. In 2019, more than half of solar PV plants in the U.S. were rated between 20 and 75 MW (NERC, 2019). Further, there is evidence that the 75 MW precedent has already influenced how independent power providers plan their facilities (Ludt, 2023; Misbrener, 2025). Therefore, based on these precedents, this proposal draws a line at 20 MW for the capacity of a plant at which the BESS is co-located, or 80 MWh for a stand-alone BESS.

This proposed threshold – 20 MW or 80 MWh – already represents a fairly large BESS facility. For example:

- In 2022, a large PV plant in Florida, built in 2019, added an 18 MW co-located BESS facility (Weaver, 2024), so if built under this proposal, it would still be below the RC IV level.
- The largest "second life" BESS facility in the world, co-located with a wind farm in Texas, has a capacity of 53 MWh, below the proposed RC IV level (Spector, 2024a).
- Microgrids, which DOE calls "essential building blocks" of a strong energy system, will often use BESS below the proposed RC IV level (Sisson, 2024). A microgrid for the 535 residents of Hot Springs, NC provides only 4.4 MWh of backup energy but is sufficient for their needs and helped with recovery after Hurricane Helene (St. John, 2024).
- Rural coops often develop BESS facilities that would fall under the proposed RC IV level. The largest coop in Minnesota is using a federal grant to develop renewable energy and is still planning only a 20 MW BESS (Fischer, 2024).
- A 25 MW (100 MWh) BESS announced last year – thus just over the proposed RC IV level – would be "the largest standalone battery project to date in the Pacific Northwest" (Gerke, 2024).
- A 30 MW BESS in Escondido, CA was "the largest of its kind" when it was built in 2017 (Elmer, 2024).

By comparison, if we were to draw a line at 75 MW (300 MWh), this proposal would apply only to BESS big enough to support a solar plant that covers a full square mile (Electrify America, 2023) or a wind farm with at least 30 large turbines (Certrec, 2025).

3. Large-scale BESS merits assignment to Risk Category IV.

<u>As backup power</u>

. As backup power for a community (or for the community's power provider), large-scale BESS already qualifies for RC IV status because its loss could represent a substantial hazard to users. In addition to meeting energy demands at peak times, BESS "can supply backup power during natural disasters and other emergencies" (NFPA, 2024). Heat is a growing threat nationwide, and an extremely effective solution, air conditioning, requires power. But extreme heat can also cause power outages or require rolling blackouts. BESS helps solve that problem (Spector, 2024b), as long as the BESS components themselves are not knocked out by earthquake or hurricane.

SEIA, the leading trade organization for the solar power industry, recognized the growing importance of BESS to public health and safety in testimony in the last code cycle: "[T]he addition of Energy Storage Systems (ESS) is changing" the degree to which power outages can "cause substantial economic losses and disruption to civilian life." "[W]ith increasing adoption of Energy Storage Systems (ESS), it is conceivable that PV paired with ESS could be a sole source of required backup power. Where PV plus ESS is the only direct source of backup power for an essential services facility [which, with the 2024 IBC, now includes any public utility power provider] ... it shall be assigned as Risk Category IV" (SEIA, 2022).

Backup power provided directly to other RC IV facilities is already assigned to RC IV. To the extent that a BESS installation also provides backup power to the grid, which then serves various RC IV facilities, it should also be considered RC IV. Further, even for uses that are *not* assigned to RC IV, such as housing for vulnerable populations, community-supporting businesses, etc., a prolonged power outage with no backup absolutely represents a substantial hazard to users. If a BESS facility is planned with the goal of providing backup power, then its design criteria, including its risk category assignment, should be suited to that plan.

<u>As grid stabilization and to enable the growth of renewable energy.</u>

Large-scale BESS is more than just backup power. Increasingly, large-scale BESS facilities are being developed to help manage and stabilize the grid itself, as well as the demand and price of the energy it delivers. From this perspective, BESS is (or soon will be) as essential to the overall functioning of a local, regional, or even national grid as a thermostat, pressure release valve, warning system, or auto-shutoff is to an expensive and essential piece of mechanical or electrical equipment.

BESS is particularly important for reaching the full potential of renewable energy sources such as wind and solar. Because these sources are intermittent, and because the demand for power varies throughout the day, wind and solar power generators cannot match demand on their own. They can even *over*-generate, leading to grid volatility and requiring generation to be "curtailed" temporarily. For this reason, the output of large wind and solar generators is typically coordinated with that of a traditional fossil fuel power plant. As we wean ourselves from fossil fuels and come to rely more on renewables, the problem of capacity being out of sync with demand becomes ever more pronounced; the graphic representation of this discrepancy is often called the "duck curve" (because it resembles a duck).

The duck curve is a problem for renewables. But BESS is expected to solve much of it, effectively flattening the duck curve (DOE, 2017; DOE, 2023; SEAM, 2025). As DOE noted eight years ago, "solar coupled with storage technologies could alleviate, and possibly eliminate, the risk of over-generation" (DOE, 2017).

NFPA (2024) is even clearer, noting that the need for storage should also motivate changes in how we design generation and BESS facilities: "Growing concerns about the use of fossil fuels and greater demand for a cleaner, more efficient, and more resilient energy grid has led to the use of energy storage systems, and that use has increased substantially over the past decade. ... However, the rise in the number of [BESS] installations requires the need for a heightened understanding of the hazards involved and more extensive measures to reduce the risks."

Thus, if we want to transition more fully away from fossil fuels, we will need more renewable power generators like wind and solar. But to make those intermittent sources work at large scale, we will need more large-scale BESS just to make the grid function.

To summarize: Large-scale BESS is a relatively new, but increasingly common and increasingly important, addition to the built environment throughout the country, but it is not clearly addressed in the building code. Considering its importance as both backup power and the future of a renewable energy system, large-scale BESS installations should be considered essential facilities and assigned to Risk Category IV.

Finally, we anticipate the opposition of the energy industry – and, it must be said, of industry's well-intentioned cheerleaders in government, who are too slow to get in front of this wave of development already affecting city councils, land use committees, and building officials across the country.

<u>Argument 1: How do we know the benefits exceed the costs?</u>

It's true, we have not produced a comprehensive benefit-cost analysis for this relatively simple proposal. However:

- Practically all of the policy judgments inherent in risk category assignment are just that – judgments, made by the good faith consensus of building officials and stakeholders in the interest of the public. Practically none of the current risk category assignments came into the code with a comprehensive benefit-cost analysis, nor should that be necessary.
- Lack of a comprehensive BCA has not stopped enlightened utilities from voluntarily using RC IV criteria even though the current code is silent (Kimball, 2024). Nor has it stopped the State of Florida, which routinely applies RC IV wind loads – a decision that served it well when its solar facilities recovered quickly after recent hurricanes and even a direct hit from a tornado (Byrd, 2024; Weaver, 2024).
- Even if we wanted to produce a BCA, a DOE-funded study has shown that estimating the benefits of proposed changes to energy infrastructure design is practically impossible (Sanstad et al., 2020).
- If the benefits are hard to quantify, however, the question is largely moot if the cost is extremely low, which it is. As we show in our cost impact statement, the construction cost premium relative to RC II is definitely less than 1% and probably much closer to 0.3%.
- Further, the cost of BESS installation has dropped so much over the last several years (and is projected to continue dropping), that any cost premium due to this proposal is already paid for many times over by savings elsewhere. The price of battery packs (by far the most costly BESS component) dropped over 80 percent from 2013 to 2023, and fell another 20 percent relative to the 2023 price in 2024 alone (Bloomberg, 2024). Overall capital expenditure costs for BESS installations are projected to fall 18 percent between 2025 and 2030 (NREL, 2024).

<u>Argument 2: Any *perceived* increase in cost or disruption to the status quo will stop developers from entering the BESS market.</u>

With respect, this is laughable, given the explosive growth in BESS, both standalone and in "solar + storage" developments. California and Texas are actively encouraging BESS development (even if they have different objectives and are largely silent with respect to design criteria and natural hazards). (ERCOT, 2023; CPUC, 2024).

This trend was foreseeable even five years ago, before any federal or state agencies stepped in: "The electric power grid in North America is undergoing a significant transformation in technology, design, control, planning, and operation, and these changes are occurring more rapidly than ever before" (NERC, 2019). With respect to BESS in particular: "U.S. battery storage capacity will increase significantly by 2025. ... Battery storage capacity in the United States was negligible prior to 2020, when electricity storage capacity began growing rapidly. As of October 2022, 7.8 GW of utility-scale battery storage was operating in the United States; developers and power plant operators expect to be using 1.4 GW more battery capacity by the end of the year. From 2023 to 2025, they expect to add another 20.8 GW of battery storage capacity." (EIA, 2022) This pattern is effectively visualized by Cleveland and Ni (2023): https://visualizingenergy.org/watch-the-history-of-battery-storage-in-the-united-states/

Further, all this growth in renewables has happened despite hurdles thrown up by local regulations, not the building code, related to noise, fire safety, loss of agricultural land, planning and zoning, etc. – hurdles fought and overcome by developers and their expensive lawyers. So a new code provision that costs almost nothing and is already satisfied in many cases is hardly likely to stop this train.

Even if one suspects that the recent growth was only possible with heavy state and federal subsidies, the attitude of the incoming administration, which derides renewable energy at every opportunity, is actually another reason to ramp up design criteria. If subsidies for new installations dry up, so will funds to quickly repair any facilities that happen to be damaged in the near future. If no repair funds are coming, the best strategy is stronger design for those facilities now in the pipeline. (Surprisingly, it's even possible that some in industry are over-relying on government, i.e. all of us, to bail them out when their under-designed products fail. One expert we consulted actually voiced potential opposition to this proposal by saying that they didn't want to require seismic certification testing because the BESS components might fail the test. Let that sink in.)

Bottom line: If this proposal is approved, and BESS development slows down as a result between now and 2030, I will personally propose to undo the proposal for the 2033 code.

<u>Argument 3: Actual power loss from BESS failure can't happen because of grid redundancy.</u>

This is a fair argument about the complex interconnectedness of the electricity grid, something the building code does not account for – or it would be if there were any plans published that explicitly discussed applicable building code provisions, the likelihood of failures, and how the current grid will respond, given how much BESS capacity is newly in place.

Even so, the proposed Exception to Section 1604.5 is meant to acknowledge these circumstances and provide relief to BESS developers who really want to avoid the 0.3% cost premium and the potential damage reduction benefits it buys. Bring your plan – presumably one produced or at least adopted by DOE, FERC, NERC, or your state's PUC, PSC, ISO, or RTO, or even your city's resilience officer or recovery planner – to the building official, and you may design using RC II criteria.

The proposed exception is consistent in principle with footnote b to current Table 1604.5, which allows a lower risk category assignment for certain hazardous materials if an assessment in accordance with ASCE 7 Section 1.5.3 indicates a low risk. The exception proposed here might read as qualitative and open to judgment, but so is ASCE 7 Section 1.5.3.

<u>Argument 4: Even if power loss occurs due to BESS failure, it's not important except for "essential facilities" like hospitals, and they're already assigned to RC IV.</u>

First, this ignores the importance of BESS to an electricity grid that relies on renewable energy sources, an importance recognized by DOE (2017; 2023) and discussed at point 3 above.

Second, even if BESS is primarily about backup power, this attitude represents obsolete thinking about what counts as important, and the role of electric power in restoring normalcy after a damaging event. This attitude effectively says that providing power to your house, your office, your grocery store, you child's school, or your mom's care facility isn't really important. Even if the code does not yet recognize any of those buildings and uses as needing RC IV design criteria, it can still be true that the chief obstacle to their recovery should not be in the power or water service over which they have no control. The electricity grid, with BESS as a critical piece, is still essential to "non-essential" buildings.

A BESS developer, engineer, building official, or recovery planner who does not see the facility as essential is effectively rationalizing its failure by saying at least one of the following:

- The only things that are truly essential are the emergency response and public safety services that have always been assigned to RC IV.
- The failed BESS facility actually performed exactly as expected, incurring substantial damage in a design-level event.
- Repair of this $50-million BESS facility will take weeks and a lot of money (including more tax dollars) because we didn't think it was worth using a slightly bigger $5 rod anchor.

In summary, this proposal comes as close as any to embodying the proverb, "For want of a nail."

Terminology

This proposal uses terminology with precedents in industry publications, the I-codes (especially the IFC), and the Department of Energy's U.S. Energy Information Administration glossary (EIA, 2025).

Battery energy storage system(s), or BESS, has emerged as an industry standard term. It is not yet explicitly defined by the I-codes, but a number of related terms are, and BESS is indirectly defined by them. The following related terms are already defined:

- IFC: "**Battery system, stationary storage.** A rechargeable energy storage system consisting of electrochemical storage batteries, battery chargers, controls and associated electrical equipment designed to provide electrical power to a building. The system is typically used to provide standby or emergency power, an uninterruptible power supply, load shedding, load sharing or similar capabilities."
- IECC, IFC: "**Energy storage system (ESS).** One or more devices, assembled together, capable of storing energy in order to supply electrical energy at a future time."
- IBC, IFC: "**Energy storage system, electrochemical.** An energy storage system that stores energy and produced electricity using chemical reactions. It includes, among others, **battery ESS** and capacitor ESS."

By using "battery," as opposed to just ESS, the proposal distinguishes its scope from capacitor ESS (per the definition of electrochemical ESS above) and from other ESS such as pumped hydro or compressed air. The IFC also defines several "battery types," but the proposal would apply to all types, including some newer types (e.g. sodium-ion or iron-air) not yet defined in the IFC.

Ancillary services is an industry standard term defined by EIA (2025): "Services that ensure reliability and support the transmission of electricity from generation sites to customer loads. Such services may include load regulation, spinning reserve, non-spinning reserve, replacement reserve, and voltage support." By providing load regulation, BESS provides an ancillary service when paired with or co-located with a power generator.

Power plant is used in the following EIA definitions:

- **Electric power plant:** A station containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.
- **Large-scale solar:** Solar thermal and photovoltaic generating units at power plants larger than or equal to one megawatt.

Power-generating station is not defined in the I-codes, but it has been used in Table 1604.5 since the 2003 edition.

Facilities providing power generation (that is, a power generation facility) was used in a change made to the 2024 code to replace the undefined "station" with the broader (and defined) "facility."

Total energy capable of being stored is borrowed from IFC Table 1207.1.3, where it is used specifically to denote the capacity of energy storage systems. Other relevant I-code precedents that might apply to BESS capacity or size come from IECC Appendix CJ, which uses, but does not define, the terms "energy capacity" (in kW or MW) and "power capacity" (in kWh or MWh). The EIA glossary contains several terms that define or use capacity in various ways.

The various BESS components, supports, and shelters listed in the third proposed new RC IV line item reference, and are generally consistent with, terms defined or cited in IFC Section 1207:

- **"Energy storage system, walk-in unit.** A prefabricated building that contains energy storage systems. It includes doors that provide walk-in access for personnel to maintain, test and service the equipment, and is typically used in outdoor and mobile ESS applications."
- **"Energy storage system cabinet.** An enclosure containing an energy storage system and meeting the applicable requirements of the listing for the system. Personnel are not able to enter the enclosure other than reaching in to access components for maintenance purposes."
- **"Equipment platform.** An unoccupied, elevated platform used exclusively for mechanical systems or industrial process equipment, including the associated elevated walkways, stairways, alternating tread devices and ladders necessary to access the platform (see Section 505.3 of the International Building Code)."

IFC Sections 1207.7.1 and 1207.7.2 provide requirements for "dedicated-use buildings" and "nondedicated-use buildings" that house BESS. Per Section 1207.7.1, a dedicated-use building is effectively defined as one used exclusively for "ESS, electrical energy generation and other electrical grid-related operations."

Representative BESS examples

The following photographs (sources credited as shown) offer representative examples of BESS installations of different scales. They are provided as background reference for readers not familiar with BESS. Nothing in this proposal, including the reason statement and cost impact data, is necessarily meant to apply to any of the specific cases shown.

<table>
<tr>
<td>Residential-scale

https://www.wsj.com/articles/your-next-home-could-run-on-batteries-1508065205
Typically “behind the meter” (owned and used by a single- or multi-unit building to manage that building’s supply and costs) and installed on or within the building.
These are not the focus of this proposal, and their capacities are well under the threshold capacities proposed for assignment to RC IV.</td>
<td>Facility- or Commercial-scale

https://insideclimatenews.org/news/19052022/inside-clean-energy-flow-battery/
Also “behind the meter,” but typically for a commercial or institutional facility. Often installed on site but in a separate cabinet or enclosure similar to a shipping container. The enclosure is not part of the BESS, but the performance of the BESS and the performance of its container or enclosure are clearly linked.
These are not the focus of this proposal, and their capacities are well under the threshold capacities proposed for assignment to RC IV.</td>

Cost Impact: Increase

Estimated Immediate Cost Impact:

Where BESS is already assigned to RC IV, there will be no cost impact.
Where BESS is already conservatively designed to facilitate use at multiple locations subject to a range of wind and earthquake loads, there will be no construction cost impact in many cases, but there could be a one-time design cost (by the manufacturer or vendor) of $30,000 for seismic certification testing of each active component, but this would only apply to installations in locations of moderate or high seismicity, and only where the specific components have not been certified previously.

In other cases, accounting for worst case changes in wind and earthquake loads, inclusion of tornado loads (which only apply to RC III and RC IV), and inclusion of seismic certification, and with additional conservative assumptions and rounding up, assignment to RC IV might raise the cost of BESS development just 0.9% (from $1907/kW to $1924/kW using the NREL benchmark).

More reasonable, but still conservative assumptions (a structural factor of 1.5, indirect cost factors of 1.0, and no seismic testing) would raise the cost only 0.3%.

The NREL (2024) cost data on which this assessment is based do not include the substantial cost of land acquisition or of ongoing operations and maintenance. If those were included in the baseline RC II cost, the impact of a change to RC IV would be even smaller.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost impacts reflect four main design changes that would apply if a BESS that might otherwise be assigned to RC II is instead required to use design criteria for RC IV:

- Higher earthquake loads, and fewer exemptions for nonstructural protection
- Inclusion of seismic certification testing costs
- Higher straight line wind loads
- Inclusion of tornado loads (which apply only in RC III and RC IV)

Factors for each of these effects were derived for different regions of the U.S. (because no one place has worst-case wind, and seismic, and tornado) through a comprehensive review of current IBC and ASCE 7 provisions for structural design, non-building structure design, and nonstructural component protection. (Details are provided in the supplemental materials available at the dropbox link given above.) Overall, the changes result in a design increase factor of 1.2 to 1.5, plus a cost for seismic certification. These were then *very conservatively* translated into a direct cost increase factors of 2.0 on the structural portion of the BESS benchmark construction cost (NREL, 2024). The NREL benchmark costs were the latest available, reflecting 2023 data, for a BESS system of 60 MW (or 240 MWh) capacity, for which the total cost is $1,907 per kW (or $477/kWh).

In the NREL benchmark, “Structural Balance of System” includes every design and construction hard cost (engineering, foundation, anchorage, etc.), and its total cost is $11/kW, or just 0.6% of the total benchmark cost. We factored this up by the conservative RC IV premium factor of 2.0. Other benchmark costs (taxes, profit, overhead, etc.) are based on the total hard cost, so those were also factored up by the Structural BOS portion with a conservative factor of 1.01. With each benchmark line item thus factored, and a cost for seismic certification added, the total cost increased from $1,907/kW to $1,924/kW.

IBC: TABLE 1604.5

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net)

2024 International Building Code

Revise as follows:

TABLE 1604.5 RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Risk Categories I, III and IV.

III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:
	• Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
	• Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of these public assembly spaces of greater than 2,500.
	• Buildings and other structures containing Group E or Group I-4 occupancies or combination thereof, with an occupant load greater than 250.
	• Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.
	• Group I-3, Condition 1 occupancies.
	• Any other occupancy with an occupant load greater than 5,000.[a]
	• Power-generating stations with individual power units rated 75 MW_{AC} (megawatts, alternating current) or greater, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.
	• Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]

IV	Buildings and other structures designated as essential facilities and buildings where loss of function represents a substantial hazard to occupants or users, including but not limited to:
	Group I-1, Condition 2 occupancies
	• Group I-2 occupancies.
	• Ambulatory care facilities having emergency surgery or emergency treatment facilities.
	• Group I-3 occupancies other than Condition 1.
	• Fire, rescue, ambulance and police stations and emergency vehicle garages
	• Designated earthquake, hurricane or other emergency shelters.
	• Designated emergency preparedness, communications and operations centers and other facilities required for emergency response.
	• Public utility facilities providing power generation, potable water treatment, or wastewater treatment.
	• Power-generating stations and other public utility facilities required as emergency backup facilities for *Risk Category* IV structures.
	• Buildings and other structures containing quantities of highly toxic materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]
	• Aviation control towers, air traffic control centers and emergency aircraft hangars.
	• Buildings and other structures having critical national defense functions.
	• Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use *gross floor area* calculations shall be permitted to use *net floor areas* to determine the total occupant load. The floor area for vehicular drive aisles shall be permitted to be excluded in the determination of net floor area in parking garages.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: Group I-1 Condition 2 facilities are large facilities specially designed for people who need help with everyday tasks (*custodial care*), and even need help evacuating in an emergency (*limited verbal or physical assistance*). Because of the residents' special needs, expected structural damage to one of these buildings will almost certainly lead to a "loss of function [that] represents a substantial hazard," requiring these buildings to be assigned to Risk Category IV.

With the current code, Chapter 4 requires these buildings to have special design features suited to the residents' disabilities. But Chapter 16 assigns them to Risk Category II, just like any market-rate housing, just like any house, condo, or apartment building. Further, because Group I-1 is currently assigned to RC II, it means that even a highly deficient existing building (like an old apartment building) can be converted to one of these facilities with essentially no structural review. This is more of a concern than in the past, as housing shortages throughout the country have led to calls for "adaptive reuse" of market housing, hotels, motels, and even office buildings into Group I-1 care facilities, and in some cases the shortage is acute enough that proponents are willing to overlook existing deficiencies (SFBOS, 2023). The answer is not to look the other way, but to discourage the conversion of deficient buildings unless they're retrofitted and to ensure that new buildings are given as much thought in Chapter 16 as they are in Chapter 4. This proposal does both.

Under current code, if a Group I-1 Condition 2 building is damaged in a design-level hurricane or earthquake – as we structural engineers expect – these vulnerable residents will have nowhere to go that can provide the design features and expert staff care they need.

Instead, assigning these buildings to RC IV will ensure, at minimal additional cost (see below):

- A stronger, more damage-resistant lateral system, and much higher likelihood of immediate reoccupancy
- More complete protection for nonstructural components and systems, including the special conditions and systems required of Group I-1 Condition 2 buildings but not found in normal multi-unit housing.
- Backup utilities, including backup power so necessary for protecting vulnerable seniors against life-threatening power outages.

We know from experience that while developers (or private equity buyers) could provide these RC IV features voluntarily, they won't. On the contrary, assisted living, senior housing, and memory care facilities, all of which could be Group I-1 Condition 2, are a growth industry, and many developers are looking to provide nothing more than what the code requires.

Private equity is increasingly buying and building assisted living (I-1) and nursing home (I-2) facilities (MEDPAC, 2021; Senate Budget Committee, 2025). Nursing homes and assisted living facilities are especially vulnerable to these new market conditions: "The past two decades have seen a rapid increase in Private Equity (PE) investment in healthcare, a sector in which intensive government subsidy and market frictions could lead high-powered **for-profit incentives to be misaligned with the social goal of affordable, quality care**. ... PE's success in other sectors may not be relevant to healthcare, which suffers from unique market frictions. For example, patients cannot accurately assess provider quality, they typically do not pay for services directly, and a web of government agencies act as both payers and regulators (Cutler, 2011; Skinner, 2011). **These features weaken the natural ability of a market to align firm incentives with consumer welfare and could mean that high-powered incentives to maximize profits have detrimental implications for consumer welfare** (Hansmann, 1980; Hart et al., 1997; Chandra et al., 2016)." (Gupta et al., 2021, emphasis added)

If the owners of these vital facilities are now more willing than ever to cut costs, cut care, and walk away from losses – at the direct expense of the vulnerable occupants and at the indirect expense of the community – the least the building code can do is ensure that a major earthquake, hurricane, or winter storm does not add to the problem by giving them yet another excuse. The building code provides essentially one tool to express the importance of natural hazard resistance and recovery through design, and that tool is assignment to Risk Category IV. While design for RC IV can be more expensive than design for RC II, the premium can be surprisingly low -- as little as 1%, or even less for some thoughtfully-designed facilities (see the Cost Impact and Justification statements). Just as important, the design requirements and the needs of tenants in Group I-1 Condition 2 facilities mean that the benefits of a RC IV design are even more likely to outweigh any additional costs. In addition to the normal benefits of reduced damage, which in turn reduces repair costs (which are also at a premium following a natural hazard event) and downtime operating losses, benefits for these special facilities would include reductions in the cost of relocating vulnerable tenants, the premium cost for suitable alternative space (which is rare), the premium cost for specialized staff, and any additional liability for losses by especially vulnerable tenant-clients.

As we consider what the appropriate performance ought to be for a large, new care facility, it might be useful to review actual performance from the last year or two. Consider these examples that demonstrate over and over the difficulty of finding appropriate buildings for care facilities and senior housing among the existing building stock, and the vulnerability that is sure to arise if we don't take the opportunity to make *new* care facilities more damage resistant:

- The country faces a potential "gray wave" of homeless seniors. The solution, of course, is to build more affordable housing, but "that housing will have to be accessible too. Older homeless peoples ... need homes they can safely navigate." (Bolton, 2024)
- If the code doesn't mandate better buildings, including appropriate fire safety for seniors and custodial care recipients, insurers will walk away. "Industry experts say increasing premiums are the result of greater weariness on the part of insurance carriers to take on what they consider to be riskier properties, especially as they also confront higher rebuilding costs, more frequent losses from natural disasters, and other challenges." (Baldassari, 2024)
- If landlords, tenants, city emergency planners, and code officials don't want to see more eviction bans, we need to be designing more damage-resistant housing. (Sisson, 2024)
- Risk Category IV ensures backup power, which might have prevented some deaths linked to power outages. "The deaths could have been caused by many dangers of power outages: people not being able to charge medical equipment, not being able to use air conditioning on hot days, or experiencing increased physical and mental stress and isolation of living without elevators or subways. ... Weather-related power outages are increasing, as climate change brings more frequent, more powerful storms that threaten our power grid and other physical infrastructure." (Siegel, 2012; NYC.gov, 2022)
- Relying on facilities to voluntarily provide backup power for vulnerable residents doesn't work, and state regulation varies considerably. "[W]hile nursing homes face such federal oversight, lower-care-level facilities that provide some medical care — known as assisted living — are regulated at the state level, so the rules for emergency preparedness vary widely. ... Maryland adopted rules for generators in assisted living facilities following Hurricane Isabel, which left more than 1.2 million residents in the state without power in 2003. Florida did so for nursing homes and assisted living facilities in 2018, after Hurricane Irma led to deaths at one facility. But Texas has not. And no requirements for generators exist in Texas for the roughly 2,000 assisted living facilities or the even less regulated independent living sites." (West, 2024)
- Texas will now require backup power, after unacceptable losses in recent years. "[D]uring Winter Storm Uri in February 2021, 10% of nursing homes and 33% of the assisted living facilities in Texas lost power. During Hurricane Beryl in July [2024], 14 nursing homes and 30 assisted living facilities lost power." (Dominguez, 2025)

I made a similar proposal last cycle (S77-22). This proposal has made changes in response to comments offered then. I also respond here to some misunderstandings voiced during last cycle's testimony.

- S77-22 was written to apply only where at least half the care recipients would qualify as Condition 2. That was consistent in concept with the exception in IEBC Sec 1002.3, which waives code upgrades when less than half of the building area is changed to Group I-1. But some felt that the proposal drew an unnecessary line, so I have removed it.
- Some felt that the proposal covered too many types of buildings, but I believe they were misled by the list of uses (mostly undefined) in IBC 308.2. In fact, both S77-22 and this proposal apply to just one type of facility – Condition 2 (Sec 308.2.2), where at least some residents need assistance with egress. ICC's Healthcare Committee already recognizes profound differences between Condition 1 and Condition 2, which is why IEBC Sec 1002.3 waives upgrade for a change from Condition 2 to Condition 1, but not the other way.
- Some were concerned that RC IV was too much to ask of a small care facility. In fact, this proposal only applies to the large care facilities in Group I-1. Smaller facilities are either Group R-3 or R-4 and would not be affected by this proposal.
- Some expressed concern about what would happen if an existing care recipient were to transition over time from Condition 1 to Condition 2, and the feasibility of enforcement. This is a good question, but it's a question for the IEBC, and the IEBC requirements for change of use within Group I-1 already present the same issues (e.g. IEBC Sec 1002.3). If a patient changes from Condition 1 to Condition 2, the IEBC already triggers compliance of egress, smoke and fire safety, room layouts, etc. to meet the IBC *as a new building*. That's already onerous enough to probably discourage the change – but again, that's an IEBC issue. Developers of new care facilities should definitely be thinking about these possibilities during design. This proposal does not change the designer's and developer's interest in looking forward to potential changes in their tenant-client base.

For reference:

Group I-1 Condition 2 buildings include ONLY:

- Buildings designed for more than 16 *custodial care* recipients, plus staff. (The same use with 1 to 5 residents is R-3, not I-1. The same use with 6 to 16 residents is R-4, not I-1.)
- Buildings where at least some of the care recipients require *limited verbal or physical assistance* to respond to an emergency. This is a lower level

of disability than being fully *incapable of self-preservation* (such I-2 facilities are already assigned to RC IV). But its design requirements are still different from even brand new market housing.

This proposal does NOT apply to R-3. Therefore, a converted dwelling or any small building converting to a care facility is not affected.

This proposal does NOT apply to R-4. Therefore, even a smaller care facility that needs flexibility as its residents' care needs change is not affected.

This proposal is only for large buildings intentionally and specifically designed as care facilities.

Compared with a normal R-2 multi-unit building (or even a similar but smaller R-4 care facility), the current code requires Group I-1 Condition 2 buildings to meet special requirements and limits regarding:

- IBC 420.6: Smoke barriers, with refuge areas and limits on smoke compartment size and maximum travel distance.
- IBC 420.7: Walls, ceilings, sprinklers, and space planning related to common areas and activity rooms.
- IBC 420.8: Kitchens and cooking areas.
- IBC 420.9: Kitchen appliances, regarding shutoffs, timers, etc. in shared cooking areas.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The initial construction cost premium to design for RC IV instead of RC II will vary significantly with the building location, size, architecture, and program. That said, premium is often surprisingly low, between 1% and 2%. Though rare, it can even be zero if the designer is thoughtful about structural system selection and nonstructural system detailing. (If the cost of land acquisition, operations, and maintenance are also considered, the construction cost premium would be even smaller relative to the total project long-term cost.)

For a new assisted living facility, assuming a construction cost between $272/sf and $444/sf (see Justification) and a conservative 1.5% cost premium, the immediate cost impact would range from $4.10/sf to $6.70/sf.

See the reason statement for a brief discussion of likely benefits that would offset any immediate construction cost premium.

Estimated Immediate Cost Impact Justification (methodology and variables):

The construction cost for a new assisted living facility is from Gaivin (2024), citing data from The Weitz Company. For a city index of 100, 2024 construction cost was expected to range from $272/sf to $347/sf for a "mid-level" building (wood-frame) and from $356/sf to $444/sf for a "high-level" building (steel or concrete).

The estimate of 1% to 2% is based on case studies of voluntary design of nominally RC II buildings for RC IV in regions of high seismicity: Almufti (2016), Bade (2014), Berkowitz (2021), Haselton et al. (2021), Lizundia (2021), Mar (2021), Moore (2021), SEFT (2015), Westermeyer (2021), and Zimmerman (2021).

This estimate stands to reason: Wind, snow, and earthquake loads can already vary significantly within a jurisdiction, but the building designs and unit costs don't change wildly from one side of the county to the other. For example, the seismic design force in Berkeley is about 1.5 times that in downtown San Francisco; so with respect to the structure, any care facility you can build as RC II in Berkeley you can also build as RC IV in San Francisco with no change to the design. The same is likely true for snow design, for example, in Vail v. Boulder and for wind design in Galveston v. the west side of Houston. On the nonstructural side, a facility's nonstructural systems might need more bracing or support when assigned to RC IV, but the number and size of the components themselves don't suddenly look

like a hospital just because the risk category has changed.

S56-25

S57-25

IBC: 1604.5, TABLE 1604.5

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net)

2024 International Building Code

Revise as follows:

1604.5 Risk category. Each *building* and *structure* shall be assigned a *risk category* in accordance with Table 1604.5. Where a referenced standard specifies an occupancy category, the *risk category* shall not be taken as lower than the occupancy category specified therein. Where a referenced standard specifies that the assignment of a *risk category* be in accordance with ASCE 7, Table 1.5-1, Table 1604.5 shall be used in lieu of ASCE 7, Table 1.5-1.

Exceptions:

1. The assignment of *buildings* and *structures* to Tsunami *Risk Categories* III and IV is permitted to be in accordance with Section 6.4 of ASCE 7.
2. Freestanding parking garages not used for the storage of emergency services vehicles or not providing means of egress for *buildings* or *structures* assigned to a higher risk category shall be assigned to Risk Category II.
3. Power-generating facilities are permitted to be assigned to Risk Category II where the *owner* has submitted and the *building official* has approved a plan to provide an alternative equivalent source of energy to the same energy consumers within one hour of the facility's outage due to a design level wind, earthquake, snow, flood, or tornado event, considering the regional effects of any such event.

TABLE 1604.5 RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Risk Categories I, III and IV.

III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:
	• Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
	• Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of these public assembly spaces of greater than 2,500.
	• Buildings and other structures containing Group E or Group I-4 occupancies or combination thereof, with an occupant load greater than 250.
	• Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.
	• Group I-3, Condition 1 occupancies.
	• Any other occupancy with an occupant load greater than 5,000.[a]
	• ~~Power-generating stations with individual power units rated 75 MW$_{AC}$ (megawatts, alternating current) or greater, water~~ Water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.
	• Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]

RISK CATEGORY	NATURE OF OCCUPANCY

IV	Buildings and other structures designated as essential facilities and buildings or structures where loss of function represents a substantial hazard to occupants or users, including but not limited to:
	• Group I-2 occupancies.
	• Ambulatory care facilities having emergency surgery or emergency treatment facilities.
	• Group I-3 occupancies other than Condition 1.
	• Fire, rescue, ambulance and police stations and emergency vehicle garages
	• Designated earthquake, hurricane or other emergency shelters.
	• Designated emergency preparedness, communications and operations centers and other facilities required for emergency response.
	Power-generating facilities with total capacity of 20 MW$_{AC}$ or greater.
	• Public utility facilities providing power generation, potable water treatment, or wastewater treatment.
	• Power-generating stations and other public utility facilities required as emergency backup facilities for *Risk Category* IV structures.
	• Buildings and other structures containing quantities of highly toxic materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]
	• Aviation control towers, air traffic control centers and emergency aircraft hangars.
	• Buildings and other structures having critical national defense functions.
	• Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use *gross floor area* calculations shall be permitted to use *net floor areas* to determine the total occupant load. The floor area for vehicular drive aisles shall be permitted to be excluded in the determination of net floor area in parking garages.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: No doubt some will open this proposal and immediately accuse me of trying to kill the wind and solar industries. Either that, or I am just too stupid for words.

But stay with me. What I'm trying to do is have a conversation about how we are going to ensure the fast recovery of electric power for the general public after a damaging natural hazard event, and the role of the building code and of building officials in doing so. In general, "grid reliability" is an increasingly complex issue, and there are lots of experts doing excellent, good-faith work on it, but they don't read our code, and we don't read their industry standards. But as long as the IBC is going to address "power-generating stations" or "public utilities" (and from what I've seen, it probably shouldn't any more), we need to get some consensus on what we expect this book to deliver.

Some recent history: Everyone agrees that a facility providing backup power to a RC IV building ought to be in RC IV too. That's flawed, but it's easy. Beyond that, the 2021 IBC had one important line about power in Table 1604.5: All other "power-generating stations" were assigned to RC III. No size limits, no distinctions by fuel source or ownership, just one broad rule. Basically it was the code saying "Electric power is important, so we want a little more strength in those structures, but not RC IV-level important."

Now, Section 1604.5 of the 2024 IBC reflects the results of three approved proposals from the last cycle:

- S76-22 (driven by me) said that power produced and delivered to the general public is so important during and after a hurricane, earthquake, or winter storm that the facilities who make and sell it -- presented as "public utility facilities providing power generation" -- need to be in RC IV. The wind and solar industry fought it, but ICC members approved it at every step.
- S81-22 (driven by the solar industry) laid out a set of requirements, now in 1604.5.2, for generally small PV installations (residential and commercial scale). But that general rule from the 2021 code about RC III? Forget it. Industry said "We don't care what the code says, we've been designing for RC II or even RC I for years, and we need the code to let us keep doing that." ICC members said ok.
- S79-22 (driven by the wind industry) said "We want/need to keep ignoring the code too." So at the Public Comment hearing they changed the RC III line to exempt all but the largest generators: 75 MW or bigger. Did any code official or building designer in the room know how big 75 MW is? I sure didn't (and I said so). Well, it turns out that the biggest wind turbine in the world is only 22 MW,

and most of the big on-shore ones are only 2 or 3 MW. So S79 effectively guarantees that no wind turbine will ever be assigned to RC III, meaning that every wind farm that isn't a public utility now defaults to RC II. 2021 IBC we hardly knew ye.

As I said, the energy industry doesn't read our code, so when shown the RC III provision from 2021, they just ignored it. (Interestingly, oil, gas, hydro, and nuclear reps didn't even come to the hearings. They *really* don't care what we do.)

And in all the discussion of those three proposals, nobody from industry came out and said that good performance and fast recovery after nat haz events is bad. They just weren't going to lift a finger to help get there. Solar had to acknowledge that wind actually does rip up solar farms, that FL has voluntarily implemented higher standards that work, that DOE has guidelines for high-wind installations, and that a couple of vendors are now specifically pushing high wind-resistant trackers. But actually require design for functionality and fast recovery? No way. And all Wind kept saying was that they've always done it their way and no turbine has ever had a foundation failure. What they failed to mention is that typical turbines today are twice as big as they were 20 years ago, so the track record for the new stuff is pretty short. Also, a slightly heftier foundation and tower would cost pennies compared with the high-tech nacelle and blades. But no, anything but RC II would kill renewables dead. Come on.

Anyway, here's where things stand:

- Pretty much all solar (unless public utility): RC II
- Pretty much all wind (unless public utility): RC II
- Oil, gas, nuclear, hydro (unless public utility?): RC III, I guess?
- Public utility generators: RC IV.

So at least the big installations, the public utility-owned generators, are designed for low damage and fast recovery. Right? Well, not really, because public utilities for electric power are not what they used to be. They're not even what they were three years ago when we used that term (which has been in Table 1604.5 since 2003) as a proxy for power that normal people and normal buildings use. Yes, the big investor-owned public utilities like PG&E, Duke Energy, and Con Edison are still around, but they all buy power from independent wind and solar providers, to the point where it's nearly impossible to say whether a new proposed wind or solar farm, no matter the size, is regulated as a public utility or not. I was a little naive on this point back in 2022, but in my defense, the web of relationships between the various players is WAY more complicated now, as construction of renewables (boosted even more by post-pandemic Fed subsidies) has really exploded.

Which leaves us with the question S76 was trying to answer: **How do we make sure that the most substantial power providers, the ones normal people absolutely rely on, are properly designing for wind, earthquake, snow, and flood?** (And we should probably throw in high heat, drought, and WUI fire too.)

From a building code perspective, we have a tested, if blunt, tool: Risk Category. Who cares how wind and solar did their work when they were little alternative sources. Now they're the big boys too, and we need them to see their own end product as important, even essential, as we do. It's not about selling panels or turbines, it's about delivering power and keeping the lights, the heat, the food cold chain, and the air conditioning on.

So that's the first part of this surprisingly serious proposal: Put any big power plant in RC IV. (And by the way, the cutoff should be 20 MW, not 75, and it should be based on the whole facility, not "individual power units." The key agencies, FERC and NERC, are actually pretty clear about those metrics.)

But won't that just rehash the arguments from last cycle? Yeah, but I'm acknowledging, as I did then, that their best argument against S76 was that the very nature of the grid provides redundancy and reliability already, so a power outage is not like a building collapse.

I get it, and I accept it, and that's **the second part of this proposal: RC II is fine if there's a real plan, grid-wide as needed, to shorten outages and help the community recover.**

Three years ago, wind and solar industry reps swore this was already doable. Ok, show us the plan. You (and DOE) have until 2028 when states start enforcing this next edition, to get it done.

(The alternative to all this, which maybe someone will propose as a floor mod: Strike all mention of power from Table 1604.5. The grid is not a building, and the building code is just not the right tool for that job.)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is obviously not just editorial or a clarification, but with the proposed Exception, it provides a means for any power industry stakeholder to keep using RC II just as they're doing now, if they just have a plan to keep the energy flowing.

Staff Analysis: CC # S57-25 and CC # 58-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

Proponents: Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com)

2024 International Building Code

Revise as follows:

TABLE 1604.5 RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Risk Categories I, III and IV.

III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:
	• Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
	• Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of these public assembly spaces of greater than 2,500.
	• Buildings and other structures containing Group E or Group I-4 occupancies or combination thereof, with an occupant load greater than 250.
	• Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.
	• Group I-3, Condition 1 occupancies.
	• Any other occupancy with an occupant load greater than 5,000.[a]
	• Power-generating stations with individual power units rated 75 MW_{AC} (megawatts, alternating current) or greater, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.
	• Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]

IV	Buildings and other structures designated as essential facilities and buildings where loss of function represents a substantial hazard to occupants or users, including but not limited to:
	• Group I-2 occupancies.
	• Ambulatory care facilities having emergency surgery or emergency treatment facilities.
	• Group I-3 occupancies other than Condition 1.
	• Fire, rescue, ambulance and police stations and emergency vehicle garages
	• Designated earthquake, hurricane or other emergency shelters.
	• Designated emergency preparedness, communications and operations centers and other facilities required for emergency response.
	• Public utility facilities providing power generation with individual power units rated 75 MW_{AC} (megawatts, alternating current) or greater, potable water treatment, or wastewater treatment.
	• Power-generating stations and other public utility facilities required as emergency backup facilities for *Risk Category* IV structures.
	• Buildings and other structures containing quantities of highly toxic materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]
	• Aviation control towers, air traffic control centers and emergency aircraft hangars.
	• Buildings and other structures having critical national defense functions.
	• Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use *gross floor area* calculations shall be permitted to use *net floor areas* to determine the total occupant load. The floor area for vehicular drive aisles shall be permitted to be excluded in the determination of net floor area in parking garages.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: During the Public Comment Hearings for ICC Group B in 2022, Proposal S79-22 was Approved As Modified by Public Comment 1. This public comment created a threshold of 75 MW_{AC} or greater for power-generating stations in Risk Category III.

This proposal seeks to include the same 75 MW_{AC} threshold in Risk Category IV as presently exists in 2024 IBC Table 1604.5 for Risk Category III.

The proponent offers the same reason statement for adding the threshold to RC IV as in the previous cycle for RC III, as in S79-22 Public Comment 1.

"ASCE 7-22 Section 15.5.4 states: "Electrical power-generating facilities are power plants that generate electricity by steam turbines, combustion turbines, diesel generators, or similar turbomachinery." Commentary to Section 15.5.4 states: "Electrical power plants closely resemble building structures, and their performance in seismic events has been good." It is clear that IBC Table 1604.5 and ASCE Section 15.5.4 were not written with renewable energy facilities in mind. The term "power generating station" is undefined and ambiguous in the 2021 IBC, and it has no threshold assigned to it. This PC seeks to establish a threshold on the term "power generating station" that is consistent with the original intent of the term in the IBC and in ASCE 7. Note 75 MWac is a better threshold than 100 MW for the smallest power-producing unit of a power generating station, as 75 MW is established in North American Electric Reliability Corporation Docket No. RR15-4-000, Order on Electric Reliability Organization Risk Based Registration Initiative and Requiring Compliance Filing (Issued March 19, 2015). The smallest power-producing unit of a renewable energy facility could be considered as one inverter, or could be one wind turbine."

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal only seeks to apply the same 75 MWAC threshold to Risk Category IV power generation as was approved for Risk Category III power generation.

Staff Analysis: CC # S58-25 and CC # 57-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

IBC: TABLE 1604.5

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Building Code

Revise as follows:

TABLE 1604.5 RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Risk Categories I, III and IV.

III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:
	• Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
	• Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of these public assembly spaces of greater than 2,500.
	• Buildings and other structures containing Group E or Group I-4 occupancies or combination thereof, with an occupant load greater than 250.
	• Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.
	• Group I-3, Condition 1 occupancies.
	Group I-2 Condition 1 occupancies with 50 or more care recipients
	• Any other occupancy with an occupant load greater than 5,000.[a]
	• Power-generating stations with individual power units rated 75 MW_{AC} (megawatts, alternating current) or greater, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.
	• Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]

IV	Buildings and other structures designated as essential facilities and buildings where loss of function represents a substantial hazard to occupants or users, including but not limited to:
	• Group I-2, Condition 2 occupancies.
	• Ambulatory care facilities having emergency surgery or emergency treatment facilities.
	• Group I-3 occupancies other than Condition 1.
	• Fire, rescue, ambulance and police stations and emergency vehicle garages
	• Designated earthquake, hurricane or other emergency shelters.
	• Designated emergency preparedness, communications and operations centers and other facilities required for emergency response.
	• Public utility facilities providing power generation, potable water treatment, or wastewater treatment.
	• Power-generating stations and other public utility facilities required as emergency backup facilities for *Risk Category* IV structures.
	• Buildings and other structures containing quantities of highly toxic materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]
	• Aviation control towers, air traffic control centers and emergency aircraft hangars.
	• Buildings and other structures having critical national defense functions.
	• Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use *gross floor area* calculations shall be permitted to use *net floor areas* to determine the total occupant load. The floor area for vehicular drive aisles shall be permitted to be excluded in the determination of net floor area in parking garages.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: The intent of this proposal is to return Nursing Homes (Group I-2 Condition 1) to Risk Category 3. There is another change to address Hospitals (Group I-2 Condition 2). The description text and Group I-2 occupancies were revised in S74-22.

This proposal has three serious problems.

The added language in the description for Risk Category IV could be read that any of the current occupancies in this list could sustain loss of function as long as that damage did not represent a substantial hazard to the occupants. The list of facilities is a listing of essential facilities that are intended to be operational after an event for the safety and recovery of the entire community. Hospitals that have emergency surgery or emergency treatment facilities are intended to be operational after an emergency. There could be a lot of damage to the building that would not be a substantial hazard to occupants, but would stop impact the functionality of the emergency room. During normal operations there are times that emergency rooms divert additional patients to other facilities that are available hence the true intention of an ER is to address a set amount of emergent patients and not to address every possible patient within the community. It is also common practice within a community to develop emergency operation plans to allow for facilities to coordinate services across the community. Hence hospitals and ER’s are expected to be functional during an emergency and to address a set amount of patients and efforts are coordinated across a community to provide essential services as needed.

If all nursing homes and hospitals are relocated to Risk Category IV with the beginning language - how would a 'substantial hazard' to the occupants be determined. Would this require protection for power and water supplies? What if the windows break? Is that a hazard in the summer or winter? That depends on the season and where in the country you are located. This language will not be uniformly understood or enforced.

This language would move all nursing homes and hospitals to Risk Category IV. Currently nursing homes with between 6 and 50 occupants can be Risk Category II; and nursing homes with more than 50 occupants and hospitals without emergency surgery or emergency treatment can be Risk Category III. While these are a vulnerable population., however, there has been no history of issues with these facilities that justifies this increase in design for higher winds, seismic and snow loads for all such facilities. Hospitals and nursing homes already include additional safety features for residents and have a high level of oversite. If the concern is to remain operational as expressed in the proponents’ reasons, there are many emergency planning options that can address this outside of a substantial increase in building construction (added cost). These facilities have staff trained in emergency care and operations and have detailed emergency operation plans. If a building has damage, the residents can be relocated to other parts of the building or to another facility. Such facilities typically have emergency generators. Operational plans for emergencies can address early evacuation plans; potable water supplies; etc.

This proposal is submitted by the ICC Committee for Healthcare (CHC). The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Per RS Means data including the 2024 year, hospital construction is approximately $500 per square foot for hospital construction. This change added 15% to 20% of construction costs, resulting in $575 to $600 per square foot. Reversing this change will reverse this increase.

Estimated Immediate Cost Impact Justification (methodology and variables):

This pricing considers the need to provide N+1 redundancy in a central utility plant for power and full air conditioning, plus additional structural scope. It does not consider premium sits such as California, New York or Gulf Coast, but a national average square footage cost. In these locations, the savings would be more.

S59-25

S60-25

IBC: TABLE 1604.5

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Building Code

Revise as follows:

TABLE 1604.5 RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Risk Categories I, III and IV.

III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:
	• Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
	• Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of these public assembly spaces of greater than 2,500.
	• Buildings and other structures containing Group E or Group I-4 occupancies or combination thereof, with an occupant load greater than 250.
	• Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.
	Group I-2, Condition 2 occupancies not having emergency surgery or emergency treatment facilities.
	• Group I-3, Condition 1 occupancies.
	• Any other occupancy with an occupant load greater than 5,000.[a]
	• Power-generating stations with individual power units rated 75 MW_{AC} (megawatts, alternating current) or greater, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.
	• Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]

IV	Buildings and other structures designated as essential facilities and buildings where loss of function represents a substantial hazard to occupants or users, including but not limited to:
	Group I-2 Condition 1
	• Group I-2, Condition 2 occupancies having emergency surgery or emergency treatment facilites.
	• Ambulatory care facilities having emergency surgery or emergency treatment facilities.
	• Group I-3 occupancies other than Condition 1.
	• Fire, rescue, ambulance and police stations and emergency vehicle garages
	• Designated earthquake, hurricane or other emergency shelters.
	• Designated emergency preparedness, communications and operations centers and other facilities required for emergency response.
	• Public utility facilities providing power generation, potable water treatment, or wastewater treatment.
	• Power-generating stations and other public utility facilities required as emergency backup facilities for *Risk Category* IV structures.
	• Buildings and other structures containing quantities of highly toxic materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]
	• Aviation control towers, air traffic control centers and emergency aircraft hangars.
	• Buildings and other structures having critical national defense functions.
	• Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use *gross floor area* calculations shall be permitted to use *net floor areas* to determine the total occupant load. The floor area for vehicular drive aisles shall be permitted to be excluded in the determination of net floor area in parking garages.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: The intent of this proposal is to restore the Group I-2 hospitals without emergency surgery or emergency treatment areas to Risk Category 3. The change for Group I-2 Nursing homes is a separate proposal. The description text and Group I-2 occupancies were revised in S74-22.

This proposal has three serious problems.

The added language in the description for Risk Category IV could be read that any of the current occupancies in this list could sustain loss of function as long as that damage did not represent a substantial hazard to the occupants. The list of facilities is a listing of essential facilities that are intended to be operational after an event for the safety and recovery of the entire community. Hospitals that have emergency surgery or emergency treatment facilities are intended to be operational after an emergency. There could be a lot of damage to the building that would not be a substantial hazard to occupants, but would impact the functionality of the emergency room. During normal operations there are times that emergency rooms divert additional patients to other facilities that are available hence the true intention of an ER is to address a set amount of emergent patients and not to address every possible patient within the community. It is also common practice within a community to develop emergency operation plans to allow for facilities to coordinate services across the community. Hence hospitals and ER's are expected to be functional during an emergency and to address a set amount of patients and efforts are coordinated across a community to provide essential services as needed.

If all nursing homes and hospitals are relocated to Risk Category IV with the beginning language - how would a 'substantial hazard' to the occupants be determined. Would this require protection for power and water supplies? What if the windows break? Is that a hazard in the summer or winter? That depends on the season and where in the country you are located. This language will not be uniformly understood or enforced. This language would move all nursing homes and hospitals to Risk Category IV.

Currently nursing homes with between 6 and 50 occupants can be Risk Category II; and nursing homes with more than 50 occupants and hospitals without emergency surgery or emergency treatment can be Risk Category III. While these are a vulnerable population., however, there has been no history of issues with these facilities that justifies this increase in design for higher winds, seismic and snow loads for all such facilities. Hospitals and nursing homes already include additional safety features for residents and have a high level of oversite. If the concern is to remain operational as expressed in the proponents' reasons, there are many emergency planning options that can address this outside of a substantial increase in building construction (added cost). These facilities have staff trained in emergency care and operations and have detailed emergency operation plans. If a building has damage, the residents can be relocated to other parts of the building or to another facility. Such facilities typically have emergency generators. Operational plans for emergencies can address early evacuation plans; potable water supplies; etc.

Note: Group I-2, Condition 1 is addressed by another proposal by this proponent.

This proposal is submitted by the ICC Committee for Healthcare (CHC). The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. 2024 International Building Code

Revise as follows:

TABLE 1604.5 RISK CATEGORY OF BUILDINGS AND OTHER STRUCTURES

RISK CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Risk Categories I, III and IV.

III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to:
	• Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300.
	• Buildings and other structures containing one or more public assembly spaces, each having an occupant load greater than 300 and a cumulative occupant load of these public assembly spaces of greater than 2,500.
	• Buildings and other structures containing Group E or Group I-4 occupancies or combination thereof, with an occupant load greater than 250.
	• Buildings and other structures containing educational occupancies for students above the 12th grade with an occupant load greater than 500.
	• Group I-3, Condition 1 occupancies.
	• Any other occupancy with an occupant load greater than 5,000.[a]
	• Power-generating stations with individual power units rated 75 MW_{AC} (megawatts, alternating current) or greater, water treatment facilities for potable water, wastewater treatment facilities and other public utility facilities not included in Risk Category IV.
	• Buildings and other structures not included in Risk Category IV containing quantities of toxic or explosive materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(1) or 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]

IV	Buildings and other structures designated as essential facilities ~~and buildings where loss of function represents a substantial hazard to occupants or users~~, including but not limited to:
	• Group I-2 occupancies.
	• Ambulatory care facilities having emergency surgery or emergency treatment facilities.
	• Group I-3 occupancies other than Condition 1.
	• Fire, rescue, ambulance and police stations and emergency vehicle garages
	• Designated earthquake, hurricane or other emergency shelters.
	• Designated emergency preparedness, communications and operations centers and other facilities required for emergency response.
	• Public utility facilities providing power generation, potable water treatment, or wastewater treatment.
	• Power-generating stations and other public utility facilities required as emergency backup facilities for *Risk Category* IV structures.
	• Buildings and other structures containing quantities of highly toxic materials that:
	  • Exceed maximum allowable quantities per control area as given in Table 307.1(2) or per outdoor control area in accordance with the *International Fire Code* ; and
	  • Are sufficient to pose a threat to the public if released.[b]
	• Aviation control towers, air traffic control centers and emergency aircraft hangars.
	• Buildings and other structures having critical national defense functions.
	• Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.5 to use *gross floor area* calculations shall be permitted to use *net floor areas* to determine the total occupant load. The floor area for vehicular drive aisles shall be permitted to be excluded in the determination of net floor area in parking garages.

b. Where approved by the building official, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided that it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

Reason: The intent of this proposal is to review the description in Risk Category IV. Revisions to Group I-2 are address in two other code changes. The description text and Group I-2 occupancies were revised in S74-22.

The scope of the Healthcare committee is for healthcare facilities, such as ambulatory care facilities, clinics, nursing homes and hospitals. Therefore, this public comment is limited to the effect of the new language to the description of Risk Category IV and how it would effect the 1st and 2nd item in the list.

- Group I-2 occupancies .
- Ambulatory care facilities having emergency surgery or emergency treatment facilities.

The added language in the description for Risk Category IV could be read that any of the current occupancies in this list could sustain loss of function as long as that damage did not represent a substantial hazard to the occupants. These are a list of essential facilities that must be operational after an event for the safety and recovery of the entire community. Hospitals that have emergency surgery or emergency treatment facilities need to be operational and functional after an emergency. There could be a lot of damage to the building that would not be a substantial hazard to occupants, but would stop the emergency room from functioning. During normal operations there are times that emergency rooms divert additional patients to other facilities that are available hence the true intention of an ER is to address a set amount of emergent patients and not to address every possible patient within the community. It is also common practice within a community to develop emergency operation plans to allow for facilities to coordinate services across the community. Hence hospitals and ER's are expected to be functional during an emergency and to address a set amount of patients and efforts are coordinated across a community to provide essential services as needed.

Additionally, the language in question could also be read to include other buildings that are not considered as essential facilities but when the loss of the function of the building is a substantial hazard to the occupants or users such as a dialysis center which loss could put those users at risk but during an emergency these services could be provided in an alternate facility. This language could cause the mis-application of Risk Category IV to facilities that were not intended to be included.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Per RS Means data including the 2024 year, hospital construction is approximately $500 per square foot for hospital construction. This change added 15% to 20% of construction costs, resulting in $575 to $600 per square foot. Reversing this change will reverse this increase.

Estimated Immediate Cost Impact Justification (methodology and variables):

This pricing considers the need to provide N+1 redundancy in a central utility plant for power and full air conditioning, plus additional structural scope. It does not consider premium sits such as California, New York or Gulf Coast, but a national average square footage cost. In these locations, the savings would be more.

S62-25

IBC: 1604.5.1

Proponents: Erik Madsen, representing NCSEA (emadsen@dci-engineers.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

Revise as follows:

1604.5.1 Multiple occupancies. Where a *building* or *structure* is occupied by two or more occupancies not included in the same *risk category*, it shall be assigned the classification of the highest *risk category* corresponding to the various occupancies. Where *buildings* or *structures* have two or more portions that are structurally separated, each portion shall be separately classified. Where a separated portion of a *building* or *structure* provides required access to, required egress from or shares life safety systems, designated seismic systems, emergency power systems, or emergency and egress lighting systems with another portion having a higher *risk category*, or provides required electrical, communications, mechanical, plumbing or conveying support to another portion assigned to *Risk Category* IV, both portions shall be assigned to the higher *risk category*.

> **Exception:** Where a *storm shelter* designed and constructed in accordance with <u>Section 423 and </u>ICC 500 is provided in a *building*, *structure* or portion thereof normally occupied for other purposes, the *risk category* for the normal occupancy of the *building* shall apply unless the *storm shelter* is a designated emergency shelter in accordance with Table 1604.5.

Reason: There is no pointer connecting the Risk Category section in 1604.5 with the storm shelter designated section of IBC Section 423. In previous code cycles, attempts were made to connect these sections by creating a pointer in the wrong location, sometimes reassigning the Risk Category in Table 1604.5 against the intent of this exception. The multiple occupancy section is clear about the application of the Risk Category. This proposal hopefully clarifies the connection between the sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Change is editorial - pointer added

S62-25

S63-25

IBC: 1604.5.2, 1604.5.3 (New)

Proponents: Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com)

2024 International Building Code

1604.5.2 Photovoltaic (PV) panel systems. Photovoltaic (PV) panel systems and *elevated PV support structures* shall be assigned a *risk category* as follows:

1. *Ground-mounted PV panel systems* serving only Group R-3 *buildings* shall be assigned to *Risk Category* I.
2. *Ground-mounted PV panel systems* other than those described in Items 1 and 5 shall be assigned to *Risk Category* II.
3. *Elevated PV support structures* other than those described in Items 4, 5 and 6 shall be assigned to *Risk Category* II.
4. Rooftop-mounted *PV panel systems* and *elevated PV support structures* installed on top of *buildings* shall be assigned to the same *risk category* as the *risk category* of the *building* on which they are mounted.
5. *PV panel systems* and *elevated PV support structures* paired with energy storage systems (ESS) and serving as a dedicated, stand-alone source of backup power for *Risk Category* IV *buildings* shall be assigned to *Risk Category* IV.
6. *Elevated PV support structures* where the usable space underneath is used for parking of emergency vehicles shall be assigned to *Risk Category* IV.

Add new text as follows:

1604.5.3 Energy storage systems (ESS). *Energy storage systems (ESS)* shall be assigned a risk category as follows:

1. *ESS* serving only Group R-3 *buildings* and installed outdoors on the ground, in detached garages or in detached accessory structures a minimum of 10 feet (3048 mm) away from property lines and *dwellings* shall be assigned to *Risk Category I.*
2. *ESS* serving a bulk-power grid and not associated with occupiable *buildings* other than on-site facilities shall be assigned to *Risk Category II.*
3. *ESS* directly serving *buildings* other than those described in Items 1 and 2 shall be assigned to the same *risk category* as the highest *risk category* of the *buildings* they serve.

Reason: For the 2024 IBC, Proposal S81-22 created new Section 1604.5.2, which establishes structural risk category for a variety of installations and use cases for photovoltaic (PV) panel systems. During the ICC Group B Public Comment Hearings, this proposal was well-received, with a 98% positive vote of the Assembly on the floor prior to the online governmental vote.

This proposal seeks to create new Section 1604.5.3 for energy storage systems (ESS), using the same or similar logic as Proposal S81-22 from last cycle.

Justification is provided here for each of the three line items in this proposal.

1. Item 1 focuses on ESS that serves only Group R-3 buildings, but includes only ESS that is not installed in or on the residence. For example, ESS installed inside the residence in non-habitable space, or inside an attached garage, or mounted on the outside of the residence is not included in Item 1, and must instead comply with Item 3. The terms used in Item 1 are consistent with terms approved during the 2nd Draft meeting for the future 2026 edition of NFPA 855 Standard for the Installation of Stationary Energy Storage Systems. These terms are expected to appear in 2026 NFPA 855 Chapter 15, Table 15.5.2 Maximum Ratings of ESS.

The effect of Item 1 is that ESS serving Group R-3 is assigned to Risk Category I only if installed a minimum of 10 feet away from property lines and dwellings, either outdoors on the ground (presumably on a concrete pad), or in detached garages, or in detached accessory structures. All other ESS serving Group R-3 buildings must comply with Item 3, and therefore must match the risk category of the building, which is Risk Category II.

2. Item 2 for ESS in proposed Section 1604.5.3 is intended to correlate with Item 2 for PV in Section 1604.5.2 for large-scale power facilities. Where ESS is remote and is connected to a bulk-power grid, it does not make any direct contribution as "lifeline infrastructure" to any individual building for which engineers are seeking to achieve functional recovery. It simply provides dispatchable power into the grid, which is managed by grid operators under the rules and standards of the North American Electric Reliability Corporation (NERC). NERC is subject to oversight by the Federal Energy Regulatory Commission (FERC).

As an example, a Risk Category IV building such as a police station, fire station, or hospital -- or any other building for which functional recovery is a goal -- is no more or less likely to experience a grid power outage if a particular ESS facility serving only the bulk-power grid is assigned to a risk category higher than RC II.

Note: In NERC standards, the defined terms "bulk electric system" and "bulk power system" are used. In the IBC, the proponent feels the term "bulk-power grid" would be more intuitive and meaningful to readers of the IBC charged with implementation, interpretation, and enforcement.

3. Item 3 requires that ESS directly serving buildings (primarily ESS installed on-site) must be assigned to a risk category that matches the risk category of the building(s) served. To keep the language simple and unambiguous, where ESS in Item 3 directly serves multiple buildings or multiple risk categories within one building, the ESS is required to be assigned to the highest risk category served.

ESS installed and configured to serve as a source of backup power during periods of grid power outage can directly serve as "lifeline infrastructure" for individual building(s) for which engineers are seeking to achieve functional recovery. This is true whether the ESS is paired with renewable energy systems such solar or wind, or is stand-alone ESS. It is also true regardless of risk category of the building(s) for which functional recovery is a goal. This is also true where ESS is configured to provide backup power to microgrids serving a distinct grouping of buildings during times of outage of a bulk-power grid.

During development of the language for this proposal, the proponent considered distinctions of whether or not a building is an "essential services facility," and whether or not a particular building or facility has a requirement for an emergency power system or standby power system." For simplicity and for clarity, the proponent decided to tie the RC of ESS directly to the RC of the building(s) served. A project engineer might not know whether the ESS is providing legally required backup power, so the proposed language should simplify the determination of risk category by the Engineer of Record for the ESS.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal seeks to establish structural risk category for a variety of installations of energy storage systems, and is intended to formalize current practice. While there could be certain cost implications up or down for individual projects, there is no trend of increased cost intended by this proposal.

S63-25

S64-25

IBC: 1604.5.3 (New), IEC (New)

Proponents: Paul Armstrong, PACCS, representing Lightning Protection Institute

2024 International Building Code

Add new text as follows:

1604.5.3 Lightning protection assessment. Buildings or structures assigned to Risk Category IV shall have a lightning risk assessment in accordance with NFPA 780 or IEC 62305-2.

Add new standard(s) as follows:

IEC

International Electrotechnical Commission
3, rue de Varembe CH-1211
Geneva,
Switzerland

IEC 62305-2-24	Protection against lightning, Part 2: Risk Management

Reason: The problem:

There is a lack of a standardized, detailed methodology within the IBC to assess and mitigate lightning risks specifically for Risk Category IV buildings and other structures. These buildings contain essential facilities (e.g., hospitals, emergency shelters) and also those buildings where the loss of function is a real hazard to the occupants/users. The assignment in Risk Category IV is to help ensure these buildings maintain functionality and safety during natural hazards; in this case severe weather events. This specialized code language will provide a systematic, accurate, and consistent approach to evaluating lightning risk for these essential uses and recommend protective measures.

Specific example:

Lightning strikes can significantly disrupt hospital operations, affecting both infrastructure and patient care. Key impacts include:

Electrical and Electronic System Failures:

a. Power Supply Disruptions: Lightning can cause power outages, compromising critical systems. For instance, a 2017 lightning strike at a Florida hospital led to a fire and subsequent failure of backup power systems, necessitating the evacuation of 225 patients.

b. Equipment Damage: Sensitive medical devices are vulnerable to voltage spikes from lightning, potentially leading to malfunctions or complete failure. This can impede patient monitoring and treatment.

Communication System Interruptions:

a. Lightning-induced surges can disrupt hospital communication networks, including telephones, intercoms, and internet services, hindering coordination among medical staff and with external emergency services.

Structural Damage:

a. Direct lightning strikes can cause fires or physical damage to hospital buildings, posing safety risks to patients and staff and potentially leading to evacuations.

To safeguard against these risks, hospitals can implement comprehensive lightning protection systems. These mitigation measures include:

- External Protection: Installation of lightning rods and other systems to intercept strikes.
- Surge Protection Devices (SPDs): To shield electrical and electronic equipment from voltage spikes.
- Equipotential Bonding**:** Ensuring all conductive parts within the hospital are at the same electrical potential to prevent dangerous voltage differences during a lightning event.
- Regular Maintenance and Compliance: Adhering to standards such as NFPA 70, NFPA 780, and UL 96A to ensure the effectiveness of lightning protection systems.

Implementing these measures can enhance hospital resilience against lightning-related incidents, ensuring continuity of critical healthcare services.

Historical Losses:

Documented instances of lightning strikes have shown that they can cause fires in critical infrastructure, power outages disrupting emergency operations, and structural damage leading to costly repairs and operational downtime.

The quantification of Impact: The new language can incorporate data from past incidents to model the economic, structural, and human costs of lightning-related failures. This data-driven foundation helps stakeholders understand the necessity of robust lightning protection.

Over the past five years, lightning strikes have significantly impacted commercial properties in the United States, leading to substantial insurance claims and financial losses. Key statistics include:

- Percentage of Claims: Lightning-induced fires account for approximately 3% to 5% of all U.S. commercial property insurance claims annually. (Institute for Intergovernmental Research) https://www.iii.org/press-release/struck-by-lightning-how-businesses-can-become-more-resilient-triple-i-and-lpi
- Annual Financial Impact: These incidents result in over $2 billion in insured losses each year for small and medium-sized businesses. (Institute for Intergovernmental Research) https://www.iii.org/press-release/when-lightning-strikes-how-business-can-protect-its-bottom-line
- Types of Damage: Lightning can cause fires, structural damage, and electrical system failures, leading to significant financial burdens for businesses. (Voss Law Firm) https://www.vosslawfirm.com/blog/a-guide-to-commercial-insurance-claims-for-lightning-strikes.
- While specific annual data for each of the past five years is limited, these figures highlight the consistent and substantial impact of lightning on commercial properties.

Implementing the analysis of the benefits of certified lightning protection systems and then securing appropriate insurance coverage are essential steps for businesses to mitigate these risks.

Lightning strikes have been responsible for several significant power outages. Notable instances include:

1. New York City Blackout (1977)

- **Date:** July 13–14, 1977
- **Cause:** A severe lightning storm led to a series of electrical failures, beginning with a lightning strike on a substation on the Hudson River. This initiated a cascading failure throughout the city's power grid.
- **Impact:** Approximately 9 million people were affected by the power outage, which lasted around 25 hours. The blackout resulted in widespread looting, arson, and significant property damage.

2. Southern Brazil Blackout (1999)

- **Date:** March 11, 1999
- **Cause:** A lightning strike at an electricity substation in Bauru, São Paulo State, caused most of the 440kV circuits at the substation to trip. This led to a chain reaction resulting in a widespread power outage.
- **Impact:** The blackout affected an estimated 75 to 97 million people across multiple states, including São Paulo, Rio de Janeiro, and Minas Gerais.

3. United Kingdom Power Outage (2019):

- **Date:** August 9, 2019
- **Cause:** A lightning strike on a transmission line led to the loss of 500 MW of embedded generation. Subsequently, two large generators, Little Barford Power Station and Hornsea Wind Farm, tripped, causing a significant drop in frequency.
- Impact: Experienced power cuts for 15 to 20 minutes. The outage also caused substantial travel disruption, particularly on the railway network, and affected infrastructure such as Newcastle Airport and Ipswich Hospital.

These events highlight the vulnerability of power grids to lightning strikes and underscore the importance of robust infrastructure and responsive measures to mitigate such risks.

How does this increase protection?

This code change will provide the following safety enhancements:

Reduce risk of structural fires and electrical surges caused by lightning.

Protect occupants and critical assets within the buildings.

Ensure that the functionality of the essential facilities continue.

Failures in electrical systems can affect life-sustaining equipment, such as ventilators and infusion pumps, endangering patient health, especially in intensive care units.

This code change will also provide improvements to functionality that ensures continuity of operations for essential services during severe weather, such as healthcare and emergency response. It will also minimize downtime by integrating resilient design features and protective measures while also facilitating adherence to higher safety standards for critical infrastructure, ensuring alignment with federal or state mandates.

Other Thoughts:

The proposed language can also accommodate different geographic and environmental factors by including variables like regional lightning density, soil conductivity, and building materials to tailor recommendations.

The proposed language could include cost-benefit analyses of different protection systems, enabling informed decisions about resource allocation. The Cost per Square Foot for Low-Rise Buildings is approximately $2.10 to $2.70 per square foot of roof area and Five-Story Buildings is approximately $1.50 to $1.90 per square foot of roof area.

The new language should help streamline assessments to integrate seamlessly into design and approval phases, avoiding delays in the construction timeline.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The proposed language could include cost-benefit analyses of different protection systems, enabling informed decisions about resource allocation. The Cost per Square Foot of such systems for Low-Rise Buildings is approximately $2.10 to $2.70 per square foot of roof area and Five-Story Buildings is approximately $1.50 to $1.90 per square foot of roof area for the installation of such protective systems based on industry studies. It should be noted however that the code change only requires the hazard assessment for Risk Category IV buildings or structures and that is considerably less in cost. The decision to install such a protective system would be a factor in whether or not it was needed for the use.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost impacts are based on industry studies. It is a simple cost of system over roof area provided. The new language should help streamline assessments to integrate seamlessly into design and approval phases, avoiding delays in the construction timeline.

Estimated Life Cycle Cost Impact:

This proposal only requires an analysis of whether the use needs protection from lightning storms. Therefore it is only a slight increase.

Staff Analysis: A review of the standard proposed for inclusion in the code, IEC 62305-2 Protection against lightning, Part 2: Risk Management 2024, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S64-25

S65-25

IBC: SECTION 202 (New), 1604.5.2 (New)

Proponents: Tom Vinson, representing American Clean Power Association (tvinson@cleanpower.org)

2024 International Building Code

Add new definition as follows:

WIND TURBINE GENERATOR SYSTEMS (WTGS). A system that incorporates an elevated generator, supported by a tower and its foundation, that converts wind kinetic energy into electrical power.

Add new text as follows:

1604.5.3 Wind Turbine Generating Systems (WTGS). *Wind turbine generating systems* shall be assigned a risk category as follows:

1. WTGS other than those described in Item 2 shall be assigned to *Risk Category* II.
2. WTGS paired with energy storage systems (ESS) and serving as a dedicated, stand-alone source of backup power for *Risk Category* IV *buildings* shall be assigned to *Risk Category* IV.

Reason: This proposal seeks clarity on the risk category of wind turbine generating systems (WTGS) in a way consistent with more than a decade of precedent in permitting such systems by authorities having jurisdiction (AHJs) while also remaining consistent with the intent of certain structural proposals adopted during the last International Building Code (IBC) revision cycle to improve resilience and functional recovery of communities in the wake of natural disasters. This proposal is also consistent with the risk category framework adopted for comparable ground-mounted PV panel systems in items 2 and 5 in 1604.5.2 during the last code revision cycle. For more than a decade, wind turbine generators have been classified as Occupancy Category II, per the *Recommended Practice for Compliance of Large Land-based Wind Turbine Support Structures* (ASCE/AWEA RP2011). This document was co-designated by the American Society of Civil Engineers (ASCE) and the American Wind Energy Association (AWEA),[1] and is used when classifying wind turbines. This has been accepted by AHJs across the country. In 2012 the ICC changed from using Occupancy Category to Risk Category. Classifying a wind turbine as Risk Category II is now equivalent to the previous classification as Occupancy Category II. It is also consistent with the more recently adopted ACP 61400-6-2023, *Wind Energy Generation Systems – Part 6: Tower and foundation design requirements – Modified Adoption of IEC 61400-6*, approved by the American National Standards Institute (ANSI) on June 27, 2023.

Justification by proposal line item is provided as follows:

1. **Wind Turbine Generator Systems (WTGS) – A system that incorporates an elevated generator, supported by a tower and its foundation, that converts wind kinetic energy into electrical power.**

There is currently no definition for wind turbine generating system in the IBC. This change would add a definition for wind turbine generating system. The wording is largely based on ASCE/AWEA RP 2011 and consistent with International Electrotechnical Commission (IEC) standards.[2]

2. **WTGS other than those described in Item 2 shall be assigned to *Risk Category* II.**

AHJs have approved the construction of tens of thousands of wind turbines as Risk Category II using ASCE/AWEA RP2011 over the last thirteen years. ACP is not aware of any increase in grid failure rates, including related to natural disasters and extreme weather, which would justify any need to categorize wind turbines at a level beyond risk category II. In addition, ACP 61400-6-2023, *Wind Energy Generation Systems – Part 6: Tower and foundation design requirements – Modified Adoption of IEC 61400-6*, approved by the American National Standards Institute (ANSI) on June 27, 2023, notes in Section 5.2.1, "WTGS [wind turbine generating systems] may be classified as Risk Category II structures, resulting in normal design importance factors. This approach mirrors implicit structural reliability levels of international wind turbine design standards such as IEC 61400-1 and is consistent with longstanding and contemporary wind industry support structure design practice in the United States and internationally."

The proposed ACP code revision recognizes that geographically dispersed power generation like wind energy improves grid resilience, reliability, and recovery, and that permitting wind turbines consistent with Risk Category II has resulted in wind farms able to withstand natural disasters and contribute to community recovery by continuing to generate electricity.

If an entire wind farm ceases operation, which is rare, geographically diverse wind farms elsewhere across the state or region are still putting electrons on the grid for delivery to homes and businesses.

Further, if a natural disaster contributes to failure at an individual wind turbine or a few turbines within a wind farm that does not mean an entire wind farm stops operating. The remaining turbines generally can continue to generate electricity if the substation and transmission system remains up and running.

We saw this in Turkey following severe earthquakes in 2023. Twenty-one wind power facilities continued operating in seven earthquake hit provinces.[3]Even when there is a direct hit on a few wind turbines from a severe tornado with one of the highest wind speeds in recorded history of at least 309 miles per hour[4] as was experienced in Iowa in May 2024, the geographic dispersion of wind turbines across hundreds or thousands of acres within a facility means that only a small subset of turbines were damaged by the tornado with the remaining turbines remaining structurally sound and able to generate electricity. For example, during the May 2024 series of Iowa tornadoes, three wind farms (out of 140 in Iowa) experienced damaged turbines, but in total only 10 turbines (2.5%) were damaged in those three wind farms with the other 386 turbines still able to generate electricity along with the other more than 6,000 in the State that were built consistent with Risk Category II.[5]'[6]

Specifying wind turbines as Risk Category II is consistent with maintaining community resilience and recovery. Grid reliability, including the performance of power generation facilities, is regulated by the North American Electric Reliability Corporation (NERC), which itself is regulated by the Federal Energy Regulatory Commission (FERC). Various reports on generation outages over the last two decades by FERC and NERC have not identified the structural integrity of wind generation specifically or power generation generally as factors in blackouts. Rather, transmission lines being down is generally the main factor.The U.S.-Canada Power Outage System Task Force Final Report on the August 14, 2003, Blackout in the Eastern United States and Canada[7] identified four major causes all related to improper operation and maintenance of the transmission system by a utility in Ohio.

A joint FERC-NERC staff report[8] on blackouts in Arizona and Southern California on September 8, 2011, found the grid operator failed to maintain the transmission system within its system operation limits, which contributed to cascading outages.

NERC's report on Hurricane Sandy,[9] which made landfall on October 29, 2012, indicated "no damage was reported" to wind turbines in the impact area.

NERC's report on Hurricane Harvey,[10] which made landfall on August 25, 2017, found "only minimal damage" was reported at wind energy facilities and facilities other than one that went offline came back online on the next day or the day after on August 26 or 27.

FERC-NERC issued a joint report[11] in February 2021 regarding an extreme cold and freeze event that led to multiple days of outages in Texas and more limited challenges in other states that identified two major causes: (1) power generation and natural gas pipelines were not adequately winterized which led to frozen equipment and systems and (2) inadequate supplies of natural gas meant there was insufficient gas for power generation as it was being used for home heating.

Even the longest power outage in U.S. history in Puerto Rico after Hurricanes Irma and Maria in September 2017 was due primarily to 80% of the transmission and distribution network being inoperable and difficult to repair given mountainous topography, rather than power generation facilities, including wind farms, being inoperable due to structural deficiencies. As a peer reviewed article[12] in the February 2019 *IEEE Power and Energy Technology Systems Journal* found, "damage to the conventional electric power generation infrastructure was relatively minor…". A 95 MW wind farm, Puerto Rico's largest, suffered "no damage" while at the other wind farm, located near Maria's landfall, the turbine blades were damaged, but only one turbine support structure failed.

Grid operators instantaneously balance generation from various power facilities in their area to match demand. As a part of this balance, the grid operators account for generation or transmission that is offline for maintenance, intermittent by design, or forced offline by a component or system failure or weather. In the U.S., the grid is largely operated on a regional basis, meaning grid operators ramp up and down generation over a geographically diverse area that is not impacted by a weather system the same way. Adding the geographic diversity of wind and solar, with the broad operating areas of the grid operators, supports resilience and recovery.

Further, grid operators require excess generation capacity that is well-beyond (15% or more)[13] demand peaks (i.e. "reserve margins") to facilitate the ability to ramp up generation to meet demand and to address generator outages (both planned an unplanned).

For the reasons above, ACP urges adoption of this proposal to specify that wind turbines are in Risk Category II, consistent with ASCE/AWEA RP 2011, ACP 61400-6-2023, and the treatment of comparable ground-mounted solar PV facilities in the IBC as this designation has been demonstrated based on real world experience to be sufficient to ensure wind energy generation in the wake of natural disasters.

3. **WTGS paired with energy storage systems (ESS) and serving as a dedicated, stand-alone source of backup power for *Risk Category* IV *buildings* shall be assigned to *Risk Category* IV.**

The intermittent nature of WTGS make them an unlikely choice to serve as a dedicated, stand-alone source of backup power for Risk Category IV buildings. But, given the increasing economic competitiveness, availability, and performance of ESS, it is conceivable WTGS could be paired with ESS to power essential facilities. In the instance where a WTGS is paired with an ESS to serve as a dedicated, stand-alone source of backup power for Risk Category IV buildings, ACP believes it makes sense for WTGS to be assigned the same risk category as the building itself.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adoption of this amendment is not impact construction costs for wind turbines as they are already designed for Risk Category II per ASCE/AWEA RP2011 and the more recently adopted ACP 61400-6-2023.

S65-25

S66-25

IBC: 1604.8, 1604.8.1, 1604.8.2, 1604.8.3, 1604.8.4 (New)

Proponents: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (coderep@stairways.org)

2024 International Building Code

1604.8 Anchorage. *Buildings* and *other structures* , and portions thereof, shall be provided with anchorage in accordance with Sections 1604.8.1 through 1604.8.3, as applicable.

1604.8.1 General. Anchorage of the roof to walls and columns, and of walls and columns to foundations, shall be provided to resist the uplift and sliding forces that result from the application of the prescribed *loads*.

1604.8.2 Structural walls. Walls that provide vertical load-bearing resistance or lateral shear resistance for a portion of the *structure* shall be anchored to the roof and to all floors and members that provide lateral support for the wall or that are supported by the wall. The connections shall be capable of resisting the horizontal forces that result from the application of the prescribed *loads*. The required earthquake out-of-plane *loads* are specified in Section 1.4.4 of ASCE 7 for walls of *structures* assigned to *Seismic Design Category* A and to Section 12.11 of ASCE 7 for walls of *structures* assigned to all other *seismic design categories*. Required anchors in *masonry* walls of hollow units or cavity walls shall be embedded in a reinforced grouted structural element of the wall. See Sections 1609 for wind design requirements and 1613 for earthquake design requirements.

1604.8.3 Decks. Where supported by attachment to an *exterior wall*, decks shall be positively anchored to the primary *structure* and designed for both vertical and lateral *loads* as applicable. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary *building structure* cannot be verified during inspection, decks shall be self-supporting. Connections of decks with cantilevered framing members to *exterior walls* or other framing members shall be designed for both of the following:

1. The reactions resulting from the *dead load* and *live load* specified in Table 1607.1, or the snow *load* specified in Section 1608, in accordance with Section 1605, acting on all portions of the deck.
2. The reactions resulting from the *dead load* and *live load* specified in Table 1607.1, or the snow *load* specified in Section 1608, in accordance with Section 1605, acting on the cantilevered portion of the deck, and no *live load* or snow *load* on the remaining portion of the deck.

Add new text as follows:

1604.8.4 Guards. Floor, deck and wall members that support guard systems shall be designed to resist the forces resulting from the application of the prescribed loads for guard systems.

Reason: Floor, deck and wall members supporting guards are overlooked by designers. The SMA believes this is due to a serious deficit in the building codes. Detailed prescriptive requirements for floor edge members supporting guards were added to the 2024 IRC. The SMA is actively soliciting jurisdictions across the nation for early adoption of these requirements. Although guard systems must support specific live loads the IBC has no requirement to provide the necessary structure to resist the loads transferred from the guard. This simple sentence will add the necessary and much needed performance requirement to the 2027 IBC and affords the opportunity to include walls that we have not been able to date to address with prescriptive requirements in the IRC.

Complete details including drawings and calculations supporting the prescriptive changes to the 2024 IRC are summarized in the document at this link, IRC 2024 - Floor framing supporting guards

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change merely provides design guidance for existing requirements and will not affect any change in the cost of construction.

S66-25

S67-25

IBC: 1605.1, 1605.1.1, 1605.2, 1802.1, 1806.1, 1808.3, 1810.3.1.1

Proponents: Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com); Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org); Bonnie Manley, representing AISC (manley@aisc.org)

2024 International Building Code

Revise as follows:

1605.1 General. *Buildings* and *other structures* and portions thereof shall be designed to resist the strength load combinations specified in ASCE 7, Section 2.3~~,~~ or the a*llowable stress design* load combinations specified in ASCE 7, Section 2.4~~, or the alternative a*llowable stress design* load combinations of Section 1605.2~~.

Exceptions:

1. The modifications to load combinations of ASCE 7, Section 2.3~~,~~ and ASCE 7, Section 2.4 ~~and Section 1605.2~~ specified in ~~ASCE 7 Chapters~~ Chapter 18 ~~and 19~~ shall apply.
2. Where the *allowable stress design* load combinations of ASCE 7, Section 2.4 are used, flat roof snow *loads* of 45 pounds per square foot (2.15 kN/m^2) and *roof live loads* of 30 pounds per square foot (1.44 kN/m^2) or less need not be combined with seismic load. Where flat roof snow *loads* exceed 45 pounds per square foot (2.15 kN/m^2), 15 percent shall be combined with seismic loads.
3. Where the *allowable stress design* load combinations of ASCE 7 Section 2.4 are used, crane hook loads need not be combined with *roof live loads* or with more than three-fourths of the snow load or one-half of the wind loads.
4. ~~Where design for tornado loads is required, the alternative *allowable stress design* load combinations of Section 1605.2 shall not apply when tornado loads govern the design.~~

1605.1.1 Stability. Regardless of which load combinations are used to design for strength, where overall *structure* stability (such as stability against overturning, sliding, or buoyancy) is being verified, use of the load combinations specified in Section 2.3 or 2.4 of ASCE 7~~, and in Section 1605.2~~ shall be permitted. Where the load combinations specified in ASCE 7, Section 2.3 are used, strength reduction factors applicable to soil resistance shall be provided by a *registered design professional*. The stability of retaining walls shall be verified in accordance with Section 1807.2.3.

Delete without substitution:

~~**1605.2 Alternative allowable stress design load combinations.** In lieu of the load combinations in ASCE 7, Section 2.4, *structures* and portions thereof shall be permitted to be designed for the most critical effects resulting from the following combinations. Where using these alternative allowable stress load combinations that include wind or seismic *loads*, allowable stresses are permitted to be increased or load combinations reduced where permitted by the material chapter of this code or the referenced standards. For load combinations that include the counteracting effects of dead and wind *loads*, only two-thirds of the minimum *dead load* likely to be in place during a design wind event shall be used. Where using these alternative load combinations to evaluate sliding, overturning and soil bearing at the soil-*structure* interface, the reduction of foundation overturning from Section 12.13.4 in ASCE 7 shall not be used. Where using these alternative basic *load* combinations for proportioning foundations for loadings, which include seismic *loads*, the vertical seismic *load effect*, E_v, in Equation 12.4-4 of ASCE 7 is permitted to be taken equal to zero. Where required by ASCE 7, Chapters 12, 13 and 15, the load combinations including overstrength of ASCE 7, Section 2.4.5 shall be used.~~

$\xcancel{D + L + (L_r \text{ or } 0.7S \text{ or } R)}$ ~~**(Equation 16-1)**~~

$\xcancel{D + L + 0.6W}$ ~~**(Equation 16-2)**~~

$\xcancel{D + L + 0.6W + 0.7S/2}$ ~~**(Equation 16-3)**~~

$\xcancel{D + L + 0.7S + 0.6(W/2)}$ ~~**(Equation 16-4)**~~

$\cancel{D + L + 0.7S + E/1.4}$ ~~(Equation 16-5)~~

$\cancel{0.9D + E/1.4}$ ~~(Equation 16-6)~~

~~**Exceptions:**~~

1. ~~Crane hook *loads* need not be combined with *roof live loads* or with more than three-fourths of the snow load or one-half of the wind load.~~
2. ~~Flat roof snow *loads* of 45 pounds per square foot (2.15 kN/m^2) or less and *roof live loads* of 30 pounds per square foot (1.44 kN/m^2) or less need not be combined with seismic loads. Where flat roof snow loads exceed 45 pounds per square foot (2.15 kN/m^2), 15 percent shall be combined with seismic loads.~~

Revise as follows:

1802.1 General. Allowable bearing pressures, allowable stresses and design formulas provided in this chapter shall be used with the *allowable stress design* load combinations specified in ASCE 7, Section 2.4 ~~or the alternative *allowable stress design* load combinations of Section 1605.2~~. The quality and design of materials used structurally in excavations and foundations shall comply with the requirements specified in Chapters 16, 19, 21, 22 and 23. Excavations and fills shall comply with Chapter 33.

1806.1 Load combinations. The presumptive load-bearing values provided in Table 1806.2 shall be used with the *allowable stress design* load combinations specified in ASCE 7, Section 2.4 ~~or the alternative *allowable stress design* load combinations of Section 1605.2. The values of vertical foundation pressure and lateral bearing pressure given in Table 1806.2 shall be permitted to be increased by one-third where used with the alternative *allowable stress design* load combinations of Section 1605.2 that include wind or earthquake *loads*~~.

1808.3 Design loads. Foundations shall be designed for the most unfavorable effects due to the combinations of *loads* specified in Section 2.3 or 2.4 of ASCE 7 ~~or the alternative *allowable stress design* load combinations of Section 1605.2~~. The *dead load* is permitted to include the weight of foundations and overlying fill. Reduced *live loads*, as specified in Sections 1607.13 and 1607.14, shall be permitted to be used in the design of foundations.

1810.3.1.1 Design methods for concrete elements. Where concrete *deep foundations* are laterally supported in accordance with Section 1810.2.1 for the entire height and applied forces cause bending moments not greater than those resulting from accidental eccentricities, structural design of the element using the *allowable stress design* load combinations specified in ASCE 7, Section 2.4 ~~or the alternative *allowable stress design* load combinations of Section 1605.2~~ and the allowable stresses specified in this chapter shall be permitted. Otherwise, the structural design of concrete *deep foundation* elements shall use the strength load combinations specified in ASCE 7, Section 2.3 and *approved* strength design methods.

Reason: This change proposal removes the **Alternative** Allowable Stress Design Load Combinations of Section 1605.2, which are not included in ASCE 7 and only exist in the IBC. ASCE/SEI is the ANSI consensus body that develops and maintains the load combinations and believes it is critical that these load combinations be removed from the IBC.

Technical Rationale

The alternative load combinations produce allowable stress design (ASD) loads that are significantly different from Allowable Stress Design Load Combinations of ASCE 7 Section 2.4. A significant non-conservative difference is the larger value of dead load prescribed for resistance to wind or earthquake-induced overturning. While that area of difference could be minimized through targeted changes to Section 1605.2 combinations, there is no compelling need to maintain the alternative ASD combinations in the IBC. Furthermore, the alternative ASD combinations are unused by standards promulgating organizations (such as ICC, AWC, and AISI/SFIA) in the development of prescriptive solutions for required member size/fastening and are also not used as the basis of prescriptive solutions contained in the building code. The combinations are largely unused due to other differences that produce less efficient designs than those associated with the ASD load combinations included in ASCE 7. The combinations of Section 1605.2 are unnecessary to accomplish an ASD design, are non-conservative for cases that involve dead load resistance to overturning (i.e., overturning stability), and are overly conservative in other cases.

Additionally, while there is an industry-wide effort underway to ensure continuing consistency between the ASD and LRFD load combinations in ASCE 7, there is no similar effort to maintain the *alternative* ASD load combinations or to better align them with the ASCE

7 ASD load combinations. Therefore, it is critical they are removed.

Coordination

During the previous code development cycle, Proposal S47-19 removed Basic Allowable Stress Design Load Combinations from the IBC due to their inclusion and ongoing maintenance in ASCE 7. The Basic ASD Load Combinations remain in ASCE 7 and will continue to be maintained. Load combinations of ASCE 7 for both strength design and allowable stress design are the preferred load combinations for design. The combinations of Section 1605.2 are unnecessary and cause confusion in the profession.

Industry Support

NCSEA polls the structural engineering profession routinely to seek feedback on technical provisions in standards and codes. In the 2018 NCSEA Survey of 10,000 practicing engineers, 84% of respondents "never or rarely" use the Alternative Allowable Stress Design Load Combinations contained in Section 1605.2 of the IBC, and 80% of respondents "would not object" to the deletion of them. In addition to design professionals, other standards development organizations support the removal of the Alternative ASD Load Combinations, including the Structural Engineers Association of California and the American Institute of Steel Construction, among others.

Finally, this change proposal also corrects Section 1605.1, Exception 1. ASCE 7-22 Chapters 18 and 19 do not currently contain modifications to the load combinations listed herein. Rather, in reviewing past editions of the IBC, it looks as if a typo occurred, and the reference to ASCE 7 Chapters 18 and 19 should have remained references to IBC Chapters 18 and 19. In the 2024 edition of the IBC, only Chapter 18 includes modifications to the load combinations. Therefore, the references to "ASCE 7" and "Chapter 19" have been deleted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal removes the Alt. ASD Load Combinations, which are not compatible with the provisions for load combinations and requirements in ASCE 7-22. The IBC points to the referenced standard for all load combinations and these outdated provisions are no longer relevant and not applicable.

S67-25

S68-25

IBC: SECTION 1606, 1606.1, 1606.2, 1606.3

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

SECTION 1606
DEAD LOADS

Revise as follows:

1606.1 General. *Buildings*, *structures,* and parts thereof shall be designed to resist the effects of dead loads.

1606.2 Weights of materials of construction. ~~For~~ In determining dead loads for purposes of design, the actual weights of materials of construction shall be used. In the absence of definite information, values used shall be subject to the approval of the *building official*.

1606.3 Weight of fixed service equipment. In determining dead loads for purposes of design, the weight of fixed service equipment, including the maximum weight of the contents of fixed service equipment, shall be included. The components of fixed service equipment that are variable, such as liquid contents and movable trays, shall not be used to counteract forces causing overturning, sliding, and uplift conditions in accordance with Section 1.3.6 of ASCE 7.

Exceptions:

1. Where force effects are the result of the presence of the variable components, the components are permitted to be used to counter those *load effects*. In such cases, the *structure* shall be designed for force effects with the variable components present and with them absent.
2. For the calculation of seismic force effects, the components of fixed service equipment that are variable, such as liquid contents and movable trays, need not exceed those expected during normal operation.

Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 *Minimum Design Loads and Associated Criteria for Buildings and Other Structures* (ASCE/SEI 7-22). These changes improve the coordination between the IBC and ASCE 7 by adding text in the IBC that appears in the corresponding section in ASCE 7.

Additionally, this change does the following: 1) It revises the section to refer to the weight of materials of construction as dead loads. While this section is a sub-section under 1606 Dead Loads, the section itself does not currently mention dead loads. 2) It aligns the text of the section with the section that follows, Section 1606.3. This section which addresses fixed service equipment starts with “In determining dead loads for purposes of design, the weight of fixed service equipment…”.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Improving coordination with ASCE 7 and consistency between sections within the IBC is not expected to affect the cost of construction.

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm^2, 1 square foot = 0.0929 m^2, 1 pound per square foot = 0.0479 kN/m^2, 1 pound = 0.004448 kN.

a. Live load reduction is not permitted.

b. Live load reduction is only permitted in accordance with Section 1607.13.1.2 or Item 1 of Section 1607.13.2.

c. Live load reduction is only permitted in accordance with Section 1607.13.1.3 or Item 2 of Section 1607.13.2.

1607.20 Stair treads. The concentrated *load* indicated in Table 1607.1 for *stair* treads shall be applied on an area of 2 inches by 2 inches (51 mm by 51 mm). This *load* need not be assumed to act concurrently with the uniform *load*.

Reason: As in One and two-family dwellings the live loads within R2 and R3 Residential units are considerably lower due to the limited occupancy. Currently the code is contradictive. In Table 1607.1 line 10 Dwellings sends you to line 27 Residential. Line 27 Residential is divided in two sections; One- and two-family dwellings and Hotels and multifamily dwellings. In both "All other areas" of One- and two-family dwellings and "Private rooms and corridors serving them" of Hotels and multifamily dwellings, the same minimum 40 psf load is required. Stairs are listed on line 32 "Stairs and Exits" but only one- and two-family dwellings have the 40 psf load leaving some to interpret that the 100 psf minimum must be applied within R2 and R3 dwellings. Obviously a 100 psf load limit on stairs within any dwelling unit is unnecessary if private rooms and corridors in R2 and R3 occupancies are allowed a 40 psf minimum. I believe this is an unintended oversight in need of the clarification provided in this proposal. The text added to the table clarifies that the 40 psf uniform load would be applicable within the dwelling units of R2 and R3 occupancies with similar occupant limitations.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$1000 Minimum savings in wood construction could be realized., Clearly a stair designed to meet a 40 psf will be lower in cost compared to a 100 psf design. Regardless of the materials used tread, stringer and riser cross-sections could be reduces significantly.

Estimated Immediate Cost Impact Justification (methodology and variables):

Based on a typical $3000 wood 14 riser staircase built to meet the 100 pond per square foot design load a savings of approximately $1000 in labor and material would be achieved if the design load were reduced to 40 pounds per square foot. Depending upon the materials used a 25% to 50% savings in the cost of stair construction could be achieved. The change in the cost of labor would not be as significant however shipping an handling costs of thinner and lighter materials could represent further cost reductions..

Reason: Overview

This code change proposal focuses on components of IBC Chapter 16 that are related to helicopter and powered-lift infrastructure. The primary intention of this code change submittal is to ensure that emergent aircraft technologies within the advanced air mobility (AAM) sector are accounted for within the IBC prior to widespread adoption of these technologies and the associated buildout of infrastructure. This is accomplished through the following change.

1. Modifying structural live load requirements for helicopters and powered-lift aircraft.

Introduction to Advanced Air Mobility

Per the National Aeronautics and Space Administration (NASA), Advanced Air Mobility (AAM) is a movement within the air travel sector that seeks to provide “safe, accessible, automated, and affordable air transportation system for passengers and cargo capable of serving previously hard-to-reach urban and rural locations.” Emergent technologies that support this mission include electric vertical takeoff and landing (eVTOL) aircraft, which are lithium-ion battery powered aircraft that have been developed by various manufacturers (e.g., Joby Aviation, BETA Technologies, and Archer Aviation) to provide intracity aerial taxi services, cargo transportation, and other air travel needs. In order to facilitate widespread adoption of eVTOL and other powered-lift aircraft, it is necessary to develop a safe and robust infrastructure network. A key component of facilitating this infrastructure development is ensuring that the IBC is updated to account for this emergent technology. The code change proposal below describes an update to Chapter 16 to better account for powered-lift aircraft use of helipads.

Chapter 16: Structural Live Load for Helipads Justification

Live load reduction footnote in Table 1607.1: Helipad live loads (primarily VTOL aircraft taking off and landing) have the similar transient nature of passenger vehicle garages in that local horizontal and vertical support members must be designed to support the full specified live load assuming full occupancy occurs for limited durations at a time. However, for a multi-story structure, it is unlikely that structural members supporting two or more floors will have full occupancy for sustained periods of time simultaneously at every floor. This revision avoids an overly conservative penalty on foundations and lower-level columns supporting multi-story garages and building structures with rooftop helipads.

Helicopter takeoff weights in Table 1607.1: The existing helicopter takeoff weight threshold of 3,000 pounds is outdated when compared to passenger vehicle garage live loads, since many passenger vehicles weigh more than 6,000 pounds with a smaller footprint (and thus closer spacing capability and higher equivalent uniform loading) than helicopters, yet passenger vehicle garage live loads are prescribed as 40 psf. Updating the threshold from 3,000 pounds to 6,000 pounds will enable new and existing helipads to support additional aircraft without the overly conservative current restriction. The footprint of a helicopter weighing 6,000 pounds that is subject to the 40 psf requirement would require a governing rotor diameter of less than 14 ft diameter, which is so extremely small that a helicopter with this rotor size would never get off the ground. As an additional justification for this update, when comparing the ASCE 7 Section 4.11 Helipad Loads for concentrated loads based on the maximum takeoff weight of the aircraft there is parity between an equivalent 40psf live load compared to a 6,000 pound aircraft with a 1.5x dynamic amplification factor applied for peak bending demand in framing members. Assuming a typical 10ft beam spacing and 40ft beam span, 40 psf results in a peak bending demand of 80,000 ft-lbs, which is greater than the two amplified concentrated loads for a 6,000 pound aircraft with 7ft wide landing gear which results in 74,250 ft-lbs. As beam spans go up to 50ft, 60 ft, or longer, the 40 psf live load becomes increasingly conservative.

Simple Helipad Cost

https://bjtonline.com/business-jet-news/everything-you-need-to-know-about-adding-a-heliport-to-your-home

Cost Impact: Decrease

Estimated Immediate Cost Impact:

It is estimated that this code change may decrease the cost of construction by a minimum of $0.00.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposed change suggests an increase in weight of helicopter and powered-lift aircraft from 3,000 pounds to 6,000 pounds while maintaining the same uniform live load requirement (i.e., 40 pounds per square foot) that is currently in Table 1607.1. This may result in a decrease in construction cost since aircraft between 3,000 pounds and 6,000 pounds will now be subject to a lower uniform live load than was previously specified, meaning that less robust, and potentially less costly, construction is required for aircraft of this size as a result of this code change proposal.

This change can be examined using an example case where a heliport is constructed to accommodate a common lightweight helicopter, such as the Bell 206, which is commonly used by news departments and hospitals. The Bell 206 aircraft has a maximum takeoff weight of 3,200 pounds, which would current require a live load rating of 60 pounds per square foot. The new code requirement would require a live load rating of 40 pounds per square foot. Assuming that the the increase in live load also results in a linear increase in construction material required to support the load, the reduction of a 60 psf load to a 40 psf load requirement would decrease the cost of material by 33% for the construction elements used to support the live load, such as columns, beams, and slabs. As such, every new helipad that is constructed to accommodate an aircraft of this type would likely see a decrease in construction costs.

One simple estimate for the construction of a "lighted concrete [heli]pad" is $15,000. Using a 33% reduction in cost based on decreasing the live load from 60 psf to 40 psf may result in the cost of construction decreasing to $10,000 due to the reduction of material required to support the decreased live load requirement.

Staff Analysis: CC # S70-25 and CC # S71-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm^2, 1 square foot = 0.0929 m^2, 1 pound per square foot = 0.0479 kN/m^2, 1 pound = 0.004448 kN.

~~a. Live load reduction is not permitted.~~

~~b. Live load reduction is only permitted in accordance with Section 1607.13.1.2 or Item 1 of Section 1607.13.2.~~

~~c. Live load reduction is only permitted in accordance with Section 1607.13.1.3 or Item 2 of Section 1607.13.2.~~

1607.6 Helipads. Helipad live loads shall not be reduced. *Helipads* shall be marked to indicate the maximum takeoff weight. The takeoff weight limitation shall be indicated in units of thousands of pounds and placed in a box that is located in the bottom right corner of the landing area as viewed from the primary approach path. The box shall be not less than 5 feet (1524 mm) in height.

1607.6.1 Concentrated loads.. *Helipads* shall be designed for the following concentrated *live loads* :

1. A single concentrated *live load*, *L*, of 3,000 pounds (13.35 kN) applied over an area of 4.5 inches by 4.5 inches (114 mm by 114 mm) and located so as to produce the maximum *load effects* on the structural elements under consideration. The concentrated load is not required to act concurrently with other uniform or concentrated *live loads*.
2. Two single concentrated *live loads*, *L*, 8 feet (2438 mm) apart applied on the landing pad (representing the helicopter's two main landing gear, whether skid type or wheeled type), each having a magnitude of 0.75 times the maximum takeoff weight of the helicopter, and located so as to produce the maximum *load effects* on the structural elements under consideration. The concentrated loads shall be applied over an area of 8 inches by 8 inches (203 mm by 203 mm) and are not required to act concurrently with other uniform or concentrated *live loads*.

1607.13 Reduction in uniform live loads. Except for uniform roof live loads, all other minimum uniformly distributed *live loads*, L_o, in Table 1607.1 are permitted to be reduced in accordance with Section 1607.13.1 or 1607.13.2. Uniform roof *live loads* are permitted to be reduced in accordance with Section 1607.14.

1607.13.1 Basic uniform live load reduction. Subject to the limitations of Sections 1607.13.1.1 through 1607.13.1.3 and Table 1607.1, members for which a value of $K_{LL}A_T$ is 400 square feet (37.16 m^2) or more are permitted to be designed for a reduced uniformly distributed *live load*, *L*, in accordance with the following equation:

$$L = L_o\left(0.25 + \frac{15}{\sqrt{K_{LL}A_T}}\right)$$ **(Equation 16-7)**

$$L = L_o\left(0.25 + \frac{15}{\sqrt{K_{LL}A_T}}\right)$$

where:

L = Reduced design *live load* per square foot (m^2) of area supported by the member. L_o = Unreduced design *live load* per square foot (m^2) of area supported by the member (see Table 1607.1). K_{LL} = *Live load* element factor (see Table 1607.13.1). A_T = Tributary area, in square feet (m^2).

L shall be not less than $0.50L_o$ for members supporting one floor and *L* shall be not less than $0.40L_o$ for members supporting two or more floors.

TABLE 1607.13.1 LIVE LOAD ELEMENT FACTOR, K_{LL}

ELEMENT	K_{LL}
Interior columns	4
Exterior columns without cantilever slabs	4
Edge columns with cantilever slabs	3
Corner columns with cantilever slabs	2
Edge beams without cantilever slabs	2
Interior beams	2
Members not previously identified including:	1
Edge beams with cantilever slabs	
Cantilever beams	
One-way slabs	
Two-way slabs	
Members without provisions for continuous shear transfer normal to their span	

1607.13.1.1 One-way slabs. The tributary area, A_T, for use in Equation 16-7 for one-way slabs shall not exceed an area defined by the slab span times a width normal to the span of 1.5 times the slab span.

1607.13.1.2 Heavy live loads. *Live loads* that exceed 100 psf (4.79 kN/m^2) shall not be reduced.

Exceptions:

1. The *live loads* for members supporting two or more floors are permitted to be reduced by not greater than 20 percent, but the reduced *live load* shall be not less than *L* as calculated in Section 1607.13.1.
2. For uses other than storage, where *approved*, additional *live load* reductions shall be permitted where shown by the *registered design professional* that a rational approach has been used and that such reductions are warranted.

1607.13.1.3 Passenger vehicle garages. The *live loads* shall not be reduced in passenger vehicle garages.

Exception: The *live loads* for members supporting two or more floors are permitted to be reduced by not greater than 20 percent, but the reduced *live load* shall be not less than *L* as calculated in Section 1607.13.1.

Add new text as follows:

<u>**1607.13.1.4 Assembly Area Loads.** Live loads shall not be reduced in assembly areas.</u>

Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures (ASCE/SEI 7-22). This proposal improves the coordination between the IBC and ASCE 7 by aligning the format of the Live Load Table in the IBC with the format of the ASCE 7 Live Load Table. Specifically two columns are added to the IBC table and three footnotes are removed. No requirements are changed, only the way in which the requirements are presented are changed.

This proposal completes the format alignment of the live load tables which was started, and mostly accomplished, in the 2021 IBC. The tables were not completely aligned in the 2021 IBC due to the existence of the Alternative Live Load Reduction provisions in the IBC (which are not in ASCE 7). With the removal of the Alternative Live Load Reduction provisions, which is proposed in a separate ASCE sponsored code change proposal, the format alignment of the IBC and ASCE 7 tables can now be completed.

Ultimately these changes go back to the removal of the sixteen footnotes to the live load table, which occurred for the 2016 edition of ASCE 7. In general having this many footnotes to a single table was unwieldy and resulted in requirements being difficult to find. The footnote information was either moved into the table itself or into new live load sections. However when this update was attempted in the IBC, for the 2021 edition, the existence of the Alternative Live Load Reduction provisions made the table changes related to live load reduction more complicated as two methods needed to be addressed. Therefore the footnotes related to live load reduction were left in place and the new columns related to live load reduction were not added.

The new text that is added in 1607.6 and 1607.13.1.4 mirrors text in ASCE 7 and is necessary to provide the reason why live load reduction is, or is not, permitted for certain uses and to provide a section to reference in the new columns. Again, no technical requirements are changed by this proposal.

The layout and look of the table was difficult to work with in cdpAccess as the column widths and text positioning do not look the same in the website preview mode and the downloaded/printed PDF version. ICC staff indicated that this is a limitation of the cdpAccess website. The existing text indents and centering/justification of text within cells are not changed by this proposal. In addition the column widths should be such that all text is readable.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modification to the live load table is a clarification that is not expected to impact the cost of construction.

Staff Analysis: CC # S71-25 and CC # S70-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S71-25

S72-25

IBC: 1607.3

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1607.3 Uniform live loads. The *live loads* used in the design of *buildings* and *other structures* shall be the maximum loads expected by the intended use or occupancy but shall not be less than the minimum uniformly distributed *live loads* given in Table 1607.1.*Roof live* ~~*Live*~~ *loads* acting on a sloping surface shall be assumed to act vertically on the horizontal projection of that surface.

Reason: This proposal corrects an inadvertent change made by an ASCE sponsored proposal in the last code change cycle. S92-22 moved the sentence “Live loads acting on a sloping surface shall be assumed to act vertically on the horizontal projection of that surface.” from a section labeled Roof Loads (1607.14) to a section with the more general label of Uniform Live Loads (1607.3). Section 1607.14 and the majority of the text within it was deleted, however this sentence needed to be kept, and as such it was moved. However, as S92-22 did not edit the sentence to specify **roof live loads**, it inadvertently expanded the scope of the provision from roof live loads to live loads in general. This proposal corrects the inadvertent change.

Refer to the highlighted portions of S92-22 shown in the graphic below.

Proponents: Jennifer Goupil, representing Structural Engineering Institute of ASCE (jgoupil@asce.org)

2021 International Building Code

Revise as follows:

1507.15 Vegetative roofs and landscaped roofs. *Vegetative roofs* and landscaped roofs shall comply with the requirements of this chapter, Section ~~1607.14.2.2~~ 1607.13.2 and the *International Fire Code*.

1603.1.2 Roof live load. The *roof live load* used in the design shall be indicated for roof areas ~~(Section 1607.14)~~.

SECTION 1607
LIVE LOADS

1607.1 General. *Live loads* are those loads defined in Chapter 2 of this code.

1607.2 Loads not specified. For occupancies or uses not designated in Section 1607, the *live load* shall be determined in accordance with a method *approved* by the *building official*.

Revise as follows:

1607.3 Uniform live loads. The *live loads* used in the design of buildings and *other structures* shall be the maximum loads expected by the intended use or occupancy but shall not be less than the minimum uniformly distributed *live loads* given in Table 1607.1. *Live loads* acting on a sloping surface shall be assumed to act vertically on the horizontal projection of that surface.

~~**1607.13**~~ **1607.3.1** ~~**Distribution of floor loads.**~~ **Partial loading of floors.** Where uniform floor *live loads* are involved in the design of structural members arranged so as to create continuity, the minimum applied loads shall be the full *dead loads* on all spans in combination with the floor *live loads* on spans selected to produce the greatest *load effect* at each location under consideration. ~~Floor~~ Uniform floor *live loads* applied to selected spans are permitted to be reduced in accordance with Section 1607.12 .

~~**1607.14.1**~~ **1607.3.2** ~~**Distribution of roof loads**~~ **Partial loading of roofs.** Where uniform roof *live loads* are reduced to less than 20 psf (0.96 kN/m^2) in accordance with Section ~~1607.14.2.1~~ 1607.13.1 and are applied to the design of structural members arranged so as to create continuity, the reduced roof *live load* shall be applied to adjacent spans or to alternate spans, whichever produces the most unfavorable *load effect*. ~~See Section 1607.14.2 for reductions in minimum roof live loads and Section 7.5 of ASCE 7 for partial snow loading.~~

1607.12 Reduction in uniform live loads. Except for uniform *live loads* at roofs, all other minimum uniformly distributed *live loads*, L_o, in Table 1607.1 are permitted to be reduced in accordance with Section 1607.12.1 or 1607.12.2. Uniform *live loads* at roofs are permitted to be reduced in accordance with Section ~~1607.14.2~~ 1607.13.

~~**1607.14 Roof loads.** The structural supports of roofs and *marquees* shall be designed to resist wind and, where applicable, snow and earthquake loads, in addition to the *dead load* of construction and the appropriate *live loads* as prescribed in this section, or as set forth in Table 1607.1. The live loads acting on a sloping surface shall be assumed to act vertically on the horizontal projection of that surface.~~

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The clarification is not expected to impact the cost of construction. See reason statement.

S73-25

IBC: 1607.8, 1607.8.1, 1607.8.2, 1607.8.3

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1607.8 Heavy vehicle loads. Floors and other surfaces that are intended to support ~~vehicle *loads*~~ vehicles with a gross vehicle weight rating greater than ~~a~~ 10,000-pounds (4536 kg) ~~gross vehicle weight rating~~ shall comply with Sections 1607.8.1 through 1607.8.5.

1607.8.1 Loads. Where a ~~any~~ *structure* does not restrict access for vehicles that exceed a 10,000-pound (4536 kg) gross vehicle weight rating, those portions of the *structure* subject to such ~~*loads*~~ vehicles shall be designed using the vehicular *live loads*, including consideration of impact and fatigue, in accordance with the codes and specifications required by the *jurisdiction* having authority for the design and construction of the roadways and bridges in the same location of the *structure*.

1607.8.2 Fire truck and emergency vehicles. Where a *structure* or portions of a *structure* are accessed by fire department vehicles and other ~~similar~~ emergency vehicles, those portions of the *structure* subject to such *loads* shall be designed for the greater of the following *loads*:

1. The actual operational *loads*, including outrigger reactions and contact areas of the vehicles as stipulated and *approved* by the *building official*.
2. The live loading specified in Section 1607.8.1.

Emergency vehicle *loads* need not be assumed to act concurrently with other uniform *live loads*.

1607.8.3 Heavy vehicle garages. Garages and portions of a building used for ~~designed to accommodate~~ vehicles ~~that exceed a~~ with a gross vehicle weight rating greater than 10,000-pounds (4536 kg) ~~gross vehicle weight rating,~~ shall be designed using the live loading specified by Section 1607.8.1; ~~. For garages the design~~ however provisions for impact and fatigue ~~is~~ are not required.

Exception: The vehicular *live loads* and *load* placement are allowed to be determined using the actual vehicle weights for the vehicles allowed onto the garage floors, provided that such *loads* and placement are based on rational engineering principles and are *approved* by the *building official*, but shall be not less than 50 psf (2.39 kN/m^2). This *live load* shall not be reduced.

Reason: The proposal makes changes to Section 1607.8 and the associated sub-sections.

1) The use of the term Gross Vehicle Weight Rating (GVWR) is revised. GVWR is not a load, it is vehicle rating. GVWR is the maximum weight a vehicle is designed for. It includes the self-weight of the vehicle (curb weight) and the weight of the passengers and cargo. The proposed wording more clearly distinguishes between vehicle weight ratings and loads.

2) Section 1607.8.3 is expanded to include “portions of a building” as there are buildings with limited heavy vehicle parking inside the footprint of the building that are not always called a garage space (loading docks, etc.). This change coordinates with the scope and phrasing used for passenger vehicle garages in IBC Section 1607.7 as well as the corresponding Truck & Bus section in ASCE 7-22.

3) The proposal changes the beginning of the first sentence of 1607.8.3 Heavy Vehicle Garages to use “used for” rather than “designed to accommodate” to be consistent with Section 1607.7 Passenger Vehicle Garages as well as the ASCE 7 section on Truck and Bus Garages.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes made are for consistency between IBC sections and better use of existing terminology and are not expected to affect the cost of construction.

S74-25

IBC: 1607.9, TABLE 1607.9 (New), 1607.9.1, 1607.9.1.1, 1607.9.1.2

Proponents: Richard Green, representing Green Facades PLLC (richard@greenfacadesllc.com); R. Scott Douglas, Douglas Engineering, representing Structural Engineers Association of Washington (sdouglasscott@gmail.com)

2024 International Building Code

Revise as follows:

1607.9 Loads on handrails, guards, grab bars and seats. *Handrails* and *guards* shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.1. Grab bars, shower seats and *accessible* benches shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.2. Glass *handrail* assemblies and guards shall also comply with Section 2407.

Add new text as follows:

TABLE 1607.9 LIVE LOAD TO HANDRAILS AND GUARDS

Handrail and Guard Design Category	Occupancy	Use examples	Handrail, top rail and guards		Components
			Concentrated Load (Pounds)	Uniform Load (plf)	Concentrated Load (Pounds)
A Limited access	Areas with limited or controlled access	Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and have an occupancy load less than 50	200	20	50
B Basic	Areas not subject to assembly or overcrowding	Areas and occupancies not in Categories A, C or D.	200	50	50
C Assembly	Areas where assembly and congregation may be anticipated and are not subject to over-crowding	Occupancies A-1, A-2, A-3, A-4, and public assembly areas including areas of banks/credit unions, shopping malls, restaurants, bars, theatres, cinemas, night clubs etc. (See also D for areas where over-crowding is reasonably anticipated); and assembly egress paths less than 9ft wide adjacent to sunken areas.	200	100	100
D Crowd	Areas susceptible to over-crowding.	All A-5 occupancy areas including, Amusement park structures, Bleachers, Grandstands, and Stadiums; and the following where subject to over-crowding is reasonably anticipated: Theaters, cinemas, night clubs, bars, auditoria, assembly areas, schools, universities, studios, shopping malls (see also C); and assembly egress paths exceeding 9ft width (perpendicular to the direction of handrail or guard) adjacent to sunken areas.	300	200	100

Revise as follows:

1607.9.1 Concentrated load. *Handrails* and *guards* shall be designed to resist ~~a concentrated *load* of 200 pounds (0.89 kN) in accordance with Section 4.5.1 of ASCE 7. Glass *handrail* assemblies and guards shall comply with Section 2407.~~ the maximum loads expected by the intended use or occupancy but shall not be less than the minimum concentrated *live loads* given in Table 1607.9. This load need not be assumed to act concurrently with the uniform load specified in Sections 1607.9.1.1 and guard component load in Section 1607.9.1.2.

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist the maximum loads expected by the intended use or occupancy but shall not be less than the minimum uniformly distributed *live loads* given in Table 1607.9.~~a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7.~~ This load need not be assumed to act concurrently with the concentrated load specified in Sections 1607.9.1.1 or the guard component load specified in 1607.9.1.2.

Exceptions:

1. For one- and two-family *dwellings*, only the single concentrated *load* required by Section 1607.9.1 shall be applied.

~~2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an *occupant load* less than 50, the minimum *load* shall be 20 pounds per foot (0.29 kN/m).~~

<u>2</u> ~~3~~. For roofs not intended for occupancy, only the single concentrated load required by Section 1607.9.1 shall be applied.

1607.9.1.2 Guard component loads. Balusters, panel fillers and guard infill components, including all rails except the *handrail, post* and the top rail, shall be designed to resist ~~a concentrated load of 50 pounds (0.22 kN) in accordance with Section 4.5.1.2 of ASCE 7.~~ <u>the maximum loads expected by the intended use or occupancy but shall not be less than the component concentrated *live loads* given in Table 1607.9. This load need not be assumed to act concurrently with the concentrated load specified in Sections 1607.9.1 or uniform load specified in Section 1607.9.1.1.</u>

Reason: 1607.9: Reference to 2407 for glass rails is moved up a level from 1607.9.1 because it applies to all load types, not just concentrated load. (Glass handrails and components are also used in occupancies that require uniform load.) The word "also" was added because 2407 does not replace these load requirements, it has additional requirements.

1607.9.1:Prior to 1985, guard loading criteria were consistent between the US and other international codes with uniform lateral loads of ~50lbf/ft (~0.75 kN/m). However, following a number of stadium and crowd disasters with multiple fatalities, guard design load for areas of public assembly was researched. This research included post-failure analysis and full-scale human testing, and concluded that loads on guards in areas of public assembly should be increased.

This recommendation for increased guard loading in areas of public assembly was widely adopted and is part of the following international standards and codes:

- National Building Code of Canada (for grandstands and stadiums),
- Eurocode EN 1991-1,
- Australian and New Zealand Standards AS 1170.1,
- British Standard BS6399 ,
- Brazilian Standard ABNT NBR 6120
- Indian Standard IS 875 pt 2
- etc.

Research has also been undertaken in 'crowd crush' and the resulting loads. Barrier collapse is a known cause of crowd collapse. The work of Prof G. Keith Still is available at Crowdrisks.com.

Video shows balcony railing collapse that killed 7 college students in Bolivia

By Tamar Lapin March 3, 2021 | 9:13pm | Updated

MORE ON: BOLIVIA

Seven college students died and four were injured during a tragic incident in Bolivia when a railing collapsed, sending them falling from a fourth-floor balcony.

Figure 7: Fatal railing collapse at university https://nypost.com/2021/03/03/video-shows-balcony-railing-collapse-that-killed-7-bolivian-students/

In crowd collapse, the push of the crowd behind the row at the handrail results in multiple people loading the guard rail, resulting in over-loading the guard. Then multiple people are pushed over the failed guard.

Design loading for balustrades in this jurisdiction is 1 kN/m = ~70lbf/ft or ***33% greater** t**han currently in IBC***. Research predicts design loads 3kN/m which is 3x the regional design load for this circumstance (4x the current IBC design load) and when the loading occurred the guard failed.**It appears evident that crowd loading on guards is greater than typical residential and office loading, thus justifying additional categories specifying greater design loads.**

Figure 8: FedEx Field Barrier Collapse 2022

Railing collapse at Lists of fatalities do not include other serious injuries, such as broken necks, which can occur, such as at the Army-Navy game at Veterans Stadium in 1998. (Styan, et.al 2007)

The changes and research that began in England following Hillsborough Disaster in 1989, where 96 people died and many more injured following the collapse of a crowd control barrier. Post-failure analysis reported by RA Smith in "Engineering Failure Analysis", found failure of the system under extreme crowding to be at
8kN/m (550 lbf/ft), so the proposed design load of 200 lbf/ft is not extreme and is reasonable. EN 1991-1 suggests a range of 3-5 kN/m (~200-340kN/m)

Figure 8: Hillsborough Braced railing collapse (Smith Report 1994)
IBC is not just used in the United States, and these failures do not just happen in 'other jurisdictions'.

THE UNIVERSITY OF TENNESSEE KNOXVILLE

Journal of Applied Sport Management

Volume 15
Issue 4 *Sport Facilities Planning, Design, Operation, and Management Trends* — Article 5

History of Railing Dangers

From 1969 to 2011, there were 22 fall-related fatalities at major league ballparks (Gorman & Weeks, 2015); Dunne et al. (2019) identified 20 incidents and 12 deaths between 1981 and 2017. More specifically, Steinbach (2009) highlighted three deaths and eight serious injuries associated with railing-related incidents from 2000 to 2009. The injuries primarily involved men in their early 20s, but some people who were injured in these incidents were those on a level below who had no warning someone might fall on them. Incidents included five falls at professional baseball games, one each at college and professional football games, one at a professional hockey game, as well as during two concerts staged at sports venues (Steinbach, 2009).

Parting Thoughts – Smith Report

Lord Justice Taylor [5] drew attention to the fact that prior to his report there had been eight official reports covering crowd safety and control at football grounds. These include the Shorth Report of 1924 (following disorder at the 1923 Cup Final), the Moelwyn Hughes Report of 1946 (following 33 deaths at Bolton Wanderers' ground), Lord Wheatley's Report of 1972 (66 deaths at Ibrox) and the Popplewell Report of 1986 (after a fire caused 56 deaths at the Bradford City ground). Taylor drew attention to the fact that 'previous reports went unheeded' and management complacency caused the attitude 'it couldn't happen here'. Certainly, after the initial reactions of horror after a disaster have subsided, there is a tendency to forget the lessons which should have been learned.

The proposed changes for assembly and crowd guard loading reflect international common practice based on a clear need and well researched science of human loading for specific occupancies that include assembly and areas with a potential for over-crowding.

Cost Impact: Increase

Estimated Immediate Cost Impact:

For typical use categories without assembly or over-crowding there is no cost impact and the changes are editorial in nature to account for assembly categories.

In major cities, the total cost of guard railing is approximately $550 per linear foot, being approximately 15% materials ($82.50), 30% fabrication ($165) and 45% site installation ($247.50).

For Category C, areas subject to assembly +3%

For Category D, areas subject to overcrowding +8%

Estimated Immediate Cost Impact Justification (methodology and variables):

Basis of Design - Steel balustrade post

Current load = 50 lbf/ft

$w := 50 \ \frac{lbf}{ft}$ Uniform Load to Guard/Handrail

$s := 5 \ ft$ Spacing of posts

$h := 42 \ in$ Height of posts

$M := w \cdot s \cdot h = 10.5 \ kip \cdot in$ Base moment

$M_u := M \cdot 1.5 = 15.75 \ kip \cdot in$ Ultimate Design Moment (Required)

$F_y := 36 \ ksi$ Yield Strength - Assuming a steel post

$b := 0.75 \ in \quad d := 1.625 \ in$ Assumed post size

$S_x := b \cdot \frac{d^2}{6} = 0.33 \ in^3$

$\phi_b M_n := 0.9 \cdot 1.6 \cdot F_y \cdot S_x = 17.111 \ kip \cdot in$ Capacity greater than demand OK

Category C, areas subject to assembly Assembly load = 100lbf/ft

$w := 100 \ \frac{lbf}{ft}$ Uniform Load to Guard/Handrail

$s := 5 \ ft$ Spacing of posts

$h := 42 \ in$ Height of posts

$M := w \cdot s \cdot h = 21 \ kip \cdot in$ Base moment

$M_u := M \cdot 1.5 = 31.5 \ kip \cdot in$ Ultimate Design Moment (Required)

$F_y := 36 \ ksi$ Yield Strength - Assuming a steel post

$b := 0.75 \ in \quad d := 2.25 \ in$ Assumed post size

$S_x := b \cdot \frac{d^2}{6} = 0.633 \ in^3$

$\phi_b M_n := 0.9 \cdot 1.6 \cdot F_y \cdot S_x = 32.805 \ kip \cdot in$ Capacity greater than demand OK

Material ratio relative to 50 lbf/ft $\frac{b \cdot d}{0.75 \ in \cdot 1.625 \ in} = 1.385$

Assume top rail and anchors increases by a similar proportion while infill elements remain unchanged.

Post, top rail and anchors as portion of materials 50%
(Post at 5ft on center, infill at 4in on center.)

Materials cost $82.50 \cdot 0.5 \cdot 1.385 + 82.50 \cdot 0.5 \cdot 1.0 = 98.381$

Materials increase $98.381 - 82.50 = 15.881$

Site Labor assumed to be similar and fabrication assumed to be similar

$New\_Cost := 550 + 15.88 = 565.88$

$Increase := \frac{New\_Cost}{550} = 1.029$ approx 3% increase.

Material

Category D, areas subject to assembly Crowd load = 200lbf/ft

$w := 200\ \frac{lbf}{ft}$	Uniform Load to Guard/Handrail
$s := 5\ ft$	Spacing of posts
$h := 42\ in$	Height of posts
$M := w \cdot s \cdot h = 42\ kip \cdot in$	Base moment
$M_u := M \cdot 1.5 = 63\ kip \cdot in$	Ultimate Design Moment (Required)
$F_y := 36\ ksi$	Yield Strength - Assuming a steel post
$b := 0.75\ in \quad d := 3.25\ in$	Assumed post size
$S_x := b \cdot \frac{d^2}{6} = 1.32\ in^3$	
$\phi_b M_n := 0.9 \cdot 1.6 \cdot F_y \cdot S_x = 68.445\ kip \cdot in$	Capacity greater than demand OK
Material ratio relative to 50 lbf/ft	$\frac{b \cdot d}{0.75\ in \cdot 1.625\ in} = 2$

Assume top rail and anchors increases by a similar proportion while infill elements remain unchanged.

Post, top rail and anchors as portion of materials 50%
(Post at 5ft on center, infill at 4in on center.)

Materials cost $82.50 \cdot 0.5 \cdot 2.0 + 82.50 \cdot 0.5 \cdot 1.0 = 123.75$

Materials increase $123.75 - 82.50 = 41.25$

Site Labor assumed to be similar and fabrication assumed to be similar

$$New\_Cost := 550 + 41.25 = 591.25$$

$$Increase := \frac{New\_Cost}{550} = 1.075$$ approx 8% increase.

Estimated Life Cycle Cost Impact:

Maintenance is unchanged.

For typical use categories without assembly or over-crowding there is no cost impact and the changes are editorial in nature to account for assembly categories.

For Category C, areas subject to assembly +3%

For Category D, areas subject to overcrowding +8%

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The changes are consistent with changes made in Canada (crowd loading) and Europe, Britain, Australasia, Brazil, India and many other parts of the world (assembly and crowd loading.) In each case code boards, with similar cost objectives ("one added dollar of cost is one less person that can afford a home") found that the type of applications that this applies to do not affect typical construction and that the loadings are based on significant research into actual loads and were found to be necessary by many events resulting in multiple deaths and injuries.

Injury events result in extensive cost to the facility operator (often hundreds of thousands of dollars or millions of dollars per event.) Insurance costs affect the entire community. Injuries to the victims may be permanent.

Codes should provide realistic loads based on best knowledge to facilitate appropriate design and prevent catastrophic collapse.

Staff Analysis: CC # S76-25/CC #S77-25, CC S80-25 and CC # S74-25 addresses requirements in a different or contradicting manner.

The committee is urged to make their intensions clear with their actions on these proposals.

S74-25

S75-25

IBC: 1607.9, 1607.9.1

Proponents: John Grenier, representing National Council of Structural Engineers Associations (NCSEA) (jgrenier@greniereng.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

Revise as follows:

1607.9 Loads on handrails, guards, grab bars and seats. *Handrails* and *guards* shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.1. Glass handrail assemblies and guards shall comply with Section 2407. Grab bars, shower seats and *accessible* benches shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.2.

1607.9.1 Concentrated load. *Handrails* and *guards* shall be designed to resist a concentrated *load* of 200 pounds (0.89 kN) in accordance with Section 4.5.1 of ASCE 7. ~~Glass *handrail* assemblies and guards shall comply with Section 2407.~~

Reason: This proposal is editorial in nature. The proposal is relocating the pointer to glass assemblies from 1607.9.1 to section 1607.9. Having the pointer in the section only for the concentrated load may give the false impression that the glass assemblies do not need to also comply with the uniform load in section 1607.9.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost of construction will not be impacted. The proposal is to clarify the existing provisions.

S75-25

S76-25

IBC: 1607.9.1.1

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7. This load need not be assumed to act concurrently with the concentrated load specified in Section 1607.9.1.

Exceptions: The uniform load need not be considered for the following occupancies:

1. ~~For one~~ One- and two-family *dwellings*~~, only the single concentrated *load* required by Section 1607.9.1 shall be applied~~.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an *occupant load* less than 50~~, the minimum *load* shall be 20 pounds per foot (0.29 kN/m)~~.
3. ~~For roofs~~ Roofs not intended for occupancy ~~, only the single concentrated load required by Section 1607.9.1 shall be applied~~.

Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 *Minimum Design Loads and Associated Criteria for Buildings and Other Structures* (ASCE/SEI 7-22). This change improves the coordination between the IBC and ASCE 7 by reducing the uniform load required by Exception 2 from 20 plf to zero to match the requirements of ASCE 7.

Removing the 20 plf load for guards and handrails in the limited occupant areas of Exception 2 means that only the 200 lb concentrated load applies to these guards and handrails. A uniform load on guards and handrails represents a load due to a group of people acting in unison, which is not expected in Group I-3, F, H and S occupancies with limited occupant loads.

Additionally, the concentrated load is deemed sufficient for guard and handrail designs in these occupancies as:

* Per the current exception (w/ the 20 plf load), the guard post design is controlled by the 200 lb load up to a post spacing of 10 feet. Guard post spacings of greater than 10 feet are not common. The horizontal rails strength demands are a function of the length squared ($M - wl^2/8$) and post spacings of 4 to 8 feet are typical in part due to the increased strength/member size required for horizontal rails with longer spans.

In researching this proposal, it was found that the 20 plf load for I-3, F, H, and S uses has been in the IBC since the inaugural 2000 edition. However, none of the three legacy codes contained this specific exception. As such the IBC rationale for requiring 20 plf for I-3, F, H, and S uses but allowing a zero uniform load for dwellings is not known. The limited occupant load and the factory/industrial use of the areas both support not requiring any uniform load resulting from a group of people acting in unison.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is a small potential for this change to decrease the cost of construction due to reducing the load in Exception 2, however as noted above the concentrated load, not the uniform load, likely control the design of the majority of guards and handrails using this exception.

Staff Analysis: CC # S76-25 and CC # S74-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S76-25

S77-25

IBC: 1607.9.1.1

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7. This load need not be assumed to act concurrently with the concentrated load specified in Section 1607.9.1.

Exceptions:

1. For one- and two-family *dwellings*, only the single concentrated *load* required by Section 1607.9.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an *occupant load* ~~less than~~ of 50 or less, the minimum *load* shall be 20 pounds per foot (0.29 kN/m).
3. For roofs not intended for occupancy, only the single concentrated load required by Section 1607.9.1 shall be applied.

Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 *Minimum Design Loads and Associated Criteria for Buildings and Other Structures* (ASCE/SEI 7-22). These changes improve the coordination between the IBC and ASCE 7 by adding text in the IBC that appears in the corresponding section in ASCE 7.

This change improves the coordination between the IBC and ASCE 7 by changing the allowable occupant load from 49 to 50 which matches the occupant load permitted by ASCE 7.In researching the reason for the difference between the IBC and ASCE 7, it was noticed that the 2000 and 2003 editions of the IBC permitted an occupant load of 50, see the 2003 IBC text shown below (the text was "have an occupant load no greater than 50"). In the 2006 edition of the IBC the text was changed such that the permitted occupant load was reduced to 49 (changed to "have an occupant load less than 50"). However there is no margin marking in the 2006 edition to indicate a code change and a review of the code development archives did not find a code change proposal containing this change. In discussing the change to this section in the 2006 edition with ICC staff, it appears that the text was changed as part of an editorial effort by staff to remove the phrase “no greater than”. However the change inadvertently changed the meaning.

2003 IBC

1607.7.1 Handrails and guards. Handrail assemblies and guards shall be designed to resist a load of 50 plf (0.73 kN/m) applied in any direction at the top and to transfer this load through the supports to the structure.

Exceptions:

1. For one- and two-family dwellings, only the single, concentrated load required by Section 1607.7.1.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an occupant load no greater than 50, the minimum load shall be 20 pounds per foot (0.29 kN/m).

1607.7.1.1 Concentrated load. Handrail assemblies and guards shall be able to resist a single concentrated load of 200 pounds (0.89 kN), applied in any direction at any point along the top, and have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building. This load need not be assumed to act concurrently with the loads specified in the preceding paragraph.

1607.7.1.2 Components. Intermediate rails (all those except the handrail), balusters and panel fillers shall be designed to withstand a horizontally applied normal load of 50 pounds (0.22 kN) on an area equal to 1 square foot ($0.093 m^2$), including openings and space between rails. Reactions due to this loading are not required to be superimposed with those of Section 1607.7.1 or 1607.7.1.1.

1607.7.1.3 Stress increase. Where handrails and guards are designed in accordance with the provisions for allowable stress design (working stress design) exclusively for the loads specified in Section 1607.7.1, the allowable stress for the members and their attachments are permitted to be increased by one-third.

1607.7.2 Grab bars, shower seats and dressing room bench seats. Grab bars, shower seats and dressing room bench seat systems shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point.

1607.7.3 Vehicle barriers. Vehicle barrier systems for passenger cars shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to

2003 INTERNATIONAL BUILDING CODE®

- **2006IBC-1607.pdf**
  https://www.cdpaccess.com/proposal/11230/34960/documentation/179953/attachments/download/8695/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The slight increase in permitted occupant load, from 49 to 50, is not expected to affect most designs.

Staff Analysis: CC # S77-25 and CC # S74-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S77-25

S78-25

IBC: 1607.9, 1607.9.1, 1607.9.1.1, 1607.9.1.2

Proponents: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (coderep@stairways.org)

2024 International Building Code

1607.9 Loads on handrails, guards, grab bars and seats. *Handrails* and *guards* shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.1. Grab bars, shower seats and *accessible* benches shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.2.

Revise as follows:

1607.9.1 Concentrated load. *Handrails* and *guards* shall be designed to resist a concentrated *load* of 200 pounds (0.89 kN) in accordance with Section 4.5.1 of ASCE 7. Glass *handrail* assemblies and guards shall comply with Section 2407.

Exception: For one- and two-family dwellings and within dwelling units, where the top of a guard system is not required to serve as a handrail, the single concentrated load shall be applied at any point along the top, in the vertical downward direction and in the horizontal direction away from the walking surface. Where the top of a guard is also serving as the handrail, a single concentrated load shall be applied in any direction at any point along the top. Concentrated loads shall not be applied concurrently.

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7. This load need not be assumed to act concurrently with the concentrated load specified in Section 1607.9.1.

Exceptions:

1. For one- and two-family *dwellings*, only the single concentrated *load* required by Section 1607.9.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an *occupant load* less than 50, the minimum *load* shall be 20 pounds per foot (0.29 kN/m).
3. For roofs not intended for occupancy, only the single concentrated load required by Section 1607.9.1 shall be applied.

1607.9.1.2 Guard component loads. Balusters, panel fillers and guard infill components, including all rails except the *handrail* and the top rail, shall be designed to resist a concentrated load of 50 pounds (0.22 kN) in accordance with Section 4.5.1.2 of ASCE 7.

Reason: This exception for residential dwelling units is verbatim from the IRC. It was added to the 2021 IRC and is proposed here to provide correlation between the IRC and IBC for certain residential applications and promote consistent interpretation and enforcement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change will not increase the cost of construction and is a clarification in nature as the current requirement is not being enforced in the residential applications cited and will not affect a measurable decrease in the cost of construction

S78-25

S79-25

IBC: 1607.9, 1607.9.1, 1607.9.1.1, 1607.9.1.2

Proponents: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (coderep@stairways.org)

2024 International Building Code

1607.9 Loads on handrails, guards, grab bars and seats. *Handrails* and *guards* shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.1. Grab bars, shower seats and *accessible* benches shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.2.

1607.9.1 Concentrated load. *Handrails* and *guards* shall be designed to resist a concentrated *load* of 200 pounds (0.89 kN) in accordance with Section 4.5.1 of ASCE 7. Glass *handrail* assemblies and guards shall comply with Section 2407.

Revise as follows:

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7. This load need not be assumed to act concurrently with the concentrated load specified in Section 1607.9.1.

Exceptions:

1. For one- and two-family *dwellings*, and within individual dwelling units in R2 and R3 occupancies only the single concentrated *load* required by Section 1607.9.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an *occupant load* less than 50, the minimum *load* shall be 20 pounds per foot (0.29 kN/m).
3. For roofs not intended for occupancy, only the single concentrated load required by Section 1607.9.1 shall be applied.

1607.9.1.2 Guard component loads. Balusters, panel fillers and guard infill components, including all rails except the *handrail* and the top rail, shall be designed to resist a concentrated load of 50 pounds (0.22 kN) in accordance with Section 4.5.1.2 of ASCE 7.

Reason: Throughout the IBC the requirements for stairs and guards within R-2 and R-3 dwelling units have been justified as similar and in most cases are exactly the same as those in One- and Two-family dwellings. We believe that the load requirements should also change to reflect the considerable difference between these residential and public/commercial applications where large numbers of occupants prevail.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This will provide for a decrease in the cost of guard construction as the guards in question will not be required to resist the more stringent uniform 50 lb per linear foot point load. See cost impact justification below for $ amount.

Estimated Immediate Cost Impact Justification (methodology and variables):

A typical example of a residential 6foot long wood guard system comprised of commodity stair parts found in one and two family homes would be the most most economical and likely represent a minimum saving s of $300 in materials alone. Materials using 3 inch posts, 2.25 inch rail and 1,25 inch balusters for a 6 foot long guard would be ~$350. When compared to the same length guard with larger section components, e.g. increased post, rail and baluster sections to 3.5, 2.75, and 1.75 inches respectively to resist the 50 lb/ft load the cost is ~$650. This represents an minimal savings of $50/linear foot. This does not include any potential changes to the building structure which could represent additional savings.

2024 International Building Code

1607.9 Loads on handrails, guards, grab bars and seats. *Handrails* and *guards* shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.1. Grab bars, shower seats and *accessible* benches shall be designed and constructed for the structural loading conditions set forth in Section 1607.9.2.

1607.9.1 Concentrated load. *Handrails* and *guards* shall be designed to resist a concentrated *load* of 200 pounds (0.89 kN) in accordance with Section 4.5.1 of ASCE 7. Glass *handrail* assemblies and guards shall comply with Section 2407.

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7. This load need not be assumed to act concurrently with the concentrated load specified in Section 1607.9.1.

Exceptions:

1. For one- and two-family *dwellings*, only the single concentrated *load* required by Section 1607.9.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an *occupant load* less than 50, the minimum *load* shall be 20 pounds per foot (0.29 kN/m).
3. For roofs not intended for occupancy, only the single concentrated load required by Section 1607.9.1 shall be applied.

Revise as follows:

1607.9.1.2 Guard infill component loads. All guard infill components except for the top rail and handrail shall meet the requirements in 1607.9.1.2.1 and 1607.9.1.2.2. These loads shall not be applied concurrently.~~Balusters, panel fillers and guard infill components, including all rails except the *handrail* and the top rail, shall be designed to resist a concentrated load of 50 pounds (0.22 kN) in accordance with Section 4.5.1.2 of ASCE 7.~~

Add new text as follows:

1607.9.1.2.1 Horizontally applied concentrated load. A horizontally applied concentrated load of 50 pounds (0.22 kN) designed in accordance with Section 4.5.1.2 of ASCE 7.

1607.9.1.2.2 Horizontally applied sphere penetration load. A horizontally applied concentrated load of 12 pounds (.0534kN) from a sphere shall not pass through the guard where openings greater than 1.25-inches (31.75 mm) exist in a guard's infill. The sphere shall have a diameter equal to the applicable infill opening limitation in Section 1015.4.

  https://www.cdpaccess.com/proposal/11752/35617/files/download/9258/

Reason: For over 30-years building officials, engineers, designers, contractors, manufactures and fabricators have been debating whether or not the sphere measurements delineated for guard opening limitations, currently in the 2024 IBC Section 1015.4 and prior editions, is simply a opening size measurement or is it an opening size measurement combined with a measured force load, citing "openings that allow passage". With a lack of language delineating no force load be applied, then the opposite is to define a specific infill penetration spread load in the model codes to cover this conflict with inspectors who routinely use many different non-codified techniques to determine if a guard meets a requirement that is not in the ICC-IBC model code.
This proposal is based on testing research done by the proponent to correlate a pound-force load on a sphere in relation to ASTM E935-00 "Test Method D - Application of horizontal static load to determine resistance to cone penetration by infill area of picket and panel railing systems", first published by ASTM in the designation: E 935 - 91 "Standard Test Methods for Performance of Permanent Metal Railing Systems and Rails for Buildings[1]", and then include this corelated cone load to a sphere load as a specific design load for infill spread for the model 2027 IBC. For those of you who are not familiar with this "Test Method" it was developed by the same group who also developed the method for testing the 1sqft area load test, published in one form or another, in every published model IBC since 2000, to the current 2024 in section "1607.9.1.2 Guard component loads", and pointing to ASCE 7 Section 4.5.1.2.

The information for this reason statement in the monograph is limited to the very basic's. For those parties interested in more detailed information on this proposal beyond the summary, we are publishing on going information though out the 2025 group "B" process at (https://railingcodes.com/infill/) to provide more up to date information and details, as this proposal progresses through the 2027 code cycle process.

ESTABLISHED ASTM TESTING METHOD HISTORY
The initial publication of ASTM E935 in 1983 included 2 test methods, "Test Method A - Horizontal Static Load Application" and "Test Method B - Vertical Static Load Application". Two additional test methods were then added to E935 in the 1991 publication of ASTM E935-91, which also includes the title changes to Test Methods A and B. In the 1991 publication, Test Method A was renamed "Application of Horizontal Static Load to Top Rail" and Test Method B was renamed "Application of Vertical Static Load to Top Rail", and the first of the 2 new test methods added in 1991 was "Test Method C - Application of Horizontal Static Load to Infill Areas of Picket and Panel Railing Systems", and the second was "Test Method D – Application of Horizontal Static Load to Determine Resistance to Cone Penetration by Infill Area of Baluster and Panel Railing Systems.", Test Method D was specifically developed to be able to test the spread between infill elements in guard systems. ASTM E935-91 cites ASTM E985 "Specifications for Permanent Metal Railing Systems and Rails for Buildings" for the specific loads to be used for each test method in E935.
ASTM E935-00 was Reapproved in 2006 and

- is the latest edition which included the test method for guard infill deflection as; "Test Method D – Application of Horizontal Static Load to Determine Resistance to Cone Penetration by Infill Area of Baluster and Panel Railing Systems".
- E935-00 also cites, as did the 1991 test method, to use
  - E985-00 for the load that will be applied for Test Method D, and
  - in section 7.1.8 "The minimum horizontal test load to be applied by a penetration cone to the infill area of a baluster or panel railing system (see Test Method D of Test Methods E935) shall be 220 N (50 lbf)."

Specifics of importance in ASTM E935-00, in Test Method D

- Test Method D specifies when testing to use a cone that is 1.25% the size of the opening limitation.
  - This translates to using a 5-inch Cone for testing an opening limitation of 4-inches in guard infill.
- The test method specifies that the cone's point be truncated to 1-inch in diameter.
  - For this reason we have limited the load requirement in this proposal to openings that allow a sphere 1.25-inches in diameter to pass through.
  - Openings smaller than the 1.25-inch sphere are exempt from this requirement

The current edition of ASTM E935-21 does not include "Test Method D". E935 was re-written to be more inline with only the sections of the "code" which were being used and removed sections that were never adopted and published as E935-13. The revisions in E935-13 of the Test Method Document outlined the test methods in Section 10 Procedure. Though some may argue that a lack of adoption means that "Test Method D" is not valid, we believe and present the fact that 3 of the 4 test methods first developed over 40 and 30 years ago are still used and that it took 30 years to add the 4th test method to clarify minimum compliance for infill spreading when the building code industry see's the need for the code to clarify the detail.

Identifying openings in Guard Infill most vulnerable to Spreading through Penetration

To simplify this code submittal which will apply to guard infill, the proposal will be focusing on wire cables as they are the most vulnerable and scrutinized type of guard infill for opening spreading/deflection concerns. Furthermore, we are narrowing the monograph reason statement even further to focus on the most vulnerable common wire cable used in the built environment, imported 1/8-inch diameter 1x19 type 316 stainless steel, arguably the most flexible type of infill commonly used in guard systems. Even though this proposal adds the requirement to all types of guard infill, and we are researching and testing different types of guard materials and construction, the ongoing results will be being published on the proponents website for public review. We stipulate for this proposal that the minimum required by code language should be based on the results of the most vulnerable and with wire cable guard infill being the most scrutinized by code officials and is likely the most affected by the addition of this proposed new model code requirement, we focused on finding this infill types pass/fail point for Test Method D of ASTM E935-00.

SAFE INFILL – SAFE CABLE DESIGN LOADS

The tensioning, stiffness and resistance that the guard infill preforms to is directly related to the material, and with wire cable this is directly related to safe cable design loads. Per industry manufacture Loos & Co. Inc., 1/8-inch diameter, 1x19 type 316 stainless steel imported wire cable, lists the minimum break point at 1,780lbf on their website. The cable's minimum break point is applied to the industry-based safety factors for designated Safe Workload and the Maximum Cable Pretension load for Cable Rail Installations. This results in a safe workload limit of 356lbf, based on 20% of the cable's minimum break load and a Maximum Cable Pretension limit of 445lbf which is 25% of the cable's minimum break load.

TRANSLATING THE ASTM E935-00 Test Method D PENETRATION CONE TEST METHOD TO SPHERE CODE

The proponent of this proposal erected a guard section 28 feet long, with cable infill and installed load cells to measure the lbf for each cable's tension that the cone and sphere were pulled between. The wire infill cables were tensioned uniformly until the infill met enough tension so the 50lbf on the cone's load cell sensor was met, (minus the drag load), without exceeding the cables work load maximum limit and pretension load. Once the guard's infill section met the Part D Test Method of E935-00, the proponent changed out the 5-inch cone designated in ASTM E935-00 with a 4-inch sphere. The 4-inch sphere was then pulled logging the tension through to failure while recording the results. Those results produced data which was then used to establish the proposed pound-force load to be applied to the sphere for the requirements listed in the code proposal.

There will be questions for how code officials might be able to verify that the infill will meet the designated new load. To start with, how are code officials inspecting the current loads for guards in IBC Section 1607.9? There are more than a few ways this can be done, of which one is manufactures specifications for guard systems. As for guards with cable infill, some cable fitting manufactures already publish charts in their installation instructions for tensioning based on cable construction, size, length, clear span, and centerline vertical spacing. There are a few ways that verifying these parameters are met if the field with simple hand tools. However, this information is different based on more than a few parameters as our research through testing is showing.

The amount of work product, information and documentation for this proposal has been document for public viewing with information, pictures and videos of the results and testing done to correlate the proposed code change on the proponents website at https://railingcodes.com/infill/

Of Note the proponent will begin holding monthly or bi-monthly working sessions, though zoom in the middle of February 2025, to discuss the proposal and the on going research as this proposal progresses through the 2027 code cycle. Those interested in joining in the group meetings can fill out a form on the proponents website.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The estimated cost impact is between $0.00 & $320.00

Estimated Immediate Cost Impact Justification (methodology and variables):

The proponent of this proposal does not believe that there will be a cost increase, let alone any significant increase in cost because we believe that an estimated 98%, if not higher, of the guards being installed today are being built to comply and all ready meet or exceed the minimum requirements set forth in this code change proposal. However, per ICC requirements if we see any possible increase we need to provide justification of that cost increase in details.

So for those guards that possibly don't meet the minimums proposed can do so at minimum cost with minor changes to the design and installation of the guard system.

As stipulated in the proposal's main reason statement the most affected type of guard infill is, imported 1x19 1/8-inch diameter stainless steel cable, and the following examples are based on an installation of the cable infill guard system on an exterior deck 24 feet wide by 15 feet projection of 2 sides, and the other 24 foot side being a building.

The following summaries are supported by the breakdowns that follow after the summary examples.

- WOOD POST GUARD INSTALLATION:
  - The 24ft guard section is divided by 4ft, this equals 6 sections, which then translates to 7 support posts.
    Next if we divide the same 24ft section by 3ft we now have 8 sections, which translates to 9 support posts.
    This is an additional 2 posts at an estimated $80.00 each
  - Then if we look at the 2 sides being 15ft and divide that by 4ft, this equals 4 sections, which translates to 5 support posts
    Next is we divide the same 15ft section by 3ft we now have 5 sections, which translates to 6 support posts per side.
    This is an additional 2 posts at an estimated $80.00 each
  - This example summary produces (4) posts at $80.00 each for a estimated total of $320.00

- WIDE SPAN POST GUARD INSTALLATION:
  - The 24ft section is divided by 5ft, this equals 5 sections, which then translates to 6 support posts.
    Next we add a midspan vertical tension baluster into each of the 5 sections
    This is an additional 5 balusters estimated at $47.49 each
    This minuses 1 post at an estimated $80.00 each
  - Then if we look at the 2 sides being 15ft and divide that by 5ft, this equals 3 sections, which translates to 4 support posts
    Next we add a midspan vertical tension baluster into each of the 3 sections on each side
    This is an additional 6 balusters estimated at $47.49 each
    This minuses 2 posts at an estimated $80.00 each
  - This example summary produces
    (3) less posts at $80.00 each and equals a credit of $240.00
    and adds (11) balusters at $47.49 each and equals a total of $522.39

This equals \$522.39 - \$240.00 for an additional estimated cost of \$282.39
The \$282.39 is less than the \$320.00 estimated cost increase

Cost Reference Supporting Documentation:

- Wood post costs
  - Wood Post Added to Wood Deck Estimated Cost
    Wood post prices pulled from lowes.com at the time of code proposals submittal.
    Severe Weather 4-in x 4-in x 6-ft 2 Southern yellow pine
    Ground contact pressure treated lumber
    Lowe's Item #312530 | Model #Y240406-GC \$9.18 each
    Simpson Strong-Tie 2-in x 4-in 14-gauge ZMAX Tension tie
    Lowe's Item #2132165 | Model #DTT2Z \$10.88 each
    Deck Plus 1/2-in x 7-in Coated Coarse Thread Hex Bolt
    Lowe's Item #756045 | Model #260735 \$4.05 each x (2) = \$8.10
    Deck Plus 1/2-in Coated Standard Washer
    Lowe's Item #756041 | Model #260724 \$0.49 each x (4) = \$1.96
    Deck Plus 1/2-in x 13 Coated Steel Hex Nut
    Lowe's Item #756033 | Model #260704 \$4.05 each x (2) = \$0.59
    Per post estimated added cost:
    Material Estimated at \$31.30 plus local sales tax
    \$25.00 Installation Labor cost
    Combined Estimate of \$56.30 Each Post
    Misc. Contingency labor/materials \$23.70
    Proposal Budget per post \$80.00
- Option for keeping wide metal or wood post spans:
  - Adding Vertical Mid-Span Baluster based on Feeney Inc. Retail Pricing
    Feeney 42-in-level baluster \$40.00 each
    Mounting Hardware estimated at \$2.49 each
    Labor cost added per baluster for installation \$5.00
    Estimated \$47.49 added for each baluster.

Labor costs will vary depending on the area of the country the work is being done.

Estimated Life Cycle Cost Impact:

We estimate no increase in life cycle cost

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Guards are a fixed building material that requires no change in the cost of the life cycle with this type of requirement.

Staff Analysis: CC # S80-25 and CC # S74-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S81-25

IBC: 1607.12.4

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1607.12.4 Fall arrest, lifeline, and rope descent system anchorages. In addition to any other applicable *live loads*, fall arrest, lifeline, and rope descent system anchorages and structural elements that support these anchorages shall be designed for a *live load* of ~~not less than~~ 3,100 pounds (13.8 kN) for each attached line, in any direction that the *load* can be applied.

Anchorages of horizontal lifelines and the structural elements that support these anchorages shall be designed for the maximum tension that develops in the horizontal lifeline from these *live loads*.

Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 *Minimum Design Loads and Associated Criteria for Buildings and Other Structures* (ASCE/SEI 7-22).

These changes improve the coordination between the IBC and ASCE 7 by removing text in the IBC that does not appear in the corresponding section in ASCE 7.

The phrase “not less than” is unnecessary as the live loads provided in Section 1607 are minimum design loads. There is no reason for this particular section to specifically reiterate that the provided live load is a minimum load.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification which does not change the required load and is not expected to affect the cost of construction.

S81-25

S82-25

IBC: 1607.13, 1607.13.1.2, 1607.13.2

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

1607.13 Reduction in uniform live loads. Except for uniform roof live loads, all other minimum uniformly distributed *live loads*, L_o, in Table 1607.1 are permitted to be reduced in accordance with Section 1607.13.1 or 1607.13.2. Uniform roof *live loads* are permitted to be reduced in accordance with Section 1607.14.

Revise as follows:

1607.13.1.2 Heavy live loads. *Live loads* that exceed 100 psf (4.79 kN/m^2) shall not be reduced.

Exceptions:

1. The *live loads* for members supporting two or more floors are permitted to be reduced by not greater than 20 percent, but the reduced *live load* shall be not less than *L* as calculated in Section 1607.13.1.
2. For uses other than storage, where *approved* by the *building official*, ~~additional *live load* reductions shall be permitted~~ the *live load* is permitted to be reduced where shown by the *registered design professional* that a rational approach has been used and that such reductions are warranted. The reduced live load shall not be less than L as calculated in Section 1607.13.1. A member shall only be permitted to have its live load reduced where the full live load will not be applied to the member's entire influence area.

1607.13.2 Alternative uniform live load reduction. As an alternative to Section 1607.13.1 and subject to the limitations of Table 1607.1, uniformly distributed *live loads* are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. For *live loads* not exceeding 100 pounds per square foot (4.79 kN/m^2), the design *live load* for structural members supporting 150 square feet (13.94 m^2) or more is permitted to be reduced in accordance with Equation 16-8.

$$R = 0.08(A - 150) \quad \textbf{(Equation 16-8)}$$

For SI: $R = 0.861(A - 13.94)$

where:

A = Area of floor supported by the member, square feet (m^2).

R = Reduction in percent.Such reduction shall not exceed the smallest of:

1.1. 40 percent for members supporting one floor.

1.2. 60 percent for members supporting two or more floors.

1.3. R as determined by the following equation:

$$R = 23.1(1 + D/L_o) \quad \textbf{(Equation 16-9)}$$

where:

D = *Dead load* per square foot (m^2) of area supported.

L_o = Unreduced *live load* per square foot (m^2) of area supported.

2. A reduction shall not be permitted where the *live load* exceeds 100 pounds per square foot (4.79 kN/m^2) except that the design *live load* for members supporting two or more floors is permitted to be reduced by not greater than 20 percent.

   Exception: For uses other than storage, where *approved* by the *building official*, ~~additional *live load* reductions shall be permitted~~ the *live load* is permitted to be reduced where shown by the *registered design professional* that a rational approach has been used and that such reductions are warranted. The reduction shall not be greater than permitted by Item 1. A member shall only be permitted to have its live load reduced where the full live load will not be applied to the member's entire influence area.

3. A reduction shall not be permitted in passenger vehicle parking garages except that the *live loads* for members supporting two or more floors are permitted to be reduced by not greater than 20 percent.
4. For one-way slabs, the area, *A*, for use in Equation 16-8 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.

Reason: This proposal helps to clarify the intended use of the exceptions that permit reduction of heavy live loads. The changes make it clear that 1) heavy live loads can not be reduced more than would be permitted by the equations for reducing all other live loads, and that 2) the reduction approach must consider whether the heavy live load occurs over the member's entire influence area. Additionally, adding the phrase "by the building official" makes the text consistent with the typical way that Chapter 16 refers to code official approval.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides clarification on the use of the heavy live load reduction exceptions and is not expected to impact the cost of construction.

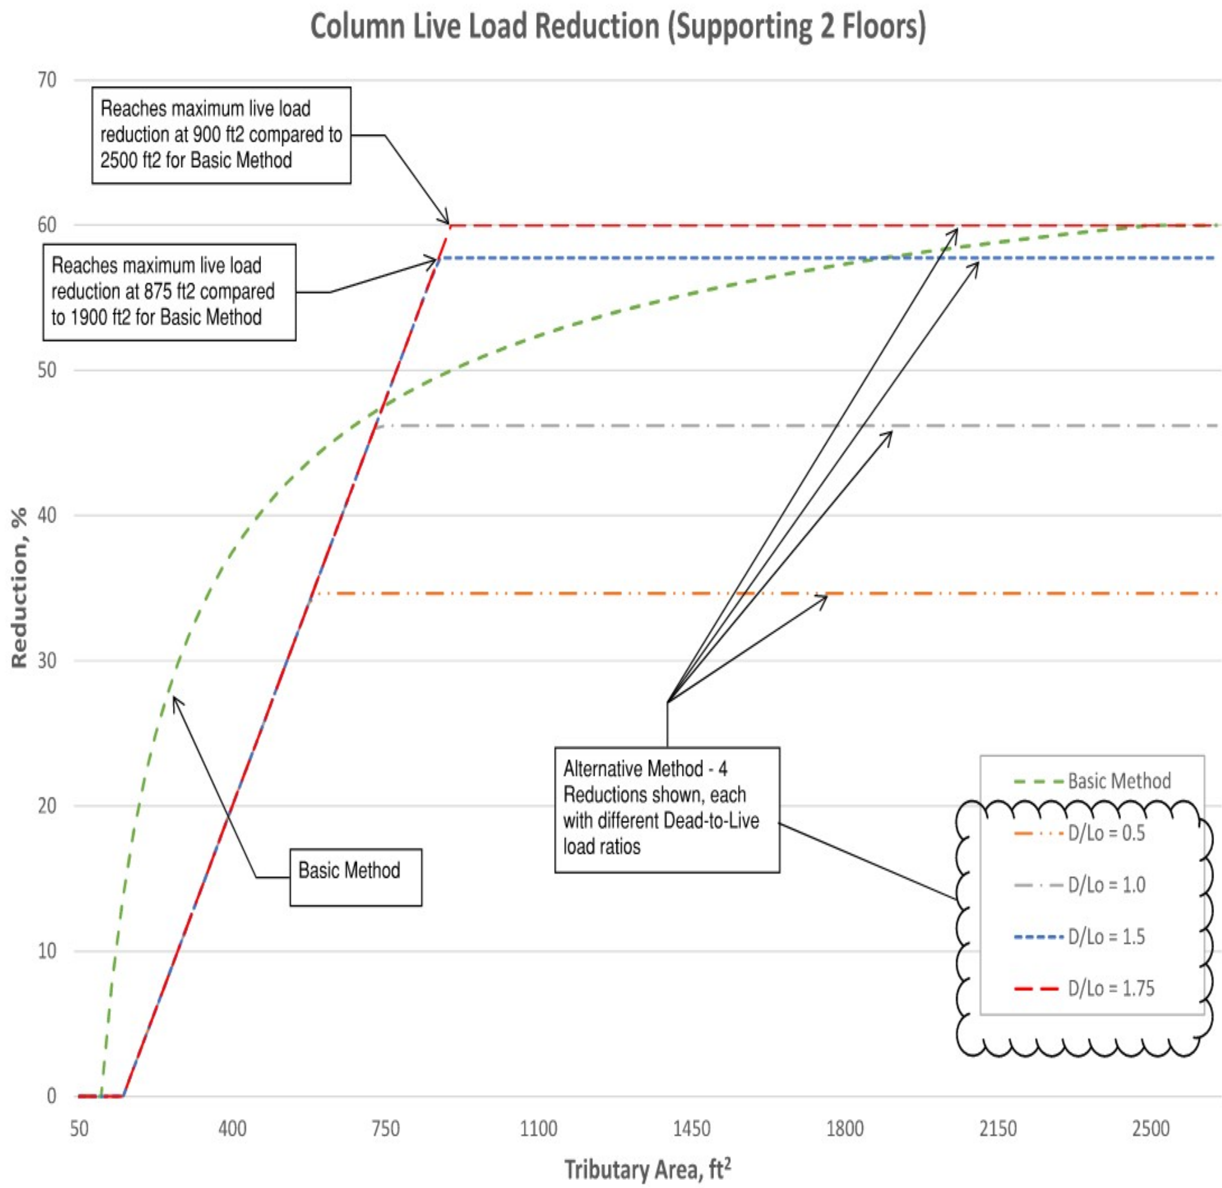
Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures (ASCE/SEI 7-22). This proposal improves the coordination between the IBC and ASCE 7 by removing a provision in the IBC that does not appear in ASCE 7. The IBC contains two methods to reduce the live load on a structural member, the Basic method (1607.13.1) and the Alternative method (1607.13.2). However ASCE 7 only contains one method to reduce live loads which corresponds to the IBC Basic method.

The Alternative method used to be in ASCE 7, however it was replaced by the Basic method in the 1982 edition. The Alternative method was developed in the late 1940's and was based on value judgements and the professional experience available at that time. It allows the live load to be reduced at a flat rate of 0.08% per square foot of area up to the maximum permitted reduction, see attached chart. The maximum permitted reduction is limited by the Dead to Live Load ratio (as well as the number of floors supported by the structural member).

The Basic method was developed approximately 30 years after the Alternative method and is based on statistical analysis and modeling considering structural reliability theory to approximate the probability of structural failure. The analysis and modeling incorporated load surveys of actual buildings, some which were available when the Alternative method was formulated, but some which were newer and not available at that time. Many of the newer surveys were also more extensive, collecting more data then had been done in the past.

The Basic method is reported to give more consistent structural reliability across the range of structural members to which live load reduction is applied (columns, beams, slabs). The attached chart shows that the rate of live load reduction is similarly steep for both the Basic and Alternative methods at relatively low tributary areas. However the rate of live load reduction for the Basic method reduces at higher areas, meaning that it takes much larger areas to achieve the largest live load reduction compared to the Alternative method. This behavior is preferred from a reliability perspective.

The Basic method also does not depend upon on the Dead to Live load ratio. This is more logical as the statistical likelihood of having the full design live load on a structural member has nothing to do with the weight of the structural member. Heavier structural framing (think concrete or masonry) is not more likely to have less live load than comparatively lighter framing (think wood or cold-formed steel). This appears to have been an value judgement applied at the time the Alternative method was developed, however structural reliability theory showed that this was not relevant. Removing the Dead to Live load ratio from the calculations also makes the live load reduction easier to calculate.In discussions within the ASCE 7 Dead & Live Load Subcommittee and with the NCSEA General Requirements Subcommittee, it does not appear that the Alternative method is widely used and thus removing it is not likely to have a significant affect on the structural design profession. However removing it will ensure that where live load reduction is applied, is it applied consistently and with consideration of modern day structural reliability concepts.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Based on feedback from the ASCE 7 Dead and Live Load Subcommittee and the NCSEA General Requirements Subcommittee the Alternative Live Load Reduction provisions are not widely used and therefore removing them from the IBC would have very little impact on structural design.

S84-25

IBC: 1607.13.2

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1607.13.2 Alternative uniform live load reduction. As an alternative to Section 1607.13.1 and subject to the limitations of Table 1607.1, uniformly distributed *live loads* are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. For *live loads* not exceeding 100 pounds per square foot (4.79 kN/m^2), the design *live load* for structural members supporting 150 square feet (13.94 m^2) or more is permitted to be reduced in accordance with Equation 16-8.

   $R = 0.08(A_{\underline{T}} - 150)$ **(Equation 16-8)**

   For SI: $R = 0.861(A_{\underline{T}} – 13.94)$
   where:
   $A_{\underline{T}}$ = ~~Area of floor~~ Tributary area supported by the member, square feet (m^2).
   R = Reduction in percent. Such reduction shall not exceed the smallest of:

   1.1. 40 percent for members supporting one floor.

   1.2. 60 percent for members supporting two or more floors.

   1.3. R as determined by the following equation:

   $R = 23.1(1+ D/L_o)$ **(Equation 16-9)**

   where:
   D = *Dead load* per square foot (m^2) of area supported.
   L_o = Unreduced *live load* per square foot (m^2) of area supported.

2. A reduction shall not be permitted where the *live load* exceeds 100 pounds per square foot (4.79 kN/m^2) except that the design *live load* for members supporting two or more floors is permitted to be reduced by not greater than 20 percent.

   Exception: For uses other than storage, where *approved*, additional *live load* reductions shall be permitted where shown by the *registered design professional* that a rational approach has been used and that such reductions are warranted.

3. A reduction shall not be permitted in passenger vehicle parking garages except that the *live loads* for members supporting two or more floors are permitted to be reduced by not greater than 20 percent.

4. For one-way slabs, the area, *A*, for use in Equation 16-8 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.

Reason: Both "tributary area" and "influence area" are common terms in building design. This proposal makes it clear which area is intended to be used in the Alternative live load reduction method. The basic live load reduction provisions clearly indicate that the area is the tributary area, however the alternative live load reduction provisions are not currently clear. This is likely because the Alternative live load reduction method predates common usage of the term influence area in structural design. At that time the term influence area was not commonly used. Now that tributary area, A_T, and influence area, $K_{LL}A_T$, are in common usage it is necessary to more clearly describe the intended area in the alternative live load reduction provisions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The clarification contained in this proposal is not likely have an impact on the cost of construction.

IBC: 1607.14.3, 1607.14.3.1, 1607.14.3.2, 1607.14.3.3, 1607.14.3.4, 1607.14.3.5, 1607.14.4 (New)

Proponents: Julie C. Furr, PE, Smith Seckman Reid, Inc, representing Self (jcfurr@ssr-inc.com)

2024 International Building Code

Revise as follows:

1607.14.3 Photovoltaic panel systems. Roof structures that provide support for *photovoltaic panel systems* shall be designed in accordance with this code, as modified by Sections 1607.14.3.1 through 1607.14.3.5~~, as applicable~~.

1607.14.3.1 Roof live load. Roof structures that support *photovoltaic panel systems* shall be designed to resist each of the following conditions:

1. Applicable uniform and concentrated roof *loads* with the *photovoltaic panel system dead loads*.

   Exceptions: *Roof live loads* need not be applied to the area covered by *photovoltaic panels* where: ~~the vertical clear space between the panels and the roof surface is 24 inches (610 mm) or less.~~

   1. ~~the~~ The vertical clear space between the panels and the roof surface is 24 inches (610 mm) or less.
   2. The horizontal clear space between the panel supports is 12 inches (305 mm) or less.

2. Applicable uniform and concentrated roof loads without the *photovoltaic panel system* present.

1607.14.3.2 Photovoltaic panels or modules. The *structure* of a roof that supports solar *photovoltaic panels* or modules shall be designed to accommodate the full solar *photovoltaic panels* or modules and ballast *dead load*, including concentrated *loads* from support frames in combination with the *loads* from Section 1607.14.3.1 and other applicable *loads*. Where applicable, snow drift *loads* created by the *photovoltaic panels* or modules shall be included.

1607.14.3.3 Photovoltaic panels installed on open grid roof structures ~~Elevated photovoltaic (PV) support structures with open grid framing~~. ~~Elevated photovoltaic (PV) support structures~~ Structures with open grid framing and without a *roof deck* or sheathing supporting photovoltaic panel systems shall be designed to support the uniform and concentrated *roof live loads* specified in Section 1607.14.3.1, except that the uniform *roof live load* shall be permitted to be reduced to 12 psf (0.57 kN/m^2).

1607.14.3.4 Ground-mounted photovoltaic (PV) panel systems. Ground-mounted photovoltaic (PV) panel systems that are independent structures and do not have accessible/occupied space underneath are not required to accommodate a *roof photovoltaic live load*. Other *loads* and combinations in accordance with Section 1605 shall be accommodated.

1607.14.3.5 Ballasted photovoltaic panel systems. Roof structures that provide support for ballasted *photovoltaic panel systems* shall be designed, or analyzed, in accordance with Chapter 16, except as modified by Section 1607.14.3. ~~Section 1604.4; checked in accordance with Section 1604.3.6 for deflections; and checked in accordance with Section 1611 for ponding.~~

Add new text as follows:

1607.14.4 Uncovered open-frame roof structures. Uncovered open-frame roof structures shall be designed for a vertical live load of not less than 10 psf (0.48 kN/m^2) of the total area encompassed by the framework.

Attached Files

- **PV California Solar News and Statistics for 2025 – Forbes Home.pdf**
  https://www.cdpaccess.com/proposal/12150/35887/files/download/9481/

Reason: This proposal aligns IBC design criteria for structures supporting photovoltaic panel systems with the 2022 California Building Code (July 2024 Supplement). Additional clarification has been added to 1607.14.3.1 to identify that supporting structures must still be designed to include typical roof live loads, unless aisles between panel support groups are too narrow to allow maintenance access.

Having experienced strong growth in solar power over the last decade, California has been afforded ample opportunity to implement, evaluate, and revise PV building code requirements. It is reasonable to expect that current CBC PV building code requirements which have already been implemented in the "nation's top solar producer" (Forbes, *California Solar Statistics for 2025,* 08-28-2024), have achieved the balance between public safety and allowing innovation within the industry.

- **CA PV IR_16-8_2022 CBC.pdf**
  https://www.cdpaccess.com/proposal/12150/35887/documentation/186459/attachments/download/9469/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The revisions clarify code language to match the prevailing standard of practice in California (largest solar producer) and as asserted by the industry.

S85-25

S86-25

IBC: 1607.16.2

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1607.16.2 Fire walls. In order to meet the structural stability requirements of Section 706.2 where the *structure* on either side of the wall has collapsed, *fire walls* and their supports shall be designed to withstand a minimum horizontal ~~allowable stress~~ *load* of 5 psf (0.240 kN/m^2).

Reason: Currently Section 1607.16.2 specifies an allowable stress load, however structural loads in the IBC are not classified as allowable stress loads or strength loads. Loads are classified as live loads, snow loads, wind loads, etc. The loads are then required to be combined (Section 1605) and the required combinations vary depending upon whether LRFD design or ASD design is utilized. Therefore the term “allowable stress” is struck from this section for consistency with the rest of Chapter 16.

While a similar section is not contained within ASCE 7, the changes in this proposal are consistent with how loads are classified in ASCE 7.

As an example, the proposed revisions make the text of this section consistent with the text in the similar Section 1607.16, which is shown below:

1607.16 Interior walls and partitions. Interior walls and partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength and stiffness to resist the loads to which they are subjected but not less than a horizontal load of 5 psf (0.240 kN/m2).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The clarification made in the proposal does not change existing requirements and will not affect the cost of construction.

S86-25

S87-25

IBC: 1607.16, 1607.16.3 (New)

Proponents: John Grenier, representing National Council of Structural Engineers Associations (NCSEA) (jgrenier@greniereng.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

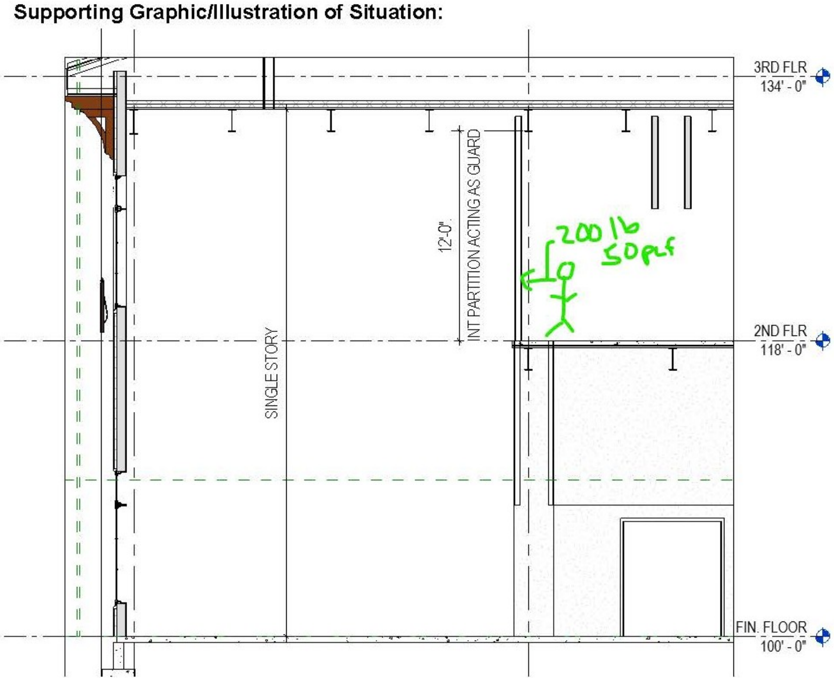
1607.16 Interior walls and partitions. Interior walls and partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength and stiffness to resist the *loads* to which they are subjected but not less than a horizontal *load* of 5 psf (0.240 kN/m^2).

Add new text as follows:

1607.16.3 Guards. Interior walls and partitions separating a floor or walking surface located more than 30 inches measured vertically to the floor below shall serve as *guards* in accordance with section 1015.1. For the design of interior walls and partitions serving as *guards*, loading set forth in section 1607.9 shall be applied at any location along the wall length at a height of 42" above the floor or walking surface.

Reason: There are instances in which light framed interior partitions or insulated metal panel walls (IMP) separate a multistory section from a single-story section (i.e. an interior partition in an industrial building that separates a multistory office space from a single-story warehouse/production space). In these cases, the interior partition will need to have adequate strength and stiffness to be able to support guard loads to prevent a potential failure of the light framed wall or its connection to the structure and prevent the fall of a person off what would then become an open-sided walking surface that is located more than 30 inches above the level or ground below. There are instances of light framed walls or insulated metal panels with common inter-story heights of 10 to 12 feet in which the 200 pound concentrated load will exceed the loading and stiffness demands of the 5 psf horizontal load of section 1607.16.

Supporting Graphic/Illustration of Situation:



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The new text is a clarification for the proper design of an interior partition / wall for the condition mentioned. The criteria is currently in the code, but this addition provides clarity.

S87-25

S88-25

IBC: 1609.1.1, 1609.4, 1609.4.1, 1609.4.2, 1609.4.3

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1609.1.1 Determination of wind loads. Wind *loads* on every *building* or *structure* shall be determined in accordance with Chapters 26 to 30 of ASCE 7. The type of opening protection required, the basic wind speed, *V*, and the exposure category for a *site* shall ~~is permitted to~~ be determined in accordance with Section 1609 ~~or ASCE 7~~. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 *buildings*.
2. Subject to the limitations of Section 1609.1.1.1, residential *structures* using the provisions of AWC WFCM.
3. Subject to the limitations of Section 1609.1.1.1, residential *structures* using the provisions of AISI S230.
4. Designs using NAAMM FP 1001.
5. Designs using TIA-222 for antenna-supporting *structures* and antennas, provided that the horizontal extent of Topographic Category 2 escarpments in Section 2.6.6.2 of TIA-222 shall be 16 times the height of the escarpment.
6. Wind tunnel tests in accordance with ASCE 49 and Sections 31.4 and 31.7 of ASCE 7.
7. *Temporary structures* complying with Section 3103.6.1.2.

The wind speeds in Figures 1609.3(1) through 1609.3(4) are basic wind speeds, *V*, and shall be converted in accordance with Section 1609.3.1 to *allowable stress design* wind speeds, V_{asd}, when the provisions of the standards referenced in Exceptions 4 and 5 are used.

1609.4 Exposure category. For each wind direction considered, an exposure category that adequately reflects the characteristics of ground surface irregularities shall be determined for the *site* at which the *building* or *structure* is to be constructed in accordance with Section 26.7 of ASCE 7. Account shall be taken of variations in ground surface roughness that arise from natural topography and vegetation as well as from constructed features.

Delete without substitution:

~~**1609.4.1 Wind directions and sectors.** For each selected wind direction at which the wind *loads* are to be evaluated, the exposure of the *building* or *structure* shall be determined for the two upwind sectors extending 45 degrees (0.79 rad) either side of the selected wind direction. The exposures in these two sectors shall be determined in accordance with Sections 1609.4.2 and 1609.4.3 and the exposure resulting in the highest wind *loads* shall be used to represent winds from that direction.~~

~~**1609.4.2 Surface roughness categories.** A ground surface roughness within each 45-degree (0.79 rad) sector shall be determined for a distance upwind of the *site* as defined in Section 1609.4.3 from the following categories, for the purpose of assigning an exposure category as defined in Section 1609.4.3. **Surface Roughness B.** Urban and suburban areas, wooded areas or other terrain with numerous closely spaced obstructions having the size of single-family *dwellings* or larger. **Surface Roughness C.** Open terrain with scattered obstructions having heights generally less than 30 feet (9144 mm). This category includes flat open country, and grasslands. **Surface Roughness D.** Flat, unobstructed areas and water surfaces. This category includes smooth mud flats, salt flats and unbroken ice.~~

~~**1609.4.3 Exposure categories.** An exposure category shall be determined in accordance with the following: **Exposure B.** For *buildings* with a mean roof height of less than or equal to 30 feet (9144 mm), Exposure B shall apply where the ground surface roughness, as defined by Surface Roughness B, prevails in the upwind direction for a distance of not less than 1,500 feet (457 m). For *buildings* with a mean roof height greater than 30 feet (9144 mm), Exposure B shall apply where Surface Roughness B prevails in the upwind direction for a distance of not less than 2,600 feet (792 m) or 20 times the height of the *building*, whichever is greater. **Exposure C.** Exposure C shall apply for all cases where Exposure B or D does not apply. **Exposure D.** Exposure D shall apply where the ground surface roughness, as defined by Surface Roughness D, prevails in the upwind direction for a distance of not less than 5,000 feet (1524 m) or 20 times the height of the building, whichever is greater. Exposure D shall apply where the ground surface roughness immediately upwind of the *site* is B or C, and the *site* is within a distance of 600 feet (183 m) or 20 times the *building height*, whichever is greater, from an Exposure D condition as defined in the previous sentence.~~

Reason: The proposal includes modification to Section 1609.4. The modification to Section 1609.4 strikes out the detailed language and provisions for determining Exposure Category in IBC and requires use of Section 26.7 of ASCE/SEI 7. The IBC 2024 1609.4 language for Exposure Category is identical to ASCE/SEI 7-22 Section 26.7. The proposed removal of exposure classifications would verify that exposure classifications are always consistent between the building code and the standard. This approach is consistent with all other wind design parameters (wind speed, elevator factor, topographic factor, directionality factor, etc.).

The change to Section 1609.1 modifies the optional language (i.e., “permitted to be”) to be charging language (i.e., “shall be”) and removed the reference to ASCE 7 as this is now referenced in Section 1609.4.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proposed IBC code changes are generally editorial clarifications that improve the thoroughness of IBC for alignment to ASCE 7.

S88-25

S89-25

IBC: 1609.2

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1609.2 Protection of openings. In *windborne debris regions*, glazing in *buildings* shall be impact resistant or protected with an impact-resistant covering meeting the requirements of an *approved* impact-resistant standard or ASTM E1996 referenced herein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the large missile test of ASTM E1996.
2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the small missile test of ASTM E1996.

<u>In the tornado-prone region, glazed openings shall be protected as required by Chapter 32 of ASCE/SEI 7.</u>

Exceptions:

1. *Wood structural panels* with a minimum thickness of $^{7}/_{16}$ inch (11.1 mm) and maximum panel span of 8 feet (2438 mm) shall be permitted for opening protection in *buildings* with a mean roof height of 33 feet (10 058 mm) or less that are classified as a Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding *loads* determined in accordance with the provisions of ASCE 7, with corrosion-resistant attachment hardware provided and anchors permanently installed on the *building*. Attachment in accordance with Table 1609.2 with corrosion-resistant attachment hardware provided and anchors permanently installed on the *building* is permitted for *buildings* with a mean roof height of 45 feet (13 716 mm) or less where V_{asd} determined in accordance with Section 1609.3.1 does not exceed 140 mph (63 m/s).
2. Glazing in *Risk Category* I *buildings*, including *greenhouses* that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in *Risk Category* II, III or IV *buildings* located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above *aggregate* surface roofs located within 1,500 feet (457 m) of the *building* shall be permitted to be unprotected.

Reason: ASCE 7-22 introduced Chapter 32 Tornado Loads and related provisions in Chapter 1 General, Chapter 2 Combination of Loads, and Chapter 26 Wind Loads: General Requirements. While IBC 2024 generally adopted and incorporated the new ASCE/SEI 7-22 provisions, several sections of IBC 2024 do not adequately clarify the tornado design requirements in ASCE/SEI 7-22. This proposal includes adding language to Section 1609.2 that clarifies the opening protection requirements in the tornado-prone region in ASCE 7, in addition to windborne debris region requirements. This language is consistent with the requirements of ASCE/SEI 7.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proposed IBC code changes aligns the IBC 2027 requirements with pre-existing ASCE/SEI 7-22 requirements.

S89-25

S90-25

IBC: 1609.2.1

Proponents: Amanda Hickman, The Hickman Group, representing AMCA International (amanda@thehickmangroup.com)

2024 International Building Code

Revise as follows:

1609.2.1 Louvers. Louvers protecting intake and exhaust ventilation ducts not assumed to be open that are located within 30 feet (9144 mm) of grade shall ~~meet the requirements of~~ be listed to indicate compliance with AMCA 540.

Reason: The IBC already requires louvers to comply with AMCA 540. However, to ensure code officials are able to enforce this provision, the revised language to require a *listing* is being proposed. Additionally, including a *listing* requirement will ensure that products will perform as rated and meet the performance requirements for the specified application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Because listing is common practice and that the cost to list/certify a product is incurred by the manufacturer and divided across multiple projects, there is no cost increase associated with this proposal.

S90-25

S91-25

IBC: 1609.8 (New), Figure 1609.8 (New), TABLE 1609.8 (New)

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, representing Self (jcrandell@aresconsulting.biz); Art DeGaetano, representing Northeast Regional Climate Center, Cornell University (atd2@cornell.edu)

2024 International Building Code

Add new text as follows:

1609.8 Wind-driven rain. Minimum design wind pressures used to evaluate the wind-driven rain resistance of building assemblies and components shall be permitted to be determined in accordance with Figure 1609.8 and Table 1609.8.

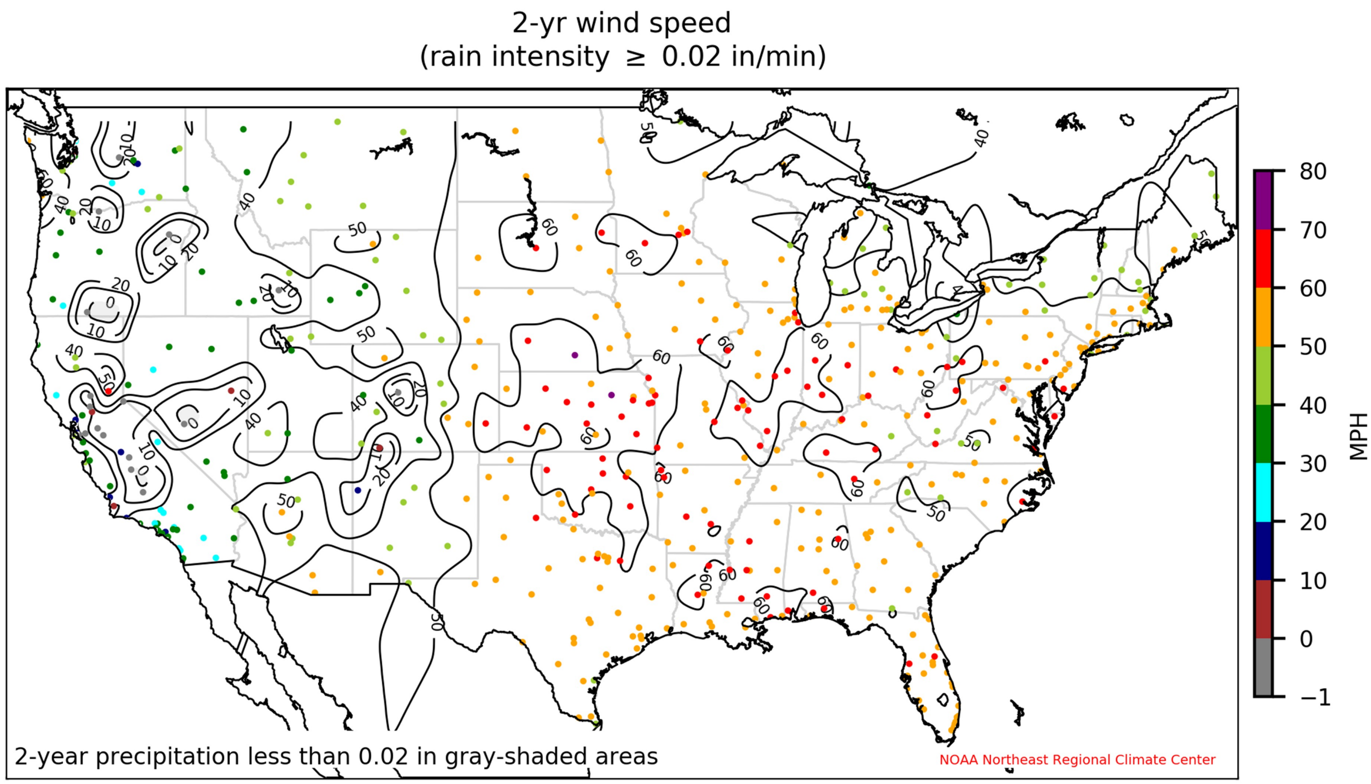


Figure 1609.8 Wind-driven rain wind speed (mph, 3 sec gust)
[For SI: 1 mph = 0.447 m/s]

TABLE 1609.8 MINIMUM WIND-DRIVEN RAIN DESIGN PRESSURE (PSF)[a,b]

		Wind-driven Rain Wind Speed (mph, 3-sec gust) from Figure 1609.8					
		≤ 30	40	50	60	70	80
Wind Exposure	Mean Roof Height (ft)						

	15	2.86	2.86	2.86	3.21	4.37	5.71
	20	2.86	2.86	2.86	3.50	4.76	6.21
	25	2.86	2.86	2.86	3.72	5.06	6.61

	40	2.86	3.14	4.90	7.06	9.61	12.6
	50	2.86	3.29	5.14	7.40	10.1	13.2
	60	2.86	3.41	5.33	7.67	10.4	13.6
	15	2.86	3.35	5.23	7.53	10.3	13.4
	20	2.86	3.51	5.48	7.90	10.8	14.0
	25	2.86	3.64	5.69	8.19	11.2	14.6
D	30	2.86	3.77	5.89	8.48	11.6	15.0
	40	2.86	3.96	6.20	8.92	12.1	15.0
	50	2.86	4.13	6.45	9.29	12.6	15.0
	60	2.86	4.26	6.65	9.58	13.0	15.0

For SI: 1 psf = 47.9 Pa; 1 mph = 0.447 m/s; 1 ft = 0.305 m

a. Wind-driven rain wind speed is to be obtained from Figure 1609.8 which provides 3-second gust wind speeds at standard conditions of wind exposure C (open, flat terrain) at a height of 33 ft (10m) above ground.

b. The tabulated pressures are positive components and cladding pressures calculated in accordance with ASCE 7 for a windward wall for the indicated exposure condition and building mean roof height. Wind directionality is not used to reduce the wind-driven rain pressure. The wind speed obtained from Figure 1609.8 used for this pressure calculation is adjusted from a 3-sec gust basis to a 1-min average wind speed using the following wind speed averaging time conversion factors: 0.72 (Exposure B), 0.79 (Exposure C), and 0.82 (Exposure D). Wind-driven rain pressures for different exposure and mean roof height conditions shall be permitted to be calculated in a consistent manner in accordance with ASCE 7 and Figure 1609.8. The calculated pressure shall not be less than 2.86 psf and need not exceed 15.0 psf.

Reason: The code lacks a risk-consistent basis for addressing wind-driven rain and resistance to water intrusion. This proposal provides a wind-driven rain hazard map (i.e., annual extreme 3-sec gust wind speeds coincidental with a minimum rainfall rate threshold) to properly characterize the hazard as it varies across wind-driven rain climatology of the U.S. Coordinating proposals have been submitted for the IBC and IRC.

First, the proposal "permits" and does not mandate use of these wind-driven rain wind speeds and associated minimum design pressures for evaluation water penetration resistance. This approach is necessary because various other code referenced product standards will need time to consider and re-align with this new hazard-based approach to wind-driven rain resistance. The proposed map and table requirements are somewhat more conservative than, but generally consistent with, current industry minimum and maximum pressure values used in practice. But now the selection of a design pressure for specification of water penetration resistance is properly related to variation in actual hazard across the US (and variation in fundamental wind load parameters such as exposure and building height).

The two key components of this proposal are further explained as follows:

Figure 1609.8 / R301.2.1.6 - The wind-driven rain wind speed map is based on the JAMC article referenced in the Bibliography as a joint effort of the University of Florida and Cornell University's Northeast Climate Data Center with support from other interested parties, including the Insurance Institute for Business and Home Safety (IBHS). Additional work to extend the research to develop a US map was funded by NOAA at Cornell University. The climatology of wind-driven rain is developed from recently available 1-min weather observations from National Weather Service Automated Surface Observing Systems (ASOS). One-minute data better represent the joint occurrence of the extremes that define wind-driven rain occurrence than hourly data, which previously was the shortest available temporal resolution. After adjusting the winds speeds to standardize for exposure and anemometer type, the wind data corresponding to specific rainfall thresholds were fit to a statistical distribution to obtain estimates of the recurrence of wind speeds associated with different rainfall intensities. The values serve as the basis for a wind-driven rain climatology for the United States that is analogous to climatologies that exist and inform building codes in Europe and Canada. The wind-driven rain map represents a 3-sec gust wind speed (miles per hour) for a 2-yr mean recurrence interval with a threshold coincidental rainfall rate of 0.02 in/min (0.5 mm/min). For additional information, refer to the JAMC article referenced in Bibliography.

Table 1609.8 / **R301.2.1.6** - The main purpose of the mapped wind-driven rain hazard is to provide a wind-driven rain wind speed from which an appropriate, risk-consistent pressure differential can be determined as a means to specify or evaluate water-resistance of wall assemblies and exterior wall covering assemblies or components. The pressure differential may be determined in two ways. One way is to use pre-calculated values as shown in the table. The other way is to calculate the pressure using the ASCE 7 provisions for wind loads, but substituting the appropriate wind-driven rain wind speed from Figure 1609.8 / R301.2.1.6 for the basic wind speed used for structural design purposes in ASCE 7.

The latter method was how the table values were generated (as detailed for transparency and repeatability in the table footnotes). An example of calculating the wind-driven rain wind pressure using Figure 1609.8 / R301.2.1.6 and the wind load provisions of ASCE 7 is as follows:

Wind-driven rain wind speed: 60 mph, 3sec gust (Figure 1609.8 / R301.2.1.6)

Wind Exposure: B (suburban/wooded)

Building Height: 30 feet

Wall Pressure coefficients – GCp = 1.0 (positive); GCpi = -0.18 (negative internal pressure)

Kz = 0.7 (exposure B, 30' height)

Kd = 1.0 (directionality not considered)

Kzt = 1.0 (no topographic wind speed up effects considered)

Ke = 1.0 (no elevation effects considered w/r to lower density of air at higher elevations)

V1-min/V3-sec conversion factor: 0.72

p = [0.00256 Kz Kzt Kd Ke $(0.72 \times V)^2$] x [GCp – GCpi]

= $0.00256(0.7)(1.0)(1.0)(1.0)(0.72 \times 60)^2$ x [1.0 + 0.18]

= (3.34 psf) x [1.18] = **3.95 psf**

The range of calculated pressures are shown in the following supplemental table without inclusion of the minimum and maximum pressure values consistent with the extremes of current practice as discussed later below. This table is provided for transparency and informational purposes.

Pressures (psf) for Water Resistance Evaluation (based on conversion to 1-min average wind speed)											
Wind Exposure	Mean Roof Height (ft)	WDR Wind Speed (MPH - 3 sec gust)									
		10	20	30	40	50	60	70	80	90	100

Second, it is important to note that the failure mode that this proposal addresses is the initiation of a leak (onset of water intrusion) at the most extreme (worst) 1-minute of coincidental wind and rain that would typically occur in a given year on average. Therefore, it provides protection for routine and lesser extreme events that have equal or lower wind-driven rain wind speed (even if the rainfall rate is substantially greater than the threshold used to develop the map). Events that exceed the wind-driven rain wind speed tend to have lower coincidental rainfall rates as based on the natural tendency or shape of the hazard curves in the climatological data (see JAMC article referenced in Bibliography).

Finally, as shown in the tabulated pressure values in the proposal, the lower limit of 2.86 psf (137 Pa) for test pressure is used to correspond with the minimum test pressure used in recognized standards addressing wind-driven rain resistance (e.g., ASTM E331) despite the table above showing that lower pressure could be justified in regions of low wind-driven rain hazard. The upper limit of 15.0 psf (718 Pa) also is based on current accepted practice for worst-case wind-driven rain climate conditions in the U.S. and ensures the availability of solutions (it also ensures equivalency with current accepted practices for regions or conditions considered to have high wind-driven rain hazard). This range of WDR pressures also is consistent with that used in Canada. These limits ensure that this new approach is “calibrated” to accepted practice and that solutions are available while also better aligning solutions with actual variation in U.S. wind-driven rain hazard. Even so, the 15 psfcap will provide substantial protection against significant water intrusion and contents damage in greater wind-driven rain hazard conditions or events (higher wind speed at greater return periods) up to the point where structural failures begin to occur and the general integrity of the building envelope is compromised. Such extreme structural safety-level events are beyond the scope of a serviceability concern underlying the current and proposed approach to water resistance. Regardless, the proposed approach deals with the matter of wind-driven rainwater resistance in a much more risk-consistent fashion based on the variation in hazard across the U.S. (wind-driven rain wind speed) and for different building conditions (e.g., wind exposure and building height).

Bibliography: Belcher, B.N., DeGaetano, A.T., Masters, F.J., Crandell, J., and Morrison, M.J. (2023). Development of an Extreme Wind-Driven Rain Climatology for the Southeastern United States Using 1-Min Rainfall and Peak Wind Speed Data. Journal of Applied Meteorology and Climatology, American Meteorological Society, DOI: https://doi.org/10.1175/JAMC-D-22-0156.1

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 - While the cost impact indicates “increased cost” (there was no suitable default answer in cdpACCESS), the proposal does not mandate any new requirements. It provides a new means or option to evaluate building wall assemblies and components for water resistance using an improved methodology based on actual wind-driven rain hazard. If voluntarily used, it could result in an increase or decrease cost for material or assembly qualification purposes relative to existing practices. But, the increase or decrease in cost to the end user may be very small. This proposal also does not require any existing materials or methods recognized in the code to alter current requirements, methods, or standards. So, it should be considered cost neutral.

Estimated Immediate Cost Impact Justification (methodology and variables):

$0 - see cost impact statement above.

Estimated Life Cycle Cost Impact:

$0 - see cost impact statement above (although improved risk-consistency of wind-driven rain performance can result in improved durability and reduced life-cycle cost impacts).

Estimated Life Cycle Cost Impact Justification (methodology and variables):

See cost impact statement.

S91-25

S92-25

IBC: 1609.8 (New), TABLE 1609.8(1) (New), TABLE 1609.8(2) (New)

Proponents: Dave Monsour, THOMAS ASSOCIATES, INC. (DASMA), representing DASMA (Door & Access Systems Manufacturers Assoc.) (dmonsour@thomasamc.com)

2024 International Building Code

Add new text as follows:

1609.8 Vehicle Access Doors. For buildings designed as enclosed, design wind pressures for vehicle access doors shall be obtained using Table 1609.8(1). Table values shall be adjusted for height and exposure by multiplying by the adjustment coefficient in Table 1609.8(2). The resulting positive and negative design wind pressures shall not be less than 10 psf.

TABLE 1609.8(1) VEHICLE ACCESS DOOR WIND LOADS FOR AN ENCLOSED BUILDING WITH A MEAN ROOF HEIGHT OF 30 FEET LOCATED IN EXPOSURE B (ASD) (psf)[a, b, c, d, e, f, g]

For SI: 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s, 1 pound per square foot = .0479 kPa

a. Interpolation shall be permitted for door areas or basic design wind speeds between those given above. For larger door areas, the values in this table shall be used.

b. Positive and negative values signify, respectively, pressures acting toward and away from the exterior surface of the door

c. Negative pressures assume the door overlaps the building's end zone by 2 feet. For overlaps less than 2 feet, the values in this table shall be used.

d. For Risk Category III and IV structures in the tornado prone region, the door shall meet the load requirements of this table or the design tornado pressure determined in accordance with Section 1609.5, whichever is greater

e. Tabulated values are calculated in accordance with ASCE 7 using the 0.6 factor for ASD and an elevation factor of 1.0. Lower elevation factors shall be permitted to be used in accordance with ASCE 7 Table 26.9-1.

f. Design wind pressures shall be determined in accordance with ASCE 7 in the following cases:

1. Buildings designed as open, partially open, or partially enclosed.
2. Door areas less than 63 ft^2.
3. Basic wind speeds greater than 200 mph.
4. Doors overlapping the building end zone more than 2 feet.
5. Building mean roof height greater than 60 feet.
6. Building types and conditions not within the scope (Section 30.1) of Chapter 30 of ASCE 7.

g. Topographic Factor, Kzt, is taken as 1. Determine design wind pressure in accordance with ASCE 7 where the topographic conditions of ASCE 7 Section 26.8 apply.

TABLE 1609.8(2) ADJUSTMENT FACTOR FOR BUILDING HEIGHT AND EXPOSURE

MEAN ROOFHEIGHT (ft)	EXPOSURE CATEGORY		
	B	C	D
15	0.82	1.21	1.47
20	0.89	1.29	1.55
25	0.94	1.35	1.61

35	1.05	1.45	1.70
40	1.06	1.49	1.74
45	1.10	1.53	1.78
50	1.13	1.56	1.81
55	1.16	1.59	1.84
60	1.19	1.62	1.87

For SI:1 foot= 304.8 mm

Reason: Vehicle access doors (e.g., sectional garage doors, rolling doors, and high-speed doors) are critical in maintaining building structural integrity during windstorms. If a vehicle access door gives way, internal pressure can build up on the roof, leading to building collapse. This phenomenon has been demonstrated in many field and laboratory studies over the years by NIST, IBHS, FEMA, and others. Yet these same organizations, as well as DASMA, report a general lack of wind-rated doors being specified and enforced in many regions throughout the country. This proposal requests a new table for vehicle access door design wind pressures. The table highlights and simplifies existing design wind pressure requirements for vehicle access doors, currently subsumed under “wall components & cladding.” The new table does not create any new requirements. We believe this new table will foster greater compliance with existing provisions of the code. A version of this table has been used for the past several editions of the Florida Building Code and in several residential codes, such as ICC 600-2020 Standard for Residential Construction in High-Wind Regions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal only clarifies existing requirements, and does not change them. The tabulated pressures are calculated in accordance with existing IBC requirements.

S92-25

S93-25

IBC: SECTION 1610, 1610.1

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

SECTION 1610
SOIL LOADS AND HYDROSTATIC PRESSURE

Revise as follows:

1610.1 Lateral pressures. *Structures* below grade shall be designed to resist lateral soil *loads* from adjacent soil. The lateral soil ~~Soil~~ *loads* specified in Table 1610.1 shall be used as the minimum design lateral soil *loads* unless determined otherwise by a geotechnical investigation in accordance with Section 1803. Foundation walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Walls that are free to move and rotate at the top, such as retaining walls, shall be permitted to be designed for active pressure.

Where applicable, lateral pressure from fixed or moving surcharge *loads* shall be added to the lateral soil *load*. Lateral pressure shall be increased if expansive soils are present at the *site*. Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1805.4.2 and 1805.4.3.

Exception: Foundation walls extending not more than 8 feet (2438 mm) below grade and laterally supported at the top by flexible *diaphragms* shall be permitted to be designed for active pressure.

Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures (ASCE/SEI 7-22). This proposal improves the coordination between the IBC and ASCE 7 by changing text in the IBC to match text in ASCE 7. Specifically the subject of the sentence is made more clear by stating "lateral soil loads" rather than "soil loads". Table 1610.1 and the corresponding ASCE 7 table provide only lateral soil loads.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification change that will not impact the cost of construction. See reason statement.

S93-25

S94-25

IBC: 1610.2

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org)

2024 International Building Code

Revise as follows:

1610.2 Uplift loads on floor and foundations. Basement floors, slabs on ground, foundations, and similar approximately horizontal elements below grade shall be designed to resist uplift *loads* where applicable. The upward pressure of water shall be taken as the full hydrostatic pressure applied over the entire area. The hydrostatic *load* shall be ~~measured from~~ determined based on the elevation of the underside of the element being evaluated. The design for upward *loads* caused by expansive soils shall comply with Section 1808.6.

Reason: This proposal is a coordination proposal to bring the 2027 IBC up to date with the provisions of the 2022 edition of ASCE/SEI 7 *Minimum Design Loads and Associated Criteria for Buildings and Other Structures* (ASCE/SEI 7-22).

These changes improve the coordination between the IBC and ASCE 7 by changing text in the IBC to match text that appears in ASCE 7. IBC Section 1610.2 states that the hydrostatic load shall be measured from the underside of the element, however what is measured is actually the difference in height between the underside of the element and the water level. The hydrostatic load is calculated based on the measured difference in height. The proposed change more closely aligns with how the load is determined.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The clarification contained in the proposal, which also improves coordination with ASCE 7, is not expected to affect the cost of construction.

S94-25

S95-25

IBC: 1611.1, 1611.2 (New); IPC: [BS] 1101.7

Proponents: Andrew Bevis, Chair, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

1611.1 Design rain loads. Each portion of a roof shall be designed to sustain the *load* of rainwater as per the requirements of Chapter 8 of ASCE 7. Rain loads shall be based on the summation of the static head, d_s, hydraulic head, d_h, and ponding head, d_p, using Equation 16-20. The hydraulic head shall be based on hydraulic test data or hydraulic calculations assuming a flow rate corresponding to a rainfall intensity equal to or greater than the 15-minute duration storm with return period given in Table 1611.1. Rainfall intensity shall be determined in inches per hour for 15-minute duration storms for the risk categories given in Table 1611.1. The ponding head shall be based on structural analysis as the depth of water due to deflections of the roof subjected to unfactored rain load and unfactored *dead load*.

$$R = 5.2(d_s + d_h + d_p) \qquad \textbf{(Equation 16-20)}$$

For SI: $R = 0.0098(d_s + d_h + d_p)$ where:

d_h = Hydraulic head equal to the depth of water on the undeflected roof above the inlet of the secondary drainage system for structural loading (SDSL) required to achieve the design flow, in inches (mm). d_p = Ponding head equal to the depth of water due to deflections of the roof subjected to unfactored rain load and unfactored *dead load*, in inches (mm). d_s = Static head equal to the depth of water on the undeflected roof up to the inlet of the secondary drainage system for structural loading (SDSL), in inches (mm). R = Rain load, in pounds per square foot (kN/m^2).

SDSL is the roof drainage system through which water is drained from the roof when the drainage systems listed in ASCE 7 Section 8.2 (a) through (d) are blocked or not working.

Add new text as follows:

1611.2 Design of roof drains. The design of the roof drainage system shall comply with the requirements of the *International Plumbing Code* based on the rainfall rates specified in the *International Plumbing Code*.

2024 International Plumbing Code

Revise as follows:

[BS] 1101.7 Roof design. Roofs shall be designed for the rain load in accordance with the *International Building Code*.~~maximum possible depth of water that will pond thereon as determined by the relative levels of roof deck and overflow weirs, scuppers, edges or serviceable drains in combination with the deflected structural elements. In determining the maximum possible depth of water, all primary roof drainage means shall be assumed to be blocked. The maximum possible depth of water on the roof shall include the height of the water required above the inlet of the secondary roof drainage means to achieve the required flow rate of the secondary drainage means to accommodate the design rainfall rate as required by Section 1106.~~

Reason: This change will clarify that there is a difference in rainfall rates between the Building Code and the Plumbing Code, however, each code needs to apply the rainfall rates specified in that particular code. The concern with the Building Code is the structural loading from the ponding of water on the roof. The Plumbing Code is concerned with the drainage of the water from the roof.

A more conservative rainfall rate is selected in the Building Code which will result in a greater structural loading on the roof. The Building Code rainfall rate is considered a microburst. This heavy rainfall in a short period of time, can result in a greater amount of water ponding near the roof drain when compared to the rainfall rates used in the Plumbing Code.

The Plumbing Code rainfall rates are designed for a greater overall amount of water during the storm incident. Hence, if there is a microburst, the plumbing storm drainage system can still drain the water within a reasonable period of time, there just may be a greater amount of ponding on the roof for a short duration.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held numerous virtual meetings open to any interested party. Related documents and reports are posted on the PMGCAC website at PMGCAC webpage.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed change is editorial without any change in the technical requirements of either code.

Staff Analysis: CC # S95-25 and CC # P1-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S95-25

S96-25

IBC: 1611.1, 1611.1.1 (New)

Proponents: Erik Madsen, representing NCSEA (emadsen@dci-engineers.com); John Grenier, representing National Council of Structural Engineers Associations (NCSEA) (jgrenier@greniereng.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

1611.1 Design rain loads. Each portion of a roof shall be designed to sustain the *load* of rainwater as per the requirements of Chapter 8 of ASCE 7. Rain loads shall be based on the summation of the static head, d_s, hydraulic head, d_h, and ponding head, d_p, using Equation 16-20. The hydraulic head shall be based on hydraulic test data or hydraulic calculations assuming a flow rate corresponding to a rainfall intensity equal to or greater than the 15-minute duration storm with return period given in Table 1611.1. Rainfall intensity shall be determined in inches per hour for 15-minute duration storms for the risk categories given in Table 1611.1. The ponding head shall be based on structural analysis as the depth of water due to deflections of the roof subjected to unfactored rain load and unfactored *dead load*.

$$R = 5.2(d_s + d_h + d_p) \qquad \textbf{(Equation 16-20)}$$

For SI: $R = 0.0098(d_s + d_h + d_p)$where:

d_h = Hydraulic head equal to the depth of water on the undeflected roof above the inlet of the secondary drainage system for structural loading (SDSL) required to achieve the design flow, in inches (mm). d_p = Ponding head equal to the depth of water due to deflections of the roof subjected to unfactored rain load and unfactored *dead load*, in inches (mm). d_s = Static head equal to the depth of water on the undeflected roof up to the inlet of the secondary drainage system for structural loading (SDSL), in inches (mm). R = Rain load, in pounds per square foot (kN/m^2).

SDSL is the roof drainage system through which water is drained from the roof when the drainage systems listed in ASCE 7 Section 8.2 (a) through (d) are blocked or not working.

Add new text as follows:

1611.1.1 Vertical walls. In determining the hydraulic head, d_h, one-half of the vertical surface area of any wall that diverts rainwater onto the roof shall be added to the projected roof area.

Reason: The requirement to include a portion of the vertical wall area in the rain tributary area is specified in the IPC Section 1106.4 and in the ASCE 7 Commentary Section C8.1.2, but not in the IBC or ASCE 7 provisions. It should be added to IBC for clarity and consistency.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This requirement exists in ASCE 7 and IPC but is not formally identified in IBC. This proposal clarifies that.

2024 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

500-YEAR FLOODPLAIN. Land in the *floodplain* subject to a 0.2% or greater chance of *flooding* in any given year; area delineated on the *Flood Insurance Rate Map* (FIRM) as Shaded Zone X or Zone B.
[BS] BASE FLOOD. The *flood* having a 1-percent chance of being equaled or exceeded in any given year.

Revise as follows:

[BS] BASE FLOOD ELEVATION. The elevation of the *base flood*, including wave height, relative to the National Geodetic Vertical Datum (NGVD), North American Vertical Datum (NAVD) or other datum specified on the *Flood Insurance Rate Map* (*FIRM*). In areas designated on the *Flood Insurance Rate Map* as Zone AO, the *base flood elevation* is the elevation of the highest existing grade of the building's perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number is taken as being equal to 2 feet (610 mm).
[BS] COASTAL A ZONE. Area within a *special flood hazard area*, landward of a V zone or landward of an open coast without mapped *coastal high-hazard areas*. In a *coastal A zone*, the principal source of *flooding* must be astronomical tides, storm surges, seiches or tsunamis, not riverine *flooding* . During the *base flood* conditions, ~~the potential for breaking~~ wave heights ~~shall be~~ are greater than or equal to $1^1/_2$ feet (457 mm). The inland limit of the *coastal A zone* is (a) the *Limit of Moderate Wave Action* if delineated on a *FIRM*, or (b) designated by the authority having *jurisdiction*.
[BS] DESIGN FLOOD. Flood corresponding to the elevations specified in Section 1.5.2 of ASCE 24 and acting over the *flood hazard area* specified in Section 1.3 of ASCE 24 or otherwise legally designated. ~~The *flood* associated with the greater of the following two areas:~~

1. ~~Area with a flood plain subject to a 1-percent or greater chance of *flooding* in any year.~~
2. ~~Area designated as a *flood hazard area* on a community's flood hazard map, or otherwise legally designated.~~

[BS] DESIGN FLOOD ELEVATION. The elevation of the "*design flood*," including wave height, relative to the datum specified on the community's legally designated flood hazard map. ~~In areas designated as Zone AO, the *design flood elevation* shall be the elevation of the highest existing grade of the building's perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet (610 mm).~~
[BS] FLOOD HAZARD AREA. The greater of the following ~~two~~ three areas:

1. The area within a flood plain subject to a 1-percent or greater chance of *flooding* in any year, including *special flood hazard areas* delineated on the *Flood Insurance Rate Map.*

2. The 500-year floodplain, when delineated on the *Flood Insurance Rate Map*.

~~2~~ 3. The area designated as a flood hazard area on a community's flood hazard map, or otherwise legally designated.

[BS] SPECIAL FLOOD HAZARD AREA. ~~The land area subject to flood hazards and shown on a~~ Land in the *floodplain* subject to a 1% or greater chance of *flooding* in any given year; area delineated on the *Flood Insurance Rate Map* ~~or other flood hazard map~~ as Zone A, AE, A1-30, A99, AR, AO, AH, V, VO, VE or V1-30.

2024 International Existing Building Code

Revise as follows:

[BS] FLOOD HAZARD AREA. The greater of the following ~~two~~three areas:

1. The area within a flood plain subject to a 1-percent or greater chance of flooding in any year~~.~~ , including special flood hazard areas delineated on the Flood Insurance Rate Map.

2. The 500-year floodplain, when delineated on the Flood Insurance Rate Map.

~~2.~~ 3. The area designated as a *flood hazard area* on a community's flood hazard map, or otherwise legally designated.

2024 International Mechanical Code

Revise as follows:

[BS] DESIGN FLOOD ELEVATION. The elevation of the "design flood," including wave height, relative to the datum specified on the community's legally designated flood hazard area map. ~~In areas designated as Zone AO, the *design flood elevation* shall be the elevation of the highest existing grade of the *building 's* perimeter plus the depth number, in feet (mm), specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet (610 mm).~~

2024 International Plumbing Code

Revise as follows:

[BS] BASE FLOOD ELEVATION. ~~A reference point, determined in accordance with the building code, based on the depth or peak elevation of flooding, including wave height, which has a 1-percent (100-year flood) or greater chance of occurring in any given year.~~ The elevation of the*base flood*, including wave height, relative to the National Geodetic Vertical Datum (NGVD), North American Vertical Datum (NAVD) or other datum specified on the*Flood Insurance Rate Map*(*FIRM*). In areas designated on the*Flood Insurance Rate Map*as Zone AO, the*base flood elevation*is the elevation of the highest existing grade of the building's perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number is taken as being equal to 2 feet (610 mm).

[BS] DESIGN FLOOD ELEVATION. The elevation of the "design flood," including wave height, relative to the datum specified on the community's legally designated flood hazard map. ~~In areas designated as Zone AO, the design flood elevation shall be the elevation of the highest existing grade of the building's perimeter plus the depth number (in feet) (mm) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet (610 mm).~~

[BS] FLOOD HAZARD AREA. The greater of the following ~~two~~three areas:

1. The area within a flood plain subject to a 1-percent or greater chance of flooding in any given year~~.~~ , including special flood hazard areas delineated on the Flood Insurance Rate Map.

2. The 500-year floodplain, when delineated on the*Flood Insurance Rate Map*.

~~2.~~3. The area designated as a *flood hazard area* on a community's flood hazard map or as otherwise legally designated.

2024 International Fuel Gas Code

Revise as follows:

[BS] DESIGN FLOOD ELEVATION. The elevation of the "design flood," including wave height, relative to the datum specified on the community's legally designated flood hazard map. ~~In areas designated as Zone AO, the *design flood elevation* shall be the elevation of the highest existing grade of the *building's* perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet (610 mm).~~

[BS] FLOOD HAZARD AREA. The greater of the following ~~two~~three areas:

1. The area within a floodplain subject to a 1 percent or greater chance of flooding in any given year~~.~~ , including special flood hazard areas delineated on the Flood Insurance Rate Map.
2. The 500-year floodplain, when delineated on the *Flood Insurance Rate Map*.

~~2.~~3. The area designated as a *flood hazard area* on a community's flood hazard map, or otherwise legally designated.

2024 International Residential Code

CHAPTER 24 FUEL GAS

SECTION G2403 (202) GENERAL DEFINITIONS

Revise as follows:

DESIGN FLOOD ELEVATION. The elevation of the "design flood," including wave height, relative to the datum specified on the community's legally designated flood hazard map. ~~In areas designated as Zone AO, the design flood elevation shall be the elevation of the highest existing grade of the *building's* perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet (610 mm).~~

FLOOD HAZARD AREA. The greater of the following ~~two~~ three areas:

1. The area within a floodplain subject to a 1 percent or greater chance of flooding in any given year

   ~~.~~ , including special flood hazard areas delineated on the Flood Insurance rate Map.
2. The 500-year floodplain, when delineated on the Flood Insurace Rate Map.

~~2.~~ 3. The area designated as a *flood hazard area* on a community's flood hazard map, or otherwise legally designated.

2024 International Private Sewage Disposal Code

Revise as follows:

[BS] DESIGN FLOOD ELEVATION. The elevation of the "design flood," including wave height, relative to the datum specified on the community's legally designated flood hazard map. ~~In areas designated as Zone AO, the design flood elevation shall be the elevation of the highest existing grade of the *building's* perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number shall be taken as being equal to 2 feet~~

~~(610 mm).~~

[BS] FLOOD HAZARD AREA. The greater of the following ~~two~~three areas:

1. The area within a flood plain subject to a 1-percent or greater chance of flooding in any given year~~.~~ , including special flood hazard areas delineated on the Flood Insurance Rate Map.

2. The 500-year floodplain, when delineated on the Flood Insurance Rate Map.

~~2.~~3. The area designated as a flood hazard area on a community's flood hazard map or as otherwise legally designated.

2024 International Swimming Pool and Spa Code

Revise as follows:

[BS] FLOOD HAZARD AREA. The greater of the following ~~two~~three areas:

1. The area within a flood plain subject to a 1-percent or greater chance of flooding in any year~~.~~ , including speical flood hazard areas delineated on the Flood Insruance Rate Map.

2. The 500-year floodplain, when delineated on the Flood Insurance Rate Map.

~~2.~~3. The area designated as a *flood hazard area* on a community's flood hazard map, or otherwise legally designated.

Reason: This proposal is a coordination proposal to bring the 2027 edition of the I-Codes up to date with the provisions in the 2022 edition of *ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, Supplement 2* (ASCE/SEI 7-22, Supplement 2) as well as the 2024 edition of *ASCE/SEI 24 Flood Resistant Design and Construction* (ASCE/SEI 24-24) --- specifically for the codes primarily affected such as the International Building Code (IBC), the International Residential Code (IRC), and the International Existing Building Code (IEBC), in Group B, but also every I-Code affected by a coordinating code change that will need to be updated. ASCE/SEI 7-22 is the current reference in 2024 I-Codes and Supplement 2 has been submitted as an Administrative Update. ASCE/SEI 24-24 has also been submitted as an Administrative Update to the 2027 I-Codes.

This proposal has been organized into Part I to Part VII and includes technical updates as well as editorial coordination. The specific changes to each section included in this proposal are outlined in Overview below, and a detailed summary of the technical updates are explained in Technical Rationale below that. In addition to the strike out/underline for the code change proposals , the MS Word documents for each affected I-Code have been provided as Attached Files for clarity.

-

Overview:

All Codes, All Chapter: Add phase "including special flood hazard areas and 500-year floodplain" following flood area for clarity. And change to clarify term definitions and when "base flood" applies and when "design flood" applies. Also aligns definitions of "base flood elevation" and "design flood elevations". "Flood Hazard Area" is updated with a new definition. These two changes are carried out throughout the series of these comprehensive code change proposal for clarification and consistency.

Since many of the I-Codes point back to the IBC for the definition, Part I has been organized to include all of the proposed changes to all of the definitions in all of the affected I-Codes.

PART I:

Section 202 Definitions: Adds a new definition for "500-year Floodplain" to distinguish it from the existing definition. While "Base Flood" remains the same, "Base Flood Elevation" is updated along with "Design Flood" and "Design Flood Elevation". "Flood Hazard Area" is updated and a new definition for "Special Flood Hazard Area" is added.

PART II:

Section 104, 107 Scope: Add phase "including special flood hazard areas" for clarity. And change to "base flood elevations" from "design flood elevations" to clarify the applicable requirements for the two separate terms. See Section 202 for the updated definitions. These two changes are carried out throughout the code change proposal for clarification and consistency.

Section 202 Definitions: Adds a new definition for “500-year Floodplain” to distinguish it from the existing definition. While “Base Flood” remains the same, “Base Flood Elevation” is updated along with “Design Flood” and “Design Flood Elevation”. “Flood Hazard Area” is updated and a new definition for “Special Flood Hazard Area” is added.

Section 802 Interior Finishes: Removes the pointer that is too specific.

Section 1108 Accessibility: Add phase “including special flood hazard areas” for clarity.

Section 1202 Interior Environment: Removes the pointer that is too specific.

Section 1402 Exterior Walls: Removes the pointer that is too specific.

Section 1603 General Structural Loads: Add phase “including special flood hazard areas” for clarity. Add pointers to ASCE/SEI 24.

Section 1612 Flood Loads: Add phase “including special flood hazard areas” for clarity. Removes the pointer that is too specific. Clarifies and aligns “Establishing the Flood Hazard Area” and the “Design Flood Elevation” with the standards. Clarifies where the requirements are for the Base Flood versus the Design Flood Elevation. Also clarifies and aligns what is required for the documentation.

Section 1804, 1805 Soils and Foundations: Add phase “including special flood hazard areas” for clarity. Removes the pointer that is too specific.

Section 2702 Electrical: Add phase “including special flood hazard areas” for clarity. Removes the pointer that is too specific. [NOTE - This will need to be updated in the International Fire Code. If this section falls in Group A Hearings, this will need to be coordinated next cycle.]

Chapter 35: Update references for ASCE/SEI 7-22 and ASCE/SEI 24.

Appendix G and J: These changes are provided in a separate Code Change Proposal but must be included for a comprehensive proposal.

-

-

Technical Rationale:

The American Society of Civil Engineers (ASCE) is proposing revisions to the International Code Council’s I-Codes for the 2027 Cycle to align the national codes with the current ASCE/SEI design standards including:

ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, 2022 edition; Supplement 2 (ASCE/SEI 7-22 S2)

ASCE/SEI 24 Flood Resistant Design and Construction, 2024 edition (ASCE/SEI 24-24)

The loading standard ASCE/SEI 7-22 S2 and the design standard ASCE/SEI 24-24 work together – these documents have been developed to be consistent and coordinated so they can be required and used together. There are three significant changes in the national loading standard ASCE/SEI 7-22 S2 including (1) an extension of the defined Flood Hazard Area to the 500-year floodplain for Rick Category II, III, and IV structures, (2) an inclusion of risk-based design for loads, and (3) requirements to include relative sea level change into design load calculations for coastal sites; see below for more technical details. There are three significant changes in the national design standard ASCE/SEI 24-24 including (1) alignment with ASCE/SEI 7-22 S2, (2) alignment with FEMA Technical Bulletins, and (3) updates for elevations, materials, and floodproofing.

Both ASCE/SEI Standards are available for purchase and the Supplement available as a free download from the ASCE Library:

ASCE/SEI 7-22 (https://doi.org/10.1061/9780784415788)

ASCE/SEI 7-22 Supplement 2 (https://doi.org/10.1061/9780784415788.sup2)

ASCE/SEI 24-24 (https://doi.org/10.1061/9780784485781)

Flood Hazard:

The ASCE 7-22 S2 updates the design requirements to define the flood hazard area for the given Risk Category of structure. Addionally, the flood hazard depth is tied to the mean recurrence interval for a given Risk Category of structure. The design flood hazard is related to Risk Category (e.g., RC II will be designed to 500-year MRI), which is consistent with the way other environmental hazards (such as wind and snow loads) relate the hazard to Risk Category. This is in contrast to the current code requirements, which only considers only 100-year MRI flood for all structures regardless of Risk Category. In some areas in the U.S., the Authority Having Jurisdiction is already requiring a higher design requirement for the flood hazard. The city of Houston, for example, moved to requiring use of the 500-year MRI as the design basis for flood following the devastation from Hurricane Harvey. At a national level, FEMA is considering the use of the 500-year flood as the basis for floodplain management.

The coordinated code change proposals submitted for Group B are drafted to bring the IBC, IRC, and IEBC into alignment with the recent changes in ASCE 7-22 Supplement 2 and ASCE 24-24. The significant changes from the updates to these standards are to differentiate between the base flood (also described as the 100-year flood, or the 1% or greater chance of flooding in any given year) and the design flood, which could be different, and is defined in the standards for each Risk Category. The design flood must include considerations for loading specified in ASCE/SEI 7-22 S2 and design specified in ASCE/SEI 24-24.

Flood damage, and associated loss dollars, has significantly expanded since the last major updates of ASCE 7 Chapter 5 and ASCE 24. Their revisions attempt to close that gap and align the risks across other hazards.

FEMA cites that flood damage cost approximately $17 billion each year between 2010 and 2018, and with rising sea levels and extreme weather could cause $20 billion of flood damage to at-risk US homes this year, rising to $32 billion by 2051. Data from 2018 Hurricane Michael shows that 42% of claimed damage amounts were in the Shaded X-Zone (500-year floodplain), exceeding the amounts in both the A and V-Zones. (FEMA. Mitigation Assessment Team Report Hurricane Michael in Florida (FEMA P-2077), February 2020).

This is further supported by FEMA's recent report “A Cost and Benefits Analysis of Increased Elevation Requirements for Public and Nonresidential Buildings in Riverine and Coastal Floodplains,” which evaluated the potential avoided losses (benefits) for 8 building types in 19 coastal floodplains and 14 riverine floodplains in the 100-year floodplain and the Shaded X Zone. The report shows that there are significant benefits to most buildings in the 100-year floodplain, particularly in steep/narrow floodplains. There were also significant benefits to buildings in the Shaded X Zone where there are currently no elevation requirements. These findings are supported by evidence from the National Flood Insurance Program (NFIP), which stated, “People outside of high-risk areas file more than 25 percent of NFIP claims and receive one-third of disaster assistance for flooding. The NFIP's preferred risk policies are designed for residential properties located in low- to moderate-risk flood zones.” Additional reports from the NFIP indicate that 40% of companies fail to reopen after a disaster, with another 25% closing within a year. These problems are only further exacerbated by the influence of development and associated runoff, changes in precipitation rates, local subsidence, and sea level change. All of which are not accounted for by FEMA's flood maps, which only account for historic flood data and not future projections. All of this data supports the need to move from a fixed freeboard approach to a risk-based elevation approach that provides consistent protection from flat/wide floodplains to steep/narrow floodplains and more appropriately addresses the influence of wave action in coastal floodplains. This recognizes that true resiliency for communities is continuity of local businesses and making sure that public services are maintained and that adaptation to changes in precipitation, development, and sea level change must be incorporated into new buildings rather than relying on often prohibitively expensive retrofit options.

The ASCE changes consider the frequency of recent and predicted events and the significant damage recorded in the Shaded X-Zone. But, while significant, the addition of the Shaded X-Zone to the standards represents a change to only 4% of the U.S. population.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

ASCE Consensus Process:

ASCE established and maintains an ANSI-accredited, consensus process for standard development. The open process includes selection of a balanced committee, including representation of all affected stakeholders, and public review of the draft standard prior to publication. The ASCE consensus process follows the *ASCE Rules for Standards Committees*, which is published on the ASCE website. The ASCE/SEI 7-22 S2 was developed by the ASCE 7-22 Standard Committee, which included approximately 50 voting members and hundreds more associate members. The ASCE/SEI 24-24 standard was developed by the ASCE 24-24 Standard Committee, which included approximately 25 voting members and 15 associate members.

Supporting Organizations:

This code change proposal has many supporters, included but not limited to the following organizations:

American Flood Coalition

Association of State Flood Plain Managers (ASFPM)

BuildStrong America

Federal Emergency Management Association

Flood Mitigation Industry Association (FMIA)

National Institute of Building Science (NIBS)

Registered Designer Professionals and planners of buildings and other infrastructure projects, Code Officials, and Authorities Having Jurisdiction owe it to the public and have an ethical obligation to provide a framework for safe, reliable structures. The public expects that the buildings in which they live, work, and play are designed consistently, with the same risk approach for all environmental hazards. Flooding is disruptive to families, businesses, and communities and it takes years to recover from these devastating disasters and overcome the losses incurred. The flood hazard must be taken seriously and incorporated into our design standards and building codes in a manner that is consistent with all of the other environmental hazards.

Cost Impact: Increase

- **2025 Cost and Benefit Analysis for ASCE 24-24.PDF**
  https://www.cdpaccess.com/proposal/11717/35911/documentation/186635/attachments/download/9868/

Estimated Immediate Cost Impact:

ASCE 7 and ASCE 24 are national minimum design standards. The effects will vary depending upon the local flood conditions and flood risk across the country and among building types. For nearly 90% of all affected structures in Numbered A Zones, the estimated immediate costs impact can be understood in analysis of the mitigation cost as a percentage of building replacement value from 0.2-6.6% for coastal sites and 0.0-4.0% for riverine sites. Additionally, average benefits per square foot range from $51-$336 for both riverine and coastal flooding, which are dependent on building type and location. See the attached “Cost and Benefits Analysis” for additional information.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

Estimated Immediate Cost Impact Justification (methodology and variables):

A building cost study was considered for 14 riverine locations and 19 coastal locations. Examples consider A Zone and X Zone conditions to understand how the ASCE changes impact the overall cost. However, since most buildings are riverine, the study focused there, but similar trends appear in coastal buildings.

Table 1 is a summary of the buildings that were considered in the study, accounting for the building type, building sizes (and average), and Flood Design Classes. The difference between a commercial and government office building plays a larger role in the losses avoided portion of the study. The cost analysis is grouped by Flood Design Class since this is the grouping used in ASCE 24 for elevation criteria.

Table 1 - Building Types Considered in Study

Building Type	Flood Design Class	Small SF	Medium SF	Large SF	Average SF
Hospital 2-3 Stories	4	25,000	70,000	145,000	80,000
Elementary School	3	25,000	40,000	65,000	43,333
Police Station	4	7,000	13,000	23,000	14,333
Office 1-Story (Government)	2	2,000	7,000	25,000	11,333
Office 3-Story (Government)	2	5,000	16,000	80,000	33,667
Office 1-Story (Commercial)	2	2,000	7,000	25,000	11,333
Office 3-Story (Commercial)	2	5,000	16,000	80,000	33,667
Retail Store	2	4,000	10,000	22,000	12,000

Table 2 provides an overview of A Zone conditions for increased building costs within the 100-yr floodplain. The values represent the breakdown of example floodplains using the numbered A Zone range to categorize how much rise there is between the various flood events. A low numbered A Zone represents a flat floodplain and a high number represents a steeper floodplain where there can be a large difference in flood elevations. The percent of numbered A Zones throughout the country based on an NFIP flood insurance policy analysis per census tract.

This provides a breakdown of how various floodplains impact the increased building cost. It's important to note that in A01-A03 the freeboard requirements equal or exceed the MRI based design flood event. Since ASCE did not change the minimum freeboard requirements for FDC 2 and FDC 4, those values are the same for ASCE 24-14 and ASCE 24-24 and therefore there is no cost increase. Additionally, for FDC 4 the analysis selected the higher of the 500-yr and BFE+2, so the delta between the ASCE 24-14 and ASCE 24-24 wasn't as high in the higher numbered A Zones as it would have been with FDC 2 and 3 where they were locked with ASCE 24-14 at BFE+1.

Table 2 - Average Building Cost Increase Percentage for Riverine A Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC3	FDC4
A01-A03	26%	0.00%	1.20%	0.00%
A04-A06	41%	1.50%	1.90%	0.50%
A07-A10	20%	2.40%	2.90%	0.60%
A11-A14	9%	4.80%	5.50%	1.00%
A15-A17	2%	8.90%	10.00%	1.60%
A18-A30	2%	11.90%	13.20%	2.10%
	Weighted Average:	1.97%	2.65%	0.49%

Table 3 provides an overview of X Zone conditions for increased building costs within the 500-yr floodplain. The 500-year floodplain represents the area between the 100-year floodplain and the 500-year flood extent, this therefore represents protection from the 101-year to the 500-year flood. In X Zones it is assumed that buildings are built on the ground as compared to elevated foundations in Zone

A. Since the X Zone represents the difference between the 100-year and the 500-year flood, the 300-year flood elevation was used as an average ground elevation. The ASCE 24-24 elevations represent the minimum required elevations required per the standard. The increased elevation is therefore the difference between ground (at the 300-year flood elevation) and the ASCE 24-24 elevation requirements. Similar to Table 2, Table 3 data is provided per Flood Design Class per grouped numbered A Zone designation.

Table 3 - Average Building Cost Increase Percentage for Riverine X Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC 3	FDC 4
A01-A03	26%	0.60%	1.70%	0.70%
A04-A06	41%	1.00%	1.50%	0.80%
A07-A10	20%	1.20%	1.80%	1.00%
A11-A14	9%	1.90%	3.00%	1.70%
A15-A17	2%	3.20%	5.00%	2.80%
A18-A30	2%	4.40%	6.70%	3.70%
	Weighted Average:	1.14%	1.93%	1.00%

It is believed that the presentation of percent increase in building cost provided a better representation of the overall cost impacts rather than providing dollar values. While the percent increase does get rather large in those areas with high numbered A Zones, this is a much smaller overall percentage of land area, so this represents a smaller portion of the floodplains in the US. However, recent events have shown that when these areas experience a flood event above the 100-year or 1% annual chance flood, that they often experience deep flooding. Experience from Western NC following Hurricane Helene demonstrated that when floods occur in areas with high numbered A Zones that significant flood damage occurs in the X Zone. There were examples of buildings elevated in the X Zone that performed very well in Hurricane Helene and had little to no observed damage. But many buildings in the X Zone that were constructed at grade were severely damaged or destroyed. While this is observational, there is substantial evidence to suggest that the percent cost increase is offset by the avoided losses. Two key factors that impact the avoided loss calculation is the impact of when the original flood insurance studies and associated maps were created (older mapping data), which can mean that the mapped risk is underestimated (increased runoff due to development and updated precipitation data) and then looking forward the impact of future changes in precipitation rates over the 50-year life of riverine buildings. Similarly, these impacts can impact coastal flooding heights as well as the impact of sea level change.

2024 International Building Code

CHAPTER 1
SCOPE AND ADMINISTRATION

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The *building official* shall not grant modifications to any provision required in *flood hazard areas*, including special flood hazard areas, as established by Section 1612.3 unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the *site* render the elevation standards of Section 1612 inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the *lot* undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the *flood* hazard.
5. Submission to the applicant of written notice specifying the difference between the ~~*design*~~ base *flood elevation* and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the ~~*design*~~ base *flood elevation* increases risks to life and property.

[A] 107.2.6 Site plan. The *construction documents* submitted with the application for *permit* shall be accompanied by a site plan showing to scale the size and location of new construction and *existing structures* on the *site*, distances from *lot lines*, the established street grades and the proposed finished grades and, as applicable, *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*, *floodways*, and ~~*design*~~ base *flood elevations*; and it shall be drawn in accordance with an accurate boundary line survey. In the case of demolition, the site plan shall show construction to be demolished and the location and size of *existing structures* and construction that are to remain on the *site* or plot. The *building official* is authorized to waive or modify the requirement for a site plan where the application for *permit* is for *alteration* or *repair* or where otherwise warranted.

[A] 107.2.6.1 ~~Design~~ Base flood elevations. Where ~~*design*~~ base *flood elevations* are not specified, they shall be established in accordance with Section 1612.3.~~1~~2.

CHAPTER 8
INTERIOR FINISHES

802.4 Applicability. For *buildings* in *flood hazard areas* ~~as established in Section 1612.3~~, *interior finishes*, *trim* and *decorative materials* below the elevation required by Section 1612 shall be *flood-damage-resistant materials*.

CHAPTER 11

ACCESSIBILITY

1108.7.5 Flood hazard areas. *Type A units* and *Type B units* shall not be required for *buildings* without elevator service that are located in *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains* ~~as established in Section 1612.3~~, where the minimum required elevation of the *lowest floor* or lowest supporting horizontal structural member, as applicable, results in all of the following:

1. A difference in elevation between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15 240 mm) exceeding 30 inches (762 mm).
2. A slope exceeding 10 percent between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15 240 mm).

Where such arrival points are not within 50 feet (15 240 mm) of the primary entrances, the closest arrival points shall be used.

CHAPTER 12
INTERIOR ENVIRONMENT

1202.4.4 Flood hazard areas. For *buildings* in *flood hazard areas* ~~as established in Section 1612.3~~, the openings for under-floor ventilation shall be deemed as meeting the flood opening requirements of ASCE 24 provided that the ventilation openings are designed and installed in accordance with ASCE 24.

CHAPTER 14
EXTERIOR WALLS

[BS] 1402.9 Flood resistance. For *buildings* in *flood hazard areas* ~~as established in Section 1612.3~~, *exterior walls* extending below the elevation required by Section 1612 shall be constructed with *flood-damage-resistant materials*.

[BS] 1402.10 Flood resistance for coastal high-hazard areas and coastal A zones. For *buildings* in *coastal high-hazard areas* and coastal A zones ~~as established in Section 1612.3~~, electrical, mechanical and plumbing system components shall not be mounted on or penetrate through *exterior walls* that are designed to break away under *flood loads*.

CHAPTER 16
STRUCTURAL DESIGN

1603.1 General. *Construction documents* shall show the material, size, section and relative locations of structural members with floor levels, column centers and offsets dimensioned. The design *loads* and other information pertinent to the structural design required by Sections 1603.1.1 through 1603.1.9 shall be indicated on the *construction documents*.

Exception: *Construction documents* for *buildings* constructed in accordance with the *conventional light-frame construction* provisions of Section 2308 shall indicate the following structural design information:

1. Floor and roof dead and *live loads*.
2. Ground snow load, p_g , and *allowable stress design* ground snow load, $p_{g(asd)}$.
3. Basic *wind speed* , V, mph (m/s), and *allowable stress design* wind speed, V_{asd}, as determined in accordance with Section 1609.3.1 and wind exposure.
4. *Seismic design category* and *site class*.
5. Flood design data, if located in *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains* ~~established in Section 1612.3~~.

6. Design load-bearing values of soils.
7. Rain load data.

1603.1.7 Flood design data. For *buildings* located in whole or in part in *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains* ~~as established in Section 1612.3~~, the documentation pertaining to design, if required in Section 1612.4, shall be included and the following information, referenced to the datum on the community's *Flood Insurance Rate Map* (*FIRM*), shall be shown, regardless of whether *flood loads* govern the design of the *building*:

1. *Flood design* class assigned according to ASCE 24.
2. In *flood hazard areas* other than *coastal high hazard areas* or *coastal A zones*, the elevation of the proposed *lowest floor*, including the basement, determined in accordance with ASCE 24.
3. In *flood hazard areas* other than *coastal high hazard areas* or *coastal A zones*, the elevation to which any nonresidential *building* will be dry floodproofed, determined in accordance with ASCE 24.
4. In *coastal high hazard areas* and *coastal A zones*, the proposed elevation of the bottom of the lowest horizontal structural member of the *lowest floor*, including the basement, determined in accordance with ASCE 24.

SECTION 1612
FLOOD LOADS

1612.1 General. Within *flood hazard areas,* including *special flood hazard areas* and *500-year floodplains* ~~as established in Section 1612.3~~, all new construction of *buildings*, *structures* and portions of *buildings* and *structures*, including *substantial improvement* and restoration of *substantial damage* to *buildings* and *structures*, shall be designed and constructed to resist the effects of flood hazards and *flood loads*. For *buildings* that are located in more than one *flood hazard area*, the provisions associated with the most restrictive *flood hazard area* shall apply.

1612.2 Design and construction. The design and construction of *buildings* and *structures* located in *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains* ~~*coastal high hazard areas* and *coastal A zones*~~, shall be in accordance with Chapter 5 of ASCE 7 and ASCE 24. Elevators, escalators, conveying systems and their components shall conform to ASCE 24 and ASME A17.1/CSA B44 as applicable.

Exception: *Temporary structures* complying with Section 3103.6.1.3.

1612.3 Establishment of flood hazard areas. ~~To establish *flood hazard areas*, the~~ The applicable governing authority shall adopt a flood hazard map and supporting data. The flood hazard map shall include, at a minimum, ~~areas of~~ special flood hazard areas and *500-year floodplains* as identified by the Federal Emergency Management Agency in an engineering report entitled "The *Flood Insurance Study* for **[INSERT NAME OF JURISDICTION]**," dated **[INSERT DATE OF ISSUANCE]**, as amended or revised with the accompanying *Flood Insurance Rate Map* (*FIRM*) and Flood Boundary and *Floodway* Map (FBFM) and related supporting data along with any revisions thereto. The adopted flood hazard map and supporting data are hereby adopted by reference and declared to be part of this section.

Add new text as follows:

1612.3.1 Establishing the design flood elevations. Within *special flood hazard areas* and *500-year floodplains*, the elevation of the *design flood* determined in accordance with ASCE 24 is the *design flood elevation* that determines elevation requirements as a function of Flood Design Class assigned according to ASCE 24. In no case shall the elevation of the *design flood* be taken as lower than the elevation of the *base flood.*

Revise as follows:

1612.3.~~1~~2 ~~Design~~ Base flood elevations. Where ~~*design*~~ *base flood elevations* are not ~~included in~~ determined for the *special flood hazard areas* established in Section 1612.3, or where *floodways* are not designated, the *building official* is authorized to require the applicant to do one of the following and use the resulting *base flood elevation* in the design and construction requirements of Section 1612.2:

1. Obtain and reasonably utilize any ~~*design*~~ *base flood elevation* and *floodway* data available from a federal, state or other source.
2. Determine the ~~*design*~~ *base flood elevation* or *floodway* in accordance with accepted hydrologic and hydraulic engineering practices used to define special *flood hazard areas*. Determinations shall be undertaken and sealed by a *registered design professional* who shall document that the technical methods used reflect currently accepted engineering practice. Studies, analyses and computations shall be submitted in sufficient detail to allow review and *approval*.

1612.3.~~2~~3 Determination of impacts. In riverine *special flood hazard areas* where ~~*design*~~ *base flood elevations* are specified but *floodways* have not been designated, the applicant shall provide a *floodway* analysis that demonstrates that the proposed work will not increase the ~~*design*~~ *base flood elevation* more than 1 foot (305 mm) at any point within the *jurisdiction* of the applicable governing authority.

1612.4 Flood hazard documentation. The following documentation shall be prepared and sealed by a *registered design professional* and submitted to the *building official*:

1. For construction in *flood hazard areas,* including *special flood hazard areas* and *500-year floodplains,* other than *coastal high hazard areas* or *coastal A zones*:
   1.1. The elevation of the *lowest floor*, including the basement, as required by the *lowest floor* elevation inspection in Section 110.3.3 and for the final inspection in Section 110.3.12.1.

   1.2. For fully enclosed areas below the lowest floor elevation required by ASCE 24 ~~*design flood elevation*~~ where provisions to allow for the automatic entry and exit of floodwaters do not meet the minimum requirements in Section 2.~~7~~ 8.2.1 of ASCE 24, *construction documents* shall include a statement that the design will provide for equalization of hydrostatic flood forces in accordance with Section 2.~~7~~ 8.2.2 of ASCE 24.

   1.3. For *dry floodproofed* nonresidential *buildings*, *construction documents* shall include a statement that the *dry floodproofing* is designed in accordance with ASCE 24 and shall include the ~~*flood* emergency~~ Inspection, Maintenance, and Operations plans specified in Chapter 6 of ASCE 24.

   1.4. For dry floodproofed nonresidential buildings, the elevation to which the building is dry floodproofed as required for the final inspection in Section 110.3.12.1.
2. For construction in *coastal high hazard areas* and *coastal A zones*:
   2.1. The elevation of the bottom of the lowest horizontal structural member as required by the *lowest floor* elevation inspection in Section 110.3.3 and for the final inspection in Section 110.3.12.1.

   2.2. *Construction documents* shall include a statement that the *building* is designed in accordance with ASCE 24, including that the pile or column foundation and *building* or *structure* to be attached thereto is designed to be anchored to resist flotation, collapse and lateral movement due to the effects of wind and *flood loads* acting simultaneously on all building components, and other *load* requirements of Chapter 16.

   2.3. For breakaway walls designed to have a resistance of more than ~~20~~ 16 psf (~~0.96~~ 0.76 kN/m^2) determined using *allowable stress design* or a resistance to an ultimate load of more than ~~33 pounds per square foot~~ 26 psf (~~1.58~~ 1.24 kN/m^2) *, construction documents shall include a statement that the breakaway wall is designed in accordance with ASCE 24.*

   2.4 For breakaway walls where provisions to allow for the automatic entry and exit of floodwaters do not meet the minimum requirements in Section 2.~~7~~ 8.2.1 of ASCE 24, *construction documents* shall include a statement that the design will provide for equalization of hydrostatic flood forces in accordance with Section 2.~~7~~ 8.2.2 of ASCE 24.

CHAPTER 18
SOILS AND FOUNDATIONS

1804.5 Grading and fill in flood hazard areas. In *flood hazard areas,* including *special flood hazard areas* and *500-year floodplains* ~~established in Section 1612.3~~, grading, fill, or both, shall not be *approved*:

1. Unless such fill is placed, compacted and sloped to minimize shifting, slumping and erosion during the rise and fall of *flood* water and, as applicable, wave action.
2. In *floodways*, unless it has been demonstrated through hydrologic and hydraulic analyses performed by a *registered design professional* in accordance with standard engineering practice that the proposed grading or fill, or both, will not result in any increase in *flood* levels during the occurrence of the ~~*design*~~ *base flood.*
3. In *coastal high hazard areas,* unless such fill is used for minimal site grading, landscaping, or to meet local drainage requirements and is conducted or placed to avoid diversion of water and waves toward any *building* or *structure*.
4. Where ~~*design*~~ *base flood elevations* are specified but *floodways* have not been designated, unless it has been demonstrated that the cumulative effect of the proposed *flood hazard area* encroachment, when combined with all other existing and anticipated *flood hazard area* encroachment, will not increase the ~~*design*~~ *base flood elevation* more than 1 foot (305 mm) at any point.

1805.1.2.1 Flood hazard areas. For *buildings* and *structures* in *flood hazard areas,* including *special flood hazard areas* and *500-year floodplains* ~~as established in Section 1612.3~~, the finished ground level of an under-floor space such as a crawl space shall be equal to or higher than the outside finished ground level on one side or more.

Exception: Under-floor spaces of Group R-3 *buildings* that meet the requirements of FEMA TB 11.

CHAPTER 27
ELECTRICAL

[F] 2702.1.8 Group I-2 occupancies. In Group I-2 occupancies located in *flood hazard areas,* including *special flood hazard areas* and *500-year floodplains* ~~established in Section 1612.3~~, where new essential electrical systems are installed, and where new essential electrical system generators are installed, the systems and generators shall be located and installed in accordance with ASCE 24. Where connections for hookup of temporary generators are provided, the connections shall be located at or above the elevation required in ASCE 24.

CHAPTER 35
REFERENCED STANDARDS

ASCE/SEI

American Society of Civil Engineers Structural Engineering Institute
1801 Alexander Bell Drive
Reston, VA 20191

Update standard(s) as follows:

7—22, including Supplements 1, 2, and 3	Minimum Design Loads and Associated Criteria for Buildings and Other Structures
24~~—14~~ 24	Flood Resistant Design and Construction

Reason: REASON STATEMENT:

This proposal is a coordination proposal to bring the 2027 edition of the I-Codes up to date with the provisions in the 2022 edition of *ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, Supplement 2* (ASCE/SEI 7-22, Supplement 2) as well as the 2024 edition of *ASCE/SEI 24 Flood Resistant Design and Construction* (ASCE/SEI 24-24) --- specifically for the codes primarily affected such as the International Building Code (IBC), the International Residential Code (IRC), and the International Existing Building Code (IEBC), in Group B, but also every I-Code affected by a coordinating code change that will need to be updated. ASCE/SEI 7-22 is the current reference in 2024 I-Codes and Supplement 2 has been submitted as an Administrative Update. ASCE/SEI 24-24 has also been submitted as an Administrative Update to the 2027 I-Codes.

This proposal has been organized into Part I to Part VII and includes technical updates as well as editorial coordination. The specific changes to each section included in this proposal are outlined in Overview below, and a detailed summary of the technical updates are explained in Technical Rationale below that. In addition to the strike out/underline for the code change proposals, the MS Word documents for each affected I-Code have been provided as Attached Files for clarity.

Overview:

All Codes, All Chapter: Add phase “including special flood hazard areas and 500-year floodplain” following flood area for clarity. And change to clarify term definitions and when “base flood” applies and when “design flood” applies. Also aligns definitions of “base flood elevation” and “design flood elevations”. “Flood Hazard Area” is updated with a new definition. These two changes are carried out throughout the series of these comprehensive code change proposal for clarification and consistency.

Since many of the I-Codes point back to the IBC for the definition, Part I has been organized to include all of the proposed changes to all of the definitions in all of the affected I-Codes.

PART I:

Section 202 Definitions: Adds a new definition for “500-year Floodplain” to distinguish it from the existing definition. While “Base Flood” remains the same, “Base Flood Elevation” is updated along with “Design Flood” and “Design Flood Elevation”. “Flood Hazard Area” is updated and a new definition for “Special Flood Hazard Area” is added.

PART II:

Section 104, 107 Scope: Add phase “including special flood hazard areas” for clarity. And change to “base flood elevations” from “design flood elevations” to clarify the applicable requirements for the two separate terms. See Section 202 for the updated definitions. These two changes are carried out throughout the code change proposal for clarification and consistency.

.

Section 802 Interior Finishes: Removes the pointer that is too specific.

Section 1108 Accessibility: Add phase “including special flood hazard areas” for clarity.

Section 1202 Interior Environment: Removes the pointer that is too specific.

Section 1402 Exterior Walls: Removes the pointer that is too specific.

Section 1603 General Structural Loads: Add phase “including special flood hazard areas” for clarity. Add pointers to ASCE/SEI 24.

Section 1612 Flood Loads: Add phase “including special flood hazard areas” for clarity. Removes the pointer that is too specific. Clarifies and aligns “Establishing the Flood Hazard Area” and the “Design Flood Elevation” with the standards. Clarifies where the requirements are for the Base Flood versus the Design Flood Elevation. Also clarifies and aligns what is required for the documentation.

Section 1804, 1805 Soils and Foundations: Add phase “including special flood hazard areas” for clarity. Removes the pointer that is too specific.

Section 2702 Electrical: Add phase “including special flood hazard areas” for clarity. Removes the pointer that is too specific. [NOTE - This will need to be updated in the International Fire Code. If this section falls in Group A Hearings, this will need to be coordinated next cycle.]

Chapter 35: Update references for ASCE/SEI 7-22 and ASCE/SEI 24.

Appendix G and J: These changes are provided in a separate Code Change Proposal but must be included for a comprehensive proposal.

-

Technical Rationale:

The American Society of Civil Engineers (ASCE) is proposing revisions to the International Code Council’s I-Codes for the 2027 Cycle to align the national codes with the current ASCE/SEI design standards including:

ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, 2022 edition; Supplement 2

(ASCE/SEI 7-22 S2)

ASCE/SEI 24 Flood Resistant Design and Construction, 2024 edition (ASCE/SEI 24-24)

The loading standard ASCE/SEI 7-22 S2 and the design standard ASCE/SEI 24-24 work together – these documents have been developed to be consistent and coordinated so they can be required and used together. There are three significant changes in the national loading standard ASCE/SEI 7-22 S2 including (1) an extension of the defined Flood Hazard Area to the 500-year floodplain for Rick Category II, III, and IV structures, (2) an inclusion of risk-based design for loads, and (3) requirements to include relative sea level change into design load calculations for coastal sites; see below for more technical details. There are three significant changes in the national design standard ASCE/SEI 24-24 including (1) alignment with ASCE/SEI 7-22 S2, (2) alignment with FEMA Technical Bulletins, and (3) updates for elevations, materials, and floodproofing.

Both ASCE/SEI Standards are available for purchase and the Supplement available as a free download from the ASCE Library:

ASCE/SEI 7-22 (https://doi.org/10.1061/9780784415788)

ASCE/SEI 7-22 Supplement 2 (https://doi.org/10.1061/9780784415788.sup2)

ASCE/SEI 24-24 (https://doi.org/10.1061/9780784485781)

Flood Hazard:

The ASCE 7-22 S2 updates the design requirements to define the flood hazard area for the given Risk Category of structure. Addionally, the flood hazard depth is tied to the mean recurrence interval for a given Risk Category of structure. The design flood hazard is related to Risk Category (e.g., RC II will be designed to 500-year MRI), which is consistent with the way other environmental hazards (such as wind and snow loads) relate the hazard to Risk Category. This is in contrast to the current code requirements, which only considers only 100-year MRI flood for all structures regardless of Risk Category. In some areas in the U.S., the Authority Having Jurisdiction is already requiring a higher design requirement for the flood hazard. The city of Houston, for example, moved to requiring use of the 500-year MRI as the design basis for flood following the devastation from Hurricane Harvey. At a national level, FEMA is considering the use of the 500-year flood as the basis for floodplain management.

The coordinated code change proposals submitted for Group B are drafted to bring the IBC, IRC, and IEBC into alignment with the recent changes in ASCE 7-22 Supplement 2 and ASCE 24-24. The significant changes from the updates to these standards are to differentiate between the base flood (also described as the 100-year flood, or the 1% or greater chance of flooding in any given year) and the design flood, which could be different, and is defined in the standards for each Risk Category. The design flood must include considerations for loading specified in ASCE/SEI 7-22 S2 and design specified in ASCE/SEI 24-24.

Flood damage, and associated loss dollars, has significantly expanded since the last major updates of ASCE 7 Chapter 5 and ASCE 24. Their revisions attempt to close that gap and align the risks across other hazards.

FEMA cites that flood damage cost approximately $17 billion each year between 2010 and 2018, and with rising sea levels and extreme weather could cause $20 billion of flood damage to at-risk US homes this year, rising to $32 billion by 2051. Data from 2018 Hurricane Michael shows that 42% of claimed damage amounts were in the Shaded X-Zone (500-year floodplain), exceeding the amounts in both the A and V-Zones. (FEMA. Mitigation Assessment Team Report Hurricane Michael in Florida (FEMA P-2077), February 2020).

This is further supported by FEMA's recent report "A Cost and Benefits Analysis of Increased Elevation Requirements for Public and Nonresidential Buildings in Riverine and Coastal Floodplains," which evaluated the potential avoided losses (benefits) for 8 building types in 19 coastal floodplains and 14 riverine floodplains in the 100-year floodplain and the Shaded X Zone. The report shows that there are significant benefits to most buildings in the 100-year floodplain, particularly in steep/narrow floodplains. There were also significant benefits to buildings in the Shaded X Zone where there are currently no elevation requirements. These findings are supported by evidence from the National Flood Insurance Program (NFIP), which stated, "People outside of high-risk areas file more than 25 percent of NFIP claims and receive one-third of disaster assistance for flooding. The NFIP's preferred risk policies are designed for residential properties located in low- to moderate-risk flood zones." Additional reports from the NFIP indicate that 40% of companies fail to reopen after a disaster, with another 25% closing within a year. These problems are only further exacerbated by the influence of development and associated runoff, changes in precipitation rates, local subsidence, and sea level change. All of which are not accounted for by FEMA's flood maps, which only account for historic flood data and not future projections. All of this data supports the need to move from a fixed freeboard approach to a risk-based elevation approach that provides consistent protection from flat/wide floodplains to steep/narrow floodplains and more appropriately addresses the influence of wave action in coastal floodplains. This recognizes that true resiliency for communities is continuity of local businesses and making sure that public services are maintained and that adaptation to changes in precipitation, development, and sea level change must be incorporated into new buildings rather than relying on often prohibitively expensive retrofit options.

The ASCE changes consider the frequency of recent and predicted events and the significant damage recorded in the Shaded X-Zone. But, while significant, the addition of the Shaded X-Zone to the standards represents a change to only 4% of the U.S. population.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

ASCE Consensus Process:

ASCE established and maintains an ANSI-accredited, consensus process for standard development. The open process includes selection of a balanced committee, including representation of all affected stakeholders, and public review of the draft standard prior to publication. The ASCE consensus process follows the *ASCE Rules for Standards Committees*, which is published on the ASCE website. The ASCE/SEI 7-22 S2 was developed by the ASCE 7-22 Standard Committee, which included approximately 50 voting members and hundreds more associate members. The ASCE/SEI 24-24 standard was developed by the ASCE 24-24 Standard Committee, which included approximately 25 voting members and 15 associate members.

Supporting Organizations:

This code change proposal has many supporters, included but not limited to the following organizations:

American Flood Coalition

Association of State Flood Plain Managers (ASFPM)

BuildStrong America

Federal Emergency Management Association

Flood Mitigation Industry Association (FMIA)

National Institute of Building Science (NIBS)

Registered Designer Professionals and planners of buildings and other infrastructure projects, Code Officials, and Authorities Having Jurisdiction owe it to the public and have an ethical obligation to provide a framework for safe, reliable structures. The public expects that the buildings in which they live, work, and play are designed consistently, with the same risk approach for all environmental hazards. Flooding is disruptive to families, businesses, and communities and it takes years to recover from these devastating disasters and overcome the losses incurred. The flood hazard must be taken seriously and incorporated into our design standards and building codes in a manner that is consistent with all of the other environmental hazards.

Cost Impact: Increase

- **2025 Cost and Benefits Analysis of ASCE 24-24.PDF**
  https://www.cdpaccess.com/proposal/12229/36061/documentation/187648/attachments/download/9869/

Estimated Immediate Cost Impact:

ASCE 7 and ASCE 24 are national minimum design standards. The effects will vary depending upon the local flood conditions and flood risk across the country and among building types. For nearly 90% of all affected structures in Numbered A Zones, the estimated immediate costs impact can be understood in analysis of the mitigation cost as a percentage of building replacement value from 0.2-6.6% for coastal sites and 0.0-4.0% for riverine sites. Additionally, average benefits per square foot range from $51-$336 for both riverine and coastal flooding, which are dependent on building type and location. See the attached “Cost and Benefits Analysis” for additional information.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

Estimated Immediate Cost Impact Justification (methodology and variables):

A building cost study was considered for 14 riverine locations and 19 coastal locations. Examples consider A Zone and X Zone conditions to understand how the ASCE changes impact the overall cost. However, since most buildings are riverine, the study focused there, but similar trends appear in coastal buildings.

Table 1 is a summary of the buildings that were considered in the study, accounting for the building type, building sizes (and average), and Flood Design Classes. The difference between commercial and government office building plays a larger role in the losses avoided portion of the study. The cost analysis is grouped by Flood Design Class since this is the grouping used in ASCE 24 for elevation criteria.

Table 1 - Building Types Considered in Study

Building Type	Flood Design Class	Small SF	Medium SF	Large SF	Average SF
Hospital 2-3 Stories	4	25,000	70,000	145,000	80,000
Elementary School	3	25,000	40,000	65,000	43,333
Police Station	4	7,000	13,000	23,000	14,333
Office 1-Story (Government)	2	2,000	7,000	25,000	11,333
Office 3-Story (Government)	2	5,000	16,000	80,000	33,667
Office 1-Story (Commercial)	2	2,000	7,000	25,000	11,333
Office 3-Story (Commercial)	2	5,000	16,000	80,000	33,667
Retail Store	2	4,000	10,000	22,000	12,000

Table 2 provides an overview of A Zone conditions for increased building costs within the 100-yr floodplain. The values represent the breakdown of example floodplains using the numbered A Zone range to categorize how much rise there is between the various flood events. A low numbered A Zone represents a flat floodplain and a high number represents a steeper floodplain where there can be a large difference in flood elevations. The percent of numbered A Zones throughout the country based on an NFIP flood insurance policy analysis per census tract.

This provides a breakdown of how various floodplains impact the increased building cost. It’s important to note that in A01-A03 the freeboard requirements equal or exceed the MRI based design flood event. Since ASCE did not change the minimum freeboard requirements for FDC 2 and FDC 4, those values are the same for ASCE 24-14 and ASCE 24-24 and therefore there is no cost increase. Additionally, for FDC 4 the analysis selected the higher of the 500-yr and BFE+2, so the delta between the ASCE 24-14 and ASCE 24-24 wasn’t as high in the higher numbered A Zones as it would have been with FDC 2 and 3 where they were locked with ASCE 24-14 at BFE+1.

Table 2 - Average Building Cost Increase Percentage for Riverine A Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC3	FDC4
A01-A03	26%	0.00%	1.20%	0.00%
A04-A06	41%	1.50%	1.90%	0.50%
A07-A10	20%	2.40%	2.90%	0.60%
A11-A14	9%	4.80%	5.50%	1.00%
A15-A17	2%	8.90%	10.00%	1.60%
A18-A30	2%	11.90%	13.20%	2.10%
	Weighted Average:	1.97%	2.65%	0.49%

Table 3 provides an overview of X Zone conditions for increased building costs within the 500-yr floodplain. The 500-year floodplain represents the area between the 100-year floodplain and the 500-year flood extent, this therefore represents protection from the 101-year to the 500-year flood. In X Zones it is assumed that buildings are built on the ground as compared to elevated foundations in Zone A. Since the X Zone represents the difference between the 100-year and the 500-year flood, the 300-year flood elevation was used as an average ground elevation. The ASCE 24-24 elevations represent the minimum required elevations required per the standard. The increased elevation is therefore the difference between ground (at the 300-year flood elevation) and the ASCE 24-24 elevation requirements. Similar to Table 2, Table 3 data is provided per Flood Design Class per grouped numbered A Zone designation.

Table 3 - Average Building Cost Increase Percentage for Riverine X Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC 3	FDC 4
A01-A03	26%	0.60%	1.80%	0.70%
A04-A06	41%	1.00%	1.50%	0.80%
A07-A10	20%	1.20%	1.80%	1.00%
A11-A14	9%	1.90%	3.00%	1.70%
A15-A17	2%	3.20%	5.00%	2.80%
A18-A30	2%	4.40%	6.70%	3.70%
	Weighted Average:	1.14%	1.93%	1.00%

It is believed that the presentation of percent increase in building cost provided a better representation of the overall cost impacts rather than providing dollar values. While the percent increase does get rather large in those areas with high numbered A Zones, this is a much smaller overall percentage of land area, so this represents a smaller portion of the floodplains in the US. However, recent events have shown that when these areas experience a flood event above the 100-year or 1% annual chance flood, that they often experience deep flooding. Experience from Western NC following Hurricane Helene demonstrated that when floods occur in areas with high numbered A Zones that significant flood damage occurs in the X Zone. There were examples of buildings elevated in the X Zone that performed very well in Hurricane Helene and had little to no observed damage. But many buildings in the X Zone that were constructed at grade were severely damaged or destroyed. While this is observational, there is substantial evidence to suggest that the percent cost increase is offset by the avoided losses. Two key factors that impact the avoided loss calculation is the impact of when the original flood insurance studies and associated maps were created (older mapping data), which can mean that the mapped risk is underestimated (increased runoff due to development and updated precipitation data) and then looking forward the impact of future changes in precipitation rates over the 50-year life of riverine buildings. Similarly, these impacts can impact coastal flooding heights as well as the impact of sea level change.

2024 International Building Code

APPENDIX G FLOOD-RESISTANT CONSTRUCTION

SECTION G101 ADMINISTRATION

Revise as follows:

G101.1 Purpose. The purpose of this appendix is to promote the public health, safety and general welfare and to minimize public and private losses due to *flood* conditions in specific *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*, through the establishment of comprehensive regulations for management of *flood hazard areas* designed to:

1. Prevent unnecessary disruption of commerce, access and public service during times of *flooding*.
2. Manage the alteration of natural flood plains, stream channels and shorelines.
3. Manage filling, grading, dredging and other *development* that may increase flood damage or erosion potential.
4. Prevent or regulate the construction of flood barriers that will divert floodwaters or that can increase flood hazards.
5. Contribute to improved construction techniques in the flood plain.

G101.2 Objectives. The objectives of this appendix are to protect human life, minimize the expenditure of public money for flood control projects, minimize the need for rescue and relief efforts associated with *flooding*, minimize prolonged business interruption, minimize damage to public *facilities* and utilities, help maintain a stable tax base by providing for the sound use and *development* of flood-prone areas, contribute to improved construction techniques in the flood plain and ensure that potential *owners* and occupants are notified that property is within *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*.

G101.3 Scope. The provisions of this appendix shall apply to all proposed *development* in ~~a~~ *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*, established in Section 1612 of this code, including certain building work exempt from *permit* under Section 105.2.

SECTION G103 APPLICABILITY

G103.1 General. This appendix, in conjunction with this code, provides minimum requirements for *development* located in *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*,including:

1. The subdivision of land.
2. Site improvements and installation of utilities.
3. Placement and replacement of *manufactured homes*.

4. Placement of *recreational vehicles*.
5. New construction and *repair*, reconstruction, rehabilitation or *additions* to new construction.
6. *Substantial improvement* of *existing buildings* and *structures*, including restoration after damage.
7. Installation of tanks.
8. *Temporary structures*.
9. Temporary or permanent storage, utility and miscellaneous Group U *buildings* and *structures*.
10. Certain building work exempt from *permit* under Section 105.2 and other *buildings* and *development* activities.

G103.2 Establishment of flood hazard areas. *Flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*, are established in Section 1612.3 of this code, adopted by the applicable governing authority on **[INSERT DATE]**.

SECTION G104
POWERS AND DUTIES

G104.3 Determination of ~~design~~ base flood elevations. If *~~design~~* *base* *flood elevations* are not specified for *special flood hazard areas* , the floodplain administrator is authorized to require the applicant to ~~meet~~ do one of the following:

1. Obtain, review and reasonably utilize *base flood elevation* data available from a federal, state or other source.
2. Determine the *~~design~~* *base* *flood elevation* in accordance with accepted hydrologic and hydraulic engineering ~~techniques~~ practices used to define *special flood hazard areas*. Such analyses shall be performed and sealed by a *registered design professional*. Studies, analyses and computations shall be submitted in sufficient detail to allow review and approval by the floodplain administrator. The accuracy of data submitted for such determination shall be the responsibility of the applicant.

G104.4 Activities in riverine flood hazard areas. In riverine *special flood hazard areas* where *~~design~~* *base* *flood elevations* are specified but *floodways* have not been designated, the floodplain administrator shall not permit any new construction, *substantial improvement* or other *development*, including fill, unless the applicant submits an engineering analysis prepared by a *registered design professional*, demonstrating that the cumulative effect of the proposed *development*, when combined with all other existing and anticipated *special flood hazard area* encroachment, will not increase the *~~design~~* *base* *flood elevation* more than 1 foot (305 mm) at any point within the community.

G104.8 Records. The floodplain administrator shall maintain a permanent record of all *permits* issued in *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*, including supporting certifications and documentation required by this appendix and copies of inspection reports, design certifications and documentation of elevations required in Section 1612 of this code and Section R306of the *International Residential Code*.

G104.9 Inspections. *Development* for which a *permit*under this appendix is required shall be subject to inspection. The floodplain administrator or the floodplain administrator's designee shall make, or cause to be made, inspections of all *development* in *flood hazard areas*, including *special flood hazard areas* and *500-year floodplains*, authorized by issuance of a *permit*under this appendix.

G104.10 Use of changed technical data. The floodplain administrator and the applicant shall not use changed *flood hazard area* boundaries, or changed *base flood elevations* or 500-year flood elevations, for proposed *buildings* or *developments* unless the floodplain administrator or applicant has applied for a conditional *Flood Insurance Rate Map* (*FIRM*) revision and has received the approval of the Federal Emergency Management Agency (FEMA).

SECTION G105
PERMITS

G105.1 Required. Any *person*, *owner* or *owner*'s authorized agent who intends to conduct any *development* in a *flood hazard area*, including *special flood hazard areas* and *500-year floodplains*, shall first make application to the floodplain administrator and shall obtain the required *permit*.

G105.2 Application for permit. The applicant shall file an application in writing on a form furnished by the floodplain administrator. Such application shall:

1. Identify and describe the *development* to be covered by the *permit*.
2. Describe the land on which the proposed *development* is to be conducted by legal description, street address or similar description that will readily identify and definitely locate the *site*.
3. Include a site plan showing the delineation of *special flood hazard areas*, *500-year floodplains*, *floodway* boundaries, *flood* zones, ~~*design*~~ *base flood elevations*, ground elevations, proposed fill and excavation and drainage patterns and *facilities*.
4. Include in subdivision proposals and other proposed *developments* with more than 50 *lots* or larger than 5 acres (20 234 m^2), *base flood elevation* data in accordance with Section 1612.3.~~1~~ 2 if such data are not identified for the *flood hazard areas* established in Section G103.2.
5. Indicate the use and occupancy for which the proposed *development* is intended.
6. Be accompanied by *construction documents*, grading and filling plans and other information deemed appropriate by the floodplain administrator.
7. State the valuation of the proposed work.
8. Be signed by the applicant or the applicant's authorized agent.

SECTION G106
VARIANCES

G106.4 Functionally dependent facilities. A *variance* is authorized to be issued for the construction or *substantial improvement* of a *functionally dependent facility* provided that the criteria in Section 1612.1 are met and the *variance* is the minimum necessary to allow the construction or *substantial improvement*, and that all due consideration has been given to methods and materials that minimize *flood* damages during the ~~*design*~~ *base flood* and do not create additional threats to public safety.

SECTION G107
SUBDIVISIONS

G107.1 General. Any subdivision proposal, including proposals for manufactured home parks and subdivisions, or other proposed new *development* in a *flood hazard area*, including *special flood hazard areas* and *500-year floodplains*, shall be reviewed to verify all of the following:

1. Such proposals are consistent with the need to minimize *flood* damage.
2. Public utilities and *facilities*, such as sewer, gas, electric and water systems, are located and constructed to minimize or eliminate *flood* damage.
3. Adequate drainage is provided to reduce exposure to *flood* hazards.

G107.2 Subdivision requirements. The following requirements shall apply in the case of any proposed subdivision, including proposals for manufactured home parks and subdivisions, any portion of which lies within a *flood hazard area*, including *special flood hazard areas* and *500-year floodplains*:

1. The *special flood hazard area* and *500-year floodplain*, including *floodways*, *coastal high-hazard areas* and coastal A zones, as appropriate, shall be delineated on tentative and final subdivision plats.

2. ~~*Design*~~ *Base flood elevations* and flood elevations in *500-year floodplains* shall be shown on tentative and final subdivision plats.
3. Residential *building lots* shall be provided with adequate buildable area outside the *floodway*.
4. The design criteria for utilities and *facilities* set forth in this appendix and appropriate International Codes shall be met.

SECTION G109
MANUFACTURED HOMES

G109.1 Required elevation ~~Elevation~~. All new and replacement *manufactured homes* to be placed or substantially improved in a *flood hazard area*, including *special flood hazard areas* and *500-year floodplains*, shall be elevated such that the top of the foundation for the *manufactured home* is at or above the ~~*design*~~ *base flood elevation* plus 2 feet.

G109.3 Anchoring. All new and replacement *manufactured homes* to be placed or substantially improved ~~in a *flood hazard area*~~ shall be installed using methods and practices that minimize *flood* damage. *Manufactured homes* shall be securely anchored to an adequately anchored foundation system to resist flotation, collapse and lateral movement. Methods of anchoring are authorized to include, but are not limited to, use of over-the-top or frame ties to ground anchors. This requirement is in addition to applicable state and local anchoring requirements for resisting wind forces.

G109.4 Protection of mechanical equipment and outside appliances. Mechanical equipment and outside appliances shall be elevated to or above the required elevation. ~~*design flood elevation*.~~

Exception: Where such equipment and appliances are designed and installed to prevent water from entering or accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic *loads* and stresses, including the effects of buoyancy, during the occurrence of *flooding* up to the elevation required by Section R306 of the *International Residential Code*, the systems and equipment shall be permitted to be located below the elevation required by Section R306 of the *International Residential Code*. Electrical wiring systems shall be permitted below the required elevation ~~design *flood* elevation~~ provided that they conform to the provisions of NFPA 70.

SECTION G110
RECREATIONAL VEHICLES

G110.2 Temporary placement. *Recreational vehicles* ~~in *flood hazard areas*~~ shall be fully licensed and ready for highway use, or shall be placed on a *site* for less than 180 consecutive days.

SECTION G112
OTHER BUILDING WORK

G112.1 Garages and accessory structures. Garages and accessory *structures* shall be designed and constructed in accordance with ASCE 24, subject to the following limitations:

1. In *special flood hazard areas* and *500-year floodplains* other than *coastal high-hazard areas* and coastal A Zones, the floors of detached garages and detached accessory storage *structures* are permitted below the elevations specified in ASCE 24, provided that such *structures* are used solely for parking or storage, are one *story* and not larger than 600 square feet (55.75 m^2).
2. In *coastal high-hazard areas* and coastal A Zones, the floors of detached garages and detached accessory storage *structures* are permitted below the elevations specified in ASCE 24, provided that such *structures* are used solely for parking or storage, are one *story* and are not larger than 100 square feet (9.29 m^2). Such *structures* shall not be required to have breakaway walls or flood openings.

G112.3 Oil derricks. Oil derricks l~~ocated in *flood hazard areas*~~ shall be designed in conformance with the *flood loads* in Sections 1603.1.7 and 1612.

SECTION G114 UTILITY AND MISCELLANEOUS GROUP U

G114.2 Flood loads. Utility and miscellaneous Group U *buildings* and *structures*, including *substantial improvement* of such *buildings* and *structures*, shall be anchored to prevent flotation, collapse or lateral movement resulting from *flood loads*, including the effects of buoyancy, during conditions of the ~~*design*~~ base *flood.*

G114.3 Required elevation ~~Elevation~~. Utility and miscellaneous Group U *buildings* and *structures*, including *substantial improvement* of such *buildings* and *structures*, shall be elevated such that the *lowest floor*, including *basement*, is elevated to or above the elevation required by ASCE 24 ~~*design flood elevation* in accordance with Section 1612 of this code~~.

G114.4 Enclosures below ~~design flood~~ the required elevation. Fully enclosed areas below the required elevation ~~*design flood elevation*~~ shall be constructed in accordance with ASCE 24.

G114.5 Flood-damage-resistant materials. *Flood-damage-resistant materials* shall be used below the required elevation ~~*design flood elevation*~~.

G114.6 Protection of mechanical, plumbing and electrical systems. Mechanical, plumbing and electrical systems, including plumbing fixtures, shall be elevated to or above the required elevation ~~*design flood elevation*~~.

Exception: Electrical systems, equipment and components; heating, ventilating, air conditioning and plumbing appliances; plumbing fixtures, duct systems and other service equipment shall be permitted to be located below the required elevation ~~*design flood elevation*~~ provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic *loads* and stresses, including the effects of buoyancy, during the occurrence of flooding to the required elevation ~~*design flood elevation*~~ in compliance with the flood-resistant construction requirements of this code. Electrical wiring systems shall be permitted to be located below the required elevation ~~*design flood elevation*~~ provided that they conform to the provisions of NFPA 70.

SECTION G115 REFERENCED STANDARDS

G115.1 General. See Table G115.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix referenced in the standard.

TABLE G115.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ASCE 24— ~~14~~ 24	*Flood Resistant Design and Construction*	G104.1, G108.3, G108.4, G111.1, G112.1, G112.5, G112.6, G112.7, G113.1, G114.4
HUD 24 CFR Part 3285 (2008)	*Manufactured Home Construction and Safety Standards*	G102
IBC—24	*International Building Code®*	G103.2, G114.1, G114.3
IRC—24	*International Residential Code®*	G109.2, G109.4, G109.5
NFPA 70—23	*National Electric Code®*	G109.4, G114.6

APPENDIX J GRADING

SECTION J101 GENERAL

J101.2 Flood hazard areas. Unless the applicant has submitted an engineering analysis, prepared in accordance with standard engineering practice by a *registered design professional*, that demonstrates the proposed work will not result in any increase in the level of the *base flood*, *grading*, *excavation* and earthwork construction, including fills and embankments, shall not be permitted in *floodways* that are in *flood hazard areas* established in Section 1612.3 or in *flood hazard areas* where ~~*design*~~ <u>*base*</u> *flood elevations* are specified but *floodways* have not been designated.

Reason: REASON STATEMENT:

This proposal is a coordination proposal to bring the 2027 edition of the I-Codes up to date with the provisions in the 2022 edition of *ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, Supplement 2* (ASCE/SEI 7-22, Supplement 2) as well as the 2024 edition of *ASCE/SEI 24 Flood Resistant Design and Construction* (ASCE/SEI 24-24) --- specifically for the codes primarily affected such as the International Building Code (IBC), the International Residential Code (IRC), and the International Existing Building Code (IEBC), in Group B, but also every I-Code affected by a coordinating code change that will need to be updated. ASCE/SEI 7-22 is the current reference in 2024 I-Codes and Supplement 2 has been submitted as an Administrative Update. ASCE/SEI 24-24 has also been submitted as an Administrative Update to the 2027 I-Codes.

This proposal has been organized into Part I to Part VII and includes technical updates as well as editorial coordination. The specific changes to each section included in this proposal are outlined in Overview below, and a detailed summary of the technical updates are explained in Technical Rationale below that. In addition to the strike out/underline for the code change proposals, the MS Word documents for each affected I-Code have been provided as Attached Files for clarity.

<u>*Overview:*</u>

All Codes, All Chapter: Add phase "including special flood hazard areas and 500-year floodplain" following flood area for clarity. And change to clarify term definitions and when "base flood" applies and when "design flood" applies. Also aligns definitions of "base flood elevation" and "design flood elevations". "Flood Hazard Area" is updated with a new definition. These two changes are carried out throughout the series of these comprehensive code change proposal for clarification and consistency.

Appendix G and J: These changes are provided in a separate Code Change Proposal but must be included for a comprehensive proposal. The proposed changes align with the IBC proposed changes including the following: differentiate between base and desgin flood; specifying that the flood hazard area includes the special flood hazard areas and the 500-year floodplain; and updates to pointers.

-

<u>*Technical Rationale:*</u>

The American Society of Civil Engineers (ASCE) is proposing revisions to the International Code Council's I-Codes for the 2027 Cycle to align the national codes with the current ASCE/SEI design standards including:

ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, 2022 edition; Supplement 2 (ASCE/SEI 7-22 S2)

ASCE/SEI 24 Flood Resistant Design and Construction, 2024 edition (ASCE/SEI 24-24)

The loading standard ASCE/SEI 7-22 S2 and the design standard ASCE/SEI 24-24 work together – these documents have been developed to be consistent and coordinated so they can be required and used together. There are three significant changes in the national loading standard ASCE/SEI 7-22 S2 including (1) an extension of the defined Flood Hazard Area to the 500-year floodplain for Rick Category II, III, and IV structures, (2) an inclusion of risk-based design for loads, and (3) requirements to include relative sea level change into design load calculations for coastal sites; see below for more technical details. There are three significant changes in the national design standard ASCE/SEI 24-24 including (1) alignment with ASCE/SEI 7-22 S2, (2) alignment with FEMA Technical Bulletins, and (3) updates for elevations, materials, and floodproofing.

Both ASCE/SEI Standards are available for purchase and the Supplement available as a free download from the ASCE Library:

ASCE/SEI 7-22 (https://doi.org/10.1061/9780784415788)

ASCE/SEI 7-22 Supplement 2 (https://doi.org/10.1061/9780784415788.sup2)

ASCE/SEI 24-24 (https://doi.org/10.1061/9780784485781)

Flood Hazard:

The ASCE 7-22 S2 updates the design requirements to define the flood hazard area for the given Risk Category of structure. Addionally, the flood hazard depth is tied to the mean recurrence interval for a given Risk Category of structure. The design flood hazard is related to Risk Category (e.g., RC II will be designed to 500-year MRI), which is consistent with the way other environmental hazards (such as wind and snow loads) relate the hazard to Risk Category. This is in contrast to the current code requirements, which only considers only 100-year MRI flood for all structures regardless of Risk Category. In some areas in the U.S., the Authority Having Jurisdiction is already requiring a higher design requirement for the flood hazard. The city of Houston, for example, moved to requiring use of the 500-year MRI as the design basis for flood following the devastation from Hurricane Harvey. At a national level, FEMA is considering the use of the 500-year flood as the basis for floodplain management.

The coordinated code change proposals submitted for Group B are drafted to bring the IBC, IRC, and IEBC into alignment with the recent changes in ASCE 7-22 Supplement 2 and ASCE 24-24. The significant changes from the updates to these standards are to differentiate between the base flood (also described as the 100-year flood, or the 1% or greater chance of flooding in any given year) and the design flood, which could be different, and is defined in the standards for each Risk Category. The design flood must include considerations for loading specified in ASCE/SEI 7-22 S2 and design specified in ASCE/SEI 24-24.

Flood damage, and associated loss dollars, has significantly expanded since the last major updates of ASCE 7 Chapter 5 and ASCE 24. Their revisions attempt to close that gap and align the risks across other hazards.

FEMA cites that flood damage cost approximately $17 billion each year between 2010 and 2018, and with rising sea levels and extreme weather could cause $20 billion of flood damage to at-risk US homes this year, rising to $32 billion by 2051. Data from 2018 Hurricane Michael shows that 42% of claimed damage amounts were in the Shaded X-Zone (500-year floodplain), exceeding the amounts in both the A and V-Zones. (FEMA. Mitigation Assessment Team Report Hurricane Michael in Florida (FEMA P-2077), February 2020).

This is further supported by FEMA's recent report "A Cost and Benefits Analysis of Increased Elevation Requirements for Public and Nonresidential Buildings in Riverine and Coastal Floodplains," which evaluated the potential avoided losses (benefits) for 8 building types in 19 coastal floodplains and 14 riverine floodplains in the 100-year floodplain and the Shaded X Zone. The report shows that there are significant benefits to most buildings in the 100-year floodplain, particularly in steep/narrow floodplains. There were also significant benefits to buildings in the Shaded X Zone where there are currently no elevation requirements. These findings are supported by evidence from the National Flood Insurance Program (NFIP), which stated, "People outside of high-risk areas file more than 25 percent of NFIP claims and receive one-third of disaster assistance for flooding. The NFIP's preferred risk policies are designed for residential properties located in low- to moderate-risk flood zones." Additional reports from the NFIP indicate that 40% of companies fail to reopen after a disaster, with another 25% closing within a year. These problems are only further exacerbated by the influence of development and associated runoff, changes in precipitation rates, local subsidence, and sea level change. All of which are not accounted for by FEMA's flood maps, which only account for historic flood data and not future projections. All of this data supports the need to move from a fixed freeboard approach to a risk-based elevation approach that provides consistent protection from flat/wide floodplains to steep/narrow floodplains and more appropriately addresses the influence of wave action in coastal floodplains. This recognizes that true resiliency for communities is continuity of local businesses and making sure that public services are maintained and that adaptation to changes in precipitation, development, and sea level change must be incorporated into new buildings rather than relying on often prohibitively expensive retrofit options.

The ASCE changes consider the frequency of recent and predicted events and the significant damage recorded in the Shaded X-Zone. But, while significant, the addition of the Shaded X-Zone to the standards represents a change to only 4% of the U.S. population.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

ASCE Consensus Process:

ASCE established and maintains an ANSI-accredited, consensus process for standard development. The open process includes selection of a balanced committee, including representation of all affected stakeholders, and public review of the draft standard prior to publication. The ASCE consensus process follows the *ASCE Rules for Standards Committees*, which is published on the ASCE website. The ASCE/SEI 7-22 S2 was developed by the ASCE 7-22 Standard Committee, which included approximately 50 voting members and hundreds more associate members. The ASCE/SEI 24-24 standard was developed by the ASCE 24-24 Standard Committee, which included approximately 25 voting members and 15 associate members.

Supporting Organizations:

This code change proposal has many supporters, included but not limited to the following organizations:

American Flood Coalition

Association of State Flood Plain Managers (ASFPM)

BuildStrong America

Federal Emergency Management Association

Flood Mitigation Industry Association (FMIA)

National Institute of Building Science (NIBS)

Registered Designer Professionals and planners of buildings and other infrastructure projects, Code Officials, and Authorities Having Jurisdiction owe it to the public and have an ethical obligation to provide a framework for safe, reliable structures. The public expects that the buildings in which they live, work, and play are designed consistently, with the same risk approach for all environmental hazards. Flooding is disruptive to families, businesses, and communities and it takes years to recover from these devastating disasters and overcome the losses incurred. The flood hazard must be taken seriously and incorporated into our design standards and building codes in a manner that is consistent with all of the other environmental hazards.

Cost Impact: Increase

- **2025 Cost and Benefits Analysis for ASCE 24-24.PDF**
  https://www.cdpaccess.com/proposal/11724/35914/documentation/186656/attachments/download/9871/

Estimated Immediate Cost Impact:

ASCE 7 and ASCE 24 are national minimum design standards. The effects will vary depending upon the local flood conditions and flood risk across the country and among building types. For nearly 90% of all affected structures in Numbered A Zones, the estimated immediate costs impact can be understood in analysis of the mitigation cost as a percentage of building replacement value from 0.2-6.6% for coastal sites and 0.0-4.0% for riverine sites. Additionally, average benefits per square foot range from $51-$336 for both riverine and coastal flooding, which are dependent on building type and location. See the attached "Cost and Benefits Analysis" for additional information.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

Estimated Immediate Cost Impact Justification (methodology and variables):

A building cost study was considered for 14 riverine locations and 19 coastal locations. Examples consider A Zone and X Zone conditions to understand how the ASCE changes impact the overall cost. However, since most buildings are riverine, the study focused there, but similar trends appear in coastal buildings.

Table 1 is a summary of the buildings that were considered in the study, accounting for the building type, building sizes (and average), and Flood Design Classes. The difference between commercial and government office building plays a larger role in the losses avoided portion of the study. The cost analysis is grouped by Flood Design Class since this is the grouping used in ASCE 24 for elevation criteria.

Table 1 - Building Types Considered in Study

Building Type	Flood Design Class	Small SF	Medium SF	Large SF	Average SF
Hospital 2-3 Stories	4	25,000	70,000	145,000	80,000
Elementary School	3	25,000	40,000	65,000	43,333
Police Station	4	7,000	13,000	23,000	14,333
Office 1-Story (Government)	2	2,000	7,000	25,000	11,333
Office 3-Story (Government)	2	5,000	16,000	80,000	33,667
Office 1-Story (Commercial)	2	2,000	7,000	25,000	11,333
Office 3-Story (Commercial)	2	5,000	16,000	80,000	33,667
Retail Store	2	4,000	10,000	22,000	12,000

Table 2 provides an overview of A Zone conditions for increased building costs within the 100-yr floodplain. The values represent the breakdown of example floodplains using the numbered A Zone range to categorize how much rise there is between the various flood events. A low numbered A Zone represents a flat floodplain and a high number represents a steeper floodplain where there can be a large difference in flood elevations. The percent of numbered A Zones throughout the country based on an NFIP flood insurance policy analysis per census tract.

This provides a breakdown of how various floodplains impact the increased building cost. It's important to note that in A01-A03 the freeboard requirements equal or exceed the MRI based design flood event. Since ASCE did not change the minimum freeboard requirements for FDC 2 and FDC 4, those values are the same for ASCE 24-14 and ASCE 24-24 and therefore there is no cost increase. Additionally, for FDC 4 the analysis selected the higher of the 500-yr and BFE+2, so the delta between the ASCE 24-14 and ASCE 24-24 wasn't as high in the higher numbered A Zones as it would have been with FDC 2 and 3 where they were locked with ASCE 24-14 at BFE+1.

Table 2 - Average Building Cost Increase Percentage for Riverine A Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC3	FDC4
A01-A03	26%	0.00%	1.20%	0.00%
A04-A06	41%	1.50%	1.90%	0.50%
A07-A10	20%	2.40%	2.90%	0.60%
A11-A14	9%	4.80%	5.50%	1.00%
A15-A17	2%	8.90%	10.00%	1.60%
A18-A30	2%	11.90%	13.20%	2.10%
	Weighted Average:	1.97%	2.65%	0.49%

Table 3 provides an overview of X Zone conditions for increased building costs within the 500-yr floodplain. The 500-year floodplain represents the area between the 100-year floodplain and the 500-year flood extent, this therefore represents protection from the 101-year to the 500-year flood. In X Zones it is assumed that buildings are built on the ground as compared to elevated foundations in Zone A. Since the X Zone represents the difference between the 100-year and the 500-year flood, the 300-year flood elevation was used as an average ground elevation. The ASCE 24-24 elevations represent the minimum required elevations required per the standard. The increased elevation is therefore the difference between ground (at the 300-year flood elevation) and the ASCE 24-24 elevation requirements. Similar to Table 2, Table 3 data is provided per Flood Design Class per grouped numbered A Zone designation.

Table 3 - Average Building Cost Increase Percentage for Riverine X Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC 3	FDC 4
A01-A03	26%	0.60%	1.80%	0.70%
A04-A06	41%	1.00%	1.50%	0.80%
A07-A10	20%	1.20%	1.80%	1.00%
A11-A14	9%	1.90%	3.00%	1.70%
A15-A17	2%	3.20%	5.00%	2.80%
A18-A30	2%	4.40%	6.70%	3.70%
	Weighted Average:	1.14%	1.93%	1.00%

It is believed that the presentation of percent increase in building cost provided a better representation of the overall cost impacts rather than providing dollar values. While the percent increase does get rather large in those areas with high numbered A Zones, this is a much smaller overall percentage of land area, so this represents a smaller portion of the floodplains in the US. However, recent events have shown that when these areas experience a flood event above the 100-year or 1% annual chance flood, that they often experience deep flooding. Experience from Western NC following Hurricane Helene demonstrated that when floods occur in areas with high numbered A Zones that significant flood damage occurs in the X Zone. There were examples of buildings elevated in the X Zone that performed very well in Hurricane Helene and had little to no observed damage. But many buildings in the X Zone that were constructed at grade were severely damaged or destroyed. While this is observational, there is substantial evidence to suggest that the percent cost increase is offset by the avoided losses. Two key factors that impact the avoided loss calculation is the impact of when the original flood insurance studies and associated maps were created (older mapping data), which can mean that the mapped risk is underestimated (increased runoff due to development and updated precipitation data) and then looking forward the impact of future changes in precipitation rates over the 50-year life of riverine buildings. Similarly, these impacts can impact coastal flooding heights as well as the impact of sea level change.

Staff Analysis: CC # S97-25 Part III and CC # S180-25 Part I/CC #S181-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

2024 International Existing Building Code

CHAPTER 1
SCOPE AND ADMINISTRATION

SECTION 104
DUTIES AND POWERS OF CODE OFFICIAL

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. For *existing buildings* located in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, for which *repairs*, *alterations* and *additions* constitute *substantial improvement*, the *code official* shall not grant modifications to provisions related to flood resistance unless a determination is made that:

1. The applicant has presented good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render compliance with the flood-resistant construction provisions inappropriate.
2. Failure to grant the modification would result in exceptional hardship.
3. The granting of the modification will not result in increased flood heights, additional threats to public safety or extraordinary public expense; create nuisances; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. The modification is the minimum necessary to afford relief, considering the flood hazard.
5. A written notice will be provided to the applicant specifying, if applicable, the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation and that construction below the design flood elevation increases risks to life and property.

[A] 104.3.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, *repair*, *alteration*, *addition* or other improvement of *existing buildings* or structures located in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, the *code official* shall determine where the proposed work constitutes *substantial improvement* or *repair* of *substantial damage*. Where the *code official* determines that the proposed work constitutes *substantial improvement* or *repair* of *substantial damage*, and where required by this code, the *code official* shall require the building to meet the requirements of Section 1612 of the *International Building Code,* or Section R306 of the *International Residential Code*, as applicable.

SECTION 109
INSPECTIONS

[A] 109.3.3 Lowest floor elevation. For *additions* and *substantial improvements* to *existing buildings* in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, on placement of the *lowest floor*, including basement, and prior to further vertical construction, the elevation documentation required in the *International Building Code*, or the *International Residential Code*, as applicable, shall be submitted to the *code official*.

[A] 109.3.10 Flood hazard documentation. Where a building is located in a *flood hazard area*, <u>including special flood hazard areas and 500-year floodplains,</u> documentation of the elevation of the *lowest floor* or the elevation of dry floodproofing, if applicable, as required in the International Building Code or the International Residential Code, as applicable, shall be submitted to the *code official*prior to the final inspection.

CHAPTER 3
PROVISIONS FOR ALL COMPLIANCE METHODS

SECTION 301
ADMINISTRATION

301.3 Alteration, addition or change of occupancy. The *alteration*, *addition* or *change of occupancy* of all *existing buildings* shall comply with one of the methods listed in Section 301.3.1, 301.3.2 or 301.3.3 as selected by the applicant. Sections 301.3.1 through 301.3.3 shall not be applied in combination with each other.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code. New structural members added as part of the *alteration* shall comply with the *International Building Code*. This exception shall not apply to the following:

1. *Alterations* for accessibility required by Section 306.
2. *Alterations* that constitute *substantial improvement* in *flood hazard areas*, <u>including special flood hazard areas and 500-year floodplains,</u> which shall comply with Sections 503.2, 701.3 or 1303.1.3.
3. Structural provisions of Section 304, Chapter 5 or to the structural provisions of Sections 706, 805 and 906.

CHAPTER 4
REPAIRS

SECTION 401
GENERAL

[BS] 401.3 Flood hazard areas. In *flood hazard* areas, <u>including special flood hazard areas and 500-year floodplains,</u> *repairs* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

SECTION 405
STRUCTURAL

[BS] 405.2.6 Flood hazard areas. In *flood hazard* areas, <u>including special flood hazard areas and 500-year floodplains,</u>buildings that have sustained *substantial damage* shall be brought into compliance with Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 5
PRESCRIPTIVE COMPLIANCE METHOD

SECTION 502
ADDITIONS

[BS] 502.2 Flood hazard areas. For buildings and structures in *flood hazard* areas, including special flood hazard areas and 500-year floodplains, ~~established in Section 1612.3 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable,~~ any *addition* that constitutes *substantial improvement* of the *existing structure* shall comply with the flood design requirements for new construction, and all aspects of the *existing structure* shall be brought into compliance with the requirements for new construction for flood design. For new foundations, foundations raised or extended upward, and replacement foundations, the foundations shall be in compliance with the requirements for new construction for flood design.

For buildings and structures in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, ~~established in Section 1612.3 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable~~, any *additions* that do not constitute *substantial improvement* of the *existing structure* are not required to comply with the flood design requirements for new construction, provided that both of the following apply:

1. The *addition* shall not create or extend a nonconformity of the *existing building* or structure with the flood-resistant construction requirements.
2. The *lowest floor* of the *addition* shall be at or above the lower of the *lowest floor* of the *existing building* or structure or the *lowest floor* elevation required in Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

SECTION 503
ALTERATIONS

[BS] 503.2 Flood hazard areas. For buildings and structures in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, ~~established in Section 1612.3 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable~~, any *alteration* that constitutes *substantial improvement* of the *existing structure* shall comply with the flood design requirements for new construction, and all aspects of the *existing structure* shall be brought into compliance with the requirements for new construction for flood design.

For buildings and structures in *flood hazard areas,* including special flood hazard areas and 500-year floodplains, ~~established in Section 1612.3 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable~~, any *alterations* that do not constitute *substantial improvement* of the *existing structure* are not required to comply with the flood design requirements for new construction.

SECTION 507
HISTORIC BUILDINGS

[BS] 507.3 Flood hazard areas. Within *flood hazard areas,* including special flood hazard areas and 500-year floodplains, ~~established in accordance with Section 1612.3 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable~~, where the work proposed constitutes *substantial improvement,* the building shall be brought into compliance with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

Exception: *Historic buildings* meeting any of the following criteria need not be brought into compliance:

1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places.
2. Determined by the Secretary of the US Department of Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district.
3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

CHAPTER 7

ALTERATIONS—LEVEL 1

SECTION 701
GENERAL

[BS] 701.3 Flood hazard areas. In *flood hazard areas*, including special flood hazard areas and 500-year floodplains, *alterations* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

SECTION 1103
STRUCTURAL

CHAPTER 11
ADDITIONS

[BS] 1103.3 Flood hazard areas. *Additions* and *foundations* in *flood hazard areas*, including special flood hazard areas and 500-year floodplains,shall comply with the following requirements:

1. For horizontal *additions* that are structurally interconnected to the *existing building*:
   - 1.1. If the *addition* and all other proposed work, when combined, constitute *substantial improvement*, the *existing building* and the *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
   - 1.2. If the *addition* constitutes *substantial improvement*, the *existing building* and the *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
   - 1.3. If the *addition* does not constitute *substantial improvement*, the *addition* is not required to comply with the flood design requirements for new construction, provided that both of the following apply:
     - 1.3.1. The *addition* shall not create or extend any nonconformity of the *existing building* with the flood-resistant construction requirements.
     - 1.3.2. The *lowest floor* of the *addition* shall be at or above the lower of the *lowest floor* of the *existing building* or the *lowest floor* elevation required in Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
2. For horizontal *additions* that are not structurally interconnected to the *existing building*:
   - 2.1. The *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
   - 2.2. If the *addition* and all other proposed work, when combined, constitute *substantial improvement*, the *existing building* and the *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
3. For vertical *additions* and all other proposed work that, when combined, constitute *substantial improvement*, the *existing building* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
4. For a new foundation, replacement foundation or a foundation raised or extended upward, the foundation shall comply with Section 1612 of the *International Building Code,* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 12
HISTORIC BUILDINGS

SECTION 1201
GENERAL

[BS] 1201.4 Flood hazard areas. In *flood hazard areas*, including special flood hazard areas and 500-year floodplains, if all proposed work, including *repairs*, work required because of a *change of occupancy*, and *alterations*, constitutes *substantial improvement*, then the *existing building* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

Exception: If a *historic building* will continue to be a *historic building* after the proposed work is completed, then the proposed work is not considered a *substantial improvement*. For the purposes of this exception, a *historic building* is any of the following:

1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places.
2. Determined by the Secretary of the US Department of Interior to contribute to the historical significance of a registered historic district or a district preliminarily determined to qualify as a historic district.
3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

CHAPTER 13
PERFORMANCE COMPLIANCE METHODS

SECTION 1303
ACCEPTANCE

[BS] 1303.1.3 Compliance with flood hazard provisions. In *flood hazard areas*, including special flood hazard areas and 500-year floodplains, buildings that are evaluated in accordance with this section shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable, if the work covered by this section constitutes *substantial improvement*. If the work covered by this section is a structurally connected horizontal *addition* that does not constitute *substantial improvement*, the *addition* is not required to comply with the flood design requirements for new construction, provided that both of the following apply.

1. The *addition* shall not create or extend any nonconformity of the *existing building* with the flood-resistant construction requirements.
2. The *lowest floor* of the *addition* shall be at or above the lower of the *lowest floor* of the *existing building* or the *lowest floor* elevation required in Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 14
RELOCATED OR MOVED BUILDINGS

SECTION 1402
REQUIREMENTS

[BS] 1402.6 Flood hazard areas. If relocated or moved into a *flood hazard area*, including special flood hazard areas and 500-year floodplains, structures shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

Reason: This proposal is a coordination proposal to bring the 2027 edition of the I-Codes up to date with the provisions in the 2022 edition of *ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, Supplement 2* (ASCE/SEI 7-22, Supplement 2) as well as the 2024 edition of *ASCE/SEI 24 Flood Resistant Design and Construction* (ASCE/SEI 24-24) --- specifically for the codes primarily affected such as the International Building Code (IBC), the International Residential Code (IRC), and the International Existing Building Code (IEBC), in Group B, but also every I-Code affected by a coordinating code change that will need to be updated. ASCE/SEI 7-22 is the current reference in 2024 I-Codes and Supplement 2 has been submitted as an Administrative Update. ASCE/SEI 24-24 has also been submitted as an Administrative Update to the 2027 I-Codes.

This proposal has been organized into Part I to Part VII and includes technical updates as well as editorial coordination. The specific changes to each section included in this proposal are outlined in Overview below, and a detailed summary of the technical updates are explained in Technical Rationale below that. In addition to the strike out/underline for the code change proposals, the MS Word documents for each affected I-Code have been provided as Attached Files for clarity.

Overview:

These changes for the IEBC provide similar updates to the IBC and IEBC, just provided in a separate Code Change Proposal. However, all changes must be included across all I-Codes for a comprehensive proposal - IBC, IRC and IEBC are included in Group B; the others will need to be addressed in the next Group A cycle.

All Chapters: Add phase “including special flood hazard areas and 500-year flood” following "flood hazard area" for clarity. These changes are carried out throughout the code change proposal for clarification and consistency.**Chapter 2:** Include the 500-year flood in definition of "Flood Hazard Area"

Chapter 5: Remove unnecessary pointers

Technical Rationale:

The American Society of Civil Engineers (ASCE) is proposing revisions to the International Code Council’s I-Codes for the 2027 Cycle to align the national codes with the current ASCE/SEI design standards including:

ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, 2022 edition; Supplement 2 (ASCE/SEI 7-22 S2)

ASCE/SEI 24 Flood Resistant Design and Construction, 2024 edition (ASCE/SEI 24-24)

The loading standard ASCE/SEI 7-22 S2 and the design standard ASCE/SEI 24-24 work together – these documents have been developed to be consistent and coordinated so they can be required and used together. There are three significant changes in the national loading standard ASCE/SEI 7-22 S2 including (1) an extension of the defined Flood Hazard Area to the 500-year floodplain for Rick Category II, III, and IV structures, (2) an inclusion of risk-based design for loads, and (3) requirements to include relative sea level change into design load calculations for coastal sites; see below for more technical details. There are three significant changes in the national design standard ASCE/SEI 24-24 including (1) alignment with ASCE/SEI 7-22 S2, (2) alignment with FEMA Technical Bulletins, and (3) updates for elevations, materials, and floodproofing.

Both ASCE/SEI Standards are available for purchase and the Supplement available as a free download from the ASCE Library:

ASCE/SEI 7-22 (https://doi.org/10.1061/9780784415788)

ASCE/SEI 7-22 Supplement 2 (https://doi.org/10.1061/9780784415788.sup2)

ASCE/SEI 24-24 (https://doi.org/10.1061/9780784485781)

Flood Hazard:

The ASCE 7-22 S2 updates the design requirements to define the flood hazard area for the given Risk Category of structure. Addionally, the flood hazard depth is tied to the mean recurrence interval for a given Risk Category of structure. The design flood hazard is related to Risk Category (e.g., RC II will be designed to 500-year MRI), which is consistent with the way other environmental hazards (such as wind and snow loads) relate the hazard to Risk Category. This is in contrast to the current code requirements, which only considers only 100-year MRI flood for all structures regardless of Risk Category. In some areas in the U.S., the Authority Having Jurisdiction is already requiring a higher design requirement for the flood hazard. The city of Houston, for example, moved to requiring use of the 500-year MRI as the design basis for flood following the devastation from Hurricane Harvey. At a national level, FEMA is considering the use of the

500-year flood as the basis for floodplain management.

The coordinated code change proposals submitted for Group B are drafted to bring the IBC, IRC, and IEBC into alignment with the recent changes in ASCE 7-22 Supplement 2 and ASCE 24-24. The significant changes from the updates to these standards are to differentiate between the base flood (also described as the 100-year flood, or the 1% or greater chance of flooding in any given year) and the design flood, which could be different, and is defined in the standards for each Risk Category. The design flood must include considerations for loading specified in ASCE/SEI 7-22 S2 and design specified in ASCE/SEI 24-24.

Flood damage, and associated loss dollars, has significantly expanded since the last major updates of ASCE 7 Chapter 5 and ASCE 24. Their revisions attempt to close that gap and align the risks across other hazards.

FEMA cites that flood damage cost approximately $17 billion each year between 2010 and 2018, and with rising sea levels and extreme weather could cause $20 billion of flood damage to at-risk US homes this year, rising to $32 billion by 2051. Data from 2018 Hurricane Michael shows that 42% of claimed damage amounts were in the Shaded X-Zone (500-year floodplain), exceeding the amounts in both the A and V-Zones. (FEMA. Mitigation Assessment Team Report Hurricane Michael in Florida (FEMA P-2077), February 2020).

This is further supported by FEMA's recent report "A Cost and Benefits Analysis of Increased Elevation Requirements for Public and Nonresidential Buildings in Riverine and Coastal Floodplains," which evaluated the potential avoided losses (benefits) for 8 building types in 19 coastal floodplains and 14 riverine floodplains in the 100-year floodplain and the Shaded X Zone. The report shows that there are significant benefits to most buildings in the 100-year floodplain, particularly in steep/narrow floodplains. There were also significant benefits to buildings in the Shaded X Zone where there are currently no elevation requirements. These findings are supported by evidence from the National Flood Insurance Program (NFIP), which stated, "People outside of high-risk areas file more than 25 percent of NFIP claims and receive one-third of disaster assistance for flooding. The NFIP's preferred risk policies are designed for residential properties located in low- to moderate-risk flood zones." Additional reports from the NFIP indicate that 40% of companies fail to reopen after a disaster, with another 25% closing within a year. These problems are only further exacerbated by the influence of development and associated runoff, changes in precipitation rates, local subsidence, and sea level change. All of which are not accounted for by FEMA's flood maps, which only account for historic flood data and not future projections. All of this data supports the need to move from a fixed freeboard approach to a risk-based elevation approach that provides consistent protection from flat/wide floodplains to steep/narrow floodplains and more appropriately addresses the influence of wave action in coastal floodplains. This recognizes that true resiliency for communities is continuity of local businesses and making sure that public services are maintained and that adaptation to changes in precipitation, development, and sea level change must be incorporated into new buildings rather than relying on often prohibitively expensive retrofit options.

The ASCE changes consider the frequency of recent and predicted events and the significant damage recorded in the Shaded X-Zone. But, while significant, the addition of the Shaded X-Zone to the standards represents a change to only 4% of the U.S. population.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

ASCE Consensus Process:

ASCE established and maintains an ANSI-accredited, consensus process for standard development. The open process includes selection of a balanced committee, including representation of all affected stakeholders, and public review of the draft standard prior to publication. The ASCE consensus process follows the *ASCE Rules for Standards Committees*, which is published on the ASCE website. The ASCE/SEI 7-22 S2 was developed by the ASCE 7-22 Standard Committee, which included approximately 50 voting members and hundreds more associate members. The ASCE/SEI 24-24 standard was developed by the ASCE 24-24 Standard Committee, which included approximately 25 voting members and 15 associate members.

Supporting Organizations:

This code change proposal has many supporters, included but not limited to the following organizations:

American Flood Coalition

American Institute of Architects (AIA)

Association of State Flood Plain Managers (ASFPM)

BuildStrong America

Federal Emergency Management Association

Flood Mitigation Industry Association (FMIA)

National Institute of Building Science (NIBS)

Registered Designer Professionals and planners of buildings and other infrastructure projects, Code Officials, and Authorities Having Jurisdiction owe it to the public and have an ethical obligation to provide a framework for safe, reliable structures. The public expects that the buildings in which they live, work, and play are designed consistently, with the same risk approach for all environmental hazards. Flooding is disruptive to families, businesses, and communities and it takes years to recover from these devastating disasters and overcome the losses incurred. The flood hazard must be taken seriously and incorporated into our design standards and building codes in a manner that is consistent with all of the other environmental hazards.

Cost Impact: Increase

- **2025 Cost and Benefits Analysis for ASCE 24-24.PDF**
  https://www.cdpaccess.com/proposal/11726/35918/documentation/186683/attachments/download/9873/

Estimated Immediate Cost Impact:

ASCE 7 and ASCE 24 are national minimum design standards. The effects will vary depending upon the local flood conditions and flood risk across the country and among building types. For nearly 90% of all affected structures in Numbered A Zones, the estimated immediate costs impact can be understood in analysis of the mitigation cost as a percentage of building replacement value from 0.2-6.6% for coastal sites and 0.0-4.0% for riverine sites. Additionally, average benefits per square foot range from $51-$336 for both riverine and coastal flooding, which are dependent on building type and location. See the attached “Cost and Benefits Analysis” for additional information.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

Estimated Immediate Cost Impact Justification (methodology and variables):

A building cost study was considered for 14 riverine locations and 19 coastal locations. Examples consider A Zone and X Zone conditions to understand how the ASCE changes impact the overall cost. However, since most buildings are riverine, the study focused there, but similar trends appear in coastal buildings.

Table 1 is a summary of the buildings that were considered in the study, accounting for the building type, building sizes (and average), and Flood Design Classes. The difference between commercial and government office building plays a larger role in the losses avoided portion of the study. The cost analysis is grouped by Flood Design Class since this is the grouping used in ASCE 24 for elevation criteria.

Table 1 - Building Types Considered in Study

Building Type	Flood Design Class	Small SF	Medium SF	Large SF	Average SF

Hospital 2-3 Stories	4	25,000	70,000	145,000	80,000
Elementary School	3	25,000	40,000	65,000	43,333
Police Station	4	7,000	13,000	23,000	14,333
Office 1-Story (Government)	2	2,000	7,000	25,000	11,333
Office 3-Story (Government)	2	5,000	16,000	80,000	33,667
Office 1-Story (Commercial)	2	2,000	7,000	25,000	11,333
Office 3-Story (Commercial)	2	5,000	16,000	80,000	33,667
Retail Store	2	4,000	10,000	22,000	12,000

Table 2 provides an overview of A Zone conditions for increased building costs within the 100-yr floodplain. The values represent the breakdown of example floodplains using the numbered A Zone range to categorize how much rise there is between the various flood events. A low numbered A Zone represents a flat floodplain and a high number represents a steeper floodplain where there can be a large difference in flood elevations. The percent of numbered A Zones throughout the country based on an NFIP flood insurance policy analysis per census tract.

This provides a breakdown of how various floodplains impact the increased building cost. It's important to note that in A01-A03 the freeboard requirements equal or exceed the MRI based design flood event. Since ASCE did not change the minimum freeboard requirements for FDC 2 and FDC 4, those values are the same for ASCE 24-14 and ASCE 24-24 and therefore there is no cost increase. Additionally, for FDC 4 the analysis selected the higher of the 500-yr and BFE+2, so the delta between the ASCE 24-14 and ASCE 24-24 wasn't as high in the higher numbered A Zones as it would have been with FDC 2 and 3 where they were locked with ASCE 24-14 at BFE+1.

Table 2 - Average Building Cost Increase Percentage for Riverine A Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC3	FDC4
A01-A03	26%	0.00%	1.20%	0.00%
A04-A06	41%	1.50%	1.90%	0.50%
A07-A10	20%	2.40%	2.90%	0.60%
A11-A14	9%	4.80%	5.50%	1.00%
A15-A17	2%	8.90%	10.00%	1.60%
A18-A30	2%	11.90%	13.20%	2.10%
	Weighted Average:	1.97%	2.65%	0.49%

Table 3 provides an overview of X Zone conditions for increased building costs within the 500-yr floodplain. The 500-year floodplain represents the area between the 100-year floodplain and the 500-year flood extent, this therefore represents protection from the 101-year to the 500-year flood. In X Zones it is assumed that buildings are built on the ground as compared to elevated foundations in Zone A. Since the X Zone represents the difference between the 100-year and the 500-year flood, the 300-year flood elevation was used as an average ground elevation. The ASCE 24-24 elevations represent the minimum required elevations required per the standard. The increased elevation is therefore the difference between ground (at the 300-year flood elevation) and the ASCE 24-24 elevation requirements. Similar to Table 2, Table 3 data is provided per Flood Design Class per grouped numbered A Zone designation.

Table 3 - Average Building Cost Increase Percentage for Riverine X Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC 3	FDC 4
A01-A03	26%	0.60%	1.80%	0.70%
A04-A06	41%	1.00%	1.50%	0.80%
A07-A10	20%	1.20%	1.80%	1.00%
A11-A14	9%	1.90%	3.00%	1.70%
A15-A17	2%	3.20%	5.00%	2.80%
A18-A30	2%	4.40%	6.70%	3.70%
	Weighted Average:	1.14%	1.93%	1.00%

It is believed that the presentation of percent increase in building cost provided a better representation of the overall cost impacts rather than providing dollar values. While the percent increase does get rather large in those areas with high numbered A Zones, this is a much smaller overall percentage of land area, so this represents a smaller portion of the floodplains in the US. However, recent events have shown that when these areas experience a flood event above the 100-year or 1% annual chance flood, that they often experience deep flooding. Experience from Western NC following Hurricane Helene demonstrated that when floods occur in areas with high numbered A Zones that significant flood damage occurs in the X Zone. There were examples of buildings elevated in the X Zone that performed very well in Hurricane Helene and had little to no observed damage. But many buildings in the X Zone that were constructed at grade were severely damaged or destroyed. While this is observational, there is substantial evidence to suggest that the percent cost increase is offset by the avoided losses. Two key factors that impact the avoided loss calculation is the impact of when the original flood insurance studies and associated maps were created (older mapping data), which can mean that the mapped risk is underestimated (increased runoff due to development and updated precipitation data) and then looking forward the impact of future changes in precipitation rates over the 50-year life of riverine buildings. Similarly, these impacts can impact coastal flooding heights as well as the impact of sea level change.

2024 International Mechanical Code

CHAPTER 1 SCOPE AND ADMINISTRATION

SECTION 104 DUTIES AND POWERS OF THE CODE OFFICIAL

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas, <u>including special flood hazard areas and 500-year floodplains,</u> as established by Section 1612.3 of the *International Building Code*, unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the *building* is to be built, stating that the cost of flood in-surance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

[A] 104.3.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, repair, *alteration*, addition or other improvement of existing *buildings* or structures located in flood hazard areas, <u>including special flood hazard areas and 500-year floodplains,</u> the code official shall determine if the proposed work constitutes substantial improvement or repair of substantial damage. Where the code official determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this code, the code official shall require the *building* to meet the requirements of Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 3 GENERAL REGULATIONS

SECTION 301

GENERAL

[BS] 301.16 Flood hazard. For structures located in flood hazard areas, including special flood hazard areas and 500-year floodplains, mechanical systems, *equipment* and *appliances* shall be located at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant *equipment*.

> **Exception:** Mechanical systems, *equipment* and *appliances* are permitted to be located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.

CHAPTER 4
VENTILATION

SECTION 401
GENERAL

401.4 Intake opening location. Air intake openings shall comply with all of the following:

1. Intake openings shall be located not less than 10 feet (3048 mm) from lot lines or buildings on the same lot.
2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks, except as specified in Item 3 or Section 501.3.1. Outdoor air intake openings shall be permitted to be located less than 10 feet (3048 mm) horizontally from streets, alleys, parking lots and loading docks provided that the openings are located not less than 25 feet (7620 mm) vertically above such locations. Where openings front on a street or public way, the distance shall be measured from the closest edge of the street or public way.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening. Separation is not required between intake air openings and living space *exhaust air* openings of an individual *dwelling unit* or *sleeping unit* where a factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the fan manufacturer's instructions.
4. Intake openings on structures in flood hazard areas, including special flood hazard areas and 500-year floodplains, shall be at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment.

CHAPTER 5
EXHAUST SYSTEMS

SECTION 501
GENERAL

501.3.1 Location of exhaust outlets.. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings that are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.

3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings, except where the exhaust opening is located not less than 1 foot (305 mm) above the gravity air intake opening into buildings for all *occupancies* other than Group U; and 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious. Separation is not required between intake air openings and living space *exhaust air* openings of an individual *dwelling unit* or *sleeping unit* where a factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the fan manufacturer's instructions.
4. Exhaust outlets serving structures in flood hazard areas, including special flood hazard areas and 500-year floodplains, shall be installed at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment.
5. For specific systems, see the following sections:
   - 5.1. Clothes dryer exhaust, Section 504.4.
   - 5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
   - 5.3. Dust, stock and refuse conveying systems, Section 510.2.
   - 5.4. Subslab soil exhaust systems, Section 511.4.
   - 5.5. Smoke control systems, Section 512.10.3.
   - 5.6. Refrigerant discharge, Section 1105.7.
   - 5.7. *Machinery room* discharge, Section 1105.6.1.

CHAPTER 6
DUCT SYSTEMS

SECTION 602
PLENUMS

[BS] 602.4 Flood hazard. For structures located in flood hazard areas, including special flood hazard areas and 500-year floodplains, *plenum* spaces shall be located above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment or shall be designed and constructed to prevent water from entering or accumulating within the *plenum* spaces during floods up to such elevation. If the *plenum* spaces are located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment, they shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.

SECTION 603
DUCT CONSTRUCTION AND INSTALLATION

[BS] 603.13 Flood hazard areas. For structures in flood hazard areas, including special flood hazard areas and 500-year floodplains, ducts shall be located above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment or shall be designed and constructed to prevent water from entering or accumulating within the ducts during floods up to such elevation. If the ducts are located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment, the ducts shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.

CHAPTER 12
HYDRONIC PIPING

SECTION 1206
PIPING INSTALLATION

1206.9.1 Flood hazard. Piping located in a flood hazard area, including special flood hazard areas and 500-year floodplains, shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the *design flood elevation*.

SECTION 1210
PLASTIC PIPE GROUND-SOURCE HEAT PUMP LOOP SYSTEMS

1210.8.6 Flood hazard. Piping located in a flood hazard area, including special flood hazard areas and 500-year floodplains, shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the *design flood elevation*.

CHAPTER 13
FUEL OIL PIPING AND STORAGE

SECTION 1305
FUEL OIL SYSTEM INSTALLATION

1305.2.1 Flood hazard. Fuel oil pipe, *equipment* and *appliances* located in flood hazard areas, including special flood hazard areas and 500-year floodplains, shall be located above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment or shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.

2024 International Plumbing Code

CHAPTER 1
SCOPE AND ADMINISTRATION

SECTION 104
DUTIES AND POWERS OF THE CODE OFFICIAL

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas, including special flood areas and 500-year floodplains. as established by Section 1612.3 of the *International Building Code* unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.

5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

[A] 104.3.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, repair, alteration, addition or other improvement of existing buildings or structures located in flood hazard areas, <u>including special flood hazard areas and 500-year floodplains,</u> the code official shall determine if the proposed work constitutes substantial improvement or repair of substantial damage. Where the code official determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this code, the code official shall require the building to meet the requirements of Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 3 GENERAL REGULATIONS

SECTION 309 FLOOD HAZARD RESISTANCE

309.1 General. Plumbing systems and equipment in structures erected in *flood hazard areas*<u>, including special flood hazard areas and 500-year floodplains,</u>shall be constructed in accordance with the requirements of this section and the *International Building Code*.

[BS] 309.2 Flood hazard. For structures located in *flood hazard areas*<u>, including special flood hazard areas and 500-year floodplains,</u> the following systems and equipment shall be located and installed as required by Section 1612 of the *International Building Code*.

1. Water service pipes.
2. Pump seals in individual water supply systems where the pump is located below the *design flood elevation*.
3. Covers on potable water wells shall be sealed, except where the top of the casing well or pipe sleeve is elevated to not less than 1 foot (305 mm) above the *design flood elevation*.
4. Sanitary drainage piping.
5. Storm drainage piping.
6. Manhole covers shall be sealed, except where elevated to or above the *design flood elevation*.
7. Other plumbing fixtures, faucets, fixture fittings, piping systems and equipment.
8. Water heaters.
9. Vents and vent systems.

2024 International Fuel Gas Code

CHAPTER 1 SCOPE AND ADMINISTRATION

SECTION 104 (IFGC) DUTIES AND POWERS OF THE CODE OFFICIAL

Revise as follows:

[A] 104.2.4.1 Flood hazard areas.. The *code official* shall not grant modifications to any provision required in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, as established by Section 1612.3 of the *International Building Code* unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

[A] 104.3.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, repair, *alteration*, addition or other improvement of existing buildings or structures located in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, the *code official* shall determine if the proposed work constitutes substantial improvement or repair of substantial damage. Where the *code official* determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this code, the *code official* shall require the building to meet the requirements of Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 3
GENERAL REGULATIONS

SECTION 301 (IFGC)
GENERAL

[BS] 301.11 Flood hazard. For structures located in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, the *appliance*, *equipment* and system installations regulated by this code shall be located at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment.

Exception: The *appliance*, *equipment* and system installations regulated by this code are permitted to be located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to such elevation.

2024 International Residential Code

CHAPTER 24
FUEL GAS

SECTION G2404 (301)
GENERAL

Revise as follows:

G2404.7 (301.11) Flood hazard. For structures located in *flood hazard areas*, including special flood hazard areas and 500-year

[illegible] Flood hazard. For structures located in flood hazard areas, <u>including special flood hazard areas and 500-year floodplains,</u> the *appliance*, *equipment* and system installations regulated by this code shall be located at or above the elevation required by Section R306 for utilities and attendant equipment.

> **Exception:** The *appliance*, *equipment* and system installations regulated by this code are permitted to be located below the elevation required by Section R306 for utilities and attendant equipment provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to such elevation.

2024 International Fire Code

CHAPTER 12
ENERGY SYSTEMS

SECTION 1203
EMERGENCY AND STANDBY POWER SYSTEMS

Revise as follows:

1203.1.8 Group I-2 occupancies. In Group I-2 occupancies located in flood hazard areas<u>, including special flood hazard areas and 500-year floodplains,</u> established in Section 1612.3 of the *International Building Code* where new essential electrical systems are installed, and where new essential electrical system generators are installed, the systems and generators shall be located and installed in accordance with ASCE 24. Where connections for hook up of temporary generators are provided, the connections shall be located at or above the elevation required in ASCE 24.

2024 International Swimming Pool and Spa Code

CHAPTER 1
SCOPE AND ADMINISTRATION

SECTION 104
DUTIES AND POWERS OF THE CODE OFFICIAL

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas<u>, including special flood hazard areas and 500-year floodplains,</u>as established by Section 1612.3 of the *International Building Code* unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

[A] 104.3.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, repair, alteration, addition or other improvement of existing buildings or structures located in flood hazard areas, including special flood hazard areas and 500-year floodplains, the code official shall determine if the proposed work constitutes substantial improvement or repair of substantial damage. Where the code official determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this code, the code official shall require the building to meet the requirements of Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 3
GENERAL COMPLIANCE

SECTION 304
FLOOD HAZARD AREAS

304.1 General. The provisions of Section 304 shall control the design and construction of pools and spas installed in *flood hazard areas*, including special flood hazard areas and 500-year floodplains.

[BS] 304.2 Determination of impacts based on location. Pools and spas located in *flood hazard areas*, including special flood hazard areas and 500-year floodplains, indicated within the *International Building Code* or the *International Residential Code* shall comply with Section 304.2.1 or 304.2.2.

Exception: Pools and spas located in riverine *flood hazard areas* that are outside of designated floodways and pools and spas located in *flood hazard areas* where the source of flooding is tides, storm surges or coastal storms.

2024 International Private Sewage Disposal Code

CHAPTER 1
SCOPE AND ADMINISTRATION

SECTION 104
DUTIES AND POWERS OF THE CODE OFFICIAL

Revise as follows:

[A] 104.2.4.1 Flood hazard areas. The code official shall not grant modifications to any provision required in flood hazard areas, including special flood hazard areas and 500-year floodplains, as established by Section 1612.3 of the *International Building Code*, unless a determination has been made that:

1. A showing of good and sufficient cause that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section 1612 of the *International Building Code* inappropriate.
2. A determination that failure to grant the variance would result in exceptional hardship by rendering the lot undevelopable.
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. A determination that the variance is the minimum necessary to afford relief, considering the flood hazard.
5. Submission to the applicant of written notice specifying the difference between the design flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation, and stating that construction below the design flood elevation increases risks to life and property.

[A] 104.3.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, repair, alteration, addition or other improvement of existing buildings or structures located in flood hazard areas, including special flood hazard areas and 500-year floodplains, the code official shall determine if the proposed work constitutes substantial improvement or repair of substantial damage. Where the code official determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this code, the code official shall require the building to meet the requirements of Section 1612 of the *International Building Code* or Section R306 of *the International Residential Code*, as applicable.

CHAPTER 3
GENERAL REGULATIONS

SECTION 301
GENERAL

301.1 Scope. The provisions of this chapter shall govern the general regulations of *private sewage disposal systems*, including specific limitations and *flood hazard areas*, including special flood hazard areas and 500-year floodplains.

SECTION 303
FLOOD HAZARD AREAS

[BS] 303.1 General. Soil absorption systems shall be located outside of *flood hazard areas*, including special flood hazard areas and 500-year floodplains.

> **Exception:** Where suitable soil absorption sites outside of the *flood hazard area* are not available, the soil absorption site is permitted to be located within the *flood hazard area*. The soil absorption site shall be located to minimize the effects of inundation under conditions of the design flood.

[BS] 303.2 Tanks. In *flood hazard areas*, including special flood hazard areas and 500-year floodplains,tanks shall be anchored to counter buoyant forces during condition of the design flood. The vent termination and service manhole of the tank shall be not less than 2 feet (610 mm) above the *design flood elevation* or fitted with covers designed to prevent the inflow of floodwater or outflow of the contents of the tanks during conditions of the design flood.

[BS] 303.3 Mound systems. Mound systems shall be prohibited in *flood hazard areas*, including special flood hazard areas and 500-year floodplains.

CHAPTER 4
SITE EVALUATION AND REQUIREMENTS

SECTION 401
GENERAL

401.2 Site evaluation. Site evaluation shall include soil conditions, properties and permeability, depth to zones of soil saturation, depth to bedrock, slope, landscape position, all setback requirements and the presence of *flood hazard areas*, including special flood hazard areas and 500-year floodplains. Soil test data shall relate to the undisturbed elevations, and a vertical elevation reference point or benchmark shall be established. Evaluation data shall be reported on approved forms. Reports shall be filed within 30 days of the completion of testing for all sites investigated.

SECTION 406

SITE REQUIREMENTS

406.1.1 Flood hazard areas. The site shall be located outside of *flood hazardareas*, including special flood hazard areas and 500-year floodplains.

Exception: Where suitable sites outside of the *flood hazard area* are not available, it is permitted for the site to be located within the *flood hazard area*. The site shall be located to minimize the effects of inundation under conditions of the design flood.

- **ATT - IEBC and OTHER I-Codes.docx**
  https://www.cdpaccess.com/proposal/12153/35919/files/download/9507/

Reason: REASON STATEMENT:

This proposal is a coordination proposal to bring the 2027 edition of the I-Codes up to date with the provisions in the 2022 edition of *ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, Supplement 2* (ASCE/SEI 7-22, Supplement 2) as well as the 2024 edition of *ASCE/SEI 24 Flood Resistant Design and Construction* (ASCE/SEI 24-24) --- specifically for the codes primarily affected such as the International Building Code (IBC), the International Residential Code (IRC), and the International Existing Building Code (IEBC), in Group B, but also every I-Code affected by a coordinating code change that will need to be updated. ASCE/SEI 7-22 is the current reference in 2024 I-Codes and Supplement 2 has been submitted as an Administrative Update. ASCE/SEI 24-24 has also been submitted as an Administrative Update to the 2027 I-Codes.

This proposal has been organized into Part I to Part VII and includes technical updates as well as editorial coordination. The specific changes to each section included in this proposal are outlined in Overview below, and a detailed summary of the technical updates are explained in Technical Rationale below that. In addition to the strike out/underline for the code change proposals, the MS Word documents for each affected I-Code have been provided as Attached Files for clarity.

Overview:

These changes provide similar updates to the IBC, IRC, and IEBC, just provided in a separate Code Change Proposal. However, all changes must be included across all I-Codes for a comprehensive proposal - IBC, IRC and IEBC are included in Group B; the others will need to be addressed in the next Group A cycle.

All Codes, All Chapter: Add phase “including special flood hazard areas and 500-year floodplain” following flood area for clarity. And change to clarify term definitions and when “base flood” applies and when “design flood” applies. Also aligns definitions of “base flood elevation” and “design flood elevations”. “Flood Hazard Area” is updated with a new definition. These two changes are carried out throughout the series of these comprehensive code change proposal for clarification and consistency.

Technical Rationale:

The American Society of Civil Engineers (ASCE) is proposing revisions to the International Code Council’s I-Codes for the 2027 Cycle to align the national codes with the current ASCE/SEI design standards including:

ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, 2022 edition; Supplement 2 (ASCE/SEI 7-22 S2)

ASCE/SEI 24 Flood Resistant Design and Construction, 2024 edition (ASCE/SEI 24-24)

The loading standard ASCE/SEI 7-22 S2 and the design standard ASCE/SEI 24-24 work together – these documents have been developed to be consistent and coordinated so they can be required and used together. There are three significant changes in the national loading standard ASCE/SEI 7-22 S2 including (1) an extension of the defined Flood Hazard Area to the 500-year floodplain for Rick Category II, III, and IV structures, (2) an inclusion of risk-based design for loads, and (3) requirements to include relative sea level change into design load calculations for coastal sites; see below for more technical details. There are three significant changes in the national design standard ASCE/SEI 24-24 including (1) alignment with ASCE/SEI 7-22 S2, (2) alignment with FEMA Technical Bulletins, and (3) updates for elevations, materials, and floodproofing.

Both ASCE/SEI Standards are available for purchase and the Supplement available as a free download from the ASCE Library:

ASCE/SEI 7-22 (https://doi.org/10.1061/9780784415788)

ASCE/SEI 7-22 Supplement 2 (https://doi.org/10.1061/9780784415788.sup2)

ASCE/SEI 24-24 (https://doi.org/10.1061/9780784485781)

Flood Hazard:

The ASCE 7-22 S2 updates the design requirements to define the flood hazard area for the given Risk Category of structure. Addionally, the flood hazard depth is tied to the mean recurrence interval for a given Risk Category of structure. The design flood hazard is related to Risk Category (e.g., RC II will be designed to 500-year MRI), which is consistent with the way other environmental hazards (such as wind and snow loads) relate the hazard to Risk Category. This is in contrast to the current code requirements, which only considers only 100-year MRI flood for all structures regardless of Risk Category. In some areas in the U.S., the Authority Having Jurisdiction is already requiring a higher design requirement for the flood hazard. The city of Houston, for example, moved to requiring use of the 500-year MRI as the design basis for flood following the devastation from Hurricane Harvey. At a national level, FEMA is considering the use of the 500-year flood as the basis for floodplain management.

The coordinated code change proposals submitted for Group B are drafted to bring the IBC, IRC, and IEBC into alignment with the recent changes in ASCE 7-22 Supplement 2 and ASCE 24-24. The significant changes from the updates to these standards are to differentiate between the base flood (also described as the 100-year flood, or the 1% or greater chance of flooding in any given year) and the design flood, which could be different, and is defined in the standards for each Risk Category. The design flood must include considerations for loading specified in ASCE/SEI 7-22 S2 and design specified in ASCE/SEI 24-24.

Flood damage, and associated loss dollars, has significantly expanded since the last major updates of ASCE 7 Chapter 5 and ASCE 24. Their revisions attempt to close that gap and align the risks across other hazards.

FEMA cites that flood damage cost approximately $17 billion each year between 2010 and 2018, and with rising sea levels and extreme weather could cause $20 billion of flood damage to at-risk US homes this year, rising to $32 billion by 2051. Data from 2018 Hurricane Michael shows that 42% of claimed damage amounts were in the Shaded X-Zone (500-year floodplain), exceeding the amounts in both the A and V-Zones. (FEMA. Mitigation Assessment Team Report Hurricane Michael in Florida (FEMA P-2077), February 2020).

This is further supported by FEMA's recent report "A Cost and Benefits Analysis of Increased Elevation Requirements for Public and Nonresidential Buildings in Riverine and Coastal Floodplains," which evaluated the potential avoided losses (benefits) for 8 building types in 19 coastal floodplains and 14 riverine floodplains in the 100-year floodplain and the Shaded X Zone. The report shows that there are significant benefits to most buildings in the 100-year floodplain, particularly in steep/narrow floodplains. There were also significant benefits to buildings in the Shaded X Zone where there are currently no elevation requirements. These findings are supported by evidence from the National Flood Insurance Program (NFIP), which stated, "People outside of high-risk areas file more than 25 percent of NFIP claims and receive one-third of disaster assistance for flooding. The NFIP's preferred risk policies are designed for residential properties located in low- to moderate-risk flood zones." Additional reports from the NFIP indicate that 40% of companies fail to reopen after a disaster, with another 25% closing within a year. These problems are only further exacerbated by the influence of development and associated runoff, changes in precipitation rates, local subsidence, and sea level change. All of which are not accounted for by FEMA's flood maps, which only account for historic flood data and not future projections. All of this data supports the need to move from a fixed freeboard approach to a risk-based elevation approach that provides consistent protection from flat/wide floodplains to steep/narrow floodplains and more appropriately addresses the influence of wave action in coastal floodplains. This recognizes that true resiliency for communities is continuity of local businesses and making sure that public services are maintained and that adaptation to changes in precipitation, development, and sea level change must be incorporated into new buildings rather than relying on often prohibitively expensive retrofit options.

The ASCE changes consider the frequency of recent and predicted events and the significant damage recorded in the Shaded X-Zone. But, while significant, the addition of the Shaded X-Zone to the standards represents a change to only 4% of the U.S. population.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

ASCE Consensus Process:

ASCE established and maintains an ANSI-accredited, consensus process for standard development. The open process includes selection of a balanced committee, including representation of all affected stakeholders, and public review of the draft standard prior to publication. The ASCE consensus process follows the *ASCE Rules for Standards Committees*, which is published on the ASCE website. The ASCE/SEI 7-22 S2 was developed by the ASCE 7-22 Standard Committee, which included approximately 50 voting members and hundreds more associate members. The ASCE/SEI 24-24 standard was developed by the ASCE 24-24 Standard Committee, which included approximately 25 voting members and 15 associate members.

Supporting Organizations:

This code change proposal has many supporters, included but not limited to the following organizations:

American Flood Coalition

American Institute of Architects (AIA)

Association of State Flood Plain Managers (ASFPM)

BuildStrong America

Federal Emergency Management Association

Flood Mitigation Industry Association (FMIA)

National Institute of Building Science (NIBS)

Registered Designer Professionals and planners of buildings and other infrastructure projects, Code Officials, and Authorities Having Jurisdiction owe it to the public and have an ethical obligation to provide a framework for safe, reliable structures. The public expects that the buildings in which they live, work, and play are designed consistently, with the same risk approach for all environmental hazards. Flooding is disruptive to families, businesses, and communities and it takes years to recover from these devastating disasters and overcome the losses incurred. The flood hazard must be taken seriously and incorporated into our design standards and building codes in a manner that is consistent with all of the other environmental hazards.

Cost Impact: Increase

- **2025 Cost and Benefits Analysis for ASCE 24-24.PDF**
  https://www.cdpaccess.com/proposal/12153/35919/documentation/186691/attachments/download/9875/

Estimated Immediate Cost Impact:

ASCE 7 and ASCE 24 are national minimum design standards. The effects will vary depending upon the local flood conditions and flood risk across the country and among building types. For nearly 90% of all affected structures in Numbered A Zones, the estimated immediate costs impact can be understood in analysis of the mitigation cost as a percentage of building replacement value from 0.2-6.6% for coastal sites and 0.0-4.0% for riverine sites. Additionally, average benefits per square foot range from $51-$336 for both riverine and coastal flooding, which are dependent on building type and location. See the attached “Cost and Benefits Analysis” for additional information.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

Estimated Immediate Cost Impact Justification (methodology and variables):

A building cost study was considered for 14 riverine locations and 19 coastal locations. Examples consider A Zone and X Zone conditions to understand how the ASCE changes impact the overall cost. However, since most buildings are riverine, the study focused there, but similar trends appear in coastal buildings.

Table 1 is a summary of the buildings that were considered in the study, accounting for the building type, building sizes (and average), and Flood Design Classes. The difference between commercial and government office building plays a larger role in the losses avoided portion of the study. The cost analysis is grouped by Flood Design Class since this is the grouping used in ASCE 24 for elevation criteria.

Table 1 - Building Types Considered in Study

Building Type	Flood Design Class	Small SF	Medium SF	Large SF	Average SF
Hospital 2-3 Stories	4	25,000	70,000	145,000	80,000
Elementary School	3	25,000	40,000	65,000	43,333
Police Station	4	7,000	13,000	23,000	14,333
Office 1-Story (Government)	2	2,000	7,000	25,000	11,333
Office 3-Story (Government)	2	5,000	16,000	80,000	33,667
Office 1-Story (Commercial)	2	2,000	7,000	25,000	11,333
Office 3-Story (Commercial)	2	5,000	16,000	80,000	33,667
Retail Store	2	4,000	10,000	22,000	12,000

Table 2 provides an overview of A Zone conditions for increased building costs within the 100-yr floodplain. The values represent the breakdown of example floodplains using the numbered A Zone range to categorize how much rise there is between the various flood events. A low numbered A Zone represents a flat floodplain and a high number represents a steeper floodplain where there can be a large difference in flood elevations. The percent of numbered A Zones throughout the country based on an NFIP flood insurance policy analysis per census tract.

This provides a breakdown of how various floodplains impact the increased building cost. It's important to note that in A01-A03 the freeboard requirements equal or exceed the MRI based design flood event. Since ASCE did not change the minimum freeboard requirements for FDC 2 and FDC 4, those values are the same for ASCE 24-14 and ASCE 24-24 and therefore there is no cost increase. Additionally, for FDC 4 the analysis selected the higher of the 500-yr and BFE+2, so the delta between the ASCE 24-14 and ASCE 24-24 wasn't as high in the higher numbered A Zones as it would have been with FDC 2 and 3 where they were locked with ASCE 24-14 at BFE+1.

Table 2 - Average Building Cost Increase Percentage for Riverine A Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC3	FDC4
A01-A03	26%	0.00%	1.20%	0.00%
A04-A06	41%	1.50%	1.90%	0.50%
A07-A10	20%	2.40%	2.90%	0.60%
A11-A14	9%	4.80%	5.50%	1.00%
A15-A17	2%	8.90%	10.00%	1.60%
A18-A30	2%	11.90%	13.20%	2.10%
	Weighted Average:	1.97%	2.65%	0.49%

Table 3 provides an overview of X Zone conditions for increased building costs within the 500-yr floodplain. The 500-year floodplain represents the area between the 100-year floodplain and the 500-year flood extent, this therefore represents protection from the 101-year to the 500-year flood. In X Zones it is assumed that buildings are built on the ground as compared to elevated foundations in Zone A. Since the X Zone represents the difference between the 100-year and the 500-year flood, the 300-year flood elevation was used as an average ground elevation. The ASCE 24-24 elevations represent the minimum required elevations required per the standard. The increased elevation is therefore the difference between ground (at the 300-year flood elevation) and the ASCE 24-24 elevation requirements. Similar to Table 2, Table 3 data is provided per Flood Design Class per grouped numbered A Zone designation.

Table 3 - Average Building Cost Increase Percentage for Riverine X Zones Per Numbered A Zone

Numbered A Zone	Percentile of Numbered A Zones	FDC 2	FDC 3	FDC 4
A01-A03	26%	0.60%	1.80%	0.70%
A04-A06	41%	1.00%	1.50%	0.80%
A07-A10	20%	1.20%	1.80%	1.00%
A11-A14	9%	1.90%	3.00%	1.70%
A15-A17	2%	3.20%	5.00%	2.80%
A18-A30	2%	4.40%	6.70%	3.70%
	Weighted Average:	1.14%	1.93%	1.00%

It is believed that the presentation of percent increase in building cost provided a better representation of the overall cost impacts rather than providing dollar values. While the percent increase does get rather large in those areas with high numbered A Zones, this is a much smaller overall percentage of land area, so this represents a smaller portion of the floodplains in the US. However, recent events have shown that when these areas experience a flood event above the 100-year or 1% annual chance flood, that they often experience deep flooding. Experience from Western NC following Hurricane Helene demonstrated that when floods occur in areas with high numbered A Zones that significant flood damage occurs in the X Zone. There were examples of buildings elevated in the X Zone that performed very well in Hurricane Helene and had little to no observed damage. But many buildings in the X Zone that were constructed at grade were severely damaged or destroyed. While this is observational, there is substantial evidence to suggest that the percent cost increase is offset by the avoided losses. Two key factors that impact the avoided loss calculation is the impact of when the original flood insurance studies and associated maps were created (older mapping data), which can mean that the mapped risk is underestimated (increased runoff due to development and updated precipitation data) and then looking forward the impact of future changes in precipitation rates over the 50-year life of riverine buildings. Similarly, these impacts can impact coastal flooding heights as well as the impact of sea level change.

Staff Analysis: Chapter 24 of the IRC is copied from the IFGC, therefore, everything in that Chapter is controlled by the scoping in the IFGC.

2024 International Residential Code

SECTION R202
DEFINITIONS

Add new definition as follows:

500-YEAR FLOODPLAIN. Land in the *floodplain* subject to a 0.2% or greater chance of *flooding* in any given year; area delineated on the *Flood Insurance Rate Map* (FIRM) as Shaded Zone X or Zone B.
BASE FLOOD. The flood having a 1-percent chance of being equaled or exceeded in any given year.
BASE FLOOD ELEVATION. The elevation of the base flood, including wave height, relative to the National Geodetic Vertical Datum (NGVD), North American Vertical Datum (NAVD) or other datum specified on the Flood Insurance Rate Map (FIRM). In areas designated on the Flood Insurance Rate Map as Zone AO, the base flood elevation is the elevation of the highest existing grade of the building's perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth number is not specified on the map, the depth number is taken as being equal to 2 feet (610 mm).
DESIGN FLOOD. Flood corresponding to the elevations specified in Section R306.1.4 and acting over the *flood hazard area*.
DESIGN FLOOD ELEVATION. The elevation of the "design flood", including wave height, releative to the datum specified on the community's legally desingated flood hazard map.
FLOOD HAZARD AREA. The greater of the following three areas:

1. The area within a floodplain subject to a 1 percent or greater chance of flooding in any given year, including special flood hazard areas delineated on the Flood Insurance Rate Map.
2. The 500-year floodplain, when delineated on the *Flood Insurance Rate Map*.
3. The area designated as a *flood hazard area* on a community's flood hazard map, or otherwise legally designated.

SPECIAL FLOOD HAZARD AREA. Land in the *floodplain* subject to a 1% or greater chance of *flooding* in any given year; area delineated on the *Flood Insurance Rate Map* as Zone A, AE, A1-30, A99, AR, AO, AH, V, VO, VE or V1-30.

Proponents: Jennifer Goupil, American Society of Civil Engineers and Structural Engineering Institute, representing American Society of Civil Engineers (jgoupil@asce.org); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org); Natalie Enclade, representing BuildStrong America (natalie@buildstrongamerica.com); Jiqiu yuan, representing National Institute of Building Sciences (jyuan@nibs.org); Joel Scata, representing NRDC (jscata@nrdc.org); Roderick Scott, Board Chair, representing Flood Mitigation Industry Association (roderick.scott75@aol.com)

2024 International Residential Code

SECTION R104
DUTIES AND POWERS OF THE BUILDING OFFICIAL

Revise as follows:

R104.2.3.1 Flood hazard areas. The *building official* shall not grant modifications to any provisions required in flood hazard areas as established ~~by~~ in the flood hazard maps identified Table R301.2 unless a determination has been made that:

1. There is good and sufficient cause showing that the unique characteristics of the size, configuration or topography of the site render the elevation standards of Section R306 inappropriate.
2. Failure to grant the modification would result in exceptional hardship by rendering the lot undevelopable.
3. The granting of modification will not result in increased flood heights, additional threats to public safety or extraordinary public expense; cause fraud on or victimization of the public; or conflict with existing laws or ordinances.
4. The modification is the minimum necessary to afford relief, considering the flood hazard.
5. Written notice specifying the difference between the ~~design~~ base flood elevation and the elevation to which the building is to be built, stating that the cost of flood insurance will be commensurate with the increased risk resulting from the reduced floor elevation and stating that construction below the ~~design~~ base flood elevation increases risks to life and property, has been submitted to the applicant.

R104.3.1 Determination of substantially improved or substantially damaged existing buildings in flood hazard areas. For applications for reconstruction, rehabilitation, *addition, alteration*, *repair* or other improvement of *existing buildings* or structures located in a flood hazard ~~area~~ areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ in the flood hazard maps identified in Table R301.2, the *building official* shall examine or cause to be examined the *construction documents* and shall make a determination with regard to the value of the proposed work. For *buildings* that have sustained damage of any origin, the value of the proposed work shall include the cost to *repair* the *building* or structure to its predamaged condition. If the *building official* finds that the value of proposed work equals or exceeds 50 percent of the market value of the building or structure before the damage has occurred or the improvement is started, the proposed work is a *substantial improvement* or *repair* of *substantial damage* and the *building official* shall require existing portions of the entire building or structure to meet the requirements of Section R306.

SECTION R106
CONSTRUCTION DOCUMENTS

R106.1.4 Information for construction in flood hazard areas. For *buildings* and structures located in whole or in part in flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ in the flood hazard maps identified Table R301.2, *construction documents* shall include:

1. Delineation of flood hazard areas, including special flood hazard areas and 500-year floodplains, floodway boundaries, ~~and~~ flood zones , base flood elevations, and the design flood elevation, as appropriate.
2. The elevation of the proposed lowest floor, including *basement*; in areas of shallow flooding (AO Zones), the height of the proposed lowest floor, including *basement*, above the highest adjacent *grade*.
3. The elevation of the bottom of the lowest horizontal structural member in coastal high-hazard areas (V Zone) and in Coastal A Zones where such zones are delineated on flood hazard maps identified in Table R301.2 or otherwise delineated by the *jurisdiction*.
4. If ~~design~~ base flood elevations are not included on the community's Flood Insurance Rate Map (FIRM), the *building official* and the applicant shall obtain and reasonably utilize any ~~design~~ base flood elevation and floodway data available from other sources.

SECTION R109
INSPECTIONS

R109.1.3 Floodplain inspections. For construction in flood hazard areas as established ~~by~~ on the flood hazard maps identified in Table Table R301.2, upon placement of the lowest floor, including *basement*, and prior to further vertical construction, the *building official* shall require submission of documentation, prepared and sealed by a *registered design professional*, of the elevation of the lowest floor, including *basement*, required in Section R306.

SECTION R301
DESIGN CRITERIA

R301.2.4 Floodplain construction. *Buildings* and structures constructed in whole or in part in flood hazard areas, including special flood hazard areas and 500-year floodplains, as established on the flood hazard maps identified Table R301.2, and *substantial improvement* and *repair* of *substantial damage* of *buildings* and structures located in whole or in part in flood hazard areas, including special flood hazard areas and 500-year floodplains, shall be designed and constructed in accordance with Section R306. *Buildings* and structures that are located in more than one flood hazard area, including A Zones, Coastal A Zones and V Zones, shall comply with the provisions associated with the most restrictive flood hazard area. *Buildings* and structures located in whole or in part in identified floodways shall be designed and constructed in accordance with ASCE 24.

SECTION R306
FLOOD-RESISTANT CONSTRUCTION

R306.1 General. *Buildings* and structures constructed in whole or in part in flood hazard areas, including special flood hazard areas and 500-year floodplains, established on the flood hazard maps identified in Table R301.2, and *substantial improvement* and *repair* of *substantial damage* of *buildings* and structures located in whole or in part in flood hazard areas, including special flood hazard areas and 500-year floodplains, shall be designed and constructed in accordance with the provisions contained in this section. *Buildings* and structures that are located in more than one flood hazard area, including A Zones, Coastal A Zones and V Zones, shall comply with the provisions associated with the most restrictive flood hazard area. *Buildings* and structures located in whole or in part in identified floodways shall be designed and constructed in accordance with ASCE 24.

R306.1.4 Establishing the design flood elevation. The design flood elevation shall be used to define flood hazardareas, including special flood hazard areas and 500-year floodplains. At a minimum, the design flood elevation shall be the higher of the following:

1. The base flood elevation at the depth of peak elevation of flooding, including wave height, that has a 1-percent (100-year flood) or greater chance of being equaled or exceeded in any given year.

2. The elevation of the design flood associated with the area designated on a flood hazard map adopted by the community, or otherwise legally designated.
3. The 500-year flood elevation determined in accordance with Table R306.1.4 or ASCE 24.

In no case shall the elevation of the design flood be lower than the elevation of the base flood.

Add new text as follows:

Table R306.1.4 Determination of 500-Year Flood Elevations

Flood Data Provided for Project Location	**FIRM shows riverine cross sections[a] for the flood source**	**FIRM does not show riverine cross sections[a] for the flood source**	**FIRM shows coastal transects[b] for the flood source**	**FIRM shows riverine cross sections[a] and coastal transects[b] for the flood source**
The FIRM shows a Shaded Zone X[e] and 500-year Flood Data is provided	Use the elevation for 500-year flood provided in the FIS Flood Profile[c].	Not Applicable	Use the 500-year wave envelope elevation.	Use the more restrictive of the 500-year flood profile elevation or the 500-year wave envelope elevation.
The FIRM shows a Shaded Zone X[e] and only a 500-year stillwater elevation is provided	Not Applicable to Riverine Conditions	Not Applicable to Riverine Conditions	For A Zones[d], use the higher of BFE plus 2.1 feet or the 500-year stillwater elevation for the nearest transect. For CHHA[f] and CAZ[g], use the higher of BFE plus 2.6 feet or the 500-year stillwater elevation for the nearest transect.	Use the more restrictive of the 500-year flood profile or: - For A Zones[d], use the higher of BFE plus 2.1 feet or the 500-year stillwater elevation for the nearest transect. - For CHHA[f] and CAZ[g], use the higher of BFE plus 2.6 feet or the 500-year stillwater elevation for the nearest transect.
The FIRM does not show a Shaded Zone X[e] and 500-year flood elevation is provided	Use the elevation for 500-year flood provided in the FIS Flood Profile[3]	Not Applicable	Not Applicable	Use the more restrictive of the 500-year flood profile or: - For A Zones[d], use the higher of BFE plus 2.1 feet. - For CHHA[f] and CAZ[g], use the higher of BFE plus 2.6 feet.
The FIRM does not show a Shaded Zone X[e] and only Base Flood Elevation is provided	Use the BFE plus 2.1 feet.	Use the BFE plus 2.1 feet.	For A Zones[d], use the BFE plus 2.1 feet. For CHHA[f] and CAZ[g], use the BFE plus 2.6 feet.	For A Zones[d], use the BFE plus 2.1 feet. For CHHA[f] and CAZ[g], use the BFE plus 2.6 feet.

a. Riverine cross sections are shown on Flood Insurance Rate Maps (FIRMs) using a line and a number or letter surrounded by a hexagon to indicate the cross section along the flood source. The same designations are used on Flood Profiles included in Flood Insurance Studies (FISs).

b. Coastal transect lines are shown on FIRMs using a line and a number surrounded by a circle, which indicates the transect number on the FIRM. The same designations are used in Stillwater Tables and Wave Envelope Profiles in FISs.

c. Flood profiles are provided in FISs for riverine flood sources studied using detailed methods. Project locations are identified by measuring up or downstream from the nearest cross section along the centerline of the flood source.

d. A Zones refer to those areas identified on FIRMs as Zone A, AE, A1-A30, A99, AR, AO and AH. Areas identified as A Zones that are located seaward of the Limit of Moderate Wave Action (LiMWA) are Coastal A Zones (CAZs).

e. Shaded Zone X includes those areas within 500-year floodplains identified on FIRMs as Zone X with shading. Shaded Zone X includes Zone B shown on older FIRMs.

f. Coastal High Hazard Areas (CHHAs) include those areas identified on FIRMS as Zone V.

g. Coastal A Zones (CAZs) include A Zones on FIRMS that are seaward of the LiMWA or otherwise designated by the jurisdiction.

Revise as follows:

R306.1.4.1 Determination of ~~design~~ base flood elevations. ~~If design~~ Where base flood elevations are not specified, the *building official* is authorized to require the applicant to comply with either of the following:

1. Obtain and reasonably use data available from a federal, state or other source.

2. Determine the ~~design~~ base flood elevation in accordance with accepted hydrologic and hydraulic engineering practices used to define special flood hazard areas. Determinations shall be undertaken by a *registered design professional* who shall document that the technical methods used reflect currently accepted engineering practice. Studies, analyses and computations shall be submitted in sufficient detail to allow thorough review and *approval*.

R306.1.4.2 Determination of impacts. In riverine special flood hazard areas where ~~design~~ base flood elevations are specified but floodways have not been designated, the applicant shall demonstrate that the effect of the proposed *buildings* and structures on ~~design~~ baseflood elevations, including fill, when combined with other existing and anticipated special flood hazard area encroachments, will not increase the ~~design~~ base flood elevation more than 1 foot (305 mm) at any point within the *jurisdiction*.

R306.1.9 Manufactured homes. The bottom of the frame of new and replacement *manufactured homes* on foundations that conform to the requirements of Section R306.2 or R306.3, as applicable, shall be elevated to or above the elevations specified in Section R306.2 (flood hazard areas including A Zones and the 500-year floodplain) or R306.3 in coastal high-hazard areas (V Zones and Coastal A Zones). The anchor and tie-down requirements of the applicable state or federal requirements shall apply. The foundation and anchorage of *manufactured homes* to be located in identified floodways shall be designed and constructed in accordance with ASCE 24.

R306.2 Flood hazard areas ~~(including A Zones)~~. Areas that have been determined to be prone to flooding and that are not subject to high-velocity wave action shall be designated as flood hazard areas. Flood hazard areas that have been delineated as subject to wave heights between 1$^1/_2$ feet (457 mm) and 3 feet (914 mm) or otherwise designated by the *jurisdiction* shall be designated as Coastal A Zones and are subject to the requirements of Section R306.3. *Buildings* and structures constructed in whole or in part in flood hazard areas, including special flood hazard areas and 500-year floodplains, but not including coastal high hazard areas and Coastal A Zones shall be designed and constructed in accordance with Sections R306.2.1 through R306.2.4.

R306.2.1 Elevation requirements.

1. Buildings and structures in flood hazard areas, not including flood hazard areas designated as Coastal A Zones, shall have the lowest floors elevated to or above the base flood elevation plus 1 foot (305 mm), or the design flood elevation determined in Section R306.1.4, whichever is higher.
2. In areas of shallow flooding (AO Zones), *buildings* and structures shall have the lowest floor (including *basement*) elevated to a height above the highest adjacent *grade* of not less than the depth number specified in feet (mm) on the FIRM plus 1 foot (305 mm), or not less than 3 feet (915 mm) if a depth number is not specified.
3. *Basement* floors that are below *grade* on all sides shall be elevated to or above base flood elevation plus 1 foot (305 mm), or the design flood elevation, whichever is higher.
4. Attached garages and carports shall comply with one of the following:
   4.1. The floors shall be elevated to or above the elevations required in Item 1 or Item 2, as applicable.
   4.2. The floors shall be at or above *grade* on not less than one side. Where an attached garage or carport is enclosed by walls, the walls shall have flood openings that comply with Section R306.2.2 and the attached garage or carport shall be used only for parking, building access or storage.

5. Detached *accessory structures* and detached garages shall comply with one of the following:
   5.1. The floors shall be elevated to or above the elevations required in Item 1 or Item 2, as applicable.
   5.2. Floors below the elevations required in Item 1 or 2, as applicable, must be:
      5.2.1. Used only for parking or storage.
      5.2.2. One story and not larger than 600 square feet (55.74 m^2).
      5.2.3. Anchored to resist flotation, collapse or lateral movement resulting from design flood loads.
      5.2.4. Equipped with flood openings that comply with Section R306.2.2.
      5.2.5. Constructed of flood-damage-resistant materials that comply with Section R306.1.8. Have mechanical, plumbing and electrical systems, if applicable, that comply with Section R306.1.6.

Exception: Enclosed areas below the elevation required in this section, including *basements* with floors that are not below *grade* on all sides, shall meet the requirements of Section R306.2.2.

R306.2.2 Enclosed area below required elevation. Enclosed areas, including *crawl spaces*, that are below the elevation required in Section R306.2.1 shall:

1. Be used solely for parking of vehicles, building access or storage.
2. Be provided with flood openings that meet the following criteria and are installed in accordance with Section R306.2.2.1:
   2.1. The total net area of nonengineered openings shall be not less than 1 square inch (645 mm^2) for each square foot (0.093 m^2) of enclosed area where the enclosed area is measured on the exterior of the enclosure walls, or the openings shall be designed as engineered openings and the *construction documents* shall include a statement by a *registered design professional* that the design of the openings will provide for equalization of hydrostatic flood forces on exterior walls by allowing for the automatic entry and exit of floodwaters as specified in Section 2.7.2.2 of ASCE 24.
   2.2. Openings shall be not less than 3 inches (76 mm) in any direction in the plane of the wall.
   2.3. The presence of louvers, blades, screens and faceplates or other covers and devices shall allow the automatic flow of floodwater into and out of the enclosed areas and shall be accounted for in the determination of the net open area.
3. <u>An exterior door that meets the requirements of Section R609 shall be installed at the top of *stairs* that provide access to the *building*.</u>

Exceptions: The following shall not be required to comply with this section:

1. Elevator shafts.
2. Utility chases that protect utility lines from freezing, provided that the utility chases are the minimum size necessary to protect the utility lines and do not provide access for a *person* to enter the space.

R306.2.2.1 Installation of openings. The walls of enclosed areas shall have openings installed such that:

1. There shall be not less than two openings on different sides of each enclosed area; if a *building* has more than one enclosed area, each area shall have openings.
2. The bottom of each opening shall be not more than 1 foot (305 mm) above the higher of the final interior grade or floor and the finished exterior *grade* immediately under each opening.
3. Openings shall be permitted to be installed in doors and windows; doors and windows without installed openings do not meet the requirements of this section.

<u>**Exception:**</u>

1. <u>For enclosed areas with only one exterior wall, flood openings in only that one exterior wall shall be permitted.</u>

2. <u>For buildings on sloped sites where the exterior grade is below the elevation required in Section R306.2.1 on only one exterior wall, the flood openings required for the enclosed area shall be located on that exterior wall.</u>

R306.2.4 Tanks. Underground tanks shall be anchored to prevent flotation, collapse and lateral movement under conditions of the base flood. Above-ground tanks shall be installed at or above the elevation required in Section R306.2.1 or shall be anchored to prevent flotation, collapse and lateral movement under conditions of the <u>design</u> ~~base~~ flood.

R306.3.2 Elevation requirements.

1. *Buildings* and structures erected within coastal high-hazard areas and Coastal A Zones, shall be elevated so that the bottom of the lowest horizontal structural members supporting the lowest floor, with the exception of piling, pile caps, columns, grade beams and bracing, is elevated to or above the base flood elevation plus 1 foot (305 mm) or the design flood elevation <u>determined in Section R306.1.4</u> , whichever is higher. Where stem wall foundations are permitted in Coastal A Zones in accordance with Section R306.3.3, the bottom of the lowest horizontal structural member supporting the lowest floor is the top of the foundation wall, or top of the portion of the foundation wall, supporting the slab.
2. *Basement* floors that are below *grade* on all sides are prohibited.
3. Attached garages used only for parking, building access or storage, and carports shall comply with Item 1 or shall be at or above *grade* on not less than one side and, if enclosed with walls, such walls shall comply with Item 7.
4. Detached *accessory structures* and detached garages shall comply with either of the following:
   - 4.1. The bottom of the lowest horizontal structural member supporting the floors shall be elevated to or above the elevation required in Item 1.
   - 4.2. Floors below the elevations required in Item 1 must be:
     - 4.2.1. Used only for parking or storage.
     - 4.2.2. One *story* and not larger than 100 square feet (9.29 m^2).
     - 4.2.3. Anchored to resist flotation, collapse or lateral movement resulting from design flood loads.
     - 4.2.4. Constructed of flood damage-resistant materials that comply with Section R306.1.8.
     - 4.2.5. Equipped with mechanical, plumbing and electrical systems, if applicable, that comply with Section R306.1.6.
5. The use of fill for structural support is prohibited.
6. Minor grading, and the placement of minor quantities of fill, shall be permitted for landscaping and for drainage purposes under and around buildings and for support of parking slabs, pool decks, patios and walkways.
7. Walls and partitions enclosing areas below the elevation required in this section shall meet the requirements of Sections R306.3.5 and R306.3.6.

R306.3.7 Stairways and ramps. *Stairways* and *ramps* that are located below the lowest floor elevations specified in Section R306.3.2 shall comply with one or more of the following:

1. Be designed and constructed with open or partially open *risers* and *guards*.
2. *Stairways* and *ramps* not part of the required means of egress shall be designed and constructed to break away during design flood conditions without causing damage to the *building* or structure, including foundation.
3. Be retractable, or able to be raised to or above the lowest floor elevation, provided that the ability to be retracted or raised prior to the onset of flooding is not contrary to the means of egress requirements of the code <u>and the stairs and ramps are capable of resisting code-required wind loads in the retracted or raised position</u>.
4. Be designed and constructed to resist flood loads and minimize transfer of flood loads to the *building* or structure, including foundation.

Areas below *stairways* and *ramps* shall not be enclosed with walls below the elevation required in Section R306.3.2 unless such walls are constructed in accordance with Section R306.3.5.

SECTION R317 GARAGES AND CARPORTS

R317.3 Flood hazard areas. Garages and carports located in flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2 shall be constructed in accordance with Section R306.

SECTION R401 GENERAL

R401.1 Application. The provisions of this chapter shall control the design and construction of the foundation and foundation spaces for *buildings*. In addition to the provisions of this chapter, the design and construction of foundations in flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2 shall meet the provisions of Section R306. Wood foundations shall be designed and installed in accordance with AWC PWF.

Exception: The provisions of this chapter shall be permitted to be used for wood foundations only in the following situations:

1. In *buildings* that have not more than two floors and a roof.
2. Where interior *basement* and foundation walls are constructed at intervals not exceeding 50 feet (15 240 mm).

Wood foundations in *Seismic Design Category* D_0, D_1 or D_2 shall be designed in accordance with accepted engineering practice.

SECTION R404 FOUNDATION AND RETAINING WALLS

R404.1.9.5 Masonry piers in flood hazard areas. Masonry piers for *dwellings* in flood hazard areas, including special flood hazard areas and 500-year floodplains, shall be designed in accordance with Section R306.

SECTION R408 UNDER-FLOOR SPACE

R408.7 Flood resistance. For *buildings* located in flood hazard areas, including special flood hazard areas and 500-year floodplains, as established on the flood hazard maps identified in Table R301.2:

1. Walls enclosing the under-floor space shall be provided with flood openings in accordance with Section R306.2.2.
2. The finished ground level of the under-floor space shall be equal to or higher than the outside finished ground level on at least one side.

Exception: Under-floor spaces that meet the requirements of FEMA TB 11.

CHAPTER 13 GENERAL MECHANICAL SYSTEM REQUIREMENTS

SECTION M1301
GENERAL

M1301.1.1 Flood-resistant installation. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, mechanical *appliances, equipment* and systems shall be located or installed in accordance with Section R306.1.6.

CHAPTER 14
HEATING AND COOLING EQUIPMENT AND APPLIANCES

SECTION M1401
GENERAL

M1401.5 Flood hazard. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, heating and cooling *equipment* and *appliances* shall be located or installed in accordance with Section R306.1.6.

CHAPTER 16
DUCT SYSTEMS

SECTION M1601
DUCT CONSTRUCTION

M1601.4.10 Flood hazard areas. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, *duct systems* shall be located or installed in accordance with Section R306.1.6.

CHAPTER 17
COMBUSTION AIR

SECTION M1701
GENERAL

M1701.2 Opening location. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established on the flood hazard maps identified in Table R301.2, *combustion air* openings shall be located at or above the elevation required in Section R306.2.1 or R306.3.2.

CHAPTER 20
BOILERS AND WATER HEATERS

SECTION M2001
BOILERS

M2001.4 Flood-resistant installation. In flood hazard areas, including special flood hazard areas and 500-year floodplains, established on the flood hazard maps identified in Table R301.2, boilers, water heaters and their control systems shall be located or installed in accordance with Section R306.1.6.

CHAPTER 21
HYDRONIC PIPING

SECTION M2101
HYDRONIC PIPING SYSTEMS INSTALLATION

M2101.29.1 Flood hazard. Piping located in ~~a~~ flood hazard areas, including special flood hazard areas and 500-year floodplains, shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the design flood elevation.

CHAPTER 22
SPECIAL PIPING AND STORAGE SYSTEMS

SECTION M2201
OIL TANKS

M2201.6 Flood-resistant installation. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, tanks shall be installed in accordance with Section R306.2.4 or R306.3.10.

CHAPTER 26
GENERAL PLUMBING REQUIREMENTS

SECTION P2601
GENERAL

P2601.3 Flood hazard areas. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, plumbing fixtures, drains, and *appliances* shall be located or installed in accordance with Section R306.1.6.

SECTION P2602
INDIVIDUAL WATER SUPPLY AND SEWAGE DISPOSAL

P2602.2 Flood-resistant installation. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2:

1. Water supply systems shall be designed and constructed to prevent infiltration of floodwaters.
2. Pipes for sewage disposal systems shall be designed and constructed to prevent infiltration of floodwaters into the systems and discharges from the systems into floodwaters.

CHAPTER 27
PLUMBING FIXTURES

SECTION P2705

INSTALLATION

P2705.1 General. The installation of fixtures shall conform to the following:

1. Floor-outlet or floor-mounted fixtures shall be secured to the drainage connection and to the floor, where so designed, by screws, bolts, washers, nuts and similar fasteners of copper, copper alloy or other corrosion-resistant material.
2. Wall-hung fixtures shall be rigidly supported so that strain is not transmitted to the plumbing system.
3. Where fixtures come in contact with walls and floors, the contact area shall be watertight.
4. Plumbing fixtures shall be usable.
5. Water closets, lavatories and bidets. A water closet, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition or vanity or closer than 30 inches (762 mm) center-to-center between adjacent fixtures. There shall be a clearance of not less than 21 inches (533 mm) in front of a water closet, lavatory or bidet to any wall, fixture or door.
6. The location of piping, fixtures or equipment shall not interfere with the operation of windows or doors.
7. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, plumbing fixtures shall be located or installed in accordance with Section R306.1.6.
8. Integral fixture-fitting mounting surfaces on manufactured plumbing fixtures or plumbing fixtures constructed on site, shall meet the design requirements of ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.4.

CHAPTER 30
SANITARY DRAINAGE

SECTION P3001
GENERAL

P3001.3 Flood-resistant installation. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, drainage, waste and vent systems shall be located and installed to prevent infiltration of floodwaters into the systems and discharges from the systems into floodwaters.

CHAPTER 31
VENTS

SECTION P3101
VENT SYSTEMS

P3101.5 Flood resistance. In flood hazard areas, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2, vents shall be located at or above the elevation required in Section R306.2 (flood hazard areas including A Zones and 500-year floodplains) or R306.3 (coastal high-hazard areas including V Zones and Coastal A Zones, where designated).

24—~~14~~ 24 Flood Resistant Design and Construction

APPENDIX BA
MANUFACTURED HOUSING USED AS DWELLINGS

SECTION BA101
SCOPE

BA101.2 Flood hazard areas. New and replacement *manufactured homes* to be installed in flood hazard areas, including special flood hazard areas and 500-year floodplains as established on the flood hazard maps identified in Table R301.2 shall meet the applicable requirements of Section R306.

APPENDIX BI
LIGHT STRAW-CLAY CONSTRUCTION

SECTION BI101
GENERAL

BI101.2 Flood hazard areas. In flood hazard areas, including special flood hazard areas and 500-year floodplains, established on the flood hazard maps identified in Table R301.2, *buildings* using *light* straw-clay *infill* shall meet the requirements of Section R306.

APPENDIX BJ
STRAWBALE CONSTRUCTION

SECTION BJ101
GENERAL

BJ101.3 Flood hazard areas. In flood hazard areas, including special flood hazard areas and 500-year floodplains established on the flood hazard maps identified in Table R301.2, *buildings* using *strawbale* wall systems shall meet the requirements of Section R306.

APPENDIX BO
EXISTING BUILDINGS AND STRUCTURES

SECTION BO102
COMPLIANCE

BO102.7 Flood hazard areas. Work performed in existing buildings located in a flood hazard area, including special flood hazard areas and 500-year floodplains, as established ~~by~~ on the flood hazard maps identified in Table R301.2 shall be subject to the provisions of Section R104.3.1.

Reason: This proposal is a coordination proposal to bring the 2027 edition of the I-Codes up to date with the provisions in the 2022 edition of *ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, Supplement 2* (ASCE/SEI 7-22, Supplement 2) as well as the 2024 edition of *ASCE/SEI 24 Flood Resistant Design and Construction* (ASCE/SEI 24-24) --- specifically for the codes primarily affected such as the International Building Code (IBC), the International Residential Code (IRC), and the International Existing Building Code (IEBC), in Group B, but also every I-Code affected by a coordinating code change that will need to be updated. ASCE/SEI 7-22 is the current reference in 2024 I-Codes and Supplement 2 has been submitted as an Administrative Update. ASCE/SEI 24-24 has also been submitted as an Administrative Update to the 2027 I-Codes.

This proposal has been organized into Part I to Part VII and includes technical updates as well as editorial coordination. The specific changes to each section included in this proposal are outlined in Overview below, and a detailed summary of the technical updates are explained in Technical Rationale below that. In addition to the strike out/underline for the code change proposals, the MS Word documents for each affected I-Code have been provided as Attached Files for clarity.

Overview:

IRC Sections: These changes for the IRC provide similar updates to the IBC and IEBC, just provided in a separate Code Change Proposal. However, all changes must be included across all I-Codes for a comprehensive proposal - IBC, IRC and IEBC are included in Group B; the others will need to be addressed in the next Group A cycle.

Chapter 1 Scope: Add phase “including special flood hazard areas” for clarity. And change to “base flood elevations” from “design flood elevations” to clarify the applicable requirements for the two separate terms. See Section 202 for the updated definitions. These two changes are carried out throughout the code change proposal for clarification and consistency.

Chapter 2 Definitions: Adds a new definition for “500-year Floodplain” to distinguish it from the existing definition. While “Base Flood” remains the same, “Base Flood Elevation” is updated along with “Design Flood” and “Design Flood Elevation”. “Flood Hazard Area” is updated and a new definition for “Special Flood Hazard Area” is added.

Chapter 3: changes included to align with standards including add phase “including special flood hazard areas” following flood hazard area for clarity.

Table R306.1.4 Determination of 500-Year Flood Provisions: This new Table is added to provide a prescriptive method for determining the elevation of the 500-year flood given the scenarios of how the flood data is provided for the flood location.

Section 306.2.2.1: Provides a clarification to the requirement and clear exceptions for how requirements are applied.

Chapter 4: changes included to align with standards including add phase “including special flood hazard areas” following flood hazard area for clarity.
Chapter 44: Illustrates the updates that will be made to the reference standards ASCE 7-22 and ASCE/SEI 24-24; updates to reference standards have been submitted to Group B Admin. **Appendix BA, BI, BJ, BO:** Consistent updates made throughout these relevant Appendices.

Mechanical: changes included to align with standards including add phase “including special flood hazard areas and 500-year floodplains” following flood hazard area for clarity.

Plumbing: changes included to align with standards including add phase “including special flood hazard areas and 500-year floodplains” following flood hazard area for clarity.

Technical Rationale:

The American Society of Civil Engineers (ASCE) is proposing revisions to the International Code Council’s I-Codes for the 2027 Cycle to align the national codes with the current ASCE/SEI design standards including:

ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures, 2022 edition; Supplement 2 (ASCE/SEI 7-22 S2)

ASCE/SEI 24 Flood Resistant Design and Construction, 2024 edition (ASCE/SEI 24-24)

The loading standard ASCE/SEI 7-22 S2 and the design standard ASCE/SEI 24-24 work together – these documents have been developed to be consistent and coordinated so they can be required and used together. There are three significant changes in the national loading standard ASCE/SEI 7-22 S2 including (1) an extension of the defined Flood Hazard Area to the 500-year floodplain for Rick Category II, III, and IV structures, (2) an inclusion of risk-based design for loads, and (3) requirements to include relative sea level change into design load calculations for coastal sites; see below for more technical details. There are three significant changes in the national design standard ASCE/SEI 24-24 including (1) alignment with ASCE/SEI 7-22 S2, (2) alignment with FEMA Technical Bulletins, and (3) updates for elevations, materials, and floodproofing.

Both ASCE/SEI Standards are available for purchase and the Supplement available as a free download from the ASCE Library:

ASCE/SEI 7-22 (https://doi.org/10.1061/9780784415788)

ASCE/SEI 7-22 Supplement 2 (https://doi.org/10.1061/9780784415788.sup2)

ASCE/SEI 24-24 (https://doi.org/10.1061/9780784485781)

Flood Hazard:

The ASCE 7-22 S2 updates the design requirements to define the flood hazard area for the given Risk Category of structure. Addionally, the flood hazard depth is tied to the mean recurrence interval for a given Risk Category of structure. The design flood hazard is related to Risk Category (e.g., RC II will be designed to 500-year MRI), which is consistent with the way other environmental hazards (such as wind and snow loads) relate the hazard to Risk Category. This is in contrast to the current code requirements, which only considers only 100-year MRI flood for all structures regardless of Risk Category. In some areas in the U.S., the Authority Having Jurisdiction is already requiring a higher design requirement for the flood hazard. The city of Houston, for example, moved to requiring use of the 500-year MRI as the design basis for flood following the devastation from Hurricane Harvey. At a national level, FEMA is considering the use of the 500-year flood as the basis for floodplain management.

The coordinated code change proposals submitted for Group B are drafted to bring the IBC, IRC, and IEBC into alignment with the recent changes in ASCE 7-22 Supplement 2 and ASCE 24-24. The significant changes from the updates to these standards are to differentiate between the base flood (also described as the 100-year flood, or the 1% or greater chance of flooding in any given year) and the design flood, which could be different, and is defined in the standards for each Risk Category. The design flood must include considerations for loading specified in ASCE/SEI 7-22 S2 and design specified in ASCE/SEI 24-24.

Flood damage, and associated loss dollars, has significantly expanded since the last major updates of ASCE 7 Chapter 5 and ASCE 24. Their revisions attempt to close that gap and align the risks across other hazards.

FEMA cites that flood damage cost approximately $17 billion each year between 2010 and 2018, and with rising sea levels and extreme weather could cause $20 billion of flood damage to at-risk US homes this year, rising to $32 billion by 2051. Data from 2018 Hurricane Michael shows that 42% of claimed damage amounts were in the Shaded X-Zone (500-year floodplain), exceeding the amounts in both the A and V-Zones. (FEMA. Mitigation Assessment Team Report Hurricane Michael in Florida (FEMA P-2077), February 2020).

This is further supported by FEMA’s recent report “A Cost and Benefits Analysis of Increased Elevation Requirements for Public and Nonresidential Buildings in Riverine and Coastal Floodplains,” which evaluated the potential avoided losses (benefits) for 8 building types in 19 coastal floodplains and 14 riverine floodplains in the 100-year floodplain and the Shaded X Zone. The report shows that there are significant benefits to most buildings in the 100-year floodplain, particularly in steep/narrow floodplains. There were also significant benefits to buildings in the Shaded X Zone where there are currently no elevation requirements. These findings are supported by evidence from the National Flood Insurance Program (NFIP), which stated, “People outside of high-risk areas file more than 25 percent of NFIP claims and receive one-third of disaster assistance for flooding. The NFIP’s preferred risk policies are designed for residential properties located in low- to moderate-risk flood zones.” Additional reports from the NFIP indicate that 40% of companies fail to reopen after a disaster, with another 25% closing within a year. These problems are only further exacerbated by the influence of development and associated runoff, changes in precipitation rates, local subsidence, and sea level change. All of which are not accounted for by FEMA’s flood maps, which only account for historic flood data and not future projections. All of this data supports the need to move from a fixed freeboard approach to a risk-based elevation approach that provides consistent protection from flat/wide floodplains to steep/narrow floodplains and more appropriately addresses the influence of wave action in coastal floodplains. This recognizes that true resiliency for communities is continuity of local businesses and making sure that public services are maintained and that adaptation to changes in precipitation, development, and sea level change must be incorporated into new buildings rather than relying on often prohibitively expensive retrofit options.

The ASCE changes consider the frequency of recent and predicted events and the significant damage recorded in the Shaded X-Zone. But, while significant, the addition of the Shaded X-Zone to the standards represents a change to only 4% of the U.S. population. The additional elevation requirements to raise homes within the special flood hazard area to above the 500-year flood elevation will affect an additional 3% of the US population. The total US population affected by the flood resistant construction requirements in this proposal would be 7% per FEMA estimates. The NYU Furman Center estimates that nearly 10% of the nation's population live in the combined 100-year and 500-year floodplain. A study from the University of Bristol argues that outdated FEMA maps underestimate the flood risk and pin the percent of the US population who reside in the 100-year floodplain to as high as 13%.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

ASCE Consensus Process:

ASCE established and maintains an ANSI-accredited, consensus process for standard development. The open process includes selection of a balanced committee, including representation of all affected stakeholders, and public review of the draft standard prior to publication. The ASCE consensus process follows the *ASCE Rules for Standards Committees*, which is published on the ASCE website. The ASCE/SEI 7-22 S2 was developed by the ASCE 7-22 Standard Committee, which included approximately 50 voting members and hundreds more associate members. The ASCE/SEI 24-24 standard was developed by the ASCE 24-24 Standard Committee, which included approximately 25 voting members and 15 associate members.

Supporting Organizations:

This code change proposal has many supporters, included but not limited to the following organizations:

American Flood Coalition

Association of State Flood Plain Managers (ASFPM)

BuildStrong America

Federal Emergency Management Association

Flood Mitigation Industry Association (FMIA)

National Institute of Building Science (NIBS)

Registered Designer Professionals and planners of buildings and other infrastructure projects, Code Officials, and Authorities Having Jurisdiction owe it to the public and have an ethical obligation to provide a framework for safe, reliable structures. The public expects that the buildings in which they live, work, and play are designed consistently, with the same risk approach for all environmental hazards. Flooding is disruptive to families, businesses, and communities and it takes years to recover from these devastating disasters and overcome the losses incurred. The flood hazard must be taken seriously and incorporated into our design standards and building codes in a manner that is consistent with all of the other environmental hazards.

Cost Impact: Increase

- **2025 Cost and Benefits Analysis for ASCE 24-24.PDF**
  https://www.cdpaccess.com/proposal/12230/35915/documentation/186663/attachments/download/9878/

Estimated Immediate Cost Impact:

ASCE 7 and ASCE 24 are national minimum design standards. The effects will vary depending upon the local flood conditions and flood risk across the country and among building types. For nearly 90% of all affected structures in Numbered A Zones, the estimated immediate costs impact can be understood in analysis of the mitigation cost as a percentage of building replacement value from 0.2-6.6% for coastal sites and 0.0-4.0% for riverine sites. Additionally, average benefits per square foot range from $51-$336 for both riverine and coastal flooding, which are dependent on building type and location. See the attached “Cost and Benefits Analysis” for additional information.

This proposal reflects the latest flood hazard science, but in general does not represent a fundamental increase in loads, resulting in higher construction costs. However, with the introduction of a higher flood design return period and future considerations for Sea Level Change, the design flood loads have increased for structures currently located in a designated flood hazard area. The ASCE revisions do not add structures to the currently defined flood hazard area, but do add small-depth flood loads for new construction in the Shaded X-Zone where there currently are none.

Estimated Immediate Cost Impact Justification (methodology and variables):

The following analysis was conducted using the cost data from the attached peer reviewed journal paper ***Material quantities and estimated construction costs for new elevated IRC 2015-compliant single-family home foundations*** (published in 2023) and using a national NFIP flood dataset to approximate the average freeboard height for all A Zones in the US.

The increase in foundation height was calculated using the NFIP flood dataset that provides the average numbered A Zone per US census tract. Numbered A Zones represent groupings of floodplains that are sorted based on the average height difference between the 10-year flood and the 100-year flood. The floodplains are sorted into categories from A01 through A30. Each increment A01 through A20 are differentiated by 6-inch increments, meaning that the difference between the 10-year flood and the 100-year flood is 6 inches for an A01 and the difference between the 10-year flood and 100-year flood is 10 feet for an A20. Between A20 and A30 the difference between the 10-year and 100-year flood is differentiated by 1-foot increments, meaning that an A30 has a difference of 20 feet between the 10-year flood and the 100-year flood.

For A Zones, calculations were done to determine the difference between the 2024 IRC requirement of BFE+1 foot and the proposed ASCE 24-24 elevation requirements for Flood Design Class 2. In situations where the 2024 IRC and ASCE 24-24 were the same a value of 0 was assigned. For each numbered A Zone where ASCE 24-24 exceeded the 2024 IRC the difference in elevation was calculated. A weighting factor was assigned to each numbered A Zone based on the US census tract data and represented as a percentage value of how many times that numbered A Zone is the most likely A Zone across the US. This provided a percentage breakdown for all numbered A Zones. This weighting factor was then applied to the difference in elevation between the ASCE 24-24 elevation and the 2024 IRC elevation values. The national average of increased elevation between the 2024 IRC and ASCE 24-24 compliance was approximately **1.2 feet** of additional elevation.

For Shaded X Zones (the 500-year floodplain) the same weighting factor for each numbered A Zone was applied. This is applicable because the numbered A Zones can roughly represent the overall floodplain cross section rather than just the cross section in the Special Flood Hazard Area (100-year floodplain). Since Shaded X Zones represent the land area between the 100-year flood elevation and the 500-year flood elevation a different technique for calculating elevation needed to be applied. In these areas there has historically been no elevation requirements. Since buildings could be constructed anywhere between the 101-year flood elevation and the 500-year flood elevation the mid-point was selected as the most likely elevation for the hypothetical building. In the Shaded X Zone this would be the ground elevation for the 300-year flood elevation. For each numbered A Zone the 300-year flood elevation was calculated to represent the ground elevation. A comparison was conducted to determine the greater of BFE+1 or the 500-year flood elevation for each numbered A Zone. The larger elevation was then subtracted from the 300-year flood elevation (ground elevation). The weighting factors for each numbered A Zone were then applied to the calculated elevation and a national average for compliance with ASCE 24-24 was determined to be approximately **0.74 feet** of additional elevation.

Data was pulled from **Table 6. Unit foundation cost increase with elevation** of the journal article in order to approximate the increase in foundation costs. Costs were provided on a $/m^2 basis for a variety of building sizes, aspect ratios of foundations and unit foundation costs for multiple heights of foundation. The costs, areas, and heights were adjusted from metric to US customary units. Within each aspect ratio the unit costs for a range of heights were compiled to create a line equation to approximate the cost between foundation heights. For A Zones and Shaded X Zones a square foot cost was calculated for each foundation type at the national average height of foundation (1.2 feet for A Zones and 0.74 feet for Shaded X Zones). The increase in foundation costs were the averaged across the different aspect ratios for each foundation type for each building size. An additional average was created across the four crawlspace foundation types represented in the journal article. This provides an approximate cost increase for three different size buildings for two different foundation types (slab on fill and crawlspace) for A Zones and Shaded X Zones. The 2,002 square foot building is indicated in the journal article to best represent the national average size single family house. According to the journal article the costs represent 2022 dollars.

	A Zone		Shaded X Zone	
Building Area (SF)	Slab On Fill Foundation	Crawlspace Foundation	Slab On Fill Foundation	Crawlspace Foundation
1496	$ 2,721	$ 2,903	$ 1,412	$ 1,761
2002	$ 3,087	$ 3,581	$ 1,526	$ 2,170
2497	$ 3,702	$ 3,981	$ 1,887	$ 2,406

Avoided Loses:

The increase in foundation cost due to additional elevation helps to avoid losses due to flooding for homes in special flood hazard areas and Shaded Zone X. It also avoids costs associated with displacement and temporary housing following storm damage. Additional elevation increases the likelihood that a home is liveable after a storm, decreases property damage and the need for replacement, and reduces risk. There is no FDIC or federally regulated lender requirement to maintain flood insurance in the Shaded Zone X. This lack of requirements to maintain an NFIP policy is coupled with high losses in the Shaded Zone X. Homeowners within the 500-year floodplain that don’t add the optional cost of a policy are left with little support when flood events exceed a Base Flood (100-year) event which has a 26 percent chance of being exceeded over a 30 year mortgage.

Staff Analysis: This proposal includes technical revisions to the code text to coordinate with an update of an existing referenced standard. This standard must be completed and readily available prior to the Public Comment Hearing. See CP28 Section 4.6.3.1.2.
CC # S97-25 Part VII and CC # S99-25 Part II addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S97-25 Part VII

S98-25

IBC: 1612.1, G103.1; IEBC: [BS] 401.3

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Building Code

Revise as follows:

1612.1 General. Within *flood hazard areas* as established in Section 1612.3, all new construction of *buildings*, *structures* and portions of *buildings* and *structures*, including *substantial improvement* and repair~~restoration~~ of *substantial damage* to *buildings* and *structures*, shall be designed and constructed to resist the effects of flood hazards and *flood loads*. For *buildings* that are located in more than one *flood hazard area*, the provisions associated with the most restrictive *flood hazard area* shall apply.

G103.1 General. This appendix, in conjunction with this code, provides minimum requirements for *development* located in *flood hazard areas*, including:

1. The subdivision of land.
2. Site improvements and installation of utilities.
3. Placement and replacement of *manufactured homes*.
4. Placement of *recreational vehicles*.
5. New construction and *repair*, reconstruction, rehabilitation or *additions* to new construction.
6. *Substantial improvement* of *existing buildings* and *structures*, including ~~restoration after~~ repair of substantial damage.
7. Installation of tanks.
8. *Temporary structures*.
9. Temporary or permanent storage, utility and miscellaneous Group U *buildings* and *structures*.
10. Certain building work exempt from *permit* under Section 105.2 and other *buildings* and *development* activities.

2024 International Existing Building Code

Revise as follows:

[BS] 401.3 Flood hazard areas. In *flood hazard areas*, buildings that have sustained *substantial damage* shall be brought into compliance~~*repairs* that constitute *substantial improvement* shall require that the building comply~~ with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

Reason:
"Substantial damage" is a defined term. Buildings in flood hazard areas that are damaged by any cause must be examined to determine whether the cost to repair the damage to pre-damage conditions meets a specific test. Damage is repaired, not "restored." In previous code cycles the phrase "restore substantial damage" was replaced with "repair of substantial damage."

For the IBC, this proposal completes the editorial adjustments for consistency throughout the codes. For the IRC, the proposal results in consistency in phrasing between Sec. 401.3 and Sec. 405.2.6.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is editorial to make the phrase "repair of substantial damage" consistent across codes. There is no change to the technical content of the provisions. By making similar language more consistent there will be no cost impact when approving this proposal.

S99-25 Part I

IBC: 1612.3.1, 1612.3.2

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1612.3.1 Determination of design ~~Design~~ flood elevations. Where *design flood elevations* are not included on~~in~~ the flood hazard map adopted by the community~~*areas* established in Section 1612.3~~, or where *floodways* are not designated, the *building official* is authorized to require the applicant to comply with~~do~~ one of the following:

1. Obtain and reasonably utilize ~~any~~ *design flood elevation* and *floodway* data available from a federal, state or other source.
2. Determine the *design flood elevation* or *floodway* in accordance with accepted hydrologic and hydraulic engineering practices used to define special *flood hazard areas*. Determinations shall be undertaken by a *registered design professional* who shall document that the technical methods used reflect currently accepted engineering practice. Studies, analyses and computations shall be submitted in sufficient detail to allow thorough review and approval.

1612.3.2 Determination of impacts. In riverine *flood hazard areas* where *design flood elevations* are specified but *floodways* have not been designated, the applicant shall provide a *floodway* analysis that demonstrates that the proposed ~~work~~ buildings and structures, including fill, when combined with other existing and anticipated flood hazard area encroachments, will not increase the *design flood elevation* more than 1 foot (305 mm) at any point within the *jurisdiction* ~~of the applicable governing authority.~~

S99-25 Part I

S99-25 Part II

IRC: R106.1.4, R306.1.4.1, R306.1.4.2

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Residential Code

Revise as follows:

R106.1.4 Information for construction in flood hazard areas. For *buildings* and structures located in whole or in part in flood hazard areas as established by Table R301.2, *construction documents* shall include:

1. Delineation of flood hazard areas, floodway boundaries and flood zones and the design flood elevation, as appropriate.
2. The elevation of the proposed lowest floor, including *basement*; in areas of shallow flooding (AO Zones), the height of the proposed lowest floor, including *basement*, above the highest adjacent *grade*.
3. The elevation of the bottom of the lowest horizontal structural member in coastal high-hazard areas (V Zone) and in Coastal A Zones where such zones are delineated on flood hazard maps identified in Table R301.2 or otherwise delineated by the *jurisdiction*.
4. ~~If~~ Where design flood elevations are not included on the community's Flood Insurance Rate Map (FIRM) and where floodways are not designated in riverine flood hazard areas, they shall be determined in accordance with Section R306.1.4.1. ~~, the *building official* and the applicant shall obtain and reasonably utilize any design flood elevation and floodway data available from other sources.~~

R306.1.4.1 Determination of design flood elevations. ~~If~~ Where design flood elevations are not included in the flood hazard map adopted by the community~~specified~~, or where floodways are not designated, the *building official* is authorized to require the applicant to comply with one~~either~~ of the following:

1. Obtain and reasonably use design flood elevation and floodway data available from a federal, state or other source.
2. Determine the design flood elevation in accordance with accepted hydrologic and hydraulic engineering practices used to define special flood hazard areas. Determinations shall be undertaken by a *registered design professional* who shall document that the technical methods used reflect currently accepted engineering practice. Studies, analyses and computations shall be submitted in sufficient detail to allow thorough review and *approval*.

R306.1.4.2 Determination of impacts. In riverine flood hazard areas where design flood elevations are specified but floodways have not been designated, the applicant shall provide a floodway analysis that demonstrates~~demonstrate~~ that the ~~effect of the~~ proposed *buildings* and structures ~~on design flood elevations~~, including fill, when combined with other existing and anticipated flood hazard area encroachments, will not increase the design flood elevation more than 1 foot (305 mm) at any point within the *jurisdiction*.

Reason:
The primary purpose of this proposal is to achieve consistency between similar sections in the IBC and IRC for floodway impacts. The proposal also improves grammar and simplifies the reference to the community's adopted flood map. The proposal is editorial in nature. The sections address two scenarios: (1) when special flood hazards areas do not have base flood elevations, and (2) when riverine waterway floodplains have base flood elevations, but do not have designated floodways. These requirements have been in the National Flood Insurance Program regulations for decades, which means they are not new to the nearly 24,000 local governments that participate in the NFIP.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal makes editorial changes primarily to make similar sections consistently written across the IBC and IRC and to improve readability. There is no change to the technical content of the provisions. Improving consistency creates no cost impact when approving this proposal.

Staff Analysis: CC # S97-25 Part VII and CC # S99-25 Part II addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S99-25 Part II

S100-25

IBC: 1613.1

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net)

2024 International Building Code

Revise as follows:

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to *structures* and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with Chapters 11, 12, 13, 15, 17 and 18 of ASCE 7, as applicable. The *seismic design category* for a *structure* is permitted to be determined in accordance with Section 1613 or ASCE 7. <u>For purposes of satisfying Chapter 13 of ASCE 7, any building or structure assigned to Risk Category IV for reasons unrelated to quantities of highly toxic or other hazardous materials shall be considered an Essential Facility within the ASCE 7 definition of that term.</u>

Exceptions:

1. Detached one- and two-family *dwellings*, assigned to *Seismic Design Category* A, B or C.
2. The *seismic force-resisting system* of wood-frame *buildings* that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage *structures* intended only for incidental human occupancy.
4. *Structures* that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic *structures*, buried utility lines and their appurtenances and nuclear reactors.
5. References within ASCE 7 to Chapter 14 shall not apply, except as specifically required herein.
6. *Temporary structures* complying with Section 3103.6.1.4.

Reason: This proposal fixes a coordination snafu between the IBC and ASCE 7 with respect to the assignment of importance factors for the seismic design of nonstructural components.

Here's the problem:

- Any building or structure assigned to Risk Category IV in the IBC is meant to have an I_p factor of 1.5, which also makes many of its nonstructural components subject to seismic certification.
- With the 2024 IBC, the overall description of RC IV was expanded to include not only *essential facilities* but also certain other buildings where failure would represent a substantial hazard. The code does not say whether these other buildings (or any building, for that matter) is or is not officially designated as an *essential facility*. In any case, it was always the clear intent of this change that any building in the latter sub-category would then also have I_p = 1.5 and be subject to all the provisions for RC IV.
- However, while we were making that change to the IBC, ASCE 7 was separately revising its Section 13.1.3 (item 3) to say that a RC IV facility only gets to I_p = 1.5 if it also affects what ASCE 7 calls (capitalized) an Essential Facility.

The unintended effect is that any building not specifically "designated" as an *essential facility* by the IBC or as an Essential Facility by ASCE 7 will fall into a crack. As it happens, the IBC doesn't actually designate *essential facilities* anywhere, except by implication if they're otherwise assigned to RC IV. But in particular, the expanded description of RC IV now raises questions about whether any building in the RC IV box is there because it's *essential* or because it's a potential substantial hazard.

Consulting with members of the ASCE 7 committee, it turns out that the change in ASCE 7 was meant to distinguish the buildings assigned to RC IV only because of hazmat issues. Those buildings, per the ASCE 7 intent, should have adequate hazmat safety and containment but do not necessarily need to remain operational -- something *essential facility* or other RC IV status implies.

This proposal seals the crack. By designating all RC IV buildings as Essential Facilities for purposes of ASCE 7 Chapter 13 -- EXCEPT those assigned to RC IV only for hazmat reasons -- all the RC IV facilities will be handled by ASCE 7 as the IBC Structural Committee intended.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal restores the intent of the IBC Structural Committee and ICC membership from the last code cycle, closing an unintended gap with ASCE 7. If this proposal is approved, compliance with the Sec 1613 will require exactly what it was always intended to require.

S100-25

S101-25

IBC: 1613.1, 1613.1.1 (New)

Proponents: Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Seth Thomas, KPFF Consulting Engineers, representing Self (seth.thomas@kpff.com)

2024 International Building Code

Revise as follows:

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to *structures* and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with Chapters 11, 12, 13, 15, 17 and 18 of ASCE 7, as applicable, as amended by Section 1613.1.1 of this code. The *seismic design category* for a *structure* is permitted to be determined in accordance with Section 1613 or ASCE 7.

Exceptions:

1. Detached one- and two-family *dwellings*, assigned to *Seismic Design Category* A, B or C.
2. The *seismic force-resisting system* of wood-frame *buildings* that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage *structures* intended only for incidental human occupancy.
4. *Structures* that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic *structures*, buried utility lines and their appurtenances and nuclear reactors.
5. References within ASCE 7 to Chapter 14 shall not apply, except as specifically required herein.
6. *Temporary structures* complying with Section 3103.6.1.4.

Add new text as follows:

1613.1.1 ASCE 7 Section 12.8.1.1. ASCE 7 Section 12.8.1.1 shall be modified as follows.

1. Strike the following from Section 12.8.1.1, Method 1:Where Equation (12.8-2) is used and the period T is less than the period at which S_a is maximum, the maximum value of S_a shall be used.
2. Replace with the following:
   Where Equation (12.8-2) is used two conditions apply:
   - 2.1. S_a need not be larger than S_{DS}., and
   - 2.2. Where the period is less than that at which S_a is maximum, the value of S_a used shall not be taken as less than S_{DS}.

   where S_{DS} = Design spectral response acceleration parameter in the short period range as determined from Section 11.4.4 or 11.4.7

-

Reason: This proposal introduces an amendment to the seismic provisions of ASCE 7-22. It is intended that the amendment be in place for the 2027 IBC for use with ASCE 7-22 and be removed from the 2030 IBC as ASCE 7-28 is adopted. The amendment format mirrors that currently used in IBC concrete Sections 1901.2 and 1905 to amend ACI 318. The wording of the amendment is based on recent work of the ASCE 7-28 Seismic Subcommittee.

The Section 12.8.1.1 provisions up to the last paragraph are the same as published in ASCE 7-22 and provided here for context. The last paragraph starting with "Where Equation (12.8-1) is used" revises the published ASCE 7-22 provisions. The balance of ASCE 7-22 provisions are intended to remain unchanged.

With increased use of ASCE 7-22 seismic provisions, it has been identified that the new multi-period response spectra (MPRS) in some geographic locations reach peak design spectral response accelerations, S_a, larger than S_{DS}, and in some cases significantly larger than both S_{DS} and what has been used in past design. This is seen rather broadly in the Central and Eastern US, where S_a often spikes at very short periods (on the order of 0.075 seconds), as seen in Figure 1. It is understood that these spectral acceleration spikes had been known of in the past, but had by specific decision of the committees involved, not influenced assignment of the short-period spectral response acceleration, S_{DS}, used in design. With full multi-period spectra now readily available to designers, design guidance relative to this very short-period spike is needed.

This proposal modifies ASCE 7-22 equivalent lateral force (ELF) design provisions, giving specific design directions in response to the short-period spikes. Two rules are provided.

1. It is not intended that design be based on the S_a spike. It is instead permitted that S_a be capped at S_{DS} for very short periods for ELF analysis.
2. The minimum spectral response acceleration, S_a, at very short periods is not to be less than S_{DS} for purposes of ELF analysis.

In this proposal, these rules are provided at the end of Method 1 provisions in Section 12.8.1.1. Figure 2 illustrates these rules for a Charleston site. It is noted that the proposed capping of MPRS is applicable to ELF design at all geographic locations.

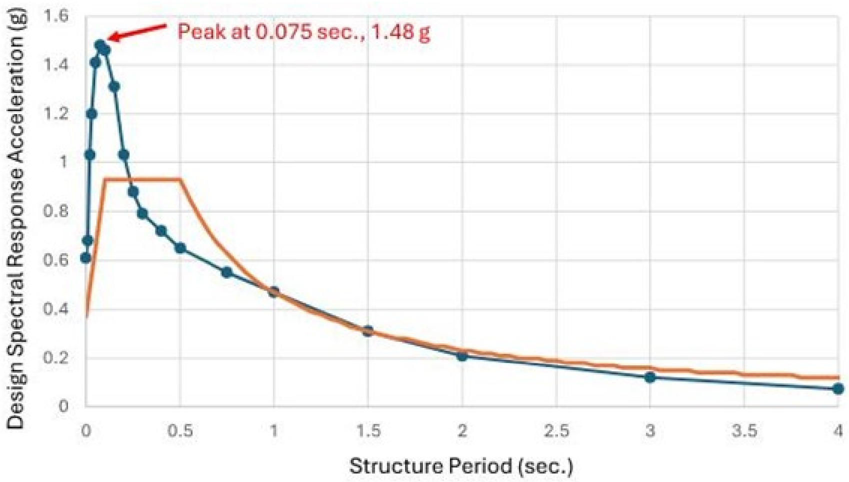

Figure 1. ASCE 7-22 design-level multi-period and two-period response spectra for Charleston, South Carolina using default site class. The short-period spike in the multi-period response spectrum is noted.

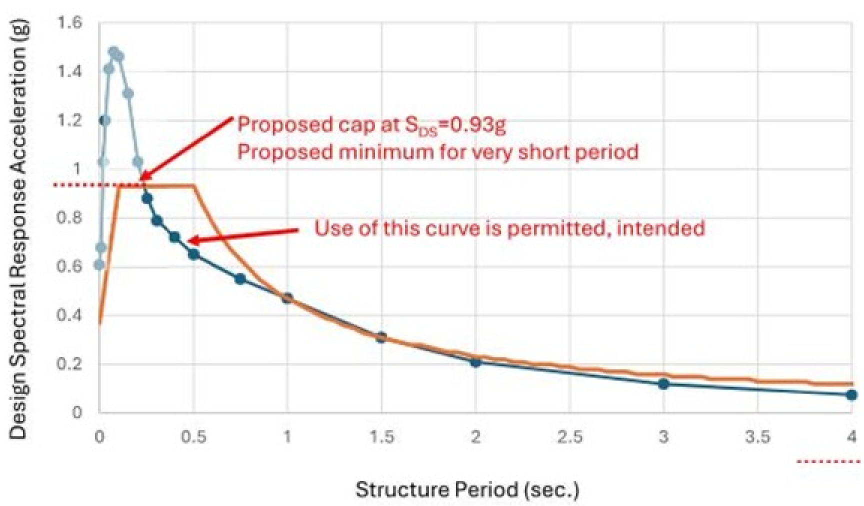

Figure 2. ASCE 7-22 design-level multi-period and two-period response spectra for Charleston, South Carolina illustrating the proposed cap for the multi-period response spectrum.

For ELF design it is also still permitted to use the traditional two-period design spectrum using the parameters S_{DS} and S_{D1}. The traditional method makes use of five equations for determining C_S. Equations (12.8-3), (12.8-4), and (12.8-5) are illustrated in ASCE 7-22 Figure C12.8-1a.

It is important that this guidance be adopted into the IBC to give a clear indication of intent to designers and plan reviewers. Within the ASCE standards process it has been determined that the modified language does not qualify as an erratum, nor does it qualify for consideration as a supplement. As a result, ASCE 7 will likely take action on this issue in the publication of ASCE 7-28. Until ASCE 7-28 is adopted, this IBC proposal is the best available method of making this information available to code users. The following provides further background on the spectral response acceleration spikes. The decision to ignore high spectral response accelerations at periods less than 0.2 seconds goes at least back to the 1997 NEHRP Provisions and the seismic provisions of ASCE 7-98. At that time the spectral acceleration spikes at short periods were identified but were judged to not be meaningful for building design. The spikes were identified to represent free-field ground motion (ground motions transmitted to the site soils). It was felt, however, that typical buildings themselves would not respond to these spikes. Commentary to the 1997 NEHRP Provisions (Appendix A, page 279) recognizes that the high peak acceleration "…has very little effect on the response of interest in ordinary structures." The concept also has a precedent in the definition of the effective peak response acceleration defined in the ATC-3 report, a precursor to the NEHRP Provisions. More recently, the commentary to ASCE 7-16 Section 21.4 included: "Periods less that 0.2 s are excluded for consistency with the parameter S_S, recognizing that certain sites, such as the (CEUS) sites, could have peak acceleration response at very short periods that would be inappropriate for defining the value S_{DS}." While the soil-structure interaction provisions of ASCE 7 Section 19.4 play a role in the translation of free-field ground motions to the base of structure ground motions that are needed for building design, the full translation is larger, more complex, and not currently laid out in design provisions. For this reason, the practical and appropriate approach remains to cap the MPS at S_{DS}.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is clarification to maintain past practice, with no substantive cost effect.

S101-25

S102-25

IBC: 1613.2

Proponents: Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com)

2024 International Building Code

Revise as follows:

1613.2 Determination of seismic design category. *Structures* shall be assigned to a S*eismic Design Category* based on one of the following methods unless the authority having *jurisdiction* or geotechnical data determines that *Site Class* DE, E or F soils are present at the site:

1. Based on the structure *risk category* using Figures 1613.2(1) through 1613.2(7).
2. Determined in accordance with ASCE 7.

Where *Site Class* DE, E or F soils are present and the site is located in the conterminous United States east of -105 degrees longitude, the *Seismic Design Category* shall be determined in accordance with ASCE 7-16.

Where *Site Class* DE, E or F soils are present and the site is not located in the conterminous United States east of -105 degrees longitude, the S*eismic Design Category* shall be determined in accordance with ASCE 7-22.

Reason: With increased use of ASCE 7-22, as adopted in the 2024 IBC, it has been identified that significant reductions in Seismic Design Category have occurred for structures on soft soil sites in a number of locations in the Central and Eastern United States between ASCE 7-16 and ASCE 7-22. The following table prepared by S.K. Ghosh and Bodhi Rudra summarizes these changes for 32 selected locations. As part of the transition from ASCE 7-16 to ASCE 7-22 there have been a number of changes in seismic hazard information that effect the assignment of Seismic Design Category. One of the many has been the deletion of specific assigned Site Coefficients F_a and F_v, which have been replaced by reliance on US Geological Survey databases that characterize Site Class effects in a more detailed fashion. It is understood that the affect of this change has been more dramatic in the Central and Eastern US than at other locations.

At the time of writing of this proposal, the changes that have impacted assignment of Seismic Design Category are still being discussed; there is a pressing concern that significant drops in Seismic Design Category would allow construction using less ductile seismic force-resisting systems at soft soil sites in the Central and Eastern United States. This change proposal is being submitted with the hope that more complete information will be available for discussion in time for the code development hearings. It is hoped that this change proposal will provide guidance not only for users of the 2027 IBC, but also to jurisdictions adopting the 2024 IBC. It is also hoped that the issues addressed in this proposal will be addressed in ASCE 7-28, permitted this revision to be deleted from the 2030 IBC.

Yellow highlighting indicates two SDC downgrade.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The intent of this change proposal is to maintain past practice with regard to Seismic Design Category assignment. With no change in assignment, there is no change in cost.

S102-25

S103-25

IBC: 1613.5 (New), 1613.5, 1613.6

Proponents: Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com)

2024 International Building Code

Add new text as follows:

1613.5 Energy storage systems. Where *energy storage systems (ESS)* are configured to supply backup power to an *emergency power system* or *standby power system* required by Section 2702, the ESS shall be designed and installed in accordance with NFPA 70, NFPA 110 and NFPA 111. ESS shall be assigned a component importance factor I_p of 1.5 in any of the following cases:

1. Where ESS is configured to supply backup power to an *emergency power system* or *standby power system* required by Section 2702.
2. Where required by Chapter 13 of ASCE 7.
3. Where required by relevant equipment and system safety standards.

Revise as follows:

~~1613.5~~1613.6 **Elevators, escalators and other conveying systems.** Elevators, escalators and other conveying systems and their components shall satisfy the seismic requirements of ASCE 7 and ASME A17.1/CSA B44 as applicable.

~~1613.6~~1613.7 **Automatic sprinkler systems.** Where required, automatic sprinkler systems, including anchorage and bracing, shall comply with ASCE 7 and Section 903.3.1.1.

Reason: With the increase in deployment of energy storage systems (ESS), especially battery energy storage systems (BESS), there has been increased attention given to seismic considerations.

While component importance factor, I_p, is primarily assigned in ASCE 7-22 Section 13.1.3, there are other cases in addition to Section 13.1.3 where I_p is specifically assigned as 1.5 in other standards. A variety of standards applicable to BESS include provisions for mechanical and seismic safety.

For example, NFPA 855 Standard for the Installation of Stationary Energy Storage Systems addresses seismic hazards.

UL 9540 Energy Storage Systems and Equipment requires mechanical tests and includes a full section on "Installation in seismic environments" that refers to additional standards for seismic evaluation and seismic testing.

While reviewing NFPA 110 Standard for Emergency and Standby Power Systems and NFPA 111 Standard on Stored Electrical Energy Emergency and Standby Power Systems, we see 2025 NFPA 111 Section 7.4.5 Seismic Risk includes specific language in Section 7.4.5.2 to state: "Components of an SEPSS shall be assigned a component importance factor of 1.5, per ASCE/SEI 7, Minimum Design Loads for Buildings and Other Structures."

SEIA is preparing to conduct a comprehensive review of all applicable standards for ESS that reference seismic hazards, seismic analysis & testing, and mitigation strategies, and will be prepared to summarize these standards prior to Committee Action Hearings #1.

The proponent wishes for this new subsection to be Section 1613.5, immediately following existing Section 1613.4 for ballasted PV systems, with the other subsections renumbered as shown.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is intended to identify and clarify cases where energy storage systems (ESS) are already required to use seismic component importance factor I_p equal to 1.5.

S104-25

IBC: 1613.6

Proponents: Jeffrey Hugo, NFSA - National Fire Sprinkler Association, representing NFSA (hugo@nfsa.org)

2024 International Building Code

Revise as follows:

1613.6 ~~Automatic sprinkler systems~~ Water-based fire protection systems. Where required, ~~automatic sprinkler systems,~~ water-based fire protection systems, including anchorage and bracing, shall comply with ASCE 7 and Section 903.3.1.1.

Reason: NFPA 13, referenced by 903.3.1.1 is the hanging and bracing standard for other water-based fire protection systems, such as NFPA 14 for standpipes. This means NFPA 14 refers to NFPA 13 for hanging, or more importantly for this context, for Currently, NFPA 13 (referenced in IBC 903.3.1.1) serves as the hanging and bracing standard for all water-based fire protection systems, including standpipes (NFPA 14) and water mist systems (NFPA 750). However, the IBC only references automatic sprinkler systems for seismic bracing, creating an inconsistent and incomplete approach to seismic protection across different water-based fire suppression systems.

The National Fire Protection Association (NFPA) is developing NFPA 200, a dedicated standard for hanging and bracing of all fire suppression systems. While NFPA 200 will not be ready for the 2027 IBC cycle, it is anticipated for inclusion in the 2030 edition, at which point IBC Chapter 16 can reference NFPA 200 to provide uniform seismic bracing requirements for all water-based systems.

Since NFPA 14 already defers to NFPA 13 for hanging and bracing, including seismic requirements, the IBC should replace the term "automatic sprinkler system" with "water-based fire protection system" to accurately reflect current industry practice. This change ensures all water-based fire suppression systems receive consistent seismic protection, aligning with existing NFPA standards and eliminating ambiguity in enforcement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This language does not change the application of the code and NFPA 13.

S104-25

S105-25

IBC: 1613.7 (New)

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net); Robert Bachman, RE Bachman Consulting Structural Engineer, representing Myself (rebachmanse@aol.com); Chris Kimball, Building Code Solutions, representing Self (chris@bcscodegroup.com)

2024 International Building Code

Add new text as follows:

1613.7 Battery energy storage systems. Components of battery energy storage systems shall satisfy the seismic requirements of ASCE 7 Chapter 13 based on the *risk category* assigned by Section 1604.5. Battery energy storage systems assigned to Risk Category IV shall be considered *designated seismic systems* and shall have the component seismic importance factor, I_p, taken as 1.5. Buildings or non-building structures, including containers and walk-in units, that house, shelter, or support battery energy storage systems shall satisfy the requirements of ASCE 7 Chapter 12 or 15 as applicable using the same *risk category* to which the battery energy storage system itself is assigned.

Attached Files

- **Photos for BESS DSS.pdf**
  https://www.cdpaccess.com/proposal/12040/35909/files/download/9266/

Reason: This proposal clarifies and simplifies the application of the code and of ASCE 7 to battery energy storage systems (BESS; see the terminology section below). BESS are a relatively new, and increasingly important, combination of non-building structures and nonstructural components. As illustrated below, BESS are often built as customized containers or equipment frames, filled with batteries and related electrical and HVAC equipment, and mounted on a platform, a slab on ground, or a set of isolated footings.

This proposal applies only to those BESS components already assigned to Risk Category IV in Section 1604.5. These might include BESS ancillary to a power plant assigned to RC IV or BESS serving a RC IV facility as backup power. The proposal does not change any of the RC IV design criteria.

The gist of the proposal is this: BESS components assigned to RC IV should have I_p = 1.5 and should be certified for seismic application. In most cases, the current code *should* already reach this result, but because BESS involve combinations of active, nonactive, heavy, and lightweight nonstructural components, some containing hazardous materials, and all interconnected within a container or frame that constitutes a non-building structure, application of the code and ASCE 7 provisions can be convoluted. This proposal improves the code's usability by making the necessary designations explicit for this defined category of components.

The proposed new section simplifies the derivation of design criteria for BESS components assigned to RC IV. To explain why this simplification is useful, consider how the current IBC and ASCE 7 work together:

- IBC Sec 1613.1 requires compliance with ASCE 7 Chapters 12, 13, and 15.
- Then, ASCE 7 Sec 13.2.3 requires seismic certification for *designated seismic systems* (DSS) in Seismic Design Category C-F.
- That relies on a definition of DSS in IBC Sec 202: "Those nonstructural components that require design in accordance with Chapter 13 of ASCE 7 and for which the component importance factor, I_p, is greater than 1 in accordance with Section 13.1.3 of ASCE 7."
- Which components are those? Back to ASCE 7 Sec 13.1.3, which sets I_p = 1.5 for any of 4 cases:

  1. "The component is required to function for life-safety purposes after an earthquake." Possibly BESS could be construed to be part of a life safety system if it provides power to a RC IV building, but maybe not; in any case, whether this condition applies to BESS is unclear.

  2. The component handles "toxic, highly toxic, or explosive substances." This could apply to parts of a BESS installation, but not to every component within or attached to the container.

  3. "The component is in or supported by a Risk Category IV structure ... and the component is required for the continued operation of a structure designated an Essential Facility, or its failure would impair the continued operation of a structure designated an Essential Facility." This is the most likely current basis for setting $I_p > 1$ for BESS assigned to RC IV. However, it's somewhat circular, or redundant, in that it relies on designation of an RC IV facility as an Essential Facility (wording that is new in ASCE 7-22). So, back to IBC for the definition of Essential Facility: "Buildings and other structures that are intended to remain operational in the event of extreme environmental loading from flood, wind, snow or earthquakes." (ASCE 7 has its own definition, which is identical to the IBC's except that ASCE 7 adds tornado to the list of perils ... as IBC should too.)

4. The component handles “hazardous substances ... and is attached to a structure ... classified ... as a hazardous occupancy.” Like item 2, this could apply to parts of a BESS installation, but only if the BESS container or frame is considered a structure so classified.

- Finally, ASCE 7 Sec 13.1.4 exempts certain lightweight components even if $I_p > 1.0$. Some components within a BESS container might thus appear exempt by weight, but insofar as the components comprise one integrated system, the functionality objective implied by the RC IV assignment should apply to all of them.

Thus, assignment of a BESS to RC IV *should* be sufficient to result in $I_p = 1.5$ and classification as a DSS. But the code path is complicated, and some of the code and ASCE 7 wording is less than clear with respect to typical BESS construction. Therefore, this proposal cuts through that uncertainty by stating simply the criteria and designations that apply where BESS is assigned to RC IV. Specifically:

- The first sentence treats typical BESS equipment – the battery racks, HVAC units, fire suppression, etc., but not the walk-in containers themselves – as nonstructural components covered by ASCE 7 Chapter 13.
- The second sentence clarifies and simplifies application of ASCE 7 Section 13.1.3, making it unnecessary to parse the ASCE wording described above. Specification of $I_p = 1.5$ also simplifies application of the exemptions in Section 13.1.4.
- The third sentence covers the design of the BESS container itself, as well as any separate shelters, enclosures, or buildings, with the intent that BESS function should not be impaired by damage to an adjacent or enclosing structure.

Notes on terminology:

- **Walk-in unit** is used consistent with the term *energy storage system, walk-in unit*, defined in the IFC and used in IFC Sec 1207: “A prefabricated building that contains energy storage systems. It includes doors that provide walk-in access for personnel to maintain, test and service the equipment, and is typically used in outdoor and mobile ESS applications.”
- **Battery energy storage system(s)**, or BESS, has emerged as an industry standard term. It is not yet explicitly defined by the I-codes, but a number of related terms are, and BESS is indirectly defined by them. The following related terms are already defined:
- IFC: “**Battery system, stationary storage.** A rechargeable energy storage system consisting of electrochemical storage batteries, battery chargers, controls and associated electrical equipment designed to provide electrical power to a building. The system is typically used to provide standby or emergency power, an uninterruptible power supply, load shedding, load sharing or similar capabilities.”
- IECC, IFC: “**Energy storage system (ESS).** One or more devices, assembled together, capable of storing energy in order to supply electrical energy at a future time.”
- IBC, IFC: “**Energy storage system, electrochemical.** An energy storage system that stores energy and produced electricity using chemical reactions. It includes, among others, **battery ESS** and capacitor ESS.”

By using “battery,” as opposed to just ESS, the proposal distinguishes its scope from capacitor ESS (per the definition of electrochemical ESS above) and from other ESS such as pumped hydro or compressed air. The IFC also defines several “battery types,” but the proposal would apply to all types, including some newer types (e.g. sodium-ion or iron-air) not yet defined in the IFC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal merely clarifies and simplifies the current expectation with respect to certain components already assigned to RC IV.

S105-25

S106-25

IBC: 1704.2.1, 1704.3, 1704.3.1, TABLE 1705.7, 1705.9

2024 International Building Code

Revise as follows:

1704.2.1 Special inspector qualifications. Prior to the start of the construction, the *approved agencies* shall provide written documentation to the *building official* demonstrating the competence and relevant experience or training of the *special inspectors* who will perform the *special inspections* and tests during construction. Experience or training shall be considered to be relevant where the documented experience or training is related in complexity to the same type of *special inspection* or testing activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

The *registered design professionals* ~~*in responsible charge*~~ ~~and engineers of record~~ involved in the design of the project are permitted to act as an *approved agency* and their personnel are permitted to act as *special inspectors* for the work designed by them, provided they qualify as *special inspectors*.

1704.3 Statement of special inspections. Where *special inspections* or tests are required by Section 1705, the *registered design professional in responsible charge* shall ~~prepare~~ review and coordinate a statement of *special inspections* prepared by one or more *registered design professionals* in accordance with Section 1704.3.1 for submittal by the applicant in accordance with Section 1704.2.3.

Exception: The statement of *special inspections* is permitted to be prepared by a qualified *person approved* by the *building official* for construction not designed by a *registered design professional*.

1704.3.1 Content of statement of special inspections. The statement of *special inspections* shall identify the following:

1. The materials, systems, components and work required to have *special inspections* or tests by the *building official* or by the *registered design professional* responsible for each portion of the work.
2. The type and extent of each *special inspection*.
3. The type and extent of each test.
4. Additional requirements for *special inspections* or tests for seismic or wind resistance as specified in Sections 1705.12, 1705.13 and 1705.14.
5. For each type of *special inspection*, identification as to whether it will be continuous *special inspection*, periodic *special inspection* or performed in accordance with the notation used in the referenced standard where the inspections are defined.
6. *Deferred submittal* items that require a supplemental statement of special inspections.

TABLE 1705.7 REQUIRED SPECIAL INSPECTIONS AND TESTS OF DRIVEN DEEP FOUNDATION ELEMENTS

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION
1. Verify element materials, sizes and lengths comply with the requirements.	X	—
2. Determine capacities of test elements and conduct additional load tests, as required.	X	—
3. Inspect driving operations and maintain complete and accurate records for each element.	X	—
4. Verify placement locations and plumbness, confirm type and size of hammer, record number of blows per foot of penetration, determine required penetrations to achieve design capacity, record tip and butt elevations and document any damage to foundation element.	X	—
5. For steel elements, perform additional special inspections in accordance with Section 1705.2.	In accordance with Section 1705.2	
6. For concrete elements and concrete-filled elements, perform tests and additional special inspections in accordance with Section 1705.3.	In accordance with Section 1705.3	
7.For specialty elements, perform additional inspections as determined by the registered design professional ~~in responsible charge~~.	In accordance with Statement of Special Inspections	

1705.9 Helical pile foundations. *Continuous special inspections* shall be performed during installation of *helical pile* foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque and other pertinent installation data as required by the *registered design professional* ~~in responsible charge~~. The *approved* geotechnical report and the *construction documents* prepared by the *registered design professional* shall be used to determine compliance.

Reason: This proposal is intended to clarify the role of the registered design professional in responsible charge (RDPIRC), the individual who coordinates the design team and liaises with the building official, and the role of the registered design professionals (RDP), those individuals whose technical expertise contribute to the project. The revisions in this proposal place the administrative tasks on the registered design professional in responsible charge and technical related tasks on the registered design professional.

1704.2.1: RDP's may serve as approved agencies for work they designed. However "engineers of record" is not an IBC term and reference to "RDPIRC" contributes to confusion regarding roles and responsibilities. It is more straightforward to simply say that RDP's may serve as an approved agency for work they designed subject to the noted qualifications, so text is proposed for deletion.

1704.3: Structural engineers often mistakenly equate the "RDPIRC" code language to the commonly used term structural "Engineer of Record," which is a contractual or project team role - not a role recognized by the IBC. The IBC does not specifically define or assign disciplinary roles because practice laws vary between jurisdictions. The IBC uses the generic term "registered design professional" in reference to any licensed/registered/certified/etc. entity that is responsible for a certain aspect of work. A structural engineer, a mechanical engineer, an architect, and a geotechnical engineer are all examples of "registered design professionals." A structural engineer who is responsible for the structural design aspects of a project is not necessarily the "registered-design-professional-in-responsible-charge."

As proposed, 1704.3 clarifies and differentiates three distinct roles and responsibilities:

1. The RDP (one or more), who authors portions of the statement of special inspections related to their work per 1704.3.1
2. The RDPIRC, who reviews and coordinates all of those portions in accordance with their duties defined in 107.3.4 and the Chapter 2 definition.
3. The applicant, who submits the statement of special inspections to the building official per their responsibility identified in 1704.2.3

1704.3.1 is included for context.

Table 1705.7 - Item 7: RDP's are responsible for specifying special inspection tasks, but those RDP's are not necessarily the RDPIRC. Thus the table should reference a "RDP," not the "RDPIRC."

1705.9: RDP's are responsible for specifying special inspection tasks, but those RDP's are not necessarily the RDPIRC. Thus the section should reference a "RDP," not the "RDPIRC."

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The tasks will still be performed, the proposal is clarifying which individual will be performing the task.

S106-25

S107-25

IBC: 1704.2.5, 1704.2.5.1, 1704.2.5.2 (New)

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1704.2.5 Special inspection of fabricated items. Where fabrication of structural, load-bearing or lateral load-resisting members or assemblies is being conducted on the premises of a fabricator's shop, *special inspections* of the *fabricated items* shall be performed during fabrication, except where the fabricator has been *approved* to perform work without *special inspections* in accordance with Section 1704.2.5.1 <u>or the manufacturing plant has been approved in accordance with Section 1704.2.5.2.</u>

1704.2.5.1 Fabricator approval. *Special inspections* during fabrication are not required where the work is done on the premises of a fabricator *approved* to perform such work without *special inspection*. Approval shall be based on review of the fabricator's written fabrication procedures and quality control manuals that provide a basis for control of materials and workmanship, with periodic auditing of fabrication and quality control practices by an *approved agency* or the *building official*. At completion of fabrication, the *approved fabricator* shall submit a *certificate of compliance* to the *owner* or the *owner 's* authorized agent for submittal to the *building official* as specified in Section 1704.5 stating that the work was performed in accordance with the *approved construction documents* .

Add new text as follows:

<u>**1704.2.5.2**</u> <u>**Modular construction.**</u> <u>Special inspections during the manufacture of modular components or modules are not required where the work is done on the premises of a manufacturing plant approved to perform such work without special inspection. The approved manufacturing plant shall demonstrate compliance with the quality control and quality assurance provisions of ICC 1200 and ICC 1205. At completion of fabrication, the approved fabricator shall submit a certificate of compliance to the owner or the owner's authorized agent for submittal to the building official as specified in Section 1704.5 stating that the work was performed in accordance with the approved construction documents.</u>

Reason: This proposal adds an option to permit manufacturers of modular components to comply with the ICC 1200 and ICC 1205 standards as one means of compliance with this section. The requirements in the ICC 1205 Standard for Off-site Construction: Inspection and Regulatory Compliance provides clear guidelines and standardized procedures that focus on inspections and regulatory compliance in off-site construction, thereby reducing the administrative burden on Code Officials. The structure of ICC 1205 ensures strict compliance with the construction standards. Ultimately, the ICC 1205 standard ensures regulatory objectives are met with fewer resources and less time, creating a more effective regulatory environment.

Some structural assemblies have concealed elements such as reinforcing or embed plates in a precast concrete wall panel or are even fabricated with embedded mechanical, electrical or plumbing components. These assemblies would fall within the definition of a modular component or panelized construction under ICC 1200 and ICC 1205 and a fabricator's shop could be required to comply with those standards under a state's modular and industrialized building program. Building officials who participated in the development of the ICC off-site construction standards indicated they would consider going through their program as an option for such assemblies rather than an explicit requirement and would accept other methods of compliance such as an industry QA/QC certification program or a traditional program of special inspections. Adding a reference to the ICC standards as a new section alongside the existing requirements for fabricated items allows for owners, registered design professionals and fabricators to select their preferred avenue for compliance.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not expected to increase or decrease the costs of construction but rather it provides another means for off-site manufacturing or construction to comply with the code.

2024 International Building Code

SECTION 1705
REQUIRED SPECIAL INSPECTIONS AND TESTS

1705.1 General. *Special inspections* and tests of elements and nonstructural components of *buildings* and *structures* shall meet the applicable requirements of this section.

1705.1.1 Special cases. *Special inspections* and tests shall be required for proposed work that is, in the opinion of the *building official*, unusual in its nature, such as, but not limited to, the following examples:

1. Construction materials and systems that are alternatives to materials and systems prescribed by this code.
2. Unusual design applications of materials described in this code.
3. Materials and systems required to be installed in accordance with additional manufacturer's instructions that prescribe requirements not contained in this code or in standards referenced by this code.

Add new text as follows:

1705.1.2 Special inspection of connections, fastening, and anchorages. Where this section is specified in Section 1705, s*pecial inspection* of connections, fastening, and anchorages shall be performed in accordance with this section. The following applicable items shall be verified to comply with *construction documents*, valid evaluation reports and manufacturer's printed installation instructions.

1. Materials of members being connected.
2. Component materials, coatings, and surface preparation.
3. Component geometry, thicknesses, clearances, and material cover.
4. Fastener type, quantity, layout, size, length, edge distances, critical spacing, seating or bearing conditions, and embedment depths or thread engagement.
5. Fastener installation torques, pre-tension loads, or other special procedures.
6. Accommodation of specified allowable movements including length, direction, freedom of slip, and clearances.
7. Pretensioned bolts and other similar connectors achieve specified contact between connected members.

1705.2.4 Open-web steel joists and joist girders. *Special inspections* of open-web *steel joists* and joist girders in *buildings*, *structures* and portions thereof shall be in accordance with Table 1705.2.4.

Revise as follows:

TABLE 1705.2.4 REQUIRED SPECIAL INSPECTIONS OF OPEN-WEB STEEL JOISTS AND JOIST GIRDERS

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION	REFERENCED STANDARD[a]
1. Installation of open-web steel joists and joist girders.			

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION	REFERENCED STANDARD
a. End connections – welding or bolted.	—	X	~~SJI specifications listed in Section 2207.1.~~ 1705.1.2
b. Bridging – horizontal or diagonal.	—	—	—
1.Standard bridging.	—	X	SJI specifications listed in Section 2207.1.
2.Bridging that differs from the SJI specifications listed in Section 2207.1.	—	X	—

a. Where applicable, see Section 1705.13.

1705.5.3 Mass timber construction. *Special inspections* of *mass timber* elements in Types IV-A, IV-B and IV-C construction shall be in accordance with Table 1705.5.3.

TABLE 1705.5.3 REQUIRED SPECIAL INSPECTIONS OF MASS TIMBER CONSTRUCTION

TYPE		CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION
1. Inspection of anchorage and connections of mass timber construction to timber deep foundation systems. Inspect per section 1705.1.2.		—	X
2. Inspect erection of mass timber construction.		—	X
3. Inspection of connections where installation methods are required to meet design loads.			
Threaded fasteners.	Verify use of proper installation equipment.	—	X
	Verify use of pre-drilled holes where required.	—	X
	Inspect screws, including diameter, length, head type, spacing, installation angle and depth.	—	X
Adhesive anchors installed in horizontal or upwardly inclined orientation to resist sustained tension loads. Inspect per section 1705.1.2.		X	—
Adhesive anchors not defined in preceding cell. Inspect per section 1705.1.2.		—	X
Bolted connections. Inspect per section 1705.1.2.		—	X
Concealed connections. Inspect per section 1705.1.2.		—	X

1705.12 Special inspections for wind resistance. *Special inspections* for wind resistance specified in Sections 1705.12.1 through 1705.12.3, unless exempted by the exceptions to Section 1704.2, are required for *buildings* and *structures* constructed in the following areas:

1. In wind Exposure Category B, where *basic wind speed*, *V,* is 150 mph (67 m/sec) or greater.
2. In wind Exposure Category C or D, where *basic wind speed*, *V,* is 140 mph (62.6 m/sec) or greater.

1705.12.1 Structural wood. *Continuous special inspection* is required during field gluing operations of elements of the *main windforce-resisting system*. *Periodic special inspection* per section 1705.1.2 is required for nailing, bolting, anchoring and other fastening of elements of the *main windforce-resisting system*, including wood shear walls, wood *diaphragms*, *drag struts*, braces and *hold-downs*.

Exception: *Special inspections* are not required for wood shear walls, shear panels and *diaphragms*, including nailing, bolting, anchoring and other fastening to other elements of the *main windforce-resisting system*, where the lateral resistance is provided by structural sheathing and the specified fastener spacing at panel edges is more than 4 inches (102 mm) on center.

1705.12.2 Cold-formed steel light-frame construction. *Periodic special inspection* is required for welding operations of elements of the *main windforce-resisting system*. *Periodic special inspection* is required for screw attachment, bolting, anchoring and other fastening of elements of the *main windforce-resisting system*, including shear walls, braces, *diaphragms*, *collectors* (*drag struts*) and *hold-downs*. Inspection tasks shall be as follows:

1. Special inspections for screw and bolt attachments to the items above shall be per the quality assurance inspector tasks listed in AISI S240 Section D6.10.
2. Special inspections for welding operations to fasten the items above shall be per the quality assurance inspector tasks listed in AISI S240 Tables D6.7-2 and D6.7-3.

Exception: *Special inspections* are not required for cold-formed steel light-frame shear walls and *diaphragms*, including screwing, bolting, anchoring and other fastening to components of the windforce-resisting system, where either of the following applies:

1. The sheathing is *gypsum board* or *fiberboard*.
2. The sheathing is *wood structural panel* or steel sheets on only one side of the shear wall, shear panel or *diaphragm* assembly and the specified fastener spacing at the panel or sheet edges is more than 4 inches (102 mm) on center (o.c.).

1705.12.3 Wind-resisting components. *Periodic special inspection* per section 1705.1.2 is required for fastening of the following systems and components:

1. *Roof covering*, *roof deck* and roof framing connections.
2. *Exterior wall covering* and wall connections to roof and floor *diaphragms* and framing.

Exceptions: Special inspections for the following items shall be performed in accordance with the referenced section rather than section 1705.1.2.

1. *Special inspections* for sidelaps of cold-formed steel deck panels and for fastening of cold-formed steel decks to roof framing and to exterior wall framing shall be performed in accordance with section 1705.2.3.
2. *Special inspections* for structural steel connections shall be performed in accordance with section 1705.2.1.
3. *Special inspections* for concrete roof deck, concrete roof framing connections, and concrete wall connections to roof and floor diaphragms and framing shall be performed in accordance with section 1705.3.
4. *Special inspections* for connections of high-load wood roof *diaphragms* to roof framing shall be performed in accordance with section 1705.5.1.
5. *Special inspections* for threaded fastener *mass timber* connections shall be performed in accordance with Table 1705.5.3.

1705.13.2 Structural wood. For the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* C, D, E or F:

1. *Continuous special inspection* shall be required during field gluing operations of elements of the *seismic force-resisting system*.
2. *Periodic special inspection* per section 1705.1.2 shall be required for nailing, bolting, anchoring and other fastening of elements of the *seismic force-resisting system*, including wood shear walls, wood *diaphragms*, *drag struts*, braces, shear panels and *hold-downs*.

Exception: *Special inspections* are not required for wood shear walls, shear panels and *diaphragms*, including nailing, bolting, anchoring and other fastening to other elements of the *seismic force-resisting system*, where the lateral resistance is provided by structural sheathing, and the specified fastener spacing at the panel edges is more than 4 inches (102 mm) on center.

1705.13.3 Cold-formed steel light-frame construction. For the *seismic force-resisting systems* of *structures* assigned to *Seismic Design Category* C, D, E or F, *periodic special inspection* shall be required for both:

1. Welding operations of elements of the *seismic force-resisting system*.
2. Screw attachment, bolting, anchoring and other fastening of elements of the *seismic force-resisting system*, including shear walls, braces, *diaphragms*, *collectors* (*drag struts*) and *hold-downs*.

Inspection tasks shall be as follows:

1. Special inspections for screw and bolt attachments to the items above shall be per the quality assurance inspector tasks listed in AISI S240 Section D6.10.
2. Special inspections for welding operations to fasten the items above shall be per the quality assurance inspector tasks listed in AISI S240 Tables D6.7-2 and D6.7-3.

Exception: *Special inspections* are not required for cold-formed steel light-frame shear walls and *diaphragms*, including screw installation, bolting, anchoring and other fastening to components of the *seismic force-resisting system*, where either of the following applies:

1. The sheathing is *gypsum board* or *fiberboard*.
2. The sheathing is *wood structural panel* or steel sheets on only one side of the shear wall, shear panel or *diaphragm* assembly and the specified fastener spacing at the panel or sheet edge is more than 4 inches (102 mm) on center.

1705.13.4 Designated seismic systems. For *structures* assigned to *Seismic Design Category* C, D, E or F, the *special inspector* shall examine *designated seismic systems* requiring seismic qualification in accordance with Section 13.2.3 of ASCE 7 and verify that the *label*, anchorage and mounting conform to the *certificate of compliance*.

1705.13.5 Architectural components. *Periodic special inspection* per section 1705.1.2 is required for the erection and fastening of exterior cladding, interior and exterior nonbearing walls and interior and exterior *veneer* in structures assigned to *Seismic Design Category* D, E or F.

Exception: *Periodic special inspection* is not required for the following:

1. Exterior cladding, interior and exterior nonbearing walls and interior and exterior *veneer* 30 feet (9144 mm) or less in height above grade or walking surface.
2. Exterior cladding and interior and exterior *veneer* weighing 5 psf (0.24 kN/m^2) or less.
3. Interior nonbearing walls weighing 15 psf (0.72 kN/m^2) or less.

1705.13.5.1 Access floors. Periodic *special inspection* per section 1705.1.2 is required for the anchorage of access floors in *structures* assigned to *Seismic Design Category* D, E or F.

1705.13.6 Plumbing, mechanical and electrical components. *Periodic special inspection* of plumbing, mechanical and electrical components shall be required for the following:

1. Anchorage of electrical equipment for emergency and *standby power systems* in *structures* assigned to *Seismic Design Category* C, D, E or F shall be inspected per section 1705.1.2.
2. Anchorage of other electrical equipment in *structures* assigned to *Seismic Design Category* E or F shall be inspected per section 1705.1.2.
3. Installation and anchorage of piping systems designed to carry *hazardous materials* and their associated mechanical units in *structures* assigned to *Seismic Design Category* C, D, E or F shall be inspected per section 1705.1.2.
4. Installation and anchorage of ductwork designed to carry *hazardous materials* in *structures* assigned to *Seismic Design Category* C, D, E or F shall be inspected per section 1705.1.2.
5. Installation and anchorage of vibration isolation systems in *structures* assigned to *Seismic Design Category* C, D, E or F where the *approved construction documents* require a nominal clearance of $^1/_4$ inch (6.4 mm) or less between the equipment support frame and restraint shall be inspected per section 1705.1.2.
6. Installation of mechanical and electrical equipment, including duct work, piping systems and their structural supports, where *automatic sprinkler systems* are installed in *structures* assigned to *Seismic Design Category* C, D, E or F to verify one of the following:
   6.1. Minimum clearances have been provided as required by Section 13.2.4 ASCE/SEI 7.
   6.2. A nominal clearance of not less than 3 inches (76 mm) has been be provided between *automatic sprinkler system* drops and sprigs and: structural members not used collectively or independently to support the sprinklers; equipment attached to the *building structure*; and other systems' piping.

Where flexible sprinkler hose fittings are used, *special inspection* of minimum clearances is not required.

Reason: This proposal does not add any new special inspections to Chapter 17, nor does it override inspection tasks that are already defined in referenced standards. Special inspections of certain connections specified in Chapter 17 do not take the place of the building official's framing inspections. The building official has authority to determine the acceptable qualifications for the special inspector.

The proposed language for these connection, anchorage and fastening special inspection requirements strives to clarify the following:

Identify a required task,

Identify a procedure to complete that task (whether by description or by referenced standard),

Define a frequency for the task (continuous vs periodic), and

Identify a standard by which to verify compliance (construction documents, evaluation reports, ASTM standard, etc.).

This proposal reduces room for interpretation, helps with enforceability of the provisions, and results in a more consistent levels of quality assurance. The descriptions of the items are written generally to include a broad range of materials, but the requirements only apply when proposed section 1705.1.2 is specifically invoked within the detailed requirements of section 1705, as indicated in this proposal.

Table 1705.2.4 Item 1a – “End connections” calls for periodic special inspection of open web steel joist end connections per SJI 100 or 200. However, those standards do not contain any special inspection requirements for member end connections. Therefore, the proposed revision clarifies what items need to be considered by the special inspector to verify that the completed end connection is compliant, and references proposed section 1705.1.2 in lieu of SJI specifications since there are no tasks for inspection of end connections defined in SJI 100/200.

Table 1705.5.3 calls for special inspection of mass timber connections and anchorages. Required tasks related to inspection of threaded fastener items are clearly identified in the table. However, inspection tasks related to adhesive anchors, bolted connections, and concealed connections are not specified. There are no referenced standards that detail inspection tasks for these items so the proposed language clarifies what items need to be considered when inspecting connections per the noted line items of the table.

Sections 1705.12.1 and 1705.13.2 call for periodic special inspection of nailing, bolting, anchoring, and other fastening of certain lateral force resisting systems but the specific inspection tasks are not identified and the NDS referenced standard does not include special inspection provisions. The proposed language in this section adds a reference to 1705.1.2 as a means for verifying compliance.

Sections 1705.12.2 and 1705.13.3 call for periodic special inspection of nailing, bolting, anchoring, and other fastening of certain lateral force resisting systems. Tasks necessary to complete these inspections are specified in AISI S240. The applicable section number of the referenced standard is provided. QAI tasks for welding elements of the of the lateral force resisting system are not provided in Section D6.10, but IBC requires special inspection of welding operations. Therefore, Tables D6.7-2 and D6.7-2 are used to define the inspection tasks to comply with the IBC requirement.

Section 1705.12.3 requires special inspections of certain roof framing connections, wall connections to diaphragms and framing, roof covering, roof deck, roof framing connections, exterior wall covering, and exterior wall framing. Exceptions have been listed for referenced standards that already specify special inspection tasks. Proposed section 1705.1.2 covers conditions that are not already addressed preexisting code provisions.

Section 1705.13.5 requires special inspection of fastening of certain instances of exterior cladding, nonbearing walls, and veneer. The proposed section 1705.1.2 provides a list of items to be referenced when verifying compliance.

Section 1705.13.5.1 requires special inspection of the anchorage of access floors. Specific inspection tasks are not identified in this section. The proposed language in this section adds a reference to proposed section 1705.1.2 as a means of verifying compliance.

Section 1705.13.6 requires special inspection of the anchorage of electrical equipment for emergency and standby power systems, anchorage of piping systems designed to carry hazardous materials and their associated mechanical units, anchorage of ductwork designed to carry hazardous materials, and anchorage of vibration isolation systems. Specific inspection tasks are not identified in this section. The proposed language in this section adds a reference to proposed section 1705.1.2 as a means of verifying compliance.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proposal does not add cost because it does not add work scope, it clarifies the tasks necessary to verify compliance when special inspections for connections are required.

S109-25

IBC: 1705.1, 1705.1.1, 1705.1.2 (New)

Proponents: Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA) (joecainpe@gmail.com)

2024 International Building Code

1705.1 General. *Special inspections* and tests of elements and nonstructural components of *buildings* and *structures* shall meet the applicable requirements of this section.

1705.1.1 Special cases. *Special inspections* and tests shall be required for proposed work that is, in the opinion of the *building official*, unusual in its nature, such as, but not limited to, the following examples:

1. Construction materials and systems that are alternatives to materials and systems prescribed by this code.
2. Unusual design applications of materials described in this code.
3. Materials and systems required to be installed in accordance with additional manufacturer’s instructions that prescribe requirements not contained in this code or in standards referenced by this code.

Add new text as follows:

1705.1.2 Ground-mounted photovoltaic (PV) panel systems. For *deep foundation* elements for *ground-mounted PV panel systems*, continuous *special inspection* need not be provided where the *building official* has determined that periodic *special inspection* or inspection by an *approved agency* is acceptable.

Reason: A requirement for continuous Special Inspection for every foundation pile for ground-mounted photovoltaic (PV) panel systems is overly restrictive. The language proposed for new Section 1705.1.2 seeks to formalize inspection practice that is commonly applied to ground-mounted PV panel systems.

Large-scale (often called "utility scale") PV facilities often have tens of thousands of small piles, and cover hundreds, or even thousands of acres. For example, a 150 MegaWatt PV facility might cover approximately 900 to 1200 acres of land. Large-scale PV facilities can be fixed-tilt, but Single Axis Trackers (SAT) are more common.

For SATs, the most common foundation type is driven steel piles. SATs usually have a torque tube supported by a central drive pile and a series of bearing piles. As these nonbuilding structures are small, the piles are small. It is common for bearing piles to be W6x9 wide-flange beams, driven to a depth of approximately 6 to 8 feet below the soil surface. These small piles are often driven into Earth using specialized equipment such as a Vermeer PD10 pile driver. These drivers are usually operated by a 2-person crew. For large projects, it is not uncommon to have about ten to twelve pile drivers and crews operating simultaneously in different "blocks" of a project.

By a strict reading of 2024 IBC Table 1705.7, this would require 10 to 12 Special Inspectors to be retained full time for 1 to 3 months, as they provide continuous special inspection of 10 to 12 two-person crews operating track-mounted, GPS locating, self-plumbing, specialized pile drivers, as they drive tens of thousands of piles. It should not be surprising that Building Officials are not enforcing continuous special inspection as indicated in Table 1705.7.

As project financing often involves third-party investors, existing measures of quality control are already in place. The developer and/or EPC (Engineer, Procure, Construct) contractor typically use a rigorous design and testing process to optimize pile specifications, as part of value engineering. As part of their risk-management process, it is common for project financiers to use third-party Independent Engineers (IEs) to ensure quality controls are in place. Under current practice, it is extremely uncommon for local Building Officials to require continuous Special Inspection for "deep" foundations for PV panel systems.

Large-scale photovoltaic power facilities typically incorporate rigorous design and quality control steps, as follows:
1. Foundation elements designed by analysis, based on geotechnical investigation.
2. As thousands of small piles are used in a PV power facility, optimization of design typically includes preconstruction pile load testing conducted on site. Independent Engineers (IE's) typically review test reports.
3. EPC contractor has their own internal quality control and reporting system, including daily logs.

4. A representative sample of production piles (for example, 1 percent) are typically proof-tested during construction, to ensure adequate pile capacities are being achieved. Adjustments are made if necessary to meet the demand.
5. County/AHJ inspectors typically conduct periodic observation of pile installation. For large-scale PV facilities, these inspectors are typically third-party inspectors.
6. IE's typically conduct site visits to observe installation methods and review inspection reports and production pile load test reports. A final report is prepared by the IE.

Owing to this rigorous program of quality control, continuous special inspection of "deep" foundations is highly redundant. A team of Special Inspectors could be required to be on-site for one to three months watching piles being installed, even though the same piles are already being observed and monitored by the Developer, the EPC Contractor, the AHJ/County inspector, and an Independent Engineer. The language proposed for new Section 1705.1.2 seeks to allow the Building Official the flexibility to allow modifications to special inspection requirements, without taking away any such authority. For example, a Building Official could require an agreed-upon frequency of periodic special inspection, or might be satisfied with quality controls in place on behalf of the owner or EPC, in addition to the inspector from the AHJ.

In the 2024 IBC, "Approved Agency" is defined as: An established and recognized organization that is regularly engaged in conducting tests, furnishing inspection services or furnishing product evaluation or certification where such organization has been approved by the *building official.*

For smaller installations -- such as residential ground-mounted PV panel systems -- continuous special inspection beyond the AHJ/County inspection adds project cost disproportionate to the risk to the project. Most AHJ/County Building Officials have agreed that special inspection is not necessary or reasonable for these small systems.

This proposal follows Proposal S140-22, so video testimony from the prior cycle might be helpful to interested parties. During testimony and Committee discussion, there was attention drawn to Section 1704.2, Exception 1: "Special inspections and tests are not required for construction of a minor nature or as warranted by conditions in the jurisdiction as approved by the building official." Some testifiers and at least one Committee member expressed a belief that Exception 1 of Section 1704.2 already covers the residential case, at a minimum.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal only seeks to formalize existing practice.

S109-25

S110-25

IBC: 1705.2.5

Proponents: Emily Dunham, representing NCSEA Code Advisory Committee Special Inspections/Quality Assurance Subcommittee (emily.dunham@greshamsmith.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

Revise as follows:

1705.2.5 Cold-formed steel trusses spanning 60 feet or greater. Where a cold-formed steel truss designed in accordance with section 2204 has a clear span ~~is~~ 60 feet (18 288 mm) or greater, the *special inspector* shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the ~~*approved* truss submittal package~~ design prepared in accordance with section 2206.1.3.2.

Reason: Section 2206.1.3.2 requires a truss plan to be developed by a registered design professional for truss bracing in trusses 60 feet or greater. Special inspections of the truss bracing should be performed in reference to this document rather than a truss submittal as the truss submittal may not include the specific bracing plan. For example, this bracing design could be provided as part of the construction documents, as a deferred submittal, or as a delegated design. The 2204 pointer clarifies that this section does not apply to steel joists in section 2207 (joist designed per SJI 100 and 200).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of which document should be referenced during the special inspection process.

S110-25

S111-25

IBC: 1705.2.5, 1705.2.6 (New), 1705.5.2, 1705.5.3 (New)

Proponents: Emily Dunham, representing NCSEA Code Advisory Committee Special Inspections/Quality Assurance Subcommittee (emily.dunham@greshamsmith.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

1705.2.5 Cold-formed steel trusses spanning 60 feet or greater. Where a cold-formed steel truss clear span is 60 feet (18 288 mm) or greater, the *special inspector* shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

Add new text as follows:

1705.2.6 Cold-formed Steel Trusses Without Wood or Gypsum Panels on the Top or Bottom Chord. *Special inspections* of cold-formed steel truss permanent individual truss member restraint and individual truss member bracing shall be required where all of the following are true:

1. The truss clear span is 40 feet or greater
2. Truss chords are not sheathed with gypsum panel product fastened per table 2508.1, wood structural panels fastened per table 2304.10.2, or steel roof deck fastened per ANSI/SDI SD Section J1.
3. Truss member lateral restraint and truss diagonal bracing design *prepared by a registered design professional* is required

The *special inspector* shall verify that the permanent individual truss member restraint and permanent individual truss member bracing is installed in accordance with the *design prepared by a registered design professional.*

1705.5.2 Metal-plate-connected wood trusses spanning 60 feet or greater. Where a truss clear span is 60 feet (18 288 mm) or greater, the *special inspector* shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

1705.5.3 Wood Trusses Without Wood or Gypsum Panels on the Top or Bottom Chord. *Special inspections* of wood truss permanent individual truss member restraint and individual truss member bracing shall be required where all of the following are true:

1. The truss clear span is 40 feet or greater.
2. A design prepared by a registered design professional is required in accordance with 2303.4.1.2.1

The *special inspector* shall verify that the permanent individual truss member restraint and permanent individual truss member bracing is installed in accordance with the *design prepared by a registered design professional.*

Reason: This provision is being updated to address longer spanning trusses that do not have sheathing bracing the top or bottom chord. Wood and cold formed steel trusses are designed to be efficient, often relying on short sections without bracing. Ceiling and roof sheathing typically provide bracing for the chord sections. However, when this sheathing is absent, the design and installation of bracing becomes crucial to prevent truss members from failing and causing collapse. The collapses can be extensive and dangerous given the large expanse of areas covered by trusses.

The 40 foot truss threshold is aligned with the prescriptive allowable roof span in 2308.2.5 and AISI 230 tables.

Additional information about the sheathing is provided in cold formed steel section in comparison to the wood truss section because AISI 202-20 does not address trusses without sheathing bracing the chords. NCSEA is working with AISI/SFIA to incorporate similar provisions to 2303.4.1.4.1 in the next revision of AISI202.

Installing this bracing is not standardized and requires specialized knowledge and skills. However, the skills required for truss bracing inspection include identification of lumber sizes, configurations and number of nails/screws. Personnel with these skills are likely already employed at most approved agencies. Building officials also have these skills but the time it takes to inspect this is more than what is typically allotted for in a building frame inspection. Consider a relatively simple 100ft x 50 ft retail building supporting 4 tenants with 3 parapet heights, a mechanical unit for each tenant, a roof access hatch, and wall and beam support conditions. This could lead to 20 truss types with 20 different configurations and bracing conditions to inspect. Inspecting these requires review of all 20 truss design drawings and bracing details. If this takes 5 minutes per truss type this duration is over 90 minutes for a single building component, this time likely exceeds time allotted by many code official for an entire frame inspection in a simple wood building. Education of officials on this topic will help the matter and may increase inspection efficiency but likely will not eliminate this issue of time constraints.

Additionally, the attached references that range in date from the early 1990s to present show that this issue has been understood for over 30 years and continues to be an issue despite the efforts of industry organizations to provide information such as articles in trade publications such as Structure Magazine, Journal of Light Frame Construction, and the Building Safety Journal.

Furthermore, the inspection of bracing of trusses is not unique to wood or cold formed steel trusses. Requirements for bracing special inspections are already required for structural steel per ASC 360 section N5.7, steel joists per IBC table 1705.2.4, and metal building systems per 1705.2.6.

This code change proposal does not alter the requirements for special inspections for all trusses. This proposal adds a small group of trusses that are very susceptible to buckling due to the lack of sheathing on the top or bottom chord**s** and proposed changes to 2303.4.1.2.1 exclude floor trusses without compression forces in the bottom chord and Group U structures. It is well understood in the industry that those types of trusses are highly susceptible to bucking when they are not sheathed. This also includes insufficient bracing at piggy back trusses. There are a few news article link examples of this at the end of this section.

To ensure the safety and integrity of these structures, special inspections should be mandated to verify that the bracing is installed correctly and securely. This inspection requirement would have the added benefit of encouraging awareness between the builder, designer and engineer of the requirements of the truss bracing for these specific projects that are vulnerable to collapse.

See the following for references to wood trusses that have collapsed without sheathing installed and additional information on common causes, including lack of bracing, for wood truss collapse:

by NBC 10 NEWS | Tue, June 7th 2022 at 10:30 PM

Updated Tue, June 7th 2022 at 11:29 PM

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0.06 per square foot

Estimated Immediate Cost Impact Justification (methodology and variables):

A parametric method of cost estimating was utilized.

Inspections for truss bracing will never be the only inspections performed on a structure making cost of mobilization a non-issue. An example of a relatively simple retail building was considered.. The space is 100 ft by 50 ft = 5,000 sq ft. There are 4 mechanical units and 3 parapet heights, a roof hatch, and wall and beam support conditions. Inspection of bracing in this space would conservatively take about 1 hour 40 minutes. Writing up a list of deficiencies would take another 30 minutes. Assuming an hourly rate of $125 at 2.25 hours, the inspections at this location would cost $270. $270/5000 sq ft results in a cost of approximately 6 cents per square foot.

a. Verify weldability of reinforcing bars other than ASTM A706.	—	X	AWS D1.4 ACI 318: Ch. 26~~.13.1.4~~	
b. Inspect welding of reinforcement for intermediate and special moment frames, boundary elements of special structural walls, ~~and~~ coupling beams and shear reinforcement.	X	—	AWS D1.4 ACI 318: Ch. 26~~.13.3~~	
c. Inspect welded reinforcement splices.	X	—	—	
d. Inspect welding of primary tension reinforcement in corbels.	X	—	—	
e. Inspect single-pass fillet welds, maximum $^5/_{16}$″, not defined in 2.b.	—	X	AWS D1.4 ACI 318: Ch. 26~~.13.3~~	
f. Inspect all other welds.	~~—~~X	~~X~~-	AWS D1.4 ACI 318: Ch. 26~~.13.3~~	
3. Inspect anchors cast in concrete.	—	X	ACI 318: Ch. 26~~.13.3.3~~	—
4. Inspect anchors post-installed in hardened concrete members.[b]				—
a. Adhesive anchors installed in horizontally or upwardly inclined orientations to resist sustained tension loads.	X	—	ACI 318: Ch. 26~~.13.3.2~~	
b. Mechanical anchors and adhesive anchors not defined in 4.a.	—	X	ACI 318: Ch. 26~~.13.3~~	
5. Verify use of required design mix.	X	~~X~~	ACI 318: Ch. ~~19,~~ 26 ~~.4.3, 26.4.4~~	1904.1, 1904.2
6. Prior to and during concrete placement, fabricate specimens for strength tests, perform slump and air content tests, and determine the temperature of the concrete.	X	—	ASTM C31 ASTM C172 ACI 318: Ch. 26~~.5, 26.12~~	—
7. Inspect concrete and shotcrete placement for proper application techniques.	X	—	ACI 318: Ch. 26~~.5~~	—
8. Verify maintenance of specified curing temperature and techniques.	—	X	ACI 318: Ch. 26~~.5.3-26.5.5~~	—
9. Inspect prestressed concrete for:				
a. Application of prestressing forces.	X	—	ACI 318: Ch. 26~~.10~~	—
b. Grouting of bonded prestressing tendons.	X	—		
10. Inspect erection of precast concrete members.	—	X	ACI 318: Ch. 26~~.9~~	—
11. For precast concrete diaphragm connections or reinforcement at joints classified as moderate or high deformability elements (MDE or HDE) in structures assigned to Seismic Design Category C, D, E or F, inspect such connections and reinforcement in the field for:			ACI 318: Ch. 26~~.13.1.3~~	
a. Installation of the embedded parts.	X	—		—
b. Completion of the continuity of reinforcement across joints.	X	—	ACI 550.5	
c. Completion of connections in the field.	X	—		
12. Inspect installation tolerances of precast concrete diaphragm connections for compliance with ACI 550.5.	—	X	ACI 318: Ch. 26~~.13.1.3~~	—
13. Verify in-situ concrete strength, prior to stressing of tendons in posttensioned concrete and prior to removal of shores and forms from beams and structural slabs.	—	X	ACI 318: Ch. 26~~.11.2~~	—
14. Inspect formwork for shape, location and dimensions of the concrete member being formed.	—	X	ACI 318: Ch. 26 ~~.11.1.2(b)~~	—

For SI: 1 inch = 25.4 mm.

a. Where applicable, see Section 1705.13.

b. Specific requirements for special inspection shall be included in the research report for the anchor issued by an approved source in accordance with 26.13 in ACI 318, or other qualification procedures. Where specific requirements are not provided, special inspection requirements shall be specified by the registered design professional and shall be approved by the building official prior to the commencement of the work.

Reason: Coordination between special inspection requirements in ACI 318 Ch. 26 and Table 1705.3 is consistently out of sync. By changing the reference standard pointer to just be Chapter 26: Construction Documents and Inspection (the only chapter directed at construction, all other chapters are directed to the designer), issues with 1705.3 not being aligned with ACI 318 is removed.

Items 1a and 1b: Amend required special inspections and tests of concrete construction table to include inspection of reinforcement in special moment frames, boundary elements of special structural walls and coupling beams as required by ACI 318-19 Section 26.13.1.3. This proposal corrects the exclusion of the required special inspections table for concrete construction of special structural systems. The proposal amends the table to include continuous inspections of reinforcement in special moment frames, boundary elements of special structural walls and coupling beams.

Item 2b: Amend to include intermediate moment frames and shear reinforcement for special structural walls to require continuous (rather than periodic) welding special inspection given the critical design role of such reinforcement.

Item 2e: Clarifying that 5/16” or less fillet welds associated with those critical elements in item 2b are to receive continuous rather than periodic welding special inspection.

Item 2f: Proposal to change back to previous continuous special inspection requirement since welds not addressed by other items should receive continuous rather than periodic special inspection, such as for common concrete tilt-up wall panel-to-panel chord bar connections. Item 2.e. addresses welds that should receive periodic special inspection. Further information and background were provided during the 2022 ICC public comment period for the 2024 IBC by Stephen Kerr and Roy Lobo, both representing the Structural Engineers Association of California (SEAOC) in response to the change from continuous to periodic in the IBC model code:

> The proposed modification is intended to preserve the "all other welds" as continuous. The proponent of S143 is correct that back in 2012 the change did modify the inspection requirements shifting the other welds to continuous. However, the change S148-12 was clear that the modifications in the change were not just organizational. The original reason statement from S148-12:
>
> > "... The purpose for this proposal is to simplify the required extent (continuous or periodic) of special inspection for the welding of reinforcing bars, which is currently based on the structural design (e.g., resisting flexural, axial or shear forces). The proposal changes the extent to continuous special inspection of all welding of reinforcing bars except for single-pass fillet welds that are a maximum of 5/16-inch where periodic special inspection is permitted. This will also be consistent with the historical approach taken by the building code for the extent of special inspections related to welding."
>
> The change to limit the periodic welding was clearly spelled out in the S148-12 change. This has been argued in subsequent code cycles with proposals S136-16 and S96-19. The code has still maintained that "all other welds" as continuously inspected. If item f "all other welds" are considered to be periodically inspected, then there is a conflict with item e for fillet welds a maximum of 5/16". Larger multi-pass fillet welds do not fall under items a - e, therefore would be considered an "all other weld" and would be periodically inspected. The larger multi-pass welds should continue to be continuously inspected.
>
> There are some additional welds that could reasonably be periodically inspected, rather than continuous. However these welds should be clearly spelled out, similar to the item e 5/16" fillet welds.

Item 5: Proposal aligns inspection requirements with reference standard ACI 318-19 Section 26.13.3.2(a) requirements.

Item 6: Proposal adding “and during” ensures concrete sampling complies with ASTM C172 requirements including sampling during placement. Sampling only prior to placement could lead to substantial delays between sampling and placement, which can lead to concrete curing or other detrimental effects not being captured by samples taken only prior to placement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal brings alignment between ACI 318 and IBC.

Staff Analysis: CC # S112-25 and CC # S113-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S113-25

IBC: TABLE 1705.3

Proponents: Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

2024 International Building Code

Revise as follows:

6. Prior to concrete placement, fabricate specimens for strength tests, perform slump and air content tests, and determine the temperature of the concrete.	X	—	ASTM C31 ASTM C172 ACI 318: 26.5, 26.12	—
7. Inspect concrete and shotcrete placement for proper application techniques.	X	—	ACI 318: 26.5	—
8. Verify maintenance of specified curing temperature and techniques.	—	X	ACI 318: 26.5.3-26.5.5	—
9. Inspect prestressed concrete for:				
a. Application of prestressing forces.	X	—	ACI 318: 26.10	—
b. Grouting of bonded prestressing tendons.	X	—		
10. Inspect erection of precast concrete members.	—	X	ACI 318: 26.9	—
11. For precast concrete diaphragm connections or reinforcement at joints classified as moderate or high deformability elements (MDE or HDE) in structures assigned to Seismic Design Category C, D, E or F, inspect such connections and reinforcement in the field for:			ACI 318: 26.13.1.3	
a. Installation of the embedded parts.	X	—		—
b. Completion of the continuity of reinforcement across joints.	X	—	ACI 550.5	
c. Completion of connections in the field.	X	—		
12. Inspect installation tolerances of precast concrete diaphragm connections for compliance with ACI 550.5.	—	X	ACI 318: 26.13.1.3	—
13. Verify in-situ concrete strength, prior to stressing of tendons in posttensioned concrete and prior to removal of shores and forms from beams and structural slabs.	—	X	ACI 318: 26.11.2	—
14. Inspect formwork for shape, location and dimensions of the concrete member being formed.	—	X	ACI 318: 26.11.1.2(b)	—

For SI: 1 inch = 25.4 mm.

a. Where applicable, see Section 1705.13.

b. Specific requirements for special inspection shall be included in the research report for the anchor issued by an approved source in accordance with 26.13 in ACI 318, or other qualification procedures. Where specific requirements are not provided, special inspection requirements shall be specified by the registered design professional and shall be approved by the building official prior to the commencement of the work.

Reason: This code change proposal provides a pointer to the requirements of special inspection of structural concrete reinforced with GFRP bars. While the inspection requirements are maintained as mandatory requirements in ACI CODE 440.11, code officials in jurisdictions where GFRP bars are being accepted recommended adding this pointer to Table 1705.3. This language is informative and consistent with current inspection criteria for steel reinforcement, directing users to ACI 318.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal has no impact on cost. ACI CODE 440.11 referenced in the IBC requires inspection. This proposal simply is a pointer to the inspection requirements ACI CODE 440.11

Staff Analysis: CC # S113-25 and CC # S112-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S113-25

S114-25

IBC: SECTION 1705, 1705.5.2

Proponents: Emily Dunham, representing NCSEA Code Advisory Committee Special Inspections/Quality Assurance Subcommittee (emily.dunham@greshamsmith.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

SECTION 1705 REQUIRED SPECIAL INSPECTIONS AND TESTS

Revise as follows:

1705.5.2 Metal-plate-connected wood trusses spanning 60 feet or greater. Where a truss clear span is 60 feet (18 288 mm) or greater, the *special inspector* shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the ~~*approved* truss submittal package~~ design prepared in accordance with section 2303.4.1.3.

Reason: Section 2303.4.1.3 requires a truss plan to be developed by a registered design professional for truss bracing in trusses 60 feet or greater. Special inspections of the truss bracing should be performed in reference to this document rather than a truss submittal as the truss submittal may not include the specific bracing plan. For example, this bracing design could be provided as part of the construction documents, as a deferred submittal, or as a delegated design.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impact is anticipated. This is a clarification of where to find specifications for the bracing that needs to be inspected.

S114-25

S115-25

IBC: 1705.10, SECTION 1708, 1708.1, 1708.2, 1708.3 (New)

SECTION 1708
IN-SITU LOAD AND INTEGRITY TESTS

1708.1 General. Whenever there is a reasonable doubt as to the structural integrity, stability or load-bearing capacity of a completed *building*, *structure* or portion thereof for the expected *loads*, an engineering assessment shall be required. The engineering assessment shall involve ~~either~~ a structural analysis, ~~or an~~ in-situ load tests, or both. The structural analysis shall be based on actual material properties and other as-built conditions that affect stability or load-bearing capacity, and shall be conducted in accordance with the applicable design standard. The in-situ ~~load~~ tests shall be conducted in accordance with Section 1708.2 or 1708.3.

If the *building*, *structure* or portion thereof is found to have inadequate stability or load-bearing capacity for the expected *loads*, modifications to ensure structural adequacy or the removal of the inadequate construction shall be required.

1708.2 In-situ load tests. In-situ load tests shall be conducted in accordance with Section 1708.2.1 or 1708.2.2 and shall be supervised by a *registered design professional*. The test shall simulate the applicable loading conditions specified in Chapter 16 as necessary to address the concerns regarding structural stability of the *building*, *structure* or portion thereof.

Add new text as follows:

1708.3 In-situ structural integrity testing of deep foundation elements. In-situ structural integrity tests of deep foundation elements shall be conducted in accordance with ASTM D4945, ASTM D5882, ASTM D6760, ASTM D7949, or other *approved methods* and shall be supervised by a *registered design professional*.

Reason: Structural integrity testing where there is a reasonable doubt of deep foundation integrity was added to section 1705, Required Special Inspections and Tests, in 2021. Unlike the rest of section 1705, section 1705.10 does not ensure compliance with the code and approved construction documents, but rather are tests to evaluate deep foundations suspected to be out of compliance. These tests would not typically be part of a special inspection and testing program developed prior to construction and therefore should not be included in section 1705. The requirements for integrity testing should be moved to section 1708 where, along with in-situ load testing and structural analysis of as-built conditions, they would be used to evaluate questionable as-built construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is an editorial change moving the clause out of a section intended for special inspections and into a section about in-situ testing.

S115-25

S116-25

IBC: SECTION 1705, 1705.13

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Building Code

SECTION 1705
REQUIRED SPECIAL INSPECTIONS AND TESTS

Revise as follows:

1705.13 Special inspections for seismic resistance. *Special inspections* for seismic resistance shall be required as specified in Sections 1705.13.1 through 1705.13.9, unless exempted by the exceptions of Section 1704.2.

Exception: The *special inspections* specified in Sections 1705.13.1 through 1705.13.9 are not required for *structures* designed and constructed in accordance with one of the following:

1. The *structure* consists of *light-frame construction*; the design spectral response acceleration at short periods, S_{DS}, as determined in Chapter 11 of ASCE/SEI 7 ~~Section 1613.2.4~~, does not exceed 0.5; and the *building height* of the *structure* does not exceed 35 feet (10 668 mm).
2. The *seismic force-resisting system* of the *structure* consists of *reinforced masonry* or reinforced concrete; the design spectral response acceleration at short periods, S_{DS}, as determined in Chapter 11 of ASCE/SEI 7 ~~Section 1613.2.4~~, does not exceed 0.5; and the *building height* of the *structure* does not exceed 25 feet (7620 mm).
3. The *structure* is a detached one- or two-family *dwelling* not exceeding two *stories above grade plane* and does not have any of the following horizontal or vertical irregularities in accordance with Section 12.3 of ASCE 7:
   3.1. Torsional or extreme torsional irregularity.
   3.2. Nonparallel systems irregularity.
   3.3. Stiffness-soft story or stiffness-extreme soft story irregularity.
   3.4. Discontinuity in lateral strength-weak story irregularity.

Reason: Section 16.13.2.4, Design spectral response acceleration parameters, was eliminated from the 2024 IBC by S128-22, by removing the equation for SDS. S128-22 simplified IBC Section 1613 by replacing ground motion acceleration maps with Seismic Design Category (SDC) maps based on default site conditions. Chapter 11 of ASCE 7 provides equation 11.4-1 for SDS. Without this proposed change, the exception will reference a code section and equation that is not contained in the IBC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost – the proposal is editorial in that it cleans up reorganization of Section 1613.

S116-25

S117-25 Part I

IBC: 1803.5.3, ASTM Chapter 35 (New)

Proponents: David Sparks, Felten Group, Inc., representing Post-Tensioning Institute (PTI) DC10.5 Slab-on-ground Committee (david.sparks@feltengroup.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1803.5.3 Expansive soil. In areas likely to have expansive soil, the *building official* shall require soil tests to determine where such soils do exist.Soils meeting all ~~four~~ of Items 1 through 3 or Item 4 of the following provisions shall be considered to be expansive~~, except that tests to show compliance with Items 1, 2 and 3 shall not be required if the test prescribed in Item 4 is conducted~~:

1. Plasticity Index (PI) of 15 or greater, determined in accordance with ASTM D4318.
2. More than 10 percent of the soil particles pass a No.200 sieve (75 µm), determined in accordance with ASTM D6913 .
3. More than 10 percent of the soil particles are less than 5 micrometers in size, determined in accordance with ASTM ~~D6913~~ D7928 .
4. Expansion Index greater than 20, determined in accordance with ASTM D4829.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

D7928-21E1	Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis

S117-25 Part I

S117-25 Part II

IRC: R403.1.8.1, ASTM Chapter 44, ASTM Chapter 44 (New)

Proponents: David Sparks, Felten Group, Inc., representing Post-Tensioning Institute (PTI) DC10.5 Slab-on-ground Committee (david.sparks@feltengroup.com)

2024 International Residential Code

Revise as follows:

R403.1.8.1 Expansive soils classifications. Soils meeting all of Items 1 through 3 or Item 4 of the following provisions shall be considered to be expansive~~, except that tests to show compliance with Items 1, 2 and 3 shall not be required if the test prescribed in Item 4 is conducted~~:

1. Plasticity Index (PI) of 15 or greater, determined in accordance with ASTM D4318.
2. More than 10 percent of the soil particles pass a No. 200 sieve (75 µm), determined in accordance with ASTM ~~D422~~ D6913.
3. More than 10 percent of the soil particles are less than 5 micrometers in size, determined in accordance with ASTM ~~D422~~ D7928.
4. Expansion Index greater than 20, determined in accordance with ASTM D4829.

Delete without substitution:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

~~D422—63(2007)E2~~	~~Test Method for Particle-Size Analysis of Soils~~

Add new standard(s) as follows:

D6913/D6913M - 17	Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
D7928-21E1	Standard Test Method for Particle Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis

Reason: For both the IBC and IRC, the language in the existing code was not clear and/or direct in identifying that two conditions exist. Either you comply with all of items 1 through 3 or you comply with item 4 alone. The revised language is used to simplify and clearly indicate what is required without confusion to the reader. So instead of using the original language which started out stating that a soils is considered expansive when it meets all of the 4 requirements with an exception excluding items 1, 2 and 3 if the user performs testing that meets item 4 requirements, this simplification creates a direct path with the two choices. It does not change the code intent.

1803.5.3 and R403.1.8.1 should match. They describe exactly the same thing, but for some reason they were not aligned. This proposed change brings the two into alignment with all the current testing method standards referenced.

For the IBC:

ASTM D6913 is not the correct standard for item 3. The correct standard is actually ASTM D7928. The correction to the referenced ASTM standard also requires the addition of ASTM D7928 within Chapter 35.

For the IRC:

ASTM D422 is no longer used and instead items 2 and 3 should reference ASTM D6913 and D7928 respectively to be correct and consistent with the IBC. This requires the deletion of the reference to ASTM D422 as well as the addition of D6913 and D7928 within Chapter 44.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is merely clarifying existing language to make the code path clear and also to reference the correct standard for the testing required for compliance with item 3.

Staff Analysis: Part I: A review of the standard proposed for inclusion in the code, ASTM D7928-21E1 Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

Part II: A review of the standard proposed for inclusion in the code, ASTM D7928-21E1 Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

The proposed referenced standard, ASTM D6913/D6913M – 17 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis, is currently referenced in the IBC.

S117-25 Part II

S118-25

IBC: SECTION 202 (New), 1803.5.6 (New), 1803.6

Proponents: Lori Simpson, Langan, representing Geocoalition (lsimpson@langan.com); Daniel Stevenson, Berkel and Company Contractors, Inc., representing GeoCoalition (dstevenson@berkelapg.com)

2024 International Building Code

Add new text as follows:

GROUND *IMPROVEMENT*. A technique which modifies the existing ground to improve the load bearing capacity of foundations, control settlement, and/or improve stability.

1803.5.6 *Ground improvement*. Where shallow foundations will bear on *improved* ground, a geotechnical investigation shall be conducted and shall include the following as applicable:

1. Recommended *ground improvement* methods.
2. Required improvement depth and horizontal extent.
3. *Ground improvement* installation procedures.
4. Required testing to confirm design assumptions.
5. Special inspection requirements.
6. Suitability of *ground improvement* materials for the intended environment.
7. Acceptance criteria.
8. Requirements for preparation of construction documents by delegated designer, as appropriate.

Revise as follows:

1803.6 Reporting. Where geotechnical investigations are required, a written report of the investigations shall be submitted to the *building official* by the *permit* applicant at the time of *permit* application. This geotechnical report shall include, but need not be limited to, the following information:

1. A plot showing the location of the soil investigations.
2. A complete record of the soil boring and penetration test logs and soil samples.
3. A record of the soil profile.
4. Elevation of the water table, if encountered.
5. Recommendations for foundation type and design criteria, including but not limited to: bearing capacity of natural or compacted soil; provisions to mitigate the effects of expansive soils; mitigation of the effects of liquefaction, differential settlement and varying soil strength; and the effects of adjacent *loads*.
6. Expected total and differential settlement.
7. *Deep foundation* information in accordance with Section 1803.5.5.
8. Special design and construction provisions for foundations of *structures* founded on expansive soils, as necessary.
9. Compacted fill material properties and testing in accordance with Section 1803.5.8.
10. *Controlled low-strength material* properties and testing in accordance with Section 1803.5.9.
11. *Ground improvement* system information in accordance with Section 1803.5.6.

Reason: Ground Improvement systems are methods which can enhance the load-bearing capacity of the ground below shallow foundations and/or control total and differential settlements within the zone of influence of the foundations. Ground improvement systems are most often used as an alternative to deep foundations (i.e., pile foundations). There is no established standard for the design or installation of ground improvement systems.

Failures of ground improvement systems can have significant impact on the structural integrity of a building. The objective of this proposal is to provide consistent requirements for a geotechnical investigation where ground improvement is recommended.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Ground improvement is commonly used; this code addition does not cause a cost impact, but provides consistent requirements for the geotechnical investigation report.

S118-25

S119-25

IBC: 1806.2

Proponents: John-Jozef Proczka, representing City of Phoenix Planning and Development Department (john-jozef.proczka@phoenix.gov)

2024 International Building Code

Revise as follows:

1806.2 Presumptive load-bearing values. The load-bearing values used in design for undisturbed supporting soils, compacted fill per the exception to Section 1804.6, and rock near the surface shall not exceed the values specified in Table 1806.2 unless data to substantiate the use of higher values are submitted and *approved*. Where the *building official* has reason to doubt the classification, strength or compressibility of the soil or rock, the requirements of Section 1803.5.2 shall be satisfied.

Presumptive load-bearing values shall apply to materials with similar physical and engineering characteristics. Mud, organic silt and organic clays (OL, OH), peat (Pt) and undocumented fill shall not be assumed to have a presumptive load-bearing capacity unless data to substantiate the use of such a value are submitted.

Exception: A presumptive load-bearing capacity shall be permitted to be used where the *building official* deems the load-bearing capacity is adequate for the support of lightweight or *temporary structures*.

Reason: The presumptive load-bearing values of soils are associated with undisturbed soils. This is present in this section in a round-about way already by indicating that undocumented fill shall not be assumed to have a presumptive capacity, but soil that is disturbed becoming the category of undocumented fill is not a leap that is readily made without this clarification. Additionally, this is already present as a requirement in Section 1809.2 that is specific to shallow foundations, however it should be placed in the presumptive load-bearing section to ensure these presumptive values are not misused and it clarifies the presumptive capacities for embedded posts and poles and deep foundations are not used with disturbed soil.

Section 1804.6 exempts compacted fill material less than 12 inches in depth from requiring a geotechnical report, and without a geotechnical report the only possible source of load bearing values for that fill is contained in these presumptive provisions. This will clarify this path for the code user.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements already present to make them more obvious.

S119-25

S120-25

IBC: 1807.1.1

Proponents: Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Seth Thomas, KPFF Consulting Engineers, representing Self (seth.thomas@kpff.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

Revise as follows:

1807.1.1 Design lateral soil loads. Foundation walls shall be designed for the lateral soil *loads* set forth in Section 1610. For structures assigned to *Seismic Design Category* D, E or F, the design of foundation walls supporting more than 6 ft. (1829 mm.) of backfill shall incorporate the additional seismic lateral earth pressure in accordance with the geotechnical investigation, where required by Section 1803.2.

Reason: This proposal is intended as a clarification of current design practice, making the seismic lateral earth pressure requirements of Section 1807.1 (foundation walls) consistent with Section 1807.2 (retaining walls). We believe this to be editorial clarification, because we believe that engineers implementing these provisions would consider a foundation wall that retains soil to also be a retaining wall and thus required to meet applicable Section 1807.2 provisions. This clarification is being made in part because the terms foundation wall and retaining wall are used differently in the IRC and could provide confusion for IBC users.

The additional lateral loading from seismic generated earth pressures is an important factor for performance in high seismic hazard areas, particularly in Seismic Design Categories (SDCs) D, E and F. Several studies show, however, that when the peak ground acceleration is below 0.3-0.4g (roughly corresponding to SDC A, B and C) there is an adequate factor of safety built into the static earth pressures, so the additional seismic lateral pressure need not be included.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides editorial clarification consistent with current practice, with no substantive change.

S120-25

S121-25

IBC: 1807.3, 1807.3.1, 1807.3.2.3

Proponents: John-Jozef "JJ" Proczka, City of Phoenix, representing City of Phoenix Planning and Development Department (john-jozef.proczka@phoenix.gov)

2024 International Building Code

1807.3 Embedded posts and poles. Designs to resist both axial and lateral *loads* employing posts or poles as columns embedded in earth or in concrete footings in earth shall be in accordance with Sections 1807.3.1 through 1807.3.3 or ASABE EP 486.3.

Revise as follows:

1807.3.1 Limitations. The design procedures outlined in this section are subject to the following limitations:

1. The frictional resistance for structural walls and slabs on silts and clays shall be limited to one-half of the normal force imposed on the soil by the weight of the footing or slab.
2. Posts embedded in earth shall not be used to provide lateral support for structural or nonstructural materials such as plaster, masonry or concrete unless bracing is provided that develops the limited deflection required.
3. The embedded post or pole shall follow the provisions of this section without being required to follow the *deep foundation* provisions if the ratio of the depth of embedment to the least horizontal dimension of the part embedded in earth is less than or equal to six.
4. The depth of embedment shall not exceed 12 feet for the purpose of calculating lateral pressure.

Wood poles shall be treated in accordance with AWPA U1 for sawn timber posts (Commodity Specification A, Use Category 4B) and for round timber posts (Commodity Specification B, Use Category 4B).

1807.3.2.3 Vertical load. The resistance to vertical *loads* shall be determined using the vertical foundation pressure set forth in Table 1806.2, the downward shaft resistance of Section 1810.3.3.1.4, or as determined in a geotechnical report for this type of foundation..

Reason: *Shallow foundations* and *deep foundations* are defined. With a straight reading, all embedded posts and poles are deep foundations. As such, all of the deep foundation provisions would need to be followed and these embedded post and pole provisions just become poorly located deep foundation provisions in the code. This is not the intent of the code. These embedded posts and poles are intended to be their own category before reaching the nonlinear interaction of soil and foundation for lateral loads that characterizes truly deep foundations.

The primary change in this proposal is to apply the ratio of embedment to least horizontal dimension and apply it to these basic provisions so that all of the deep foundation provisions do not need to be followed, as this will limit the behavior to behave rigidly with respect to the soil.

The 12 foot depth item is already present in the code in the definition of "d" used in the equations. It is a difficult to find/easy to miss item, and is really a limitation, so this proposal brings more prominence to it by placing it in the limitations section.

The shaft resistance provisions for axial loads are brought in as an option to resist downward loading, as they are prescriptive and there is no reason not to allow their use for this type of foundation as an option to the end bearing resistance that is currently the only option. Note that uplift loads are not included as there is a separate deep foundation section for those.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal could increase or could decrease the cost of construction depending on the interpretation that is currently being enforced, due to the current conflict between code intent and code wording. Based upon the intent of the code there would be no cost impact.

S122-25 Part I

IBC: 1808.1, 1808.2.1 (New), PTI Chapter 35 (New)

Proponents: David Sparks, representing Post-Tensioning Institute (PTI) DC10.5 Slab-on-ground Committee (david.sparks@feltengroup.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

1808.1 General. Foundations shall be designed and constructed in accordance with Sections 1808.2 through 1808.9. *Shallow foundations* shall satisfy the requirements of Section 1809. *Deep foundations* shall satisfy the requirements of Section 1810.

Exception: Design of post-tensioned slabs-on-ground need not comply with the requirements of Sections 1808.8, 1809, and 1810. Materials and construction of post-tensioned slabs-on-ground shall comply with PTI DC10.5 and PTI M10.6.

Add new text as follows:

1808.2.1 Post-tensioned slabs-on-ground.. Post-tensioned slabs-on-ground shall be designed in accordance with PTI DC10.5.

Add new standard(s) as follows:

PTI

Post-Tensioning Institute
38800 Country Club Drive
Farmington Hills, MI 48331

M10.6-15	Specification for Unbonded Single Strand Tendons for Slab-on-Ground Construction

S122-25 Part I

S122-25 Part II

IRC: R402.5 (New), R403.6 (New), PTI Chapter 44 (New)

Proponents: David Sparks, representing Post-Tensioning Institute (PTI) DC10.5 Slab-on-ground Committee (david.sparks@feltengroup.com)

2024 International Residential Code

Add new text as follows:

R402.5 Post-tensioned slabs-on-ground.. Post-tensioned slabs-on-ground materials and installation shall be in accordance with PTI DC10.5 and PTI M10.6.

R403.6 Post-tensioned slabs-on-ground.. Post-tensioned slabs-on-ground constructed on soil not classified as expansive in accordance with Section R403.1.8.1 shall be designed in accordance with PTI DC10.5.

Add new standard(s) as follows:

PTI

Post-Tensioning Institute
38800 Country Club Drive
Farmington Hills, MI 48331

M10.6-15	Specification for Unbonded Single Strand Tendons for Slab-on-Ground Construction

Reason: Currently, the IBC only contains a reference to the PTI DC10.5 standard for Post-Tensioned Slabs-On-Ground (PTSOG) within chapter 1808.6.2 (which is under expansive soils). The title of the PTI DC10.5 standard does include soils that are not considered expansive as defined by 1803.5.3. Without a reference to the PTI DC10.5 standard from a section of 1808 that is not exclusive to expansive soils, there is currently no path from the IBC to the PTI DC10.5 document for the design of PTSOG on stable soils. Because the PTI DC10.5 standard contains stand-alone provisions for concrete specifications and shallow foundation design methodologies, it is necessary to add an exception in 1808.1 indicating that PTSOG need not comply with 1808.8, 1809, and because it is not a deep foundation 1810. Additionally, since all foundations must be designed for capacity and settlement including non-expansive and expansive soils, the reference for non-expansive soils can be inserted into a subsection of 1808.2 - 1808.2.1. This will direct PTSOG design for non-expansive soils to the DC10.5 standard.

Although the 2024 IRC added a reference to the DC10.5 standard in Chapter 5 (Floors), this did not address the need for a reference to the standard under Chapter 4 (Foundations) beyond Section R403.1.8 for expansive soils which refers back to 1808.6 in the IBC. In order to better define the PTSOG as a foundation, we suggest adding section R402.5 for the materials and installation of PTSOG directing scope to DC10.5 and additionally the M10.6 document. Once that is in place, then a new section under R403 for PTSOG (R403.6) which will indicate that PTSOG on soils not classified as expansive per R403.1.8.1 shall be designed per the DC10.5 standard, with a reference to R403.1.8 for expansive soils).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes to the IBC and IRC are meant to clarify the scope of the DC10.5 document as it pertains to non-expansive soils. As such, there is no cost increase or decrease associated with the changes.

Staff Analysis: A review of the standard proposed for inclusion in the code, PTI M10.6-15 Specification for Unbonded Single Strand Tendons for Slab-on-Ground Construction, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

2024 International Building Code

Add new definition as follows:

LOAD TRANSFER LAYER. Granular or cementitious materials placed between ground improvement elements and shallow foundations.

Add new text as follows:

1705.6.1 Ground improvement. Special Inspections and tests shall be performed during installation of *ground improvement* as specified in Table 1705.6.1. The approved geotechnical report and *construction documents* prepared by the *registered design professional* shall be used to determine compliance.

TABLE 1705.6.1 REQUIRED SPECIAL INSPECTIONS AND TESTS OF GROUND IMPROVEMENT

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION
1. Inspect implementation and verification procedures and maintain complete accurate records for each application of *ground improvement* systems.	X	-
2. Verify *ground improvement* equipment, materials, locations, diameters, and plumbness, as applicable.	X	-
3. Verify embedment into bearing strata, as applicable. Record relevant ground effects.	X	-
4. Verify working grade elevation	-	X
5. Verify material quantities used, as applicable.	X	-
6. Verify improvement using methods specified in geotechnical report.	-	X

1809.15 Ground improvement. *Ground improvement* shall be in accordance with this section.

1809.15.1 General. *Ground improvement* shall be designed, detailed, and constructed in accordance with sections 1809.15.1 through 1809.15.3.

1809.15.1.1 Geotechnical Investigation. *Ground improvement* shall be designed and installed on the basis of a geotechnical investigation and written report as set forth in Section 1803.

1809.15.2 Design. *Ground Improvement* for shallow foundation support shall be designed by a *registered design professional.* The *registered design professional* shall provide construction documents and calculations that include all of the following:

1. Structural loads, including vertical, lateral, and rotational, and maximum permissible total and differential settlements as provided by the *registered design professional in responsible charge* for the structure being supported.
2. Cut and fill heights, as shown on the site plan.
3. Geotechnical and structural capacity analyses.
4. Where required, thickness and characteristics of the load transfer layer.
5. Allowable bearing pressures.
6. Minimum safety factor used to determine the allowable bearing pressure. Where ground improvement includes individual elements, provide separate factors of safety for the individual elements and the overall system.
7. Predicted maximum total and differential settlements.

8. Recommended testing and acceptance criteria for the installation of the *ground improvement.*

9. Plans and specifications necessary for the completion of the work.

1809.15.3 Installation. *Ground improvement* shall be installed in accordance with construction documents provided by the *registered design professional.*

1809.15.4 Special inspection. Special inspections in accordance with 1705.6.1 shall be provided for *ground improvement.*

Reason: Ground Improvement systems are *methods which* can enhance the load-bearing capacity of the ground below shallow foundations and/or control total and differential settlements within the zone of influence of the foundations. Ground improvement systems are most often used as an alternative to deep foundations (i.e., pile foundations). There is no established standard for the design or installation of ground improvement.

Failures of ground improvement systems can have significant impact on the structural integrity of a building. The objective of this proposal is to provide consistent requirements for the design, construction, and inspection of ground improvement systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Ground improvement is commonly used; this code addition does not cause a cost impact, but provides consistent requirements for design, construction, and inspection of ground improvement systems.

2024 International Building Code

Add new definition as follows:

RIGID INCLUSIONS. Vertical elements within the ground consisting of timber, steel, *concrete*, grout, or other combination of cementitious materials mixed with aggregates, or other materials that are significantly stiffer than the ground in which they are installed and do not require lateral confinement of the surrounding soil for internal stability. Rigid inclusions are not connected directly to foundations.
RIGID INCLUSION SYSTEMS. *Rigid inclusions*, the strata and materials in which they are installed, and a *load transfer layer*.

Add new text as follows:

1705.6.2 Rigid inclusion systems. Special Inspections and tests shall be performed during installation of rigid inclusion systems as specified in Tables 1705.6.1 and 1705.6.2. The approved geotechnical investigation and *construction documents* prepared by the *registered design professional(s)* shall be used to determine compliance.

TABLE 1705.6.2 REQUIRED SPECIAL INSPECTIONS AND TESTS OF RIGID INCLUSION SYSTEMS

TYPE	CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION
1. Inspect installation and load testing operations, and maintain complete and accurate records for each *rigid inclusion*	X	-
2. Verify *rigid inclusion* materials, placement locations, diamters, and plubness. Verify embedment into bearing strata and adequate end-bearing strata capacity. Record concrete or grout volumes. Verify top of *rigid inclusions* elevations.	X	-
3. Perform test and *special inspections* on *concrete* or grout in accordance with applicable requirements of Section 1705.3	In accordance with Section 1705.3	
4. During *rigid inclusion* load transfer/layer installation, verify use of proper materials, procedures, material densities, and lift thicknesses.	X	-

1809.16 Rigid inclusions. *Rigid inclusions* shall be in accordance with this section.

1809.16.1 General. Where *ground improvement systems* use *rigid inclusions*, *rigid inclusion systems* shall be designed, detailed and installed in accordance with sections 1809.16.2 through 1809.16.1.3.

1809.16.2 Design and detailing. *Rigid inclusion systems* shall be designed and detailed in accordance with sections 1809.16.2.1 through 1809.16.2.4.

1809.16.2.1 Design requirements. In addition to the requirements of Section 1809.15.1, the *registered design professional* shall provide construction documents and calculations that include all of the following:

1. The load distribution and strain compatibility between the *rigid inclusions* and surrounding strata.
2. The structural compatibility between the *rigid inclusions* and the shallow foundations including impacts of concentrated reaction loads imposed by the *rigid inclusions* on shallow foundations.
3. Minimum number and configuration of *rigid inclusions* to establish vertical, lateral, and rotational stability of foundations.

1809.16.2.2 Allowable stresses. The allowable stresses for materials used in *rigid inclusions* shall be in accordance with section

1810.3.2.6. Allowable stresses for materials not included in section 1810.3.2.6 shall be approved by the *building official.*

1809.16.2.3 Load Test. Where *rigid inclusions* are used to increase bearing capacity, or where predicted settlements without *rigid inclusions* would cause harmful distortion or instability in the structure, control test elements shall be tested in accordance with ASTM D1143 or ASTM D4945. One or more load tests shall be conducted in each area of similar subsurface conditions. The resulting allowable load shall be not more than one-half of the ultimate load bearing capacity as assessed by one of the published methods listed in section 1810.3.3.1.3.

1809.16.2.4 Seismic Design Categories C through F. For structures assigned to *seismic design category* C, D, E or F, materials used in *rigid inclusions* shall comply with section 1809.16.2.4.1, and reinforcement shall be provided in accordance with section 1809.16.2.4.2.

1809.16.2.4.1 Materials. For structures assigned to *seismic design category* C, D, E or F, materials used in rigid inclusions shall comply with one of the following:

1. Steel elements meeting the requirements of 1810.3.2.3.
2. Timber elements meeting the requirements of 1810.3.2.4.
3. Concrete elements meeting the requirements of 1808.8.1.
4. Other *approved* materials, which have adequate strength and ductility to resist imposed ground curvatures.

1809.16.2.4.2 Seismic reinforcement for concrete rigid inclusions. Where a *structure* is assigned to *Seismic Design Category* C, reinforcement shall be provided in accordance with Section 1809.16.2.4.2.1. Where a *structure* is assigned to *Seismic Design Category* D, E or F, reinforcement shall be provided in accordance with Sections 1809.16.2.4.2.2 and 1809.16.2.4.2.3.

1809.16.2.4.2.1 Seismic reinforcement in Seismic Design Category C. For *structures* assigned to *Seismic Design Category* C, concrete *rigid inclusions* shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis. At least one longitudinal bar, with a minimum longitudinal reinforcement ratio of 0.002, shall be provided throughout the minimum reinforced length of the element as defined in this section starting at the top of the element. The minimum reinforced length of the *rigid inclusion* shall be taken as the greatest of the following:

1. One-third of the element length.
2. A distance of 10 feet (3048 mm).
3. Three times the least element dimension.
4. Three times the least element dimension below the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft- to medium-stiff clay.

Exception: The requirements of this section shall not apply to concrete *rigid inclusions* cast in structural steel pipes or tubes.

1809.16.2.4.2.2 Seismic reinforcement in Seismic Design Categories D through F. For *structures* assigned to *Seismic Design Category* D, E or F, concrete *rigid inclusions* shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis. For *Site Class* A, B, BC, C, CD, D or DE sites, not less than one longitudinal bar, with a minimum longitudinal reinforcement ratio of 0.003, shall be provided throughout the minimum reinforced length of the *rigid inclusion*. For *Site Class* E and F sites, not less than four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.005, shall be provided throughout the minimum reinforced length of the *rigid inclusion*. The minimum reinforced length of the *rigid inclusion* is defined in this section as starting at the top of the element. The minimum reinforced length of the *rigid inclusion* shall be taken as the greatest of the following:

1. One-half of the element length.

2. A distance of 10 feet (3048 mm).
3. Three times the least element dimension.
4. Seven times the least element dimension below the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft- to medium-stiff clay.

Exceptions: The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.

1809.16.2.4.2.3 Transverse Confinement for Site Classes E and F. For *Site Class* E or F sites, transverse confinement reinforcement shall be provided in the rigid inclusion in accordance with Section 1810.3.9.4.2.2.

1809.16.3 Installation. The *rigid inclusion systems* shall be installed in accordance with construction documents provided by the *rigid inclusion systems* designer.

1809.16.4 Special inspection. *Special Inspections* in accordance with 1705.6.1 and 1705.6.2 shall be provided for *rigid inclusion systems*.

Reason: Ground Improvement systems are *methods which* can enhance the load-bearing capacity of the ground below shallow foundations and/or control total and differential settlements within the zone of influence of the foundations. Ground improvement systems are most often used as an alternative to deep foundations (i.e., pile foundations). Rigid inclusions are not presently addressed in the IBC. There is no established standard for the design or installation of rigid inclusion systems.

Failures of ground improvement systems can have significant impact on the structural integrity of a building. The objective of this proposal is to provide consistent requirements for the design, construction, and inspection of rigid inclusions systems.

Graphical comparison of different foundation systems:

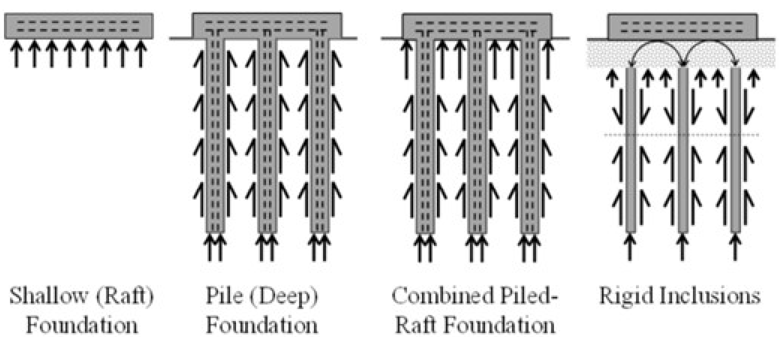

Figure 1. Generalized load path diagrams for typical foundation systems.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Cost impact is the cost of reinforcement in each rigid inclusion, where it will be required and has not been previously used in design. The increase could be on the order of $3 to $16 per foot of length of rigid inclusions.

Estimated Immediate Cost Impact Justification (methodology and variables):

Where reinforcement will be required to be used in a rigid inclusion, there may be a cost increase, as not all designers are including it now. Where reinforcement is required, the cost increase will depend on:

- the amount of steel needed - from a single bar to a full cage
- the length the reinforcement is needed - a single bar will likely be for the full length, but a cage might only be needed in the upper 10 to 20 feet.

Estimated Life Cycle Cost Impact:

This proposal will not impact life cycle cost.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Once constructed, there is no cost change over the life cycle of the structure.

S124-25

S125-25

IBC: 1810.2.2

Proponents: Daniel Stevenson, Berkel and Company Contractors, Inc., representing GeoCoalition (dstevenson@berkelapg.com); Lori Simpson, Langan, representing Geocoalition (lsimpson@langan.com)

2024 International Building Code

Revise as follows:

1810.2.2 Stability. *Deep foundation* elements shall be braced to provide lateral stability in all directions. Three or more elements connected by a rigid cap shall be considered to be braced, provided that the elements are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A two-element group in a rigid cap shall be considered to be braced along the axis connecting the two elements. Isolated cast-in-place *deep foundation* elements without lateral bracing shall be considered braced where adequate lateral support in accordance with Section 1810.2.1 is provided for the entire height and analysis demonstrates that the element can support the required loads, including mislocations required by Section 1810.3.1.3, with neither harmful distortion nor instability in the *structure*. ~~Methods used to brace *deep foundation* elements shall be subject to the approval of the *building official*.~~

Deep foundation elements supporting walls shall be placed alternately in lines spaced not less than 1 foot (305 mm) apart and located symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and lateral forces, or the foundation elements are adequately braced to provide for lateral stability. Methods used to brace *deep foundation* elements shall be subject to the approval of the *building official*.

Exception~~s~~: A single row of *deep foundation elements* without lateral bracing is permitted for one- and two-family *dwellings* and lightweight construction not exceeding two *stories above grade plane* or 35 feet (10 668 mm) in *building height*, provided that the centers of the elements are located within the width of the supported wall.

1. ~~Isolated cast-in-place *deep foundation* elements without lateral bracing shall be permitted where the least horizontal dimension is not less than 2 feet (610 mm), adequate lateral support in accordance with Section 1810.2.1 is provided for the entire height and analysis demonstrates that the element can support the required loads, including mislocations required by Section 1810.3.1.3, with neither harmful distortion nor instability in the *structure*.~~
2. ~~A single row of *deep foundation* elements without lateral bracing is permitted for one- and two-family *dwellings* and lightweight construction not exceeding two *stories above grade plane* or 35 feet (10 668 mm) in *building height*, provided that the centers of the elements are located within the width of the supported wall.~~

Reason: This section has been reformatted for clarity. The first exception has been slightly reworded and moved into the main section, as this exception is actually an example of acceptably braced elements and not an exception to the bracing requirement. It follows the given “deemed to comply” bracing examples of a group of 3 piles and a group of 2 piles. The “not less than 2 feet” requirement has been removed, as the analysis required makes the current 2 feet limit unnecessary. The 2 feet limit can increase costs on projects where analysis shows smaller shafts are acceptable.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal will decrease the cost of construction. The expected cost savings range from $0 to $3500 per foundation. These cost savings are based in a unit rate basis.

Estimated Immediate Cost Impact Justification (methodology and variables):

The current 2 feet size limit for isolated deep foundation elements can increase costs where analysis shows that smaller shafts are acceptable. Deleting this limit will reduce costs on some projects. For example, a 24-inch diameter concrete deep foundation element that is 50 feet deep will have a volume of 5.82 cubic yards. A 16-inch diameter concrete deep foundation element that is 50 feet deep will have a volume of 2.59 cubic yards. The unit cost of concrete deep foundation elements can vary greatly. However, a unit cost of $1000/CY can be considered a reasonable value. If analysis can demonstrate that a 16-inch diameter deep foundation element can be used where the code currently requires a 24-inch diameter element, the expected savings per element would be $1000 x (5.82-2.59) =

$3230.

Estimated Life Cycle Cost Impact:

This proposal will have no impact on the estimated life cycle cost.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This proposal does not impact the durability or the expected maintenance costs of deep foundations.

S125-25

S126-25

IBC: 1810.3.1.4, 1810.3.1.5

Proponents: Nathalie Boeholt, Seattle Dept. of Construction and Inspections (SDCI), representing Washington Association of Building Officials Technical Code Development Committee (WABO TCD) (nathalie.boeholt@seattle.gov); Julius Carreon, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee (jcarreon@bellevuewa.gov); Micah Chappell, Seattle Dept. of Construction and Inspections (SDCI), representing Washington Association of Building Officials Technical Code Development Committee (WABO TCD) (micah.chappell@seattle.gov)

2024 International Building Code

Revise as follows:

1810.3.1.4 Driven piles. Driven piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by handling, driving, ~~and~~ service, and design loads.

1810.3.1.5 Helical piles. *Helical piles* shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by installation into the ground and service and design loads.

Reason: The proposed change is a clarification to add the term "design loads" to the list of design conditions. It seems obvious that driven piles and helical piles should be designed for "design loads" and not just "service loads" but the term "service loads", even though it is not defined in the IBC, was added as a new definition in ASCE 7-16. Its definition includes the following: "...Service live loads and environmental loads for a particular limit state are permitted to be less than the design loads specified in the standard...". The words "less than the design loads" could add confusion and create situations where driven piles and helical piles are under designed. This change will avoid this potential confusion.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No impact to cost, this is simply a code language clarification. Most designers should already know and do this.

S126-25

S127-25

IBC: 1810.3.3.1.2, CHAPTER 35, ASTM Chapter 35 (New)

Proponents: Daniel Stevenson, Berkel and Company Contractors, Inc., representing GeoCoalition (dstevenson@berkelapg.com); Lori Simpson, Langan, representing Geocoalition (lsimpson@langan.com)

2024 International Building Code

Revise as follows:

1810.3.3.1.2 Load tests. Where design compressive *loads* are greater than those determined using the allowable stresses specified in Section 1810.3.2.6, where the design *load* for any *deep foundation* element is in doubt, or where cast-in-place *deep foundation* elements have an enlarged base formed either by compacting concrete or by driving a precast base, control test elements shall be tested in accordance with ASTM D1143<u>,</u> ~~or~~ ASTM D4945<u>, or ASTM D8169</u>. One element or more shall be load tested in each area of uniform subsoil conditions. Where required by the *building official*, additional elements shall be load tested where necessary to establish the safe design capacity. The resulting allowable *loads* shall not be more than one-half of the ultimate axial load capacity of the test element as assessed by one of the published methods listed in Section 1810.3.3.1.3 with consideration for the test type, duration and subsoil. The ultimate axial load capacity shall be determined by a *registered design professional* with consideration given to tolerable total and differential settlements at design *load* in accordance with Section 1810.2.3. In subsequent installation of the balance of *deep foundation* elements, all elements shall be deemed to have a supporting capacity equal to that of the control element where such elements are of the same type, size and relative length as the test element; are installed using the same or comparable methods and equipment as the test element; are installed in similar subsoil conditions as the test element; and, for driven elements, where the rate of penetration (for example, net displacement per blow) of such elements is equal to or less than that of the test element driven with the same hammer through a comparable driving distance.

CHAPTER 35
REFERENCED STANDARDS

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

<u>ASTM D8169/D8169M-18</u> <u>Standard Test methods for Deep Foundations Under Bi-Directional Static Axial Compressive Load</u>

Reason: ASTM D8169 is the standard test method for deep foundations under bi-directional static axial compressive load. Bi-directional load tests have been routinely used for decades and are becoming increasingly common. For elements with high ultimate capacities, especially drilled shafts, bi-directional tests can be the only practical option to conduct a static load test. Adding this test method to the Code will allow building officials, engineers, and contractors to better characterize the response of deep foundation elements under load. These tests can increase safety and reduce costs, both for the test and the foundation.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Top-down tests conducted in accordance with ASTM D1143 are generally more economical than bi-directional tests conducted in accordance with ASTM D8169. However, for high-capacity load tests bi-directional tests can be more cost effective than traditional top-down tests (ASTM D1143). Expected savings could range from $0 to $40,000 per test. This cost was calculated on a unit rate basis.

Bi-directional tests can also be performed for relatively high loads where top-down tests are not practical. Because bi-directional load tests can be conducted at higher loads than top-down tests, they can be used to justify higher allowable loads for deep foundations. Higher allowable loads will decrease the overall cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

The costs of load test are project specific and vary considerably. A high-capacity (e.g. 1000 tons) top-down load test may cost as much as $100,000, whereas a comparable bi-directional load test would cost approximately $60,000. This would produce a net savings of $40,000 per test. In addition, bi-directional load tests can be used to confirm tension capacity, which would eliminate the need to perform separate tension load tests. This could save an additional $50,000 per tension test.

Because of the multiple variables involved, it is difficult to assess the potential cost decrease which could be realized from the higher allowable foundation loads justified from bi-directional load tests. These savings can potential far exceed the potential decrease in the cost of the tests.

Estimated Life Cycle Cost Impact:

This proposal will not impact life cycle cost.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM D8169/D8169M-18 Standard Test Methods for Deep Foundations Under Bi-Directional Static Axial Compressive Load, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S127-25

S128-25

IBC: 1810.3.3.1.2

Proponents: Daniel Stevenson, Berkel and Company Contractors, Inc., representing GeoCoalition (dstevenson@berkelapg.com); Lori Simpson, Langan, representing Geocoalition (lsimpson@langan.com)

2024 International Building Code

Revise as follows:

1810.3.3.1.2 Load tests. Where design compressive *loads* are greater than those determined using the allowable stresses specified in Section 1810.3.2.6, where the ultimate axial load capacity~~design *load*~~ for any *deep foundation* element is in doubt, or where cast-in-place *deep foundation* elements have an enlarged base formed either by compacting concrete or by driving a precast base, control test elements shall be tested in accordance with ASTM D1143 or ASTM D4945. One element or more shall be load tested in each area of ~~uniform subsoil~~similar subsurface conditions. Where required by the *building official*, additional elements shall be load tested where necessary to establish the allowable loads~~safe design capacity~~. The resulting allowable *loads* shall not be more than one-half of the ultimate axial load capacity of the test element as assessed by one of the published methods listed in Section 1810.3.3.1.3 with consideration for the test type, duration and subsoil. The ultimate axial load capacity shall be determined by a *registered design professional* with consideration given to tolerable total and differential settlements at design *load* in accordance with Section 1810.2.3. In subsequent installation of the balance of *deep foundation* elements, all elements shall be deemed to have an ultimate axial load capacity ~~supporting capacity~~ equal to that of the control element where such elements are of the same type, size and relative length as the test element; are installed using the same or comparable methods and equipment as the test element; are installed in similar ~~subsoil~~ subsurface conditions as the test element; and, for driven elements, where the rate of penetration (for example, net displacement per blow) of such elements is equal to or less than that of the test element driven with the same hammer through a comparable driving distance.

Reason: The purpose of this proposal is to clarify the code by using more consistent and accurate terminology. Current code language in this section uses the terms "design load", "safe design capacity", "supporting capacity", and "allowable load" interchangeably. This inconsistent terminology can be confusing, as it is sometimes difficult to tell if the current terminology is referring to the allowable load or the ultimate load capacity.

To be consistent with the title of the parent section 1810.3.3 (Determination of allowable loads), the term "allowable load" will be used when referring to the maximum load that is permitted to be applied to a deep foundation element. When referring to the load which would cause failure, the term "ultimate axial load capacity" will be used. Also, the term "subsoil" will be replaced with the more accurate term "subsurface", to add consistency with previous sections in chapter 18 (1803.3).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the code by using more consistent terminology. It does not change code requirements.

S129-25

IBC: 1810.3.3.1.5, ASTM Chapter 35 (New)

Proponents: Daniel Stevenson, Berkel and Company Contractors, Inc., representing GeoCoalition (dstevenson@berkelapg.com); Lori Simpson, Langan, representing Geocoalition (lsimpson@langan.com)

2024 International Building Code

Revise as follows:

1810.3.3.1.5 ~~Uplift capacity~~Allowable uplift load of a single deep foundation element. Where required by the design, the uplift capacity of a single *deep foundation* element shall be determined by an *approved* method of analysis based on a minimum safety factor ~~of safety~~ of three or by load tests conducted in accordance with ASTM D1143, ASTM D3689, ASTM D4945, or ASTM D8169. Where uplift capacity is determined by load tests conducted in accordance with ASTM D1143, the test element shall be instrumented to determine load transfer response. The maximum allowable uplift *load* shall not exceed the ultimate load capacity ~~as determined in Section 1810.3.3.1.2, using the results of load tests conducted in accordance with ASTM D3689, divided by a factor of safety of two.~~ evaluated in accordance with one of the following methods divided by a safety factor of two:

1. The test load which produces a net upward movement equal to the theoretical elastic lengthening plus 0.15 inch (4 mm).
2. Other method *approved* by the *building official*.

Exception: Where uplift is due to wind or seismic loading, the minimum safety factor ~~of safety~~ shall be two where capacity is determined by an analysis and one and one-half where capacity is determined by load tests.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

D8169/D8169M-18 Standard Test Methods for Deep Foundations Under Bi-Directional Static Axial Compressive Load

Reason: Terminology has been revised to be more consistent with other code sections. The title of the parent Section 1810.3.3 is “Allowable axial load,” and the title of the following Section 1810.3.3.6 is “Allowable uplift load of grouped deep foundation elements.” The title of this section has been changed to “Allowable uplift load of a single deep foundation element” for consistency.

Current code states that the ultimate load capacity shall be as determined in Section 1810.3.3.1.2. However, Section 1810.3.3.1.2 addresses only compressive load tests. Section 1810.3.3.1.2 does not say how to determine the ultimate load capacity for compressive or tensile loads. For compressive load tests, Section 1810.3.3.1.2 refers to Section 1810.3.3.1.3 for load test evaluation methods. The evaluation methods given in 1810.3.3.1.3 (with the possible exception of #4, “Other methods approved by the building official”) are not applicable for tension load tests. For these reasons, the reference to Section 1810.3.3.1.2 has been removed, and replaced with criteria appropriate for tension load tests.

Load tests conducted in accordance with ASTM D4945, ASTM D8169, and ASTM D1143 (when elements are properly instrumented) are frequently used to evaluate tensile capacity of deep foundation elements. Therefore, we have added these standards as acceptable test methods for the determination of allowable uplift loads.

The proposed method #1 for evaluating the ultimate tension load capacity is the same as given in AASHTO specifications.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal will decrease the cost of construction. Expected cost decrease ranges from $0 to $30,000 per load test. This cost was calculated on a unit rate basis.

Estimated Immediate Cost Impact Justification (methodology and variables):

In some cases, this proposal would decrease the cost of construction by permitting more economical load test methods. The cost of a standard tension load test conducted in accordance with ASTM D3689 can vary greatly. However, most tests can be conducted for $50,000 or less. Load tests conducted in accordance with ASTM D4945 and D8169 can assess both the compression and tension capacity of deep foundation elements, negating the need for a separate tension load test. The potential savings are therefore up to $50,000 per test.

Estimated Life Cycle Cost Impact:

There is no impact on estimated life cycle cost impact.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This proposal will not impact the life cycle cost of buildings. It does not impact the durability of foundations nor the expected maintenance cost.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM D8169/D8169M-18 Standard Test Methods for Deep Foundations Under Bi-Directional Static Axial Compressive Load, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

Proponents: Daniel Stevenson, Berkel and Company Contractors, Inc., representing GeoCoalition (dstevenson@berkelapg.com); Lori Simpson, Langan, representing Geocoalition (lsimpson@langan.com)

2024 International Building Code

Revise as follows:

1810.3.3.2 Allowable lateral load. Where required by the design, the allowable lateral load ~~capacity~~ of a single *deep foundation* element or a group thereof shall be determined by an *approved* method of analysis. ~~to not less than twice the proposed design working *load*. *The* resulting~~ allowable lateral *load* shall not be more than ~~one-half of~~ the *load* that produces a gross lateral movement of 1/2 ~~1~~ inch (~~25~~13 mm) at the lower of the top of the foundation element and the ground surface. ~~, unless it can be shown that the predicted lateral movement shall cause neither harmful distortion of, nor instability in, the *structure*, nor cause any element to be loaded beyond its capacity.~~ Group effects shall be evaluated where required by Section 1810.2.5.

Exception: Lateral movements exceeding 1/2 inch shall be permitted where the *registered design professional in responsible charge* determines that the predicted lateral movement shall cause neither harmful distortion of, nor instability in, the *structure*, nor cause any element to be loaded beyond its capacity.

Where lateral load tests are performed, elements shall be tested in accordance with ASTM D3966. Load tests shall be evaluated considering pile head fixity, soil stratification, and group effects.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

D3966/D3966M Standard Test Methods for Deep Foundation Elements Under Static Lateral Load

Reason: The section has been reorganized for clarity. An implied exception "…the predicted lateral movement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any element to be loaded beyond its structural capacity" has been moved to an explicit exception. It has been clarified that it is the registered design professional in responsible charge who shall be able to invoke this exception.

An analysis should always be performed to determine the allowable lateral load of a deep foundation element. A load test alone is not a reliable method of determining the allowable lateral load of a deep foundation element. Load tests are usually conducted with different boundary conditions than those deep foundation elements used for support of actual structures. Conventional load tests do not provide information regarding moments and shears along the length of the deep foundation element, which is needed to design the element structurally. Only an analysis will provide this information.

The acceptance criterion has been changed from "not be more than one-half of the *load* that produces a gross lateral movement of 1 inch" to "not be more than the load that produces a gross lateral movement of 1/2 inch." The movement response of deep foundation members subjected to lateral loads is nonlinear. The current code provision produces inconsistent movement at the allowable lateral loads. Allowable movements for serviceability are evaluated at the allowable ASD loads. The proposed change creates consistency with current engineering practice.

Where lateral load tests are performed, it has been clarified that lateral load tests shall be conducted in accordance with ASTM D3966.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed change clarifies the code and makes code more consistent with current engineering practice. On some projects, there could be a slight decrease in construction costs due to the revised movement criteria. However, the overall impact on construction cost will be insignificant.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM D3966/D3966M Standard Test Methods for Deep Foundation Elements Under Static Lateral Load, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

2024 International Building Code

SECTION 1810
DEEP FOUNDATIONS

Revise as follows:

1810.3.9.4.1 Seismic reinforcement in Seismic Design Category C. For *structures* assigned to *Seismic Design Category* C, cast-in-place *deep foundation* elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

Not fewer than four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.0025, shall be provided throughout the minimum reinforced length of the element as defined in this section starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following, <u>but need not exceed the length of the member</u>:

1. One-third of the element length.
2. A distance of 10 feet (3048 mm).
3. Three times the least element dimension.
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of ASCE 7, Section 2.3.

Transverse reinforcement shall consist of closed ties or spirals with a minimum $^3/_8$ inch (9.5 mm) diameter. Spacing of transverse reinforcement shall not exceed the smaller of 6 inches (152 mm) or 8-longitudinal-bar diameters, within a distance of three times the least element dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 16 longitudinal bar diameters throughout the remainder of the reinforced length.

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. A spiral-welded metal casing of a thickness not less than the manufacturer's standard No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

1810.3.9.4.2 Seismic reinforcement in Seismic Design Categories D through F. For *structures* assigned to *Seismic Design Category* D, E or F, cast-in-place *deep foundation* elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

Not fewer than four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.005, shall be provided throughout the minimum reinforced length of the element as defined in this section starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following<u>, but need not exceed the length of the member:</u>

1. One-half of the element length.
2. A distance of 10 feet (3048 mm).
3. Three times the least element dimension.
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of ASCE 7, Section 2.3.

Transverse reinforcement shall consist of closed ties or spirals not smaller than No. 3 bars for elements with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger elements. Throughout the remainder of the reinforced length outside the regions with transverse confinement reinforcement, as specified in Section 1810.3.9.4.2.1 or 1810.3.9.4.2.2, the spacing of transverse reinforcement shall not exceed the least of the following:

1. 12 longitudinal bar diameters.
2. One-half the least dimension of the element.
3. 12 inches (305 mm).

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. A spiral-welded metal casing of a thickness not less than manufacturer's standard No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

Reason: Clarifies requirements for deep foundations less than 10 feet in depth, (or the depth is less than 3 times the least element dimension) and provides consistency with the reference standard. Avoids interpretations that imply deep foundations under these conditions would need to be a minimum of 10 feet deep (or 3 times the least dimension in depth).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost – the proposal is a clarification of the depth of foundation and does not contain any new requirements.

2024 International Building Code

Revise as follows:

1810.3.11.2 Seismic Design Categories D through F. For *structures* assigned to *Seismic Design Category* D, E or F, *deep foundation* element resistance to uplift forces or rotational restraint shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. ~~Anchorage shall develop not less than 25 percent of the strength of the element in tension~~. Anchorage of deep foundation elements into the pile cap shall comply with the following:

1. The anchorage shall be designed to resist a tensile force of not less than 25 percent of the strength of the element in tension. In addition, in the case of steel H-piles or unfilled steel pipe piles, the anchorage shall be designed to resist a tensile force of not less than 10 percent of the pile compression capacity.

~~1~~ 2. In the case of uplift, the anchorage shall be ~~capable of developing~~ designed to resist a tensile force of not less than the least of the following:

   ~~1.1~~ 2.1. The nominal tensile strength of the longitudinal reinforcement in a concrete element.

   ~~1.2~~ 2.2. The nominal tensile strength of a steel element.

   ~~1.3~~ 2.3. The frictional force developed between the element and the soil multiplied by 1.3.

   2.4 The axial tension force resulting from load combinations with the seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

   ~~**Exception:** The anchorage is permitted to be designed to resist the axial tension force resulting from the seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.~~

~~2~~ 3. In the case of rotational restraint, the anchorage shall be designed to resist the axial and shear forces, and moments resulting from not less than the least of the following:

   3.1 The load combinations with the seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.~~ or~~

   3.2 The ~~anchorage shall be capable of developing the~~ full axial, bending and shear nominal strength of the element.

~~3. The connection between the pile cap and the steel H-piles or unfilled steel pipe piles in *structures* assigned to *Seismic Design Category* D, E or F shall be designed for a tensile force of the least of the following not less than 10 percent of the pile compression capacity.~~

   ~~**Exceptions:**~~

   ~~1. Connection tensile capacity need not exceed the strength required to resist seismic *load effects* including overstrength of ASCE 7 Section 12.4.3 or 12.14.3.2.~~

   ~~2. Connections need not be provided where the foundation or supported *structure* does not rely on the tensile capacity of the piles for stability under the design seismic force.~~

Exception: Anchorage of steel H-piles or unfilled steel pipe piles into the pile cap need not be provided where the foundation or supported structure does not rely on the tensile capacity of the piles for stability under the design seismic force.

Where the vertical lateral-force-resisting elements are columns, the pile cap flexural strengths shall exceed the column flexural strength. ~~The connection between batter piles and pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be designed to resist forces and moments that result from the application of seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.~~

Add new text as follows:

<u>**1810.3.11.2.1 Batter Piles.** The anchorage between batter piles and piles caps shall be designed to resist the greatest of the following:</u>

1. <u>The nominal strength of the pile acting as a short column.</u>
2. <u>The axial and shear forces, and moments resulting from the load combinations with seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.</u>

Reason: Section 1810.3.11.2 concerns the anchorage of pile caps to deep foundation elements (i.e. piles) in seismic design categories D, E and F. It was amended by proposal S132-19 in the 2021 IBC to add sub-section 3 related specifically to steel H-piles and unfilled steel pipe piles. This proposal does not remove the content of sub-section 3 but rather reorganizes the whole section to make it clearer and more homogeneous rather than a piece-mealed section. There were already requirements for steel piles in sub-section 1, so it makes sense to combine these requirements. This proposal is editorial and does not change the technical intent of this section.

The sentence "anchorage shall develop not less than 25 percent of the strength of the element in tension" has moved to a new sub-section 1 and the next sub-sections have moved down, 1 has become 2 and 2 has become 3. The reason for this move is that it represents a minimum load the anchorage must be designed for and should not get lost in the first paragraph. The other minimum anchorage requirement is specific to steel piles where the anchorage must be designed for 10% of the pile compression capacity; this minimum has been moved from section 3 to the new sub-section 1. These changes allow the minimum requirements to be together in the same sub-section and clearly noted in the overall section.

The existing exceptions related to using the seismic load effects including overstrength are deleted and moved to 2.4 and 3.1 in the requirements for "the case of uplift" (sub-section 2) and "the case of rotational restraint" (sub-section 3) respectively. They were not really exceptions since the language was already listing minimum design loads ("the least of"), but rather another lower threshold the anchorage can be designed for.

As explained above, previous sub-section 3 related to steel piles is deleted and its requirements are moved as such:

- The requirement for 10% of the pile compression capacity has moved to sub-section 1.
- Previous sub-section 3 exception 1, concerning the option to design for a tensile force including overstrength, was repetitive and already included in the uplift case requirements (new sub-section 2.4).
- Previous sub-section 3 exception 2, concerning an exception in the case where there is no uplift, has been moved into a single exception located after the three sub-sections and has been kept to only apply to steel piles.

The last reorganization is the creation of section 1810.3.11.2.1 where the requirements specific for batter piles have been relocated. Their anchorage requirements were located in the last paragraph, the same paragraph as an unrelated requirement for pile cap design where the LFRS is columns, so it makes sense to separate them. For added clarity, batter piles now get their own section, so that their anchorage requirements are not missed, and are clear and separate from the general anchorage requirements above. No technical change is proposed, the technical content is simply moved. Two new sub-items are created, one for each requirement, and the language "the greatest of the following" is added to clarify the apparent original intent of this language: since it didn't include "the least of", it was assumed the intent was to design for the maximum of the two load cases.

Throughout this section, this proposal replaces the term "connection" with the term "anchorage". The term "connection" was imported from ASCE 7 in the 2021 code and was not coordinated with the terminology previously used in this code section. This proposal resolves this inconsistency in code language.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is a re-organization of section 1810.3.11.2 and does not increase the cost of construction. The technical requirements for the anchorage of deep foundation elements to pile caps do not change.

Staff Analysis: CC # S132-25 and CC # S133-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

2024 International Building Code

Revise as follows:

1810.3.11.2 Seismic Design Categories D through F. For *structures* assigned to *Seismic Design Category* D, E or F, connection of *deep foundations* to pile caps shall be designed in accordance with 1810.3.11.2.1 and 1810.3.11.2.2. Where the vertical lateral-force-resisting elements are columns, the pile cap flexural strengths shall exceed the column flexural strength.~~*deep foundation* element resistance to uplift forces or rotational restraint shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop not less than 25 percent of the strength of the element in tension. Anchorage into the pile cap shall comply with the following:~~

1. ~~In the case of uplift, the anchorage shall be capable of developing the least of the following:~~
   - ~~1.1. The nominal tensile strength of the longitudinal reinforcement in a concrete element.~~
   - ~~1.2. The nominal tensile strength of a steel element.~~
   - ~~1.3. The frictional force developed between the element and the soil multiplied by 1.3.~~

   ~~**Exception:** The anchorage is permitted to be designed to resist the axial tension force resulting from the seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.~~

2. ~~In the case of rotational restraint, the anchorage shall be designed to resist the axial and shear forces, and moments resulting from the seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7 or the anchorage shall be capable of developing the full axial, bending and shear nominal strength of the element.~~
3. ~~The connection between the pile cap and the steel H-piles or unfilled steel pipe piles in *structures* assigned to *Seismic Design Category* D, E or F shall be designed for a tensile force of not less than 10 percent of the pile compression capacity.~~

   ~~**Exceptions:**~~

   1. ~~Connection tensile capacity need not exceed the strength required to resist seismic *load effects* including overstrength of ASCE 7 Section 12.4.3 or 12.14.3.2.~~
   2. ~~Connections need not be provided where the foundation or supported *structure* does not rely on the tensile capacity of the piles for stability under the design seismic force.~~

~~Where the vertical lateral-force-resisting elements are columns, the pile cap flexural strengths shall exceed the column flexural strength. The connection between batter piles and pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be designed to resist forces and moments that result from the application of seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.~~

Add new text as follows:

1810.3.11.2.1 Connections. *Deep foundation* element resistance to uplift forces or rotational restraint shall be provided by connection to the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Connections shall develop not less than 25 percent of the strength of the element in tension. For elements required to resist uplift forces, provide rotational restraint, or both, connection to the pile cap shall comply with the following:

1. In the case of uplift, the connection shall be capable of developing the least of the following:
   1.1. The nominal tensile strength of the longitudinal reinforcement in a concrete element.
   1.2. The nominal tensile strength of a steel element.
   1.3. The frictional force developed between the element and the soil multiplied by 1.3.

   Exception: The connection is permitted to be designed to resist the axial tensile force resulting from the seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

2. In the case of rotational restraint, the connection shall be designed to resist the axial and shear forces, and moments resulting from the seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7 or the connection shall be capable of developing the full axial, bending and shear nominal strength of the element.
3. The connection between the pile cap and the steel H-piles or unfilled steel pipe piles in *structures* assigned to *Seismic Design Category* D, E or F shall be designed for a tensile force of not less than 10 percent of the pile compression capacity.

   Exceptions:

   1. Connection tensile capacity need not exceed the strength required to resist seismic *load effects* including overstrength of ASCE 7 Section 12.4.3 or 12.14.3.2.
   2. Connections need not be provided where the foundation or supported *structure* does not rely on the tensile capacity of the piles for stability under the design seismic force.

1810.3.11.2.2 Batter Piles. The connection between batter piles and pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be designed to resist axial forces and moments that result from the application of seismic *load effects* including overstrength factor in accordance with Section 2.3.6 or 2.4.5 of ASCE 7.

Reason: Section 1810.3.11.2 has been reorganized for clarity. Terminology has been revised for clarity and accuracy. Current code language uses the terms "anchorage" and "connection" interchangeably. While the term "anchorage" is generally considered to apply only to tensile forces, the more general term "connection" is considered to apply to tensile, compressive, and shear forces. This section has requirements for resistance of tension, compression, and shear loads. Therefore, the term "anchorage" has been replaced with the more inclusive term "connection".

Also, the existing code language is sometimes confusing and can appear contradictory. The requirements of " ...not less than 25 percent of the strength of the element intension.", and then later "The nominal tensile strength..." appear contradictory if one does not realize that the more restrictive requirement is only required for piles required to resist uplift forces. The added phrase "For elements required to resist uplift forces or provide rotational restraint" clarifies that the intent of the code is that the more restrictive requirements apply only to elements required to resist uplift forces or provide rotational restraint. This added phrase is taken verbatim from ASCE-7 section 12.13.6.5, except that the word “pile” has been changed to “element”. ASCE section 12.13.6.5 contains the same requirements as IBC section 1810.3.11.2. Adding this phrase into 1810.3.11.2 will provide more consistency between IBC and referenced standard ASCE-7.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not change any code requirement, it only clarifies the code. Therefore there is no cost impact.

Staff Analysis: CC # S133-25 and CC # S132-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

Proponents: David Fanella, representing Concrete Reinforcing Steel Institute (dfanella@crsi.org); Michael Ugalde, representing nVent - Director (michael.ugalde@nvent.com)

2024 International Building Code

1901.2 Plain and reinforced concrete. Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 as supplemented in Section 1905 of this code.

Add new text as follows:

1901.2.2 Structural concrete with mechanical splices of deformed steel reinforcing bars in tension or compression. Mechanical splices shall satisfy the requirements of ASTM A1034. Mechanical splices classified as Type 1, 2, or 3 in accordance with ASTM A1034 shall be permitted in accordance with this section.

1901.2.2.1 Type 1 mechanical splices. Type 1 mechanical splices shall not be permitted for the following:

1. In locations where yielding of reinforcement is expected under applicable strength design load combinations specified in Section 1605.
2. For splicing the following reinforcement: (a) integrity reinforcement, (b) reinforcement in regions where moment redistribution has been applied in design, (c) reinforcement in regions where moments are determined using the simplified method of analysis, and (d) reinforcement in two-way slabs where moments are determined using the direct design method of analysis.

1901.2.2.2 Type 3 mechanical splices. Reinforcing bars in a Type 3 mechanical splice shall conform to ASTM A706 and shall be longitudinally aligned.

1901.2.2.3 Mechanical splices in special moment frames and special structural walls. Mechanical splices in special moment frames and special structural walls shall satisfy this section:

1. Mechanical splices shall be Type 2 or Type 3.
2. Type 3 mechanical splices shall be permitted at any location for cast-in-place construction.
3. Type 2 mechanical splices in special moment frames are prohibited within joints, within a distance equal to twice the member depth from the column or beam face, and within a distance equal to twice the member depth from critical sections where yielding of the reinforcement is likely to occur as a result of lateral displacements beyond the linear range of behavior.
4. Type 2 mechanical splices in special structural walls are prohibited within the following:

   4.1. Boundary regions over a height h_{sx} above and l_d below critical sections where yielding of the longitudinal reinforcement is likely to occur as a result of lateral displacements where h_{sx} need not exceed 20 ft (6.1 m). Boundary regions shall include those with lengths that extend horizontally from the extreme compression fiber a distance at least the greater of $c - 0.1l_w$ and $c/2$ and within a length equal to the wall thickness measured beyond the intersecting region(s) of connected walls.

   4.2. Coupling beams

   4.3. A distance equal to twice the member depth from critical sections where yielding of the reinforcement is likely to occur as a result of lateral displacements beyond the linear range of behavior.

1901.2.2.4 Mechanical splices in diaphragms and collectors assigned to Seismic Design Category D, E, or F. Type 2 or Type 3 mechanical splices are required where mechanical splices are used in the region of the connection between the diaphragm and the vertical elements of the seismic force-resisting system.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

A1034/A1034M-24 Standard Specification for Mechanical Splices for Steel Reinforcing Bars

Reason: This proposal requires that mechanical splices of deformed steel reinforcing bars in tension or compression conform with the requirements in ASTM A1034/A1034M—Standard Specification for Mechanical Splices for Steel Reinforcing Bars. This standard is proposed as a referenced standard in this code change proposal. A new type of mechanical splice is included that can be used within any region of a structural member assigned to any seismic design category.

The acceptance criteria in ASTM A1034/A1034M were created with significant input and collaboration amongst mechanical splice producers. The latest results from an on-going joint CRSI, ACI, and Pankow Foundation-sponsored research project that addresses the use of mechanical splices with high-strength reinforcement in the potential flexural yielding regions of special structural systems formed the basis of the acceptance criteria in this standard.
Three types of mechanical splices are defined in ASTM A1034/A1034M: Type 1, Type 2, and Type 3. The Type 1 and Type 2 mechanical splice nomenclature is the same as the industry has relied on for decades. The new Type 3 mechanical splice can be utilized within any region of a structural member assigned to any seismic design category; this type of mechanical splice will substantially improve constructability of structural members in seismic design category D and above, especially for special reinforced concrete structural walls.
Referencing ASTM A1034/A1034M provides an opportunity to revise the mechanical splice requirements, if required, in a timely fashion as new test data become available compared to having to wait for changes to be introduced in the 2031 edition of ACI 318.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

- The cost of construction will not increase for Type 1 and Type 2 mechanical splices because reference to these types is well known in the reinforced concrete industry and because mechanical splice producers have test data based on the acceptance criteria requirements in ASTM A1034/A1034M.
- Additional testing for Type 3 mechanical splices may be required based on the ASTM A1034/A1034M acceptance criteria requirements; however, this testing will be required regardless of which code or standard requirements take precedence, which means there is no impact on cost.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM A1034/A1034M-24 Standard Specification for Mechanical Splices for Steel Reinforcing Bars, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

A970/A970M-24 Standard Specification for Headed Steel Bars for Concrete Reinforcement

Reason: This proposal provides minimum conditions for the use of Grade 60 and Grade 80 headed deformed bars in tension. The basis of the proposal is on the findings of recent research that examines the impact of the net bearing area on the tension development length of the deformed headed bar as a function of steel grade.

Grade 60 and Grade 80 headed bars with bearing areas of 4A_b are well-researched and well-established within the industry with demonstrated successful in-service performance in reinforced concrete structures. The term A_b is the area of the deformed reinforcing bar. Research of headed deformed bars conducted and published by the University of Kansas over the last 8 years has confirmed the implementation of a minimum bearing area equal to 4A_b in ACI 318 and ASTM A970/A970M Annex A1 for headed bars. The following two University of Kansas reports are of particular interest with respect to head size (see attached reports):

- SMR Report No. 117, *Anchorage of Conventional and High-Strength Headed Reinforcing Bars*. The main conclusion of this report is that there are no clear differences in anchorage strength associated with head size ranging from 3.8 to 9.5A_b for both Grade 60 and Grade 80 bars.
- SMR Report No. 127, *Anchorage of Headed Reinforcing Bars in Concrete*. The report states that an increase in net bearing area of the head from 4 to 9.5A_b has no effect on the anchorage strength.

The standard ASTM A970/A970M—Standard Specification for Headed Steel Bars for Concrete Reinforcement is proposed as a referenced standard in this code change proposal.

Grade 80 headed bars with 4A_b have been prevalent since headed bar applications were first adopted, and are commonly used across the United States, especially in areas where seismic detailing is required. Grade 80 headed bars are commonly used to reduce reinforcement congestion and enhance constructability. In many cases, designs are so complex, and reinforcement arrangements are so congested, that Grade 80 headed bars are an absolute necessity for the physical installation of reinforcing bars and placement/consolidation of concrete in accordance with ACI 318 requirements and project documents. The industry is not aware of any concerns or issues with in-service performance of Grade 80 headed reinforcing bars with net bearing areas of $4A_b$.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Based on the findings from substantial research projects, Grade 60 and Grade 80 headed reinforcing bars have been successfully used in many types of building projects for many years, especially in projects where constructability issues must be addressed. Thus, this proposal results in no impact on the cost of construction.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM A970/A970M-24 Standard Specification for Headed Steel Bars for Concrete Reinforcement, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

Skalko, P.E. & Associates LLC, representing Precast/Prestressed Concrete Institute (svskalko@svskalko-pe.com); Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

2024 International Building Code

1901.2 Plain and reinforced concrete. Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 as supplemented in Section 1905 of this code.

Add new text as follows:

1901.2.1 Precast pretensioned concrete. Precast pretensioned concrete members and connections shall be permitted to be designed in accordance with ACI/PCI CODE 319.

Add new standard(s) as follows:

ACI

American Concrete Institute
38800 Country Club Drive
Farmington Hills, MI 48331-3439

ACI/PCI CODE 319-25

Structural Precast Concrete - Code Requirements

Reason: ACI/PCI CODE 319 is a new standard jointly developed through a consensus process compliant with ICC's Council Policy 28. It contains methodologies, alternative systems, and specialized construction requirements unique to precast, and precast, pretensioned concrete. ACI/PCI CODE 319 does not address the design of cast-in-place. Design of precast members or structures will require the use of both ACI 318 and ACI-PCI CODE 319. Code provisions relating to both cast-in-place and precast concrete have not been repeated where not necessary. Requirements concerning cover over reinforcement and design load combinations are examples of non-repetition. Section numbering for ACI/PCI CODE 319 follows the format of ACI 318 for easy referencing between the two documents. Where new items occur, they have been placed with new section numbers in the appropriate location.

The process for developing ACI-PCI CODE 319 code was composed of two primary activities. First, sections of ACI 318 applicable to precast, pretensioned concrete were identified, which would be used in ACI-PCI CODE 319. The committee voted first on which sections should be included and which would be either out-of-scope or referenced directly to ACI 318. Language of duplicated sections was adjusted to narrow the scope to precast concrete.

Secondly, PCI's Design Standard Committee (PCI-DSC) developed and incorporated new precast, pretensioned provisions into ACI/PCI CODE 319. A list of items that needed to be in the new precast code was developed. Items with completed research were prioritized and balloted within the PCI-Design Standard Committee (DSC), reviewed/approved by PCI TAC and submitted to the ACI-PCI 319 Committee for review and balloting before inclusion in ACI-PCI CODE 319. Examples include intermediate precast structural walls, precast diaphragms with cast-in-place pour strips, and torsion design of compact sections.

Both organizations and committees worked collaboratively to coordinate the development of this document.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This document provides additional design methodologies typically used in Precast concrete construction. There are no signifcant changes that would increase or decreease the cost of using precst concrete as a building material.

Staff Analysis: A review of the standard proposed for inclusion in the code, ACI/PCI CODE 319-25 Structural Precast Concrete - Code Requirements, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S137-25

IBC: 1901.2.1

Proponents: Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org); Jerzy Zemajtis, NEx, An ACI Center of Excellence for Nonmetallic Building Materials, representing Jerzy Zemajtis, NEx (jerzy.zemajtis@nonmetallic.org); Doug Gremel, representing Owens Corning (douglas.gremel@owenscorning.com); Shamim Rashid-Sumar, representing National Ready Mixed Concrete Association (ssumar@nrmca.org); Dr. Julian Mills-Beale, representing National Ready Mixed Concrete Association (jmills-beale@nrmca.org); Vicki Brown, Widener University, representing American Concrete Institute (vlbrown@widener.edu); John Busel, representing American Composites Manufacturers Association (jbusel@acmanet.org)

2024 International Building Code

Revise as follows:

1901.2.1 Structural concrete with GFRP reinforcement. Cast-in-place structural concrete internally reinforced with glass fiber reinforced polymer (GFRP) reinforcement conforming to ASTM D7957 and designed in accordance with ACI CODE 440.11 shall be permitted where fire-resistance ratings are not required, and ~~only for~~

1. In any structural elements of buildings ~~*structures*~~ assigned to *Seismic Design Category* A, or
2. In structural elements not part of the seismic force resisting system in buildings assigned to SDC B or C.

Reason: This proposal aligns the limitations in the IBC for the use of glass fiber reinforced polymer reinforcement with the limitations in ACI CODE 440.11-22 Building Code Requirements for Structural Concrete Reinforced with Glass Fiber-Reinforced Polymer (GFRP) Bars. When initially introduced into the IBC, to avoid confusion, the permissible use was presented as overly conservative with regard to use in structural elements. This proposal does retain restrictions for use in structural elements that are part of the seismic force resisting system in buildings assigned to SDC B or C. This alignment will expand the acceptable use the IBC by aligning with the requirements of ACI CODE 440.11 increasing applications where non-corrosive GFRP may be used to enhance building safety and durability. Further the alignment will avoid possible confusion by eliminating differences between the provisions of the IBC and ACI CODE 440.11.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact as this proposal only expands the permissible use of GRFP reinforcement, furthering options for alternative design and construction.

Reason: The purpose of this code change is to counteract new overly conservative requirements for seismic testing and load-rating of post-installed concrete anchors. These conservative and stringent seismic qualification protocols were added into the most recent versions of ACI 355.2 and ACI 355.4, which were published in November of 2024. The ACI 355.2 standard governs the qualification of post-installed mechanical anchors, while the ACI 355.4 standard governs the qualification of post-installed adhesive anchors. The new 2024 versions of the ACI 355 testing standards have also **eliminated** the current simulated seismic testing regime that has been successfully used by these standards for the last two decades to load-rate anchors that resist earthquake-induced forces. The revisions made to the seismic testing regime within these standards have been shown to significantly reduce the capacity of post-installed anchors. ACI 355.2 and ACI 355.4 are currently not referenced directly by the IBC, but they are instead referenced by ACI 318, which is referenced directly by the IBC for concrete design, including anchorage to concrete. This code change will directly reference the previous versions of the ACI 355 testing standards in the IBC, specifically for the seismic qualification of post-installed anchors in concrete.

The following are specific reasons that the new criteria should not be adopted into the IBC:

1. The revised seismic testing parameters included within the new ACI 355 qualification standards are overly restrictive due to the reasons below.

   a. **Incorrect application:** The wider concrete cracks specified in the new ACI 355 standards are only considered to occur right at the edges of plastic hinge zones within lateral-force resisting systems in concrete frame buildings, yet they will be applied to all post-installed anchors within any concrete element located anywhere in the structure.

   b. **Testing representativeness**: The new standards mandate testing for wider crack widths of 0.032” for 25 cycles. This is not representative of real data from earthquake responses of buildings, which typically result in maximum shaking for only 4-5 cycles.

   c. **Misaligned with the original intent of the testing regime:** The new testing protocols come from European design methodology and anchor qualification methods. In Europe, a three-tier seismic qualification exists. Low hazard and risk structures do not require any cyclic testing (the lowest tier), in the US this has been called *ASPC0*. ASPC stands for ‘Anchor Seismic Performance Category’. The middle tier is called “C1” in Europe (*ASPC1* in the US), which corresponds to the current seismic testing regime used in US building codes today. The most severe tier in Europe is called “C2” (*ASPC2* in the US) and has rigorous testing requirements that are required for a limited subset of buildings that are under higher seismic hazard and risk levels only. However, this highest tier, *ASPC2*, has been implemented within the new ACI test standards as the **only** method for seismic qualification, and is required in all structures Seismic Design Category C and above.

Proponents and researchers involved with developing the *ASPC2* testing regime integrated into the new ACI 355 qualification standards never intended this protocol to 'replace' the *ASPC1* regime. Per Marhenholtz and Wood, "*Principally, the integration of the C2 performance category in the U.S. design standards is feasible. However, one critical issue to be discussed and further explored is when is it appropriate to use C1 or C2 anchors. To date, the European approach is inconclusive in this sense…*" and "*The European design requirements can be considered very stringent due to the generally lower peak ground acceleration requiring C1 or even C2 qualified anchors*"(*Reference 1*). As such, the *ASPC2*-only approach within the new ACI 355 standards is not appropriate, overly conservative, and uncalibrated to the design standards referenced in the US model building code, which have yet to adopt this three-tier approach.

d. **Not driven by a real-world need:** There does not appear to be a demand from industry, designers, owners, or building officials for a change in the seismic qualification of post-installed anchors in the United States. Marhenholtz and Wood, who were researchers involved in the development of the C2 testing protocols in Europe, state in their ACI Structural Journal article, "*On the other hand, the current ACI 355 seismic qualification is generally perceived to be sufficient as United States building authorities did not ask for more rigorous qualification requirements, and it is used by many U.S. and international designers and specifiers*" (*Reference 1*).

2. It is inappropriate to apply the new seismic qualification testing protocols to a wide range of building types and anchor applications.

a. **Based on simulation of one type of building:** The justification of the cyclic loading and crack width protocols in the new qualification standards were derived from 2D-frame analytical models of concrete special moment frames and ordinary moment frames coupled with concrete shearwalls (*Reference 2*). Other building types like steel-framed structures, light-framed construction, metal building systems, or low-rise pre-cast or tilt-up structures were not considered. Yet, the new testing requirements will be applied to all anchor applications in all building types.

b. **Based on simulation of one seismic hazard:** The selected seismic hazard assumed in the research used to develop the new seismic testing protocols was located in the Los Angeles basin with comparatively high spectral acceleration values of 2.01g for S_S and 0.61g for S_1. Per Marenholtz et al., "*While it is recognized that a variety of seismic conditions exist throughout the world, the significant seismic hazard of the selected site is anticipated to conservatively represent demands at many locations*" (*Reference 2*). The application of this hazard to all sites in Seismic Design Categories C and above is too broad and overly conservative.

c. **Large cracks only occur in limited locations:** The research simulations showed that large cracks of 0.032" only occur in or near plastic hinge zones in these concrete buildings (*Reference 2*). But even within concrete frame buildings, the vast majority of anchors are installed away from plastic hinge zones, and ACI 318 already excludes the use of anchors within plastic hinge zones. Per Marhenholtz and Wood, "*However, it is noted that the 0.8 mm (0.032") width crack represents a maximum value not generally to be anticipated and the structural analysis may result in smaller crack widths*" (*Reference 1*). Therefore, the wider crack width criteria is not appropriate in most applications.

3. There will be a significant reduction in the capacity of post-installed concrete anchors, which will result in increased construction costs and potentially impractical design solutions.

a. **Reduced Capacities:** Application of the new seismic testing requirements will result in a reduction in capacity of post-installed concrete anchors in all buildings that are Seismic Design Category C and above, regardless of the application.

While there is currently no published data in the United States of new capacities tested to the 2024 versions of the ACI 355 standards, equivalent capacity reductions in Europe shed light on what reductions to expect. Please refer *Reference 1* and the "*C1 v. C2 European Capacity Comparisons*" document attached to this proposal for additional information.

A design example based on a US-sold adhesive anchor product that has completed third-party testing with both the previous version of ACI 355.4 and the new 2024 version has been developed to provide a US-product based data point. Please refer to the attached document "*ASPC 1 vs ASPC 2 – Design Example*" for this information.

b. **Increased costs:** This reduced anchor capacity will result in increased costs of anchorage construction, due to both a reduced supply of available anchors that meet the new requirements, and a need to install larger, longer, and/or a higher quantity of anchors compared to what would be required under current qualification standards.

c. **Impact on current design practices:** The reduction in the capacity of anchors that have been successfully used for years will require designers to revise existing anchor solutions due to the overly conservative qualifications. In some cases, the new solutions may be impractical or inappropriate due to other design and construction constraints. Refer to the multiple letters of support from practicing engineers and engineering firms attached to this proposal to appreciate the impact this will have on designers.

4. A 3-tiered system has not been adopted in the U.S.: While a 3-tiered approach including this more conservative testing regime was proposed to the ASCE 7-22 Seismic Subcommittee last cycle, the ASCE 7-22 standard only references existing seismic qualification and design standards (namely ACI 355.2-19 and ACI 318-19) that align with *ASPC1* level qualification testing.

5. The ACI 355 standards are referenced in ACI 318. Since these new test requirements are located in standards that were part of ACI 318-25 by reference only, the full ACI 318 committee may not have considered the effects that the revisions to the newly published ACI 355 standards would have on the industry, and how they might need to be coordinated with the existing seismic requirements for concrete anchorage design within Chapter 17 of ACI 318. Due to the late publication of the ACI 355 standards, there was not adequate time for the ACI 318-25 committee to deliberate on these matters, and as such, the design assumptions within ACI 318 are not currently aligned with the 2024 versions of the ACI 355 testing standards.

6. The requirements are not based on real-world observations. Oftentimes, building code changes typically occur due to examples of failures in the field, or when recurring substandard conditions are found in the industry. The proponents are not aware of real-world failures of currently qualified, properly installed anchors that would justify the need for these new severe qualification requirements. Refer to the Thornton Tomasetti letter of support, authored by Ojala and Cochran, as well as other letters that are attached to this proposal, for additional commentary and perspective in this regard.

7. There will be effects on published documents that will require revisions: ICC and FEMA documents, among others, will be required to be revised because any anchor selections will likely have to be changed due to the decreased anchor capacities under the new qualification protocols.

a. One example is the soon-to-be-published ICC 1300, Vulnerability-Based Seismic Assessment and Retrofit of One- and Two-Family Dwellings, which in turn is based on FEMA P1100. These documents give prescriptive solutions for seismic retrofitting. Some of the anchorage specified uses post-installed concrete anchors, and the spacing is based on current capacities, which were presumably considered adequate.

b. Another example of prescriptive anchorage that may be affected is Appendix A, Chapter A3 of the IEBC (Guidelines for the Seismic Retrofit of Existing Buildings).

In summary, the implementation of the severe seismic testing regime within the 2024 versions of the ACI 355 standards is unnecessarily conservative and is not implemented in a way that is compatible with other design standards that are referenced in the building code. For this code cycle, it is strongly recommended to keep the seismic qualification of post-installed concrete anchors the same as it currently is, to allow for a rational and compatible 3-tiered approach that will apply the highest level of testing only where necessary, as well as be calibrated to the design assumptions within ACI 318 and ASCE 7, in a future code cycle.

Hoehler, *Development and validation of European guidelines for seismic qualification of post-installed anchors*, Engineering Structures, Volume 148 (2017). ISSN 0141-0296. https://pmc.ncbi.nlm.nih.gov/articles/PMC5714297/

Cost Impact: Decrease

Estimated Immediate Cost Impact:

If this code change is not approved, costs of post-installed anchor solutions within Seismic Design Category C and above will increase significantly. If this code change is approved, costs will remain the same as previous versions of the code; but since this proposal prevents an otherwise increase in costs, the proponents consider this proposal to result in a cost decrease ($0 minimum decrease).

Estimated Immediate Cost Impact Justification (methodology and variables):

A design example was performed using a 1/2" diameter adhesive anchor in 5000 psi concrete, having a tension load of 6500 lbs and a shear load in one direction of 1000 lbs. In this case the 1/2" anchor would require an embedment of 8" under current code requirements. Under the new requirements that would be in place were this code change **not** approved, the 1/2" anchor with 8" embedment would be overstressed by 300%, and instead a 3/4" anchor with 5.25" embedment would be required to achieve the same capacity. This will require a 100% increase in adhesive volume for the larger diameter anchor, along with a 60% increase in steel threaded rod material. If this code change were **not** approved, additional labor (installed) costs and construction time will also apply in most cases, due to a combination of larger holes and/or deeper embedment depths to drill, or an increase in the quantity of anchors required to achieve sufficient design capacity. Also, refer to the Design Example attached to this proposal for additional details and information.

Overall Interaction Comparison Case 1 vs Case 2				
	ASPC1- 1/2" GR55 at 8" Embedment		ASPC2 - 3/4" GR55 at 5.25" Embed	
Loading Case	Capacity	DCR	Capacity	DCR
Steel Tension	7988 lbf	0.814	8830 lbf	0.7361
Breakout Tension	13260 lbf	0.490	7049 lbf	0.9221
Bond Tension	7185 lbf	**0.905**	6756 lbf	**0.9621**
Steel Shear	3115 lbf	**0.321**	5569 lbf	**0.1796**
Pryout Shear	24384 lbf	0.041	19403 lbf	0.0515
Interaction		**99.67%**	**Interaction**	**99.47%**

Estimated Life Cycle Cost Impact:

No life cycle impact. Initial cost only.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

No life cycle impact. Initial cost only.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:

CHAPTER 19
CONCRETE

SECTION 1905
SEISMIC REQUIREMENTS

1905.1 General. In addition to the provisions of ACI 318, structural concrete shall comply with the requirements of Section 1905.

Revise as follows:

1905.3 Intermediate precast structural walls. Intermediate precast structural walls shall comply with Section 18.5 of ~~ACI 318~~ ACI/PCI CODE 319 ~~and this section~~.

Delete without substitution:

~~**1905.3.1 Connections designed to yield.** Connections that are designed to yield shall be capable of maintaining 80 percent of their *design strength* at the deformation induced by the design displacement or shall use Type 2 mechanical splices.~~

Add new standard(s) as follows:

ACI

American Concrete Institute
38800 Country Club Drive
Farmington Hills, MI 48331-3439

ACI/PCI CODE 319-25

Structural Precast Concrete - Code Requirements

Reason: Reference to ACI/PCI 319 aligns with current industry requirements for the design of this type of lateral systems. The document clarifies requirements of design of strong and ductile connections between precast concrete components. The refernce to ACI/PCI 319 allows the subsection, 1905.3.1 to be deleted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no substantiave change in requirements that would have a cost implication.

Staff Analysis: A review of the standard proposed for inclusion in the code, ACI/PCI CODE 319-25 Structural Precast Concrete - Code Requirements, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S140-25

S141-25

IBC: CHAPTER 19, SECTION 1909 (New), 1909.1 (New), CHAPTER 35, PCI Chapter 35 (New)

Proponents: Edith Gallandorm, representing Precast/Prestressed Concrete Institute (egallandorm@pci.org); Stephen Skalko, Stephen V. Skalko, P.E. & Associates LLC, representing Precast/Prestressed Concrete Institute (svskalko@svskalko-pe.com)

2024 International Building Code

CHAPTER 19
CONCRETE

Add new text as follows:

SECTION 1909
PRECAST CONCRETE INSULATED WALL PANELS

1909.1 General. Precast concrete insulated wall panels shall be in accordance with the requirements of ANSI/PCI 150.

CHAPTER 35
REFERENCED STANDARDS

Add new standard(s) as follows:

PCI

Precast Prestressed Concrete Institute
8770 West Bryn Mawr, Suite 1150
Chicago, IL 60631-3517

ANSI/PCI 150	Specification for the Design of Precast Concrete Insulated Wall Panels

Reason: This change introduces a special methodology of construction. Historically this type of construction was addressed in State-of-the-art documents or proprietary information. The document was developed through a consensus process compliant with ICC's Council Policy 28.

Bibliography: *ANSI/PCI 150-24 Specification for the Design of Precast concrete Insulated Wall Panels*

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Procedure in new document is comparable to current design and construction methodology. There may be minor to insignificant cost increase due to clarification of minimum reinforcement requirements, potentially 0-2% of insulated precast concrete panel cost.

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/PCI 150 Specification for the Design of Precast Concrete Insulated Wall Panels, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

IBC: CHAPTER 19, SECTION 1909 (New), 1909.1 (New), 1909.1.1 (New), 1909.1.2 (New), 1909.1.3 (New), 1909.2 (New), 1909.2.1 (New), 1909.3 (New), 1909.4 (New), 1909.5 (New), 1909.6 (New), 1909.7 (New), 1909.8 (New), 1909.9 (New), 1909.10 (New), ASTM Chapter 35 (New)

Proponents: Jennifer Hatfield, J. Hatfield & Associates, representing National Roof Deck Contractors Association (jen@jhatfieldandassociates.com)

2024 International Building Code

CHAPTER 19
CONCRETE

Add new text as follows:

SECTION 1909
LIGHTWEIGHT INSULATING CONCRETE ROOF INSULATION

1909.1 Lightweight insulating concrete. Material produced with or without aggregate additions to hydraulic cement, water and air to form a hardened material possessing insulating qualities, which, when oven dried shall have a unit weight no greater than 50 pcf (801 kg/m^3).

1909.1.1 Lightweight cellular insulating concrete. Insulating concrete formulated by mixing a hydrated cementitious matrix around discrete air cells created by the addition of preformed foam formed from surfactants. The cured cellular lightweight insulating concrete shall have minimum compressive strength of 160 psi (1103 kPa) when tested in accordance with ASTM C495 and C796.

1909.1.2 Lightweight aggregate insulating concrete. Insulating concrete formulated by mixing lightweight aggregates such as Vermiculite or Perlite. The cured lightweight aggregate insulating concrete shall have minimum compressive strength of 160 psi (1103 kPa) when tested in accordance with ASTM C495.

1909.1.3 Lightweight cellular/aggregate (hybrid) insulating concrete. Insulated concrete formulated by combining preformed foam with lightweight aggregates to impart properties of both lightweight aggregate and cellular lightweight insulating concrete. It shall have a minimum compressive strength of 200 psi (1379 kPa) when tested in accordance with ASTM C495.

1909.2 Materials. Lightweight insulating concrete may be poured over galvanized metal decks vented and nonvented, cementitious wood fiber acoustical decks, structural concrete slabs, lightweight structural concrete slabs, precast concrete, prepared structural wood decks, and existing roof systems. Where manufacturer installation instructions require, lightweight insulating concrete over structural concrete slabs, twin tees, precast units or other nonventing substrate shall be vented.

1909.2.1 Limitations of use. Lightweight insulating concrete, in conjunction with galvanized formed steel sheets, shall not be used as a roof deck in areas where highly corrosive chemicals are used or stored. Lightweight insulating concrete shall not be poured directly over a painted or nongalvanized steel deck.

1909.3 Minimum thickness. Minimum thickness of lightweight insulating concrete shall be 2 inches (51 mm) over the top plane of the substrate unless otherwise specified in the product approval. Lightweight insulating concrete shall be of sufficient thickness to receive the specified base ply fastener length.

1909.4 Galvanized coatings. Galvanized coatings of formed steel sheets shall be in accordance with ASTM A525. Base steel shall be in accordance with ASTM A446, Grade A, B, C, D or greater and ASTM A1008 C, D or E.

1909.5 Vermiculite or perlite. Vermiculite or perlite shall be in accordance with ASTM C332, Group I.

1909.6 Preformed foam. Preformed foam surfactants shall be in accordance with ASTM C869.

1909.7 Base ply fasteners. All base ply fasteners for use with a specific lightweight insulating concrete roof deck system shall be approved for use in the manufacturer’s installation instructions and the design pressure requirements of Section 1609.

1909.8 Fastener withdrawal. The lightweight insulating concrete fastener withdrawal shall have a minimum resistance of 40 pounds (178 N) at time of roofing.

1909.9 Insulation board. Insulation board shall comply with the following:

1. When used with lightweight insulating concrete, insulation board shall conform to Type I expanded polystyrene insulation density or greater, as defined in ASTM C578 or as approved for use in the manufacturer's installation instructions.
2. Packaged insulation board delivered to the job site shall comply with the provisions of Section 2603.2.
3. Installation of insulating board in conjunction with lightweight insulating concrete shall comply with the uplift requirements in Section 1609.
4. Insulation panels shall be placed in a minimum $^{1}/_{8}$-inch (3.2 mm) slurry of insulating concrete while the material is still in a plastic state. The insulating concrete shall be cast over the insulation boards according to the insulating concrete manufacturer’s installation instructions. Insulation panels shall be provided with holes and/or slots for keying and venting.

1909.10 Reinforcing mesh. Reinforcing mesh shall be provided as required to meet fire-rating and/or special structural design requirements, and follow the manufacturer's installation instructions. Fiber reinforcement may be used.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

A446-76(1981)e1	Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) By The Hot-Dip Process, Structural (Physical) Quality
A525-91be1	Standard Specification for General Requirements for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process
A1008/A1008M-24	Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Required Hardness, Solution Hardened, and Bake Hardenable
C332-17	Standard Specification for Lightweight Aggregates for Insulating Concrete
C495-12 (2019)	Standard Test Method for Compressive Strength of Lightweight Insulating Concrete
C618-22	Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete
C796/C796M-19	Standard Test Method for Foaming Agents for Use in Producing Cellular Concrete Using Preformed Foam
C869/C869M-11(2016)	Standard Specification for Foaming Agents Used in Making Preformed Foam for Cellular Concrete

Reason: Currently, the IBC has no requirements for lightweight insulating concrete (LWIC) roof insulation, a type of roofing system that has been successfully applied throughout the country for over 70 years. This system combines lightweight concrete and expanded polystyrene (EPS) insulation to create a durable, energy efficient roof insulation.

This proposal creates a new section under Chapter 19 for LWIC roof insulation, providing requirements to assist code officials and contractors on proper application. This language stems directly from LWIC roof insulation requirements that have been in the Florida Building Code since its inception in 2001. Those provisions also fall within Chapter 19 of the Florida Building Code.

Many other states have looked to Florida's LWIC concrete provisions for guidance on LWIC installation. This proposal improves the code by ensuring requirements exist within the IBC, eliminating the need to look to Florida's code for direction. The proposal relies both on Florida provisions and industry best practices, and will ensure LWIC roof systems are installed properly by giving code users the requirements to reference when addressing LWIC roof insulation systems.

Bibliography: Florida Building Code, Building, Section 1917

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Minimum decrease would be $0.

The addition of lightweight insulating concrete installation requirements will bring clarity to both industry and code officials by having a clear set of requirements within the code. Having clear provisions, rather than relying on guidelines and best practices that may sometimes conflict, will eliminate confusion and lessen permitting and inspection time. Thereby, resulting in a decrease in time and cost.

Estimated Immediate Cost Impact Justification (methodology and variables):

The methodology used is based on no current I-code requirements existing for LWIC roof insulation systems. Although industry best practices, product manufacturer guidelines, and Florida code provisions do exist, conflicting information could cause confusion in the field. It is not possible to put an exact figure on any possible decrease, as it could vary widely, but clarity for industry and code officials should lessen cost.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:

ASTM A446-76(1981)e1 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) By The Hot-Dip Process, Structural (Physical) Quality

ASTM A525-91be1 Standard Specification for General Requirements for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process

ASTM A1008/A1008M-24 Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Required Hardness, Solution Hardened, and Bake Hardenable

ASTM C332-17 Standard Specification for Lightweight Aggregates for Insulating Concrete

ASTM C495-12 (2019) Standard Test Method for Compressive Strength of Lightweight Insulating Concrete

ASTM C618-22 Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete

ASTM C796/C796M-19 Standard Test Method for Foaming Agents for Use in Producing Cellular Concrete Using Preformed Foam

S142-25

S143-25

IBC: SECTION 2103, 2103.1

Proponents: Nicholas Lang, Concrete Masonry & Hardscapes Association, representing Masonry Alliance for Codes & Standards (nlang@masonryandhardscapes.org)

2024 International Building Code

SECTION 2103
MASONRY CONSTRUCTION MATERIALS

Revise as follows:

2103.1 Masonry units. Concrete *masonry units*, clay or shale *masonry units*, stone *masonry units*, *glass unit masonry* ~~and~~ *AAC masonry* units <u>and manufactured stone veneer units</u> shall comply with Article 2.3 of TMS 602. Architectural *cast stone* shall conform to TMS 504.

> **Exception:** *Structural clay tile* for nonstructural use in fireproofing of structural members and in wall furring shall not be required to meet the compressive strength specifications. The *fire-resistance rating* shall be determined in accordance with ASTM E119 or UL 263 and shall comply with the requirements of Table 705.5.

Reason: Section 2103.1 references The Masonry Society (TMS) 602 for requirements for various masonry units. It lists the types of units that are covered in the reference section. Missing from this list is manufactured stone veneer units. This change proposes to add that so the list of materials encompasses those in Article 2.3 of TMS 602.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply aligns the list of materials with the reference standard included.

S143-25

S144-25

IBC: 2103.2.3, 2103.2.3.1, 2103.2.3.2, 2103.2.3.7, ANSI Chapter 35 (New)

Proponents: Shamim Rashid-Sumar, representing National Ready Mixed Concrete Association (ssumar@nrmca.org); James Farny, Portland Cement Association, representing US cement manufacturers (jfarny@cement.org); Dr. Julian Mills-Beale, representing National Ready Mixed Concrete Association (jmills-beale@nrmca.org); Nicholas Lang, representing Concrete Masonry & Hardscapes Association (nlang@masonryandhardscapes.org); Ryan marino, representing Tile Council of North America (rmarino@tileusa.com)

2024 International Building Code

Revise as follows:

2103.2.3 Mortars for ceramic wall and floor tile. ~~Portland~~ Cement *mortars* for installing ceramic wall and floor tile shall comply with ANSI A108.1A and ANSI A108.1B and be of the compositions indicated in Table 2103.2.3.

2103.2.3.1 Dry-set ~~Portland~~ cement mortars. Premixed prepared ~~Portland~~ cement *mortars*, which require only the addition of water and are used in the installation of ceramic tile, shall comply with ANSI A118.1. The shear bond strength for tile set in such *mortar* shall be as required in accordance with ANSI A118.1. Tile set in dry-set ~~Portland~~ cement *mortar* shall be installed in accordance with ANSI A108.5.

2103.2.3.2 ~~Latex-modified~~ Modified ~~Portland~~ dry-set cement mortar. ~~Latex-modified~~ Modified ~~Portland~~ dry-set cement ~~thin-set~~ *mortars* in which ~~latex is added to~~ additives have been incorporated to improve performance above an ANSI A118.1 dry-set *mortar* ~~as a replacement for all or part of the gauging water~~ that are used for the installation of ceramic tile shall comply with ANSI A118.4 or ANSI A118.15. Tile set in ~~latex-~~modified ~~Portland~~ dry-set cement *mortar* shall be installed in accordance with ANSI A108.5.

2103.2.3.7 ~~Portland cement~~ Cement grouts. ~~Portland cement~~ Cement grouts used for the installation of ceramic tile shall comply with ANSI A118.6 or A118.7. ~~Portland cement~~ Cement grouts for tile work shall be installed in accordance with ANSI A108.10.

Add new standard(s) as follows:

ANSI

American National Standards Institute
25 West 43rd Street, Fourth Floor
New York, NY 10036

A118.7-19	Standard Specifications for High Performance Cement Grouts for Tile Installation
A118.15-23	Specifications for Improved Modified Dry-Set Cement Mortar

Reason: This proposal is part of a series of proposals to the IBC and IRC to update cement terminology in the building codes.

The proposed revisions reflect current cement technology and market conditions, which can vary across regions. Nationally, the market is no longer dominated by portland cement. More than sixty percent of the current cement market consists of blended cement, including portland-limestone cement (PLC) and other blended cements that meet the requirements of ASTM C595/C595M, Specification for Blended Hydraulic Cements (Portland Cement Association, 2025). ASTM C595/C595M is referenced in the International Building Code/ International Residential Code.

This specific proposal also updates terminology based on standards currently referenced related to dry-set cement mortars.

The revised terminology in the proposal is consistent with ANSI A118.1. ANSI A118.1 no longer uses the term portland in its title, and instead refers to dry-set cement. The standard also allows for types of cement other than portland cement.

In ANSI A118.4, the terms portland and latex are no longer used, and instead refer to “modified dry-set cement mortars.”

Finally, the proposal adds reference to ANSI A118.7 and A118.15 for high performance cement grouts for tile installation and modified dry-set cement mortars.

Bibliography: Portland Cement Association, 2025. Reducing Carbon at the Cement Plant. https://cementprogress.com/reducing-carbon-at-the-cement-plant/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This editorial code change will not impact the cost of construction. See reason statement.

Staff Analysis: A review of the following standards proposed for inclusion in the code regarding some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025:

ANSI A118.7-19 Standard Specifications for High Performance Cement Grouts for Tile Installation

ANSI A118.15-23 Specifications for Improved Modified Dry-Set Cement Mortar

S145-25

IBC: CHAPTER 21, SECTION 2107, 2107.3

Proponents: Nicholas Lang, Concrete Masonry & Hardscapes Association, representing Masonry Alliance for Codes & Standards (nlang@masonryandhardscapes.org); Charles Clark Jr, Brick Industry Association, representing Masonry Alliance for Codes and Standards (cclark@bia.org)

2024 International Building Code

CHAPTER 21
MASONRY

SECTION 2107
ALLOWABLE STRESS DESIGN

Delete without substitution:

~~**2107.3 TMS 402, Section 6.1.7, splices of reinforcement.** Add to Section 6.1.7 as follows:~~

> ~~6.1.7 – Splices of reinforcement. Lap splices, welded splices or mechanical splices are permitted in accordance with the provisions of this section. Welding shall conform to AWS D1.4. Welded splices shall be of ASTM A706 steel reinforcement. Reinforcement larger than No. 9 (M #29) shall be spliced using mechanical connections in accordance with Section 6.1.7.2.~~

Reason: ASCE 7-02 added Chapter 14, which modified the various material standard's seismic design criteria. Since then, several of the materials standard's development organizations have been working with ASCE 7's seismic committee to reconcile the differences between these documents. TMS is one of them. TMS 402 has revised their provisions and subsequently removed almost all of the masonry provisions from recent editions of ASCE 7.

The 2003 IBC code development process considered the provisions of ASCE 7 Chapter 14, and placed some, but not all of those provisions in the material chapters of the IBC. This provision was one of them. In the ensuing twenty-plus years this provision has been revised and adopted into the current masonry standard, TMS 402, and removed from ASCE 7. Now it is time to remove it from the IBC to avoid an archaic conflict.

TMS 402-22 Section 6.1.7.3 deals with welded splices, and is identical to this IBC revision, except it goes further and allows welding of other grades of reinforcing bars, if a carbon equivalent is provided. This is in accordance with AWS D1.4. The TMS Standard improves on this portion of the IBC.

TMS 402-22 Section 6.1.7.2 deals with mechanical splices and is much more specific than the IBC. It includes provisions for size and placement of mechanical splices in Section 6.1.7.2.3 (a) through (e). Subsequent to these changes, the ASCE 7 seismic and main committees removed this provision from Section 14.4 of ASCE 7. It now needs to be removed from the IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change aligns the IBC with current versions of TMS 402 and ASCE 7.

S145-25

S146-25

IBC: CHAPTER 21, SECTION 2108, 2108.3

Proponents: Nicholas Lang, Concrete Masonry & Hardscapes Association, representing Masonry Alliance for Codes & Standards (nlang@masonryandhardscapes.org); Charles Clark Jr, Brick Industry Association, representing Masonry Alliance for Codes and Standards (cclark@bia.org)

2024 International Building Code

CHAPTER 21
MASONRY

SECTION 2108
STRENGTH DESIGN OF MASONRY

Revise as follows:

2108.3 TMS 402, Section 6.1.7, splices. Add to Sections~~s~~ 6.1.7.2.1 ~~and 6.1.7.3.1~~ as follows:

> ~~6.1.7.3.1 – Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls.~~
>
> 6.1.7.2.1 – Mechanical splices shall be classified as Type 1 or 2 in accordance with Section 18.2.7.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special *reinforced masonry* shear walls. Type 2 mechanical splices are permitted in any location within a member.

Reason: ASCE 7-02 added Chapter 14, which modified the various material standard's seismic design criteria. Since then, several of the materials standard's development organizations have been working with ASCE 7's seismic committee to reconcile the differences between these documents. TMS is one of them. TMS 402 has revised their provisions and subsequently removed almost all of the masonry provisions from recent editions of ASCE 7.

The 2003 IBC code development process considered the provisions of ASCE 7 Chapter 14, and placed some, but not all of those provisions in the material chapters of the IBC. This provision was one of them. In the ensuing twenty-plus years this provision has been revised and adopted into the current masonry standard, TMS 402, and removed from ASCE 7. Now it is time to remove it from the IBC to avoid an archaic conflict.

TMS 402-22 Section 6.1.7.3 deals with welded splices. The TMS Standard does not permit welded splices to be in the plastic hinge zones, which makes this IBC modification no longer necessary.

Subsequent to this change in TMS 402-22, the ASCE 7 seismic and main committees removed this provision from Section 14.4 of ASCE 7. It now needs to be removed from the IBC.

NOTE: A separate proposal has been submitted to remove the modification to TMS 402 Section 6.1.7.2.1 from this section. If both proposals are approved, it is the intent that all of Section 2108.3 be deleted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change aligns the IBC with current versions of TMS 402 and ASCE 7.

S146-25

S147-25

IBC: CHAPTER 21, SECTION 2108, 2108.3

Proponents: Nicholas Lang, Concrete Masonry & Hardscapes Association, representing Masonry Alliance for Codes & Standards (nlang@masonryandhardscapes.org); Charles Clark Jr, Brick Industry Association, representing Masonry Alliance for Codes and Standards (cclark@bia.org)

2024 International Building Code

CHAPTER 21
MASONRY

SECTION 2108
STRENGTH DESIGN OF MASONRY

Revise as follows:

2108.3 TMS 402, Section 6.1.7, splices. Add to Section~~s~~ ~~6.1.7.2.1 and~~ 6.1.7.3.1 as follows:

6.1.7.3.1 – Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls.

~~6.1.7.2.1 – Mechanical splices shall be classified as Type 1 or 2 in accordance with Section 18.2.7.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special *reinforced masonry* shear walls. Type 2 mechanical splices are permitted in any location within a member.~~

Reason: ASCE 7-02 added Chapter 14, which modified the various material standard's seismic design criteria. Since then, several of the materials standard's development organizations have been working with ASCE 7's seismic committee to reconcile the differences between these documents. TMS is one of them. TMS 402 has revised their provisions and subsequently removed almost all of the masonry provisions from recent editions of ASCE 7.

The 2003 IBC code development process considered the provisions of ASCE 7 Chapter 14, and placed some, but not all of those provisions in the material chapters of the IBC. This provision was one of them. In the ensuing twenty-plus years this provision has been revised and adopted into the current masonry standard, TMS 402, and removed from ASCE 7. Now it is time to remove it from the IBC to avoid an archaic conflict.

TMS Section 6.1.7.2.1 requires all mechanical splices to develop 125% of f_y, and thus be Type 2 splices. That eliminates the need for this provision.

Subsequent to this change, the ASCE 7 seismic and main committees removed this provision from Section 14.4 of ASCE 7. It now needs to be removed from the IBC.

NOTE: A separate proposal has been submitted to remove the modification to TMS 402 Section 6.1.7.3.1 from this section. If both proposals are approved, it is the intent that all of Section 2108.3 be deleted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change aligns the IBC with current versions of TMS 402 and ASCE 7.

S147-25

S148-25

IBC: 2111.12

Proponents: Charles Clark Jr, Brick Industry Association, representing Masonry Alliance for Codes and Standards (cclark@bia.org)

2024 International Building Code

Revise as follows:

2111.12 Fireplace clearance. ~~Any portion of a *masonry* fireplace located in the interior of a *building* or within the *exterior wall* of a *building* shall have a clearance to combustibles of not less than 2 inches (51 mm) from the front faces and sides of *masonry* fireplaces and not less than 4 inches (102 mm) from the back faces of *masonry* fireplaces. The airspace shall not be filled, except to provide *fireblocking* in accordance with Section 2111.13.~~ Wood beams, joists, studs and other combustible materials shall have a clearance of not less than 2 inches (51 mm) from the front faces and sides of masonry fireplaces and not less than 4 inches (102 mm) from the back faces of masonry fireplaces. The airspace shall not be filled except for non combustible material or to provide fire blocking in accordance with Section 2111.13.

Exceptions:

1. *Masonry* fireplaces *listed* and *labeled* for use in contact with combustibles in accordance with UL 127 and installed in accordance with the manufacturer's instructions are permitted to have combustible material in contact with their *exterior surfaces*.
2. ~~Where *masonry* fireplaces are constructed as part of *masonry* or concrete walls, combustible materials shall not be in contact with the *masonry* or concrete walls less than 12 inches (306 mm) from the inside surface of the nearest firebox lining.~~ Masonry fireplaces with walls at least 12 inches 305 mm) thick are permitted to have combustible material in contact with their exterior surface.
3. Exposed combustible *trim* and the edges of sheathing materials, such as wood siding, flooring and drywall, are permitted to abut the *masonry* fireplace sidewalls and hearth extension, in accordance with Figure 2111.12, provided that such combustible *trim* or sheathing is not less than ~~12 inches (306 mm)~~ 8 inches (203 mm) from the inside surface of the nearest firebox lining. Where the fireplace opening is 6 square feet (0.6 m2) or larger such combustible or sheathing shall be permitted to abut the masonry fireplace sidewalls and hearth extension provided such combustible or sheathing is not less than 12 inches (305 mm) from the inside surface of the nearest firebox lining.
4. Exposed combustible mantels or *trim* is permitted to be placed directly on the *masonry* fireplace front surrounding the fireplace opening, provided that such combustible materials shall not be placed within 6 inches (153 mm) of a fireplace opening. Combustible material directly above and within 12 inches (305 mm) of the fireplace opening shall not project more than $^{1}/_{8}$ inch (3.2 mm) for each 1-inch (25 mm) distance from such opening. Combustible materials located along the sides of the fireplace opening that project more than $1^{1}/_{2}$ inches (38 mm) from the face of the fireplace shall have an additional clearance equal to the projection.

Reason: This code change is editorial to align the IBC fireplace clearance provisions with those in the IRC.

Referring to "masonry or concrete walls" in Exception 2 can be ambiguous and confusing. What matters is that combustible materials should not be less than 12 inches (305 mm) from the inside surface of the nearest firebox lining. The change in Exception 3 is to be consistent with Section 2111.11 allowing small fireplaces with openings under 6 square feet to have hearth extensions 8 inches beyond the fireplace opening,

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal will not increase or decrease the cost of construction. This change is just a clarification. Refer to reason statement.

S149-25

IBC: 2113.19

Proponents: Charles Clark Jr, Brick Industry Association, representing Masonry Alliance for Codes and Standards (cclark@bia.org)

2024 International Building Code

Revise as follows:

2113.19 Chimney clearances. Any portion of a *masonry* chimney located in the interior of the *building* or within the *exterior wall* of the *building* shall have a minimum airspace clearance to combustibles of 2 inches (51 mm). Chimneys located entirely outside the *exterior walls* of the *building*, including chimneys that pass through the soffit or *cornice*, shall have a minimum airspace clearance of 1 inch (25 mm). The airspace shall not be filled, except to provide *fireblocking* in accordance with Section 2113.20.

Exceptions:

1. *Masonry* chimneys equipped with a chimney lining system *listed* and *labeled* for use in chimneys in contact with combustibles in accordance with UL 1777, and installed in accordance with the manufacturer's instructions, are permitted to have combustible material in contact with their exterior surfaces.
2. ~~Where *masonry* chimneys are constructed as part of *masonry* or concrete walls, combustible materials shall not be in contact with the *masonry* or concrete wall less than 12 inches (305 mm) from the inside surface of the nearest flue lining.~~ Masonry chimneys with chimney walls at least 8 inches (203 mm) thick are permitted to have combustible material in contact with their exterior surface.
3. ~~Exposed combustible *trim* and the edges of sheathing materials, such as wood siding, are~~ Combustible materials shall be permitted to abut the *masonry* chimney sidewalls, in accordance with Figure 2113.19, provided that such combustible ~~*trim* or sheathing~~ material is not less than ~~12 inches (305 mm)~~ 8 inches (203 mm) from the inside surface of the nearest flue lining. ~~Combustible material and *trim* shall not overlap the corners of the chimney by more than 1 inch (25 mm).~~

Reason: This code change proposal is primarily to align the IBC chimney clearances with those in the IRC Section R1003.18.

Referring to "masonry or concrete walls" can be ambiguous and confusing. What matters is that combustible materials should not be less than 8 inches (203 mm) from the inside surface of the nearest flue lining. Since we determined that an 8 inch thick masonry wall in contact with combustible framing was safer than a 4 inch wall and 2 inches of airspace, there is no reason to limit the requirement for 8 inch thick chimney walls to "Exposed combustible trim and the edges of sheathing materials, such as wood siding and flooring."

Bibliography: The engineering study at https://www.rumford.com/code/EightInchThickTestReport.pdf supports changing the provisions in this Section as shown in this proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal will not increase or decrease the cost of construction. This change is just a clarification. Refer to reason statement.

S149-25

S150-25

IBC: 2201.3

Proponents: Bonnie Manley, representing AISC (manley@aisc.org)

2024 International Building Code

Revise as follows:

2201.3 Protection against corrosion. ~~The protection of steel~~ Steel members shall be protected against corrosion in accordance with the applicable referenced standards within this chapter.

Reason: Last cycle, Proposal S187-22 successfully reorganized and streamlined Chapter 22. Recent questions received by the AISC Steel Solution Center have indicated some confusion about the simple reference to "protection." Rather than leave it vague and open to interpretation, this proposal clarifies that the steel is to be “protected against corrosion,” which is in keeping with the provision in previous editions of the IBC (specifically, IBC-21 Section 2203.1).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is intended to be an editorial clarification of the existing provisions and is not intended to impact the cost of construction.

S150-25

S151-25

IBC: 2203.1

Proponents: Bonnie Manley, representing AISC (manley@aisc.org)

2024 International Building Code

Revise as follows:

2203.1 General. The design, fabrication, and erection of ~~austenitic and duplex~~ structural stainless steel shall be in accordance with AISC 370.

Reason: This proposal fixes the charging language for the adoption of AISC 370. Specifically, AISC 370 includes precipitation hardening stainless steel for tension members in addition to austenitic and duplex stainless steels. Rather than have IBC include a laundry list of the various types of structural stainless steel, it would be more appropriate to point to AISC 370, where detailed limits on alloys are provided.

The change from “manufacture” to "fabrication" returns the language to that approved in Proposal S187-22 Section 2203.1. AISC 370, Section A1 states that AISC 370 “shall apply to the design, fabrication, and erection of structural stainless steel systems…” The use of “manufacture” is inappropriate in this instance. Please note, this portion of the change has been submitted as possible errata on the 2024 IBC.

AISC makes its standards available to all free of charge at https://www.aisc.org/publications/steel-standards/.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is intended to be an editorial clarification of the existing provisions and is not intended to impact the cost of construction.

Staff Analysis: Note: This proposal reflects staff identified errata for Section 2203.1 (correction of "fabrication" to replace "manufacture")

S151-25

S152-25

IBC: 2303.1.1

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org)

2024 International Building Code

Revise as follows:

2303.1.1 Sawn lumber. Sawn lumber used for load-supporting purposes, including end-jointed, face-glued or edge-glued lumber, machine stress-rated or machine-evaluated lumber, shall be identified by the grade *mark* of a lumber grading or inspection agency that has been *approved* by an *accreditation body* that complies with DOC PS 20 or equivalent. Grading practices and identification shall comply with rules published by an agency approved in accordance with the procedures of DOC PS 20 or equivalent procedures.

Reason: DOC PS 20 establishes the grading and inspection standards for various sawn wood products, which includes face-glued lumber in addition to end-jointed and edge-glued lumber. IBC 2303.1.1 currently refers to end-jointed and edge-glued lumber and does not mention face-glued lumber. This omission may cause confusion regarding its acceptance under the IBC. This proposal aims to clarify that face-glued lumber is indeed permitted alongside the other glued lumber products identified in DOC PS 20.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no technical changes proposed in this code change. Face-glued lumber is already included in DOC PS 20. This change only adds it to a list of sawn lumber products in Section 2303.1.1 to avoid confusion.

S152-25

S153-25

IBC: SECTION 202 (New), 2303.1.1.3 (New), 2303.1.1.3.1 (New), ASTM Chapter 35 (New)

Proponents: Garian Cika, representing City of Eugene

2024 International Building Code

Add new definition as follows:

SALVAGE LUMBER. Sawn lumber that has been previously used in buildings or other structures.

Add new text as follows:

2303.1.1.3 Salvage lumber. *Salvage lumber* shall be free of areas of decay and insect damage. *Salvage lumber* shall be permitted for use in structural applications in accordance with Section 2303.1.1.3.1. *Salvage lumber* that does not meet the provisions of Section 2303.1.1.3.1 shall be permitted for use in non-structural applications.

2303.1.1.3.1 Salvage lumber in structural applications. *Salvage lumber* used in structural applications shall be free of locations where net section has been reduced. Each piece of salvage lumber to be used in structural applications shall be proof loaded in flat-wise, third-point bending in accordance with ASTM D4761 to 2.1 times the reference bending design value, adjusted by the flat use factor, assigned to the selected grade of lumber in the AWC NDS. Pieces of *salvage lumber* that do not exhibit structural failure at a load corresponding to 2.1 times the reference bending design value shall be permitted for use in structural applications.

Exception: *Salvage lumber* identified by an existing *grade mark* in accordance with 2303.1.1 shall be permitted to use 90% of the design values assigned to that grade of sawn lumber in the AWC NDS provided the following conditions are met:

1. The *salvage lumber* is free of locations where net section has been reduced.
2. A visual inspection of the salvage lumber shows no sign of failure.
3. It is known that the *salvage lumber* has not been subjected to sustained exposure to elevated temperatures above 100°F (38°C).

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

ASTM D4761-19 Standard Test Methods for Mechanical Properties of Lumber and Wood-Based Structural Materials

Reason: Research, including studies by the Consortium for the Research on Renewable Industrial Materials (CORRIM 2010), highlights a key advantage of salvage lumber over materials reused like steel and concrete when it comes to energy use and carbon footprint (Lippke et al. 2004, Perez-Garcia et al. 2005). The timber framing industry understood this as early as the 1970s, using salvage lumber from industrial structures for new projects. Over the last 30 years, businesses selling salvage sawn lumber from deconstructed buildings have grown rapidly.

There's a significant opportunity here: since the early 1900s, more than 3 trillion board feet of lumber have been processed in the United States, much of which is still in use today (Steer 1948, Howard 2001). However, current building codes do not appear to specifically recognize the use of salvage sawn lumber, creating inconsistencies in how it's handled on job sites. Some building inspectors may allow salvage sawn lumber because it has a proven track record, while others may reject it outright due to a lack of official guidance administered by code. This uncertainty can be solved by updating codes to reflect the value of this material, permitting salvage sawn lumber to be reused safely.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact because sawn lumber is currently allowed by code. This code proposal adds another lumber choice for builders and designers; it is not a requirement to use salvage lumber. Data showing salvage lumber is equal (or less) in cost to non-salvage lumber from Reuse Institute:

Reclaimed Lumber Prices						
From: The Reuse Center, Bellingham, WA	Prices good for week of: 11/18/2024					
From: 'Deconstruction Dave' Bennink, Owner	*antique wood based on rough-sawn finish, like 100 years old or older; Antique is likely Douglas Fir not Hem Fir					
Warehouse phone 360-733-1363		Reuse Center	Reuse Center	Comparison:	Comparison:	
MATERIAL TYPE	Unit Type	Standard utility grade	Antique/rustic*	Lowes Price	Lowes material	
		Price per unit	Price per unit	listed online	description	
2x4	lineal foot	$0.39	$1	$0.54	Hemfir kiln dried	Lowes
2x6	lineal foot	$0.49	$2	$0.83	Hemfir kiln dried	Lowes

2x8	lineal foot	$0.75	$2.50	$1.12	Hemfir kiln dried	Lowes
2x10	lineal foot	$1.00	$3.35	$1.49	Hemfir kiln dried	Lowes
2x12	lineal foot	$1.33	$4.00	$1.86	Premiun Grade Fir	Home Depot

S154-25 Part I

IBC: 2303.4.1.1

Proponents: Greg Greenlee, SBCA, representing SBCA, Technical Director (ggreenlee@sbcacomponents.com); Jay Jones, representing Truss Plate Institute, Executive Director (jpjones@tpinst.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

2303.4.1.1 Truss design drawings. The written, graphic and pictorial depiction of each individual truss shall be provided to the *building official* for approval prior to installation. Truss design drawings shall be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the following information~~:~~, and for metal plate connected wood trusses, any additional information required to be included on the *truss design drawings* per *ANSI/TPI 1.*

1. ~~Slope or depth, span and spacing.~~
2. ~~Location of all joints and support locations.~~
3. ~~Number of plies if greater than one.~~
4. ~~Required bearing widths.~~
5. ~~Design *loads* as applicable, including:~~
   - 5.1. ~~Top chord *live load*.~~
   - 5.2. ~~Top chord *dead load*.~~
   - 5.3. ~~Bottom chord *live load*.~~
   - 5.4. ~~Bottom chord *dead load*.~~
   - 5.5. ~~Additional *loads* and locations.~~
   - 5.6. ~~Environmental design criteria and *loads* (such as wind, rain, snow, seismic).~~
6. ~~Other lateral *loads*, including *drag strut loads*.~~
7. ~~Adjustments to wood member and metal connector plate design value for conditions of use.~~
8. ~~Maximum reaction force and direction, including maximum uplift reaction forces where applicable.~~
9. ~~Joint connection type and description, such as size and thickness or gage, and the dimensioned location of each joint connector except where symmetrically located relative to the joint interface.~~
10. ~~Size, species and grade for each wood member.~~
11. ~~Truss-to-truss connections and truss field assembly requirements.~~
12. ~~Calculated span-to-deflection ratio and maximum vertical and horizontal deflection for live and total *load* as applicable.~~
13. ~~Maximum axial tension and compression forces in the truss members.~~
14. ~~Required permanent *individual truss member* restraint location and the method and details of restraint and diagonal bracing to be used in accordance with Section 2303.4.1.2.~~

1. Building code used for design.
2. Slope or depth, span and spacing.

3. Location of all joints and support locations.
4. Number of plies if greater than one.
5. Required bearing widths and if wane is restricted in the bearing area.
6. Design loads as applicable, including:
    6.1. Top chord controlling case of *live load*, reduced *live load* if used, snow load, or rain load;
    6.2. Top chord *dead load*;
    6.3. Bottom chord *live load*;
    6.4. Bottom chord *dead load*;
    6.5. Additional loads and locations;
    6.6. Environmental load design criteria (wind speed, snow, rain, seismic, and all applicable factors as required to calculate the truss loads); and
    6.7. Other lateral loads, including *drag strut loads*.
7. Adjustments to wood member and connector design values for conditions of use.
8. Maximum reaction force and direction at each bearing location, including maximum uplift reaction forces where applicable.
9. Joint connector type, manufacturer, size, and thickness or gauge, and the dimensioned location of each connector except where symmetrically located relative to the joint interface.
10. Size, species, and grade for each wood member.
11. Truss-to-truss connection and truss field assembly requirements.
12. Calculated span-to-deflection ratio and/or maximum vertical and horizontal deflection for live load, and for live plus dead load and KCR as applicable.
13. Maximum axial tension and compression forces in the truss members.
14. Fabrication tolerances as applicable.
15. Required permanent individual truss member restraint locations.
16. Truss designer.
17. A note on each *truss design drawing* to install the permanent *truss member lateral restraint* and *truss diagonal braces* in accordance with Section 2303.4.1.2.

S154-25 Part I

S154-25 Part II

IRC: R502.12.4, R802.10.1

Proponents: Greg Greenlee, SBCA, representing SBCA, Technical Director (ggreenlee@sbcacomponents.com); Jay Jones, representing Truss Plate Institute, Executive Director (jpjones@tpinst.org)

2024 International Residential Code

Revise as follows:

R502.12.4 Truss design drawings. *Truss design drawings*, prepared in compliance with Section R502.12.1, shall be submitted to the *building official* and *approved* prior to installation. *Truss design drawings* shall be provided with the shipment of trusses delivered to the job site. *Truss design drawings* shall include, at a minimum, the following information ~~specified as follows:~~, and for metal plate connected wood trusses, any additional information required to be included on the *truss design drawings* per *ANSI/TPI 1*.

1. ~~Slope or depth, span and spacing.~~
2. ~~Location of all joints.~~
3. ~~Required bearing widths.~~
4. ~~Design loads as applicable:~~
   - 4.1. ~~Top chord *live load*.~~
   - 4.2. ~~Top chord *dead load*.~~
   - 4.3. ~~Bottom chord *live load*.~~
   - 4.4. ~~Bottom chord *dead load*.~~
   - 4.5. ~~Concentrated loads and their points of application.~~
   - 4.6. ~~Controlling wind and earthquake loads.~~
5. ~~Adjustments to lumber and joint connector design values for conditions of use.~~
6. ~~Each reaction force and direction.~~
7. ~~Joint connector type and description, such as size, thickness or gage, and the dimensioned location of each joint connector except where symmetrically located relative to the joint interface.~~
8. ~~Lumber size, species and grade for each member.~~
9. ~~Connection requirements for:~~
   - 9.1. ~~Truss-to-girder-truss.~~
   - 9.2. ~~Truss ply-to-ply.~~
   - 9.3. ~~Field splices.~~
10. ~~Calculated deflection ratio, maximum description for live and total load, or both.~~
11. ~~Maximum axial compression forces in the truss members to enable the building designer to design the size, connections and anchorage of the permanent continuous lateral bracing. Forces shall be shown on the truss drawing or on supplemental documents.~~
12. ~~Required permanent truss member bracing location.~~

1. Building code used for design.
2. Slope or depth, span and spacing.
3. Location of all joints and support locations.

4. Number of plies if greater than one.
5. Required bearing widths and if wane is restricted in the bearing area.
6. Design loads as applicable, including:
   6.1 Top chord controlling case of *live load*, reduced *live load* if used, snow load, or rain load;
   6.2 Top chord *dead load*;
   6.3 Bottom chord *live load*;
   6.4 Bottom chord *dead load*;
   6.5 Additional loads and locations;
   6.6 Environmental load design criteria (wind speed, snow, rain, seismic, and all applicable factors as required to calculate the truss loads); and
   6.7 Other lateral loads, including *drag strut loads*.
7. Adjustments to wood member and connector design values for conditions of use.
8. Maximum reaction force and direction at each bearing location, including maximum uplift reaction forces where applicable.
9. Joint connector type, manufacturer, size, and thickness or gauge, and the dimensioned location of each connector except where symmetrically located relative to the joint interface.
10. Size, species, and grade for each wood member.
11. Truss-to-truss connection and truss field assembly requirements.
12. Calculated span-to-deflection ratio and/or maximum vertical and horizontal deflection for live load, and for live plus dead load and KCR as applicable.
13. Maximum axial tension and compression forces in the truss members.
14. Fabrication tolerances as applicable.
15. Required permanent individual truss member restraint locations.
16. Truss designer.
17. A note on each *truss design drawing* to install the permanent lateral restraint and diagonal braces in accordance with the project-specific bracing requirements when they exist or with standard industry details such as BCSI B3 for metal plate connected wood trusses in the absence of specific information by any registered design professional.

R802.10.1 Truss design drawings. *Truss design drawings*, prepared in conformance to Section R802.10.1, shall be provided to the *building official* and *approved* prior to installation. *Truss design drawings* shall be provided with the shipment of trusses delivered to the job site. *Truss design drawings* shall include, at a minimum, the following information~~:~~, and for metal plate connected wood trusses, any additional information required to be included on the *truss design drawings* per *ANSI/TPI 1*.

~~1. Slope or depth, span and spacing.~~

~~2. Location of all joints.~~

~~3. Required bearing widths.~~

~~4. Design loads as applicable.~~

~~4.1. Top chord *live load* (as determined from Section R301.6).~~

~~4.2. Top chord *dead load*.~~

~~4.3. Bottom chord *live load*.~~

~~4.4. Bottom chord *dead load*.~~

~~4.5. Concentrated loads and their points of application.~~

~~4.6. Controlling wind and earthquake loads.~~

~~5. Adjustments to lumber and joint connector design values for conditions of use.~~

~~6. Each reaction force and direction.~~

~~7. Joint connector type and description such as size, thickness or gage and the dimensioned location of each joint connector except where symmetrically located relative to the joint interface.~~

~~8. Lumber size, species and *grade for each member*.~~

~~9. Connection requirements for:~~

~~9.1. Truss to girder-truss.~~

~~9.2. Truss ply to ply.~~

~~9.3. Field splices.~~

~~10. Calculated deflection ratio or maximum description for live and total load.~~

~~11. Maximum axial compression forces in the truss members to enable the building designer to design the size, connections and anchorage of the permanent continuous lateral bracing. Forces shall be shown on the *truss design drawing* or on supplemental documents.~~

~~12. Required permanent truss member bracing location.~~

1. Building code used for design.

2. Slope or depth, span and spacing.

3. Location of all joints and support locations.

4. Number of plies if greater than one.

5. Required bearing widths and if wane is restricted in the bearing area.

6. Design loads as applicable, including:

   6.1. Top chord controlling case of *live load*, reduced *live load* if used, snow load, or rain load;

   6.2. Top chord *dead load*;

   6.3. Bottom chord *live load*;

   6.4. Bottom chord *dead load*;

   6.5. Additional loads and locations;

   6.6. Environmental load design criteria (wind speed, snow, rain, seismic, and all applicable factors as required to calculate the truss loads); and

   6.7. Other lateral loads, including *drag strut loads*.

7. Adjustments to wood member and connector design values for conditions of use.

8. Maximum reaction force and direction at each bearing location, including maximum uplift reaction forces where applicable.

9. Joint connector type, manufacturer, size, and thickness or gauge, and the dimensioned location of each connector except where symmetrically located relative to the joint interface.
10. Size, species, and grade for each wood member.
11. Truss-to-truss connection and truss field assembly requirements.
12. Calculated span-to-deflection ratio and/or maximum vertical and horizontal deflection for live load, and for live plus dead load and KCR as applicable.
13. Maximum axial tension and compression forces in the truss members.
14. Fabrication tolerances as applicable.
15. Required permanent individual truss member restraint locations.
16. Truss designer.
17. A note on each *truss design drawing* to install the permanent lateral restraint and diagonal braces in accordance with the project-specific bracing requirements when they exist or with standard industry details such as BCSI B3 for metal plate connected wood trusses in the absence of specific information by any registered design professional.

Reason: ANSI/TPI 1 is the referenced standard for metal-plate-connected wood trusses. The requirements for information to be included on metal-plate-connected wood trusses are specified in ANSI/TPI 1. Previously this information had been copied from ANSI/TPI 1 and included in the IRC and IBC for wood trusses. ANSI/TPI 1 is on a development cycle that is different than the IBC and IRC causing the potential for conflicting information. Additionally, currently the language in the IRC and the IBC does not match and does not match what is in ANSI/TPI 1.

It should be noted that the language in these sections is not exclusive to metal-plate-connected wood trusses. While it isn't explicitly stated, presumably truss members are permitted to be joined by nails, glue, bolts, timber connectors, or other approved framing devises in addition to metal connector plates. Accordingly, a pointer to ANSI/TPI 1 has been added for metal-plate connected wood trusses to capture any component specific requirements that may be introduced in the referenced standard.

This change will ensure that the information provided in the truss design drawings is consistent between references in the IRC and IBC, and current with the most recent version of ANSI/TPI 1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal eliminates inconsistent information and reduces confusion. There is no impact on the cost of construction.

Proponents: Greg Greenlee, SBCA, representing SBCA, Technical Director (ggreenlee@sbcacomponents.com); Jay Jones, representing Truss Plate Institute, Executive Director (jpjones@tpinst.org)

2024 International Building Code

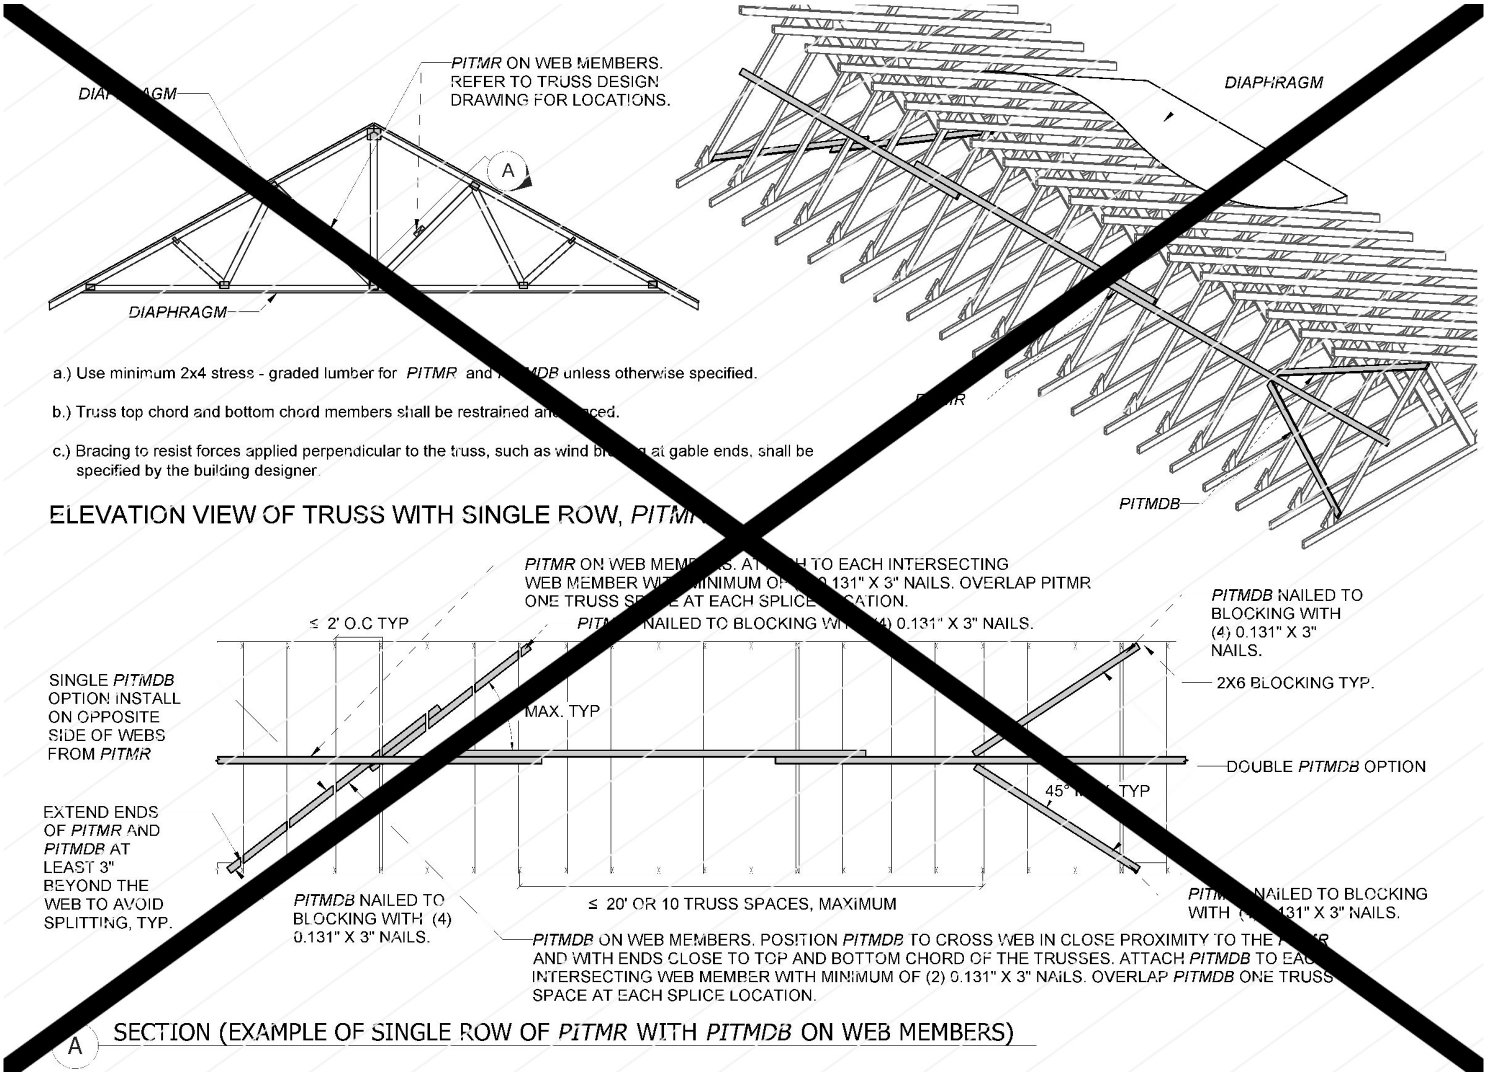
Revise as follows:

[BS] ~~PERMANENT INDIVIDUAL~~ TRUSS ~~MEMBER~~ DIAGONAL BRACING ~~(PITMDB)~~. Structural member or assembly intended to permanently stabilize the ~~*PITMRs*~~ *truss member lateral restraint*.
[BS] ~~PERMANENT INDIVIDUAL~~ TRUSS MEMBER LATERAL RESTRAINT ~~(PITMR)~~. Permanent restraint ~~Restraint~~ that is used to prevent local buckling of an individual truss chord or web member due to ~~because~~ of the axial forces in the *individual truss member.*

2303.4.1.2 Permanent ~~individual~~ truss member lateral restraint ~~(PITMR)~~ and ~~permanent individual~~ truss ~~member~~ diagonal bracing ~~(PITMDB)~~. Where the truss design drawings designate the need for permanent ~~*permanent individual*~~ *truss member lateral restraint*, it shall be accomplished by one of the following methods:

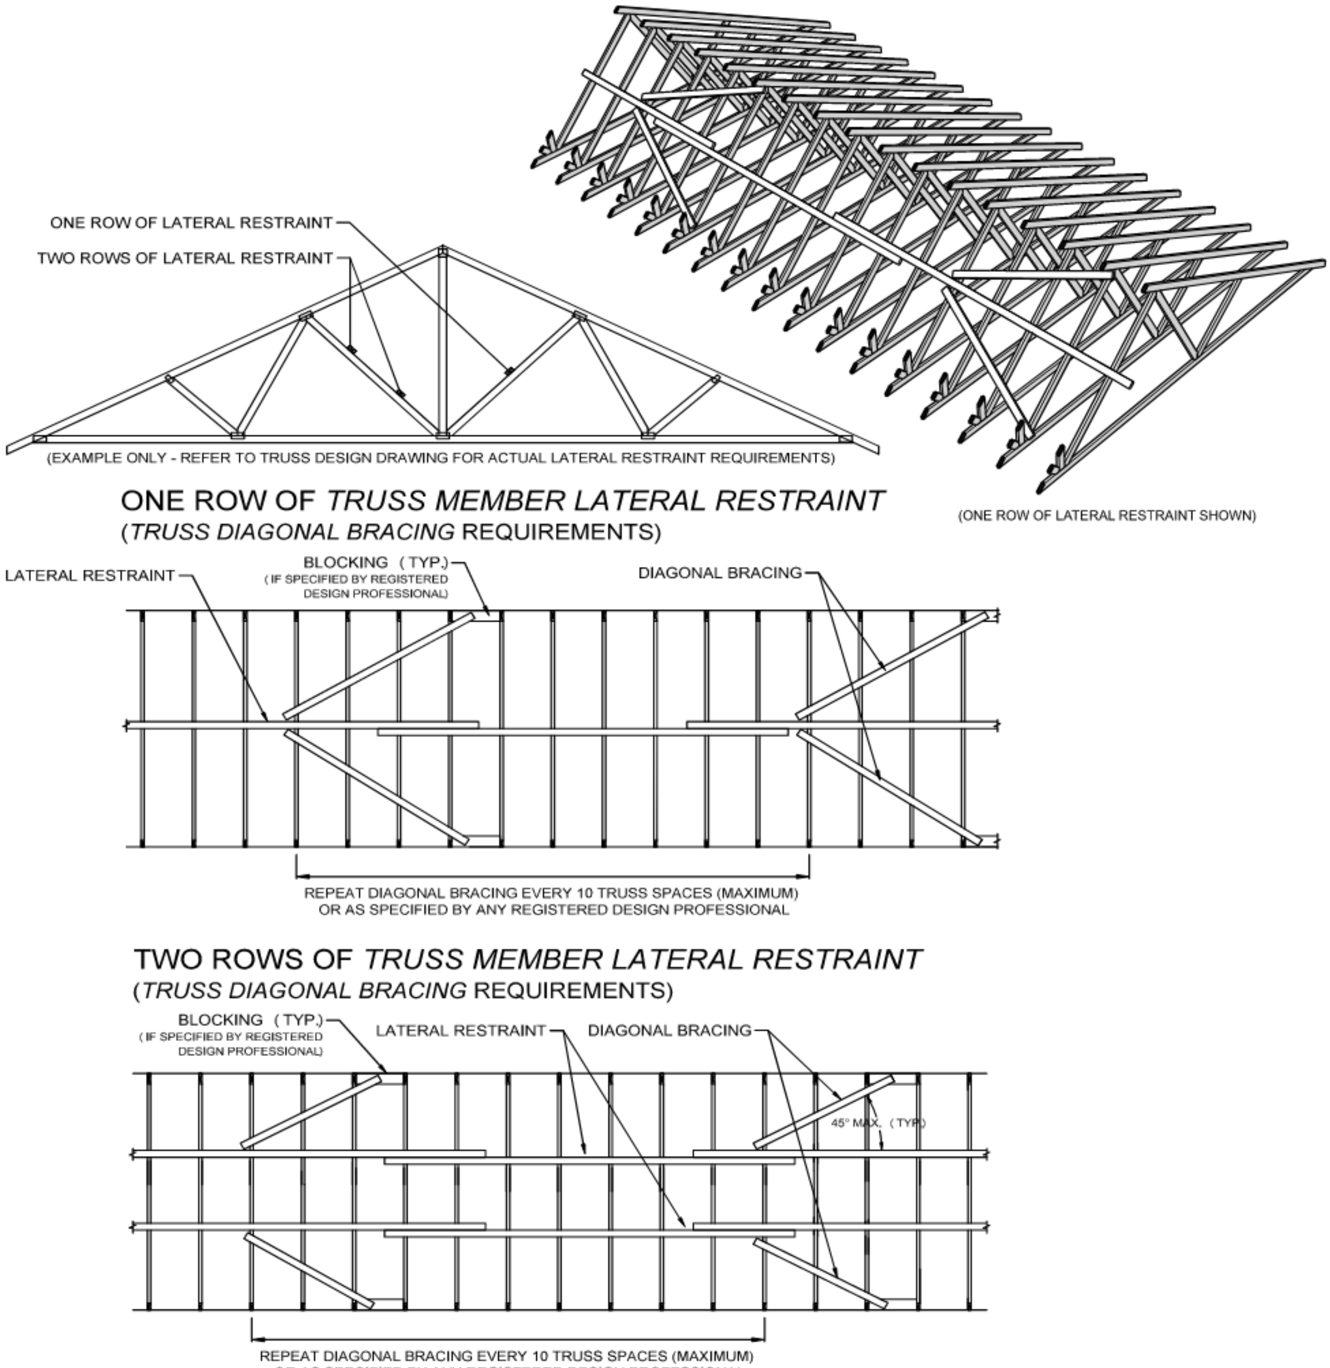
1. ~~*PITMR* and *PITMDB*~~ Permanent *truss member lateral restraint* and *truss diagonal bracing* installed using standard industry lateral restraint and diagonal bracing details in accordance with TPI 1, Section 2.3.3.1.1, accepted engineering practice, or Figures 2303.4.1.2(1) ~~,~~ and (3) ~~, and (5)~~.
2. *Individual truss member* reinforcement in place of the specified lateral restraints (i.e., buckling reinforcement such as T-reinforcement, L-reinforcement, proprietary reinforcement, etc.) such that the buckling of any *individual truss member* is resisted internally by the individual truss. The buckling reinforcement of individual truss members shall be installed as shown on the truss design drawing, on supplemental truss member buckling reinforcement details provided by the truss designer or in accordance with Figure~~s~~ 2303.4.1.2 (2) ~~and (4)~~.
3. A project-specific ~~*PITMR* and *PITMDB*~~ permanent *truss member lateral restraint* and *truss diagonal bracing* design provided by any *registered design professional*.

Delete and substitute as follows:



~~For SI:1 inch = 25.4 mm, 1 foot = 304.8 mm.~~

~~FIGURE 2303.4.1.2 (1) PITMR AND PITMDB FOR TRUSS WEB MEMBERS REQUIRING ONE ROW OF PITMR~~



1. Use minimum 2x4 stress-graded lumber for Lateral Restraints and Diagonal Bracing.
2. Attach Lateral Restraints to each intersecting web member with a minimum of (2) 3" x 0.131" nails except use (3) nails where the Diagonal Braces terminate.
3. Attach Diagonal Brace to each intersecting web member with a minimum of (2) 3" x 0.131" nails. Nail to blocking at ends when specified by a registered design professional.
4. Extend ends of Lateral Restraints and Diagonal Braces 3" beyond the web to avoid splitting.
5. Install Diagonal Braces so they terminate in close proximity to the Lateral Restraint and the ends are close to the top and bottom chords.

For SI:1 inch = 25.4 mm, 1 foot = 304.8 mm.

~~FIGURE 2303.4.1.2(5) PITMR AND PITMDB FOR FLAT PORTION OF TOP CHORD IN A PIGGYBACK ASSEMBLY~~

Delete and substitute as follows:

~~**2303.4.1.2.1 Trusses installed without a diaphragm.** Trusses installed without a *diaphragm* on the top or bottom chord shall require a project specific *PITMR* and *PITMDB* design prepared by a *registered design professional.*~~

~~**Exception:** Group U occupancies.~~

<u>**2303.4.1.2.1 Trusses installed without continuous wood or gypsum panels bracing the truss chords.** Truss top chords not braced with continuous wood structural panels fastened per Table 2304.10.2 and truss bottom chords not braced with gypsum panel product fastened per Table 2508.1 or continuous wood structural panels fastened per Table 2304.10.2 shall require a project specific permanent *truss member lateral restraint* and *truss diagonal bracing* design prepared by a *registered design professional.*</u>

<u>**Exceptions:**</u>

1. <u>Group U occupancies.</u>
2. <u>Floor trusses without compression forces in the bottom chord</u>
3. <u>Piggyback base truss top chords and other trusses with partially over-framed chords</u>

Reason: This proposal is intended to address and clarify a few issues related to permanent restraint and bracing for wood trusses. Each item is described below.

<u>Nomenclature Consistency</u>

Between TPI 1, SBCA's BCSI and the IBC multiple terms and acronyms have been adopted to describe a member used to restrain a truss web and the members used to collect the restraining forces and resolve them. As an industry we are working to consolidate the terminology across all these documents.

This past year members of the Structural Building Components Association (SBCA), Truss Plate Institute (TPI) and National Framers Council (NFC) formed a task group to review and update the Building Component Safety Information (BCSI) document. During these meetings the task group discussed and determined that the terms 'lateral restraint' and 'diagonal bracing' are the most widely used and best understood within the industry. PITMR and PITMDB are not widely considered to be part of the truss industry's vernacular. When these terms were added to the IBC in 2018 it was an attempt to better describe the terminology. We have found that this has not happened as intended.

To maintain clarity in the code the terms 'truss member lateral restraint' and 'truss diagonal bracing' were added. These will replace PITMR and PITMD in the definitions, Section 2303.4.1.2 and 2303.4.1.2.1, and Figures 2303.4.1.2 (1) and (3).

The updated version of BCSI uses the terms 'lateral restraint' and 'diagonal bracing'. When ANSI/TPI 1 is up for its next review a similar terminology consolidation review will occur with the intention to match what has been used in ANSI/TPI 1 and proposed in this modification. Adding these defined terms and modifications to these sections and figures were made to use these terms consistently.

<u>Consolidation and Correction in Figures</u>

Figure 2303.4.1.2 (1) was combined with Figure 2303.4.1.2 (3), and Figure 2303.4.1.2 (2) was combined with Figure 2303.4.1.2 (4). These figures were also modified to replace the use of PITMR and PITMBD with the terms 'lateral restraint' and 'diagonal bracing'. The diagonal brace spacing is shown incorrectly in Figures 2303.4.1.2 (1) and (3) which has been corrected in the new Figure 2303.4.1.2 (1). Finally, nailing requirements for the lateral restraint and diagonal brace members were clarified.

<u>Figures 2303.4.1.2 (1) and (3)</u>

In both Figures 2303.4.1.2(1) and (3) the single brace option has been removed with a preference for the double brace option that provides more capacity with the prescriptive nailing requirements. The change coincides with recement modifications to the BCSI document.

The note in the current Figures 2303.4.1.2(1) and (3) requiring blocking at the ends of the diagonal braces has been revised to indicate that blocking is only required when specified by a registered design professional. This change was made because the prescriptive conditions addressed by this detail do not inherently require blocking at these locations. However, blocking may be required if the bracing is designed by a registered design professional and a different bracing solution is specified. The new Figure 2303.4.1.2(1) shows the blocking and includes a note regarding the registered design professional.

For the condition currently shown in Figure 2303.4.1.2 (1) and (3), and in the proposed version, the bracing force at the joint where the blocking is specified is limited by the prescriptive two-nail connection of the lateral restraint to the web (three-nail connection in the proposed version), where the diagonal braces terminate. This bracing force is distributed equally between the two diagonal braces and transferred to the joint where blocking is shown. Therefore, using this detail, the maximum force that can be transferred to that joint is low and field performance confirms that this low force can be effectively transferred without blocking.

Figures 2303.4.1.2 (2) and (4)

The web reinforcing tables in Figures 2303.4.1.2 (2) and (4) were combined and revised by removing the 'L', 'U', and scab reinforcement options, matching revisions made to the latest version of BCSI. Although, the 'L', 'U', and scab reinforcements are viable options, they are not always equivalent to the 1 or 2 rows of CLRs as indicated in the current table. The condensed table is shown in the new Figure 2303.4.1.2 (2).

Figure 2303.4.1.2 (5)

The permanent restraint and bracing requirements in Figure 2303.4.1.2 (5) were enhanced to limit diagonal brace spacing as a function of the compressive force in the flat portion of the base truss top chord. Field observations have shown that these are critical elements, and it is important that the connections in the bracing and restraint system are not over stressed. A table has been added providing maximum diagonal bracing spacing requirements for different levels of compression forces in the flat portion of the top chord member. Also, an upper applicability limit for the prescriptive detail has been added so that it is not used in conditions that may overstress the prescribed connections.

Use of the Term 'Diaphragm'

The defined term 'diaphragm' was replaced in Section 2303.4.1.2.1 with 'continuous wood panel' or 'gypsum panel' sheathing to underscore that a diaphragm is not necessarily needed to brace the chord of a truss. A building designer may opt to use a diaphragm, but it isn't a requirement to brace the truss. Continuous sheathing is the term used in ANSI/TPI 1, DSB and BCSI. With the addition of the terms 'wood structural panel' and gypsum panel product' references for required fastening for each of these added.

Added Exceptions

Two exceptions were added to clarify where the code provision does not apply and a project specific permanent restraint and bracing plan is not required. First, Exception 2 was added for when a floor truss is not subject to compression forces in the bottom chord, and buckling isn't a concern. Exception 3 clarifies that the provision does not apply to piggyback base truss top chords and other trusses with partially over-framed chords where there are other controlling requirements, such as the new Figure 2303.4.1.2 (3).

Building Component Safety Information Guide to Good Practice for Handling, Installing, Restraining and Bracing of Structural Building Components (BCSI-2025), SBCA

Cost Impact: Increase

Estimated Immediate Cost Impact:

Terminology Changes

The terminology changes in this proposal are editorial.

Cost Impact: **NONE**

Reference to a "Diaphragm"

The proposed change clarifies that "rigid sheathing" is required to brace the truss chords rather than referencing a "diaphragm." This is not a change in policy but rather a correction to align the code language with standard industry practices. Historically, diaphragms have not been explicitly designed to brace truss chords, and current construction methods already rely on rigid sheathing for this purpose. Therefore, this proposal does not introduce any changes to typical construction practices. Instead, it ensures the model code is technically accurate and eliminates potential confusion during code enforcement.

Cost Impact: **NONE**

Change in Blocking Guidance for Diagonal Bracing for Truss Webs

The current Figures 2303.4.1.2 (1 and 3) include a note requiring blocking at the ends of all diagonal braces. The proposed change updates this requirement, specifying that blocking is only necessary when indicated by a Registered Design Professional. Truss designs utilizing the prescriptive methods outlined in these figures do not require blocking under this change. As a result, costs will decrease for conditions where this prescriptive method is used (see "*Blocking Cost Justification*" below for cost decrease calculations).

Cost Impact: **DECREASE $0.03/sq ft**

<u>Change to Diagonal Brace Frequency for Truss Webs</u>

In Figures 2303.4.1.2 (1 and 3) the proposed change adjusts the dimension used to specify the spacing between sets of diagonal bracing. The dimension will now reflect the distance between lateral restraint anchor points rather than to the end of the diagonal brace. This revision reduces the allowable spacing between sets of diagonal bracing from 26 feet on center (effectively) to 20 feet on center. As a result, this change will lead to a slight increase in construction costs (see "Web Diagonal Brace Cost Justification" below for cost increase calculations).

Cost Impact: **INCREASE $0.01/sq ft.**

-

<u>Revisions to the Web Reinforcement Tables - Figures 2303.4.1.2(2 and 4)</u>

The proposed changes to these tables involve removing two of the four options for web reinforcement. Since the remaining two alternatives are equivalent in terms of installation cost, these revisions will not impact overall construction costs.

Cost Impact: **NONE**

<u>Change to Diagonal Brace Frequency for Piggyback Trusses</u>

This proposal introduces guidance for the required spacing of diagonal brace sets in piggyback trusses. Currently, Figure 2304.1.2(5) prescriptively requires diagonal brace sets every 10 feet for <u>all</u> conditions and is dimensioned to the end of the Diagonal Brace set. The proposed change adjusts the brace set frequency based on the compression force in the flat top chord and is dimensioned between anchor points. As a result, closer spacing will be required in certain cases where the compression force is high in the flat top chord, leading to a slight increase in construction costs for these specific conditions (see "Piggyback Diagonal Brace Cost Justification" below for cost increase calculation).

Cost Impact: **INCREASE 0.04/sq ft.** (where piggyback trusses are used that have high compression forces)

Estimated Immediate Cost Impact Justification (methodology and variables):

<u>Blocking Cost Justification</u>

Assumptions

1. A typical 40 ft span truss requires, on average, 2 Lateral Restraints.
2. Diagonal Bracing is required every 20 ft along each line of Lateral Restraint. (This results in 4 Diagonal Braces every 20 ft.)
3. Each Diagonal Brace requires 1 Block.

Calculation of Blocks per Square Foot

For a 40 ft x 20 ft area (800 sq ft):
4 Blocks are needed per 800 sq ft. or 4/800 = **0.005 Blocks /sq ft.**

Material Cost

1. Size of one Block: 24 inches (2 ft) long.
2. Cost of Blocking Material: **$1.00 per 24-inch block** (2x6 SPF #1/#2) (*)

Labor Rate

1. Framer Rate: $50/hour (*)
2. Time to install one Block: 5 minutes (or 1/12 of an hour)

Labor Cost to install one block:

$50/hr. /12 = **$4.17 /Block**

Total Installed Cost per Block

Material Cost + Labor Cost = $1.00 + $4.17 = **$5.17/Block**

Total Installed Cost per Square Foot

Since 1 block covers 200 sq ft:

$5.17/200 sq ft = **$0.03/sq ft.**

Summary

- Material Cost per Block: **$1.00**
- Labor Cost per Block: **$4.17**
- Total Installed Cost per Block: **$5.17**
- Total Installed Cost per Square Foot: **$0.03/sq ft**

** The cost estimates for material and labor were confirmed as reasonable values by a large truss manufacturing company located in Illinois.*

Web Diagonal Brace Cost Justification

Assumptions

1. A typical 40 ft span truss requires, on average, 2 Lateral Restraints.
2. Currently in 2024 IBC, Diagonal Bracing is required every **26 ft** (effectively) along each line of Lateral Restraint
3. It is **proposed** to correct this figure to show Diagonal Bracing required every **20 ft** along each line of Lateral Restraint.

Calculation of Diagonal Brace Sets per Square Foot

Current:

For a 40 ft x 26 ft area (1040 sq ft):

Two Diagonal Brace Sets are needed per 1040 sq ft. or 2/1040 = **0.00192 Diagonal Brace Sets /sq ft.**

Proposed:

For a 40 ft x 20 ft area (800 sq ft):

Two Diagonal Brace Sets are needed per 800 sq ft. or 2/800 = **0.00250 Diagonal Brace Sets /sq ft.**

Material Cost

1. One Diagonal Brace assumed to be 10 ft long
2. Cost of Diagonal Brace material: **$4.00 per 10 ft** board (2x4 SPF #1/#2) (*)

2 Diagonals in each set = 2 x $4.00 = **$8.00** / **Diagonal Brace Set**

Labor Cost

1. Framer Rate: **$50/hour**(*)
2. Time to cut and install one Diagonal Brace Set: 10 minutes (or 1/6 of an hour)

$50/hr. /6 = **$8.33** / **Diagonal Brace Set**

Total Installed Cost per Diagonal Brace Set

Material Cost + Labor Cost = $8.00 + $8.33 = **$16.33**/ **Diagonal Brace Set**

Change in Cost per Square Foot

Current:

$16.33 x 0.00192 = $0.0314/ sq ft.

Proposed:

$16.33 x 0.00250 = $0.0408/ sq ft.

Difference:

$0.0408 – $0.0314 = $0.0094 (**About 1 cent /sq ft**. increase)

* *The cost estimates for material and labor were confirmed as reasonable values by a large truss manufacturing company located in Illinois.*

Piggyback Diagonal Brace Cost Justification

Assumptions

1. A typical 40 ft span piggyback truss requires 4 Diagonal Braces to form one Brace Set.
2. Currently in 2024 IBC, Diagonal Brace Sets are required every **10 ft** throughout the run or trusses.
3. It is **proposed** to decrease the spacing between Diagonal Bracing sets in certain cases (high force flat top chord members) to as little as every **6 ft**.

Calculation of Diagonal Brace Sets per Square Foot

Current:

For a 40 ft x 10 ft area (400 sq ft):

One Diagonal Brace Set per 400 sq ft. or 1/400 = **0.00250 Diagonal Brace Sets /sq ft.**

Proposed for certain conditions:

For a 40 ft x 6 ft area (240 sq ft):

One Diagonal Brace Set per 240 sq ft. or 1/240 = **0.0042 Diagonal Brace Sets /sq ft.**

Material Cost

1. One Diagonal Brace in the set assumed to be 6 ft long
2. Cost of Diagonal Brace material: **$3.00 per 6 ft** board (2x4 SPF #1/#2) (*)

4 Diagonals in each Set = 4 x $3.00 = **$12.00 / Diagonal Brace Set**

Labor Cost

1. Framer Rate: **$50/hour** (*)
2. Time to cut and install one Diagonal Brace Set: 12 minutes (or 1/5 of an hour)

$50/hr. /5 = **$10.00 / Diagonal Brace Set**

Total Installed Cost per Diagonal Brace Set

Material Cost + Labor Cost = $12.00 + $10.00 = **$22.00/ Diagonal Brace Set**

Change in Cost per Square Foot

Current:

$22.00 x 0.00250 = $0.055/ sq ft.

Proposed:

$22.00 x 0.00420 = $0.092/ sq ft.

Difference:

\$0.092 – \$0.055 = **\$0.037** (**About 4 cents /sq ft**. increase in the worst conditions)

** The cost estimates for material and labor were confirmed as reasonable values by a large truss manufacturing company located in Illinois.*

S155-25

S156-25

IBC: 2303.4.1.2.2 (New)

Proponents: Greg Greenlee, SBCA, representing SBCA, Technical Director (ggreenlee@sbcacomponents.com); Jay Jones, Truss Plate Institute, representing Truss Plate Institute, Executive Director (jpjones@tpinst.org)

2024 International Building Code

Add new text as follows:

2303.4.1.2.2 Truss Bracing Inspections. Permanent *truss member lateral restraint* and *truss diagonal bracing* to be inspected during the framing inspection per section 110.3.4.

Reason: The proposal clarifies that permanent truss member lateral restraint and truss diagonal bracing inspections should be included as part of the framing inspection.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Section 110.3.4 already provides for framing inspections.

S156-25

S157-25

IBC: 2303.4.1.4.1

Proponents: Jack Butler, Butler & Butler, LLC, representing American Institute of Building Design (abutler@mpzero.com); Steven Mickley, representing American Institute of Building Design (steve.mickley@aibd.org)

2024 International Building Code

Revise as follows:

2303.4.1.4.1 Truss design drawings. Where required by ~~the *registered design professional*, the *building official* or~~ the statutes of the *jurisdiction* in which the project is to be constructed, each individual truss design drawing shall bear the seal and signature of the registered design professional serving as the the truss designer.

Exceptions:

1. Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings, the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.
2. Where a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings, the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

Reason: The revised wording reflects the single legally controlling element regarding professional practice requirements: the laws applicable in the jurisdiction. When laws of the jurisdiction permit someone other than a registered design professional to prepare the truss design drawings, then a requirement for signed and sealed drawings is not only inappropriate but is contrary to state law. Registered design professionals and building officials are not authorized to modify the provisions of state law.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modification expresses the controlling nature of state professional regulations and thereby serves to clarify the intent of the subsection.

S157-25

S158-25

IBC: 2303.4.6, 2303.4.7, 2308.11.12

Proponents: Greg Greenlee, SBCA, representing SBCA, Technical Director (ggreenlee@sbcacomponents.com); Jay Jones, representing Truss Plate Institute, Executive Director (jpjones@tpinst.org)

2024 International Building Code

Revise as follows:

2303.4.6 TPI 1 specifications. In addition to Sections 2303.4.1 through 2303.4.5, the design, manufacture and quality criteria ~~assurance~~ of metal-plate-connected wood trusses shall be in accordance with TPI 1 with quality assurance audits performed by an *approved* third-party agency. Job-site inspections shall be in compliance with Section 110.4, as applicable.

2303.4.7 Truss quality assurance. Trusses not part of a manufacturing process in accordance with either Section 2303.4.6 or a referenced standard, which provides requirements for quality control inspections and for quality assurance audits done under the supervision of ~~a~~ an approved third-party quality assurance ~~control~~ agency, shall be manufactured in compliance with Sections 1704.2.5 and 1705.5, as applicable.

2308.11.12 Wood trusses. The design, manufacturer and quality requirements of w~~W~~ood trusses shall be ~~designed~~ in accordance with Section 2303.4. Connection to *braced wall lines* shall be in accordance with Section 2308.10.7.2.

Reason: The modifications clarify the quality requirements for trusses manufactured that are not part of a process in accordance with TPI 1 or another referenced standard should include both quality control inspections and quality assurance audits not just quality control. The revised language also coordinates the quality requirements with the language in with TPI 1 and used in the industry.

There is confusion in the industry about the quality requirements, the difference between quality control and quality assurance, and if third-party quality assurance audits are required. This language will clarify these items and make consistent requirements.

Additionally, the modifications clarify that quality assurance audits performed must be done by an approved third-party agency.

As written the section 2308.11.12 only references the design requirements of Section 2303.4. The modification clarifies that it shall include the design, manufacturer and quality requirements. This revised language is consistent with the proposed modifications to Section 2303.4.6 and 2303.4.7, and is consistent with TPI 1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications clarify the current code requirements. No new requirements are added.

IBC: 1402.11 (New), 2304.3.3, 2304.3.3.1 (New), 2510.8 (New)

Proponents: Mellisa Mooren, representing Self (mmooren@skyeenv.com); Emily Lorenz, representing International Institute of Building Enclosure Consultants (IIBEC) (emilyblorenz@gmail.com)

2024 International Building Code

Add new text as follows:

1402.11 Accommodation of Framing Shrinkage. Exterior cladding systems shall be designed and constructed to accommodate vertical movements associated with shrinkage and compression.

Revise as follows:

2304.3.3 Shrinkage. Wood walls and bearing partitions shall not support more than two floors and a roof unless an analysis satisfactory to the *building official* shows that shrinkage of the wood framing will not have adverse effects on the *structure* or any plumbing, electrical or mechanical systems, exterior cladding systems, or other equipment installed therein due to excessive shrinkage or differential movements caused by shrinkage. The analysis shall show that the roof drainage system and the foregoing systems or equipment will not be adversely affected or, as an alternate, such systems shall be designed to accommodate the differential shrinkage or movements.

Add new text as follows:

2304.3.3.1 Exterior cladding. The exterior cladding system shall be designed and installed to prevent adverse effects to cladding materials. Provisions shall be made to protect cladding systems from damage resulting from vertical movements associated with shrinkage and compression of the wood framing.

2510.8 Accommodation of Framing Shrinkage. Exterior cladding systems shall be designed and constructed to accommodate vertical movements associated with shrinkage and compression**.**

Reason: The intention of this code change proposal is to ensure that the cladding and structure designs are coordinated. The building enclosure is an important part of ensuring design loads are resisted, occupants are comfortable, and energy performance is achieved. Building enclosure consultants have been involved in numerous cases where differential wood shrinkage is not adequately considered in the design of the building enclosure system, which has been documented to cause significant damages to building envelope components, resulting in premature failure of the building enclosure.

Wood shrinkage is the dimensional change in wood associated with a change in moisture content, and it can be well over 1 in. on buildings that are four to six stories tall. Wood changes dimension in three directions: longitudinal, radial, and tangential. The tangential direction is the most significant, and the framing at floor lines often includes wood bands that are oriented such that the tangential shrinkage is vertical.

The *International Building Code* requires a shrinkage analysis for wood buildings greater than two stories tall, but the relationship between this analysis and the effect on exterior cladding systems is often ignored or misunderstood by design professionals. This code change highlights that exterior cladding systems need to be evaluated for shrinkage-related damage, similar to existing code requirements for plumbing, electrical, or mechanical systems. It also adds a pointer in Chapter 14 to ensure that the connection between wood shrinkage and exterior cladding systems is made.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost implication associated with this proposed code revision. Specifically, the existing code already includes a requirement to consider the vertical movements associated with wood frame shrinkage. The proposed revision simply alerts the design professionals (structural engineer and architect) to include building envelope components when considering potential damages associated with vertical movements.

IBC: TABLE 1404.5.2.2, TABLE 1404.5.3.1, TABLE 1404.5.3.2, TABLE 2304.6.1, TABLE 2304.10.2

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org); Jason Smart, representing American Wood Council (jsmart@awc.org)

2024 International Building Code

Revise as follows:

[BS] TABLE 1404.5.2.2 FURRING MINIMUM FASTENING REQUIREMENTS FOR APPLICATION OVER FOAM PLASTIC SHEATHING TO SUPPORT CLADDING WEIGHT[a]

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 pound per square foot (psf) = 0.0479 kPa, 1 pound per square inch = 0.00689 MPa.

DR = Design Required, o.c. = on center.

a. Wood furring shall be Southern Pine, Douglas Fir-Larch, Hem-Fir, Spruce-Pine-Fir ~~spruce-pine-fir~~ or ~~any softwood~~ other species with a specific gravity of 0.42 or greater in accordance with AWC NDS. Steel furring shall be minimum 33 ksi steel. Cold-formed steel studs shall be minimum 33 ksi steel for 33 mil and 43 mil thickness and 50 ksi steel for 54 mil steel or thicker.

b. Screws shall comply with the requirements of AISI S240.

c. Where the required cladding fastener penetration into wood material exceeds $^3/_4$ inch and is not more than $1^1/_2$ inches, a minimum 2-inch nominal wood furring or an approved design shall be used.

d. Foam sheathing shall have a minimum compressive strength of 15 pounds per square inch in accordance with ASTM C578 or ASTM C1289.

e. Furring shall be spaced not more than 24 inches on center, in a vertical or horizontal orientation. In a vertical orientation, furring shall be located over wall studs and attached with the required fastener spacing. In a horizontal orientation, the indicated 8-inch and 12-inch fastener spacing in furring shall be achieved by use of two fasteners into studs at 16 inches and 24 inches on center, respectively.

[BS] TABLE 1404.5.3.1 CLADDING MINIMUM FASTENING REQUIREMENTS FOR DIRECT ATTACHMENT OVER FOAM PLASTIC SHEATHING TO SUPPORT CLADDING WEIGHT[a]

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 pound per square foot (psf) = 0.0479 kPa.

DR = Design Required, o.c. = on center.

a. Wood framing shall be Southern Pine, Douglas Fir-Larch, Hem-Fir, Spruce-Pine-Fir, ~~spruce-pine-fir~~ or ~~any wood~~ other species with a specific gravity of 0.42 or greater in accordance with ANSI/AWC NDS.

b. The thickness of *wood structural panels* complying with the specific gravity requirement of Note a shall be permitted to be included in satisfying the minimum penetration into framing.

c. Nail fasteners shall comply with ASTM F1667, except nail length shall be permitted to exceed ASTM F1667 standard lengths.

d. Foam sheathing shall have a minimum compressive strength of 15 psi in accordance with ASTM C578 or ASTM C1289.

[BS] TABLE 1404.5.3.2 FURRING MINIMUM FASTENING REQUIREMENTS FOR APPLICATION OVER FOAM PLASTIC SHEATHING TO SUPPORT CLADDING WEIGHT[a, b]

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 pound per square foot (psf) = 0.0479 kPa, 1 pound per square inch = 0.00689 MPa.

DR = Design Required, o.c. = on center.

a. Wood framing and furring shall be Southern Pine, Douglas Fir-Larch, Hem-Fir, Spruce-Pine-Fir, ~~spruce-pine-fir~~ or ~~any wood~~ other species with a specific gravity of 0.42 or greater in accordance with ANSI/AWC NDS.

b. Nail fasteners shall comply with ASTM F1667, except nail length shall be permitted to exceed ASTM F1667 standard lengths.

c. The thickness of *wood structural panels* complying with the specific gravity requirements of Note a shall be permitted to be included in satisfying the minimum required penetration into framing.

d. Where the required cladding fastener penetration into wood material exceeds $^3/_4$ inch and is not more than $1^1/_2$ inches, a minimum 2-inch nominal wood furring or an *approved* design shall be used.

e. Foam sheathing shall have a minimum compressive strength of 15 psi in accordance with ASTM C578 or ASTM C1289.

f. Furring shall be spaced not greater than 24 inches on center in a vertical or horizontal orientation. In a vertical orientation, furring shall be located over wall studs and attached with the required fastener spacing. In a horizontal orientation, the indicated 8-inch and 12-inch fastener spacing in furring shall be achieved by use of two fasteners into studs at 16 inches and 24 inches on center, respectively.

TABLE 2304.6.1 MAXIMUM BASIC WIND SPEED, V , PERMITTED FOR WOOD STRUCTURAL PANEL WALL SHEATHING USED TO RESIST WIND PRESSURES[a, b, c]

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 mile per hour = 0.447 m/s.

a. Panel strength axis shall be parallel or perpendicular to supports. Three-ply plywood sheathing with studs spaced more than 16 inches on center shall be applied with panel strength axis perpendicular to supports.

b. The table is based on wind pressures acting toward and away from building surfaces in accordance with Section 30.4 of ASCE 7. Lateral requirements shall be in accordance with Section 2305 or 2308.

c. Wood structural panels with span ratings of wall-16 or wall-24 shall be permitted as an alternative to panels with a 24/0 span rating. Plywood siding rated 16 on center or 24 on center shall be permitted as an alternative to panels with a 24/16 span rating. Wall-16 and plywood siding 16 on center shall be used with studs spaced not more than 16 inches on center.

d. Fastener spacing applies where the framing is Southern Pine, Douglas Fir-Larch, Hem-Fir, Spruce-Pine-Fir or other species with a specific gravity greater than or equal to 0.42 in accordance with AWC NDS. Where the specific gravity of the wood species used for wall framing is greater than or equal to 0.35 but less than 0.42 ~~in accordance with AWC NDS~~, nail spacing in the field of the panel shall be multiplied by 0.67. Where the specific gravity of the wood species used for wall framing is less than 0.35, fastening of the wall sheathing shall be designed in accordance with AWC NDS.

TABLE 2304.10.2 FASTENING SCHEDULE

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm.

a. Nails spaced at 6 inches at intermediate supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.

b. Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).

c. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.

d. RSRS is a Roof Sheathing Ring Shank nail meeting the specifications in ASTM F1667.

e. Tabulated fastener requirements apply where the basic wind speed, *V*, is less than 140 mph and the wood species used for roof framing is Southern Pine, Douglas Fir-Larch, Hem-Fir, Spruce-Pine-Fir or other species with a specific gravity greater than or equal to 0.42 in accordance with AWC NDS. Where the specific gravity of the wood species used for roof framing is greater than or equal to 0.35 but less than 0.42, fastening of roof sheathing shall be with RSRS-03 ($2\frac{1}{2}$″ × 0.131″ × 0.281″ head) nails unless alternative fastening is designed in accordance with AWC NDS. Where the specific gravity of the wood species used for roof framing is less than 0.35, fastening of the roof sheathing shall be designed in accordance with AWC NDS. For wood structural panel roof sheathing attached to gable-end roof framing and to intermediate supports within 48 inches of roof edges and ridges, nails shall be spaced at 4 inches on center where the basic wind speed, *V*, is greater than 130 mph in Exposure B or greater than 110 mph in Exposure C. Spacing exceeding 6 inches on center at intermediate supports shall be permitted where the fastening is designed per the AWC NDS. ~~Where the specific gravity of the wood species used for roof framing is greater than or equal to 0.35 but less than 0.42 in accordance with AWC NDS, fastening of roof sheathing shall be with RSRS-03 ($2\frac{1}{2}$″ × 0.131″ × 0.281″ head) nails unless alternative fastening is designed in accordance with AWC NDS. Where the specific gravity of the wood species used for roof framing is less than 0.35, fastening of the roof sheathing shall be designed in accordance with AWC NDS.~~

f. Fastening is only permitted where the basic wind speed, *V*, is less than or equal to 110 mph and where fastening is to wood framing of a species with specific gravity greater than or equal to 0.42 in accordance with AWC NDS.

g. Nails and staples are carbon steel meeting the specifications of ASTM F1667. Connections using nails and staples of other materials, such as stainless steel, shall be designed by acceptable engineering practice or approved under Section 104.2.3.

Reason: There are several sections of the IBC which direct the user to the ANSI/AWC *National Design Specification (NDS) for Wood Construction* to determine the specific gravity of the wood. This code change proposes to add names of common wood species that have a specific gravity of 0.42 or greater to reduce the need to lookup wood specific gravity in the NDS. The common wood species names listed (i.e., Southern Pine, Douglas Fir-Larch, Hem-Fir, Spruce-Pine-Fir) all have specific gravity of 0.42 or greater and are used elsewhere in the code such as in span tables for joist, rafters, and headers. This revision will make the code easier to use without changing the technical requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no technical change proposed in this code change. The footnote clarifications improve the ease-of-use of the code.

S160-25

S161-25

IBC: 2304.10.1

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org)

2024 International Building Code

Revise as follows:

2304.10.1 Fire protection of connections. Connections used with *fire-resistance-rated* members and in *fire-resistance-rated* assemblies ~~of Type IV-A, IV-B, or IV-C construction~~ shall be <u>in accordance with Section 704.5.2.</u> ~~protected for the time associated with the fire-resistance rating. Protection time shall be determined by one of the following:~~

1. ~~Testing in accordance with Section 703.2 where the connection is part of the *fire resistance* test.~~
2. ~~Engineering analysis that demonstrates that the temperature rise at any portion of the connection is limited to an average temperature rise of 250°F (139°C), and a maximum temperature rise of 325°F (181°C), for a time corresponding to the required *fire-resistance* rating of the structural element being connected. For the purposes of this analysis, the connection includes connectors, fasteners, and portions of wood members included in the structural design of the connection.~~

Reason: This proposal coordinates Section 2304.10.1 with FS9-24 which was approved in Group A to move this language into Section 704.5.2. This was done to ensure that these requirements are applied to all connections of fire-resistance-rated wood members and assemblies regardless of construction type.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a change to coordinate with action taken on FS9-24 in Group A.

Staff Analysis: FS9-24 was AMC2 (by Comment #1 at CAH #2) and is public comment (PC) eligible.

S161-25

S162-25

IBC: 2304.10.6.2

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org)

2024 International Building Code

Revise as follows:

2304.10.6.2 ~~Fastenings~~ Fasteners and connectors for wood foundations. ~~Fastenings, including nuts and washers,~~ Fasteners and connectors for wood foundations shall be as required in AWC PWF.

Reason: “Fastenings” is an outdated term and is proposed to be replaced by "fasteners and connectors" which is consistent with terminology used in ANSI/AWC Permanent Wood Foundation (PWF) Design Specification in Section 2.4.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no technical changes proposed in this code change. This proposal editorially coordinates with terminology used in the PWF.

S162-25

S163-25

IBC: 2304.11, 2304.11.1, TABLE 2304.11, 2304.11.1.1, 2304.11.1.2, 2304.11.1.3, AWC Chapter 35 (New)

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org)

2024 International Building Code

Revise as follows:

2304.11 Heavy timber construction. Where a *structure*, portion thereof or individual structural elements are required by provisions of this code to be of heavy timber, the *building elements* therein shall comply with the applicable provisions of either Sections 2304.11.1 through 2304.11.4 or ANSI/AWC FDS requirements for heavy timber. ~~Minimum dimensions of heavy timber shall comply with the applicable requirements in Table 2304.11 based on roofs or floors supported and the configuration of each structural element, or in Sections 2304.11.2 through 2304.11.4. Lumber decking shall be in accordance with Section 2304.9.~~

2304.11.1 Details of heavy timber structural members. Heavy timber structural members shall be detailed and constructed in accordance with Sections 2304.11.1 through 2304.11.1.3. Minimum dimensions of heavy timber shall comply with the applicable requirements in Table 2304.11.1 based on roofs or floors supported and the configuration of each structural element, or in Sections 2304.11.2 through 2304.11.4. Lumber decking shall be in accordance with Section 2304.9.

TABLE ~~2304.11~~ 2304.11.1 MINIMUM DIMENSIONS OF HEAVY TIMBER STRUCTURAL MEMBERS

SUPPORTING	HEAVY TIMBER STRUCTURAL ELEMENTS	MINIMUM NOMINAL SOLID SAWN SIZE		MINIMUM GLUED-LAMINATED NET SIZE		MINIMUM STRUCTURAL COMPOSITE LUMBER NET SIZE	
		Width, inch	Depth, inch	Width, inch	Depth, inch	Width, inch	Depth, inch
Floor loads only or combined floor and roof loads	Columns; Framed sawn or glued-laminated timber arches that spring from the floor line; Framed timber trusses	8	8	$6^3/_4$	$8^1/_4$	7	$7^1/_2$
	Wood beams and girders	6	10	5	$10^1/_2$	$5^1/_4$	$9^1/_2$
Roof loads only	Columns (roof and ceiling loads); Lower half of: wood-frame or glued-laminated arches that spring from the floor line or from grade	6	8	5	$8^1/_4$	$5^1/_4$	$7^1/_2$
	Upper half of: wood-frame or glued-laminated arches that spring from the floor line or from grade	6	6	5	6	$5^1/_4$	$5^1/_2$
	Framed timber trusses and other roof framing;[a] Framed or glued-laminated arches that spring from the top of walls or wall abutments	4[b]	6	3[b]	$6^7/_8$	$3^1/_2$[b]	$5^1/_2$

For SI: 1 inch = 25.4 mm.

a. Spaced members shall be permitted to be composed of two or more pieces not less than 3 inches nominal in thickness where blocked solidly throughout their intervening spaces or where spaces are tightly closed by a continuous wood cover plate of not less than 2 inches nominal in thickness secured to the underside of the members. Splice plates shall be not less than 3 inches nominal in thickness.

b. Where protected by approved automatic sprinklers under the roof deck, framing members shall be not less than 3 inches nominal in width.

2304.11.1.1 Columns. Minimum dimensions of columns shall be in accordance with Table 2304.11.1. Columns shall be connected in an *approved* manner. Columns shall be continuous or aligned vertically from floor to floor in all stories of Type IV-HT construction. Girders and beams at column connections shall be closely fitted around columns and adjoining ends shall be cross tied to each other, or intertied by caps or ties, to transfer horizontal *loads* across joints. Wood bolsters shall not be placed on tops of columns unless the columns support roof *loads* only. Where traditional heavy timber detailing is used, connections shall be by means of reinforced concrete or metal caps with brackets, by properly designed steel or iron caps, with pintles and base plates, by timber splice plates affixed to the columns by metal connectors housed within the contact faces, or by other *approved* methods.

2304.11.1.2 Floor framing. Minimum dimensions of floor framing shall be in accordance with Table 2304.11.1. *Approved* wall plate boxes or hangers shall be provided where wood beams, girders or trusses rest on *masonry* or concrete walls. Where intermediate beams are used to support a floor, they shall rest on top of girders, or shall be supported by an *approved* metal hanger into which the ends of the beams shall be closely fitted. Where traditional heavy timber detailing is used, these connections shall be permitted to be supported by ledgers or blocks securely fastened to the sides of the girders.

2304.11.1.3 Roof framing. Minimum dimensions of roof framing shall be in accordance with Table 2304.11.1. Every roof girder and not less than every alternate roof beam shall be anchored to its supporting member to resist forces as required in Chapter 16.

Add new standard(s) as follows:

AWC

American Wood Council
222 Catoctin Circle SE, Suite 201
Leesburg, VA 20175

ANSI/AWC FDS-2024 Fire Design Specification for Wood Construction

Reason:
This proposal adds a reference to the ANSI/AWC *Fire Design Specification for Wood Construction* (FDS) heavy timber provisions to allow for an additional compliance path independent from the existing IBC heavy timber provisions. Section 2304.11 has been restructured to be charging language only, with the technical provisions relocated to 2304.11.1 to avoid conflict with the FDS. The FDS brings forth requirements consistent with the IBC, but with consistent product terminology and revised organization for heavy timber used in construction.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal adds an additional option in the code for heavy timber requirements. Therefore, it does not result in an increase in the cost of construction, because the existing compliance option is still available. This proposal could potentially decrease construction costs if this option is used, but will have no effect on construction costs if it is not used. Therefore, the decrease in cost is conservatively estimated as $0.

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/AWC FDS-2024 Fire Design Specification for Wood Construction, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S163-25

S164-25

IBC: 2304.11.2.2

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org); Jason Smart, representing American Wood Council (jsmart@awc.org)

2024 International Building Code

Revise as follows:

2304.11.2.2 Interior walls and partitions. Interior walls and partitions shall be of solid wood construction formed by not less than two layers of 1-inch (25 mm) matched boards or laminated construction 4 inches (102 mm) thick, *cross-laminated timber* not less than 3" in thickness, or of 1-hour fire-resistance-rated construction.

Reason: The ANSI/AWC *Fire Design Specification for Wood Construction* (FDS) provides the most up-to-date provisions for heavy timber members. This proposal aligns the provisions in the code for heavy timber interior walls and partitions with the FDS by adding the minimum thickness of cross-laminated timber (CLT) for that application. As stated in the FDS and IBC 2301.2, the minimum thicknesses specified for CLT are actual dimensions.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal only adds an equivalent option in the code for heavy timber walls and partitions. It does not increase the cost of construction, because the existing compliance option is still available. This proposal could potentially decrease construction costs if this option is used, but will have no effect on construction costs if it is not used. Therefore, the decrease in cost is conservatively estimated as $0.

S164-25

S165-25

IBC: 2304.11.3, 2304.11.3.1, 2304.11.3.2

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org)

2024 International Building Code

2304.11.3 Floors. Floors shall be without concealed spaces or with concealed spaces complying with Section 602.4.4.3. Wood floors shall be constructed in accordance with Section 2304.11.3.1 or 2304.11.3.2.

Revise as follows:

2304.11.3.1 Cross-laminated timber floors. *Cross-laminated timber* shall be not less than 4 inches (102 mm) in thickness. *Cross-laminated timber* shall be continuous from support to support and mechanically fastened to one another. *Cross-laminated timber* shall be permitted to be connected to walls without a shrinkage gap ~~providing~~ provided swelling or shrinking is considered in the design. Corbelling of *masonry* walls under the floor shall be permitted to be used.

2304.11.3.2 Sawn or glued-laminated plank floors. Sawn or glued-laminated plank floors shall be one of the following:

1. Sawn or glued-laminated planks, splined or tongue-and-groove, of not less than 3 inches (76 mm) nominal in thickness covered with 1-inch (25 mm) nominal dimension tongue-and-groove flooring, laid crosswise or diagonally, $^{15}/_{32}$-inch (12 mm) *wood structural panel*, ~~or~~ $^{1}/_{2}$-inch (12.7 mm) *particleboard*, or ¾ - inch (19 mm) thickness concrete or gypsum concrete topping.
2. Planks not less than 4 inches (102 mm) nominal in width set on edge close together and well spiked and covered with 1-inch (25 mm) nominal dimension flooring or $^{15}/_{32}$-inch (12 mm) *wood structural panel*, ~~or~~ $^{1}/_{2}$-inch (12.7 mm) *particleboard*, or ¾ - inch (19 mm) thickness concrete or gypsum concrete topping.

The lumber shall be laid so that continuous lines of joints will occur only at points of support. Floors shall not extend closer than $^{1}/_{2}$ inch (12.7 mm) to walls. Such $^{1}/_{2}$-inch (12.7 mm) space shall be covered by a molding fastened to the wall and so arranged that it will not obstruct the swelling or shrinkage movements of the floor. Corbelling of masonry walls under the floor shall be permitted to be used in place of molding.

Reason: This proposal adds an option of ¾" concrete or gypsum concrete topping above sawn or glued-laminated plank floors to protect against passage of flames and gasses to match ANSI/AWC Fire Design Specification for Wood Construction (FDS). Concrete or gypsum concrete topping is not currently recognized under the heavy timber provisions of the IBC. Recognized materials for this purpose are currently limited to flooring or panels of prescribed thicknesses. This requirement does not replace the requirement for 1" noncombustible material used above mass timber flooring in Type IV-A and IV-B construction. There is also an editorial grammatical change in 2304.11.3.1.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal adds an additional option in the code for toppings on sawn or glued-laminated plank floors. Therefore, it does not result in an increase in the cost of construction, because the existing compliance options are still available. This proposal could potentially decrease construction costs if this option is used, but will have no effect on construction costs if it is not used. Therefore, the decrease in cost is conservatively estimated as $0.

2024 International Building Code

Revise as follows:

2308.8.1.1 Allowable girder spans. The allowable spans of girders that are fabricated of dimension lumber shall not exceed the values set forth in Table 2308.8.1.1(1), 2308.8.1.1(2), 2308.8.1.1(3) or 2308.8.1.1(~~2~~4).

TABLE 2308.8.1.1(1) LATERALLY SUPPORTED HEADER AND GIRDER SPANS[a, b] FOR EXTERIOR BEARING WALLS (Maximum spans for Douglas fir-larch, hem-fir, Southern pine and spruce-pine-fir and required number of jack studs)

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.

b. Spans are based on minimum design properties for No. 2 grade lumber of Douglas fir-larch, hem-fir, Southern pine and spruce-pine fir.

c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. NJ = Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.

e. Use 30 psf allowable stress design ground snow load for cases in which allowable stress design ground snow load is less than 30 psf and the roof live load is equal to or less than 20 psf.

f. Spans are calculated assuming a single span header or girder under uniform load where the top of the header or girder is laterally braced by perpendicular framing. Where the top of the header or girder is not laterally braced (for example, cripple studs bearing on the header), refer to Table 2308.8.1.1(2). ~~tabulated spans for headers consisting of 2 × 8, 2 × 10, or 2 × 12 sizes shall be multiplied by 0.70 or the header or girder shall be designed.~~

Add new text as follows:

TABLE 2308.8.1.1(2)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.

b. Spans are based on minimum design properties for No. 2 grade lumber of Douglas Fir-Larch, Hem-Fir, Southern Pine, and Spruce-Pine-Fir.

c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. NJ = Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.

e. Use 30 psf allowable stress design ground snow load for cases in which allowable stress design ground snow load is less than 30 psf and the roof live load is equal to or less than 20 psf.

f. Spans are assuming a single span header or girder under uniform load where the top of the header or girder is not laterally braced by perpendicular framing.

Revise as follows:

TABLE 2308.8.1.1(~~2~~3) LATERALLY SUPPORTED HEADER AND GIRDER SPANS[a, b] FOR INTERIOR BEARING WALLS (Maximum spans for Douglas fir-larch, hem-fir, Southern pine and spruce-pine-fir and required number of jack studs)

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Spans are given in feet and inches.

b. Spans are based on minimum design properties for No. 2 grade lumber of Douglas fir-larch, hem-fir, Southern pine and spruce-pine fir.

c. *Building* width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. NJ = Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an *approved* framing anchor attached to the full-height wall stud and to the header.

e. Spans are calculated assuming a single span header or girder under uniform load where the top of the header or girder is laterally braced by perpendicular framing. Where the top of the header or girder is not laterally braced (for example, cripple studs bearing on the header), refer to Table 2308.8.1.1(4). ~~tabulated spans for headers consisting of 2 × 8, 2 × 10, or 2 × 12 sizes shall be multiplied by 0.70 or the header or girder shall be designed.~~

Add new text as follows:

	4-2 × 12	8-0	1	6-4	2	5-6	2

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Spans are given in feet and inches.

b. Spans are based on minimum design properties for No. 2 grade lumber of Douglas Fir-Larch, Hem-Fir, Southern Pine, and Spruce-Pine-Fir.

c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. NJ = Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an *approved* framing anchor attached to the full-height wall stud and to the header.

e. Spans are assuming a single span header or girder under uniform load where the top of the header or girder is not laterally braced by perpendicular framing.

Reason: Laterally unsupported header and girder spans are currently addressed by a conservative adjustment in footnote f of the existing header/girder span tables. Spans for laterally unsupported headers and girders are added consistent with ANSI/AWC 2024 Wood Frame Construction Manual to show appropriate spans, avoiding the unnecessary conservatism. With this proposal, the laterally unsupported header and girder condition is now addressed by stand-alone tables and no longer needs to be addressed through an adjustment factor footnote. Existing tables have been renumbered and titles have been revised to reflect that they are applicable to laterally supported headers and girders.

Additionally, language has been added to the footnotes to clarify that all header and girder calculations are based on the assumption that they are single-span headers or girders. This clarification is necessary as multi-span headers are not addressed by the tables.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal revises the code for laterally unsupported (dropped) header and girder spans. The new tables remove unnecessary conservatism, therefore this proposal could potentially decrease construction costs where the tables are used. The decrease in cost is conservatively estimated as $0.

2024 International Building Code

Revise as follows:

2308.6.1 Floor joists, roof rafters and ceiling joists. Notches on framing ends shall not exceed one-fourth the member depth. Notches in the top or bottom of the member shall not exceed one-sixth the depth and shall not be located in the middle third of the span. A notch not more than one-third of the depth is permitted in the top of a rafter or ceiling joist not further from the face of the support than the depth of the member. Holes bored in members shall not be within 2 inches (51 mm) of the top or bottom of the member and the diameter of any such hole shall not exceed one-third the depth of the member. *Holes bored in the middle third of the span shall be located in the center third of the joist depth and shall not exceed one third of the joist depth.* Where the member is notched, the hole shall not be closer than 2 inches (51 mm) to the notch. (*See Figure 2308.6.1)*

Add new text as follows:

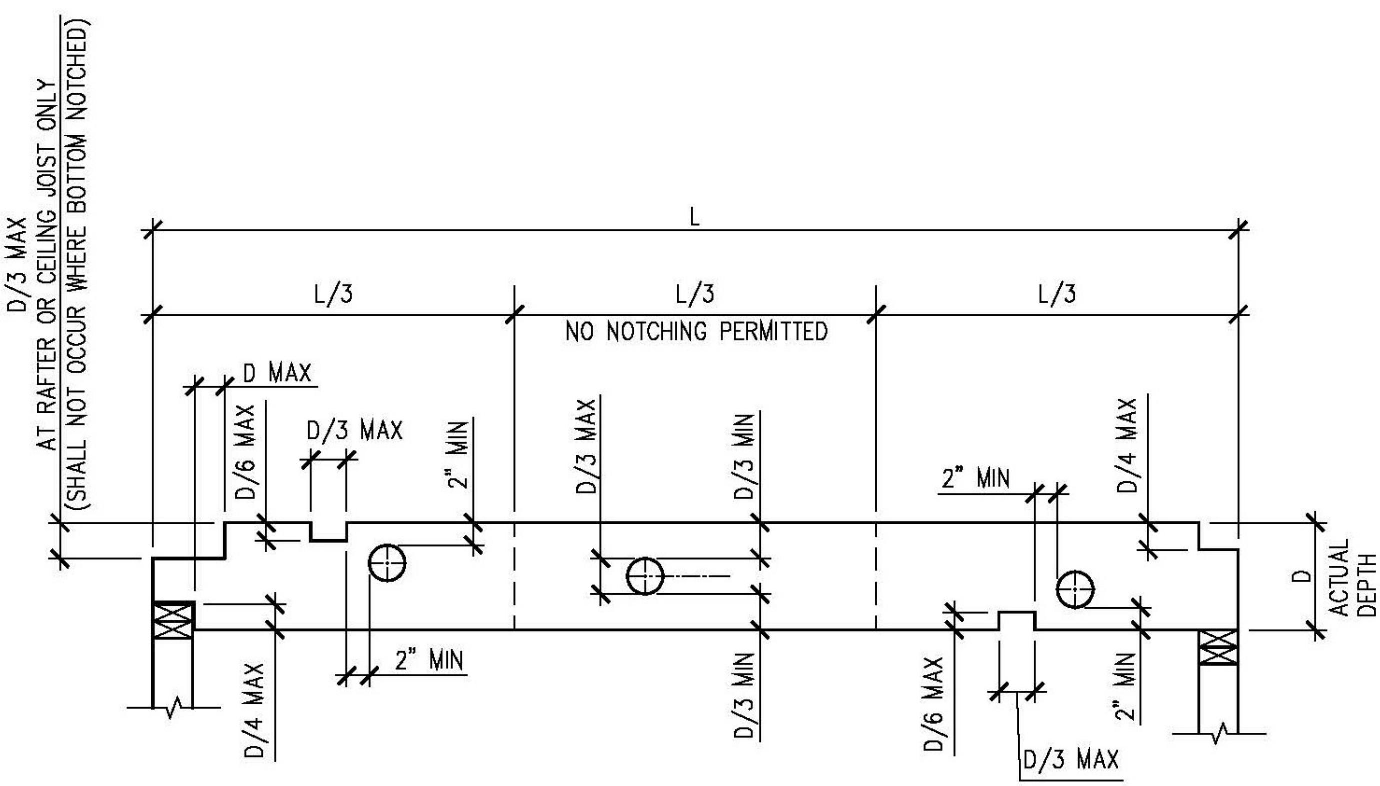

FIGURE 2308.6.1 JOIST BORING AND NOTCHING LIMITS

Revise as follows:

2308.6.2 Wall studs. In exterior walls and bearing partitions, a wood stud shall not be cut or notched in the middle one-third of the stud length and the cut or notch shall not exceed ~~in excess of~~ 25 percent of its depth. In nonbearing partitions that do not support loads other than the weight of the partition, a stud shall not be cut or notched in excess of 40 percent of its depth. *(See Figure 2308.6.2)*

Add new text as follows:

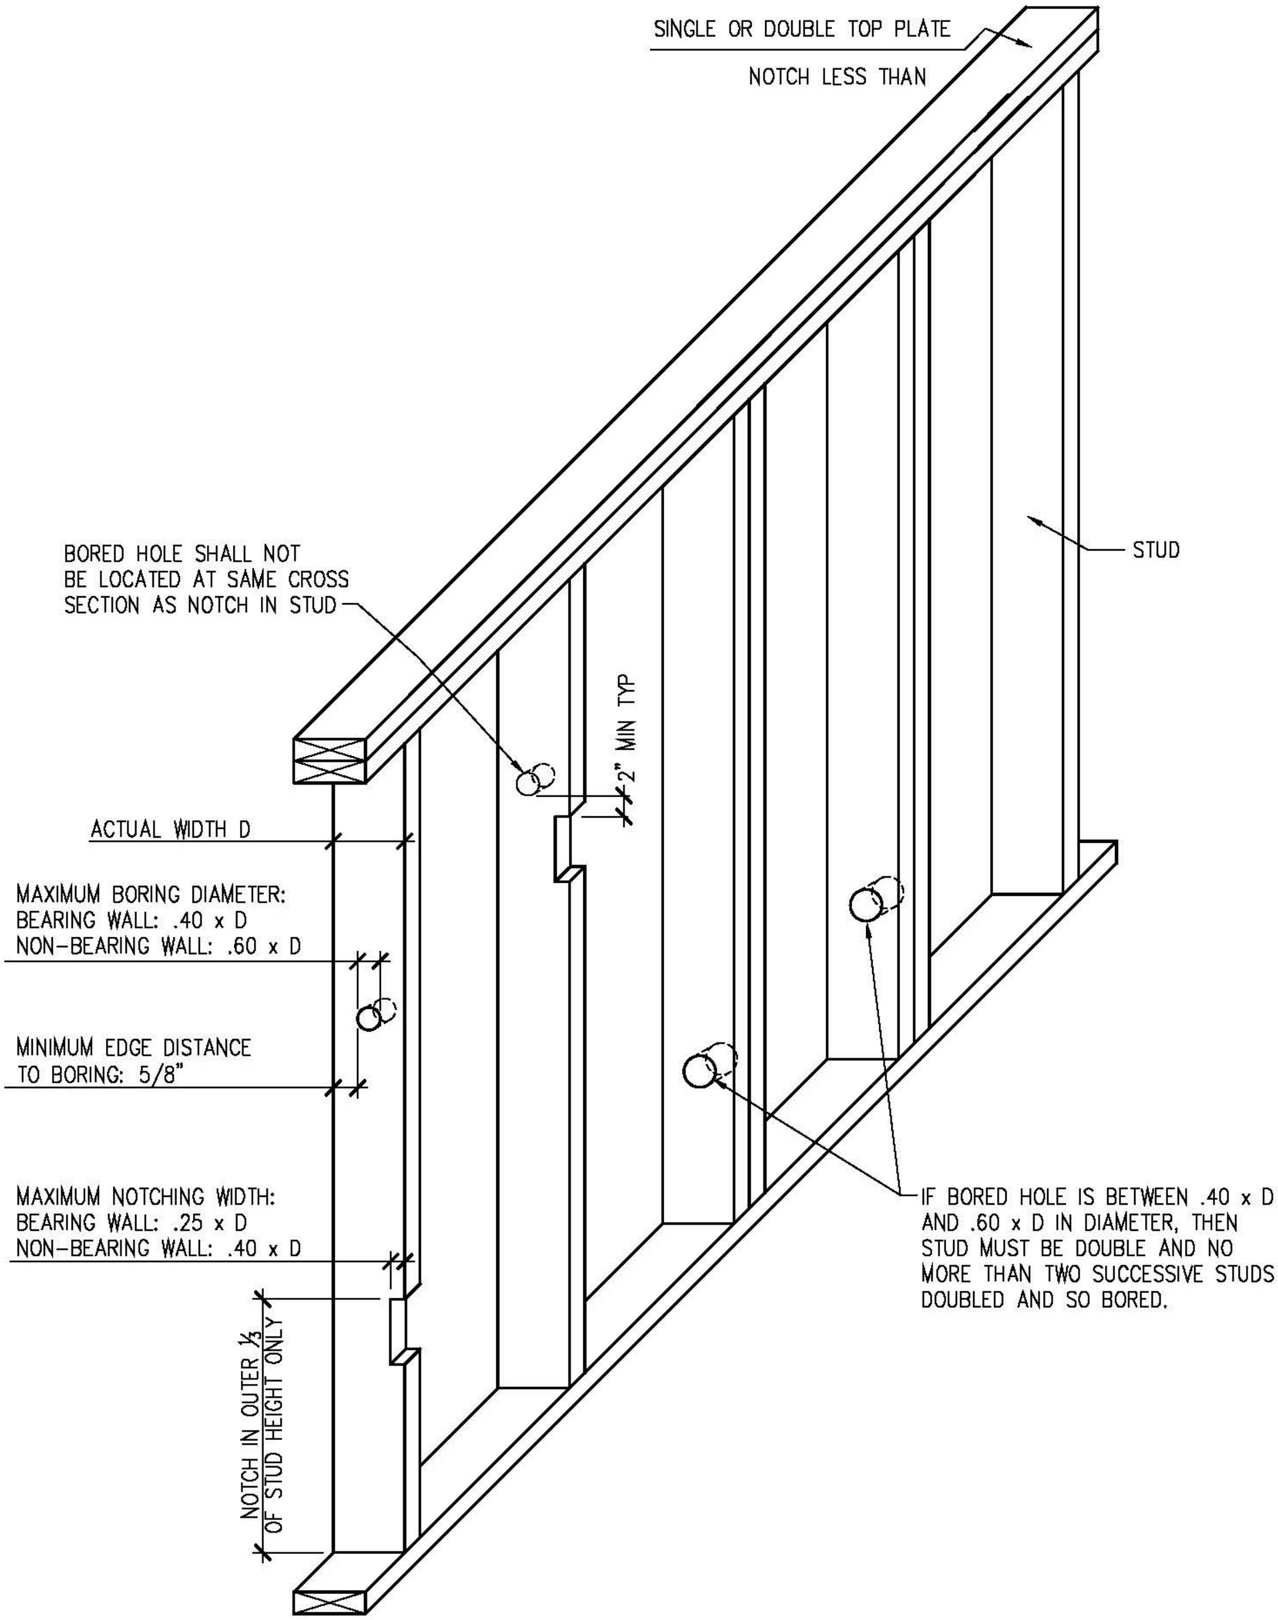

FIGURE 2308.6.2 WALL BORING AND NOTCHING LIMITS

Revise as follows:

2308.6.3 Bored holes. The diameter of bored holes in exterior walls and bearing partitions, wood studs shall not exceed 40 percent of the stud depth. The diameter of bored holes in in interior nonbearing partitions , wood studs shall not exceed 60 percent of the stud depth ~~in nonbearing partitions~~. ~~The diameter of bored holes in wood studs shall not exceed 60 percent of the stud depth in any wall where each stud is doubled, provided that not more than two such successive doubled studs are so bored.~~ The edge of the bored hole shall not be closer than $^{5}/_{8}$ inch (15.9 mm) to the edge of the stud. Bored holes shall not be located within 2 inches of ~~at~~ the same section of stud as a cut or notch.

Exception: The diameter of bored holes in exterior walls and bearing partitions wood studs shall not exceed 60 percent of the stud depth when studs are doubled, provided that not more than two such successive doubled studs are so bored.

2308.6.4 Limitations. In designated lateral force-resisting system assemblies designed in accordance with this code ~~and greater than three *stories* in height or~~ in *Seismic Design Categories* C, D, E and F, the cutting, notching and boring of wall studs shall be as prescribed by the *registered design professional*.

~~In *structures* designed in accordance with the International Residential Code, modification of wall studs shall comply with the *International Residential Code*.~~

Reason: This proposal seeks to remove redundant language contained within the code section.

Section 2308 is limited to conventional light-frame construction. Section 2308.2.1 and Table 2308.2.1 limits the height of buildings, with a maximum of 3 stories in Seismic Design Category A and B, and fewer stories in higher SDC C, D and E. So the requirement for omitting the prescriptive limits to buildings of greater height is redundant.

Reference to IRC is not needed.

Proposal seeks to clarify language for notching and boring.

Wall stud notching is limited to the outer 1/3rd of studs this is consistent with limitations on joists and the location limits contained in the NDS WFCM.

Bored hole language was restructured to provide more clarity on which studs have 40% or 60% limits.

Bored hole language was clarified so that bore holes will not occur within the influence of a notch portion of a stud.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal may slightly increase the cost of construction, however the cost is increase is estimated to be close to negligible - estimated cost increase $0. Notching limitations on stud walls will limit where notches can occur thus potentially increasing the cost of construction

Estimated Immediate Cost Impact Justification (methodology and variables):

By clarifying the limitations on cutting, notching or boring of wood studs, the contractor will need to more carefully plan for the installation of electrical wiring and the in wall plumbing for a project, resulting in potentially more time needed during the construction process.

Estimated Life Cycle Cost Impact:

Decrease

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This proposal has the potential of reducing life cycle costs by eliminating distressed or damaged wall framing that would require replacement or strengthening.

IBC: 2308.6, 2308.6.1 (New), 2308.6.2 (New), 2308.6.1, 2308.6.1.1, 2308.6.2, 2308.6.3, 2308.6.4, 2308.8.3, 2308.11.8

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org); Jason Smart, representing American Wood Council (jsmart@awc.org)

2024 International Building Code

Revise as follows:

2308.6 Cutting, notching and boring of ~~dimensional~~ structural wood framing. Structural wood framing members shall not be cut, bored or notched in excess of the limitations specified in this section. ~~The provisions of this section shall only apply to dimensional wood framing and shall not include engineered wood products, heavy timber or prefabricated/manufactured wood assemblies.~~

Add new text as follows:

2308.6.1 Engineered wood products. Cuts, notches and holes bored in trusses, *structural composite lumber*, structural glued-laminated timber, cross-laminated timber or prefabricated wood I-joists are prohibited except where permitted by the manufacturer's recommendations or where the effects of such *alterations* are specifically considered in the design of the member by a *registered design professional.*

2308.6.2 Sawn lumber. This section shall apply to sawn lumber with nominal thickness of 2 inches to 4 inches.

Revise as follows:

~~2308.6.1~~ **2308.6.2.1 Floor joists, roof rafters and ceiling joists.** Notches on framing ends shall not exceed one-fourth the member depth. Notches in the top or bottom of the member shall not exceed one-sixth the depth and shall not be located in the middle third of the span. A notch not more than one-third of the depth is permitted in the top of a rafter or ceiling joist not further from the face of the support than the depth of the member. Holes bored in members shall not be within 2 inches (51 mm) of the top or bottom of the member and the diameter of any such hole shall not exceed one-third the depth of the member. Where the member is notched, the hole shall not be closer than 2 inches (51 mm) to the notch.

~~2308.6.1.1~~ **2308.6.2.1.1 Ceiling joists.** Where ceiling joists also serve as floor joists, they shall be considered floor joists within this section.

~~2308.6.2~~ **2308.6.2.2 Wall studs.** In exterior walls and bearing partitions, a wood stud shall not be cut or notched in excess of 25 percent of its depth. In nonbearing partitions that do not support loads other than the weight of the partition, a stud shall not be cut or notched in excess of 40 percent of its depth.

~~2308.6.3~~ **2308.6.2.3 Bored holes.** The diameter of bored holes in wood studs shall not exceed 40 percent of the stud depth. The diameter of bored holes in wood studs shall not exceed 60 percent of the stud depth in nonbearing partitions. The diameter of bored holes in wood studs shall not exceed 60 percent of the stud depth in any wall where each stud is doubled, provided that not more than two such successive doubled studs are so bored. The edge of the bored hole shall not be closer than $^{5}/_{8}$ inch (15.9 mm) to the edge of the stud. Bored holes shall not be located at the same section of stud as a cut or notch.

~~2308.6.4~~ **2308.6.2.4 Limitations.** In designated lateral force-resisting system assemblies designed in accordance with this code and greater than three *stories* in height or in *Seismic Design Categories* C, D, E and F, the cutting, notching and boring of wall studs shall be as prescribed by the *registered design professional*.

In *structures* designed in accordance with the International Residential Code, modification of wall studs shall comply with the *International Residential Code*.

2308.8.3 Engineered wood products. Engineered wood products shall be installed in accordance with manufacturer's recommendations. ~~Cuts, notches and holes bored in trusses, *structural composite lumber*, structural glued-laminated members or I-joists are not permitted except where permitted by the manufacturer's recommendations or where the effects of such alterations are specifically considered in the design of the member by a *registered design professional*.~~

2308.11.8 Engineered wood products. Engineered wood products shall be installed in accordance with manufacturer's recommendations. ~~*Prefabricated wood I-joists*, *structural glued-laminated timber* and *structural composite lumber* shall not be notched or drilled except where permitted by the manufacturer's recommendations or where the effects of such alterations are specifically considered in the design of the member by a *registered design professional*.~~

Reason: Changes adopted in 2024 IBC Section 2308.6 can be misinterpreted to prohibit the use of the provisions for cuts, notches, and bored holes in engineered wood products used in light-frame conventional construction, even when the engineered wood products have been evaluated for the effects of such cuts, notches, and bored holes with guidance provided by manufacturer's recommendations. This proposal adds language to make it clear that notching and boring of engineered wood products must be in accordance with manufacturer's recommendations or as specifically accounted for by the design.

The title of the section is revised to replace the term "dimensional" with "structural" to clarify its application to structural wood framing. A new section has been added which becomes Section 2308.6.1 and addresses limitations for engineered wood products, and Section 2308.6.2, and the subsections therein, addresses limitations for sawn lumber.

Additionally, Sections 2308.8.3 for floor framing and 2308.11.8 for roof framing have been revised to limit their provisions to specify that engineered wood products must be installed in accordance with the manufacturer's instructions and to remove any duplicated notching and boring provisions in Section 2308.6.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no technical changes proposed in this code change. The proposal reorganizes existing provisions and clarifies their intent.

S169-25

IBC: 2308.6, 2308.6.1, 2308.6.1.1, 2308.6.2, 2308.6.3, 2308.6.4

Proponents: Julius Carreon, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee (jcarreon@bellevuewa.gov); Micah Chappell, Seattle Dept. of Construction and Inspections (SDCI), representing Washington Association of Building Officials Technical Code Development Committee (WABO TCD) (micah.chappell@seattle.gov)

2024 International Building Code

2308.6 Cutting, notching and boring of dimensional wood framing. The provisions of this section shall only apply to dimensional wood framing and shall not include engineered wood products, heavy timber or prefabricated/manufactured wood assemblies.

Revise as follows:

2308.6.1 Floor joists, roof rafters and ceiling joists. Notches on framing ends shall not exceed one-fourth the member depth. Notches in the top or bottom of the member shall not exceed one-sixth the depth and shall not be located in the middle third of the span. A notch not more than one-third of the depth is permitted in the top of a rafter or ceiling joist not further from the face of the support than the depth of the member. Holes bored in members shall not be within 2 inches (51 mm) of the top or bottom of the member and the diameter of any such hole shall not exceed one-third the depth of the member. Where the member is notched or bored, the notch or hole shall not be closer than 2 inches (51 mm) to ~~the~~ another notch or bore.

2308.6.1.1 Ceiling joists. Where ceiling joists also serve as floor joists, they shall be considered floor joists within this section.

2308.6.2 Wall studs. In exterior walls and bearing partitions, a wood stud shall not be cut or notched in excess of 25 percent of its depth. In nonbearing partitions that do not support loads other than the weight of the partition, a stud shall not be cut or notched in excess of 40 percent of its depth.

2308.6.3 Bored holes. The diameter of bored holes in wood studs shall not exceed 40 percent of the stud depth. The diameter of bored holes in wood studs shall not exceed 60 percent of the stud depth in nonbearing partitions. The diameter of bored holes in wood studs shall not exceed 60 percent of the stud depth in any wall where each stud is doubled, provided that not more than two such successive doubled studs are so bored. The edge of the bored hole shall not be closer than $^{5}/_{8}$ inch (15.9 mm) to the edge of the stud. Bored holes shall not be located ~~at~~ within two inches (51mm) of the same section of stud as a cut or notch.

2308.6.4 Limitations. In designated lateral force-resisting system assemblies designed in accordance with this code and greater than three *stories* in height or in *Seismic Design Categories* C, D, E and F, the cutting, notching and boring of wall studs shall be as prescribed by the *registered design professional*.

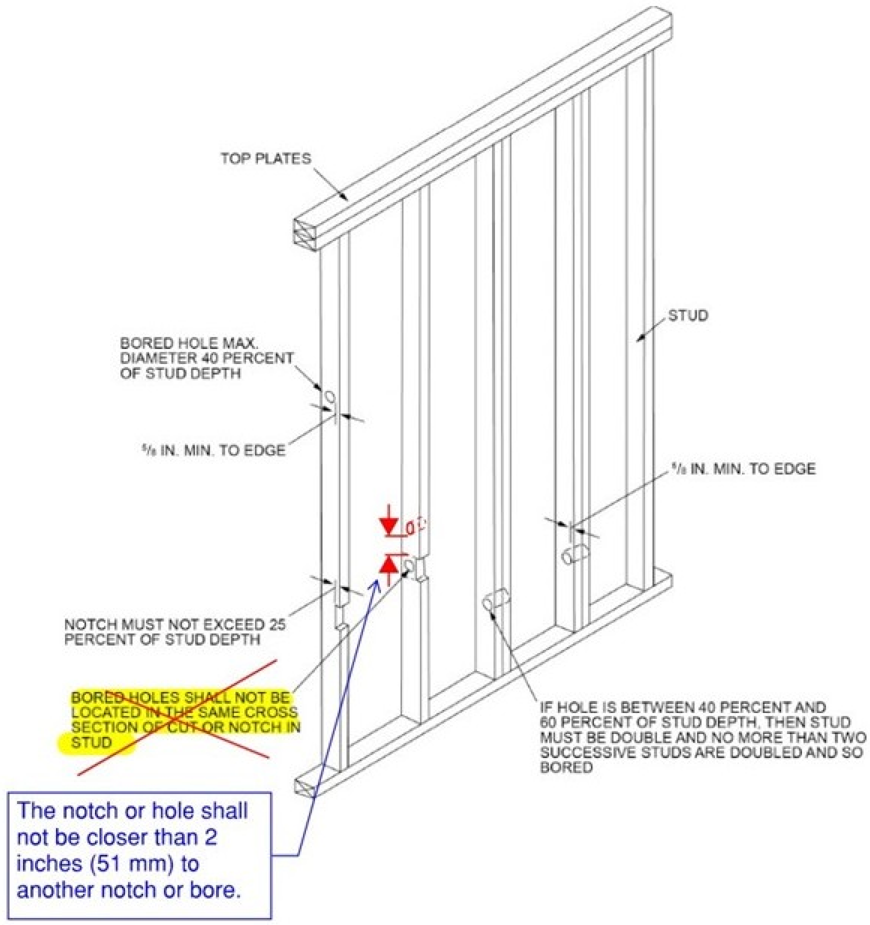
In *structures* designed in accordance with the International Residential Code, modification of wall studs shall comply with the *International Residential Code*.

Reason: This code change proposal is intended to correct the editorial inconsistencies in the reorganized code provisions for cutting, notching and boring of dimensional wood framing in the 2024 edition of the International Building Code.

The code provisions for cutting, notching and boring of dimensional wood framing have been re-organized and consolidated into a single location, Section 2308.6 (Conventional Construction), through code change proposal S224-22. The original proponent, Building Code Action Committee (BCAC) (bcac@iccsafe.org) submitted a Public Comment that included the above editorial changes and proposed relocating the provisions to Section 2304 (General Construction Requirements) during the Public Comment Hearing (PCH) process. However, this was disapproved primarily because the voters preferred to retain these provisions within the conventional construction section (Section 2308). We believe the following proposed revisions will clarify the intent of the code requirements:

- **2308.6.1 Floor joists, roof rafters, and ceiling joists:** The proposed amendment to the last sentence clarifies that the 2-inch minimum spacing allowance applies to wood members that are either notched or bored.
- **2308.6.3 Bored holes**: The proposed amendment to the last sentence makes the boring and notching requirements for wall studs consistent with the permitted 2-inch spacing requirements for joists, rafters, and beams (IBC 2308.6.1).

WABO TCD has also submitted a separate and almost identical code change proposal to the IRC Section R502.8 and Section R602.6, that address the same items above. Please see the attached mark-up IRC Figure R602-6 illustrating the proposed change in the spacing and boring requirements for wall studs.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the intent of the code and does not result in any economic impact.

S169-25

S170-25

IBC: 2308.6.2, 2308.6.2.1 (New), 2308.9.8

Proponents: Stephen Kerr, representing NCSEA (skerr@jwa-se.com)

2024 International Building Code

2308.6.2 Wall studs. In exterior walls and bearing partitions, a wood stud shall not be cut or notched in excess of 25 percent of its depth. In nonbearing partitions that do not support loads other than the weight of the partition, a stud shall not be cut or notched in excess of 40 percent of its depth.

Add new text as follows:

<u>**2308.6.2.1 Drilling and notching of wall plates.** In stud partitions where the cutting, drilling or notching of the sole plates or top plates exceeds 50 percent of its width, a galvanized metal tie not less than 0.054 inch thick (1.37 mm) (16 gage) and 1 1/2 inches (38 mm) in width shall be fastened to each plate across and to each side of the opening with not less than eight 10d (0.148 inch diameter) nails having a minimum length of 1 1/2 inches (38 mm) at each side or equivalent. The metal tie must extend not less than 6 inches past the opening.</u>

Revise as follows:

2308.9.8 Pipes in walls. Stud partitions containing plumbing, heating or other pipes shall be framed and the joists underneath spaced to provide proper clearance for the piping. Where a partition containing piping runs parallel to the floor joists, the joists underneath such partitions shall be doubled and spaced to permit the passage of pipes and shall be bridged. Where plumbing, heating or other pipes are placed in, or partly in, a partition, necessitating the cutting of the soles or plates <u>see section 2308.6.2.1.</u>~~, a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 1 1/2 inches (38 mm) in width shall be fastened to each plate across and to each side of the opening with not less than six 16d nails.~~

Reason: Currently the conventional construction provisions of the IBC 2308.9.8 require metal tie straps for any size pipe within a wall that require cutting of the plate, no matter how minor the notching or cutting may be. The notching requirement modifications proposed are to make the IBC conventional construction more consistent with the current provisions within the IRC for top plates. Currently the IBC requires the plate straps to be installed at sole plates and all stud partitions (not just top plates within exterior walls and loadbearing partitions as is the case with IRC). No changes are proposed to where the straps are to be installed. The proposed notching requirements are located in section 2308.6.2.1 and not within 2308.9.8 because the International Mechanical Code (IMC Section 302.3) and International Fuel Gas Code (IFGC Section 302.3) currently refer to section 2308.6 for cutting, notching and boring in wood framing. The International Plumbing Code (IPC Section 307.2) currently references section 2308.10 of the IBC; however, there is a separate proposal to correct the pointer to the correct section. Placing all notching requirements within one section within the IBC makes logical sense and will hopefully simplify the code and reduce confusion by not having repeating provisions in multiple code sections.

The nailing requirements are also updated to be consistent with the IRC nailing requirements as well as standard practice. Updates reflect the nail specification to include the nail diameter and nail length. Note that currently in section 2308.9.8 species a 16d nail but does not specify a nail diameter or length, indicating that this provision is has not been maintained. Taken from Table 2304.10.2 typical 16d nails are 16d common that are 3 ½" long x 0.168" diameter. This provision reduces the required nail from a 16d nail to a 10d (0.148 inch diameter) nail and the nail length limited to only 1 ½" long versus a 3 ½" 16d nail, while increasing the total number of nails. This is consistent with the action taken in RB172-06/07 where the nail size, length and quantity were changed within the IRC. Because the straps will be the same as those within the IRC no new strap configurations will be required by hardware manufacturers, so existing straps will be readily available for construction.

Note that the straps contained in this proposal are separate from the "shield plates" that are required to protect pipes close to the edge of the framing members. IMC section 305.5, IPC section 305.6 and IFGC section 404.7 all contain requirements for protection against physical damage where piping is installed within concealed locations. This proposal does not impact those requirements.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The cost of construction may slightly increase, with a net additional cost of less than $1 per strap.

Estimated Immediate Cost Impact Justification (methodology and variables):

While the number of nails increases the size of the nails is decreasing and more importantly reducing the likelihood of splitting the top plate. Adding four nails per strap should take less than one additional minute per strap. Based on a union carpenter rate of $61/hr (https://unionpayscales.com/trades/ubc-carpenters/) the additional time to install the extra nails is less than $1 per strap. Straps are already available to achieve the nailing because the nail requirements are already contained within the IRC, so no new strap design needs to be produced.

Estimated Life Cycle Cost Impact:

There should be no life cycle cost change.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The change in strap nailing will not change the life span of the structure, and the amount of materials within the connection is about the same. Strap length is equivalent to current requirements, and while the number of nails increases the length of the nails decreases, so there should be a near net amount of steel within each connection.

S170-25

S171-25

IBC: TABLE 2308.8.1.1(1)

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org)

2024 International Building Code

Revise as follows:

TABLE 2308.8.1.1(1) HEADER AND GIRDER SPANS[a, b] FOR EXTERIOR BEARING WALLS (Maximum spans for Douglas fir-larch, hem-fir, Southern pine and spruce-pine-fir and required number of jack studs)

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.

b. Spans are based on minimum design properties for No. 2 grade lumber of Douglas fir-larch, hem-fir, Southern pine and spruce-pine fir.

c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. NJ = Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.

e. Use 30 psf allowable stress design ground snow load for cases in which allowable stress designground snow load is less than 30 psf and the roof liveload is equal to or less than 20 psf.

f. Spans are calculated assuming a single span header or girder under uniform load where the top of the header or girder is laterally braced by perpendicular framing. Where the top of the header or girder is not laterally braced (for example, cripple studs bearing on the header), tabulated spans for headers consisting of 2 × 8, 2 × 10, or 2 × 12 sizes shall be multiplied by 0.70 or the header or girder shall be designed.

Reason: This proposal updates the header tables in multiple locations to be aligned with ASCE 7-22. The proposed spans align with those found in the ANSI/AWC *2024 Wood Frame Construction Manual (WFCM).* Additionally, language has been added to footnote f to clarify that all header and girder calculations are based on the assumption that they are single-span headers or girders. This clarification is necessary as multi-span headers are not addressed by the tables.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal updates the header tables in multiple locations to be aligned with ASCE 7-22. Updated spans are typically shorter by either 1 or 2 inches. This minor adjustment in span will likely not impact the lumber lengths needed for construction, as some trimming will still be necessary to accommodate the actual header span end use. As the cost impact cannot be a decrease, and any increase is minimal that may not be realized due to typical waste, the cost impact is estimated at an increase of $0.

S171-25

S172-25

IBC: 2308.8.2.2, TABLE 2304.10.2

Proponents: David Tyree, representing American Wood Council (dtyree@awc.org); Shane Nilles, representing American Wood Council (snilles@awc.org); Jason Smart, representing American Wood Council (jsmart@awc.org)

2024 International Building Code

Revise as follows:

2308.8.2.2 Bearing. The ends of each joist shall have not less than 1 $^1/_2$ inches (38 mm) of bearing on wood or metal, or not less than 3 inches (76 mm) on *masonry*, except where supported on a 1-inch by 4-inch (25 mm by 102 mm) let-in ribbon strip, and the joist and ribbon strip shall be nailed to the adjoining stud in accordance with Table 2304.10.2.

TABLE 2304.10.2 FASTENING SCHEDULE

Portions of table not shown remain unchanged.

DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER[g]	SPACING AND LOCATION
	Wall	
28. Ribbon strip supporting joists	3-8d box (2$^1/_2$″ x 0.113″); or 2-8d common (2$^1/_2$″ × 0.131″); or 2-10d box (3″ × 0.128″); or 2-1$^3/_4$″ 16 gage staples, 1″ crown	Face nail at each stud
29. Joist to stud where supported by ribbon strip	4-8d box (2$^1/_2$″ × 0.113″); or 3-8d common (2$^1/_2$″ × 0.131″); or floor 3-10d box (3″ × 0.128″); or 3-3″ × 0.131″ nails; or 3-3″ 14 gage staples, $^7/_{16}$″ crown	Face nail

Reason: Section 2308.8.2.2 permits a ribbon strip to provide bearing for joists but does not specify how the ribbon strip is required to be let-in to the stud and fastened. Additionally, the joists are required to be nailed to the adjacent stud, but no fasteners are specified. This code change provides provisions for proper installation of the ribbon strip and associated fastening with two new rows being added to Table 2304.10.2. The nailing for "Ribbon strip to supporting joists" is based on current item #19 and the nailing for "Joist to stud where supported by ribbon strip" is based on current item #21.

NOTE: The existing items in Table 2304.10.2 will be renumbered accordingly but are not shown for brevity.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal provides clarification for installation of ribbon strips which is already a framing option in the code.

S172-25

S173-25

IBC: 2308.9.3.2, 2308.9.3.2.1 (New)

Proponents: John Grenier, representing National Council of Structural Engineers Associations (NCSEA) (jgrenier@greniereng.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

2308.9.3.2 Top plates. Bearing and exterior wall studs shall be capped with double top plates installed to provide overlapping at corners and at intersections with other partitions. End joints in double top plates shall be offset not less than 48 inches (1219 mm), and shall be nailed in accordance with Table 2304.10.2. Plates shall be a nominal 2 inches (51 mm) in depth and have a width not less than the width of the studs.

Exception: A single top plate is permitted, provided that the plate is adequately tied at corners and intersecting walls by not less than the equivalent of 3-inch by 6-inch (76 mm by 152 mm) by 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by six 8d [$2^1/_2$-inch by 0.113-inch (64-mm by 2.87 mm)] box nails or equivalent on each side of the joint. For the butt-joint splice between adjacent single top plates, not less than the equivalent of a 3-inch by 12-inch (76 mm by 304 mm) by 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by 12 8d [$2^1/_2$-inch by 0.113-inch (64 mm by 2.87 mm)] box nails on each side of the joint shall be required, provided that the rafters, joists or trusses are centered over the studs with a tolerance of not more than 1 inch (25 mm). The top plate shall not be required over headers that are in the same plane and in line with the upper surface of the adjacent top plates and are tied to adjacent wall sections as required for the butt joint splice between adjacent single top plates.

Where bearing studs are spaced at 24-inch (610 mm) intervals, top plates are less than two 2-inch by 6-inch (51 mm by 152 mm) or two 3-inch by 4-inch (76 mm by 102 mm) members and the floor joists, floor trusses or roof trusses that they support are spaced at more than 16-inch (406 mm) intervals, such joists or trusses shall bear within 5 inches (127 mm) of the studs beneath or a third plate shall be installed.

Add new text as follows:

2308.9.3.2.1 Wall top plate support.. Wall top plates shall be supported out of plane by diaphragms, perpendicular framing or blocking spaced no more than 32 inches on center and connected per table 2304.10.2, or by diagonal bracing specified by a registered design professional.

Reason: Bracing of the wall top plate at walls parallel to metal plate connected wood trusses is addressed in BCSI B-3 which is not part of this code. Also, wall bracing at the top plate at the gable end of wood walls is referenced in FEMA FAI 22 Building Performance: Hurricane Andrew In Florida – Observations and FEMA P-55 Recommendations, and Technical Guidance and Coastal Construction Manual - Principles and Practices of Planning, Siting, Designing, Constructing, and Maintaining Residential Buildings in Coastal Areas, Fourth Edition, Volume II. Both of these documents note the failure of walls due to unbraced walls at the base of a the gable end wall/top plate of wall. Although these documents reference residential structures, the same principles apply to light framed wood constructed buildings for commercial and other uses. Additionally, see photo examples of construction deficiencies discovered in new construction by the author.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost increase for this code change proposal. This is a clarification of current requirements to brace the wall top plates.

S173-25

S174-25

IBC: 2404.1

Proponents: Gwenyth Searer, Wiss, Janney, Elstner Associates, Inc., representing myself (gsearer@wje.com)

2024 International Building Code

Revise as follows:

2404.1 Vertical glass. Glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors and other exterior applications shall be designed to resist the wind *loads* due to *basic wind speed* , *V*, in Section 1609 for components and cladding. Glass in glazed curtain walls, glazed storefronts and glazed partitions shall meet the seismic requirements of ASCE 7, Section 13.5.9. The load resistance of glass under uniform *load* shall be determined in accordance with ASTM E1300.

The design of vertical glazing shall be based on Equation 24-1.

$$0.6F_{gw} \le F_{ga} \quad \textbf{(Equation 24-1)}$$

where:

F_{gw} = Wind *load* on the glass due to *basic wind speed* , *V*, computed in accordance with Section 1609. F_{ga} = Short duration *load* on the glass as determined in accordance with ASTM E1300.

<u>**Exception:** For buildings and structures assigned to Seismic Design Category B where the component Importance Factor, I_p, is equal to 1.0, and for all buildings and structures assigned to Seismic Design Category A, glass in glazed curtain walls, glazed storefronts, and glazed partitions need not meet the seismic requirements of ASCE 7, Section 13.5.9.</u>

Reason: The portion of IBC Section 2404.1 that points to Section 13.5.9 of ASCE 7-22 creates a significant conflict with that standard. The way IBC Section 2404.1 is worded, the sentence "*Glass in glazed curtain walls, glazed storefronts and glazed partitions shall meet the seismic requirements of ASCE 7, Section 13.5.9*" requires compliance with Section 13.5.9 for all buildings and structures regardless of their Seismic Design Category.

However, buildings and structures in Seismic Design Category A are not designed for seismic loads, so seismic drifts are not calculated and it would consequently be difficult to determine whether or not glass met the fall-out seismic drift requirement of Section 13.5.9.1. Further, Section 11.7 of ASCE 7-22 provides a blanket statement that nonstructural components on buildings and structures assigned to Seismic Design Category A are exempt from seismic design requirements. Finally, Section 13.1.4 of ASCE 7-22 points the user to Table 13-1, which lists nonstructural components that are exempt from the requirements of Chapter 13 of ASCE 7-22; in this table, all nonstructural components are exempted from compliance with the entirety of Chapter 13 for all buildings and structures assigned to Seismic Design Category A.

Similarly for buildings and structures assigned to Seismic Design Category B, Table 13.1-1 of ASCE 7-22 exempts all architectural components except parapets from compliance with the entirety of Chapter 13 provided that the component Importance Factor, I_p, is equal to 1.0. So again, IBC Section 2404.1 points the user to Section 13.5.9 of ASCE 7-22, but that section does not apply, along with the whole chapter, if the component Importance Factor is equal to 1.To address this conflict, an exception is proposed to Section 2404.1 to provide an "out" for glass in all buildings and structures assigned to Seismic Design Category A, and for glass in buildings and structures assigned to Seismic Design Category B as long as the component Importance Factor is equal to 1.

Bibliography: https://unitedfacade.com/curtain-wall-system-cost-and-comparison-with-other-wall-systems

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The removal of this conflict likely reduces head-scratching by engineers, architects, and building officials because they no longer have to figure out whether Section 13.5.9 must be followed, which could easily save several thousand dollars per building, perhaps more. In cases where the provisions of Section 13.5.9 would have mistakenly applied to the design of the glass, there might be significant cost savings if the building is large. Based on my thirty years of experience in the field of structural engineering, I estimate that this could easily save between ten thousand and several tens of thousands of dollars or more per building compared to a design where Section 13.5.9 was mistakenly applied. This cost would depend on the cladding construction, the size of the building, and how much drift could be accommodated by the cladding selected for the building.

Estimated Immediate Cost Impact Justification (methodology and variables):

It makes logical sense that removing a conflict from the code will reduce design time and construction costs. Given that structural and facade consultants charge out at several hundred dollars per hour, it wouldn't take many hours to save several thousand dollars by not having them re-engineer a cladding design to meet requirements that make little to no sense. Similarly, for the cladding itself, avoiding having a cladding to allow greater drifts than normal would preclude the need for larger joints, more sealant, and more attention to detail during construction. Given that claddings can easily cost $100 per square foot (https://unitedfacade.com/curtain-wall-system-cost-and-comparison-with-other-wall-systems/), saving even a small percentage of this cost can quickly add up to tens of thousands of dollars for a large building.

S174-25

S175-25

IBC: 2407.1

Proponents: Kevin Brinkman, NEI, representing NEII (klbrinkman@neii.org)

2024 International Building Code

Revise as follows:

2407.1 Materials. Glass used in a *handrail* or a *guard* shall be laminated glass constructed of fully tempered or heat-strengthened glass and shall comply with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1. Glazing in a *handrail* or a *guard* shall be of an *approved* safety glazing material that conforms to the provisions of Section 2406.1.1. For all glazing types, the minimum nominal thickness shall be $^1/_4$ inch (6.4 mm).

~~Exception~~ Exceptions:

1. Single fully tempered glass complying with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1 shall be permitted to be used in *handrails* and *guards* where there is no walking surface beneath them or the walking surface is permanently protected from the risk of falling glass.
2. Glazing used in escalators and moving walks shall comply with the requirements for glazing in ASME A17.1/CSA B44.

Reason: Specific glazing requirements for escalators and moving walks are already addressed in ASME A17.1/CSA B44 Safety Code for Elevators and Escalators, requirements 6.1.3.3.3 and 6.2.3.3.3. These requirements are more appropriately defined in the elevator/escalator code. The proposed exception removes potential conflict between codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact because this proposal is a clarification of where to find the existing requirements for glazing used on escalators and moving walks.

Gypsum casting and molding plaster	ASTM C59
Gypsum Keene's cement	ASTM C61
Gypsum plaster	ASTM C28
Gypsum veneer plaster	ASTM C587
Interior bonding compounds, gypsum	ASTM C631
<u>Lathing Accessories, Furring Accessories and Fasteners</u>	<u>ASTM C1861</u>
Lime plasters	ASTM C5; C206
Masonry cement	ASTM C91
Metal lath	ASTM C847
Plaster aggregatesSand Perlite Vermiculite	ASTM C35; C897 ASTM C35 ASTM C35
Plastic cement	ASTM C1328
Portland cement	ASTM C150
Steel screws	ASTM C1002; C954
Welded wire lath	ASTM C933
Woven wire plaster base	ASTM C1032

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

<u>ASTM C1861-23a</u>	<u>Standard Specification for Lathing and Furring Accessories, and Fasteners, for Interior and Exterior Portland Cement-Based Plaster</u>

Reason: ASTM C1861 has been a reference standard in ASTM C1063, the metal lathing installation standard, since 2017.

ASTM C1861 is a product standard for lathing accessories, furring accessories and fasteners where their installation is specified in ASTM C1063.

Lathing accessory product manufacturers and project architectural specifications have been referencing ASTM C1861 for several years.

ASTM C1861 meets CP-28-05, Sections 4.4 and 4.6 requirements.

ASTM C1861 meets the requirements in the ICC References Standards Guide as a second tier reference standard and as such is currently enforceable by building code officials.

The ASTM C1861 task group members have expressed full support of an application to ICC for IBC for considering ASTM C1861 as a reference standard.

ASTM C1861 has been balloted for inclusion as a reference standard into ASTM E2128 Standard Guide for Evaluating Water Leakage of Buildings

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed referenced standard is already being used in industry for many years.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM C1861-23a Standard Specification for Lathing and Furring Accessories, and Fasteners, for Interior and Exterior Portland Cement-Based Plaster, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

S177-25

S178-25

IBC: TABLE 2507.2

Proponents: Shamim Rashid-Sumar, representing National Ready Mixed Concrete Association (ssumar@nrmca.org); James Farny, Portland Cement Association, representing US cement manufacturers (jfarny@cement.org); Dr. Julian Mills-Beale, representing National Ready Mixed Concrete Association (jmills-beale@nrmca.org)

2024 International Building Code

Revise as follows:

TABLE 2507.2 LATH, PLASTERING MATERIALS AND ACCESSORIES

MATERIAL	STANDARD
Accessories for gypsum veneer base	ASTM C1047
Blended cement	ASTM C595
Cold-formed steel studs and track, structural	AISI S240
Cold-formed steel studs and track, nonstructural	AISI S220
Exterior plaster bonding compounds	ASTM C932
Performance ~~Hydraulic~~ hydraulic cement	ASTM C1157~~; C1600~~
Rapid-hardening hydraulic cement	ASTM C1600
Gypsum casting and molding plaster	ASTM C59
Gypsum Keene's cement	ASTM C61
Gypsum plaster	ASTM C28
Gypsum veneer plaster	ASTM C587
Interior bonding compounds, gypsum	ASTM C631
Lime plasters	ASTM C5; C206
Masonry cement	ASTM C91
Metal lath	ASTM C847
Plaster aggregatesSand Perlite Vermiculite	ASTM C35; C897 ASTM C35 ASTM C35
Plastic cement	ASTM C1328
Portland cement	ASTM C150
Steel screws	ASTM C1002; C954
Welded wire lath	ASTM C933
Woven wire plaster base	ASTM C1032

Reason: This proposal is part of a series of proposals to the IBC and IRC to update cement terminology in the building codes.

The proposed revisions reflect current cement technology and market conditions, which can vary across regions. Nationally, the market is no longer dominated by portland cement. More than sixty percent of the current cement market consists of blended cements, including portland-limestone cement (PLC) and other blended cements that meet the requirements of ASTM C595/C595M, Specification for Blended Hydraulic Cements (Portland Cement Association, 2025). ASTM C595/C595M is referenced in the International Building Code/ International Residential Code.

This specific proposal provides clarification and differentiation between ASTM C1157 for performance hydraulic cement and ASTM C1600 for rapid-hardening hydraulic cement.

Bibliography: Portland Cement Association, 2025. Reducing Carbon at the Cement Plant. https://cementprogress.com/reducing-carbon-at-the-cement-plant/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This editorial code change will not impact the cost of construction. See reason statement.

S178-25

S179-25

IBC: 1612.2, 3103.6.1.3, G113.1, G113.3

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Building Code

Revise as follows:

1612.2 Design and construction. The design and construction of *buildings* and *structures* located in *flood hazard areas*, including *coastal high hazard areas* and *coastal A zones*, shall be in accordance with Chapter 5 of ASCE 7 and ASCE 24. Elevators, escalators, conveying systems and their components shall conform to ASCE 24 and ASME A17.1/CSA B44 as applicable.

~~**Exception:** *Temporary structures* complying with Section 3103.6.1.3.~~

Delete and substitute as follows:

~~**3103.6.1.3 Flood loads.** *Public-occupancy temporary structures* need not be designed for flood loads specified in Section 1612. Controlled occupancy procedures in accordance with Section 3103.8 shall be implemented.~~

<u>**3103.6.1.3 Flood loads.** Temporary structures shall not be located in floodways and coastal high hazard areas. Temporary structures located in flood hazard areas other than floodways and coastal high hazard areas shall comply with Section 1612.</u>

SECTION G113
TEMPORARY STRUCTURES AND TEMPORARY STORAGE

Revise as follows:

G113.1 Temporary structures. <u>Temporary structures shall not be located in floodways and coastal high hazard areas.</u> *Temporary structures* shall be erected for a period of less than 180 days. *Temporary structures* shall be anchored to prevent flotation, collapse or lateral movement resulting from hydrostatic *loads*, including the effects of buoyancy, during conditions of the *design flood*. Fully enclosed *temporary structures* shall have flood openings that are in accordance with ASCE 24 to allow for the automatic entry and exit of floodwaters.

G113.2 Temporary storage. Temporary storage includes storage of goods and materials for a period of less than 180 days. Stored materials shall not include *hazardous materials*.

G113.3 Floodway encroachment. *Temporary* ~~*structures* and temporary~~ storage in *floodways* shall meet the requirements of G104.5.

Reason: The proposal rectifies a disconnect that was created in the 2024 code cycle. The disconnect is between the IBC provisions for temporary structures in flood hazard areas and the minimum requirements of the National Flood Insurance Program. IBC Sec. 102.2 states that “the provisions of this code shall not be deemed to nullify any provisions of local, state or federal law. FEMA states that the most recent editions of the I-Codes meet or exceed the minimum requirements of the NFIP for buildings and structures. That is no longer the case, given the exemption of “public occupancy temporary structures” from the requirements of Section 1612 Flood Loads.

The exception to Sec. 1612.3 and Sec. 3103.6.1.3 completely circumvents all flood requirements for “public occupancy temporary structures.” We understand that those structures must have “controlled occupancy procedures” in place, but those procedures are about public safety, not about reducing flood damage. One of the objectives of the NFIP is to minimize flood damage to structures and collateral damage caused by structures that are not designed and constructed to resist damage.

Anyone watching reports of flooding will see dislodged structures. Not only do they contribute to debris, but they can also batter other buildings and can block bridge and culvert openings. Many communities attempt to impose requirements on owners/operators to have temporary structures removed from flood hazard areas before the onset of flooding, but often that just doesn't happen.

The proposal does not require temporary structures to fully comply with the elevation or dry floodproofing requirements of ASCE 24. ASCE 24 categorizes temporary structures in place for fewer than 180 days as Flood Design Class 1. It allows them below the flood elevation, with specific "wet floodproofing" measures to reduce damage.

The proposal limits placement of temporary structures in two parts of flood hazard areas:

1. Floodways, which are typically relatively narrow areas along riverine waterways where floodwater is deeper and flows faster. Floodways are delineated by FEMA to preclude encroachments that restrict flows – unless engineering analyses are performed. The NFIP requirements related to encroachments do not distinguish between whether the encroaching activities are permanent or temporary.
2. Coastal high hazard areas (flood Zone V), delineated along coastal shorelines and some very large lakes, are where waves during base flood conditions are expected to be 3 feet or higher. Those waves impose significant impact loads. This is why foundations for buildings in these areas must be columns or piles. We have observed for decades that non-elevated buildings in these areas sustain significant damage or are destroyed. Satisfying the ASCE 24 requirements for temporary structures, including anchoring to resist flood loads, would be impractical.

The proposed change to Sec. 3103.6.1.3 points to Sec. 1612, which relies on the referenced standard, ASCE 24. ASCE 24 has provisions for temporary structures that are in place for fewer than 180 days, which are Flood Design Class 1. Those temporary structures are specifically identified for be wet floodproofed. What that means is those structures must:

1. Be anchored to resist flotation and movement during conditions of the base flood.
2. Have flood damage-resistant materials below the base flood elevation.
3. Have flood openings in accordance with ASCE 24, when the structures are enclosed by walls.
4. Have mechanical systems, plumbing fixtures and electrical systems located at or above the base flood elevation, except that electrical wiring systems are permitted to be located below the base flood elevation provided they conform to the provisions of NFPA 70.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal requires all temporary structures to meet flood-resistant provisions, eliminating the exception for public occupancy temporary structures. However, there is no impact on the cost of construction of those structures because communities must still comply with NFIP regulations, which have similar requirements as IBC 1612/ASCE 24 described in the reason statement.

We acknowledge that there may be some cost associated with prohibiting temporary structures in floodways and coastal high hazard areas (e.g., finding alternate locations, lost opportunity cost, etc.). However, those costs may be offset by avoiding the cost of anchoring temporary structures in those high-risk flood hazard areas which typically have higher velocity flows or breaking waves. Anchoring to resist those loads could be costly and impractical for temporary structures. In addition, locating temporary structures outside of floodways eliminates the need and cost of preparing the engineering analyses required by Sec. 1612.3.2 to evaluate the impact of such structures on the floodway.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-B CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

SECTION G109
MANUFACTURED HOMES

Revise as follows:

G109.4 Protection of mechanical equipment and outside appliances.
The following shall be elevated to or above the *design flood elevation:*

1. Mechanical equipment and ~~outside~~ exterior appliances ~~shall be elevated to or above the *design flood elevation*~~.
2. Replacement of exterior equipment and exterior appliances damaged by *flood*

Exception: Where such equipment and appliances are designed and installed to prevent water from entering or accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic *loads* and stresses, including the effects of buoyancy, during the occurrence of *flooding* up to the elevation required by Section R306 of the *International Residential Code*, the systems and equipment shall be permitted to be located below the elevation required by Section R306 of the *International Residential Code*. Electrical wiring systems shall be permitted below the design *flood* elevation provided that they conform to the provisions of NFPA 70.

SECTION G114
UTILITY AND MISCELLANEOUS GROUP U

G114.6 Protection of mechanical, plumbing and electrical systems. The following shall be elevated to or above the *design flood elevation:*

1. Mechanical, plumbing and electrical systems, including plumbing fixtures~~, shall be elevated to or above the *design flood elevation*~~.
2. Replacement of exterior equipment and exterior appliances damaged by *flood.*

Exception: Electrical systems, equipment and components; heating, ventilating, air conditioning and plumbing appliances; plumbing fixtures, duct systems and other service equipment shall be permitted to be located below the *design flood elevation* provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic *loads* and stresses, including the effects of buoyancy, during the occurrence of flooding to the *design flood elevation* in compliance with the flood-resistant construction requirements of this code. Electrical wiring systems shall be permitted to be located below the *design flood elevation* provided that they conform to the provisions of NFPA 70.

2024 International Existing Building Code

Revise as follows:

[BS] 401.3 Flood hazard areas. In *flood hazard areas,* the following ~~*repairs* that constitute *substantial improvement*~~ shall require that the building comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable~~.~~:

1. Repairs that constitute *substantial improvement.*
2. Replacement of exterior equipment and exterior appliances damaged by *flood* .

2024 International Fuel Gas Code

Revise as follows:

[BS] 301.11 Flood hazard. For structures located in *flood hazard areas*, the following ~~the *appliance*, *equipment* and system installations regulated by this code~~ shall be located at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment~~.~~:

1. *Appliance*, *equipment* and system installations regulated by this code.
2. Replacement of exterior equipment and exterior appliances damaged by *flood.*

Exception: The *appliance*, *equipment* and system installations regulated by this code are permitted to be located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to such elevation.

2024 International Mechanical Code

Revise as follows:

[BS] 301.16 Flood hazard. For structures located in flood hazard areas, the following ~~mechanical systems, *equipment* and *appliances*~~ shall be located at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant *equipment*~~.~~ :

1. Mechanical systems, *equipment* and *appliances*
2. Replacement of exterior equipment and exterior appliances damaged by *flood*

Exception: Mechanical systems, *equipment* and *appliances* are permitted to be located below the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.

S180-25 Part I

S180-25 Part II

IRC: R306.1.6

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Residential Code

SECTION R306
FLOOD-RESISTANT CONSTRUCTION

Revise as follows:

R306.1.6 Protection of mechanical, plumbing and electrical systems. <u>The following</u> ~~Electrical systems, *equipment* and components; heating, ventilating, air-conditioning; plumbing *appliances* and plumbing fixtures; *duct systems*; and other service *equipment*~~ shall be located at or above the elevation required in Section R306.2 or R306.3~~.~~<u>:</u>

1. <u>Electrical systems, *equipment* and components; heating, ventilating, air-conditioning; plumbing *appliances* and plumbing fixtures; *duct systems*; and other service *equipment.*</u>
2. <u>Replacement of exterior equipment and exterior appliances damaged by *flood*</u>
3. If replaced as part of a *substantial improvement*, electrical systems, *equipment* and components; heating, ventilating, air-conditioning and plumbing *appliances* and plumbing fixtures; *duct systems*; and other service *equipment* ~~shall meet the requirements of this section.~~

Systems, fixtures, and *equipment* and components shall not be mounted on or penetrate through walls intended to break away under flood loads.

Exception: Locating electrical systems, *equipment* and components; heating, ventilating, air-conditioning; plumbing *appliances* and plumbing fixtures; *duct systems*; and other service *equipment* is permitted below the elevation required in Section R306.2 or R306.3 provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the required elevation in accordance with ASCE 24. Electrical wiring systems are permitted to be located below the required elevation provided that they conform to the provisions of the electrical part of this code for wet locations.

Reason:

Many buildings in floodplains were built before communities started regulating and requiring buildings to be elevated and constructed to minimize exposure to flooding. During a flood, exterior equipment that serves those non-elevated buildings gets damaged, even when the building itself is not substantially damaged. Having replacement equipment installed fully elevated minimizes future damage, saving owners time and money. In addition, when homes are flooded and elevated exterior equipment remains functional, clean-up and drying out are easier and faster. This means better management of mold conditions and businesses and families can more quickly move back into safer buildings.The State of Florida adopted similar provisions for the 8th Edition of the Florida Building Code.

The code change for Sec. 401.3, for repairs, requires replacement exterior equipment damaged by flood to be raised to or above the elevation required by the IRC, based on flood zone, unless the replacement equipment meets the limitations of the exception to be located below those elevations. The definition of “repair” includes “reconstruction, replacement or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.”

Methods used to raise replacement exterior equipment are the same as the methods used when equipment is installed to serve new construction (wall-mounted, pedestal, platforms, or platforms that are cantilevered from or knee braced to the structure). Photographs below show typical methods of elevating equipment that serves dwellings.In some areas where the base flood elevation is very high, equipment can be installed on roofs rather than very tall platforms.

FEMA’s Mitigation Assessment Team reports prepared after some significant flood events document widespread damage to non-elevated exterior equipment. Elevating equipment at the time of replacement also saves homeowners from having to pay for replacement equipment after any subsequent flood event.

Equipment on wall-mounted bracket (https://www.energy.gov/energysaver/heat-pump-systems)

Equipment on wall mounted platform

Equipment on concrete platform

Equipment on platform

Photographs are provided courtesy of FEMA P-348 and Rebecca Quinn

Cost Impact: Increase

Estimated Immediate Cost Impact:

When nonconforming dwellings in flood hazard areas have non-elevated exterior equipment, this code change proposal requires compliance when the exterior equipment is replaced after being damaged by flooding. For new construction, exterior equipment is elevated as high as the dwelling because typical exterior equipment used for dwellings is not designed to satisfy the requirements and limitations of the exception that allows for inherently watertight equipment below the design flood elevation. Increased costs incurred would depend on the type of equipment. The cost to raise a compressor on a pedestal or platform includes the cost of the pedestal/platform and minor costs to extend wiring and piping, if necessary. Unlike elevating on a platform, the cost to wall-mount a mini-split heat pump does not vary based on height above grade, other than the additional length of wiring and refrigerant line. The actual cost increase of this proposal depends on the method of elevation (pedestal, platform, cantilevered/knee braced platform, wall-mounted), how high above grade is necessary to meet the elevation requirements of R306.2 or R306.3, as applicable, and other factors such as soil type. The cost of a professionally-built 6 foot tall wooden platform is approximately $500. For areas of shallower flooding, prefabricated metal stands are available for under $200. Wall mount brackets are in the range of $50 and that cost does not vary based on height above grade. The cost of additional refrigerant line to account for additional height will vary based on height above grade, but costs approximately $100 for 10 feet of copper refrigerant line. In areas where a very tall platform would be required, roof-mounting may be more cost-effective.

At least two long-term benefits off-set the upfront additional installation costs: damage avoided and cost of complete replacement if flooded, and faster drying, clean-up, and re-occupancy after subsequent flood events.

Estimated Immediate Cost Impact Justification (methodology and variables):

The dollar values included in the cost impact statement were obtained using publicly available data on home advisor websites and supplier websites

Staff Analysis: CC # S97-25 Part III and CC # S180-25 Part I addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals..

S180-25 Part II

S181-25

IBC: G109.1, G109.4

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Building Code

APPENDIX G
FLOOD-RESISTANT CONSTRUCTION

SECTION G109
MANUFACTURED HOMES

Revise as follows:

G109.1 Required elevation~~Elevation.~~ All new and replacement *manufactured homes* to be placed or substantially improved in a *flood hazard area* shall be elevated such that the top of the foundation for the *manufactured home* is at or above the ~~*design flood elevation*~~ elevations specified in Section R306.2 or R306.3 of the *International Residential Code*, as applicable to the flood hazard area.

G109.4 Protection of mechanical equipment and outside appliances. Mechanical equipment and outside appliances shall be elevated to or above the ~~*design flood elevation*~~ required elevations.

> **Exception:** Where such equipment and appliances are designed and installed to prevent water from entering or accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic *loads* and stresses, including the effects of buoyancy, during the occurrence of *flooding* up to the required elevation ~~required by Section R306 of the *International Residential Code*~~, the systems and equipment shall be permitted to be located below the required elevation ~~required by Section R306 of the *International Residential Code*~~. Electrical wiring systems shall be permitted below the required elevations ~~design *flood* elevation~~ provided that they conform to the provisions of NFPA 70.

Reason:
Many states do not apply building codes to installation of manufactured homes. Those that do have requirements in IRC Sec. R306.1.9, which requires the homes to be elevated the same as site-built homes. Some communities elect to adopt IBC Appendix G, which includes requirements for manufactured homes.

This proposal modifies the IBC Appendix G provisions for elevation of manufactured homes to achieve the same elevation as the IRC for dwellings and manufactured homes by referring to elevation requirements in R306. IRC R306.1.9 requires the bottom of the frame of manufactured homes (equivalent to the top of the foundation) to be at or above the same elevations specified for dwellings in R306.2 or R306.3, as applicable to the flood hazard areas. There is no reasonable justification to have manufactured homes used as dwellings less protected than site-built dwellings, which is the current situation when IBC Appendix G109 is used to regulate installation of manufactured homes.

Bibliography: Kodavatiganti Y, Rahim MA, Friedland CJ, Mostafiz RB, Taghinezhad A and Heil S (2023), Material quantities and estimated construction costs for new elevated IRC 2015-compliant single-family home foundations. Front. Built Environ. 9:1111563. doi: 10.3389/fbuil.2023.1111563

Cost Impact: Increase

Estimated Immediate Cost Impact:

Most communities use FEMA Flood Insurance Studies and Flood Insurance Rate Maps for regulatory purposes. Those products delineate Special Flood Hazard Areas and, where detailed studies have been performed, they establish the base flood elevation (BFE). Unless communities adopt different maps, the design flood elevation equals the BFE for the purposes of enforcing the code. The current text requires the top of foundations for manufactured homes to be elevated to the BFE. Pointing to Sec. R306 will require one additional foot of elevation. Most manufactured homes in flood Zone A/AE are installed on piers or perimeter walls. In Coastal A Zones and coastal high hazard areas, (Zone V), foundations must be piles or columns.

The cost impact for this proposal is for an additional foot of foundation. Table 5 of the paper "Material quantities and estimated construction costs for new elevated IRC 2015-compliant single-family home foundations" (Kodavatiganti et al, 2023) estimates costs of foundations for site-built foundations at height increments of 0.3 m (approximately 1 ft) above grade. Using data from this table, the cost of an additional 1 foot of elevation for a 139 square meter (1496 square feet) home with a linear 1:5 aspect ratio (similar to a manufactured home) on a foundation of regularly spaced CMU piers on isolated concrete pads (CS-4 in the table) is $1,493 which translates to $1 per square foot. For a stem wall foundation on internal CMU piers (CS-3 in the table), with the same building footprint and aspect ratio, the cost of freeboard ranges from $2,223 for 0.2 m CMU to $3,379 for 0.3 m CMU. which translates to $1.49 to $2.26 per square foot.

This incremental per-foot cost is in-line with estimates for foundation and installation of double-wide manufactured homes (28' x 70') reported in 2018 to Pinellas County, Florida, by a licensed installer who indicated the cost difference between 3' and 4' tall foundations was $2,500 and the cost difference between 4' and 5' tall foundations was $5,000, with most of the additional cost associated with installation of the unit on the site-built foundation. Installation on foundations that are taller than about 6 to 7 ft above grade typically requires different equipment, which is more costly.

Estimated Immediate Cost Impact Justification (methodology and variables):

The paper by Kodavatiganti et al. determined costs of new construction of slab-on-fill and a variety of crawlspace foundations for varying building size, footprint aspect ratio, and elevation above grade. The cost difference between elevations was based on additional material costs using RSMeans. The methodology is more fully described in the paper.

Staff Analysis: CC # S97-25 Part III and CC #S181-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

S181-25

S182-25

IBC: G114.3, G114.4, G114.5, G114.6

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Building Code

APPENDIX G
FLOOD-RESISTANT CONSTRUCTION

SECTION G114
UTILITY AND MISCELLANEOUS GROUP U

G114.1 Utility and miscellaneous Group U. Utility and miscellaneous Group U includes *buildings* that are accessory in character and miscellaneous *structures* not classified in any specific occupancy in this code, including, but not limited to, *agricultural buildings*, aircraft hangars (accessory to a one- or two-family residence), barns, carports, fences more than 6 feet (1829 mm) high, grain silos (accessory to a residential occupancy), *greenhouses*, livestock shelters, *private garages*, retaining walls, sheds, stables and towers.

G114.2 Flood loads. Utility and miscellaneous Group U *buildings* and *structures*, including *substantial improvement* of such *buildings* and *structures*, shall be anchored to prevent flotation, collapse or lateral movement resulting from *flood loads*, including the effects of buoyancy, during conditions of the *design flood*.

Revise as follows:

G114.3 Required elevation ~~Elevation~~. Unless dry floodproofed in accordance with ASCE 24, utility ~~Utility~~ and miscellaneous Group U *buildings* and *structures* that have floors, including *substantial improvement* of such *buildings* and *structures*, shall be elevated such that the *lowest floor*, including *basement*, is elevated to or above the elevation specified in ASCE 24. ~~*design flood elevation* in accordance with Section 1612 of this code.~~

G114.4 Enclosures ~~below design flood elevation~~. Fully enclosed areas below the required elevation ~~*design flood elevation*~~ shall be constructed in accordance with ASCE 24.

G114.5 Flood-damage-resistant materials. *Flood-damage-resistant materials* shall be used below the required elevation ~~*design flood elevation*~~.

G114.6 Protection of mechanical, plumbing and electrical systems. Mechanical, plumbing and electrical systems, including plumbing fixtures, shall be elevated to or above the required elevation ~~*design flood elevation*~~.

> **Exception:** Electrical systems, equipment and components; heating, ventilating, air conditioning and plumbing appliances; plumbing fixtures, duct systems and other service equipment shall be permitted to be located below the required elevation ~~*design flood elevation*~~ provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic *loads* and stresses, including the effects of buoyancy, during the occurrence of flooding to the required elevation ~~*design flood elevation*~~ in compliance with the flood-resistant construction requirements of this code. Electrical wiring systems shall be permitted to be located below the required elevation ~~*design flood elevation*~~ provided that they conform to the provisions of NFPA 70.

Reason:
Group U includes buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy. When proposed in flood hazard areas, IBC Sec. 1612 requires design in accordance with ASCE 24 Flood Resistant Design and Construction. Group U buildings are nonresidential in nature, which means in floodplains they can be elevated or dry floodproofed, and some can be wet floodproofed. Wet floodproofing refers to a range of measures that allow areas to flood, while minimizing damage.

The proposed phrase “unless otherwise provided in ASCE 24” is added for clarity so that users know that Group U buildings that have floors and that qualify for dry floodproofing or wet floodproofing can be constructed with those measures. And then for Group U buildings with floors that are elevated, rather than send users to IBC Sec 1612 which refers users to ASCE 24 to determine the appropriate height of lowest floors, the change directs users to ASCE 24. The proposal puts the elevation requirement in G114.3, and changes other references to point to that section, thus ensuring consistency. The requirements for enclosures, materials, and mechanical, plumbing, and electrical systems are unchanged.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds more direct pointers to existing requirements in the code. There is no change to the technical content of the provisions. By reminding users of existing applicable requirements there will be no cost impact when approving this proposal.

S182-25

S183-25

IBC: N104.1.2, N106.2.1

Proponents: Rebecca Quinn, RCQuinn Consulting, representing Association of State Floodplain Managers (rebecca@rcquinnconsulting.com); Chad Berginnis, representing Association of State Floodplain Managers (cberginnis@floods.org)

2024 International Building Code

APPENDIX N
REPLICABLE BUILDINGS

Revise as follows:

N104.1.2 Structural plans, specifications and engineering details. Where approval of the structural requirements of the *replicable design* is sought, the submittal documents shall include details for each wind region, *seismic design category*, flood hazard area and *climate zone* for which approval is sought; and shall include the following:

1. Signed and sealed structural design calculations that support the member sizes on the drawings.
2. Design *load* criteria, including: frost depth, *live loads*, snow *loads*, wind *loads*, earthquake design date, flood loads, and other special *loads*
3. Details of foundations and superstructure.
4. Details of compliance with Section 1612 for replicable buildings proposed to be located in *flood hazard areas*.
5. ~~4.~~ Provisions for *special inspections*.

N106.2.1 Architectural plans and specifications. Architectural plans and specifications shall include the following:

1. *Construction documents* for variations from the *replicable design*.
2. Construction for portions that are not part of the *replicable design*.
3. Documents for local requirements as identified by the *building official*.
4. *Construction documents* detailing the foundation system.
5. *Construction documents* detailing compliance with Section 1612 for replicable buildings proposed to be located in *flood hazard areas*.

Reason: The objectives of Appendix N Replicable Buildings stated in Section N101.2 are to “allow a jurisdiction to recover from a natural disaster faster and allow for consistent application of codes for replicable building projects.” However, the most common natural disaster is missing from the list in N103.1 which specifies construction document requirements. This proposal rectifies that omission. In addition, compliance with flood requirements is site-specific and should be included in structural plans and documents specific to locations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal explicitly specifies documentation of compliance with existing requirements in the code. Buildings in flood hazard areas must already comply with the cited code requirements. There is no change to the technical content of the provisions. By being more explicit about existing documentation requirements there will be no cost impact when approving this proposal.

S183-25

S184-25

IBC: APPENDIX H, SECTION H101, H101.2

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Building Code

APPENDIX H
SIGNS

SECTION H101
GENERAL

H101.1 General. A *sign* shall not be erected in a manner that would confuse or obstruct the view of or interfere with exit signs required by Chapter 10 or with official traffic signs, signals or devices. *Signs* and *sign* support *structures*, together with their supports, braces, guys and anchors, shall be kept in repair and in proper state of preservation. The display surfaces of *signs* shall be kept neatly painted or posted at all times.

Revise as follows:

H101.2 Signs exempt from permits. Exemptions from permit requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction. Permits shall not be required for the following *signs*: ~~The following *signs* are exempt from the requirements to obtain a *permit* before erection~~:

1. Painted nonilluminated *signs*.
2. Temporary *signs* announcing the sale or rent of property.
3. *Signs* erected by transportation authorities.
4. *Projecting signs* not exceeding 2.5 square feet (0.23 m^2).
5. The changing of moveable parts of an *approved sign* that is designed for such changes, or the repainting or repositioning of display matter shall not be deemed an alteration.

Reason: This code change clarifies the extent of exemptions from compliance with other provisions of code and the other laws and ordinances of the jurisdiction. The langage mirrors language found in 105.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change reaffirms the codes intent to provide exemptions from permitting requirements only within this body of code.

IBC: APPENDIX N, SECTION N101, N101.1, N101.2, SECTION N104, N104.1, SECTION N105, N105.1, N105.3, N105.4, SECTION N106, N106.1, N106.2, SECTION N107, N107.1, N107.2

Proponents: Kota Wharton, representing City of Grove City (kwharton@grovecityohio.gov)

2024 International Building Code

APPENDIX N
REPLICABLE BUILDINGS

SECTION N101
ADMINISTRATION

N101.1 Purpose. The purpose of this appendix is to provide a format and direction regarding the implementation of a *replicable building* program.

Revise as follows:

N101.2 Objectives. Such programs allow a *jurisdiction* to ~~recover from a natural disaster faster and~~ allow for consistent application of the codes for *replicable building* projects. It will result in faster turnaround for the end user, and a quicker turnaround through the plan review process.

SECTION N104
REPLICABLE DESIGN SUBMITTAL REQUIREMENTS

N104.1 General. A summary description of the *replicable design* and related *construction documents* shall be submitted to an *approved agency* or the *building official*. Where approval is requested for elements of the *replicable design* that is not within the scope of the *International Building Code*, the *construction documents* shall specifically designate the codes for which review is sought. *Construction documents* shall be prepared by a *registered design professional* where required by the statutes of the *jurisdiction* in which the project is to be constructed ~~be signed, sealed and dated by a *registered design professional*~~.

SECTION N105
REVIEW AND APPROVAL OF REPLICABLE DESIGN

N105.1 General. Proposed *replicable designs* shall be reviewed by an *approved agency* or the *building official*. The review shall be applicable only to the *replicable design* features submitted in accordance with Section N104. The review shall determine compliance with this code and additional codes specified in Section N104.1.

N105.3 Deficiencies. Where the review of the submitted *construction documents* identifies elements where the design is deficient and will not comply with the applicable code requirements, the *approved agency* or *building official* shall notify the proponent of the *replicable design*, in writing, of the specific areas of noncompliance and request correction.

N105.4 Approval. Where the review of the submitted *construction documents* determines that the design is in compliance with the codes designated in Section N104.1, and where deficiencies identified in Section N105.3 have been corrected, the *approved agency* or *building official* shall issue a summary report of *Approved* Replicable Design. The summary report shall include any limitations on the *approved replicable design* including, but not limited to, climate zones, wind regions and *seismic design categories*.

SECTION N106
SITE-SPECIFIC APPLICATION OF APPROVED REPLICABLE DESIGN

N106.1 General. Where site-specific application of a *replicable design* that has been *approved* under the provisions of Section N105 is sought, the *construction documents* submitted to the *building official* shall comply with this section.

N106.2 Submittal documents. A summary description of the *replicable design* and related construction document shall be submitted to the *building official*. *Construction documents* shall be signed, sealed and dated by the *registered design professional*. A statement~~, signed, sealed and dated by the *registered design professional*,~~ that the *replicable design* submitted for local review is the same as the *replicable design* reviewed by the *approved* agency or *building official* shall be submitted. The statement shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.

SECTION N107
SITE-SPECIFIC REVIEW AND APPROVAL OF REPLICABLE DESIGN

N107.1 General. Proposed site-specific application of *replicable design* shall be submitted to the *building official* in accordance with the provisions of Chapter 1 and Appendix N.

N107.2 Site-specific review and approval of replicable design. The *building official* shall verify that the *replicable design* submitted for site-specific application is the same as the *approved replicable design* reviewed by the *approved agency* or the *building official*. In addition, the *building official* shall review the following for code compliance.

1. *Construction documents* for variations from the *replicable design*.
2. Construction for portions of the building that are not part of the *replicable design*.
3. Documents for local requirements as identified by the *building official*.

Reason: This code change does the following:

- Revises the intent of the replicable building projects program to allow for non-disaster related projects.
- Clarifies that the building official is able to review prototypical construction drawings.
- Clarifies that a registered design professional's seal is only required where required by the jurisdictions existing laws.

First, the intent of the replicable building program is artificially limited to disaster recovery. While the use may be most beneficial there, the program could be effective for rapid development and address building and housing shortages. The proposed language expands the program.

Second, the proposed language clarifies that the building official is able to review these plans. While inherent, because the building official could approve their agency as the approved agency, the proposed language makes it clear that the building official can receive the plans.

Third, as in other provisions of the code, the I-Codes historically stay out of asserting sealing requirements. The proposed language reaffirms the deference to jurisdictions to set their own rules about seal requirements.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Where adopted, the expansion of the program to non-recovery objectives and removal of seal requirements (where not required by other laws). Minimum $0 decrease

Estimated Immediate Cost Impact Justification (methodology and variables):

The assertion of first statements is founded in the initial assertions for the program; faster turnaround for the end user and a quicker turnaround through the plan review process.

Removal of seal requirements, where not required by other laws, the proposed language would have an appreciable decrease in cost.

S185-25

S186-25

IBC: 1705.5.2

Proponents: Emily Dunham, representing NCSEA Code Advisory Committee Special Inspections/Quality Assurance Subcommittee (emily.dunham@greshamsmith.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Building Code

Revise as follows:

1705.5.2 ~~Metal-plate-connected~~ Wood trusses spanning 60 feet or greater. Where a truss clear span is 60 feet (18 288 mm) or greater, the *special inspector* shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the *approved* truss submittal package.

Reason: Removal of "Metal plate connected" from the title correlates the title of the section with the enforceable language that only applies to trusses with a clear span of 60' or greater. All wood trusses with spans 60 feet or greater are required to have a special plan developed per section 2303.4.1.3. Consequently, special inspections should be performed for these same trusses and not limited to metal-plate-connected wood trusses.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Title changes are editorial and will have no cost impact, refer to reason statement.

TENTATIVE ORDER OF DISCUSSION
2025 PROPOSED CHANGES TO THE
INTERNATIONAL EXISTING BUILDING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some EB code change proposals may not be included on this list, as they are being heard by another committee.

IEBC: SECTION 202

Proponents: Gwenyth Searer, Wiss, Janney, Elstner Associates, Inc., representing myself (gsearer@wje.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Revise as follows:

[BS] SUBSTANTIAL STRUCTURAL DAMAGE. A condition where any of the following apply:

1. The vertical elements of the lateral force-resisting system have suffered damage such that the lateral load-carrying capacity of any story in any horizontal direction has been reduced by more than 33 percent from its predamage condition.
2. The capacity of any vertical component carrying gravity load, or any group of such components, that has a tributary area more than 30 percent of the total area of the structure's floor(s) and roof(s) has been reduced more than 20 percent from its predamage condition, and the remaining capacity of such affected elements, with respect to all dead and live loads, is less than 75 percent of that required by the *International Building Code* for new buildings of similar structure, purpose and location.
3. The capacity of any structural component carrying snow load, or any group of such components, that supports more than 30 percent of the roof area of similar construction has been reduced more than 20 percent from its predamage condition, and the remaining capacity with respect to dead, live and snow loads is less than 75 percent of that required by the *International Building Code* for new buildings of similar structure, purpose and location.

For purposes of this definition, work done to implement repairs <u>and work done to repair damage resulting from fire suppression efforts </u>shall not be considered damage that reduces structural capacity.

Reason: After a fire, sheathing, including gypsum board and other architectural finishes, may be removed to address water staining and to reduce or eliminate the potential for mold growth. Oftentimes, wall sheathing and finishes are removed wholesale due to the concern that the potential for mold growth is a significant liability. It may also be easier for a restoration contractor to simply remove all of the finishes during the emergency cleanup rather than removing just the water-damaged portions. In many older structures, however, gypsum board sheathing and similar finishes are used to resist lateral loads. During the time between removal and replacement of these finishes, the temporary decrease in lateral load-carrying capacity can appear to be total in the affected areas. Since these finishes are being removed to water staining and/or to mitigate the potential for mold, it makes sense to exclude the transitory removal and replacement of these elements in any calculation of loss of lateral load-carrying capacity. This proposal adds this commonsense interpretation into the definition of *substantial structural damage*.

Note that this proposal does not exclude seismic damage to gypsum board and other sheathing from being considered in a loss-of-lateral-load-carrying-capacity calculation; it only addresses elements that are removed and replaced due to damage from fire-suppression efforts. Similarly, this proposal does not impact the substantial damage trigger that covers flood upgrades.

Bibliography: "Evaluation of the Effects of the Oakland's Earthquake Damage Repair Ordinance" by G.R. Searer, T.F. Paret, S.A. Freeman, and U.M., Gilmartin, pubished in the Proceedings of the 8th US Conference on Earthquake Engineering in San Francisco, California in April 2006.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

It will clearly cost less, and in some cases a lot less, to repair water damage from fire-fighting efforts in like kind and quality rather than triggering wholesale upgrade of the lateral force resisting system and foundation. Although there have not been many studies that quantify the costs of upgrades of existing buildings, the proponent conducted a study of the Oakland Earthquake Damage Repair Ordinance that was implemented after the 1989 Loma Prieta Earthquake and found that repair+upgrade cost anywhere from 53 percent more to 3370 percent more, with several projects costing about 400 percent more, than if repair-only had been permitted. So for a project that would only address the damaged elements and cost, say $100,000, the repair+upgrade might cost $500,000. Thus if the trigger could be softened in the case of water damage to gypsum board finishes that may also serve as lateral force resisting elements, that could potentially save $400,000. Although these savings seem high, one can imagine a moderately-sized fire on the top story of a large two- or three-story wood-framed apartment building that was built in the 1960s or 1970s. The water would make its way down through the structure, wetting gypsum board finishes that may serve as the lateral force resisting system. Rather than coring holes in the gypsum board at the top and bottom of each stud bay and forcing air through the cavity to dry it out, a contractor might decide to just demolish and replace the bottom two feet of all gypsum board walls on the ground floor (where the water tends to accumulate) or even just remove all of the gypsum board because gypsum board is inexpensive. But in doing so, someone might consider the structure to have incurred substantial structural damage due to the demolition that was performed, thus triggering upgrade of the lateral force resisting system.

Such a triggered upgrade might include removal of undamaged finishes in many areas; might include addition of plywood wall sheathing in areas that never had plywood, might include addition of holddowns, anchor bolts, and steel hardware; and might include upgrade of the undamaged foundation. Suddenly it doesn't seem so unlikely that one might save a substantial amount of money if allowed to do repair-only.

Estimated Immediate Cost Impact Justification (methodology and variables):

The study that quantified the cost differential of repair+upgrade compared to repair-only is this paper: "Evaluation of the Effects of the Oakland's Earthquake Damage Repair Ordinance" by G.R. Searer, T.F. Paret, S.A. Freeman, and U.M., Gilmartin, pubished in the Proceedings of the 8th US Conference on Earthquake Engineering in San Francisco, California in April 2006.

EB1-25

EB2-25

IEBC: SECTION 202 (New)

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Add new definition as follows:

CHARACTER DEFINING FEATURE. Visual aspects and physical features that comprise the appearance and historic significance of the historic building, such as the overall shape of the building, its materials, craftsmanship, decorative details, interior spaces and features, as well as the various aspects of its site and environment.

Reason: Current text uses a variety of unspecific terms to establish when special consideration will be given to historic materials.

The proposed term is used by the professionals working in the historic preservation field (local, state, national), and has been reviewed by the federal National Park Service, involved in all projects using historic tax incentives, and responsible for the National Register of Historic Places (NRHP): the ICC codes reference the NRHP to define what buildings are considered historic.

By adding the proposed definition, the code official is relieved of the responsibility of identifying historic materials and a single definition is used in lieu of current language that is vague and inconsistent:

1203.5 "…where it is demonstrated that they are historic finishes."

1203.8 "Historic glazing materials…"

1203.10.12 "…replaced in a manner that will preserve the historic appearance…"

1203.11 "… would damage the historic character…"

1203.14. "…lead to a loss of historic character…"

The proposed code change for Section 1201.2 Report, uses this definition in determining how historic materials would be identified and documented by the registered design professional or, in the case of buildings covered in the scope of the *International Residential Code*, by the owner.

This is one of a group of code change proposals related to IEBC Chapter 12 Historic buildings. While they work together, each proposal can stand on it's own merit. Please see the proposal for the reorganization of this chapter for a clean copy of what this chapter would look like if all the proposals pass.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a definition. It does not change construction requirements.

EB3-25

IEBC: SECTION 202 (New)

Proponents: Tim Earl, GBH International, representing the Gypsum Association (tearl@gbhint.com)

2024 International Existing Building Code

Add new definition as follows:

GYPSUM BOARD. A type of gypsum panel product consisting of a noncombustible core primarily of gypsum with paper surfacing.
GYPSUM PANEL PRODUCT. The general name for a family of sheet products consisting essentially of gypsum complying with the standards listed in Tables 2506.2, 2507.2 and Chapter 35 of the International Building Code. Gypsum board and glass mat gypsum panels are all gypsum panel products.
GYPSUM SHEATING. Gypsum panel products specifically manufactured with enhanced water resistance for use as a substrate for exterior surface materials.
GYPSUM WALLBOARD. A gypsum board used primarily as an interior surfacing for building structures.

Reason: These definitions for terms used in the IEBC are identical to the definitions in the other codes. They are being added here for consistency across the codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is simply editorial with no cost impact.

Staff Analysis: This proposal is simply duplicating definitions from the IBC, IFC, and IMC. The definitions cannot be revised in this proposal as they are scoped to another committee.

EB3-25

EB4-25

IEBC: SECTION 202 (New)

Proponents: Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov); Stephen Van Hoose, representing NYS DOS (stephen.vanhoose@dos.ny.gov); Bryan Toepfer, representing NY DOS (bryan.toepfer@dos.ny.gov); Larissa DeLango, representing NYSDOS (larissa.delango@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Kevin Duerr-Clark, representing NYSDOS (kevin.duerr-clark@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov)

2024 International Existing Building Code

Add new definition as follows:

RECONFIGURATION OF SPACE. A reconfiguration of space includes a change of a space from nonhabitable to *habitable*, the installation or removal of walls, partitions, or any other division of space, or the *change of use* of a space in which the new use could be considered an increase in hazard as determined by the *code official*.

Reason: The term "reconfiguration of space" is used in Chapter 9, but is not defined within any of the codes. This definition provides clarity as to what the term means.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply adds a definition for a term, it does not add code requirements.

EB4-25

EB5-25

IEBC: SECTION 301, 301.1, 301.2, 301.3, 301.4, 401.1, 401.1.1 (New), 401.1.1, [BS] 401.3, 501.1, 501.1.1, 601.1, 601.1.1, 601.2, 602.1, 603.1, 604.1, 605.1, 606.1, 607.1, 701.1, [BS] 701.3, 801.1, 801.2, 801.3, 801.4, 901.1, 901.2, 1001.1, 1101.1, 1101.4, 1201.1, 1301.1, 1301.1.1, 1401.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, representing Self (sorlowski@sbcc.codes); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

CHAPTER 3
PROVISIONS FOR ALL COMPLIANCE METHODS

Revise as follows:

SECTION 301
~~ADMINISTRATION~~ GENERAL

301.1 ~~Applicability~~ Scope. ~~The *repair*~~ *Repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with Section 301.2, 301.3 or 301.4. The provisions of Sections 302 through 309 shall apply to ~~all~~ *alterations*, *repairs*, *additions*, relocation of structures and *changes of occupancy* regardless of compliance method.

301.1.1 Bleachers, folding and telescopic seating and grandstands. Existing bleachers, folding and telescopic seating and grandstands shall comply with ICC 300.

301.2 Repairs. *Repairs* shall comply with ~~the requirements of~~ Chapter 4.

301.3 Alteration, addition or change of occupancy. ~~The *alteration*~~ *Alteration*, *addition* or *change of occupancy* of all *existing buildings* shall comply with one of the methods listed in Section 301.3.1, 301.3.2 or 301.3.3 as selected by the applicant. Sections 301.3.1 through 301.3.3 shall not be applied in combination with each other.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code. New structural members added as part of the *alteration* shall comply with the *International Building Code.* This exception shall not apply to the following:

1. *Alterations* for accessibility required by Section 306.
2. *Alterations* that constitute *substantial improvement* in *flood hazard areas*, which shall comply with Sections 503.2, 701.3 or 1303.1.3.
3. Structural provisions of Section 304, Chapter 5 or to the structural provisions of Sections 706, 805 and 906.

301.3.1 Prescriptive compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 5 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.3.2 Work area compliance method. *Alterations*, *additions* and *changes of occupancy* complying with the applicable requirements of Chapters 6 through 12 of this code shall be considered in compliance with the provisions of this code.

301.3.3 Performance compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 13 of this code shall be considered in compliance with the provisions of this code.

301.4 Relocated buildings. Relocated buildings shall comply with ~~the requirements of~~ Chapter 14.

CHAPTER 4
REPAIRS

SECTION 401
GENERAL

401.1 Scope. *Repairs* shall comply with ~~the requirements of~~ this chapter. *Repairs* to *historic buildings* need only comply with Chapter 12.

Add new text as follows:

401.1.1 Nonapplicability. This chapter shall not apply to conditions listed in section 401.1.1.1 and 401.1.1.2.

Revise as follows:

~~401.1.1~~401.1.1.1 Bleachers, folding and telescopic seating and grandstands. *Repairs* to existing bleachers, folding and telescopic seating and grandstandsshall comply with ICC 300.

[BS] ~~401.3~~ 401.1.1.2 Flood hazard areas. In *flood hazard areas*, *repairs* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

401.2 Compliance. The work shall not make the building less complying than it was before the *repair* was undertaken. Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to requirements for alterations.

CHAPTER 5
PRESCRIPTIVE COMPLIANCE METHOD

SECTION 501
GENERAL

501.1 Scope. ~~The provisions of this chapter shall control the *alteration*~~ *Alteration*, *addition* and *change of occupancy* of *existing buildings* and structures, including *historic buildings* and structures ~~as referenced in Section 301.3.1~~ using the prescriptive compliance method shall comply with this chapter.

Delete without substitution:

~~**501.1.1 Compliance with other methods.** *Alterations*, *additions* and *changes of occupancy* to *existing buildings* and structures shall comply with the provisions of this chapter or with one of the methods provided in Section 301.3.~~

CHAPTER 6
CLASSIFICATION OF WORK

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. ~~The provisions of this chapter shall be used in conjunction with Chapters 7 through 12 and shall apply to the *alteration*, *addition* and *change of occupancy* of *existing structures*, including historic structures, as referenced in Section 301.3.2. The work performed on an *existing building* shall be classified in accordance~~Classification of work area compliance method level shall comply with this chapter.

Delete without substitution:

~~**601.1.1 Compliance with other alternatives.** *Alterations*, *additions* and *changes of occupancy* to *existing structures* shall comply with the provisions of Chapters 7 through 12 or with one of the alternatives provided in Section 301.3.~~

Revise as follows:

601.2 Work area. The *work area*~~, as defined in Chapter 2,~~ shall be identified on the construction documents.

SECTION 602
ALTERATION—LEVEL 1

602.1 ~~Scope~~ General. Level 1 alterations include the removal and replacement or the covering of existing materials, elements, *equipment or fixtures*using new materials, elements, *equipment or fixtures* that serve the same purpose.

SECTION 603
ALTERATION—LEVEL 2

603.1 ~~Scope~~ General. Level 2 *alterations* include the addition or elimination of any door or window, the reconfiguration or extension of any system, or the installation of any additional equipment, and shall apply where the w*ork area* is equal to or less than 50 percent of the building area.

> **Exception:** The movement or addition of nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height shall not be considered a Level 2 *alteration*.

SECTION 604
ALTERATION—LEVEL 3

604.1 ~~Scope~~ General. Level 3 *alterations* apply where the *work area* exceeds 50 percent of the *building area*.

SECTION 605
CHANGE OF OCCUPANCY

605.1 ~~Scope~~ General. *Change of occupancy* provisions apply where the activity is classified as a *change of occupancy* as defined in Chapter 2.

SECTION 606
ADDITIONS

606.1 ~~Scope~~ General. Provisions for *additions* shall apply where work is classified as an *addition* as defined in Chapter 2.

SECTION 607
HISTORIC BUILDINGS

607.1 ~~Scope~~ General. *Historic building* provisions shall apply to buildings classified as historic as defined in Chapter 2.

CHAPTER 7
ALTERATIONS—LEVEL 1

SECTION 701
GENERAL

701.1 Scope. Level 1 *alterations* ~~as described in Section 602~~ shall comply with ~~the requirements of~~ this chapter. Level 1 *alterations* to *historic buildings* shall comply with this chapter, except as modified in Chapter 12.

Add new text as follows:

701.1.1 Nonapplicability. This chapter shall not apply to conditions listed in section 701.1.1.1.

Revise as follows:

[BS] ~~701.3~~ 701.1.1.1 Flood hazard areas. In *flood hazard areas*, *alterations* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

701.2 Conformance. An *existing building* or portion thereof shall not be altered such that the building becomes less safe than its existing condition.

> **Exception:** Where the current level of safety or sanitation is proposed to be reduced, the portion altered shall conform to the requirements of the *International Building Code*.

CHAPTER 8
ALTERATIONS—LEVEL 2

SECTION 801
GENERAL

801.1 Scope. Level 2 *alterations* ~~as described in Section 603~~ shall comply with ~~the requirements of~~ this chapter and Chapter 7.

> ~~**Exception:** Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section 306.7.1 shall be permitted to comply with Chapter 7.~~

Add new text as follows:

801.1.1 Nonapplicability. This chapter shall not apply to conditions listed in Sections 801.1.1.1 through 801.1.1.3.

801.1.1.1.1 Accessibility. Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section 306.7.1 shall be permitted to comply with Chapter 7.

Delete without substitution:

~~**801.2 Alteration Level 1 compliance.** In addition to the requirements of this chapter, all work shall comply with the requirements of Chapter 7.~~

Revise as follows:

~~801.3~~ <u>801.1.1.2</u> **System installations.** Requirements related to *work area* are not applicable where the Level 2 *alterations* are limited solely to one or more of the following:

1. Mechanical systems, electrical systems, fire protection systems and abatement of hazardous materials.
2. Windows, hardware, operating controls, electrical outlets and signs.
3. *Alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.

~~801.4~~ <u>801.1.1.3</u> **Compliance.** New construction elements, components, systems and spaces shall comply with the requirements of the *International Building Code*.

Exceptions:

1. Where windows are added they are not required to comply with the light and ventilation requirements of the *International Building Code*.
2. Newly installed electrical equipment shall comply with the requirements of Section 806.
3. The length of dead-end corridors in newly constructed spaces shall only be required to comply with the provisions of Section 804.8.
4. The minimum ceiling height of the newly created habitable and occupiable spaces and corridors shall be 7 feet (2134 mm).
5. Where provided in below-grade transportation stations, existing and new escalators shall be permitted to have a clear width of less than 32 inches (815 mm).
6. New structural members and connections shall be permitted to comply with alternative design criteria in accordance with Section 302.

CHAPTER 9
ALTERATIONS—LEVEL 3

SECTION 901
GENERAL

901.1 Scope. Level 3 *alterations* ~~as described in Section 604~~ shall comply with ~~the requirements of~~ this chapter <u>and Chapters 7 and 8. The requirements of Sections 802,803,804, and 805 shall apply within all work areas regardless of the number of tenants.</u>

Add new text as follows:

<u>**901.1.1** **Nonapplicability**.</u> <u>This chapter shall not apply to conditions listed in Section 901.1.1.1.</u>

<u>**901.1.1.1** **Accessibility**.</u> <u>Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section 306.7.1 shall not be required to comply with this chapter.</u>

Delete without substitution:

~~**901.2 Compliance.** In addition to the provisions of this chapter, work shall comply with all of the requirements of Chapters 7 and 8. The requirements of Sections 802, 803, 804 and 805 shall apply within all *work areas* whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.~~

~~**Exception:** Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section 306.7.1 shall not be required to comply with this chapter.~~

CHAPTER 10
CHANGE OF OCCUPANCY

SECTION 1001
GENERAL

Revise as follows:

1001.1 Scope. ~~The provisions of this chapter shall apply where a *change*~~ <u>*Change*</u> *of occupancy* <u>shall comply with this chapter.</u> ~~occurs, as defined in Section 202.~~

CHAPTER 11
ADDITIONS

SECTION 1101
GENERAL

1101.1 Scope. ~~An *addition* to a building or structure shall comply with~~<u>Additions shall comply with this chapter and</u> the International Codes as adopted for new construction. ~~without requiring the~~<u>Unless required by this chapter, the</u> *existing building* or structure <u>shall not be required</u> to comply with <u>this chapter or the International codes.</u> ~~any requirements of those codes or of these provisions, except as required by this chapter. Where an *addition* impacts the *existing building* or structure, that portion shall comply with this code.~~

1101.2 Creation or extension of nonconformity. An *addition* shall not create or extend any nonconformity in the *existing building* to which the *addition* is being made with regard to accessibility, structural strength, supports and attachments for nonstructural components, fire safety, means of egress or the capacity of mechanical, plumbing or electrical systems.

> **Exception:** Nonconforming supports and attachments for nonstructural components that serve the *addition* from within the existing building need not be altered to comply with *International Building Code* Section 1613 unless the components are part of the *addition*'s life safety system or are required to serve an *addition* assigned to *Risk Category* IV.

[BS] 1101.3 Risk category assignment. Where the *addition* and the *existing building* have different occupancies, the *risk category* of each existing and added occupancy shall be determined in accordance with Section 1604.5.1 of the *International Building Code*. Where application of that section results in a higher *risk category* for the *existing building* compared wih the *risk category* for the *existing building* before the *addition*, such a change shall be considered a *change of occupancy* and shall comply with Chapter 10 of this code. Where application of that section results in a higher *risk category* for the *addition* compared with the *risk category* for the *addition* by itself, the *addition* and any systems in the *existing building* required to serve the *addition* shall comply with the requirements of the *International Building Code* for new construction for the higher *risk category*.

Delete without substitution:

~~**1101.4 Other work.** Any *repair* or *alteration* work within an *existing building* to which an *addition* is being made shall comply with the applicable requirements for the work as classified in Chapter 6.~~

CHAPTER 12
HISTORIC BUILDINGS

SECTION 1201
GENERAL

Revise as follows:

1201.1 Scope. ~~This chapter is intended to provide means for the preservation of *historic buildings*.~~*Historic buildings* shall comply with ~~the provisions of~~ this chapter. ~~relating to their *repair*, *alteration*, relocation and *change of occupancy*.~~

CHAPTER 13
PERFORMANCE COMPLIANCE METHODS

SECTION 1301
GENERAL

1301.1 Scope. ~~The provisions of this chapter shall apply to the *alteration*~~ Alteration, *addition* and *change of occupancy* of *existing structures*, including historic structures, using the performance compliance method shall comply with this chapter. ~~as referenced in Section 301.3.3. The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in *existing buildings* while permitting, *alteration*, *addition* and *change of occupancy* without requiring full compliance with Chapters 6 through 12, except where compliance with the prescriptive method of Chapter 5 or the work area method of other provisions of this code is specifically required in this chapter.~~

Delete without substitution:

~~**1301.1.1 Compliance with other methods.** *Alterations*, *additions* and *changes of occupancy* to *existing structures* shall comply with the provisions of this chapter or with one of the methods provided in Section 301.3.~~

CHAPTER 14
RELOCATED OR MOVED BUILDINGS

SECTION 1401
GENERAL

Revise as follows:

1401.1 Scope. ~~This chapter provides requirements for relocated~~ Relocated or moved structures, including *relocatable buildings* ~~as defined in Chapter 2~~shall comply with this chapter.

Reason: Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained.

The Scoping Task group proposes that the recommended changes will improve the code by:
1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

This proposal is submitted with the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial and there is no cost impact on the cost of construction.

EB6-25 Part I

IEBC: [A] 101.2, CHAPTER 3, SECTION 301, 301.1, 301.2, 301.3, 301.3.1, 301.3.2, 301.3.3, 301.4, SECTION 302, 302.2, 302.2.1, 302.3, 302.4, [BS] 302.4.1, 302.5, 302.1, CHAPTER 4, SECTION 401, 401.1, CHAPTER 5, SECTION 501, 501.1, 501.1.1, SECTION 506, CHAPTER 6, SECTION 601, 601.1, 601.1.1, SECTION 602, 602.1, 602.2, SECTION 603, 603.1, 603.2, SECTION 604, 604.1, 604.2, SECTION 605, 605.1, 605.2, SECTION 606, 606.1, 606.2, SECTION 607, 607.1, 607.2, CHAPTER 7, SECTION 701, 701.1, CHAPTER 8, SECTION 801, 801.1, 801.2, CHAPTER 9, SECTION 901, 901.1, 901.2, CHAPTER 10, SECTION 1001, 1001.1, CHAPTER 11, SECTION 1101, 1101.1, CHAPTER 12, SECTION 1201, 1201.1, SECTION 1204, SECTION 1206, CHAPTER 13, SECTION 1301, 1301.1, 1301.1.1, CHAPTER 14, SECTION 1401, 1401.1

Proponents: Grant Ullrich, City of Chicago, representing Self (grant.ullrich@cityofchicago.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE EXISTING BUILDING CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Existing Building Code

[A] 101.2 Scope. The provisions of this code shall apply to the *repair*, *alteration*, *change of occupancy*, *addition* to and relocation of *existing buildings*.

Exception: Detached one- and two-family dwellings and townhouses not more than three stories above grade plane in height with a separate means of egress, and their accessory structures not more than three stories above grade plane in height, shall comply with this code or the *International Residential Code.*

CHAPTER 3
PROVISIONS FOR ALL COMPLIANCE METHODS

Revise as follows:

SECTION 301
~~ADMINISTRATION~~ GENERAL

301.1 ~~Applicability~~ Scope. ~~The *repair*,~~ *Repairs,* *alterations*, *changes of occupancy*, *additions* to ~~or~~ and relocations of ~~all~~ *existing buildings* shall comply with Section 301.2, 301.3 or 301.4. ~~The provisions of~~ Sections 302 through 309 shall apply to all work. ~~*alterations*, *repairs*, *additions*, relocation of structures and *changes of occupancy* regardless of compliance method.~~

301.2 Repairs. *Repairs* shall comply with ~~the requirements of~~ Chapter 4.

301.3 Alterations, ~~addition or~~ changes of occupancy and additions. ~~The *alteration*,~~ *Alterations,* ~~*addition* or~~ *changes of occupancy* and *additions* ~~of all *existing buildings*~~ shall comply with one of the methods listed in Section 301.3.1, 301.3.2 or 301.3.3 as selected by the applicant. Sections 301.3.1 through 301.3.3 shall not be applied in combination with each other.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with ~~the provisions of~~ this code. New structural members added as part of the *alteration* shall comply with the *International Building Code.* This exception shall not apply to the following:

1. *Alterations* for accessibility required by Section 306.
2. *Alterations* that constitute *substantial improvement* in *flood hazard areas*, which shall comply with Sections 503.2, 701.3 or 1303.1.3.
3. Structural provisions of Section 304, Chapter 5 or to the structural provisions of Sections 706, 805 and 906.

301.3.1 Prescriptive compliance method. *Alterations*, ~~*additions* and~~ *changes of occupancy* and *additions* complying with Chapter 5 ~~of~~

~~this code~~ in buildings complying with the *International Fire Code* shall be considered in compliance with ~~the provisions of~~ this code.

301.3.2 Work area compliance method. *Alterations*, ~~*additions* and~~ *changes of occupancy* and *additions* complying with the applicable requirements of Chapters 6 through 12 ~~of this code~~ shall be considered in compliance with ~~the provisions of~~ this code.

301.3.3 Performance compliance method. *Alterations*, ~~*additions* and~~ *changes of occupancy* and *additions* complying with Chapter 13 ~~of this code~~ shall be considered in compliance with ~~the provisions of~~ this code.

301.4 ~~Relocated buildings~~ Relocations. ~~Relocated buildings~~ Relocations of *existing buildings*, including *relocatable buildings*, shall comply with ~~the requirements of~~ Chapter 14.

Delete without substitution:

~~SECTION 302~~
~~GENERAL PROVISIONS~~

Revise as follows:

~~302.2~~ 301.5 Additional codes. ~~Alterations,~~ ~~*repairs*,~~ *Repairs, alterations,* ~~*additions* and~~ *changes of occupancy*, *additions* to~~, or~~ and relocations ~~of,~~ of *existing buildings* ~~and structures~~ shall comply with the provisions for *repairs, alterations,* ~~*repairs, additions* and~~ *changes of occupancy, additions* ~~or~~ and relocations, respectively, in this code and the *International Energy Conservation Code*, *International Fire Code*, *International Fuel Gas Code*, *International Mechanical Code*, *International Plumbing Code*, *International Private Sewage Disposal Code*, *International Property Maintenance Code*, *International Residential Code* and NFPA 70. Where provisions of the other codes conflict with provisions of this code, the provisions of this code shall take precedence.

~~302.2.1~~ 301.5.1 Additional codes in health care. In existing Group I-2 occupancies, ambulatory health care *facilities*, outpatient clinics and hyperbaric *facilities*, *repairs, alterations*, ~~*repairs, additions* and~~ *changes of occupancy*, ~~to, or~~ *additions* and relocations ~~of, *existing buildings* and structures~~ shall also comply with NFPA 99.

~~302.3~~ 301.6 Existing materials. Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the code official to be *unsafe*.

~~302.4~~ 301.7 New and replacement materials. Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided that *unsafe* conditions are not created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

[BS] ~~302.4.1~~ 301.7.1 New structural members and connections. New structural members and connections shall comply with the detailing provisions of the *International Building Code* for new buildings of similar structure, purpose and location.

Exception: Where alternative design criteria are specifically permitted.

~~302.5~~ 301.8 Occupancy and use. Where determining the appropriate application of ~~the referenced sections of~~ this code, the occupancy and use of a building shall be determined in accordance with Chapter 3 of the *International Building Code*.

~~302.1~~ 301.9 Dangerous conditions. The *code official* shall have the authority to require the elimination of conditions deemed *dangerous*.

CHAPTER 4
REPAIRS

SECTION 401

GENERAL

401.1 Scope. *Repairs* shall comply with ~~the requirements of~~ this chapter. *Repairs* to *historic buildings* need only comply with Chapter 12.

CHAPTER 5
PRESCRIPTIVE COMPLIANCE METHOD

SECTION 501
GENERAL

501.1 Scope. ~~The provisions of this chapter shall control the~~ Where the applicant has selected the prescriptive compliance method, *alterations*, *additions* and *changes of occupancy* ~~of~~ to *existing buildings* ~~and structures~~, including *historic buildings*, ~~and structures as referenced in Section 301.3.1~~ shall comply with this chapter.

Delete without substitution:

~~**501.1.1 Compliance with other methods.** *Alterations*, *additions* and *changes of occupancy* to *existing buildings* and structures shall comply with the provisions of this chapter or with one of the methods provided in Section 301.3.~~

Revise as follows:

SECTION 506
CHANGES OF OCCUPANCY

CHAPTER 6
~~CLASSIFICATION OF WORK~~ WORK AREA COMPLIANCE METHOD

SECTION 601
GENERAL

601.1 Scope. Where the applicant has selected the work area compliance method, ~~The provisions of this chapter shall be used in conjunction with Chapters 7 through 12 and shall apply to the~~ *alterations*, ~~*addition* and~~ *changes of occupancy* and *additions* ~~of *existing structures*~~ to *existing buildings*, including ~~historic structures~~ *historic buildings*, ~~as referenced in Section 301.3.2~~ shall comply with this chapter. ~~The work performed on an *existing building* shall be classified in accordance with this chapter.~~

Delete without substitution:

~~**601.1.1 Compliance with other alternatives.** *Alterations*, *additions* and *changes of occupancy* to *existing structures* shall comply with the provisions of Chapters 7 through 12 or with one of the alternatives provided in Section 301.3.~~

Revise as follows:

SECTION 602
~~ALTERATION~~ALTERATIONS—LEVEL 1

602.1 ~~Scope~~ General. Level 1 alterations include the removal and replacement or the covering of existing materials, elements, *equipment or fixtures* using new materials, elements, *equipment or fixtures* that serve the same purpose.

602.2 ~~Application~~ Compliance. Level 1 *alterations* shall comply with ~~the provisions of~~ Chapter 7.

SECTION 603
~~ALTERATION~~ ALTERATIONS—LEVEL 2

603.1 ~~Scope~~ General. Level 2 *alterations* include the addition or elimination of any door or window, the reconfiguration or extension of any system, or the installation of any additional equipment, and shall apply where the w*ork area* is equal to or less than 50 percent of the building area.

Exception: The movement or addition of nonfixed and movable fixtures, cases, racks, counters and partitions not over 5 feet 9 inches (1753 mm) in height shall not be considered a Level 2 *alteration*.

603.2 ~~Application~~ Compliance. Level 2 *alterations* shall comply with ~~the provisions of Chapter 7 for Level 1 *alterations* as well as the provisions of Chapter 8~~ Chapters 7 and 8.

SECTION 604
~~ALTERATION~~ALTERATIONS—LEVEL 3

604.1 ~~Scope~~ General. Level 3 *alterations* apply where the *work area* exceeds 50 percent of the *building area*.

604.2 ~~Application~~ Compliance. Level 3 *alterations* shall comply with ~~the provisions of Chapters 7 and 8 for Level 1 and 2 *alterations*, respectively, as well as the provisions of Chapter 9~~ Chapters 7 through 9.

SECTION 605
~~CHANGE~~CHANGES OF OCCUPANCY

Delete without substitution:

~~**605.1 Scope.** *Change of occupancy* provisions apply where the activity is classified as a *change of occupancy* as defined in Chapter 2.~~

Revise as follows:

~~**605.2**~~ **605.1** ~~**Application**~~ **Compliance.** *Changes of occupancy* shall comply with ~~the provisions of~~ Chapter 10.

SECTION 606
ADDITIONS

Delete without substitution:

~~**606.1 Scope.** Provisions for *additions* shall apply where work is classified as an *addition* as defined in Chapter 2.~~

Revise as follows:

~~**606.2**~~ **606.1** ~~**Application**~~ **Compliance.** *Additions* to *existing buildings* shall comply with ~~the provisions of~~ Chapter 11.

SECTION 607
HISTORIC BUILDINGS

Delete without substitution:

~~**607.1 Scope.** *Historic building* provisions shall apply to buildings classified as historic as defined in Chapter 2.~~

Revise as follows:

~~**607.2**~~ **607.1** ~~**Application**~~ **Compliance.** Except as specifically provided ~~for~~ in Chapter 12 where the applicant elects to use Chapter 12 , *historic buildings* shall comply with applicable provisions of ~~this code for the type of work being performed~~ Chapters 7 through 11.

CHAPTER 7
ALTERATIONS—LEVEL 1

SECTION 701
GENERAL

701.1 Scope. Level 1 *alterations* ~~as described in Section 602~~ shall comply with ~~the requirements of~~ this chapter. Level 1 *alterations* to *historic buildings* shall comply with this chapter, except as modified in Chapter 12.

CHAPTER 8
ALTERATIONS—LEVEL 2

SECTION 801
GENERAL

801.1 Scope. Level 2 *alterations* ~~as described in Section 603~~ shall comply with ~~the requirements of~~ this chapter and Chapter 7. Level 2 *alterations* to *historic buildings* shall comply with this chapter and Chapter 7, except as modified in Chapter 12.

Exception: Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section 306.7.1 shall be permitted to comply with Chapter 7.

Delete without substitution:

~~**801.2 Alteration Level 1 compliance.** In addition to the requirements of this chapter, all work shall comply with the requirements of Chapter 7.~~

CHAPTER 9
ALTERATIONS—LEVEL 3

SECTION 901
GENERAL

Revise as follows:

901.1 Scope. Level 3 *alterations* ~~as described in Section 604~~ shall comply with ~~the requirements of~~ this chapter and Chapters 7 and 8. Level 3 *alterations* to *historic buildings* shall comply with this chapter and Chapters 7 and 8, except as modified in Chapter 12.

901.2 Compliance. ~~In addition to the provisions of this chapter, work shall comply with all of the requirements of Chapters 7 and 8.~~ The requirements of Sections 802, 803, 804 and 805 shall apply within all *work areas* whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.

Exception: Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section 306.7.1 shall not be required to comply with this chapter.

CHAPTER 10
~~CHANGE~~CHANGES OF OCCUPANCY

SECTION 1001
GENERAL

Delete and substitute as follows:

~~**1001.1 Scope.** The provisions of this chapter shall apply where a *change of occupancy* occurs, as defined in Section 202.~~

1001.1 Scope. *Changes of occupancy* shall comply with this chapter. *Changes of occupancy* to *historic buildings* shall comply with this chapter, except as modified in Chapter 12.

CHAPTER 11
ADDITIONS

SECTION 1101
GENERAL

Revise as follows:

1101.1 Scope. ~~An *addition* to a building or structure~~ *Additions* to *existing buildings* shall comply with the International Codes as adopted for new construction without requiring the *existing building* ~~or structure~~ to comply with any requirements of those codes or of these provisions, except as required by this chapter and Chapter 3. Where an *addition* impacts the *existing building* ~~or structure~~, that portion of the *existing building* shall comply with this code.

CHAPTER 12
HISTORIC BUILDINGS

SECTION 1201
GENERAL

1201.1 Scope. ~~This chapter is intended to provide means for the preservation of *historic buildings. Historic*~~ Where use of this chapter is elected by the applicant, *historic buildings* shall be permitted to comply with ~~the provisions of~~ this chapter instead of the corresponding provisions in Chapters 3, 4, 7 through 11 and 14. ~~relating to their *repair*, *alteration*, relocation and *change of occupancy*~~.

SECTION 1204
~~CHANGE~~CHANGES OF OCCUPANCY

SECTION 1206
~~RELOCATED BUILDINGS~~ RELOCATIONS

CHAPTER 13

PERFORMANCE COMPLIANCE ~~METHODS~~ METHOD

SECTION 1301
GENERAL

1301.1 Scope. ~~The provisions of this chapter shall apply to the~~ Where the applicant has selected the performance compliance method, *alterations*, ~~*addition* and~~ *changes of occupancy* ~~of~~ and *additions* to *existing* ~~*structures*~~ *buildings*, including ~~historic structures~~ *historic buildings*, ~~as referenced in Section 301.3.3~~ shall comply with this chapter. ~~The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in *existing buildings* while permitting, *alteration*, *addition* and *change of occupancy* without requiring full compliance with Chapters 6 through 12, except where compliance with the prescriptive method of Chapter 5 or the work area method of other provisions of this code is specifically required in this chapter.~~

Delete without substitution:

~~**1301.1.1 Compliance with other methods.** *Alterations*, *additions* and *changes of occupancy* to *existing structures* shall comply with the provisions of this chapter or with one of the methods provided in Section 301.3.~~

Revise as follows:

CHAPTER 14
~~RELOCATED OR MOVED BUILDINGS~~ RELOCATIONS

SECTION 1401
GENERAL

1401.1 Scope. ~~This chapter provides requirements for relocated or moved structures~~ Relocations of *existing buildings*, including *relocatable buildings*, ~~as defined in Chapter 2~~ shall comply with this chapter. Relocations of *historic buildings* shall comply with this chapter, except as modified in Chapter 12.

2024 International Building Code

CHAPTER 33
SAFEGUARDS DURING CONSTRUCTION

SECTION 3301
GENERAL

Revise as follows:

3301.1 Scope. ~~The provisions of this chapter shall govern safety~~ Safety during construction and the protection of adjacent public and private properties shall comply with this chapter. Fire safety during construction shall also comply with ~~the applicable provisions of~~ Chapter 33 of the *International Fire Code*.

2024 International Existing Building Code

CHAPTER 15
CONSTRUCTION SAFEGUARDS

SECTION 1501
GENERAL

Revise as follows:

[BG] 1501.1 Scope. ~~The provisions of this chapter shall govern safety~~ Safety during construction and the protection of adjacent public and private properties shall comply with this chapter. Fire safety during construction shall also comply with ~~the applicable provisions of~~ Chapter 33 of the *International Fire Code.*

Reason: This proposal is intended to complement and extend the work of the Scoping Task Group and IEBC scoping cleanup proposal submitted by BCAC (Proposal 11184).

The scoping task group aimed to create greater consistency in the scoping language for each chapter in the I-Codes and remove redundant administrative language from scoping sections.

This proposal builds on that work in the context of the IEBC by improving editorial consistency across the IEBC.

- For consistency in chapter and section titles and scoping section language, where types of work are referred to in scoping statements they are referred to in the plural (repairs vs repair and additions vs addition).
- “Relocations” instead of various formulations of “relocated and moved buildings.”
- Where the various types of work are listed, the items have been reordered to match the order in which they appear in the IEBC scoping section (101.2): repair, alteration, change of occupancy, addition [to], and relocation [of].
- Chapter 6, which is the charging chapter for the work area compliance method is retitled from “Classification of Work” to “Work Area Compliance Method” for consistency with the naming of Chapters 5 and 13.
- The title of Chapter 13 is changed from plural to singular to better reflect that the chapter contains a single method.
- The scoping statements for Level 2 and 3 alterations and changes of occupancy (801.1, 901.1, and 1001.1) are revised to indicate

the relationship to Chapter 12, similar to the language in the scoping statement for Level 1 alterations (701.1).

- The scoping statement for Chapter 14 (Relocations) is revised to indicate the relationship to Chapter 12, similar to the language in the scoping statement for Chapter 5 (Repairs).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial.

2024 International Existing Building Code

CHAPTER 3
PROVISIONS FOR ALL COMPLIANCE METHODS

Revise as follows:

SECTION 301
~~ADMINISTRATION~~ GENERAL

301.1 ~~Applicability~~ Scope. ~~The *repair*~~ *Repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with ~~Section 301.2, 301.3 or 301.4~~ this chapter. ~~The provisions of Sections 302 through 309 shall apply to all *alterations*, *repairs*, *additions*, relocation of structures and *changes of occupancy* regardless of compliance method.~~

Exceptions:

1. Detached one- and two-family *dwellings* and *townhouses* not more than three *stories above grade plane* in height with a separate *means of egress*, and their accessory structures not more than three *stories above grade plane* in height, shall comply with this code or the *International Residential Code*.
2. Existing buildings shall comply with this code or the *International Building Code*.

301.1.1 ~~302.1~~ Dangerous conditions. The *code official* shall have the authority to require the elimination of conditions deemed *dangerous*. Like materials shall be permitted for repairs and alterations, provided that unsafe conditions are not created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

301.1.2 ~~302.2~~ Additional codes. *Alterations, repairs, additions* and *changes of occupancy* to~~, or relocation of,~~ *existing buildings* and structures shall comply with the provisions for existing buildings in ~~*alterations, repairs, additions* and *changes of occupancy* or relocation, respectively, in this code and~~ the *International Energy Conservation Code*, *International Fire Code*, *International Fuel Gas Code*, *International Mechanical Code*, *International Plumbing Code*, *International Private Sewage Disposal Code*, *International Property Maintenance Code*, *International Residential Code* and NFPA 70. Where provisions of the other codes conflict with provisions of this code, the provisions of this code shall take precedence.

301.2 Repairs. *Repairs* shall comply with ~~the requirements of~~ Chapter 4.

301.3 ~~301.4~~ Relocated buildings. Relocated buildings shall comply with ~~the requirements of~~ Chapter 5 ~~14~~.

301.4 ~~301.3~~ Alteration, addition or change of occupancy. ~~The *alteration*~~ *Alteration*, *addition* or *change of occupancy* of ~~all~~ *existing* *buildings* shall comply with one of the methods listed in Section 301.4.1 ~~301.3.1~~, 301.4.2~~301.3.2~~ or 301.4.3~~301.3.3~~ as selected by the applicant. Sections 301.4.1 ~~301.3.1~~ through 301.4.3~~301.3.3~~ shall not be applied in combination with each other. The provisions of Sections 302 through 314 shall apply to all *alterations*, *additions*, or *changes of occupancy* regardless of compliance method.

> **Exception:** ~~Subject to the approval of the *code official*, *alterations* complying~~ Existing buildings that comply with the building code and laws in ~~existence~~ effect at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code. New structural members added as part of the *alteration* shall comply with the *International Building Code*. This exception shall not apply to the following:
>
> 1. *Alterations* for accessibility required by Section 308 ~~306.~~
> 2. ~~*Alterations* that constitute *substantial*~~ *Substaintial improvement* in *flood hazard areas*, ~~which~~ shall comply with Sections 503.2, 701.3 or 1303.1.3.
> 3. Structural provisions with a change of occupancy shall comply with ~~of~~ Section 311 ~~304~~, Chapter 5 or ~~to the structural provisions of~~ Sections 706, 805 and 906.

301.4.1 ~~301.3.1~~ Prescriptive compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 5 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.4.2~~301.3.2~~ Work area compliance method. *Alterations*, *additions* and *changes of occupancy* complying with the applicable requirements of Chapters 6 through 12 of this code shall be considered in compliance with the provisions of this code.

301.4.3~~301.3.3~~ Performance compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 13 of this code shall be considered in compliance with the provisions of this code.

Delete without substitution:

~~SECTION 302~~
~~GENERAL PROVISIONS~~

~~**302.3 Existing materials.** Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the code official to be *unsafe*.~~

~~**302.4 New and replacement materials.** Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided that *unsafe* conditions are not created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.~~

~~**302.5 Occupancy and use.** Where determining the appropriate application of the referenced sections of this code, the occupancy and use of a building shall be determined in accordance with Chapter 3 of the *International Building Code*.~~

Add new text as follows:

SECTION 302
SPECIAL USE AND OCCUPANCY

Revise as follows:

302.1 ~~301.1.1~~ Bleachers, folding and telescopic seating and grandstands. Existing bleachers, folding and telescopic seating and grandstands shall comply with ICC 300.

302.2 ~~302.2.1~~ Additional codes in health care. In existing Group I-2 occupancies, ambulatory health care *facilities*, outpatient clinics and hyperbaric *facilities*, *alterations*, *repairs*, *additions* and *changes of occupancy* to, or relocation of, *existing buildings* and structures shall also comply with NFPA 99.

Delete without substitution:

~~SECTION 303~~
~~STORM SHELTERS~~

Revise as follows:

302.3 ~~303.1 General~~ Storm shelters. This section applies to the design and construction of storm shelters for the purpose of providing protection during tornados, hurricanes and other severe windstorms.

302.3.1 ~~303.1.1~~ Construction. *Storm shelters* shall be constructed in accordance with Section 423 of the *International Building Code* and ICC 500 and shall be designated as hurricane shelters, tornado shelters or combined hurricane and tornado shelters.

Exception: *Storm shelters* added to critical emergency operations facilities or Group E occupancies are not required to comply with the travel distance in Section 423.4.2 or 423.5.2 of the *International Building Code*.

302.3.2 ~~303.2~~ Addition to a Group E occupancy. Where an *addition* is added to an existing Group E occupancy located in an area where the shelter design wind speed for tornados is 250 mph (402.3 km/h) in accordance with Figure 304.2(1) of ICC 500 and the occupant load in the *addition* is 50 or more, the *addition* shall have a *storm shelter* constructed in accordance with ICC 500.

Exceptions:

1. Group E day care *facilities*.
2. Group E occupancies accessory to places of religious worship.
3. *Additions* meeting the requirements for shelter design in ICC 500.

302.3.2.1 ~~303.2.1~~ Design occupant capacity. The required design occupant capacity of the *storm shelter* shall include all buildings on the site, and shall be the total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.

Exceptions:

1. Where an *addition* is being added on an existing Group E site, and where the *addition* is not of sufficient size to accommodate the required occupant capacity of the *storm shelter* for all of the buildings on-site, the *storm shelter* shall at a minimum accommodate the required capacity for the *addition*.
2. Where *approved* by the *code official*, the required design occupant capacity of the shelter shall be permitted to be reduced by the design occupant capacity of any existing *storm shelters* on the site.

302.3.3 ~~303.3~~ Occupancy classification. The occupancy classification for *storm shelters* shall be determined in accordance with Section 423.3 of the *International Building Code*.

Add new text as follows:

SECTION 303
BUILDING HEIGHT AND AREA

303.1 General. Building height and area shall comply with the International Building Code or the International Residential code for new construction or this code.

Revise as follows:

SECTION 304 ~~309~~
FIRE AND SMOKE PROTECTION FEATURES ~~ADDITIONS AND REPLACEMENTS OF EXTERIOR WALL COVERINGS AND EXTERIOR WALL ENVELOPES~~

Delete without substitution:

~~**309.1 General.** The provisions of Section 309 apply to all *alterations*, *repairs*, *additions*, relocations of structures and *changes of occupancy* regardless of compliance method.~~

Revise as follows:

304.1 ~~**309.2**~~ **Additions and replacements.** Where an *exterior wall covering* or *exterior wall envelope* is added or replaced, the materials and methods used shall comply with the requirements for new construction in Chapter 14 and Chapter 26 of the *International Building Code* if the added or replaced *exterior wall covering* or *exterior wall envelope* involves two or more contiguous stories and comprises more than 15 percent of the total wall area on any side of the building.

304.1.1 ~~**309.2.1**~~ **Automatic sprinkler systems.** Combustible *exterior wall covering* or combustible exterior wall envelopes shall not be added to an existing high-rise building that is not protected throughout with an automatic sprinkler system.

Exceptions:

1. Where such material is located on a single story and is less than 15 percent of the wall area on any side of the building.
2. Water-resistive barriers installed in accordance with Section 1402.6 of the *International Building Code*.

Add new text as follows:

SECTION 305
INTERIOR FINISHES

305.1 General. Interior finishes shall comply with the International Building Code or the International Residential code for new construction or this code.

Revise as follows:

SECTION 306 ~~307~~
AUTOMATIC SPRINKLER SYSTEMS AND FIRE ALARM AND DETECTION SYSTEMS ~~SMOKE ALARMS~~

306.1 ~~**307.1**~~ **Smoke alarms.** Where an *alteration*, *addition*, *change of occupancy* or relocation of a building is made to an *existing building* or structure of a Group R and I-1 occupancy, the *existing building* shall be provided with smoke alarms in accordance with the International Fire Code or Section R310 of the *International Residential Code*.

Exception: Work classified as Level 1 *Alterations* in accordance with Chapter 7.

Delete without substitution:

~~SECTION 308~~
~~CARBON MONOXIDE DETECTION~~

Revise as follows:

<u>306.2</u> ~~308.1~~ **Carbon monoxide detection.** Where an *addition*, *alteration*, *change of occupancy* or relocation of a building is made to an *existing building* , the *existing building* shall be provided with carbon monoxide detection in accordance with the International Fire Code or Section R311 of the *International Residential Code*.

Exceptions:

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.
2. Installation, *alteration* or *repairs* of plumbing or mechanical systems, other than fuel-burning appliances.
3. Work classified as Level 1 *Alterations* in accordance with Chapter 7.
4. In Group I-2 occupancies, carbon monoxide detection is not required in each sleeping unit where carbon monoxide detection, which transmits an alarm signal to an *approved* location, is provided in each space containing a carbon monoxide source.

Add new text as follows:

<u>SECTION 307</u>
<u>MEANS OF EGRESS</u>

Revise as follows:

<u>307.1</u> ~~306.7.2~~ **Accessible means of egress.** Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be added in existing *facilities*. <u>Required accessible means of egress shall be maintained during construction, demolition, remodeling or *alterations* and *additions* to any occupied building.</u>

<u>**Exception:** Existing means of egress need not be maintained where *approved* temporary means of egress and accessible means of egress systems and *facilities* are provided.</u>

<u>307.2</u>~~306.6.1~~ **Accessible means of egress.** <u>In additions, at least</u> ~~Not fewer than~~ one accessible means of egress from the *addition* shall be provided where required by Section 1009.1 of the *International Building Code*. An additional accessible means of egress shall be provided where an additional means of egress is required due to the *addition*. Where an accessible means of egress serving the *addition* is within the *existing building*, the following are required:

1. An accessible route from the *addition* to the *existing building* shall be provided.
2. The accessible means of egress in the *existing building* shall comply with Section <u>308</u> ~~306~~.7.1.

<u>307.2.1</u>~~306.6.1.1~~ **Additions for elevators.** Where an *addition* is being constructed exclusively to accommodate the installation of an elevator or elevators to improve accessibility, an accessible means of egress in accordance with Section 1009.1 of the *International Building Code* is not required where all of the following conditions are provided:

1. Two-way communication is provided at all elevator landings that are part of the *addition* in accordance with Section 1009.8 of the *International Building Code*.
2. Each elevator landing is on floor level with access to a horizontal exit or to a stairway with a width of not less than 36 inches (914 mm).
3. The elevator does not serve a required accessible floor or occupied roof more than four stories above or below the level of exit discharge.

SECTION <u>308</u>~~306~~

ACCESSIBILITY ~~FOR EXISTING BUILDINGS~~

308 ~~306~~.1 ~~Scope~~ Accessibility. The provisions of Sections 308 ~~306~~.1 through 308.7.17~~306.7.16~~ apply to the accessibility for maintenance and *repair*, *change of occupancy*, *additions* and *alterations* to *existing buildings*, including those identified as *historic buildings*.

308 ~~306~~.2 General. A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy. ~~Required accessible means of egress shall be maintained during construction, demolition, remodeling or *alterations* and *additions* to any occupied building.~~

~~**Exception:** Existing means of egress need not be maintained where *approved* temporary means of egress and accessible means of egress systems and *facilities* are provided.~~

308 ~~306~~.2.1 Prohibited reduction in accessibility. An *alteration* or *addition* that decreases or has the effect of decreasing accessibility of a building, *facility* or element thereof, below the requirements for new construction at the time of the *alteration* or *addition* is prohibited. The number of accessible elements need not exceed that required for new construction at the time of *alteration* or *addition.*

308 ~~306~~.3 Design. Buildings and *facilities* shall be designed and constructed to be accessible in accordance with this code and the *alteration* and *existing building* provisions in ICC A117.1, as applicable.

308 ~~306~~.4 Extent of application. An *alteration* of an existing *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction.

308 ~~306~~.5 Change of occupancy. Where an existing building undergoes a *change of occupancy* that includes alterations, such alterations shall comply with Section 308 ~~306~~.7.

308 ~~306~~.6 Additions. Where additions contain dwelling or sleeping units, the accessibility requirements shall apply only to the quantity of the dwelling or sleeping units in the *addition*. Provisions for new construction shall apply to *additions*. An *addition* that affects the accessibility to, or contains an area of, a *primary function* shall comply with the requirements in Section 308 ~~306~~.7.1.

308 ~~306~~.7 Alterations. A *facility* that is altered shall comply with the applicable provisions in Chapter 11 of the *International Building Code,* ICC A117.1 and the provisions of Sections 308 ~~306~~.7.1 through 308 ~~306~~.7.18, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

308 ~~306~~.7.1 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to, or contains an area of, *primary function*, the route to the *primary function* area shall be accessible. Toilet facilities and drinking fountains serving the area of *primary function*, including the route from the area of primary function to these facilities, shall be accessible. Priority shall be given to the improvements affecting the accessible route to the primary function area.

Exceptions:

1. The cumulative costs of providing the accessible route, toilet facilities and drinking fountains are not required to exceed 20 percent of the costs of the *alterations* affecting the area of *primary function*.
2. This provision does not apply to *alterations* limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration*of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.
5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

308.7.2~~306.7.3~~ Alteration of Type A units. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.

<u>308.7.3</u>~~306.7.4~~ Type B units. Type B dwelling or sleeping units required by Section 1108 of the *International Building Code* are not required to be provided in *existing buildings* and *facilities* undergoing *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

<u>308.7.4</u>~~306.7.5~~ Entrances. Where an *alteration* includes *alterations* to an entrance that is not accessible, and the *facility* has an accessible entrance, the altered entrance is not required to be accessible unless required by Section <u>308</u> ~~306~~.7.1. Signs complying with Section 1112 of the *International Building Code* shall be provided.

<u>308.7.5</u>~~306.7.6~~ Accessible route. Exterior accessible routes, including curb ramps, shall be not less than 36 inches (914 mm) minimum in width.

<u>308.7.6</u>~~306.7.7~~ Elevators. Altered elements of existing elevators shall comply with ASME A17.1. Where the elevator emergency communication system is altered or replaced, that system shall comply with Section 3001.2 of the *International Building Code*. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

<u>308.7.7</u>~~306.7.8~~ Limited-use/limited-application elevators. Limited-use/limited-application elevators installed in accordance with ASME A17.1 shall be permitted as a component of an accessible route.

<u>308.7.8</u>~~306.7.9~~ Platform lifts. Vertical and inclined platform (wheelchair) lifts installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.

<u>308.7.9</u>~~306.7.10~~ Stairways and escalators in existing buildings. Where an escalator or stairway is added where none existed previously and major structural modifications are necessary for installation, an accessible route complying with Section 1104.4 of the *International Building Code* is required between levels served by such escalator or stairway.

<u>308.7.10</u>~~306.7.11~~ Determination of number of units. Where Chapter 11 of the *International Building Code* requires Accessible, Type A or Type B units and where such units are being altered or added within an *existing building*, the number of Accessible, Type A and Type B units shall be determined in accordance with Sections <u>30.7.10.1</u>306.7.11.1 through <u>308.7.10.3</u>~~306.7.11.3~~.

<u>308.7.10.1</u>~~306.7.11.1~~ Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added within an *existing building* , the requirements of Section 1108 of the *International Building Code* for Accessible units apply only to the quantity of dwelling or sleeping units being altered or added.

<u>308.7.10.2</u>~~306.7.11.2~~ Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered or added within an *existing building* , the requirements of Section 1108 of the *International Building Code* for Type A units apply only to the quantity of the dwelling or sleeping units being altered or added.

<u>308.7.10.3</u>~~306.7.11.3~~ Type B dwelling or sleeping units. Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered or added within an *existing building* and where the *work area* is greater than 50 percent of the aggregate area of the building, the requirements of Section 1108 of the *International Building Code* for Type B units apply only to the quantity of the dwelling or sleeping units being altered or added.

<u>308.7.11</u>~~306.7.12~~ Toilet rooms. Where it is *technically infeasible* to alter existing toilet rooms to be accessible, one accessible single-user toilet room or one accessible family or assisted-use toilet room constructed in accordance with Section 1110.2.1 of the *International Building Code* is permitted. This toilet room shall be located on the same floor and in the same area as the existing toilet rooms. At the inaccessible toilet rooms, directional signs indicating the location of the nearest such toilet room shall be provided. These directional signs shall include the International Symbol of Accessibility, and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

<u>308.7.12</u>~~306.7.13~~ Bathing rooms. Where it is *technically infeasible* to alter existing bathing rooms to be accessible, one accessible single-user bathing room or one accessible family or assisted-use bathing room constructed in accordance with Section 1110.2.1 of the *International Building Code* is permitted. This accessible bathing room shall be located on the same floor and in the same area as the existing bathing rooms. At the inaccessible bathing rooms, directional signs indicating the location of the nearest such bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility, and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

308.7.13~~306.7.14~~ Additional toilet and bathing facilities. In assembly and mercantile occupancies, where additional toilet fixtures are added, not fewer than one accessible family or assisted-use toilet room shall be provided where required by Section 1110.2.1 of the *International Building Code*. In recreational *facilities*, where additional bathing rooms are being added, not fewer than one family or assisted-use bathing room shall be provided where required by Section 1110.2.1 of the *International Building Code*.

308.7.14~~306.7.15~~ Adult changing stations. Where additional toilet facilities are being added, in occupancies where adult changing stations are required by Section 1110.4.1 of the *International Building Code*, not fewer than one accessible family or assisted-use toilet room with an adult changing station shall be provided in accordance with Section 1110.4 of the *International Building Code*. The adult changing station shall be permitted to be located in a family or assisted-use toilet room or bathing room required by Section 308.7.11 ~~306.7.12~~, 308.7.12~~306.7.13~~ or 308.7.13~~306.7.14~~.

308.7.15~~306.7.16~~ Dressing, fitting and locker rooms. Where it is *technically infeasible* to provide accessible dressing, fitting or locker rooms at the same location as similar types of rooms, one accessible room on the same level shall be provided. Where separate-sex *facilities* are provided, accessible rooms for each sex shall be provided. Separate-sex *facilities* are not required where only unisex rooms are provided.

308.7.16~~306.7.17~~ Amusement rides. Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in Section 1111.4.8 of the *International Building Code.*

308.7.17~~306.7.18~~ Historic structures. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the historic structure, as determined by the authority having jurisdiction, the alternative requirements of Sections 308.7.17.1 ~~306.7.18.1~~ through 308.7.17.7 ~~306.7.18.7~~ for that element shall be permitted.

Exceptions:

1. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in historic structures.
2. The altered element or space is not required to be on an accessible route, unless required by Section 308.7.17.1 ~~306.7.18.1~~ or 308.7.17.2 ~~306.7.18.2.~~

308.7.17.1~~306.7.18.1~~ Site arrival points. Not fewer than one exterior accessible route, including curb ramps from a site arrival point to an accessible entrance, shall be provided and shall not be less than 36 inches (914 mm) minimum in width.

308.7.17.2~~306.7.18.2~~ Multiple-level buildings and facilities. An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.

308.7.17.3~~306.7.18.3~~ Entrances. Where an entrance cannot be made accessible in accordance with Section 308 ~~306~~.7.5, an accessible entrance that is unlocked while the building is occupied shall be provided; or, a locked accessible entrance with a notification system or remote monitoring shall be provided.

Signs complying with Section 1112 of the *International Building Code* shall be provided at the public entrances and the accessible entrance.

308.17.4~~306.7.18.4~~ Toilet facilities. Where toilet rooms are provided, not fewer than one accessible single-user toilet room or one accessible family or assisted-use toilet room complying with Section 1110.2.1 of the *International Building Code* shall be provided.

308.7.17.5~~306.7.18.5~~ Bathing facilities. Where bathing rooms are provided, not fewer than one accessible single-user bathing room or one accessible family or assisted-use bathing rooms complying with Section 1110.2.1 of the *International Building Code* shall be provided.

308.7.17.6~~306.7.18.6~~ Type A units. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.

308.7.17.7~~306.7.18.7~~ Type B units. Type B dwelling or sleeping units required by Section 1108 of the *International Building Code* are not required to be provided in *historic buildings*.

Add new text as follows:

SECTION 309
INTERIOR ENVIRONMENTS

309.1 General. Interior environments shall comply with the International Building Code or the International Residential code for new construction or this code.

SECTION 310
ENERGY CONSERVATION

310.1 Energy Conservation. Energy conservation shall comply with Section 301.1.2.

Revise as follows:

SECTION SECTION 311~~304~~
STRUCTURAL ~~DESIGN LOADS AND EVALUATION AND DESIGN PROCEDURES~~

[BS] 311.1 ~~302.4.1~~ New structural members and connections. New structural members and connections shall comply with the detailing provisions of the *International Building Code* for new buildings of similar structure, purpose and location.

Exception: Where alternative design criteria are specifically permitted.

[BS] 311.2 ~~304.1~~ Live loads. Where an *addition* or *alteration* does not result in increased design live load, existing gravity load-carrying structural elements shall be permitted to be evaluated and designed for live loads *approved* prior to the *addition* or *alteration*. If the *approved* live load is less than that required by Section 1607 of the *International Building Code*, the area designated for the nonconforming live load shall be posted with placards of *approved* design indicating the *approved* live load. Where the *addition* or *alteration* results in increased design live load, the live load required by Section 1607 of the *International Building Code* shall be used.

[BS] 311.3 ~~304.2~~ Snow loads on adjacent buildings. Where an *alteration* or *addition* changes the potential snow drift effects on an adjacent building, the *code official* is authorized to enforce Section 7.12 of ASCE 7.

[BS] 311.4 ~~304.3~~ Seismic evaluation and design procedures. Where required, seismic evaluation or design shall comply with the procedures and criteria in this section, regardless of which compliance method is used. The scope of the required evaluation or design shall be as indicated in applicable provisions of Chapters 4 through 12.

[BS] 311.4.1~~304.3.1~~ Full seismic criteria. Where required, seismic evaluation or design shall comply with one of the following methodologies, which shall not be applied in combination with each other:

1. Section 1613 of the *International Building Code*. Where the existing seismic force-resisting system is a type that can be designated as "Ordinary," values of R, Ω_0 and C_d used for analysis in accordance with Chapter 16 of the *International Building Code* shall be those specified for structural systems classified as "Ordinary" in accordance with Table 12.2-1 of ASCE 7, unless it can be demonstrated that the structural system will provide performance equivalent to that of a "Detailed," "Intermediate" or "Special" system.
2. ASCE 41, using a Tier 3 procedure and both levels of the two-level performance objective in Table <u>311.4.1</u> ~~304.3.1~~ for the applicable *risk category*.

[BS] TABLE <u>311.4.1</u>~~304.3.1~~ PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH FULL SEISMIC CRITERIA

RISK CATEGORY (Based on IBC Table 1604.5)	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-1N EARTHQUAKE HAZARD LEVEL	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-2N EARTHQUAKE HAZARD LEVEL
I	Life Safety (S-3)	Collapse Prevention (S-5)
II	Life Safety (S-3)	Collapse Prevention (S-5)
III	Damage Control (S-2)	Limited Safety (S-4)
IV	Immediate Occupancy (S-1)	Life Safety (S-3)

[BS] <u>311.4.2</u> ~~304.3.2~~ Reduced seismic criteria. Where required, seismic evaluation or design shall comply with one of the following methodologies, which shall not be applied in combination with each other:

1. Section 1613 of the *International Building Code* using 75 percent of the prescribed forces. Values of R, Ω_0 and C_d used for analysis shall be as specified in Section <u>311.4.1</u> ~~304.3.1~~ of this code.
2. Applicable chapters of Appendix A of this code, for structures or portions of structures specified in Items 2.1 through 2.4 subject to the limitations of the respective chapter.
   - 2.1. Chapter A1 for unreinforced masonry bearing wall buildings assigned to *Risk Category* I or II.
   - 2.2. Chapter A2 for the wall anchorage system in reinforced concrete and reinforced masonry wall buildings with flexible diaphragms assigned to *Risk Category* I or II.
   - 2.3. Chapter A3 for cripple walls and sill plate anchorage in residential buildings of light-frame wood construction assigned to *Risk Category* I or II.
   - 2.4. Chapter A4 for soft, weak or open-front wall conditions in multiple-unit residential buildings of wood construction assigned to *Risk Category* I or II.
3. ASCE 41, using the performance objective in Table <u>311.4.2</u> ~~304.3.2~~ for the applicable *risk category*.

[BS] TABLE <u>311.4.2</u> ~~304.3.2~~ PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH REDUCED CRITERIA FORCES

RISK CATEGORY (Based on IBC Table 1604.5)	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-1E EARTHQUAKE HAZARD LEVEL	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-2E EARTHQUAKE HAZARD LEVEL
I	Life Safety (S-3). See Note a	Collapse Prevention (S-5)
II	Life Safety (S-3). See Note a	Collapse Prevention (S-5)
III	Damage Control (S-2). See Note a	Limited Safety (S-4). See Note b
IV	Immediate Occupancy (S-1)	Life Safety (S-3). See Note c

a. For Risk Categories I, II and III, the Tier 1 and Tier 2 procedures need not be considered for the BSE-1E earthquake hazard level.

b. For Risk Category III, the Tier 1 screening checklists shall be based on the Collapse Prevention, except that checklist statements using the Quick Check provisions shall be based on *MS*-factors that are the average of the values for Collapse Prevention and Life Safety.

c. For Risk Category IV, the Tier 1 screening checklists shall be based on Collapse Prevention, except that checklist statements using the Quick Check provisions shall be based on *MS*-factors for Life Safety.

Delete without substitution:

~~SECTION 305~~
~~IN-SITU LOAD TESTS~~

Revise as follows:

[BS] 311.5 ~~305.1 General~~ In-situ load tests. Where used, in-situ load tests shall be conducted in accordance with Section 1708 of the *International Building Code*.

Add new text as follows:

SECTION 312
ELECTRICAL

312.1 Electrical. Electrical provisions shall comply with Section 301.1.2.

SECTION 313
MECHANICAL

313.1 Mechanical. Mechanical systems shall comply with Section 301.1.2.

SECTION 314
PLUMBING

314.1 Plumbing. Plumbing systems shall comply with Section 301.1.2.

Attached Files

- **BCAC IEBC Chaper 3 clean draft.pdf**
  https://www.cdpaccess.com/proposal/11299/34350/files/download/9915/

Reason: This is a relocation and clarification of requirements explaining the use of the IEBC and the application of Chapter 3 to all methods. It is not intended to have any change to construction requirements.

301.1 Scope - this is a simplification. The exceptions allow for existing buildings to comply with new construction. The deleted sentence is addressed in Section 301.4.

301.1.1 Dangerous conditions - the added sentence was moved from existing Section 302.4

301.2 Repairs and 301.3 Relocation - these are chapter that are separate from the methods for alterations and additions.

301.4 Alterations, addition or change of occupancy - the new last sentence clarifies the application of the common elements.

302.3, 302.4 and 302.5 - these are redundant statements that addressed elsewhere in the chapter.

Over time, provisions have been added to Chapter 3 in a random manner. This organization is the same as what is proposed for IRBC Chapter 10 and follows the basic organization of the IBC.

Section 302 Special use and occupancies - this will bleachers, health care, storm shelters currently in Chapter 3.

Section 303 Building Height and area - for building height and area there are provisions in some of the methods that are different than new construction. At this time, this is a place holder so that general items that would be applicable would have a place to go to.

Section 304 Fire and smoke protection features (fire safety items) - this will include exterior wall coverings, currently in Chapter 3. The current Section 309.1 is addressed in the main paragraphs, so this is deleted as redundant.

Section 305 Interior Finishes - for interior finishes there are provisions in some of the methods that are different than new construction. At this time, this is a place holder so that general items that would be applicable would have a place to go to.

Section 306 Automatic sprinkler systems and fire alarm and detections systems - this includes smoke alarms and carbon monoxide detection already in Chapter 3.

Section 307 Means of egress - the accessible means of egress provisions are in Chapter 10 of the IBC. To make them easier to locate, the have been moved out from within the accessibility requirement. There are means of egress provisions currently found in the other methods. Some suggested to move hear under other changes are emergency escape and rescue openings, window guards, fire escapes.

Section 308 Accessibility - this includes the accessibility requirements currently in Chapter 3.

Section 309 Interior environments - for interior finishes there are provisions in some of the methods that are different than new construction. At this time, this is a place holder so that general items that would be applicable would have a place to go to. Some suggested to move hear under other changes are classroom acoustics.

Section 310 Energy conservation - The IECC is referenced in Section 301.2.2 and includes existing building provisions. This section is here to be consistent with other chapters.

Section 311 - Structural - this include the structural loads and in-situ loads currently in Chapter 3

Section 312 through 314 - there are provisions in the other codes for existing building rather than in the IEBC. This pointer is a reference to the additional codes

This proposal is part of a package of code changes to expand and reorganize Chapter 3 to increase understanding of the options available in the IEBC. Attached is a clean copy of Chapter 3 if all the associated proposals are accepted.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a reorganization. Please see the reason statement.

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

CHAPTER 3
PROVISIONS FOR ALL COMPLIANCE METHODS

SECTION 301
ADMINISTRATION

Revise as follows:

301.1 Applicability. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with Section 301.2, 301.3, ~~or~~ 301.4 or 301.5. The provisions of Sections 302 through 309 shall apply to all *alterations*, *repairs*, *additions*, relocation of structures and *changes of occupancy* regardless of compliance method.

301.1.1 Bleachers, folding and telescopic seating and grandstands. Existing bleachers, folding and telescopic seating and grandstands shall comply with ICC 300.

301.2 Repairs. *Repairs* shall comply with the requirements of Chapter 4.

Add new text as follows:

301.3 Historic buildings. *Alterations*, *additions* or *changes of occupancy* of *historic buildings* shall comply with one of the methods described in Section 301.5 except as modified by Chapter 13.

301.4 Relocated buildings. Relocated buildings shall comply with the requirements of Chapter 14.

Revise as follows:

~~301.3~~ 301.5 Alteration, addition or change of occupancy. The *alteration*, *addition* or *change of occupancy* of all *existing buildings* shall comply with one of the methods listed in Section ~~301.3.1~~ 301.5.1, ~~301.3.2~~ 301.5.2 or ~~301.3.3~~ 301.5.3 as selected by the applicant. Sections ~~301.3.1~~ 301.5.1 through ~~301.3.3~~ 301.5.3 shall not be applied in combination with each other.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code. New structural members added as part of the *alteration* shall comply with the *International Building Code*. This exception shall not apply to the following:

1. *Alterations* for accessibility required by Section 306.
2. *Alterations* that constitute *substantial improvement* in *flood hazard areas*, which shall comply with Sections 503.2, 701.3 or 1303.1.3.
3. Structural provisions of Section 304, Chapter 5 or to the structural provisions of Sections 706, 805 and 906.

~~**301.3.1**~~ **301.5.1** **Prescriptive compliance method.** *Alterations*, *additions* and *changes of occupancy* complying with Chapter 5 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

~~**301.3.2**~~ **301.5.2** **Work area compliance method.** *Alterations*, *additions* and *changes of occupancy* complying with the applicable requirements of Chapters 6 through ~~12~~ 11 of this code shall be considered in compliance with the provisions of this code.

~~**301.3.3**~~ **301.5.3** **Performance compliance method.** *Alterations*, *additions* and *changes of occupancy* complying with Chapter 12 ~~13~~ of this code shall be considered in compliance with the provisions of this code.

SECTION 306
ACCESSIBILITY FOR EXISTING BUILDINGS

306.1 Scope. The provisions of Sections 306.1 through ~~306.7.18~~ 306.7.17 apply to maintenance and *repair*, *change of occupancy*, *additions* and *alterations* to *existing buildings*~~, including those identified as *historic buildings*~~.

CHAPTER 5
PRESCRIPTIVE COMPLIANCE METHOD

SECTION 501
GENERAL

501.1 Scope. The provisions of this chapter shall control the *alteration, addition* and *change of occupancy* of *existing buildings* and structures~~, including *historic buildings* and structures~~ as referenced in Section ~~301.3~~ 301.5.1.

Exception: Historic buildings shall comply with this chapter except as modifed in Chapter 13.

Delete without substitution:

~~SECTION 507~~
~~HISTORIC BUILDINGS~~

~~**507.1 Historic buildings.** The provisions of this code that require improvements relative to a building's existing condition or, in the case of *repairs*, that require improvements relative to a building's predamage condition, shall not be mandatory for *historic buildings* unless specifically required by this section.~~

~~**507.2 Life safety hazards.** The provisions of this code shall apply to *historic buildings* judged by the *code official* to constitute a distinct life safety hazard.~~

~~**[BS] 507.3 Flood hazard areas.** Within *flood hazard areas* established in accordance with Section 1612.3 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable, where the work proposed constitutes *substantial improvement,* the building shall be brought into compliance with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.~~

~~**Exception:** *Historic buildings* meeting any of the following criteria need not be brought into compliance:~~

1. ~~Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places.~~
2. ~~Determined by the Secretary of the US Department of Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district.~~
3. ~~Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.~~

~~**[BS] 507.4 Structural.** *Historic buildings* shall comply with the applicable structural provisions in this chapter.~~

~~**Exceptions:**~~

1. ~~The *code official* shall be authorized to accept existing floors and existing live loads and to approve operational controls that limit the live load on any floor.~~
2. ~~*Repair* of *substantial structural damage* is not required to comply with Sections 405.2.3 and 405.2.4. *Substantial structural damage* shall be repaired in accordance with Section 405.2.1.~~

CHAPTER 6
CLASSIFICATION OF WORK

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. The provisions of this chapter shall be used in conjunction with Chapters 7 through ~~12~~ 11 and shall apply to the *alteration*, *addition* and *change of occupancy* of *existing structures*~~, including historic structures,~~ as referenced in Section ~~301.3.2~~ 301.5.2. The work performed on an *existing building* shall be classified in accordance with this chapter.

Exception: Historic buildings shall comply with this chapter except as modifed in Chapter 13.

Delete without substitution:

~~SECTION 607~~
~~HISTORIC BUILDINGS~~

~~**607.1 Scope.** *Historic building* provisions shall apply to buildings classified as historic as defined in Chapter 2.~~

~~**607.2 Application.** Except as specifically provided for in Chapter 12, *historic buildings* shall comply with applicable provisions of this code for the type of work being performed.~~

CHAPTER 7
ALTERATIONS—LEVEL 1

SECTION 701
GENERAL

Revise as follows:

701.1 Scope. Level 1 *alterations* as described in Section 602 shall comply with the requirements of this chapter. ~~Level 1 *alterations* to *historic buildings* shall comply with this chapter, except as modified in Chapter 12.~~

CHAPTER 8

ALTERATIONS—LEVEL 2

SECTION 801
GENERAL

801.1 Scope. Level 2 *alterations* as described in Section 603 shall comply with the requirements of this chapter.

Exception: Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section 306.7.1 shall be permitted to comply with Chapter 7.

CHAPTER 9
ALTERATIONS—LEVEL 3

SECTION 901
GENERAL

901.1 Scope. Level 3 *alterations* as described in Section 604 shall comply with the requirements of this chapter.

CHAPTER ~~13~~12
PERFORMANCE COMPLIANCE METHODS

SECTION ~~1301~~ 1201
GENERAL

~~1301.1~~ 1201.1 Scope. The provisions of this chapter shall apply to the *alteration*, *addition* and *change of occupancy* of *existing structures* ~~, including historic structures,~~ as referenced in Section ~~301.3.3~~ 301.5.3. The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in *existing buildings* while permitting, *alteration*, *addition* and *change of occupancy* without requiring full compliance with Chapters 6 through 12, except where compliance with the prescriptive method of Chapter 5 or the work area method of other provisions of this code is specifically required in this chapter.

Exception: Historic buildings shall comply with this chapter except as modified in Chapter 13.

~~1301.1.1~~ 1201.1.1 Compliance with other methods. *Alterations*, *additions* and *changes of occupancy* to *existing structures* shall comply with the provisions of this chapter or with one of the methods provided in Section ~~301.3~~ 301.5.

CHAPTER ~~12~~ 13
HISTORIC BUILDINGS

SECTION ~~1201~~ 1301
GENERAL

1301.1 ~~1201.1~~ Scope. This chapter is intended to provide means for the preservation of *historic buildings. Historic buildings* shall comply with the provisions of this chapter relating to their *repair*, *alteration*, relocation and *change of occupancy*.

SECTION ~~1202~~ 1302
REPAIRS

SECTION ~~1203~~ 1303
FIRE SAFETY

Add new text as follows:

SECTION 1304
ACCESSIBILITY

1304.1 General. The provisions of Sections 306.1 through 306.7.17 apply to maintenance and *repair*, change of occupancy, additions and alterations for accessibility to existing buildings identified as historic buildings.

~~306.7.18~~ 1304.2 ~~Historic structures~~ Application. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the historic structure, as determined by the authority having jurisdiction, the alternative requirements of Sections 1304.2.1 ~~306.7.18.1~~ through 1304.2.7 ~~306.7.18.7~~ for that element shall be permitted.

Exceptions:

1. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in historic structures.
2. The altered element or space is not required to be on an accessible route, unless required by Section ~~306.7.18.1~~ 1304.2.1 or ~~306.7.18.2~~ 1304.2.2.

Revise as follows:

~~306.7.18.1~~ 1304.2.1 Site arrival points. Not fewer than one exterior accessible route, including curb ramps from a site arrival point to an accessible entrance, shall be provided and shall not be less than 36 inches (914 mm) minimum in width.

~~306.7.18.2~~ 1304.2.2 Multiple-level buildings and facilities. An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.

~~306.7.18.3~~ 1304.2.3 Entrances. Where an entrance cannot be made accessible in accordance with Section 306.7.5, an accessible entrance that is unlocked while the building is occupied shall be provided; or, a locked accessible entrance with a notification system or remote monitoring shall be provided.

Signs complying with Section 1112 of the *International Building Code* shall be provided at the public entrances and the accessible entrance.

~~306.7.18.4~~ 1304.2.4 Toilet facilities. Where toilet rooms are provided, not fewer than one accessible single-user toilet room or one accessible family or assisted-use toilet room complying with Section 1110.2.1 of the *International Building Code* shall be provided.

~~306.7.18.5~~ 1304.2.5 Bathing facilities. Where bathing rooms are provided, not fewer than one accessible single-user bathing room or one accessible family or assisted-use bathing rooms complying with Section 1110.2.1 of the *International Building Code* shall be provided.

~~306.7.18.6~~ 1304.2.6 Type A units. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.

~~306.7.18.7~~ 1304.2.7 Type B units. Type B dwelling or sleeping units required by Section 1108 of the *International Building Code* are not required to be provided in *historic buildings*.

SECTION ~~1205~~ 1305

STRUCTURAL

SECTION ~~1204~~ 1306
CHANGE OF OCCUPANCY

SECTION ~~1206~~ 1307
RELOCATED BUILDINGS

Reason: The purpose of this proposal is to move the requirements for historic buildings into one location so it can be generally referenced the same as Repairs and Relocated buildings. This will improve consistency across the three methods for the reuse of historic buildings. Some sections without changes are included to better show consistency across methods and chapters.

This is one of a group of changes from BCAC regarding the reuse of historic buildings. See the proposal to reorganize the chapter for a clean copy of the chapter for Historic Buildings if all the proposals are approved, however, they are all stand alone proposals.301.1 and 301.3 - allows for the requirements for historic buildings to be in one chapter, regardless of method.
306 - accessibility in historic building has been relocated to the historic building chapter.
501.1, 601.1, 1301.1 - allows for historic buildings to use the same exceptions for existing building offered for all existing buildings. The exception allows for historic buildings to have additional allowances currently permitted.
507 - deleted
507.1 similar to 1201.1
507.2 similar to 1201.5 and 1205.2
507.3 - same as 1201.4
507.4 - same as 1205.1
607, 701.1 - Deleted reference to Chapter 12 in work area method as redundant. This is addressed in 301.3 and 601.1.
Move chapter for Performance compliance methods to Chapter 12
Move chapter for Historic Buildings to Chapter 13 - this moves historic buildings out of the work area method.
1304(new) - relocate the historic building provisions for accessibility from Chapter 3.
1305 & 1306 - Switch structural and change of occupancy sections so that the order of the sections are related to IBC chapter orders and consistent with BCAC proposals for Chapter 3 and 10.
This is one of a group of code change proposals related to IEBC Chapter 12 Historic buildings. While they work together, each proposal can stand on it's own merit. Please see the proposal for the reorganization of this chapter for a clean copy of what this chapter would look like if all the proposals pass.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a movement of existing sections with no change in construction requirements.

EB8-25

EB9-25

IEBC: CHAPTER 3, SECTION 301, 301.1, 301.1.1, 301.2, 301.4, 301.3, 301.3.1, 301.3.2, 301.3.3, SECTION 310 (New), 310.1 (New)

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

CHAPTER 3
PROVISIONS FOR ALL COMPLIANCE METHODS

SECTION 301
ADMINISTRATION

301.1 Applicability. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with Section 301.2, 301.3 or 301.4. The provisions of Sections 302 through ~~309~~ 310 shall apply to all *alterations*, *repairs*, *additions*, relocation of structures and *changes of occupancy* regardless of compliance method.

Delete without substitution:

~~**301.1.1 Bleachers, folding and telescopic seating and grandstands.** Existing bleachers, folding and telescopic seating and grandstands shall comply with ICC 300.~~

301.2 Repairs. *Repairs* shall comply with the requirements of Chapter 4.

Revise as follows:

301.3 ~~301.4~~ Relocated buildings. Relocated buildings shall comply with the requirements of Chapter 14.

~~301.3~~ 301.4 Alteration, addition or change of occupancy. The *alteration*, *addition* or *change of occupancy* of all *existing buildings* shall comply with one of the methods listed in Section ~~301.3.1~~301.4.1, ~~301.3.2~~301.4.2 or ~~301.3.3~~301.4.3 as selected by the applicant. Sections ~~301.3.1~~301.4.1 through ~~301.3.3~~301.4.3 shall not be applied in combination with each other.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code. New structural members added as part of the *alteration* shall comply with the *International Building Code*. This exception shall not apply to the following:

1. *Alterations* for accessibility required by Section 306.
2. *Alterations* that constitute *substantial improvement* in *flood hazard areas*, which shall comply with Sections 503.2, 701.3 or 1303.1.3.
3. Structural provisions of Section 304, Chapter 5 or to the structural provisions of Sections 706, 805 and 906.

~~301.3.1~~301.4.1 Prescriptive compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 5 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

~~301.3.2~~301.4.2 Work area compliance method. *Alterations*, *additions* and *changes of occupancy* complying with the applicable requirements of Chapters 6 through 12 of this code shall be considered in compliance with the provisions of this code.

~~301.3.3~~301.4.3 Performance compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 13 of this code shall be considered in compliance with the provisions of this code.

Add new text as follows:

SECTION 310 BLEACHERS, FOLDING AND TELESCOPIC SEATING AND GRANDSTANDS

310.1 Bleachers, folding and telescopic seating and grandstands. Existing bleachers, folding and telescopic seating and grandstands shall comply with ICC 300.

Reason: This proposal moves requirements specific to bleachers out of Administration. ICC 300 does include provisions for repairs, alterations and relocated bleachers. This should be applied the same as other special items, such as storm shelters.

This proposal is part of a package of code changes to expand and reorganize Chapter 3 to increase understanding of the options available in the IEBC. Please see the proposal for reorganization for a clean version of what Chapter 3 will look like if all the proposals are successful.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a relocation of requirements. It is not intended to have any change to construction requirements.

EB9-25

EB10-25 Part I

IEBC: 301.1, SECTION 310 (New), 310.1 (New), 310.1.1 (New), 310.1.2 (New), 310.1.3 (New), UL Chapter 16 (New)

Proponents: Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA); John Taecker, representing Taecker Codes & Technical Services (john@taeckercodes.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE EXITING BUILDING CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Existing Building Code

Revise as follows:

301.1 Applicability. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with Section 301.2, 301.3 or 301.4. The provisions of Sections 302 through ~~309~~310 shall apply to all *alterations*, *repairs*, *additions*, installation of rooftop-mounted *photovoltaic (PV) panel systems*, relocation of structures and *changes of occupancy* regardless of compliance method.

Add new text as follows:

SECTION 310
INSTALLATION OF ROOFTOP-MOUNTED PHOTOVOLTAIC (PV) PANEL SYSTEMS

310.1 General. Rooftop-mounted *photovoltaic (PV) panel systems* installed on existing buildings shall be designed and installed in accordance with this section, the *International Fire Code*, NFPA 70 and the manufacturer's installation instructions. Roof structures that provide support for PV panel systems shall be evaluated in accordance with this section.

310.1.1 Equipment. *Photovoltaic panels* and modules shall be *listed* and *labeled* in accordance with both UL 61730-1 and UL 61730-2. Inverters shall be *listed* and *labeled* in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

310.1.2 Fire classification. Rooftop-mounted *PV panel systems* shall have a fire classification in accordance with Section 1505.9 of the *International Building Code* or Section R329 of the *International Residential Code.*

310.1.3 Access and pathways. Roof access, pathways and spacing requirements shall be provided in accordance with Section 1205 of the *International Fire Code* or Section R329 of the *International Residential Code.*

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

61730-2—2017	Photovoltaic (PV) Module Safety Qualification — Part 2: Requirements for Testing—with Revisions through April 2020
61730-1—2017	Photovoltaic (PV) Module Safety Qualification — Part 1: Requirements for Construction—with Revisions through April 2020
1741—2010	Inverters, Converters, Controllers and Interconnection System Equipment for Use with Distributed Energy Resources—with Revisions through June 2021

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 2703A--2002 Outline of Investigation for Flashing Devices and Systems for Rooftop-Mounted Photovoltaics, with regard to some of the key ICC criteria for referenced standards (Section

4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

The proposed referenced standards, listed below, are currently referenced in the IBC:

- UL 61730-1--2017 Photovoltaic (PV) Module Safety Qualification -- Part 1: Requirements for Construction--with Revisions through April 2020
- UL 61730-2--2017 Photovoltaic (PV) Module Safety Qualifcation -- Part 2: Requirements for Testing--with Revisions through April 2020

The proposed referenced standard, UL 1741--2010 Inverters, Converters, Controllers and Interconnectioni System Equipment for Use with Distribued Energey Resoruces--with Revisions through June 2021, is currently referenced in the IMC.

EB10-25 Part I

EB10-25 Part II

IEBC: [BS] 304.1, 310.1.4 (New), 310.2 (New), 310.2.1 (New), 310.2.1.1 (New), 310.2.1.2 (New), 310.2.1.3 (New), 310.2.1.4 (New), 310.2.2 (New), 310.2.2.1 (New), 310.2.2.2 (New), 310.2.3 (New), 310.2.3.1 (New), 310.3 (New), UL Chapter 16 (New)

Proponents: Joseph H. Cain, P.E., representing Solar Energy Industries Association (SEIA)

2024 International Existing Building Code

Revise as follows:

[BS] 304.1 Live loads. Where an *addition* or *alteration* does not result in increased design live load, existing gravity load-carrying structural elements shall be permitted to be evaluated and designed for live loads *approved* prior to the *addition* or *alteration*. If the *approved* live load is less than that required by Section 1607 of the *International Building Code*, the area designated for the nonconforming live load shall be posted with placards of *approved* design indicating the *approved* live load. Where the *addition* or *alteration* results in increased design live load, the live load required by Section 1607 of the *International Building Code* shall be used. *Roof live load* used for evaluation of installation of rooftop-mounted *PV panel systems* shall be in accordance with this section and Section 310.

Add new text as follows:

310.1.4 Flashing of PV panel system attachments. Flashing shall be installed in a manner that prevents water from entering the roof at attachment points for rooftop-mounted *PV panel systems* in accordance with one of the following:

1. The *roof covering* manufacturer's installation instructions, or
2. A metallic or nonmetallic flashing material or system that is *listed* and *labeled* in accordance with UL 2703A and installed in accordance with the flashing manufacturer's installation instructions.

310.2 Structural loads and resistance. Structural loads for rooftop-mounted *PV panel systems* shall be determined in accordance with Chapter 16 of the *International Building Code* and ASCE 7. Roof structures providing support for *PV panel systems* shall be evaluated or designed in accordance with this section.

310.2.1 Gravity loads and resistance. Gravity loads for installation of rooftop-mounted *PV panel systems* shall be determined in accordance with this section.

310.2.1.1 Dead load. The weight of *PV panel systems* including their mounting system and ballast shall be considered as dead load.

310.2.1.2 Roof live load. *Roof live load* shall be determined in accordance with Section 304.1 and either Section 1607.14.3 of the *International Building Code* or Section R329 of the *International Residential Code*, as applicable for the type of building.

Exception: *Roof live load* need not be applied to the area of the roof covered by *PV panel systems* where the clear height between the *PV panels* and the roof surface is 24 inches (610 MM) or less.

310.2.1.3 Snow load. Design snow load shall be determined in accordance with Chapter 7 of ASCE 7, but the design roof load shall be not less than that determined by Section 304.1 and Section 1607.14.3 of the *International Building Code*.

310.2.1.4 Existing structural elements carrying gravity load. Any existing gravity load-carrying structural element for which installation of a rooftop-mounted *PV panel system* causes an increase in design dead, live or snow load, including snow drift effects, of more than 5 percent shall be evaluated, replaced or altered as needed to carry the gravity loads required by the *International Building Code* for new structures.

Exceptions:

1. Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the altered building supporting the *PV panel system* complies with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code.*
2. For Group R3 and R4 occupancies, installation of rooftop-mounted *PV panel systems* weighing 4 psf (0.1915 kN/m^2) or less over an existing single layer of *roof covering.*

310.2.2 Lateral loads and resistance. Lateral loads for installation of rooftop-mounted *PV panel systems* shall be determined in accordance with this section.

310.2.2.1 Wind loads. Rooftop-mounted *PV panel systems* shall be designed in accordance with Section 1609 of the *International Building Code* and ASCE 7.

310.2.2.2 Existing structural elements carrying lateral load. Where the installation of a rooftop-mounted *PV panel system* increases design lateral loads, the lateral force-resisting system of the building shall meet the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code.

Exceptions:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with installation of a rooftop-mounted *PV panel system* considered is not more than 10 percent greater than its demand-capacity ratio without the *PV panel system* shall be permitted to remain unaltered.
2. Increases in the demand-capacity ratio due to lateral loads from seismic forces need not be evaluated for the installation of rooftop-mounted *PV panel systems* where the additional roof dead load due to the system, including ballast where applicable, does not exceed 10 percent of the dead load of the existing roof.

310.2.3 Ballasted photovoltaic (PV) panel systems. Ballasted, roof-mounted *PV panel systems* need not be rigidly attached to the roof or supporting structure. Ballasted, unattached *PV panel systems* shall be designed and installed only on roofs with slopes not more than 1 unit vertical in 12 units horizontal. Ballasted, unattached PV panel systems shall be designed to accommodate sliding in accordance with ASCE 7 Chapter 13.

310.2.3.1 Roof structures supporting ballasted PV panel systems. Roof structures that provide support for ballasted PV panel system shall be checked for deflections, including ponding, in accordance with the *International Building Code*.

310.3 Reinstallation of PV panel systems. Existing installations of rooftop-mounted *PV panel systems approved* under previous code requirements shall be permitted to be reinstalled after *roof repair* or *roof replacement*, provided all of the following conditions are met:

1. Existing rooftop-mounted *PV panel systems* shall be reinstalled in accordance with the manufacturer's installation instructions and the minimum requirements of the edition of the codes to which it was originally installed.
2. The system shall be reinstalled in the previous location or in an *approved* location.
3. Components of the rooftop-mounted *PV panel system* shall not be reused unless such components are in good working condition and *approved.*
4. All single-use components of the PV mounting system shall be replaced in accordance with the manufacturer's installation instructions.

Add new standard(s) as follows:

2703A-2022 Outline of Investigation for Flashing Devices and Systems for Rooftop-Mounted Photovoltaics

Reason: Through several cycles of I-code development, the solar industry and other stakeholders have created code provisions that occur in many locations throughout the I-codes, including the IBC, IFC, and IRC. In previous development cycles, we have created a "solar road map" in IBC Section 3111, and another "solar roadmap" in IRC R329.

This proposal is intended to create a new solar roadmap in the IEBC, by creating new Section 310. This technical requirements in proposed Section 310 are modeled after the other existing solar roadmaps, and are drawn from many different code provisions throughout the I-codes.

The following list identifies sections of other I-codes that were used as sources of language for this IEBC proposal. In some cases the language is the same as other I-codes. In some cases the language is modified to be appropriate to PV-specific requirements in the IEBC.

Section 310.1 General is based on IBC 3111.3 and IBC 1607.14.3.5.

Section 310.1.1 Equipment is based on IBC 3111.3.1.

Section 310.1.2 Fire classification is based on IBC Sections 3111.3.2 and 1505.9, and IRC Section R329.4.2.

Section 310.1.3 Access and pathways is based on IBC Section 3111.3.4 and IRC Section R329.6.

Section 310.1.4 Flashing of PV panel system attachments is a new PV-specific section based on IBC 1503.2 and IRC R903.2. The proposed language is the same as language proposed for the IBC, IRC and IEBC in other proposals submitted for Group B.
Section 310.2 Structural loads and resistance is based on IBC 1607.14.3.

Section 310.2.1.1 Dead load is based on IBC 1606.4.

Section 310.1.2 Roof live load is based on IBC Section 1607.14.3.1 and IRC Section R329.4.1.1.

Section 310.2.1.3 Snow load is based on IBC Section 1608.1.

Section 310.2.1.4 Existing structural elements carrying gravity load is based on IEBC Sections 503.3 & 805.2 and IRC Appendix BO, Section BO105.4.2.1.

Section 310.2.2.1 Wind loads is based on IBC Section 3111.1.1.

Section 310.2.2.2 Existing structural elements carrying lateral load is based on IEBC Sections 503.4 and 805.3.

Section 310.2.3 Ballasted PV panel systems is based on IBC 1613.4.

Section 310.2.3.1 Roof structures supporting ballasted PV panel systems is based on IBC 1607.14.3.5.

Section 310.3 Reinstallation of PV panel systems is newly proposed language that is the same as other proposals for the IBC, IRC, and IEBC.

UL Standards 61730-1, 61730-2, and 1741 are already referenced standards in the IBC and IRC. This proposal seeks to add them to the IEBC, along with any updates submitted in Group B ADMIN proposals.

UL 2703A Outline of investigation for flashing devices and systems for rooftop-mounted photovoltaics is a new standard that is also proposed to become a referenced standard in the IBC and IRC in other Group B proposals.

If both parts of this proposal are approved the language will appear as follows:

SECTION 310

INSTALLATION OF ROOFTOP-MOUNTED PHOTOVOLTAIC (PV) PANEL SYSTEMS

310.1 General . Rooftop-mounted *photovoltaic (PV) panel systems* installed on existing buildings shall be designed and installed in accordance with this section, the *International Fire Code,* NFPA 70 and the manufacturer's installation instructions. Roof structures that provide support for PV panel systems shall be evaluated in accordance with this section.

310.1.1 Equipment . *Photovoltaic panels* and modules shall be *listed* and *labeled* in accordance with both UL 61730-1 and UL 61730-2. Inverters shall be *listed* and *labeled* in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

310.1.2 Fire classification . Rooftop-mounted *PV panel systems* shall have a fire classification in accordance with Section 1505.9 of the *International Building Code* or Section R329 of the *International Residential Code.*

310.1.3 Access and pathways . Roof access, pathways and spacing requirements shall be provided in accordance with Section 1205 of the *International Fire Code* or Section R329 of the *International Residential Code.*

310.1.4 Flashing of PV panel system attachments. Flashing shall be installed in a manner that prevents water from entering the roof at attachment points for rooftop-mounted *PV panel systems* in accordance with one of the following:

1. The *roof covering* manufacturer's installation instructions, or

2. A metallic or nonmetallic flashing material or system that is *listed* and *labeled* in accordance with UL 2703A and installed in accordance with the flashing manufacturer's installation instructions.

310.2 Structural loads and resistance. Structural loads for rooftop-mounted *PV panel systems* shall be determined in accordance with Chapter 16 of the *International Building Code* and ASCE 7. Roof structures providing support for *PV panel systems* shall be evaluated or designed in accordance with this section.

310.2.1 Gravity loads and resistance . Gravity loads for installation of rooftop-mounted *PV panel systems* shall be determined in accordance with this section.

310.2.1.1 Dead load . The weight of *PV panel systems* including their mounting system and ballast shall be considered as dead load.

310.2.1.2 Roof live load.*Roof live load* shall be determined in accordance with Section 304.1 and either Section 1607.14.3 of the *International Building Code* or Section R329 of the *International Residential Code,* as applicable for the type of building.

Exception: *Roof live load* need not be applied to the area of the roof covered by *PV panel systems* where the clear height between the *PV panels* and the roof surface is 24 inches (610 MM) or less.

310.2.1.3 Snow load . Design snow load shall be determined in accordance with Chapter 7 of ASCE 7, but the design roof load shall be not less than that determined by Section 304.1 and Section 1607.14.3 of the *International Building Code*.

310.2.1.4 Existing structural elements carrying gravity load. Any existing gravity load-carrying structural element for which installation of a rooftop-mounted *PV panel system* causes an increase in design dead, live or snow load, including snow drift effects, of more than 5 percent shall be evaluated, replaced or altered as needed to carry the gravity loads required by the *International Building Code* for new structures.

Exceptions:

1.Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the altered building supporting the *PV panel system* complies with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code.*

2.For Group R3 and R4 occupancies, installation of rooftop-mounted *PV panel systems* weighing 4 psf (0.1915 kN/m^2) or less over an existing single layer of *roof covering.*

310.2.2 Lateral loads and resistance. Lateral loads for installation of rooftop-mounted *PV panel systems* shall be determined in accordance with this section.

310.2.2.1 Wind loads. Rooftop-mounted *PV panel systems* shall be designed in accordance with Section 1609 of the *International Building Code* and ASCE 7.

310.2.2.2Existing structural elements carrying lateral load. Where the installation of a rooftop-mounted *PV panel system* increases design lateral loads, the lateral force-resisting system of the building shall meet the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code.

Exceptions:

1.Any existing lateral load-carrying structural element whose demand-capacity ratio with installation of a rooftop-mounted *PV panel system* considered is not more than 10 percent greater than its demand-capacity ratio without the *PV panel system* shall be permitted to remain unaltered.

2.Increases in the demand-capacity ratio due to lateral loads from seismic forces need not be evaluated for the installation of rooftop-mounted *PV panel systems* where the additional roof dead load due to the system, including ballast where applicable, does not exceed 10 percent of the dead load of the existing roof.

310.2.3 Ballasted photovoltaic (PV) panel systems. Ballasted, roof-mounted *PV panel systems* need not be rigidly attached to the roof or supporting structure. Ballasted, unattached *PV panel systems* shall be designed and installed only on roofs with slopes not more than 1 unit vertical in 12 units horizontal. Ballasted, unattached PV panel systems shall be designed to accommodate sliding in accordance with ASCE 7 Chapter 13.

310.2.3.1 Roof structures supporting ballasted PV panel systems . Roof structures that provide support for ballasted PV panel system shall be checked for deflections, including ponding, in accordance with the *International Building Code*.

310.3 Reinstallation of PV panel systems. Existing installations of rooftop-mounted *PV panel systems approved* under previous code requirements shall be permitted to be reinstalled after *roof repair* or *roof replacement,* provided all of the following conditions are met:

1.Existing rooftop-mounted *PV panel systems* shall be reinstalled in accordance with the manufacturer's installation instructions and the minimum requirements of the edition of the codes to which it was originally installed.

2.The system shall be reinstalled in the previous location or in an *approved* location.

3.Components of the rooftop-mounted *PV panel system* shall not be reused unless such components are in good working condition and *approved.*

4.All single-use components of the PV mounting system shall be replaced in accordance with the manufacturer's installation instructions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal creates a new "solar road map" in the IEBC, drawn mostly from existing language already found in the IBC, IRC, IFC, and IEBC. It provides options for compliance under the IEBC.

Staff Analysis: A review of the standard proposed for inclusion in the code, UL 2703A--2002 Outline of Investigation for Flashing Devices and Systems for Rooftop-Mounted Photovoltaics, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

The proposed referenced standards, listed below, are currently referenced in the IBC:

- UL 61730-1--2017 Photovoltaic (PV) Module Safety Qualification -- Part 1: Requirements for Construction--with Revisions through April 2020
- UL 61730-2--2017 Photovoltaic (PV) Module Safety Qualifcation -- Part 2: Requirements for Testing--with Revisions through April 2020

The proposed referenced standard, UL 1741--2010 Inverters, Converters, Controllers and Interconnectioni System Equipment for Use with Distribued Energey Resoruces--with Revisions through June 2021, is currently referenced in the IMC.

EB10-25 Part II

EB11-25

IEBC: 301.1, SECTION 310 (New), 310.1 (New)

Proponents: Jeffrey Shapiro, LTFR, representing Lake Travis Fire Rescue

2024 International Existing Building Code

Revise as follows:

301.1 Applicability. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with Section 301.2, 301.3 or 301.4. The provisions of Sections 302 through 310~~309~~ shall apply to all *alterations*, *repairs*, *additions*, relocation of structures and *changes of occupancy* regardless of compliance method.

Add new text as follows:

SECTION 310
FIRE PROTECTION FOR POST-FIRE REPAIR OR RECONSTRUCTION

310.1 Institutional and residential occupancies. Where an unsprinklered Group I, Group R-1, Group R-2 or Group R-4 Occupancy is repaired or reconstructed following a fire incident that caused more than 25-percent of a fire area to remain unoccupiable for a period of 60 or more days, an automatic sprinkler system complying with Section 903.3 shall be installed throughout such fire area or fire areas as part of the repair or reconstruction.

Reason: This proposal is being added to correlate with a new Section 1108 in the IFC, being added by Proposal F162-24, which has been recommended for Approval as Submitted. There was a single comment considered at CAH#2, but the IFC Technical Committee sustained their initial action after hearing discussion. Because many fire-damaged buildings will be rebuilt under the IEBC, it is important for the IEBC to include these provisions in addition to Chapter 11 of the IFC, which deals with construction requirements for existing buildings. The following is the reason statement that was provided with F162-24.

This proposal reflects the progress of a FCAC task group on the topic of retrofitting certain occupancies that have suffered a catastrophic fire. There was insufficient time for further discussion and consideration that might have yielded a consensus proposal, so I am submitting this as a basis for continued discussion. Although I serve as a consultant to the National Fire Sprinkler Association, this proposal has not been reviewed or endorsed by NFSA, and I am not representing NFSA on this issue. My motivation comes from many years in the fire service observing reconstruction of unsprinklered buildings without sprinklers following a catastrophic fire, which has always struck me as illogical. If a newly built occupancy requires sprinklers, repair or reconstruction of a previously existing occupancy that suffered a catastrophic fire, particularly residential and institutional uses where occupants will be sleeping, should not be permitted by code.

During task group discussions, there was broad agreement that something could be done to address this concern in the code, but reaching agreement on code text was challenging. Essentially, the questions are, 1) what should be the trigger, or level of loss, warranting the addition of fire sprinklers in repair or reconstruction, and 2) what portion of a building should be required to be sprinklered?

Discussion explored the possibility of using fire fatalities as a Step 1 trigger, but consensus on a number of fatalities could not be reached. Some believed that a single fire fatality should be enough, while others looked at two or more or didn't support the concept. Also, defining a "fire fatality" in the code is challenging as an enforcement tool because the term might refer to individuals who were deceased at the scene, or it might also include individuals who are injured and later died as a result of such injuries. And, severe injuries might be regarded by those who deal with burn injuries as an equally sufficient justification vs. a fatality. For these reasons, the life-loss and injury triggers were abandoned in this proposal, in favor of trying to define a level of property damage that could be reasonably associated with a catastrophic fire.

Another Step 1 trigger that was considered was "multiple offender" buildings, or buildings that experience repeated fire incidents. This approach was also abandoned because consensus could not be reached on the number of fires over a time period, the damage level that should be considered as a contributing fire, or how a jurisdiction would keep track of a repeating fire incident history over time.

The approach that did gain sufficient traction was looking at a "fire area" as defined in the code to require a minimum 2-hour separation from other portions of a building, and a level of damage to a fire area that should be considered as sufficient to warrant requiring sprinklers as part of repair or reconstruction. There is not a scientific basis for establishing a threshold of this nature, so the threshold must ultimately be decided by a consensus of stakeholders. The suggested 25% of a fire area being unhabitable for a period of 90 or more days seems sufficient to serve as a benchmark. It was pointed out during discussion that, due to permitting delays, 30 days could be a very short timeframe for construction to be completed. However, it's difficult to argue that a fire wasn't a major incident if 25%+ of a fire area remains uninhabitable for 60 days. For example, an 8-unit fire area in an apartment building would require 3 or more units to be vacated for 60 days to trigger this section. A 40-room hotel would require 11 rooms to be vacated for more than 60 days to trigger this section. True, this might encourage a rapid pace of reconstruction by some to avoid the sprinkler requirement, but so be it. It's better to have this requirement as a starting point in the code, and if someone can beat the clock, that should not be a reason to do nothing in the code.

With regard to Step 2, the portion of a building that should be required to be sprinklered where Step 1 has been satisfied, there were two discussion paths, either the entire building or only a sufficiently damaged fire area. This proposal suggests the latter based on feedback from the task group. Considering that a fire area might be a floor or section of a large building, much of which might not have been affected by the fire incident, some would regard it as excessive to require retrofitting sprinklers in those unaffected areas since such areas would not otherwise undergo repair or reconstruction. Hence, the suggested path of only requiring sufficiently impacted fire areas to be sprinklered. Such areas would probably experience substantial removal of drywall due to smoke and water damage, allowing for sprinkler system installation when the structure is exposed.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The cost of installing a fire sprinkler system in a multifamily residential occupancy is nominally 1% to 2% of the total construction cost. This can vary depending on the building design, local codes, and specific system requirements. Estimated cost range from $2 to $10 per square foot is likely.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost will vary depending on the extent of damage and repair or reconstruction to be done after a particular incident. Also, existing water supply and standpipe piping have an impact on the extent of work required to accomplish an installation. In addition, sprinkler installation costs may be offset by taking advantage of sprinkler incentives associated with other aspects of construction that reduce overall costs.

EB12-25

IEBC: 301.2

Proponents: Peter Somers, Magnusson Klemencic Associates, representing self (psomers@mka.com); Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com)

2024 International Existing Building Code

Revise as follows:

301.2 Repairs. *Repairs* shall comply with the requirements of Chapter 4. *Reroofing*, other than *roof repairs* to damaged areas, shall be considered an *alteration* and must comply with either Chapter 5 or Chapter 7.

Reason: There is a significant amount of confusion as to when reroofing work would be performed as a repair under Chapter 4 or as an alteration when following the prescriptive method (Chapter 5) or the work area method (Chapter 7). Sections 503.6 and 706.3.1 require unreinforced masonry (URM) parapets to be braced when 25% of the roofing materials are replaced. Similarly, Sections 503.12 and 706.3.2 require the entire roof diaphragm and its connections to be evaluated in high-wind regions when 50% of the roofing materials are replaced.

Some designers and building owners argue that replacing a roof that has exceeded its useful life should be considered a repair, and not an alteration, and should therefore comply with Chapter 4. Chapter 4 would not require the bracing of URM parapets in high-seismic regions or the evaluation of the roof diaphragm and connections in a high-wind region.

As Chapter 3 is the scoping chapter for all compliance methods, this is an appropriate location to make it clear that reroofing operations, other than roof repairs after a wind or other event, are required to meet the provisions for alterations under Chapter 5 or 7. This clarification is needed to ensure that the URM parapets in high seismic regions are braced and roof diaphragms in high wind regions are adequate prior to a building owner replacing the roofing materials when the existing materials have reached their useful life.

There are numerous FEMA publications that address the importance of bracing URM parapets in high seismic regions, and this change would clarify when such a retrofit would be required. A partial list of these FEMA publications are as follows:

FEMA P-774, *Unreinforced Masonry Buildings and Earthquakes, Developing Successful Risk Reduction Programs*

FEMA P-2082-1, *NEHRP Recommended Seismic Provisions for New Buildings and Other Structures, Volume 1 – Part 1 Provisions, Part 2 Commentary*

FEMA P-155, R*apid Visual Screening of Buildings for Potential Seismic Hazards: Supporting Documentation*

FEMA P-154, *Rapid Visual Screening of Buildings for Potential Seismic Hazards: A Handbook*

FEMA 547, *Techniques for the Seismic Rehabilitation of Existing Buildings*

FEMA P-58-2, *Seismic Performance Assessment of Buildings, Volume 2 – Implementation Guide, Second Edition*

FEMA, *Wasatch Front Unreinforced Masonry Risk Reduction Strategy*

FEMA, *Wasatch Front URM Risk Reduction Strategy Best Practices and Replicability*

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The intent of the current IEBC is to treat reroofing as an alteration subject to the requirements of Chapters 5 and 7. This proposal merely clarifies that intent.

EB12-25

EB13-25

IEBC: 301.3, 301.3.1, 301.3.2, 301.3.3

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

2024 International Existing Building Code

Revise as follows:

301.3 Alteration, addition or change of occupancy. *Existing buildings* complying with this code as required by *International Residential Code* Section R102.6.1, shall comply with Section 301.3.1. The *alteration*, *addition* or *change of occupancy* of all other *existing buildings* shall comply with one of the methods listed in Section 301.3.1, 301.3.2 or 301.3.3 as selected by the applicant. Sections 301.3.1 through 301.3.3 shall not be applied in combination with each other.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code. New structural members added as part of the *alteration* shall comply with the *International Building Code*. This exception shall not apply to the following:

1. *Alterations* for accessibility required by Section 306.
2. *Alterations* that constitute *substantial improvement* in *flood hazard areas*, which shall comply with Sections 503.2, 701.3 or 1303.1.3.
3. Structural provisions of Section 304, Chapter 5 or to the structural provisions of Sections 706, 805 and 906.

301.3.1 Prescriptive compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 5 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.3.2 Work area compliance method. *Alterations*, *additions* and *changes of occupancy* complying with the applicable requirements of Chapters 6 through 12 of this code shall be considered in compliance with the provisions of this code.

301.3.3 Performance compliance method. *Alterations*, *additions* and *changes of occupancy* complying with Chapter 13 of this code shall be considered in compliance with the provisions of this code.

Reason: IRC Section R102.6.1 indicates that where an addition, alteration or change of use is made to an existing structure that results in a use, occupancy, height or means of egress outside of the scope of the IRC, the building must comply with the IEBC.

> **R102.6.1 Additions, alterations, change of use or repairs.** Additions, alterations or repairs to any structure shall conform to the requirements for a new structure without requiring the existing structure to comply with the requirements of this code, unless otherwise stated. Additions, alterations, repairs and relocations shall not cause an existing structure to become less compliant with the provisions of this code than the existing building or structure was prior to the addition, alteration or repair. Where additions, alterations or changes of use to an existing structure result in a use, occupancy, height or means of egress outside the scope of this code, the building shall comply with the International Existing Building Code.

IEBC Section 301.3 then allows the project to use either the prescriptive, work area or performance compliance methods. This proposal is to change this to only allow the prescriptive compliance method when changing from an IRC regulated structure to an IEBC regulated structure. This is needed since the work area and performance compliance methods do not address a change in codes, whereas the prescriptive compliance method will typically require work or change of occupancy to comply with the IBC.

There are significant differences between the IRC and the IBC that are not accounted for in the work area and performance compliance methods, such as means of egress requirements and exterior wall requirements for fire-resistance ratings and openings. In the work area compliance method, this is most easily seen in Section 1011 for change of occupancy classification - this section includes hazard tables for various components of design such as means of egress, heights and areas, and exterior walls, and these tables are based on occupancy classification. It is not possible to use these tables when changing from the IRC to the IEBC/IBC since the IRC does not have occupancy classifications. Also, it would not be appropriate to arbitrarily assign an occupancy classification to an IRC use, since there are fundamental differences in the codes. For example, the IRC has no common path of travel limitations so a change to an equal hazard category, based on an assigned occupancy for the IRC use, would allow unlimited common path of travel before two exits are required. Also, the IRC allows non-rated exterior walls with unlimited openings at a fire separation distance of 3' if a sprinkler system is provided, and 5' if not - the IBC doesn't allow this until 10' (for a VB construction type). If an IRC single family home was to be assigned an R-3 occupancy for the hazard tables, it could be changed to Group A, B, E, I, F-2, S-2 or U with non-rated exterior walls and unlimited openings at an FSD of 3' or 5', which isn't appropriate.

The performance compliance method also appears to not account for a change in code from IRC to IBC since it does not account for fundamental differences in the code. For example, exterior wall requirements for fire-resistance rating and openings are not even considered.

Please support this change requiring prescriptive compliance method when changing from and IRC regulated project to an IEBC/IBC regulated project. Using other compliance methods is not appropriate since fundamental code differences are not accounted for.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not change the cost of construction for the following reasons:

1. Use of the work area compliance method is currently allowed but is not possible to use since the hazard tables cannot be used without an existing occupancy group. Therefore, eliminating this option will not change the cost of construction.

2. Use of the performance compliance method is rarely used even when changing occupancy within the IBC, and the proponents of this proposal have never seen it used for a change from an IRC regulated structure to an IBC regulated structure. If this method were to be used for a change from IRC to IBC, the cost could go up or down relative to the prescriptive path required with this proposal.

EB13-25

EB14-25

IEBC: 302.2

Proponents: Andrew Bevis, Chair, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

302.2 Additional codes. *Alterations, repairs, additions* and *changes of occupancy* to, or relocation of, *existing buildings* and structures shall comply with the provisions for *alterations, repairs, additions* and *changes of occupancy* or relocation, respectively, in this code and the *International Energy Conservation Code*, *International Fire Code*, *International Fuel Gas Code*, *International Mechanical Code*, *International Plumbing Code*, *International Private Sewage Disposal Code*, *International Property Maintenance Code*, *International Residential Code*<u>, *International Swimming Pool and Spa Code*</u> and NFPA 70. Where provisions of the other codes conflict with provisions of this code, the provisions of this code shall take precedence.

Reason: Any alteration, repair, addition or change of occupancy related to swimming pools and spas should be done in accordance with the International Swimming Pool and Spa Code (ISPSC). There are unique hazards associated with pools and spas that are specifically addressed by the provisions of the ISPSC.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held numerous virtual meetings open to any interested party. Related documents and reports are posted on the PMGCAC website at PMGCAC webpage.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Jurisdictions will be enforcing the minimum requirements for pools and spas. This proposal only clarifies that they would be using the ISPSC for enforcement.

EB14-25

EB15-25

IEBC: SECTION 310 (New), 302.2.1, 501.3, 707.1, 806.3

Proponents: Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Add new text as follows:

SECTION 310 HEALTH CARE FACILITIES

Revise as follows:

~~302.2.1~~ 310.1 ~~Additional codes in health care~~ Health care facilities. In existing Group I-2 occupancies, ambulatory health care *facilities*, outpatient clinics and hyperbaric *facilities*, any altered or added portion of the~~*alterations*, *repairs*, *additions* and *changes of occupancy* to, or relocation of,~~ *existing* ~~*buildings* and structures~~ medical gas system shall ~~also comply with~~ be required to meet the installation requirement in NFPA 99.

Delete without substitution:

~~**501.3 Health care facilities.** In Group I-2 *facilities*, ambulatory care *facilities* and outpatient clinics, any altered or added portion of an existing electrical or medical gas systems shall be required to meet installation and equipment requirements in NFPA 99.~~

~~**707.1 Health care facilities.** In Group I-2 facilities, ambulatory care facilities and outpatient clinics, any altered portion of an existing electrical systems shall be required to meet installation and equipment requirements in NFPA 99.~~

~~**806.3 Health care facilities.** In Group I-2 *facilities*, ambulatory care *facilities* and outpatient clinics, any added portion of an existing electrical system shall be required to meet installation and equipment requirements in NFPA 99.~~

Reason: Provisions for healthcare facilities are current located in Chapter 3, the prescriptive method under general; and in the work area method under alterations Level 1 and 2. The intent of this relocation to Chapter 3 is so that this provision only needs to be addressed once. This will reduce duplication and possibly not be coordinated over time.While the current text does not include hyperbaric facilities, IBC Section 425 indicates compliance with NFPA 99.

This proposal is part of a package of code changes to expand and reorganize Chapter 3 to increase understanding of the options available in the IEBC. Please see the proposal for reorganization for a clean version of what Chapter 3 will look like if all the proposals are successful.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) the ICC Committee for Healthcare (CHC). .

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a relocation of requirements. It is not intended to have any change to construction requirements.

EB15-25

EB16-25

IEBC: 302.3, 302.3.1 (New), 302.3.1.1 (New), 302.3.1.2 (New), 302.3.1.3 (New), AISC (New)

Proponents: Bonnie Manley, representing AISC (manley@aisc.org); Robert Pekelnicky, Degenkolb Engineers, representing Self (rpekelnicky@degenkolb.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

302.3 Existing materials. Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the code official to be *unsafe*.

Add new text as follows:

302.3.1 Evaluation of existing structural members and connections. The evaluation of existing structural members and connections shall comply with Sections 302.3.1.1 through 302.3.1.3.

302.3.1.1 Existing structural steel and composite structural steel and concrete members and connections. The evaluation, repair, and alteration of existing structural steel and composite structural steel and concrete members and connections shall be in accordance with AISC 360, Appendix 5.

302.3.1.2 Existing structural stainless steel members and connections. The evaluation, repair, and alteration of existing structural stainless steel members and connections shall be in accordance with AISC 370, Appendix 5.

302.3.1.3 Other existing structural members and connections. The evaluation, repair, and alteration of existing structural members and connections not covered in Section 302.3.1.1 and 302.3.1.2 shall be in accordance with the *International Building Code* as amended by this code.

Add new standard(s) as follows:

AISC

American Institute of Steel
130 East Randolph Street, Suite 2000
Chicago, IL 60601-6219
United States

ANSI/AISC 360—22	Specification for Structural Steel Buildings
ANSI/AISC 370—21	Specification for Structural Stainless Steel Buildings

Reason: While IEBC Section 302.4.1 points users to the IBC for provisions on new structural members and connections, there is no comparable guidance in IEBC Section 302.3 for existing structural members and connections. This proposal is intended to provide the missing requirements for existing buildings utilizing structural steel, composite structural steel and concrete, and structural stainless steel members and connections by adopting direct references to AISC 360 and AISC 370. Both standards are already recognized and adopted by the IBC Chapter 22. Each document includes a mandatory appendix for the evaluation of existing structural members and connections by one of three methods: structural analysis, load tests, or a combination of structural analysis and load tests. Additionally, AISC 360 Appendix 5 specifically contains provisions that allow the user to establish the capacities of older steel connectors, which is important when assessing alterations, additions, and repairs to existing structural steel buildings that have riveted construction.

It is anticipated that guidance for other existing structural materials may be added to this section in the future. In the meantime, Section 302.3.1.3 has been added to provide a direct pointer to the IBC for materials not covered in the other subsections.

AISC makes its standards available to all free of charge at https://www.aisc.org/publications/steel-standards/.

Bibliography: AISC (2022), Specification for Structural Steel Buildings, ANSI/AISC 360-22, American Institute of Steel Construction, Chicago, Ill., August 1, 2022. Available at: https://www.aisc.org/publications/steel-standards/.

AISC (2021), Specification for Structural Stainless Steel Buildings, ANSI/AISC 370-21, American Institute of Steel Construction, Chicago, Ill., June 11, 2021. Available at: https://www.aisc.org/publications/steel-standards/.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

AISC 360 and AISC 370 are already adopted in IBC Chapter 22. This proposal is simply adding a direct pointer in the IEBC to Appendix 5 in both documents.

Staff Analysis: The proposed referenced standards, ANSI/AISC 360--22, Specification for Structural Steel Buildings and ANSI/AISC 370--21, Specification for Structural Stainless Steel Buildings are currently referenced in the IBC.

2024 International Existing Building Code

Add new text as follows:

[BS] 304.3.3 Structural observation. Structural observation in accordance with Section 1704.6 of the *International Building Code*, shall be provided for all work required to comply with either Section 304.3.1 or Section 304.3.2, regardless of the requirements and allowances in Section 1704.6.1 of the *International Building Code*.

Exception: Retrofit work that does not require design by a registered design professional need not comply with this section.

Reason: Structural observation, along with building department inspections and special inspections, is an important part of construction quality assurance for seismic retrofit.

IBC Section 1704.6 is the general provision for structural observation for new buildings. However, Section 1704.6.1 specifically requires structural observation only for Risk Category III-IV, high-rise buildings (H>75'), Seismic Design Category E, and where required by discretion of the design professional or the code official. Therefore, to ensure structural observation for all triggered retrofits (and to simplify the requirement), the proposal includes the phrase "regardless of the requirements and allowances in Section 1704.6.1." The proposal will change nothing for retrofits designed with IEBC Chapter A1, A2, or A4, all of which already explicitly require structural observation.

The proposed exception recognizes that some retrofits (such as most retrofits using IEBC Appendix A3 (or ICC-1300 if that standard is added to the IEBC by a separate proposal) do not require the involvement of a design professional, so making this requirement in those cases would impose a significant additional cost and could wrongly make a design professional liable for the design. The exception does not mention those standards by name, however, since they also encompass engineered design in some cases.

The proposal is limited to structural observation because IEBC Section 109 already addresses inspections, and Section 109.3.9 specifically calls for Special Inspection per the IBC. More specific adjustments to IBC Chapter 17 suited to existing building projects might be appropriate, but they are beyond the scope of this limited proposal, since a full revision of Chapter 17 would also require coordination with AISC or other provisions for existing buildings.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Where structural observation would already be required or would not be required at all (see the Impact Justification), there would be no cost impact. Where a cost increase occurs, it is a design cost, not a construction cost.
We estimate the design cost increase, roughly and conservatively, as $1,000 per site visit, where the number of structural observation site visits could be just one or could be more, depending on the size and scope of the retrofit. In accordance with IBC Section 1704.6.1, compliance is generally by affidavit, with the design professional proposing the "frequency and extent" of observation appropriate to "representative" conditions, then submitting a written statement when the work is complete. Depending on the size and scope of the retrofit, the structural observation could involve a single site visit or perhaps a dozen or more over the course of a long or complicated project.

Estimated Immediate Cost Impact Justification (methodology and variables):

As noted in the reason statement, seismic retrofit using IEBC Appendix A1, A2, or A4 already requires structural observation, so there will be no cost increase for those projects. Retrofit using the prescriptive methods of IEBC Appendix A3 or ICC-1300 will have no cost increase because they are exempt by the proposed exception. And in many cases where the code official would already require compliance with IBC Chapter 17 for a retrofit project (as many do), there would be no cost increase relative to current practice.

In other cases (low rise buildings in Risk Category I or II and Seismic Design Category B-D, using IBC-based or ASCE 41 criteria), the cost increase would be based on the number of hours to complete the structural observation site visits and reporting multiplied by the design professional's hourly billing rate.

Our estimate of $1,000 per site visit is an approximation that will vary with local or regional billing rates and professional practices, as well as project conditions. It is intended to include the time needed for the site visit itself, documentation of the site visit, and travel to a nearby site.

2024 International Existing Building Code

Revise as follows:

[BS] 304.3.1 Full seismic criteria. Where required, seismic evaluation or design shall comply with one of the following methodologies, which shall not be applied in combination with each other:

1. Section 1613 of the *International Building Code* using 100 percent of hte prescribed forces. Where the existing seismic force-resisting system is a type that can be designated as "Ordinary," values of R, Ω_0 and C_d used for analysis in accordance with Chapter 16 of the *International Building Code* shall be those specified for structural systems classified as "Ordinary" in accordance with Table 12.2-1 of ASCE 7, unless it can be demonstrated that the structural system will provide performance equivalent to that of a "Detailed," "Intermediate" or "Special" system. <u>The requirements for deformation compatibility in Section 12.12.4 of ASCE 7 shall be applicable for all structures in Seismic Design Categories D through F.</u>
2. ASCE 41, using a Tier 3 procedure and both levels of the two-level performance objective in Table 304.3.1 for the applicable *risk category*.

[BS] TABLE 304.3.1 PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH FULL SEISMIC CRITERIA

RISK CATEGORY (Based on IBC Table 1604.5)	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-1N EARTHQUAKE HAZARD LEVEL	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-2N EARTHQUAKE HAZARD LEVEL
I	Life Safety (S-3)	Collapse Prevention (S-5)
II	Life Safety (S-3)	Collapse Prevention (S-5)
III	Damage Control (S-2)	Limited Safety (S-4)
IV	Immediate Occupancy (S-1)	Life Safety (S-3)

[BS] 304.3.2 Reduced seismic criteria. Where required, seismic evaluation or design shall comply with one of the following methodologies, which shall not be applied in combination with each other:

1. Section 1613 of the *International Building Code* using 75 percent of the prescribed forces. Values of R, Ω_0 and C_d used for analysis shall be as specified in Section 304.3.1 of this code. <u>The requirements for deformation compatibility in Section 12.12.4 of ASCE 7 shall be applicable for all structures in Seismic Design Categories D through F using the forces prescribed in this section.</u>
2. Applicable chapters of Appendix A of this code, for structures or portions of structures specified in Items 2.1 through 2.4 subject to the limitations of the respective chapter.
   - 2.1. Chapter A1 for unreinforced masonry bearing wall buildings assigned to *Risk Category* I or II.
   - 2.2. Chapter A2 for the wall anchorage system in reinforced concrete and reinforced masonry wall buildings with flexible diaphragms assigned to *Risk Category* I or II.
   - 2.3. Chapter A3 for cripple walls and sill plate anchorage in residential buildings of light-frame wood construction assigned to *Risk Category* I or II.
   - 2.4. Chapter A4 for soft, weak or open-front wall conditions in multiple-unit residential buildings of wood construction assigned to *Risk Category* I or II.
3. ASCE 41, using the performance objective in Table 304.3.2 for the applicable *risk category*.

[BS] TABLE 304.3.2 PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH REDUCED CRITERIA FORCES

RISK CATEGORY (Based on IBC Table 1604.5)	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-1E EARTHQUAKE HAZARD LEVEL	STRUCTURAL PERFORMANCE LEVEL FOR USE WITH BSE-2E EARTHQUAKE HAZARD LEVEL
I	Life Safety (S-3). See Note a	Collapse Prevention (S-5)
II	Life Safety (S-3). See Note a	Collapse Prevention (S-5)
III	Damage Control (S-2). See Note a	Limited Safety (S-4). See Note b
IV	Immediate Occupancy (S-1)	Life Safety (S-3). See Note c

a. For Risk Categories I, II and III, the Tier 1 and Tier 2 procedures need not be considered for the BSE-1E earthquake hazard level.

b. For Risk Category III, the Tier 1 screening checklists shall be based on the Collapse Prevention, except that checklist statements using the Quick Check provisions shall be based on *MS*-factors that are the average of the values for Collapse Prevention and Life Safety.

c. For Risk Category IV, the Tier 1 screening checklists shall be based on Collapse Prevention, except that checklist statements using the Quick Check provisions shall be based on *MS*-factors for Life Safety.

Reason: When option 1 in Section 304.3.1 or 304.3.2 is used to evaluate an existing building or retrofit, deformation compatibility assessment of the existing building is sometimes neglected by designers even though it is technically required by the current IEBC. The reference to ASCE 7, through IBC Section 1613, requires that ASCE 7 is followed completely, unless specific items are excluded by the IEBC.

However, experience suggests that some ASCE 7-based retrofits are designed based on ASCE 7 seismic forces and drifts for the new seismic force-resisting system, but the deformation compatibility of the original lateral system now acting as secondary elements is sometimes ignored. Ignoring deformation compatibility can lead to a collapse of the gravity load supporting system. This is especially critical for existing buildings that do not have the structural integrity and interconnected requirements found in the design standards for new construction.

Several studies have documented these conditions including the ongoing ATC-140 project [ATC 140-7 “Update of Seismic Evaluation and Retrofit of Existing Buildings Guidance” prepared by the Applied Technology Council for FEMA] and a design guide prepared by the Structural Engineers of Southern California (SEAOSC) and ICC in support of using 75% of IBC forces for seismic retrofits in the City of Los Angeles [“Design Guide Volume 1, City of Los Angeles Mandatory Earthquake Hazard Reduction in Existing Non-Ductile Concrete Buildings (NDC)” 2016]

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is simply clarifying that the deformation compatibility provisions that are already required by ASCE 7 are applicable to the use of ASCE 7 to existing buildings.

Revise as follows:

ASCE/SEI

American Society of Civil Engineers Structural Engineering Institute
1801 Alexander Bell Drive
Reston, VA 20191-4400

41— ~~2017~~ 2023 Seismic Evaluation and Retrofit of Existing Buildings

Reason: This proposal is completely editorial, replacing the provisions in these sections of the IEBC with direct reference to the same provisions in ASCE 41. There are two primary reasons for this change:

1. This makes the references to ASCE 41 more consistent with the references to ASCE 7 by simply pointing to the applicable section in the reference standard rather than repeating the performance criteria. For ASCE 7, Sections 304.3.1 item 1 and 304.3.2 item 1 point to ASCE 7 for the seismic design parameters (R, Ω0, Cd) and the Importance Factor (implicitly, since there is no direct reference), which relates seismic performance to risk category. The referenced sections of ASCE 41 (Section 2.4.5 for full seismic

criteria and Section 2.4.1 for reduced seismic criteria) include references to tables that define performance based on risk category and the remainder of the ASCE 41 standard includes requirements for achieving that performance. The duplication of ASCE 41 Tables 2-5 and 2-3 within the IEBC is unnecessary and could lead to conflicts if there are changes to the corresponding changes to the ASCE 41 tables.

2. Including the ASCE 41 performance criteria tables in the IEBC was helpful, and in fact necessary for previous versions of ASCE 41, since the ASCE 41 standard was not fully aligned with risk categories as used by the IBC and ASCE 7. However, with the publication of ASCE 41-23, the standard is now fully aligned with risk categories, again rendering duplication of the performance criteria tables (and the footnotes to Table 304.3.2) unnecessary, and potentially in conflict with ASCE 41.

In short, this proposal follows the relationship between ASCE 7 and the IBC/IEBC, whereby the code defines seismic performance through the assignment of risk category, and the standard provides the technical requirements for achieving that performance objective commensurate with the assigned risk category.

In addition, the proposal provides a direct reference to the ASCE 41 Benchmark Building provisions, which allows recently constructed buildings to be shown in compliance with the required seismic performance objectives without requiring seismic evaluation. The Benchmark Building provisions have always been a path to compliance with reduced seismic criteria when using ASCE 41, but the direct reference makes this compliance path more clear. As more and more “modern” structures (those designed to recent editions of ASCE 7) are being renovated, it is helpful to allow these renovations to be deemed to comply without performing unnecessary seismic evaluations. Again, this path to compliance is allowed in the 2024 IEBC by referencing ASCE 41; the proposed updates make this a more direct reference.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impacts. This proposal is fully editorial, replacing specific criteria in the IEBC with pointer to reference the same criteria in ASCE 41.

Staff Analysis: This proposal includes technical revisions to the code text to coordinate with an update of an existing referenced standard. This standard must be completed and readily available prior to the Public Comment Hearing. See CP28 Section 4.6.3.1.2.

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Revise as follows:

[BS] 304.3.2 Reduced seismic criteria. Where required, seismic evaluation or design shall comply with one of the following methodologies, which shall not be applied in combination with each other:

1. Section 1613 of the *International Building Code* using 75 percent of the prescribed forces. Values of R, Ω_0 and C_d used for analysis shall be as specified in Section 304.3.1 of this code.
2. Applicable chapters of Appendix A of this code, for structures or portions of structures specified in Items 2.1 through 2.4 subject to the limitations of the respective chapter.
   2.1. Chapter A1 for unreinforced masonry bearing wall buildings assigned to *Risk Category* I or II.
   2.2. Chapter A2 for the wall anchorage system in reinforced concrete and reinforced masonry wall buildings with flexible diaphragms assigned to *Risk Category* I or II.
   2.3. Chapter A3 for cripple walls and sill plate anchorage in residential buildings of light-frame wood construction assigned to *Risk Category* I or II.
   2.4. Chapter A4 for soft, weak or open-front wall conditions in multiple-unit residential buildings of wood construction assigned to *Risk Category* I or II.
3. ASCE 41, using the performance objective in Table 304.3.2 for the applicable *risk category*.
4. The provisions of ICC 1300 for one- and two-family dwellings or townhouses of wood light-frame construction, addressing one or more of the following vulnerable configurations.
   4.1. Crawlspace dwellings per Chapter 4 of ICC 1300.
   4.2 Living-space-over-garage dwellings per Chapter 5 of ICC 1300.
   4.3. Hillside dwellings per Chapter 6 of ICC 1300.

Add new standard(s) as follows:

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

ICC 1300-2024	Vulnerability-based Seismic Assessment and Retrofit of One- and Two-Family Dwellings.

Reason: The recently published document *Vulnerability-Based Seismic Assessment and Retrofit of One- and Two-Family Dwellings Volume 1 - Prestandard* (FEMA P-1100, 2018) has been converted to Standard ICC 1300 by the ICC Residential Assessment and Seismic Retrofit Standards Committee. The FEMA prestandard and the ICC standard have used state-of-the-art analysis tools and performance-based methods to develop seismic retrofit provisions for cripple wall, living-space-over-garage, and hillside dwellings.

This proposal recognizes this seismic retrofit standard as providing seismic performance that is equivalent to or exceeds the other methodologies listed in Section 304.3.2. The ICC 1300 standard expands the scope of available prescriptive residential seismic retrofit solutions, thereby encouraging seismic retrofit.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides the option of additional methodologies for seismic retrofit, and in particular prescriptive design methodologies that do not require engineering. The choice to use this methodology is voluntary. This proposal does not impose any new mandatory requirements.

Staff Analysis: A review of the standard proposed for inclusion in the code, ICC 1300--2024 Vulnerability-based Seismic Assessment and Retrofit of One- and Two-Family Dwellings, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

2024 International Existing Building Code

Revise as follows:

306.6.1.1 Additions for elevators. Where an *addition* is being constructed exclusively to accommodate the installation of an elevator or elevators to improve accessibility, an accessible means of egress in accordance with Section 1009.1 of the *International Building Code* is not required where all of the following conditions are provided:

1. Two-way communication is provided at all elevator landings that are part of the *addition* in accordance with Section 1009.8 of the *International Building Code*.
2. Each elevator landing is on floor level with access to a horizontal exit or to a stairway with a width of not less than 36 inches (914 mm).
3. The elevator does not serve a required accessible ~~floor~~ story or ~~occupied~~ occupiable roof more than four stories above or below the level of exit discharge.

306.7.12 Toilet rooms. Where it is *technically infeasible* to alter existing toilet rooms to be accessible, one accessible single-user toilet room or one accessible family or assisted-use toilet room constructed in accordance with Section 1110.2.1 of the *International Building Code* is permitted. This toilet room shall be located on the same ~~floor~~ *story* and in the same area as the existing toilet rooms. At the inaccessible toilet rooms, directional signs indicating the location of the nearest such toilet room shall be provided. These directional signs shall include the International Symbol of Accessibility, and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

306.7.13 Bathing rooms. Where it is *technically infeasible* to alter existing bathing rooms to be accessible, one accessible single-user bathing room or one accessible family or assisted-use bathing room constructed in accordance with Section 1110.2.1 of the *International Building Code* is permitted. This accessible bathing room shall be located on the same ~~floor~~ *story* and in the same area as the existing bathing rooms. At the inaccessible bathing rooms, directional signs indicating the location of the nearest such bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility, and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

306.7.16 Dressing, fitting and locker rooms. Where it is *technically infeasible* to provide accessible dressing, fitting or locker rooms at the same location as similar types of rooms, one accessible room on the same ~~level~~ *story* shall be provided. Where separate-sex *facilities* are provided, accessible rooms for each sex shall be provided. Separate-sex *facilities* are not required where only unisex rooms are provided.

306.7.18.2 Multiple-level buildings and facilities. An accessible route from an accessible entrance to public spaces on the ~~level~~ *story* of the accessible entrance shall be provided.

Reason: This proposal is a companion proposal to #10999. Please see that proposal for reasoning.

This proposal is submitted by the ICC Adaptive Reuse Working Group (ARWG).

ARWG was convened in 2024 by ICC Government Relations to explore opportunities to facilitate the reuse of existing nonresidential buildings for multi-family residential uses through better training on use of the International Codes for adaptive reuse work and potential amendments to the International Codes. ARWG held numerous virtual meetings in 2024 and met in person at the 2024 annual business meeting in Long Beach. ARWG consists of code officials, design professionals, and other interested parties.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial.

EB21-25

EB22-25

IEBC: 306.7.1

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

306.7.1 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to, or contains an area of, *primary function*, the route to the *primary function* area shall be accessible. Toilet facilities and drinking fountains serving the area of *primary function*, including the route from the area of primary function to these facilities, shall be accessible. ~~Priority shall be given to the improvements affecting the accessible route to the primary function area.~~

Exceptions:

1. The cumulative costs of providing the accessible route, toilet facilities and drinking fountains are not required to exceed 20 percent of the costs of the *alterations* affecting the area of *primary function*.
2. This provision does not apply to *alteration s*limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration*of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.
5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

Reason: This was added by EB26-22. The proponents said this was to clarify what was required. However, while this sounds like a good idea, this will cause lots of confusion with existing buildings.

1. Some will read this to require improvements for the entrance or for an elevator above every other improvement. In the past you could have spent the money where it would have the most effect. What advantage is there for putting in supports for a ramp, or the pit for an elevator (which will not improve access for anyone) when the 20% could have fixed all the bathrooms (which helps persons with walkers, canes, those who need grab bars to stand up or sit down, lever faucets for persons with limited hand dexterity, etc.).
2. If the improvements to the building are a series of small improvements, you cannot really build part of an elevator pit, shaft and cab. Is this saying the money has to be accumulated to provide for a future elevator? Who administers this? What happens if this is years and multiple projects away?
3. The first sentence says that the accessible route includes toilet and drinking fountains. So if those are part of the accessible route, what exactly is this additional sentence trying to say is the priority?
4. The proponent of E26-22 said the fixing getting into the building should always be the priority over fixing the bathrooms. However, bathrooms and parking spaces are the number 1 and 2 when it comes to complaints. Fixing those areas benefits a much larger percentage of persons with disabilities – persons using walkers or canes, persons with stamina or strength issues, persons with mobility issue. While access for a person is a wheelchair is important, that is not the only focus of these improvements.
5. Improvements for accessibility can include lowering counters for access to services, switching out hardware or installing automatic openers at doors to make them easier to use persons with limited strength, signage for persons with vision impairments, adding visible alarms for persons with hearing impairments, etc. Are these considered part of the 'accessible route'? Or do I need to make these a last priority?
6. A tenant would be more likely to want to concentrate on making their space as accessible across the board as possible. If a tenant wants to make this a priority for their space, that is a good thing. Is this telling them that they have to spend for improvements to the common entrance for the building instead?
7. Someone might have a small alteration for this year, but a much larger one planned for next year – where they could afford an

elevator. Why is that not a valid consideration for where money should be spent?

8. The ADA has a priority list in their initial drafts, but it was removed so that what money that was spent could be used the most effectively in that situation. All existing buildings are different, and improvements can happen continually or once every 20 years. This needs to be decided on a case-by-case basis.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost for providing the accessible route will stay at the 20% maximum. The intent of this proposal is to clarify. Please see reason statement.

EB22-25

EB23-25

IEBC: 306.7.2, 306.7.2.1 (New), 503.20, 905.4

Proponents: David Renn, PE, SE, City and County of Denver, representing Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org)

2024 International Existing Building Code

Revise as follows:

306.7.2 Accessible means of egress. Except as requried by Section 306.7.2.1, accessible~~Accessible~~ means of egress required by Chapter 10 of the *International Building Code* are not required to be added in existing *facilities*.

Add new text as follows:

306.7.2.1 Two-way communication system. Where the *work area* for *alterations* exceeds 50 percent of the *building area* and the building has elevator service, a two-way communication system shall be provided where required by Section 1009.8 of the *International Building Code*.

Delete without substitution:

~~**503.20 Two-way communications systems.** Where the *work area* for *alterations* exceeds 50 percent of the building area and the building has elevator service, a two-way communication systems shall be provided where required by Section 1009.8 of the *International Building Code*.~~

~~**905.4 Two-way communications systems.** In buildings with elevator service, a two-way communication system shall be provided where required by Section 1009.8 of the *International Building Code*.~~

Reason: In the 2021 IEBC, a new requirement was added to require the addition of a two-way communication system at elevators where the work area for alterations exceeds 50 percent of the building area (i.e., a Level 3 alteration). This requirement occurs in the prescriptive compliance method in Section 503.20 (Section 503 is for alterations) and occurs in the work-area compliance method in Section 905.4 (Section 905 is means of egress for Level 3 alterations). A two-way communication system at elevators is an accessible means of egress element required in Section 1009 of the IBC.

Since accessibility requirements (including accessible means of egress) for all compliance methods are given in IEBC Section 306, it is better to locate this requirement in 306, which is what this proposal does. In particular, this requirement is moved to Section 306.7.2 which is specifically for accessible means of egress for alterations.

Also, relocating this requirement fixes an unintentional consequence that occurred when this requirement was added. The requirement was only intended for Level 3 alterations where significant work is being done; however, it is also required for a change of occupancy when using the work-area compliance method since Section 1011.5.2 requires compliance with Section 905 (including 905.4) where a change of occupancy results in an equal or lesser-hazard category. This requires a two-way communication system to be added even if there is no work being done with the change of occupancy. Interestingly, Section 1011.5.1 for a change to a higher-hazard category does not require the two-way communication system to be added. This proposal fixes this by only requiring the two-way communication system where Level 3 alterations are being completed, which is consistent with the intent.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal fixes an unintentional requirement in the code for a change of occupancy. Since this proposal changes the code to be in line with the intent of the code for two-way communication systems, it is considered a clarification that has no cost impact.

EB23-25

EB24-25

IEBC: SECTION 202 (New), 306.7.11.1

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org); Jeff O'Neill, Chair, representing Committee on Healthcare (ahc@iccsafe.org)

2024 International Existing Building Code

Add new definition as follows:

ASSISTED BATHING. A roll-in shower designed for adults who need assistance and configured to allow space to enable a care giver to assist.
ASSISTED TOILETING. A water closet designed for adults who need assistance and configured to allow space to enable a care giver to assist.

Revise as follows:

306.7.11.1 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added within an *existing building*, the requirements of Section 1108 of the *International Building Code* for Accessible units apply only to the quantity of dwelling or sleeping units being altered or added.

Exception: Where permitted for Group I-1 and I-2 dwelling units and sleeping units in accordance with Sections 1108.5.1.1, 1108.5.1.2, 1108.5.2.1 and 1108.5.4 of the International Building Code, toilet and bathing rooms within Accessible units shall be permitted to comply with the assisted toileting and assisted bathing requirements.

Reason: The IBC allows for assisted toileting and bathing for new construction as an option for a percentage of the Accessible units in Assisted living, Nursing homes and Rehabilitation facilities. The percentage varies depending on the need. The purpose of the assisted toileting and bathing is to address the special needs for person who need assistance in toileting and bathing due to strength or stability issues. The technical information was removed from the IBC in E122-24 because the 2025 edition of the ICC A117.1 will now include those provisions. Putting this exception here just allows for facilities that are being renovated to use the same options permitted for them in new construction. This option was developed based on a study done by the Rothschild Foundation, and has already been proven to improve accessibility and safety for both residents and care givers.

This is a joint proposal with the BCAC and Healthcare committees.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 and 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This exception is allowing an option that is already permitted for new construction. Since this is an option, it would not increase the cost of construction.

Staff Analysis: This proposal is simply duplicating a definition added in the 2024 cycle to the IBC. The definition cannot be revised in this proposal as it is likely to be scoped to another committee and should be identical

EB25-25

IEBC: SECTION 202 (New), SECTION 306, 306.7.12, 306.7.13, 306.7.14, 306.7.15, 306.7.18.4, 306.7.18.5

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Add new definition as follows:

FAMILY OR COMPANION BATHING ROOM. A room for toileting and bathing that provides privacy and designed for a family with children and for people with disabilities with a companion or assistant.
FAMILY OR COMPANION TOILET ROOM. A toilet room that provides privacy and designed for a family with children and for people with disabilities with a companion or assistant.

SECTION 306
ACCESSIBILITY FOR EXISTING BUILDINGS

Revise as follows:

306.7.12 Toilet rooms. Where it is *technically infeasible* to alter existing toilet rooms to be accessible, one accessible single-user toilet room or one accessible family or ~~assisted-use~~ companion toilet room constructed in accordance with Section 1110.2.1 of the *International Building Code* is permitted. This toilet room shall be located on the same floor and in the same area as the existing toilet rooms. At the inaccessible toilet rooms, directional signs indicating the location of the nearest such toilet room shall be provided. These directional signs shall include the International Symbol of Accessibility, and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

306.7.13 Bathing rooms. Where it is *technically infeasible* to alter existing bathing rooms to be accessible, one accessible single-user bathing room or one accessible family or ~~assisted-use~~ companion bathing room constructed in accordance with Section 1110.2.1 of the *International Building Code* is permitted. This accessible bathing room shall be located on the same floor and in the same area as the existing bathing rooms. At the inaccessible bathing rooms, directional signs indicating the location of the nearest such bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility, and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

306.7.14 Additional toilet and bathing facilities. In assembly and mercantile occupancies, where additional toilet fixtures are added, not fewer than one accessible family or ~~assisted-use~~ companion toilet room shall be provided where required by Section 1110.2.1 of the *International Building Code*. In recreational *facilities*, where additional bathing rooms are being added, not fewer than one family or assisted-use bathing room shall be provided where required by Section 1110.2.1 of the *International Building Code*.

306.7.15 Adult changing stations. Where additional toilet facilities are being added, in occupancies where adult changing stations are required by Section 1110.4.1 of the *International Building Code*, not fewer than one accessible family or ~~assisted-use~~ companion toilet room with an adult changing station shall be provided in accordance with Section 1110.4 of the *International Building Code.* The adult changing station shall be permitted to be located in a family or assisted-use toilet room or bathing room required by Section 306.7.12, 306.7.13 or 306.7.14.

306.7.18.4 Toilet facilities. Where toilet rooms are provided, not fewer than one accessible single-user toilet room or one accessible family or ~~assisted-use~~ companion toilet room complying with Section 1110.2.1 of the *International Building Code* shall be provided.

306.7.18.5 Bathing facilities. Where bathing rooms are provided, not fewer than one accessible single-user bathing room or one accessible family or ~~assisted-use~~ companion bathing rooms complying with Section 1110.2.1 of the *International Building Code* shall be provided.

Reason: The IBC and IPC Development Committees approved E126-22 Part 1 and 2 with Group A. The intent of this proposal is to coordinate with those changes.

Both the family or assisted use bathrooms and assisted toileting and bathing options are included in the IBC. This proposal not intended to change any technical requirements. However, the terminology is so close, it is causing confusion – especially when it comes to the options for the water closet and showers permitted in the family or assisted use toilet or bathroom. Do I have to use the water closet with two swing up grab bars or only a roll-in shower? That is not the intent. This change in terminology will clarify the options.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification in terminology for different options permitted in IBC. There are no changes to construction requirements.

Staff Analysis: This proposal is simply duplicating a definition added in the 2024 cycle to the IBC. The definition cannot be revised in this proposal as it is likely to be scoped to another committee and should be identical.

EB25-25

EB26-25

IEBC: 307.1, 308.1

Proponents: Jeffrey Shapiro, P.E., FSFPE, LTFR, representing Lake Travis Fire Rescue (jeff.shapiro@intlcodeconsultants.com)

2024 International Existing Building Code

Revise as follows:

307.1 Smoke alarms. Where an *alteration*, *addition*, *change of occupancy* or relocation of a building is made to an *existing building* or structure of a Group R and I-1 occupancy, the *existing building* shall be provided with smoke alarms in accordance with Section 907 of the *International Fire Code* or Section R310 of the *International Residential Code*.

~~**Exception:** Work classified as Level 1 *Alterations* in accordance with Chapter 7.~~

Where a *repair* is made to an existing building or structure of a Group R and I-1 occupancy, the existing building shall be provided with smoke alarms in accordance with Section 1103.8 of the *International Fire Code*.

308.1 Carbon monoxide detection. Where ~~an~~ a repair, *addition*, *alteration*, *change of occupancy* or relocation of a building is made to an *existing building* , the *existing building* shall be provided with carbon monoxide detection in accordance with Section 915 of the *International Fire Code* or Section R311 of the *International Residential Code*.

~~**Exceptions:**~~

1. ~~Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, the addition or replacement of windows or doors, or the addition of porches or decks.~~
2. ~~Installation, *alteration* or *repairs* of plumbing or mechanical systems, other than fuel-burning appliances.~~
3. ~~Work classified as Level 1 *Alterations* in accordance with Chapter 7.~~
4. ~~In Group I-2 occupancies, carbon monoxide detection is not required in each sleeping unit where carbon monoxide detection, which transmits an alarm signal to an *approved* location, is provided in each space containing a carbon monoxide source.~~

Reason: This proposal fixes two issues in the IEBC related to smoke and carbon monoxide detection regulations. With respect to smoke alarms, the current exception in Section 307.1 suggests that smoke alarms need not be provided where Level 1 alterations are performed. That is not correct because Chapter 11 of the IFC requires ALL Group I-1 and Group R occupancies to be provided with smoke detection. If alternations, additions, changes of occupancy or relocations are being done, then the IEBC needs to point to smoke alarm provisions for new construction in the IFC and/or IRC. If repairs are being performed, the IEBC needs to point to the existing building provisions in IFC Chapter 11, since all Group I-1 and Group R occupancies, regardless of whether they are being repaired or otherwise touched, are required by the IFC to have smoke detection. The proposed second sentence is limited to repairs only because that is the other topic covered by the IEBC scope. You'd only be in the IEBC in the first place if you're doing repairs, alterations, etc.

With respect to CO detection, Proposal F148-24 (Approved by the IFC Technical Committee without comment and now on the consent agenda) was a complete rewrite of the CO detection requirements and clarified a number of shortcomings in the 2024 IFC/IBC text. All existing occupancies, regardless of whether they are being repaired, altered, added to or subject to a change of occupancy now require CO detection in accordance with IFC Section 915 if there is a CO source (newly defined if F148-24). Current Exceptions 1-3 in the IEBC are no longer valid since there are no similar exceptions to the IFC and IBC provisions that will be in the 2027 code. Unlike many other IEBC provisions, work being done/not done is not a trigger for CO detection. With respect to the current Exception 4, this isn't needed either and doesn't correlate with the new IFC requirements applicable to existing I-2 Occupancies. However, Section 915.4.1, Exception 2 of Proposal F148-24 provides a path to a similar outcome for sleeping areas in new and existing Group I-2 Occupancies that require CO detection.

It should be noted that changes made by this proposal are exclusively for correlation with the in the 2027 IFC that are applicable to all existing buildings and occupancies, even if no work under the IEBC scope is being performed. The IEBC is scoped with the authority to lessen requirements associated with repair, alteration, addition, relocation or change of use that would otherwise apply. It cannot lessen IFC requirements that are applicable to all existing buildings or occupancies, regardless of whether such work is performed.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes simply correlate with overarching IFC provisions that have already been approved for the 2027 codes consent agenda.

EB26-25

EB27-25 Part I

IEBC: SECTION 202, SECTION 309, 309.2, 309.2.1

Proponents: Eric Banks, e.w.banks consulting llc, representing North American Modern Building Alliance (eric.banks@ewbanksconsulting.com); Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE EXISTING BUILDING CODE COMMITTEE. PART II WILL BE HEARD BY THE ADMIN CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Existing Building Code

Delete without substitution:

~~**[BF] EXTERIOR WALL COVERING.** A material or assembly of materials applied on the exterior side of exterior walls for the purpose of providing a weather-resisting barrier, insulation or for aesthetics, including but not limited to, veneers, siding, exterior insulation and finish systems, architectural trim and embellishments, such as cornices, soffits, facias, gutters and leaders.~~

~~**[BF] EXTERIOR WALL ENVELOPE.** A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space from the detrimental effects of the exterior environment.~~

Revise as follows:

SECTION 309 ADDITIONS AND REPLACEMENTS OF EXTERIOR WALL COVERINGS AND ~~EXTERIOR WALL ENVELOPES~~EXTERIOR WALL ASSEMBLIES

309.2 Additions and replacements. Where an ~~*exterior wall covering*~~ exterior wall covering or ~~*exterior wall envelope*~~ exterior wall assembly is added or replaced, the materials and methods used shall comply with the requirements for new construction in Chapter 14 and Chapter 26 of the *International Building Code* if the added or replaced ~~*exterior wall covering*~~ exterior wall covering or ~~*exterior wall envelope*~~ exterior wall assembly involves two or more contiguous stories and comprises more than 15 percent of the total wall area on any side of the building.

309.2.1 Automatic sprinkler systems. Combustible ~~*exterior wall covering*~~ exterior wall covering or combustible ~~exterior wall envelopes~~ exterior wall assemblies shall not be added to an existing high-rise building that is not protected throughout with an automatic sprinkler system.

Exceptions:

1. Where such material is located on a single story and is less than 15 percent of the wall area on any side of the building.
2. Water-resistive barriers installed in accordance with Section 1402.6 of the *International Building Code*.

EB27-25 Part I

EB27-25 Part II

IEBC: [A] 106.2.4

Proponents: Eric Banks, e.w.banks consulting llc, representing North American Modern Building Alliance (eric.banks@ewbanksconsulting.com); Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

2024 International Existing Building Code

Revise as follows:

[A] 106.2.4 ~~Exterior wall envelope~~ Exterior wall assembly. Construction documents for work affecting the ~~*exterior wall envelope*~~ exterior wall assembly shall describe the ~~*exterior wall envelope*~~ exterior wall assembly in sufficient detail to determine compliance with this code. The construction documents shall provide details of the ~~*exterior wall envelope*~~ exterior wall assembly as required, including windows, doors, flashing, intersections with dissimilar materials, corners, end details, control joints, intersections at roof, eaves or parapets, means of drainage, water-resistive barriers and details around openings.

The construction documents shall include manufacturer's installation instructions that provide supporting documentation that the proposed penetration and opening details described in the construction documents maintain the wind and weather resistance of the ~~*exterior wall envelope*~~ exterior wall assembly. The supporting documentation shall fully describe the exterior wall system that was tested, where applicable, as well as the test procedure used.

Reason:

Proponent: Eric Banks, e.w.banks consulting llc, representing North American Modern Building Alliance (eric.banks@ewbanksconsulting.com):

This proposal harmonizes the terminology regarding exterior wall coverings and exterior wall assemblies of the IEBC with the IBC.

In the 2018 I-Codes, defined terms for *exterior wall covering* and *exterior wall envelope* were, intentionally, identical in the IBC and IEBC. Unfortunately, revisions to the IBC terms during the intervening code cycles have neglected to include correlating revisions to the IEBC terms. There is no legitimate need for any inconsistency or variation in the terms between the IBC and IEBC. IEBC Sections 106.2.4, 309, 309.2 and 309.2.1. are the only sections that reference the exterior wall covering and exterior wall envelope defined terms.

The resulting inconsistency in terminology and definitions between the IEBC and the IBC becomes problematic where provisions of Section 309 require *exterior wall coverings* and *exterior wall envelopes* to comply with requirements of IBC Chapters 14 and 26, and where Section 309.2 places other limitations on changes to certain existing exterior wall assemblies. For one, there simply is no exterior wall envelope in the IBC anymore.

The *exterior wall covering* and *exterior wall envelope* term definitions are scoped to the IBC – Fire Safety Code Development Committee (Group A). There is no opportunity to revise the definitions in Group B to bring them back into harmony with the IBC terms. These two IBC terms are often the subject of proposed revisions (include 2024 Group A proposals) and future proposals for further revision are reasonably anticipated. Removing the defined terms for exterior wall covering and exterior wall envelope from the IEBC will, based on IEBC Section 201.3 (Terms defined in other codes), ensure that (1) the IEBC will default to the IBC defined terms, and (2) any revisions to the IBC definitions for e*xterior wall covering* and *exterior wall assembly* will automatically flow into the IEBC without the need for specific code change proposal(s).The North American Modern Building Alliance (NAMBA) is focused on addressing fire safety through the development and enforcement of building codes. Members of NAMBA are: ACC Center for the Polyurethanes Industry, ACC North American Flame Retardant Alliance, Atlas Roofing Corp., BASF Corporation, Covestro, DuPont, EIFS Industry Members Association, EPS Industry Alliance, GAF, Huntsman, Kingspan Insulation LLC, Metal Construction Association, Owens Corning, Polyisocyanurate Insulation Manufacturers Association, Rmax - A Business Unit of the Sika Corporation.

Co-proponent: Marcelo Hirschler, representing GBH International (mmh@gbint.com):

This is a purely editorial proposal to ensure that the IEBC uses the same terms and definitions as the IBC. Nothing is being changed in any section other than the terminology.

In the 2024 IBC, the code no longer uses the term "exterior wall envelope" and replaced it with the term "exterior wall assembly" throughout.

The 2024 IEBC states in chapter 2 on definitions that the terms "exterior wall envelope" and "exterior wall covering" are based on the IBC fire safety decisions, but they were not updated formally in the IEBC. However earlier action, as part of the Errata, updated the IEBC definitions by replacing "exterior wall envelope" with "exterior wall assembly" and revising "exterior wall covering" to make them both consistent with the IBC ones.

This proposal simply provides that consistency between the IBC and IEBC and replaces the term "exterior wall envelope" everywhere else in the IEBC by the correct term "exterior wall assembly".

2024 International Building Code

EXTERIOR WALL ASSEMBLY. *A system including the exterior wall covering, framing, and components such as weather-resistive barriers and insulating materials. This system provides protection of the building structural members and conditioned interior space from the detrimental effects of the exterior environment.*

EXTERIOR WALL COVERING. *A material or assembly of materials applied on the exterior side of exterior walls for the purpose of providing a weather-resisting barrier, insulation or for aesthetics, including but not limited to, veneers, siding, exterior insulation and finish systems, rainscreen systems, architectural trim and embellishments such as cornices, soffits, fascias, gutters and leaders.*

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not add, remove, or alter any requirement of the code, therefore, it presents no inherent increase or decrease in the cost of construction. The proposal seeks to simply coordinate terminology and definitions regarding exterior wall coverings and exterior wall assemblies of the IEBC with the those in the IBC.

EB27-25 Part II

EB29-25

IEBC: SECTION 202 (New), 309.1, 309.2, 309.2.1

Proponents: Marcelo Hirschler, representing GBH International (mmh@gbhint.com)

2024 International Existing Building Code

Add new definition as follows:

HIGH-RISE BUILDING. A *building* with an occupied floor or occupied roof located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

309.1 General. The provisions of Section 309 apply to all *alterations*, *repairs*, *additions*, relocations of structures and *changes of occupancy* regardless of compliance method.

309.2 Additions and replacements. Where an *exterior wall covering* or *exterior wall envelope* is added or replaced, the materials and methods used shall comply with the requirements for new construction in Chapter 14 and Chapter 26 of the *International Building Code* if the added or replaced *exterior wall covering* or *exterior wall envelope* involves two or more contiguous stories and comprises more than 15 percent of the total wall area on any side of the building.

Revise as follows:

309.2.1 Automatic sprinkler systems. ~~Combustible *exterior wall covering* or combustible exterior wall envelopes~~ *Exterior wall coverings* or *exterior wall assemblies* shall not be added to an existing high-rise building that is not protected throughout with an automatic sprinkler system unless the *exterior wall assembly* complies with the requirements of Chapters 14 and 26 of the International Building Code.

> **~~Exceptions~~ Exception:** Where the added exterior wall assembly is located on a single story and is less than 15 percent of the wall area on any side of the building.
>
> 1. ~~Where such material is located on a single story and is less than 15 percent of the wall area on any side of the building.~~
> 2. ~~Water-resistive barriers installed in accordance with Section 1402.6 of the *International Building Code*.~~

Reason: Exterior wall assemblies that have met the requirements of NFPA 285 (as required by chapters 14 and 26 of the IBC) have been shown to provide a high level of fire safety. In fact there does not appear to have been a fatal fire starting in an exterior wall assembly that has been tested to, and complied with, NFPA 285. Therefore there is no need to demand that the replacement or added exterior wall assembly be composed exclusively of noncombustible materials, just like new construction does not require exterior wall assemblies to be constructed exclusively of noncombustible materials. The IBC (and IEBC) require that exterior wall assemblies comply with the appropriate (and severe) NFPA 285 test. Demanding the exclusive use of noncombustible materials will thwart innovation and mean that there are fewer (safe) options for repairs or alterations of existing buildings.

The IFC already requires that all high-rise buildings be sprinklered and testing to NFPA 285, as required in IBC Chapters 14 an 26, applies specifically to buildings over 40 feet in height, which means that it applies to all high-rise buildings. This code proposal retains the requirement that the high-rise building must be sprinklered. In order to clarify the concept of what is a high-rise building in the IEBC, this proposal adds a definition of high-rise building, which is identical to that in the IBC.

The code proposal retains the first exception presently in the code, while slightly rewording it.

The code proposal deletes the second exception, for two reasons.

First: the charging section already will require complying with the entirety of chapter 14, including 1402.6.

Second: It is impossible for water-resistive barriers to be "installed in accordance with Section 1402.6 of the IBC" because that section does not provide any "installation" information on water-resistive barriers. Section 1402.6 of the IBC simply describes (in exceptions 2.1 and 2.2) the fire properties (in terms of heat release, effective heat of combustion, flame spread, and smoke development) that water-resistive barriers need to comply with in order for testing the exterior wall assembly to NFPA 285 not be required, which applies only if such a water-resistive barrier is the only combustible component in the exterior wall.

Note that the IBC uses the term "exterior wall assembly" and not the term "exterior wall envelope", used in earlier editions. A separate proposal recommends making that correlative change throughout the IEBC.

The IBC section 1402.6 reads as follows:
1402.6 Water-resistive barriers. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible water-resistive barrier shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.Combustibility shall be determined in accordance with Section 703.3. For the purposes of this section, fenestration products, flashing of fenestration products and water-resistive-barrier flashing and accessories at other locations, including through wall flashings, shall not be considered part of the water-resistive barrier.
Exceptions:
1. Exterior walls in which the water-resistive barrier is the only combustible component and the exterior wall has an exterior wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Exterior walls in which the water-resistive barrier is the only combustible component and the water-resistive barrier complies with the following:
2.1 A peak heat release rate of less than 150 kW/m2, a total heat release of less than 20 MJ/m2 and an effective heat of combustion of less than 18 MJ/kg when tested on specimens at the thickness intended for use, in accordance with ASTM E1354, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.
2.2 A flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E2404.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code proposal will allow added flexibility in the use of exterior wall assemblies, as it does not require that all components be noncombustible. That means that a lager selection of materials will be able to be chosen for the exterior wall assembly. That means that it is likely that less testing to ASTM E136 will be required. On the other hand, it is possible that new testing to NFPA 285 may be required but it is likely that systems will be used that have already been used elsewhere or for which engineering assessments of equivalency are available.

Staff Analysis: This proposal is simply duplicating a definition from the IBC and IFC. The definition cannot be revised in this proposal as it is scoped to another committee.

EB29-25

EB30-25

IEBC: 309.2, 309.2.1

Proponents: Eric Banks, e.w.banks consulting llc, representing North American Modern Building Alliance (eric.banks@ewbanksconsulting.com)

2024 International Existing Building Code

Revise as follows:

309.2 Additions and replacements. Where an *exterior wall covering* or *exterior wall envelope* is added or replaced, the materials and methods used shall comply with the requirements for new construction in Chapter 14 and Chapter 26 of the *International Building Code* if the added or replaced *exterior wall covering* or *exterior wall envelope* involves two or more contiguous stories and comprises more than 15 percent of the total wall area on any side of the building.

309.2.1 Automatic sprinkler systems. Combustible *exterior wall covering* or combustible exterior wall envelopes shall not be added to an existing high-rise building that is not protected throughout with an automatic sprinkler system.

Exceptions:

1. Where such material is located on a single story and is less than 15 percent of the wall area on any side of the building.
2. Water-resistive barriers installed in accordance with Section 1402.6 of the *International Building Code*.
3. *Additions* or *replacements* of combustible *exterior wall coverings* and combustible exterior wall envelopes on the basis of an *approved* engineering analysis.

Reason: This proposal seeks to provide flexibility in complying with Section 309.2.1 while still adhering to its intent and the intent of the code. Adding a third exception allowing the these type of additions and replacements on the basis of a specific engineering analysis of changes performed by a qualified approved source.

Retrofits, updates, and improvements to exterior walls and roofs of existing buildings provide building owners and local jurisdictions with one of the best means to achieve meaningful and long-term reductions in energy consumption and related emissions from buildings. In many cases, these retrofits, updates, and improvements will add insulation, remove and replace existing insulation, reduce air leakage, and increase the water resistance and weather resistance of the exterior walls of buildings. Well-designed building envelopes / enclosures also improve the long-term durability and lifespan of buildings.

Two cycles ago, Section 309 was added to the 2021 IEBC. Section 309 ensured the addition or modification of exterior wall coverings and exterior wall assemblies must comply with the requirements of IBC Chapter 14 on Exterior Walls and Chapter 26 on Plastic. Both IBC chapters include important fire safety provisions such as testing of assemblies in accordance with NFPA 268 for ignition resistance from exterior radiant heat exposure and NFPA 285 for vertical and lateral flame propagation when various combustible materials, conditions, and assemblies are present. Fire safety provisions in IBC Chapters 14 & 26 also address issues of fire-resistance-rated assemblies, when such ratings are required. The addition of Section 309 was reasonable and appropriate.

Last cycle saw the addition of Section 309.2.1 that effectively prohibits adding combustible exterior wall coverings and combustible exterior wall assemblies to certain high-rise buildings. In doing so, this section prevents the ability of building owners to make substantial improvements to exterior wall assemblies of existing non-sprinklered high-rise buildings. A blanket prohibition for all non-sprinklered high-rise buildings allows no opportunity for innovative, performance-based solutions backed up by fire test data and sound evaluation and analysis performed by qualified professionals. This proposal is not intended to 'undo' Section 309.2.1, but to provide flexibility in allowing additions and replacements that are subject to increased oversight and justification.

The North American Modern Building Alliance (NAMBA) is focused on addressing fire safety through the development and enforcement of building codes. Members of NAMBA are: ACC Center for the Polyurethanes Industry, ACC North American Flame Retardant Alliance, Atlas Roofing Corp., BASF Corporation, Covestro, DuPont, EIFS Industry Members Association, EPS Industry Alliance, GAF, Huntsman, Kingspan Insulation LLC, Metal Construction Association, Owens Corning, Polyisocyanurate Insulation Manufacturers Association, Rmax - A Business Unit of the Sika Corporation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal provides an additional compliance option for the alteration, repair, and addition to certain existing buildings, therefore, does not inherently present an increase or decrease to the cost of construction

EB30-25

EB31-25

IEBC: SECTION 310 (New), 310.1 (New)

Proponents: Bryan Holland, representing National Electrical Manufacturers Association (NEMA) (bryan.holland@nema.org); Megan Hayes, representing NEMA (megan.hayes@nema.org)

2024 International Existing Building Code

Add new text as follows:

SECTION 310
DATA CENTERS AND COMPUTER ROOMS

310.1 Data centers and computer rooms. Where an alteration, addition, change of occupancy or relocation of a building is made to an existing building or structure or part of a building or structure that contain data centers or computers rooms shall comply with Section 2702.2.20 and Section 429 of the International Building Code.

Reason: Data centers and computers rooms have and are rapidly becoming critical infrastructure requiring reliable power systems with sufficient standby and emergency power, resilient to transient energy from overvoltage and surge currents. This proposal adds essential power reliability by mandating standby power for the equipment and systems installed for existing data centers and computer rooms along with emergency power for life safety and fire responder operations. Additionally, surge protection will be required for all existing services and feeders installed for the normal, standby, and emergency equipment and systems. The combination of standby power, emergency power, and surge protection will ensure existing data centers and computer rooms will remain energized during normal power outages and will not be damaged from transient surges after undergoing alteration, addition, change of occupancy, or relocation.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal will increase the cost of existing data centers and computer rooms undergoing alteration, addition, change of occupancy, or relocation by requiring compliance with the requirements outlined in Sections 429 and 2702.2.20 of the IBC as required for new data centers and computer rooms. The increased costs at time of alteration, addition, change of occupancy, or relocation will be offset operational savings achieved by reduced downtime, increased productivity, and protection against data loss and equipment damage. This return on investment will vary depending on project scale and scope.

For example, a small computer room with a single network terminal may only require the installation of a single surge-protective device and a UPS for standby power backup whereas and existing 50k square foot standalone data center with thousands of network terminals may require extensive electrical infrastructure upgrades to meet the proposed requirements in Sections 429 and 2702.2.20.

Actual costs in dollars could be as low as $500 in the first example above to more than $100k in electrical upgrades in the second example above.

Estimated Immediate Cost Impact Justification (methodology and variables):

Unknown - No Cost Impact Justification Study Performed. NEMA's proposals are developed by a member consensus process where both our bylaws and federal regulations prohibit us from discussing prices, cost, and other financial details of electrical products.
The best we can offer is a statement that we acknowledge the proposed requirements will indeed increase the cost of construction dependent on the scale and scope of the project, but that we also believe these initial costs will be offset by operational savings achieved by reduced downtime, increased productivity, and protection against data loss and equipment damage, as stated in our proposal.

IEBC: SECTION 310 (New), 310.1 (New), 310.1.1 (New), [BS] 503.2, [BS] 701.3, [BS] 1303.1.3

Proponents: Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Add new text as follows:

SECTION 310
FLOOD HAZARD AREAS

310.1 Flood hazard areas. In *flood hazard areas*, *alterations* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

310.1.1 Compliance with flood hazard provisions. For projects utilizing the Performance Compliance Method with a structurally connected horizontal addition that does not constitute *substantial improvement*, the addition is not required to comply with the flood design requirements for new construction, provided that both of the following apply:

1. The *addition* shall not create or extend any nonconformity of the *existing building* with the flood-resistant construction requirements.
2. The *lowest floor* of the *addition* shall be at or above the lower of the *lowest floor* of the *existing building* or the *lowest floor elevation* required in Section 1612 of the *International Building Code* or Section 306 of the *International Residential Code* as applicable.

Delete without substitution:

~~**[BS] 503.2 Flood hazard areas.** For buildings and structures in *flood hazard areas* established in Section 1612.3 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable, any *alteration* that constitutes *substantial improvement* of the *existing structure* shall comply with the flood design requirements for new construction, and all aspects of the *existing structure* shall be brought into compliance with the requirements for new construction for flood design.~~

~~For buildings and structures in *flood hazard areas* established in Section 1612.3 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable, any *alterations* that do not constitute *substantial improvement* of the *existing structure* are not required to comply with the flood design requirements for new construction.~~

~~**[BS] 701.3 Flood hazard areas.** In *flood hazard areas*, *alterations* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.~~

~~**[BS] 1303.1.3 Compliance with flood hazard provisions.** In *flood hazard areas*, buildings that are evaluated in accordance with this section shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable, if the work covered by this section constitutes *substantial improvement*. If the work covered by this section is a structurally connected horizontal *addition* that does not constitute *substantial improvement*, the *addition* is not required to comply with the flood design requirements for new construction, provided that both of the following apply.~~

~~1. The *addition* shall not create or extend any nonconformity of the *existing building* with the flood-resistant construction requirements.~~

~~2. The *lowest floor* of the *addition* shall be at or above the lower of the *lowest floor* of the *existing building* or the *lowest floor* elevation required in Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.~~

Reason: Provisions for flood hazard areas are current located in the prescriptive method under alterations; in the work area method alterations Level 1, and is addressed in the performance compliance method. The intent of this relocation to Chapter 3 is so that this provision only needs to be addressed once. This will reduce duplication and possibly not be coordinated over time.

This proposal is part of a package of code changes to expand and reorganize Chapter 3 to increase understanding of the options available in the IEBC. Please see the proposal for reorganization for a clean version of what Chapter 3 will look like if all the proposals are successful.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a relocation of requirements. It is not intended to have any change to construction requirements.

Staff Analysis: CC # EB32-25 and CC # EB64-25 addresses requirements in a different or contradicting manner. The committee is urged to make their intensions clear with their actions on these proposals.

Proponents: Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

SECTION ~~505~~310 WINDOWS AND EMERGENCY ESCAPE OPENINGS

Delete without substitution:

~~**505.1 Replacement windows.** The installation or replacement of windows shall be as required for new installations.~~

Add new text as follows:

310.1 General. The installation of replacement windows shall be as required for new installation. Windows in alterations and changes of occupancy shall comply with Section 310.2 through 310.4.

Revise as follows:

~~505.2~~310.2 Window fall prevention on replacement windows. In Group R-2 or R-3 buildings containing dwelling units, and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices or other window fall prevention devices complying with ASTM F2090 shall be installed where an existing window is replaced and where all of the following apply to the replacement window:

1. The window is operable.
2. One of the following applies:
   - 2.1. The window replacement includes replacement of the sash and frame.
   - 2.2. The window replacement includes the sash only where the existing frame remains.
3. One of the following applies:
   - 3.1. In Group R-2 or R-3 buildings containing dwelling units, the bottom of the clear opening of the window opening is at a height less than 36 inches (915 mm) above the finished floor.
   - 3.2. In one- and two-family dwellings and townhouses regulated by the *International Residential Code*, the bottom of the clear opening of the window opening is at a height less than 24 inches (610 mm) above the finished floor.
4. The window will permit openings that will allow passage of a 4-inch-diameter (102 mm) sphere when the window is in its largest opened position.
5. The vertical distance from the bottom of the clear opening of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

Exception: Operable windows where the bottom of the clear opening of the window opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F2006.

~~505.3~~310.3 Replacement window emergency escape and rescue openings. ~~Where windows are required to provide *emergency*~~

~~*escape and rescue openings* in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code,* replacement windows shall be exempt from the requirements of Section 1031.3 of the *International Building Code* and Section 319.2 of the *International Residential Code,* provided that the replacement window meets the following conditions:~~

1. ~~The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.~~
2. ~~Where the replacement of the window is part of a *change of occupancy,* it shall comply with Section 1011.5.6.~~

Where operable windows are required to serve as *emergency escape and rescue openings*in accordance with Section 1031 of the*International Building Code*or in accordance with Section R319 of the*International Residential Code*,replacement windows shall be exempt from the requirements of Section 1031.3 of the *International Building Code* and Section 319.2 of the *International Residential Code*, provided that the replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.

~~505.3.1~~310.3.1 Control devices. Window opening control devices or fall prevention devices complying with ASTM F2090 shall be permitted for use on windows required to provide *emergency escape and rescue openings*. After operation to release the control device allowing the window to fully open, the control device shall not reduce the net clear opening area of the window unit. *Emergency escape and rescue openings* shall be operational from the inside of the room without the use of keys or tools.

~~505.4~~310.4 Bars, grilles, covers or screens. Bars, grilles, covers, screens or similar devices are permitted to be placed over *emergency escape and rescue openings*, bulkhead enclosure or window wells that serve such openings, provided all of the following conditions are met:

1. The minimum net clear opening size complies with the code that was in effect at the time of construction.
2. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening.
3. Where such devices are installed, they shall not reduce the net clear opening of the *emergency escape and rescue openings*.
4. Smoke alarms shall be installed in accordance with Section 907.2.11 of the *I nternational Building Code*.

Delete without substitution:

~~**702.4 Window fall prevention .** In Group R-2 or R-3 buildings containing dwelling units and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices or other window fall prevention devices complying with ASTM F2090 shall be installed where an existing window is replaced and where all of the following apply to the replacement window:~~

1. ~~The window is operable.~~
2. ~~One of the following applies:~~
   - 2.1. ~~The window replacement includes replacement of the sash and frame.~~
   - 2.2. ~~The window replacement includes the sash only where the existing frame remains.~~

3. ~~One of the following applies:~~

 3.1. ~~In Group R-2 or R-3 buildings containing dwelling units, the bottom of the clear opening of the window opening is at a height less than 36 inches (915 mm) above the finished floor.~~

 3.2. ~~In one- and two-family dwellings and townhouses regulated by the *International Residential Code*, the bottom of the clear opening of the window opening is at a height less than 24 inches (610 mm) above the finished floor.~~

4. ~~The window will permit openings that will allow passage of a 4-inch-diameter (102 mm) sphere when the window is in its largest opened position.~~

5. ~~The vertical distance from the bottom of the clear opening of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).~~

~~**Exception:**~~

~~Operable windows where the bottom of the clear opening of the window opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F2006.~~

~~**702.5 Replacement window for emergency escape and rescue openings.** Where windows are required to provide *emergency escape and rescue openings* in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, replacement windows shall be exempt from the requirements of Section 1031.3 of the *International Building Code* and Section R310.2 of the *International Residential Code*, provided that the replacement window meets the following conditions:~~

1. ~~The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.~~
2. ~~Where the replacement window is part of a *change of occupancy* it shall comply with Section 1011.5.6.~~

~~**702.5.1 Control devices.** Window opening control devices or fall prevention devices complying with ASTM F2090 shall be permitted for use on windows required to provide *emergency escape and rescue openings*. After operation to release the control device allowing the window to fully open, the control device shall not reduce the net clear opening area of the window unit. *Emergency escape and rescue openings* shall be operational from the inside of the room without the use of keys or tools.~~

~~**702.6 Bars, grilles, covers or screens.** Bars, grilles, covers, screens or similar devices are permitted to be placed over *emergency escape and rescue openings*, bulkhead enclosure or window wells that serve such openings, provided all of the following conditions are met:~~

1. ~~The minimum net clear opening size complies with the code that was in effect at the time of construction.~~
2. ~~Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening.~~
3. ~~Where such devices are installed, they shall not reduce the net clear opening of the *emergency escape and rescue openings*.~~
4. ~~Smoke alarms shall be installed in accordance with Section 907.2.11 of the *International Building Code*.~~

~~**1011.5.6 Existing emergency escape and rescue openings.** Where a *change of occupancy* would require an *emergency escape and*~~

~~*rescue opening* in accordance with Section 1031 of the *International Building Code*, operable windows serving as the *emergency escape and rescue opening* shall comply with the following:~~

1. ~~An existing operable window shall provide a minimum net clear opening of 4 square feet (0.38 m^2) with a minimum net clear opening height of 22 inches (559 mm) and a minimum net clear opening width of 20 inches (508 mm).~~
2. ~~A replacement window where such window complies with both of the following:~~
   - ~~2.1.~~ ~~The replacement window meets the size requirements in Item 1.~~
   - ~~2.2.~~ ~~The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.~~

Reason: Provisions for window fall prevention devices and emergency escape and rescue openings are current located in the prescriptive method in it's own section, but it deals with replacement windows, so that would be applicable in alterations and change of occupancy; and in the work area method under alterations Level 1 and change or occupancy. The intent of this relocation to Chapter 3 is so that this provision only needs to be addressed once. This will reduce duplication and possibly not be coordinated over time.

This proposal is part of a package of code changes to expand and reorganize Chapter 3 to increase understanding of the options available in the IEBC. Please see the proposal for reorganization for a clean version of what Chapter 3 will look like if all the proposals are successful.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a relocation of requirements. It is not intended to have any change to construction requirements.

EB33-25

EB34-25

IEBC: SECTION 310 (New), 310.1 (New), SECTION 708, 708.1, SECTION 809, 809.1, SECTION 907, 907.1, SECTION 1104, 1104.1

Proponents: Eirene Knott, representing BRR Architecture (eirene.knott@brrarch.com); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Add new text as follows:

SECTION 310 ENERGY CONSERVATION

310.1 Minimum requirements. *Alterations* or additions to *existing buildings* or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code or International Residential Code.* The *alterations* and additions shall conform to the energy requirements of *International Energy Conservation Code or International Residential Code.*

Delete without substitution:

~~SECTION 708 ENERGY CONSERVATION~~

~~**708.1 Minimum requirements.** Level 1 *alterations* to *existing buildings* or structures do not require the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.~~

~~SECTION 809 ENERGY CONSERVATION~~

~~**809.1 Minimum requirements.** Level 2 *alterations* to *existing buildings* or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.~~

~~SECTION 907 ENERGY CONSERVATION~~

~~**907.1 Minimum requirements.** Level 3 *alterations* to *existing buildings* or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.~~

~~SECTION 1104 ENERGY CONSERVATION~~

~~**1104.1 Minimum requirements.** *Additions* to *existing buildings* shall conform to the energy requirements of the *International Energy*~~

~~*Conservation Code* or *International Residential Code* as they relate to new construction.~~

Reason: Provisions for energy conservation are current located in the the work area method under additions, alterations Level 1, 2 and 3. The IECC contains provisions for alterations to existing buildings, so while this is currently not in the Prescriptive method, this makes sense to be applicable to all options.

The intent of this relocation to Chapter 3 is so that this provision only needs to be addressed once. This will reduce duplication and possibly not be coordinated over time.

This proposal is part of a package of code changes to expand and reoganize Chapter 3 to increase understanding of the options available in the IEBC. Please see the proposal for reorganization for a clean version of what Chapter 3 will look like if all the proposals are successful.

2024 International Existing Building Code

Add new text as follows:

SECTION 310 ENHANCED CLASSROOM ACOUSTICS

310.1 Enhanced classroom acoustics. In Group E occupancies, classrooms with a volume of 20,000 cubic feet or less, that are located in additions, or in alterations where the area of work exceeds 50 percent of the building area, shall be provided with enhanced classroom acoustics. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.

Delete without substitution:

~~**502.6 Enhanced classroom acoustics.** In Group E occupancies, enhanced classroom acoustics shall be provided in all classrooms in the *addition* with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.~~

~~**503.18 Enhanced classroom acoustics.** In Group E occupancies, where the *work area* exceeds 50 percent of the building area, enhanced classroom acoustics shall be provided in all classrooms with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.~~

~~**506.6 Enhanced classroom acoustics.** In Group E occupancies, where the *work area* exceeds 50 percent of the building area, enhanced classroom acoustics shall be provided in all classrooms with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.~~

~~**903.4 Enhanced classroom acoustics.** In Group E occupancies, where the *work area* is a Level 3 *alteration*, enhanced classroom acoustics shall be provided in all classrooms with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.~~

~~**1011.4 Enhanced classroom acoustics.** In Group E occupancies, where the *work area* is a Level 3 *alteration*, enhanced classroom acoustics shall be provided in all classrooms with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.~~

~~**1101.6 Enhanced classroom acoustics.** In Group E occupancies, enhanced classroom acoustics shall be provided in all classrooms in the *addition* with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.~~

Reason: Provisions for classroom acoustics are currently located in the prescriptive method under additions, alterations (exceeding 50%), and change of occupancy (with alterations exceeding 50%); and in the work area method under additions, alterations Level 3, and change of occupancy (with alterations Level 3). The intent of this relocation to Chapter 3 is so that this provision only needs to be addressed once. This will reduce duplication and possibly not be coordinated over time.

This proposal is part of a package of code changes to expand and reorganize Chapter 3 to increase understanding of the options available in the IEBC. Please see proposal EB7-25 for reorganization and a clean version of what Chapter 3 will look like if all the proposals are successful.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a relocation of requirements. It is not intended to have any change to construction requirements.

EB35-25

EB36-25

IEBC: SECTION 310 (New), 310.1 (New), CHAPTER 10, SECTION 1009, 1009.1

Proponents: Julius Carreon, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee (jcarreon@bellevuewa.gov); Micah Chappell, Seattle Dept. of Construction and Inspections (SDCI), representing Washington Association of Building Officials Technical Code Development Committee (WABO TCD) (micah.chappell@seattle.gov); Sean Angeley, City of Bellingham, representing Washington Associated of Building Officials, Technical Code Development Committee (smangeley@cob.org)

2024 International Existing Building Code

Add new text as follows:

<u>**SECTION 310**</u>
<u>**PLUMBING**</u>

<u>**310.1 Minimum Fixtures.** Where an *alteration* results in increased occupant load of the story by more than 20 percent, plumbing fixtures for the story shall be provided in quantities specified in the International Plumbing Code based on the increased occupant load.</u>

CHAPTER 10
CHANGE OF OCCUPANCY

SECTION 1009
PLUMBING

Revise as follows:

1009.1 Increased demand. Where the occupancy of an *existing building* or part of an *existing building* is changed such that the new occupancy is subject to increased or different plumbing fixture requirements or to increased water supply requirements in accordance with the *International Plumbing Code*, the new occupancy shall comply with the intent of the respective *International Plumbing Code* provisions.

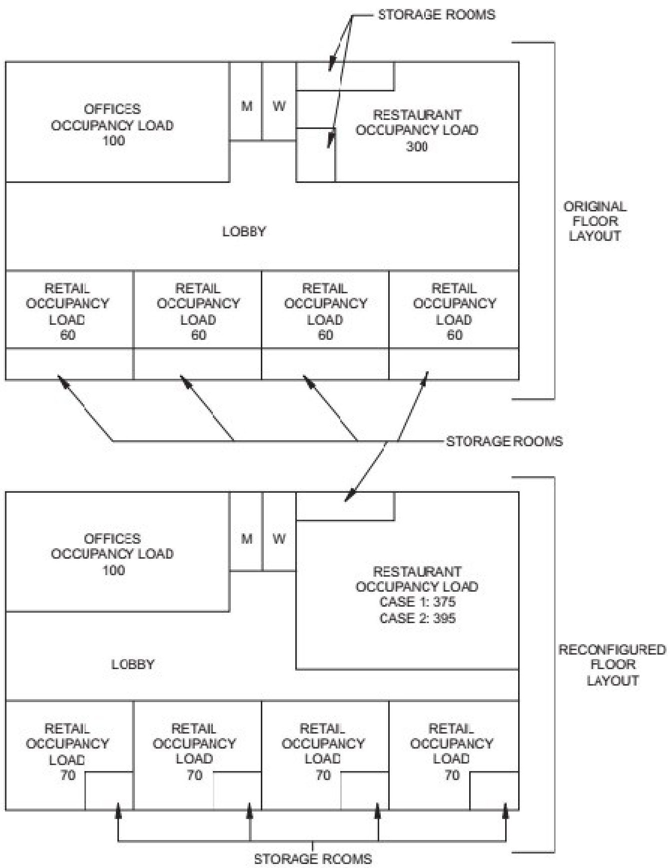
> ~~**Exception:** Only where the occupant load of the story is increased by more than 20 percent, plumbing fixtures for the story shall be provided in quantities specified in the International Plumbing Code based on the increased occupant load.~~

Reason: This code change is to undo the inadvertently substantive change when the plumbing requirements in the alterations section of the code (Section 809 in the 2018 IEBC and prior) were moved to the exception for plumbing fixtures in the change of occupancy section during the 2021 code cycle (See EB92-19): https://www.cdpaccess.com/proposal/5439/8306/preview/.

This provision allows existing plumbing fixtures to remain unchanged as long as renovations result in an occupant load increase of no more than 20% of the current load. During the 2021 code change cycle, proponents of EB92-19 argued that a 20% occupant load increase qualifies as a change of occupancy. They suggested relocating this provision from the Level 2 Alteration section to the Change of Occupancy chapter as an exception.

While we acknowledge that a significant occupant load increase could qualify as a change of occupancy, even within the same group classification (e.g., converting a restaurant to a bar/nightclub within Group A-2), we interpret the 20% allowance differently. We believe it should only apply to reconfigurations where the building's use or occupancy does not change, aligning with the definition of an alteration (See Figure 809.1 as an example). This interpretation reflects that plumbing fixture requirements depend not only on occupant load but also on the building's use or occupancy type (see IBC Table 2902.1). For instance, in a change of occupancy scenario, converting a mercantile space (occupancy load factor = 60 sf/person) to a business use (occupancy load factor = 150 sf/person) could decrease the occupant load of the space but necessitate different plumbing fixture requirements. Applying the 20% exception in this scenario seems inappropriate because it could result in significantly insufficient plumbing fixtures for the new business use. Hence, this proposal is intended to correct this by removing the exception in Section 1009.1 and relocating it back to the alteration section.

In place of relocating the 20% plumbing allowance back to the alteration level 2 work area section, we believe it should be permitted for any compliance method. Hence, we are proposing to relocate the provision as a new section in Chapter 3.



(Alteration example from 2018 IEBC Commentary Figure 809.1)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code proposal is a clarification (or correction) that could decrease construction costs for alteration projects but may increase costs for change-of-occupancy projects.

2024 International Existing Building Code

Revise as follows:

SECTION ~~504~~ 310
FIRE ESCAPES

[BE] ~~504.1~~ 310.1 Where permitted. Fire escapes shall be permitted only as provided for in Sections ~~504.1.1~~ 310.1.1 through ~~504.1.4~~ 310.1.4.

[BE] ~~504.1.1~~ 310.1.1 New buildings. Fire escapes shall not constitute any part of the required means of egress in new buildings.

[BE] ~~504.1.2~~ 310.1.2 Existing fire escapes. Existing fire escapes shall continue to be accepted as a component in the means of egress in *existing buildings* only.

Add new text as follows:

310.1.2.1 Use of existing ladders. In buildings of Group E or I occupancy, rooming houses and childcare centers, use of existing ladders is prohibited.

Revise as follows:

[BE] ~~504.1.3~~ 310.1.3 New fire escapes. New fire escapes for *existing buildings* shall be permitted only where exterior stairways cannot be utilized because of lot lines limiting stairway size or because of sidewalks, alleys or roads at grade level. New fire escapes shall not incorporate ladders or access by windows.

Add new text as follows:

310.1.3.1 Use of windows. Windows shall be permitted to provide access from single dwelling units or sleeping units in Group R and I-1 occupancies or to provide access from spaces having a maximum occupant load of 10 in other occupancy classifications, provided:

1. The window shall have a minimum net clear opening of 5.7 square feet (0.53 m^2) or 5 square feet (0.46 m^2) where located at grade.
2. The minimum net clear opening height shall be 24 inches (610 mm) and net clear opening width shall be 20 inches (508 mm).
3. The bottom of the clear opening shall not be greater than 44 inches (1118 mm) above the floor.

Revise as follows:

[BE] ~~504.1.4~~ 310.1.4 Limitations. Fire escapes ~~shall comply with this section and~~ shall not constitute more than 50 percent of the required number of exits nor more than 50 percent of the required exit capacity.

[BE] ~~504.2~~ 310.2 Location. Where located on the front of the building and where projecting beyond the building line, the lowest landing shall be not less than 7 feet (2134 mm) or more than 12 feet (3658 mm) above grade, and shall be equipped with a counterbalanced stairway to the street. In alleyways and thoroughfares less than 30 feet (9144 mm) wide, the clearance under the lowest landing shall be not less than 12 feet (3658 mm).

[BE] ~~504.3~~ 310.3 Construction. The fire escape shall be designed to support a live load of 100 pounds per square foot (4788 Pa) and shall be constructed of steel or other *approved noncombustible materials*. Fire escapes constructed of wood not less than nominal 2 inches (51 mm) thick are permitted on buildings of Type V construction. Walkways and railings located over or supported by combustible roofs in buildings of Type III and IV construction are permitted to be of wood not less than nominal 2 inches (51 mm) thick.

[BE] ~~504.4~~ 310.4 Dimensions. Stairways shall be not less than 22 inches (559 mm) wide with risers not more than, and treads not less than, 8 inches (203 mm) and landings at the foot of stairways not less than 40 inches (1016 mm) wide by 36 inches (914 mm) long, located not more than 8 inches (203 mm) below the door.

[BE] ~~504.5~~ 310.5 Opening protectives. Doors and windows within 10 feet (3048 mm) of fire escape stairways shall be protected with $^{3}/_{4}$-hour opening protectives.

Exception: Opening protection shall not be required in buildings equipped throughout with an *approved* automatic sprinkler system.

Add new text as follows:

310.6 Access. Occupants shall have unobstructed access to the fire escape without having to pass through a room subject to locking.

Revise as follows:

802.2.1 Existing vertical openings. Existing interior vertical openings connecting two or more floors shall be enclosed with *approved* assemblies having a fire-resistance rating of not less than 1 hour with *approved* opening protectives.

Exceptions:

1. Where vertical opening enclosure is not required by the *International Building Code* or the *International Fire Code*.
2. Interior vertical openings other than stairways may be blocked at the floor and ceiling of the *work area* by installation of not less than 2 inches (51 mm) of solid wood or equivalent construction.
3. The enclosure shall not be required where:
    - 3.1. Connecting the main floor and mezzanines; or
    - 3.2. All of the following conditions are met:
        - 3.2.1. The communicating area has a low-hazard occupancy or has a moderate-hazard occupancy that is protected throughout by an automatic sprinkler system.
        - 3.2.2. The lowest or next-to-the-lowest level is a street floor.
        - 3.2.3. The entire area is open and unobstructed in a manner such that it is reasonable to assume that a fire in any part of the interconnected spaces will be readily obvious to all of the occupants.
        - 3.2.4. Exit capacity is sufficient to provide egress simultaneously for all occupants of all levels by considering all areas to be a single floor area for the determination of required exit capacity.
        - 3.2.5. Each floor level, considered separately, has not less than one-half of its individual required exit capacity provided by an exit or exits leading directly out of that level without having to traverse another communicating floor level or be exposed to the smoke or fire spreading from another communicating floor level.
4. In Group A occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories.

5. In Group B occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories. This enclosure, or the enclosure specified in Section 802.2.1, shall not be required in the following locations:
   5.1. Buildings not exceeding 3,000 square feet (279 m^2) per floor.
   5.2. Buildings protected throughout by an *approved* automatic fire sprinkler system.
6. In Group E occupancies, the enclosure shall not be required for vertical openings not exceeding three stories where the building is protected throughout by an *approved* automatic fire sprinkler system.
7. In Group F occupancies, the enclosure shall not be required in the following locations:
   7.1. Vertical openings not exceeding three stories.
   7.2. Special-purpose occupancies where necessary for manufacturing operations and direct access is provided to not fewer than one protected stairway.
   7.3. Buildings protected throughout by an *approved* automatic sprinkler system.
8. In Group H occupancies, the enclosure shall not be required for vertical openings not exceeding three stories where necessary for manufacturing operations and every floor level has direct access to not fewer than two remote enclosed stairways or other *approved* exits.
9. In Group M occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories. This enclosure, or the enclosure specified in Section 802.2.1, shall not be required in the following locations:
   9.1. Openings connecting only two floor levels.
   9.2. Occupancies protected throughout by an *approved* automatic sprinkler system.
10. In Group R-1 occupancies, the enclosure shall not be required for vertical openings not exceeding three stories in the following locations:
    10.1. Buildings protected throughout by an *approved* automatic sprinkler system.
    10.2. Buildings with less than 25 dwelling units or sleeping units where every sleeping room above the second floor is provided with direct access to a fire escape that complies with Section 310 or other *approved* second means of egress ~~exit by means of an *approved* exterior door or window having a sill height of not greater than 44 inches (1118 mm)~~ and where both of the following conditions are met:
        10.2.1. Any exit access corridor exceeding 8 feet (2438 mm) in length that serves two means of egress, one of which is an unprotected vertical opening, shall have not fewer than one of the means of egress separated from the vertical opening by a 1-hour fire barrier.
        10.2.2. The building is protected throughout by an automatic fire alarm system, installed and supervised in accordance with the *International Building Code*.
11. In Group R-2 occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories. This enclosure, or the enclosure specified in Section 802.2.1, shall not be required in the following locations:
    11.1. Vertical openings not exceeding two stories with not more than four dwelling units per floor.
    11.2. Buildings protected throughout by an *approved* automatic sprinkler system.
    11.3. Buildings with not more than four dwelling units per floor where every sleeping room above the second floor is provided with direct access to a fire escape the complies with Section 310 or other *approved* second means of egress ~~exit by means of an *approved* exterior door or window having a sill height of not greater than 44 inches (1118 mm)~~ and the building is protected throughout by an automatic fire alarm system complying with Section 803.4.
12. One- and two-family dwellings.
13. Group S occupancies where connecting not more than two floor levels or where connecting not more than three floor levels and the structure is equipped throughout with an *approved* automatic sprinkler system.

14. Group S occupancies where vertical opening protection is not required for open parking garages and ramps.

804.5.1.2 Fire escapes required. For other than Group I-2, where more than one exit is required, an existing or newly constructed fire escape complying with Section ~~804.5.1.2.1~~ 310 shall be accepted as providing one of the required means of egress.

Delete without substitution:

~~**804.5.1.2.1 Fire escape access and details.** Fire escapes shall comply with all of the following requirements:~~

1. ~~Occupants shall have unobstructed access to the fire escape without having to pass through a room subject to locking.~~
2. ~~Access to a new fire escape shall be through a door, except that windows shall be permitted to provide access from single dwelling units or sleeping units in Group R-1, R-2 and I-1 occupancies or to provide access from spaces having a maximum occupant load of 10 in other occupancy classifications.~~
   - 2.1. ~~The window shall have a minimum net clear opening of 5.7 square feet (0.53 m^2) or 5 square feet (0.46 m^2) where located at grade.~~
   - 2.2. ~~The minimum net clear opening height shall be 24 inches (610 mm) and net clear opening width shall be 20 inches (508 mm).~~
   - 2.3. ~~The bottom of the clear opening shall not be greater than 44 inches (1118 mm) above the floor.~~
   - 2.4. ~~The operation of the window shall comply with the operational constraints of the *International Building Code*.~~
3. ~~Newly constructed fire escapes shall be permitted only where exterior stairways cannot be utilized because of lot lines limiting the stairway size or because of the sidewalks, alleys, or roads at grade level.~~
4. ~~Openings within 10 feet (3048 mm) of fire escape stairways shall be protected by fire assemblies having minimum $^3/_4$-hour fire-resistance ratings.~~

   ~~**Exception:** Opening protection shall not be required in buildings equipped throughout with an *approved* automatic sprinkler system.~~
5. ~~In all buildings of Group E occupancy, up to and including the 12th grade, buildings of Group I occupancy, rooming houses and childcare centers, ladders of any type are prohibited on fire escapes used as a required means of egress.~~

~~**804.5.1.2.2 Construction.** The fire escape shall be designed to support a live load of 100 pounds per square foot (4788 Pa) and shall be constructed of steel or other *approved noncombustible materials*. Fire escapes constructed of wood not less than nominal 2 inches (51 mm) thick are permitted on buildings of Type V construction. Walkways and railings located over or supported by combustible roofs in buildings of Types III and IV construction are permitted to be of wood not less than nominal 2 inches (51 mm) thick.~~

~~**804.5.1.2.3 Dimensions.** Stairways shall be not less than 22 inches (559 mm) wide with risers not more than, and treads not less than, 8 inches (203 mm). Landings at the foot of stairways shall be not less than 40 inches (1016 mm) wide by 36 inches (914 mm) long and located not more than 8 inches (203 mm) below the door.~~

Revise as follows:

1305.2.11 Means of egress capacity and number. Evaluate the means of egress capacity and the number of exits available to the building occupants. In applying this section, the means of egress are required to conform to the following sections of the *International Building Code*: 1003.7, 1004, 1005, 1006, 1007, 1016.2, 1026.1, 1028.3, 1028.5, 1030.2, 1030.3, 1030.4 and 1031. The number of exits credited is the number that is available to each occupant of the area being evaluated. Existing fire escapes shall be accepted as a component in the means of egress when conforming to Section ~~504~~ 310.

Under the categories and occupancies in Table 1305.2.11, determine the appropriate value and enter that value into Table 1306.1 under Safety Parameter 1305.2.11, Means of Egress, for means of egress and general safety.

1305.2.11.1 Categories. The categories for means-of-egress capacity and number of exits are:

1. Category a—Compliance with the minimum required means-of-egress capacity or number of exits is achieved through the use of a fire escape in accordance with Section ~~504~~ 310.
2. Category b—Capacity of the means of egress complies with Section 1005 of the *International Building Code*, and the number of exits complies with the minimum number required by Section 1006 of the *International Building Code*.
3. Category c—Capacity of the means of egress is equal to or exceeds 125 percent of the required means-of-egress capacity, the means of egress complies with the minimum required width dimensions specified in the *International Building Code*, and the number of exits complies with the minimum number required by Section 1006 of the *International Building Code*.
4. Category d—The number of exits provided exceeds the number of exits required by Section 1006 of the *International Building Code*. Exits shall be located a distance apart from each other equal to not less than that specified in Section 1007 of the *International Building Code*.
5. Category e—The area being evaluated meets both Categories c and d.

Reason: In the current IEBC, there are two largely duplicative sections that address fire escapes, neither of which is fully coordinated with provisions in the IFC addressing fire escapes. The slight differences between the provisions in the prescriptive compliance method (as referenced in the performance compliance method) and the work area method do not appear to have any substantive basis. It is also confusing that these provisions are scoped to different committees. This proposal relocates the provisions from the prescriptive compliance method (Chapter 5) to the provisions for all compliance methods (Chapter 3). This proposal also incorporates three existing provisions from the work area compliance method to the new uniform provisions:

- Section 804.5.1.2.1(5) becomes 310.1.2.1.
- Section 804.5.1.2.1(2) becomes 310.1.3.1.
- Section 804.5.1.2.1(1) becomes 310.6.

Creating uniform provisions for fire escapes will facilitate further coordination between the IEBC and IFC in a future code development cycle.

This proposal is submitted by the ICC Adaptive Reuse Working Group (ARWG) and the ICC Building Code Action Committee (BCAC).

ARWG was convened in 2024 by ICC Government Relations to explore opportunities to facilitate the reuse of existing nonresidential buildings for multi-family residential uses through better training on use of the International Codes for adaptive reuse work and potential amendments to the International Codes. ARWG held numerous virtual meetings in 2024 and met in person at the 2024 annual business meeting in Long Beach. ARWG consists of code officials, design professionals, and other interested parties.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies and consolidates existing requirements related to fire escapes.

EB37-25

EB38-25

IEBC: 401.4 (New)

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net); Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Peter Somers, Magnusson Klemencic Associates, representing self (psomers@mka.com)

2024 International Existing Building Code

Add new text as follows:

<u>**401.4 Demolition and replacement.** Where the building above the foundation is deemed by the code official to be damaged beyond repair or where the intent is to demolish and replace the damaged building, the replacement building, including its remaining or replaced foundation, shall comply with the requirements for new construction in Chapter 16 of the *International Building Code*.</u>

Reason: If the best way to "repair" a building is to demolish and replace it, should the replacement be designed like a new building? This question has been posed in each of the last two code cycles (see the history below), and there is growing consensus around the answer: Yes, since the replacement will have essentially the same value and longevity as new construction, it should be designed with the standards for new construction.

Many code officials already implement this policy based on their own judgment. But because the code is unclear, practice is inconsistent, and owners do not know in advance what rules will apply. This proposal offers a uniform approach consistent with current IEBC principles. Nearly all agree that where the entire building is destroyed by a damaging event (fire, flood, earthquake, etc.), the replacement structure should be designed and built as new construction.

This proposal codifies this common-sense requirement in two cases:

<u>Where the code official deems the building "damaged beyond repair."</u> Yes, this calls for judgment – the same judgment that is already being applied without this provision. There is no way to fully define and quantify this damage state, and past attempts to do so have failed (see below). Indeed, any quantitative rule would just create a game that the code official will have to referee anyway. So we might as well make it clear from the start that code official discretion will be needed here, as the code official sees fit. If the owner proposes to repair what remains, the code official can accept that and not have to make a call.

<u>Where the owner proposes to demolish the damaged building as a means of "repair."</u> In many such cases, the code official will agree with the owner. In other cases, however, an owner might want to tear down a repairable building in order to take advantage of allowances that the IEBC grants to repairs, but not to new construction. These allowances, which include reduced design loads (Section 304) and the use of "like materials" (Section 302.4), while appropriate for typical damage and repairs, should not apply if the project is essentially new construction. We anticipate some questions about the proposal's details:

<u>Why must the foundation comply, especially given the potential cost of replacing it?</u> The proposal starts by considering damage to the portion above the foundation because fire, earthquake, and other causes of extensive damage often leave the existing foundation intact, or at least reusable. Even so, new structural elements, as required, generally need an equally compliant foundation. Any attempt to write a provision that would allow foundation re-use by default would inevitably end up having to parse deficient conditions. It is better to set an enforceable rule, as proposed, and rely on the judgment of design professionals and code officials for case-by-case variances. That said, nothing in the proposal prevents an adequate foundation in good condition from being re-used with the approval of the code official.

<u>Why does the proposal require IBC compliance for only the structural design in Chapter 16?</u> This responds to questions asked about a similar proposal last cycle (EB36-22; see below). Limiting the requirement to the structural design helps accommodate non-conforming conditions in the original building, e.g. regarding building separation, stair width, or similar issues. In typical repairs, the IEBC already requires the repair itself to match the IBC, with allowances for existing non-conforming conditions. Reduced structural loads are among the IEBC's most common allowances (Section 302.4), so this proposal focuses on Chapter 16. (That said, if the committee prefers to require full IBC compliance, that is easily achieved by simply striking the words "Chapter 16 of".)

<u>What if only part of the building is damaged beyond repair?</u> This proposal does not affect current practice regarding partial demolition and replacement. Such cases will continue to rely on the preferences and judgment of owners, design professionals, and code officials. In the case of damage beyond repair to a well-defined portion of a building, such as a top story or a wing (in plan), one rational approach would be to demolish and replace that portion as if it were an addition, i.e. designed as new construction with consideration for any structural and functional interaction with the remaining portions of the existing building. This approach was part of proposal EB36-22 (see

below), but it raised enough questions about interpretation and potential implementation that committee members suggested it be removed, so we have removed it from this proposal.

Finally, some history. As noted, since the code does not clearly address this situation, code officials have grappled with it inconsistently.

- Some jurisdictions apply a “50 percent replacement cost” threshold adapted from legacy codes, but requiring the code official to calculate replacement costs and account for changing real estate markets was explicitly rejected for the IEBC some years ago (though a similar test is used in flood hazard areas to determine whether damage meets the definition of *substantial damage*).
- Others have tried to define “complete damage,” adapted from the current IEBC definition of *substantial structural damage* or similar measures of the affected area, but none of those attempts have made it into the model code.
- EB41-19 tried to define a triggering loss level as damage “[down] to the foundation,” but that left too many loopholes (e.g. where a nominal portion of the superstructure – just a few feet of framing, or even just a sill plate – remains).
- EB41-19 also suggested treating this situation as a Level 3 alteration, but that would not have invoked “new construction” requirements and would have left open questions about how to define the work area.
- EB36-22 was nearly identical to this proposal, but it included a second sentence addressing cases of partial demolition and replacement (to a wing or “portion” of the building). The proposal was disapproved 8-7 (with the chair breaking a tie vote), with essentially all of the opposition related to the second sentence, which this proposal no longer includes.
- As a public comment in 2022, we proposed eliminating the second sentence, and the revised proposal was supported 93-49 – 65.5% approval, just short of the two-thirds requirement.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0.00. Where current practice and code official judgment already apply the code this way there will be no cost increase.

The revisions will not have a cost impact since this is essentially a reorganization and clarification of current code requirements for adding new lateral elements into existing URM buildings.

These revisions may or may not have an impact on construction cost, dependent on several factors that can be specific to each individual URM building and retrofit approach.

The revisions in Section A113.1 could lead to minor increase in the construction costs for wall anchorage retrofits depending on which method is used for IEBC-triggered seismic evaluation and retrofit of existing URM buildings (note that chapter A1 is just one of several possible retrofit procedures listed in IEBC Section 304.3.2 for triggered seismic retrofits that allow the use of reduced seismic criteria).

Specifically, this proposal could result in a slight increase in the number of retrofit anchors in a building or require increased length of development of the wall anchorage into the diaphragm system. Additional single anchors can range in cost from $50.00 to $100.00, not including labor.

Given the very wide range of seismic retrofit scope and costs for URM buildings, reflecting high variability in existing structural systems, varying current condition of the structure at the time of retrofit, and range of impacts to existing architectural finishes required to access retrofit areas, a direct cost impact or percentage increase of construction cost is impossible to estimate.

At most this will have a minor increase in the structural cost of the wall anchorage retrofit, which itself is generally a small percentage of the total retrofit cost for most URM retrofits using Appendix A1

Estimated Immediate Cost Impact Justification (methodology and variables):

Because this proposal merely codifies what most jurisdictions and code officials already understand to be the intent of the code with respect to "total loss" buildings, we believe there will actually be no cost increase at all relative to current practice.

But if a jurisdiction currently allows a severely damaged building to be rebuilt entirely from its existing foundation to match the pre-damage nonconforming conditions, the proposal requires only the structural elements of the replacement building to meet IBC requirements as new construction; therefore, there would be no cost increase for any other system or element. Further, even in this second case, damage at a "total loss" level would already trigger structural criteria for new construction for most elements carrying dead, live, snow, and wind (if the damage was due to wind) loads. A cost increase would be expected only with respect to the lateral system of the replacement building (i.e. wind, if the damage was *not* caused by wind, and seismic), where the IEBC allows loads for repair projects lower than loads for new construction. Instead of original wind or reduced seismic loads, the replacement would have to use W and E loads as for new construction.

EB39-25

IEBC: 403.1, SECTION 202 (New)

Proponents: Jeffrey Hugo, NFSA - National Fire Sprinkler Association, representing NFSA (hugo@nfsa.org)

2024 International Existing Building Code

Revise as follows:

403.1 General. *Repairs* shall be done in a manner that maintains the level of fire protection provided. *Construction documents* shall not be required to be prepared or submitted for approval to *repair* a *fire protection system.*

Add new definition as follows:

FIRE PROTECTION SYSTEM. Approved devices, equipment and systems or combinations of systems used to detect a fire, activate an alarm, extinguish or control a fire, control or manage smoke and products of a fire or any combination thereof.

Reason: Construction documents are meant to describe the design, location, and physical characteristics of a project to support the permitting process for new construction or significant alterations. However, when it comes to repairs, the scope of work is fundamentally different. According to the IEBC, repairs involve replacing, renewing, or reconstructing parts of an existing building for maintenance or to fix damage—and for fire protection systems, these repairs must be "like for like" replacements. This means the repaired components must match the original in terms of function, design, and characteristics. Requiring construction documents for repairs is unnecessary because:

1. Repairs Restore, Not Redesign:
   Repairs don't change the original design or functionality of a fire protection system—they simply bring it back to its approved condition. Since the IEBC requires that replacements are "like for like," there's no need for additional documentation to prove compliance with the system's original design.
2. Purpose of Repairs:
   The goal of a repair is straightforward: maintain the system or fix specific damage. This type of work doesn't introduce new construction or changes that would justify creating new construction documents.
3. Avoiding Unnecessary Delays:
   Requiring construction documents for routine repairs adds unnecessary delays and costs for building owners and contractors. It also creates more work for code officials without adding value to the approval process.
4. IEBC Requirements Are Clear:
   The IEBC already specifies that repairs must involve "like for like" replacements, ensuring that the original design, safety features, and compliance are preserved. This requirement ensures repairs meet the same standards without the need for additional documentation.

This proposal adds the definition of fire protection system to the IEBC to align it with the IBC and IFC, creating consistency across the codes. A fire protection system is defined as *approved devices, equipment, and systems or combinations of systems used to detect a fire, activate an alarm, extinguish or control a fire, control or manage smoke and products of a fire, or any combination thereof.* Adding this definition ensures users of the IEBC have a clear understanding of what constitutes a fire protection system, making the code easier to apply and enforce while maintaining consistency with related codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The clarifies the code that construction documents for repairs are not required.

Staff Analysis: This proposal is simply duplicating a definition from the IBC and IFC. The definition cannot be revised in this proposal as it is scoped to another committee.

IEBC: [BS] 405.2.7 (New)

Proponents: Randy Shackelford, representing Simpson Strong-Tie Co. (rshackelford@strongtie.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Add new text as follows:

[BS] 405.2.7 Decks and Balconies. Where damage occurs to gravity load-carrying structural framing components or their connections in decks or balconies, all structural framing components and their connections shall be evaluated and repaired or retrofitted to comply with the applicable provisions for dead, live, snow, and handrail and guard loads of the *International Building Code.*

Exception: Decks and balconies constructed prior to 2018 are permitted to be designed for a live load equal to the occupancy served.

Reason: This code change aims to address one of the elements of a structure that is most likely to deteriorate over time and cause life-safety issues: exterior decks and balconies.
The industry group for the deck industry is NADRA, the North American Deck and Railing Association. They state on their website that "With more than 60 million decks in the US (50m residential and 10m commercial), it is estimated that 30 million decks are past their useful life and need to be replaced or repaired. It is crucial for homeowners to have their decks inspected to verify the integrity of their deck to ensure user safety as well as help extend the deck's life-span, improve appearance, and increase livability."
Professor Emeritus Frank Woeste, a well-known wood engineer, states in his article "Preventing Early Framing Failures" that "Sometimes, the structural connections-think bolts, lag screws, engineered structural screws, ordinary decking screws, concrete anchors, joist hangers, and other structural connector hardware-are deficient due to a design defect or corrosion (rust), which alone can cause a deck element to fail without warning. But decayed framing system components, such as joists, beams, posts, footings, stairways, guard systems and handrails, decking and treads, can alone cause or contribute to a collapse event. Or course, decayed wood coupled with a deficient connection can jointly cause a collapse event."

Failure of deteriorated decks is so common, in fact that there is an actual Deck Safety Month. Several articles and reports of injuries and even deaths related to deck failures are contained in the Bibliography of this proposal.

With so many deck and balcony elements that can deteriorate over time, we think it just makes sense that when part of a deck or balcony is damaged, that it be examined and repaired, if necessary. There is no other trigger that we are aware of that would encourage a building owner to have their deck examined by a professional.

The exception is added because, prior to the 2018 IBC, decks and balconies were designed to resist a live load equal to the occupancy served. In that year the deck live load was increased by 50%. It would be unfair to require decks designed to meet the old live load to be upgraded to the new higher live load.

Investigation underway after Galveston house balcony collapses, killing 'PR Fairy' Susan Farb Morris   ABC 13 News

https://abc13.com/post/susan-farb-morris-death-investigation-galveston-beach-house-balcony-collapse/14966607/

Cost Impact: Increase

Estimated Immediate Cost Impact:

Provided that this code proposal alone, rather than just owners preference, requires a damaged deck/balcony to be brought up to code in the case of damage, there will be a cost increase.

Regarding the dollar amount and detail cost – we can provide the following estimate. There are two cases: When the inspection finds that the rest of the deck/balcony still meets code, and when the inspection finds that there are other deficiencies that need to be corrected.

1. Inspection finds that deck/balcony otherwise meets code:

a)

Design professional site visit to examine existing structure and damage to structure:

3 hours x $185/ hr = $555 - including travel time

b) Design professional to analyze structure based on field observations and provide letter of findings

3 hours x $185 / hr = $555

2. If structure is deemed deficient-

a) Design professional provide design drawings and details for retrofit (assume 3 sheets including – specifications / general notes – foundation and framing plan – details)

3 hours design x $185/hr = $555

5 hours drafting x $100 / hr = $400

b) It is impossible to estimate the costs to repair the structurally damaged deck/balcony because it will involve too many factors, such as the size of the deck/balcony, the scope of the damage, what material the deck/balcony is constructed of.

Total to check if it meets code - $1,110

Total if deck/balcony does not meet code to provide design for retrofit: $955

Retrofit/repair cost will vary depending on level of deterioration and is impossible to accurately estimate.

Estimated Immediate Cost Impact Justification (methodology and variables):

Design professional inspection, analysis, and design cost data based on experience of a design engineer in Austin, Texas.

The additional cost to repair/retrofit the deck/balcony will depend on too many variables to be able to make an accurate estimate. It will depend on the size and construction method of the deck/balcony, and scope of the damage to the deck/balcony.

Estimated Life Cycle Cost Impact:

Long term, inspection and improvement of damaged decks/balconies will reduce the possibility of injury to deck/balcony occupants if there were a failure.

EB40-25

EB41-25

IEBC: [BS] 405.2.2, [BS] 405.2.3, [BS] 405.2.4, [BS] 405.2.4.1, [BS] 405.2.5

Proponents: Julie C. Furr, PE, Smith Seckman Reid, Inc, representing Self (jcfurr@ssr-inc.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Revise as follows:

[BS] 405.2.2 Disproportionate earthquake damage. A building assigned to Seismic Design Category D, E or F that has sustained *disproportionate earthquake damage* shall comply with Section 405.2.3. ~~be subject to the requirements for buildings with *substantial structural damage* to vertical elements of the lateral force-resisting system~~.

[BS] 405.2.3 Substantial structural damage to vertical elements of the lateral force-resisting system. ~~A building that has sustained *substantial structural damage*~~ Where the building has sustained *substantial structural damage* based on the amount of damage to the vertical elements of its lateral force-resisting system, the building shall be evaluated in accordance with Section 405.2.3.1, and either repaired in accordance with Section 405.2.3.2 or repaired and retrofitted in accordance with Section 405.2.3.3, depending on the results of the evaluation.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B or C whose *substantial structural damage* was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

[BS] 405.2.4 Substantial structural damage to gravity load-carrying components. Where the building has sustained *substantial structural damage* based on the amount of damage to gravity load-carrying components, damaged gravity load-carrying components ~~Gravity load-carrying components that have sustained *substantial structural damage*~~ shall be retrofitted to comply with the applicable provisions for dead, live and snow loads in the *International Building Code*. Undamaged gravity load-carrying components, including undamaged foundation components, that receive dead, live or snow loads from retrofitted components shall also be retrofitted if required to comply with these design loads.

[BS] 405.2.4.1 Lateral force-resisting system ~~elements~~. ~~Regardless of the level of damage to vertical elements of the lateral force-resisting system, if *substantial structural damage*~~ Where the building has sustained *substantial structural damage* based on the amount of damage to gravity load-carrying components, and the damage was caused primarily by wind or seismic effects, ~~then~~ the building shall be evaluated in accordance with Section 405.2.3.1 and, if noncompliant, retrofitted in accordance with Section 405.2.3.3.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B or C whose *substantial structural damage* was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

[BS] 405.2.5 Substantial structural damage to snow load-carrying components. ~~Where *substantial structural damage* to any snow load-carrying components is caused by or related to snow load effects, any~~ Where the building has sustained substantial structural damage based on the amount of damage to gravity load-carrying components caused by snow effects, damaged and undamaged components required to carry snow loads on roof framing of similar construction shall be repaired, replaced or retrofitted to satisfy the requirements of Section 1608 of the *International Building Code*.

Reason: This proposal clarifies that *substantial structural damage* is a condition sustained by the BUILDING, not individual components/systems. While SSD is determined based on the amount of collective damage to components/systems, the components/systems themselves are either undamaged or damaged and require repair. No technical changes have been made to the intent of the sections. This clarification is necessary to avoid confusion caused by literal interpretations of the current language.

For example: it has been argued that in a storm damaged building, individual elements that were damaged but still standing were not required to be brought up to current code, since less than 20% of each individual element was damaged. The roof had experienced a partial collapse and one exterior wall had completely collapsed, resulting in a determination of SSD for the building.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies intent and does not make technical changes to the provisions.

EB41-25

EB42-25

IEBC: SECTION 202, [BS] 405.2.4, [BS] 405.2.5, [BS] 405.2.4.1

Proponents: Julie C. Furr, representing NCSEA Existing Building Committee (jcfurr@ssr-inc.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Revise as follows:

[BS] SUBSTANTIAL STRUCTURAL DAMAGE. A condition where any of the following apply:

1. The vertical elements of the lateral force-resisting system have suffered damage such that the lateral load-carrying capacity of any story in any horizontal direction has been reduced by more than 33 percent from its predamage condition.

2. The capacity of any vertical component carrying gravity load, or any group of such components, that has a tributary area more than 30 percent of the total area of the structure's floor(s) and roof(s) has been reduced more than 20 percent from its predamage condition, and the remaining capacity of such affected elements, with respect to all dead and live loads, is less than 75 percent of that required by the *International Building Code* for new buildings of similar structure, purpose and location.

3. The capacity of any structural component carrying snow load, or any group of such components, that supports more than 30 percent of the roof area of similar construction has been reduced more than 20 percent from its predamage condition caused by snow loads, and the remaining capacity with respect to dead, live and snow loads is less than 75 percent of that required by the *International Building Code* for new buildings of similar structure, purpose and location.

For purposes of this definition, work done to implement repairs shall not be considered damage that reduces structural capacity.

[BS] 405.2.4 Substantial structural damage to gravity load-carrying components. Gravity load-carrying components that have sustained *substantial structural damage* shall be retrofitted to comply with the applicable provisions for dead, live and snow loads in the *International Building Code*. ~~Undamaged~~ Damaged or undamaged gravity load-carrying components, including undamaged foundation components, that receive dead, live or snow loads from retrofitted components shall also be retrofitted if required to comply with these design loads.

[BS] ~~405.2.5~~ 405.2.4.1 Substantial structural damage to snow load-carrying components. Where *substantial structural damage* to any snow load-carrying components is caused by or related to snow load effects, any components required to carry snow loads on roof framing of similar construction shall be repaired, replaced or retrofitted to satisfy the requirements of Section 1608 of the *International Building Code*.

[BS] ~~405.2.4.1~~ 405.2.4.2 Lateral force-resisting elements. Regardless of the level of damage to vertical elements of the lateral force-resisting system, if *substantial structural damage* to gravity load-carrying components was caused primarily by wind or seismic effects, then the building shall be evaluated in accordance with Section 405.2.3.1 and, if noncompliant, retrofitted in accordance with Section 405.2.3.3.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B or C whose *substantial structural damage* was not caused by earthquake need not be evaluated or retrofitted for load combinations that include earthquake effects.

2. One- and two-family dwellings need not be evaluated or retrofitted for load combinations that include earthquake effects.

Reason: This proposal does three things:

1. Clarifies that when substantial structural damage has occurred, damaged and undamaged elements within the load path must be

considered when designing repairs.
2. Clarifies that Item 3 of the SSD definition applies only when the damage has been caused by snow.
3. Reorders sections so that both 405.2.5 and 405.2.4.1 are subsections of 405.2.4

Item-3 was introduced into the 2018 IEBC specifically to address roof framing components that were damaged from snow load effects. Prior to the 2018 IEBC, only elements damaged from snow required repair. Since the 2015 edition of the IEBC, damage to components supporting snow load would have been considered less-than substantial damage and allowed to be restored to its pre-damaged condition.

The 2009 Spokane / Coeur d'Alene and 2011, 2015 New England winters resulted in hundreds of damaged or collapsed roofs. As a result, the variable loading patterns of snow was considered a potential hazard to other undamaged roof framing components of similar construction and the concern was addressed in item-3.

The way the current language is written, if a roof is damaged from other effects such as fire of deterioration and is in a region where snow loads apply, and more than 30% of if components of similar construction are damaged, it would be considered substantial structural damage and subjected to repair section 405.2.4.

In 2021, compliance with snow loads was added to 405.2.4 meaning that repair to components carrying snow load damaged by effects other than snow load would have to be repaired to consider IBC snow loads as well as components receiving dead, live and snow loads from retrofitted components including foundations.

Clearly, this could lead to a substantial effort for repairs of damaged components not related to snow load effects. This code change proposal restores the original intent of the code and clarifies the intent of Item-3 that was meant to address only components damaged from the effects of snow.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Minimum $0.00. Where current practice and code official judgment already apply the code, this way the revisions will reduce the costs of repairing components carrying snow load if the damage was not from the effects of snow load and will not have a cost impact.

Estimated Immediate Cost Impact Justification (methodology and variables):

This code change proposal would reduce the costs of repairing components carrying snow load if the damage was not from the effects of snow load, but minimally the cost would not increase.

EB42-25

EB43-25

IEBC: [BS] 405.2.4

Proponents: Michael Fillion, representing self (mrf.structure@verizon.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Revise as follows:

[BS] 405.2.4 Substantial structural damage to gravity load-carrying components. Gravity load-carrying components that have sustained *substantial structural damage* shall be retrofitted to comply with the applicable provisions for dead, live and snow loads in the *International Building Code*. Undamaged gravity load-carrying components, including undamaged foundation components, that receive dead, live or snow loads from retrofitted components shall also be retrofitted if required to comply with these design loads.

<u>**Exception:** Components that have sustained substantial structural damage from snow loads.</u>

Reason: This code change proposal is for clarification and to assure that the code user is directed to the correct section of this code when evaluating gravity load-carrying components that have sustained substantial structural damage. Prior to the 2018 edition of the IEBC, there were two conditions that described substantial structural damage, Condition-1 applied to vertical elements of the lateral force-resisting system and Condition-2 applied to vertical components carrying gravity load. For Condition-2, the corresponding repair section is **405.2.4**, substantial structural damage to gravity load-carrying components which required gravity load-carrying components that have sustained substantial structural damage to be retrofitted to comply with the applicable provisions for dead and live loads in the International Building Code.

In the 2011 and 2015 New England winters, they experienced a prolonged period of sub-freezing temperatures and a series of snowstorms, the cumulative effect resulting in hundreds of roofs being damaged or collapsed from snow loads. The 2015 IEBC and prior editions allowed these snow damaged components to be restored to their predamaged condition. Of concern was when there was damage to a substantial number of similar components. Due to variations in wind direction affecting snow drifts and areas of snow accumulation along with other factors, there was concern that the other undamaged components of similar construction could also, in time, be subjected to the same damaging effects. These concerns were addressed in the 2018 IEBC. Section **405.2.1.1** requires that when there is less than substantial structural damage, structural components whose damage was caused by or related to snow load effects shall be repaired, replaced or altered to satisfy the requirements of Section 1608 of the International Building Code. To address the concern of when a substantial amount of similar components are damaged, **Condition-3** was added to the definition of substantial structural damage and applied when more than 30 percent of the roof area of similar construction has been reduced more than 20 percent from its predamaged condition, and the remaining capacity with respect to dead, live and snow loads is less than 75 percent of that required by the international building code for new buildings. As an example of similar construction, consider the drifting zone between a high and low roof. If more than 30 percent of the roof rafters in that zone sustain substantial structural damage, then the remaining undamaged rafters in that zone would have to be evaluated for IBC compliance and retrofitted if required. The corresponding repair section for substantial structural damage to snow load-carrying components is **405.2.5.**

In the 2021 Edition of the IEBC, snow loads were added to the retrofit compliance requirement of section **405.2.4.**

Because of that, when there is substantial structural damage to gravity load carrying components caused by snow, sections **405.2.4** and **405.2.5** both apply. These sections have different repair / evaluation scopes. For section **405.2.4**, the damaged components are required to be repaired, section **405.2.5** not only requires the damaged components to be repaired but also requires undamaged components of similar construction to be evaluated and retrofitted as required for IBC compliance.

By adding the exception, users are directed to the proper repair section.

For substantial structural damage Condition-2, section **405.2.4** is used. For Condition-3, section **405.2.5** is used.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is for clarification to direct code users to the correct code section

EB43-25

EB44-25

IEBC: 406.1, NFPA Chapter 16 (New)

Proponents: Bryan Holland, representing National Electrical Manufacturers Association (NEMA) (bryan.holland@nema.org)

2024 International Existing Building Code

Revise as follows:

406.1 General. Maintenance and *repairs* ~~*Repairs*~~ to existing electrical wiring and equipment shall be in accordance with NFPA 70 and NFPA 70B, as applicable.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

70B-23	Standard for Electrical Equipment Maintenance

Reason: This proposal adds the term "maintenance" and a pointer to NFPA 70B in section 406.1 to ensure existing electrical wiring and equipment are properly maintained and repaired in compliance with the NEC and NFPA 70B. NFPA 70B details preventive maintenance for electrical, electronic, and communication systems and equipment, such as those used in industrial plants, institutional and commercial buildings, and large multi-family residential complexes, to prevent equipment failures and worker injuries. The section 202 definition of "Repair" is: *The reconstruction, replacement or renewal of any part of an existing building for the purpose of its maintenance or to correct damage.* As such, it is essential that Section 406.1 pointer users to the applicable NFPA standard for electrical equipment maintenance. The proposal also adds the 70B standard to Chapter 16 as an official referenced standard.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code proposal has no cost impact on the cost of construction but will require compliance with NFPA 70B when electrical equipment installed in an existing building undergoes repair or maintenance. The cost to maintain equipment varies greatly and is dependent on the scale, scope, environmental conditions, and other variables associated with the electrical equipment being maintained.

Staff Analysis: A review of the standard proposed for inclusion in the code, NFPA 70B--2023 Standard for Electrical Equipment Maintenance, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before April 1, 2025.

EB44-25

EB45-25

IEBC: 407.2, UL Chapter 16 (New)

Proponents: Andrew Bevis, Chair, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

407.2 Mechanical draft systems for manually fired appliances and fireplaces. A mechanical draft system shall be permitted to be used with manually fired appliances and fireplaces where such a system complies with all of the following requirements:

1. The mechanical draft device shall be *listed* and labeled in accordance with UL 378 and shall be installed in accordance with the manufacturer's ~~installation~~ instructions.
2. A device shall be installed that produces visible and audible warning upon failure of the mechanical draft device or loss of electrical power at any time that the mechanical draft device is turned on. This device shall be equipped with a battery backup if it receives power from the building wiring.
3. A smoke detector shall be installed in the room with the appliance or fireplace. This device shall be equipped with a battery backup if it receives power from the building wiring.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

UL 378--2006	Draft Equipment—With Revisions Through September 2013

Reason: These changes will align with the changes to this specific requirement in Section 804.3.8 of the International Mechanical Code. The PMCCAC recommends that the Code Correlation Committee assign a [M] scoping to this section because this is specifically covered already in the IMC. Having the same committee responsible for this requirement in the I-Codes will help ensure consistency.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held numerous virtual meetings open to any interested party. Related documents and reports are posted on the PMGCAC website at PMGCAC webpage.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal aligns with what is already required by the IMC.

Staff Analysis: The proposed referenced standards are currently referenced in the IMC:

IEBC: 408.1

Proponents: Gregory Benton, NYS, representing Department of State, Division of Building Standards and Codes (gregory.benton@dos.ny.gov); China Clarke, representing New York State Dept of State (china.clarke@dos.ny.gov); Chad Sievers, NYS, representing NYS Dept of State (chad.sievers@dos.ny.gov); Jeanne Rice, representing NYSDOS (jeanne.rice@dos.ny.gov); Bryant Arms, representing NYS DOS (bryant.arms@dos.ny.gov)

2024 International Existing Building Code

Revise as follows:

408.1 Materials. Plumbing materials and supplies that are prohibited in the *International Plumbing Code* shall not be used for *repairs* ~~that are prohibited in the *International Plumbing Code*~~.

Reason: Current wording can be easily misinterpreted to mean repairs can't be performed on prohibited plumbing configurations, i.e. building traps, rather than prohibited materials and supplies can't be used for repairs. Suggest rearranging wording to make this more straightforward.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is solely an editorial clarification.

EB46-25

EB47-25

IEBC: 408.2

Proponents: Andrew Bevis, Chair, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

408.2 Maximum flow and w~~W~~ater ~~closet replacement~~ consumption. The maximum flow and water consumption ~~flow rates and quantities~~ for all replaced ~~water closets~~ plumbing fixtures shall ~~be 1.6 gallons (6 L) per flushing cycle.~~ comply with the *International Plumbing Code* or *International Residential Code*.

~~**Exception:** Blowout-design water closets [3.5 gallons (13 L) per flushing cycle].~~

Reason: The IPC and IRC provides consumption flow rates and quantities for a number of plumbing fixtures. This requirement should cover all fixtures with consumption and flow rates requirements, not just water closets.

The PMGCAC recommends that the Code Correlation Committee assign a [P] scoping to this section because the plumbing code committee has oversight on plumbing fixture requirements. Having the same committee responsible for plumbing fixtures in the I-Codes will help ensure consistency.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held numerous virtual meetings open to any interested party. Related documents and reports are posted on the PMGCAC website at PMGCAC webpage.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will not increase the cost of construction. This is not a requirement to replace all water closets. The requirement only applies when the water closet is replaced. The cost is already present by choosing to replace the water closet.

EB47-25

EB48-25

IEBC: 501.1, 501.1.1, 601.1, 601.1.1, 1301.1, 1301.1.1

Proponents: Grant Ullrich, Chair, representing ICC Adaptive Reuse Working Group (grant.ullrich@cityofchicago.org); Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

501.1 Scope. ~~The provisions of this chapter shall control the alteration,~~ *Alterations, additions* and *changes of occupancy* ~~of~~ to *existing buildings* ~~and structures~~, including *historic buildings*, ~~and structures as referenced in Section 301.3.1~~ using the prescriptive compliance method shall comply with this chapter.

Delete without substitution:

~~**501.1.1 Compliance with other methods.** *Alterations*, *additions* and *changes of occupancy* to *existing buildings* and structures shall comply with the provisions of this chapter or with one of the methods provided in Section 301.3.~~

Revise as follows:

601.1 Scope. ~~The provisions of this chapter shall be used in conjunction with Chapters 7 through 12 and shall apply to the *alteration*~~ *Alterations*, *additions* and *changes of occupancy* ~~of~~ to *existing* ~~*structures*~~ *buildings*, including ~~historic structures~~ *historic buildings*, ~~as referenced in Section 301.3.2. The work performed on an *existing building* shall be classified in accordance~~ using the work area compliance method shall comply with this chapter.

Delete without substitution:

~~**601.1.1 Compliance with other alternatives.** *Alterations*, *additions* and *changes of occupancy* to *existing structures* shall comply with the provisions of Chapters 7 through 12 or with one of the alternatives provided in Section 301.3.~~

Revise as follows:

1301.1 Scope. ~~The provisions of this chapter shall apply to the *alteration*~~ *Alterations*, *additions* and *changes of occupancy* ~~of~~ to *existing* ~~*structures*~~ *buildings*, including ~~historic structures~~ *historic buildings*, as ~~referenced in Section 301.3.3~~ using the performance compliance method shall comply with this chapter. ~~The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in *existing buildings* while permitting, *alteration*, *addition* and *change of occupancy* without requiring full compliance with Chapters 6 through 12, except where compliance with the prescriptive method of Chapter 5 or the work area method of other provisions of this code is specifically required in this chapter.~~

Delete without substitution:

~~**1301.1.1 Compliance with other methods.** *Alterations*, *additions* and *changes of occupancy* to *existing structures* shall comply with the provisions of this chapter or with one of the methods provided in Section 301.3.~~

Reason: This proposal is an editorial cleanup of Sections 501.1, 601.1, 1301.1. First, the referenced types of work are changed from singular to plural for consistency with other code sections, including Chapter 3. Second, terminology is standardized to use the defined terms "existing building" and "historic building." Because of the revised wording of these sections, their subsections are no longer needed and deleted without substitution.

This proposal is submitted by the ICC Adaptive Reuse Working Group (ARWG) and the ICC Building Code Action Committee (BCAC).

ARWG was convened in 2024 by ICC Government Relations to explore opportunities to facilitate the reuse of existing nonresidential buildings for multi-family residential uses through better training on use of the International Codes for adaptive reuse work and potential amendments to the International Codes. ARWG held numerous virtual meetings in 2024 and met in person at the 2024 annual business meeting in Long Beach. ARWG consists of code officials, design professionals, and other interested parties.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is editorial. See reason statement.

EB48-25

EB49-25

IEBC: 502.1, 502.1.1 (New), 502.1.2 (New)

Proponents: Kurt Beres, representing MA Design (kurtb@ma-architects.com)

2024 International Existing Building Code

Revise as follows:

502.1 General. *Additions* to any building or structure shall comply with the requirements of the *International Building Code* for new construction. *Alterations* to the *existing building* or structure shall be made to ensure that the *existing building* or structure together with the *addition* are not less complying with the provisions of the *International Building Code* than the *existing building* or structure was prior to the *addition* except that the structural elements need only comply with Sections 502.2 through 502.3.An *existing building* together with its *additions* shall comply with the height and area provisions of Chapter 5 of the *International Building Code*. Where a new *occupiable roof* is added to a building or structure, the *occupiable roof* shall comply with the provisions of the *International Building Code* .

~~**Exception**~~ **Exceptions**:

1. In-filling of floor openings and nonoccupiable appendages such as elevator and exit stairway shafts shall be permitted beyond that permitted by the *International Building Code.*
2. In Other than Group R and Group I Occupancies, additions complying with section 502.1.1 through 502.1.2.

Add new text as follows:

502.1.1 Exceeding allowable height or area. When the combined height or area of the existing building and the addition exceeds the height or area allowed by Chapter 5 of the International Building Code, including any allowable area and height increases, a fire wall or a fire barrier is to be provided between the existing building and addition. The following requirements shall apply:

1. When a fire wall that complies with Section 706 of the International Building Code is constructed between the existing building and the addition, the addition shall be is permitted to be considered a separate building.
2. When a fire barrier that complies with Section 707 of the International Building Code is constructed between the addition, all of the following is required shall comply:
   - 2.1. The combined height and area of the existing building and the addition are to be used to determine the construction type and the fire protection requirements for the addition.
   - 2.2. The construction type of the existing building and addition may differ.
   - 2.3. When the addition is equipped throughout with an automatic sprinkler system installed in accordance with section 903.3.1.1 of the International Building Code, the following is permitted shall apply:
     - 2.3.1. The Chapter 5 tabular values corresponding to a building equipped throughout with an automatic sprinkler installed in accordance with 903.3.1.1 of the building code may be used, whether or not the existing building is equipped throughout with an automatic sprinkler system. in accordance with 903.3.1.1 of the building code.
     - 2.3.2. The addition is eligible for all applicable code alternatives, exceptions, trade-offs or reductions whether or not the existing building is equipped throughout with an automatic sprinkler system in accordance with section 903.3.1.1. of the building code.
     - 2.3.3. A new fire protection system is not required in the existing building. Any existing fire protection systems shall be maintained in the existing building, if provided.

502.1.2 Not Exceeding allowable height and area.. When the combined height and area of the existing building and the addition does not exceed the height and area allowed by Chapter 5 of the International Building Code, but the area of the existing building plus the new addition creates a fire area greater than the threshold limits of Chapter 9 of the International Building Code, the limit of the protection system installation is to be determined in accordance with one of the following:

1. When a fire wall that complies with Section 706 of the International Building Code is constructed between the existing building and the addition, a fire protection system is to be provided in the addition where required by Chapter 9 of the International Building Code in the addition only.
2. When a fire barrier that complies with Table 707.3.10 of the International Building Code is constructed between the exiting building and the addition, a fire protection system is to be provided in the addition where required by Chapter 9 of the International Building Code in the addition only.
3. When a fire wall or a fire barrier is not provided between the existing building and the addition, a fire protection system is to be installed where required by Chapter 9 of the International Building Code in the addition and the fire protection system must extend into the existing building to a fire barrier complying with Table 707.3.10 of the International Building Code.

Reason: The proposed code modification is based on the Ohio Existing Building Code and provides alternatives to the design of additions to existing buildings that may not be able to be modified due to a) technical feasibility, b) cost impacts of making the entire combined building compliant with the building code. As a result it increases design flexibility, adaptive reuse of existing structures, while reducing cost. It has proven to be a beneficial addition to the Ohio Building Code that would benefit from use and input from a wider audience.

Bibliography: 2024 Ohio Existing Building Code forms the basis for this proposed section.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost impact will vary by project but it is expected that not only will there be a reduction in the cost due to constructing fire barriers in lieu of fire walls, but it will allow for increased adaptive reuse of existing structures where modifying the existing structure is cost prohibitive.

Estimated Immediate Cost Impact Justification (methodology and variables):

Variables:

The size, length of fire wall, and extent of existing fire suppression.

Fire Wall to Fire Barrier converting a fire wall to fire barrier on a most recent project resulted in $457/lf to $377lf reduction or roughly 17.5% in the construction of the wall.

Sprinklers from another recent project to install into an existing structure was $8/sf. So assuming an existing 9,000sf small warehouse building 50'x180' with a new addition of indeterminate size. The cost savings would be $72,000 for a sprinkler system and potentially $4,000 in the construction of the wall.

Methodology:

There is a significant cost difference between building fire barriers vs. fire walls, and adding sprinklers to existing structures. The above example is based on recent sf and lf costs for fire barriers vs fire walls as well as adding a sprinkler system to an existing structure. The LF for a Fire Wall vs/ Fire Barrier did not include any costs associated with additional structure to construct the fire wall, or rated door assemblies. The sprinkler value did not include any additional pip or capacity sizing to expand the sprinkler main to accommodate the existing structure vs the addition as these can vary.

Estimated Life Cycle Cost Impact:

There can be significant reduction of cost, as it expands the life cycle of existing structures, allowing them to be more easily incorporated into expansions and/or additions.

2024 International Existing Building Code

CHAPTER 5
PRESCRIPTIVE COMPLIANCE METHOD

SECTION 502
ADDITIONS

Revise as follows:

[BS] 502.1.1 Risk category assignment. The risk category of the *addition* and *existing building* shall be classified in accordance with Section 1604.5 of the *International Building Code.* Where the *addition* is structurally independent of ~~and~~ the *existing building*, or the addition and the existing building have different occupancies, the *risk category* of each existing and added occupancy shall be determined in accordance with Section 1604.5.1 of the *International Building Code*. Where application of that section results in a higher *risk category* for the *existing building* compared with the *risk category* for the *existing building* before the *addition*, such a change shall be considered a *change of occupancy* and shall comply with Section 506 of this code. Where application of that section results in a higher *risk category* for the *addition* compared with the *risk category* for the *addition* by itself, the *addition* and any systems in the *existing building* required to serve the *addition* shall comply with the requirements of the *International Building Code* for new construction for the higher *risk category*. Where the addition is not structurally independent of the *existing building*, the *existing building* and its *addition* acting together as a single structure shall be assigned a risk category in accordance with Table 1604.5 of the *International Building Code.* Where the *addition* results in a building being assigned to a higher *risk category* for the *existing building* compared with the *risk category* for the *existing building* before the *addition*, such a change shall comply with Section 506 of this code.

> **Exception:** Unless risk category IV is triggered, the original risk category classification of the existing building is permitted to remain where the increase in building area or increase in occupant load due to the addition is less than 10 percent than before the addition. The cumulative effect of changes in building area or occupant load over time shall be considered.

CHAPTER 11
ADDITIONS

SECTION 1101
GENERAL

[BS] 1101.3 Risk category assignment. The risk category of the *addition* and *existing building* shall be classified in accordance with Section 1604.5 of the *International Building Code.* Where the *addition* is structurally independent of ~~and~~ the *existing building*, or the addition and the existing building have different occupancies, the *risk category* of each existing and added occupancy shall be determined in accordance with Section 1604.5.1 of the *International Building Code.* Where application of that section results in a higher *risk category* for the *existing building* compared with the *risk category* for the *existing building* before the *addition*, such a change shall be considered a *change of occupancy* and shall comply with Chapter 10 of this code. Where application of that section results in a higher *risk category* for the *addition* compared with the *risk category* for the *addition* by itself, the *addition* and any systems in the *existing* *building* required to serve the *addition* shall comply with the requirements of the *International Building Code* for new construction for the higher *risk category*. Where the addition is not structurally independent of the *existing building*, the *existing building* and its *addition* acting together as a single structure shall be assigned a risk category in accordance with Table 1604.5 of the *International Building Code.* Where the *addition* results in a building being assigned to a higher *risk category* for the *existing building* compared with the *risk category* for the *existing building* before the *addition*, such a change shall comply with Chapter 10 of this code.

> **Exception:**Unless risk category IV is triggered, the original risk category classification of the existing building is permitted to remain where the increase in building area or increase in occupant load due to the addition is less than 10 percent than before the addition. The cumulative effect of changes in building area or occupant load over time shall be considered.

Reason: The proposed amendment to Sections 502.1.1 and 1101.3 of the International Existing Building Code (IEBC) aims to provide clear and specific guidelines for assigning risk categories to building additions and the existing structures they adjoin.

Historically, users of the International Existing Building Code (IEBC) referred to Section 1604.5 of the International Building Code (IBC) to determine the appropriate risk category, as there was no explicit provision within the IEBC itself. The 2024 edition of the IEBC now includes a provision for risk category assignment for additions. However, the amendments to Sections 502.1.1 and 1101.3 specifically address the assignment of risk categories in cases where the addition and the existing building have different uses (multiple occupancies). These amendments do not address scenarios where the addition and the existing building share similar occupancies or when an addition is structurally connected to the existing building. This omission may lead to confusion among users regarding the continued necessity of referring to IBC Section 1604.5 to determine the risk category for these cases.

This proposal resolves potential ambiguities by:

- Adding a reference to IBC Section 1604.5 for general risk category classification.
- Establishing that when an addition is structurally independent or occupied by different occupancies, the risk category for each portion shall be evaluated per IBC Section 1604.5.1 and the new IEBC provisions in Section 502.1.1 (and Section 1101.3) to determine whether the existing building and/or the addition must be classified under a higher risk category.
- Establishing that when an addition is not structurally independent, regardless whether the addition and the existing building have different or similar uses, the combined structure shall be assigned a single risk category using IBC Table 1604.5.

If the addition results in a higher risk category for the existing building, the change must comply with IEBC Section 506, the Change of Occupancy provision for the prescriptive method, or IEBC Chapter 10 for the work area method.

This proposal provides an exception that allows the original risk category to remain if the increase in building area or occupant load is less than 10%, unless risk category IV is triggered. This proposed exception aligns with the lateral design exceptions offered for existing buildings in other sections of the IEBC, such as Exception 1 of Section 506.5.3, concerning seismic loads for buildings and structures undergoing a change of occupancy. This exception provides the necessary flexibility to existing buildings undergoing small additions that do not involve essential facilities.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal will not increase or decrease the cost of construction since this is intended to clarify the proper application of the code. In some cases, with small additions, construction costs may decrease because this proposal provides an exception for triggering a higher risk category if the proposed addition is less than 10% of the existing building.

EB50-25

EB51-25

IEBC: 502.1.2, 1101.2

Proponents: David Bonowitz, representing David Bonowitz, S.E. (dbonowitz@att.net); Kelly Cobeen, Wiss Janney Elstner Associates, representing Self (kcobeen@wje.com); Peter Somers, Magnusson Klemencic Associates, representing self (psomers@mka.com)

2024 International Existing Building Code

Revise as follows:

502.1.2 Creation or extension of nonconformity. ~~An *addition* shall not~~ Where the intended *addition* would create or extend any nonconformity in the *existing building* to which the *addition* is being made with regard to accessibility, structural strength, supports and attachments for nonstructural components, fire safety, means of egress or the capacity of mechanical, plumbing or electrical systems, the nonconforming components and systems shall be altered to comply with the requirements of the *International Building Code* for new construction.

.

> **Exception:** Nonconforming supports and attachments for nonstructural components that serve the *addition* from within the *existing building* need not be altered to comply with *International Building Code* Section 1613 unless the components are part of the *addition*'s life-safety system or are required to serve an *addition* assigned to *Risk Category* IV.

1101.2 Creation or extension of nonconformity. ~~An *addition* shall not~~ Where the intended *addition* would create or extend any nonconformity in the *existing building* to which the *addition* is being made with regard to accessibility, structural strength, supports and attachments for nonstructural components, fire safety, means of egress or the capacity of mechanical, plumbing or electrical systems, the nonconforming components and systems shall be altered to comply with the requirements of the *International Building Code* for new construction.

> **Exception:** Nonconforming supports and attachments for nonstructural components that serve the *addition* from within the existing building need not be altered to comply with *International Building Code* Section 1613 unless the components are part of the *addition*'s life safety system or are required to serve an *addition* assigned to *Risk Category* IV.

Reason: The proposal is an editorial clarification. The current wording just says what's not allowed. More effective wording, as proposed, tells the user what to do in unacceptable cases, with specific design criteria. This is consistent with how other structural provisions in the IEBC are written. The IBC is specified as the criteria for modification of any non-conforming elements, consistent with the rest of Sections 502 and 1101, which are about additions.

As background, we note that Section 502.1.2 was added to the 2024 IEBC by proposal EB48-22 (SCSC was the proponent), based on wording and logic from Section 1101.2. EB48-22 added the words "supports and attachments for nonstructural components," as well as the Exception.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal merely restates the current provision in a way that is more direct and complete for the user, consistent with how other IEBC provisions are written.

2024 International Existing Building Code

CHAPTER 5
PRESCRIPTIVE COMPLIANCE METHOD

Revise as follows:

[BS] 502.2 Flood hazard areas. For buildings and structures in *flood hazard* areas established in Section 1612.3 of the *International Building Code*, or Section R322 of the *International Residential Code*, additions and foundations shall comply with the following, as applicable~~,~~:

1. An ~~any~~ *addition* that constitutes *substantial improvement* of the *existing structure* shall comply with the flood design requirements for new construction, and all aspects of the *existing structure* shall be brought into compliance with the requirements for new construction for flood design.
2. For new foundations, foundations raised or extended upward, and replacement foundations, the foundations shall be in compliance with the requirements for new construction for flood design.
3. Existing buildings with slab-on-ground foundations shall not be elevated on new, raised, extended, or replaced foundations unless the existing slabs are assessed in accordance with ACI 562 and, if required in accordance with the assessment, strengthened in accordance with ACI 562 and ACI 318 to meet the load requirements of Chapter 16 of the *International Building Code*, or Chapter 3 of the *International Residential Code*, as applicable.
4. ~~For buildings and structures in *flood hazard areas* established in Section 1612.3 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable, any~~ Any *additions* that do not constitute *substantial improvement* of the *existing structure* are not required to comply with the flood design requirements for new construction, provided that both of the following apply:

   4.1 The *addition* shall not create or extend a nonconformity of the *existing building* or structure with the flood-resistant construction requirements.

   4.2 The *lowest floor* of the *addition* shall be at or above the lower of the *lowest floor* of the *existing building* or structure or the *lowest floor* elevation required in Section 1612 of the *International Building Code* or Section R306 of the *International Residential Code*, as applicable.

CHAPTER 11
ADDITIONS

[BS] 1103.3 Flood hazard areas. *Additions* and *foundations* in *flood hazard areas* shall comply with the following requirements:

1. For horizontal *additions* that are structurally interconnected to the *existing building*:
   1.1. If the *addition* and all other proposed work, when combined, constitute *substantial improvement*, the *existing building* and the *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

   1.2. If the *addition* constitutes *substantial improvement*, the *existing building* and the *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

   1.3. If the *addition* does not constitute *substantial improvement*, the *addition* is not required to comply with the flood design requirements for new construction, provided that both of the following apply:
      1.3.1. The *addition* shall not create or extend any nonconformity of the *existing building* with the flood-resistant construction requirements.
      1.3.2. The *lowest floor* of the *addition* shall be at or above the lower of the *lowest floor* of the *existing building* or the *lowest floor* elevation required in Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

2. For horizontal *additions* that are not structurally interconnected to the *existing building*:
   2.1. The *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
   2.2. If the *addition* and all other proposed work, when combined, constitute *substantial improvement*, the *existing building* and the *addition* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.

3. For vertical *additions* and all other proposed work that, when combined, constitute *substantial improvement*, the *existing building* shall comply with Section 1612 of the *International Building Code*, or Section R306 of the *International Residential Code*, as applicable.
4. For a new foundation, replacement foundation or a foundation raised or extended upward, the foundation shall comply with Section 1612 of the *International Building Code,* or Section R306 of the *International Residential Code*, as applicable.
5. <u>For existing buildings with slab-on-ground foundations, the buildings shall not be elevated on new, raised, extended, or replaced foundations unless the existing slabs are assessed in accordance with ACI 562 and, if required in accordance with the assessment, strengthened in accordance with ACI 562 and ACI 318 to meet the load requirements of Chapter 16 of the *International Building Code*, or Chapter 3 of the *International Residential Code*, as applicable.</u>

Add new standard(s) as follows:

2024 International Residential Code

APPENDIX BO
EXISTING BUILDINGS AND STRUCTURES

SECTION BO102
COMPLIANCE

BO102.7 Flood hazard areas. Work performed in existing buildings located in a flood hazard area as established by Table R301.2 shall be subject to the provisions of Section R104.3.1.

Add new text as follows:

<u>**BO102.7.1** **Elevation projects.** Existing buildings in flood hazard areas with slab-on-ground foundations shall not be elevated on new, raised, extended, or replaced foundations unless the existing slabs are assessed in accordance with ACI 562 and, if required in accordance with the assessment, strengthened in accordance with ACI 562 and ACI 318 to meet the load requirements of Chapter 3.</u>

Add new standard(s) as follows:

ACI

American Concrete Institute
38800 Country Club Drive
Farmington Hills, MI 48331

<u>562-21</u> <u>Assessment, Repair, and Rehabilitation of Existing Concrete Structures—Code Requirements</u>

Reason:
All across the country, communities are seeing permit applications to raise existing buildings on foundations that comply with elevation and foundation requirements for construction in flood hazard areas. From a structural perspective, these projects are relatively straightforward when the existing foundations are perimeter walls, piers, piles, or columns. However, it is significantly more complicated when existing buildings have slab-on-ground foundations.

On-ground slabs are designed to be supported by underlying soils, so it's not a surprise that elevating buildings that are on existing slab foundations can be challenging. One method to elevate buildings on slabs is elevating the slab itself. These slabs would need to perform as elevated structural floor systems, which they were not necessarily originally designed to do. This proposal is intended to ensure that slabs are appropriately evaluated and reinforced, if necessary, as structural elements to resist flood loads and load combinations.

It should be the standard of care that contractors and design professionals perform evaluations of slab foundations as part of proposals to elevate buildings on those foundations. However, FEMA has reported on problems and failures of elevation projects when slabs are not evaluated and strengthened before raising. However, we're also aware that many slab-on-ground buildings have been successfully raised when assessments are performed prior to starting the elevation process, and when the assessments prompt strengthening. Citing the standard ACI 562 brings consistency to those assessments to determine what additional stiffening and/or strengthening of the now spanning structural slab is required to accommodate the required loads.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal would require that a specific set of standards be used to evaluate existing slabs when buildings on those slab foundations are proposed to be elevated and, if necessary, those slabs would need to be reinforced and strengthened in accordance with those standards. In order to meet the code requirement that buildings and structures be constructed to safely support all loads, a design professional or contractor should perform some type of evaluation of an existing slab foundation to determine whether the slab should be reinforced as part of a project to elevate-in-place or relocate the building. There is no added cost of construction for this proposal because this proposal simply specifies the consensus standards to accomplish something they should already be doing. Not performing an evaluation is negligent and exposes the designer/builder to liability. Not adequately performing the evaluation could also add repair costs if the slab is elevated without reinforcement and subsequently cracks or fails.

Staff Analysis: Part I: The proposed referenced standard, ACI 318-19 Building Code Requirements for Structural Concrete and Commentary, is currently referenced in the IBC and IRC.

Part II: The proposed referenced standard, ACI 562-21 Assessment, Repair, and Rehabilitation of Existing Concrete Structures—Code Requirements, is currently referenced in the IEBC.

2024 International Existing Building Code

Revise as follows:

[BS] 502.3 Existing structural elements carrying gravity load. Any existing gravity load-carrying structural element for which an *addition* and its related *alterations* cause an increase in design dead, live or snow load, including snow drift effects, of more than 5 percent shall be replaced or altered as needed to carry the gravity loads required by the *International Building Code* for new structures. Any existing gravity load-carrying structural element whose vertical load-carrying capacity is decreased as part of the *addition* and its related *alterations* shall be considered to be an altered element subject to the requirements of Section 503.3. Any existing element that will form part of the lateral load path for any part of the *addition* shall be considered to be an existing lateral load-carrying structural element subject to the requirements of Section 502.4 ~~502.3~~.

Exception: Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code.* ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the *existing building* and the *addition* together comply with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.~~

[BS] 502.4 Existing structural elements carrying lateral load. Where the *addition* is structurally independent of the *existing structure*, existing lateral load-carrying structural elements shall be permitted to remain unaltered. Where the *addition* is not structurally independent of the *existing structure*, the lateral force-resisting system of the *existing structure* and its *addition* acting together as a single structure shall comply with Section 1609 of the *International Building Code* and with Section 304.3.1 of this code.

Exceptions:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *addition* considered is not more than 10 percent greater than its demand-capacity ratio with the *addition* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Sections 1609 and 1613 of the *International Building Code*. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of *additions* and *alterations* since original construction. When calculating demand-capacity ratios for wind, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* in compliance with Section 1609 of the *International Building Code* or the code wind forces in effect at the time. When calculating demand-capacity ratios for earthquake, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* in compliance with Section 304.3.1 or the full seismic forces in effect at the time.
2. Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code.* ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the *existing building* and the *addition* together comply with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.~~

[BS] 503.3 Existing structural elements carrying gravity load. Any existing gravity load-carrying structural element for which an *alteration* causes an increase in design dead, live or snow load, including snow drift effects, of more than 5 percent shall be replaced or altered as needed to carry the gravity loads required by the *International Building Code* for new structures. Any existing gravity load-carrying structural element whose gravity load-carrying capacity is decreased as part of the *alteration* shall be shown to have the capacity to resist the applicable design dead, live and snow loads including snow drift effects required by the *International Building Code* for new structures.

Exceptions:

1. Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code*. ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the altered building complies with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.~~
2. Buildings in which the increased dead load is due entirely to the addition of a second layer of roof covering weighing 3 pounds per square foot (0.1437 kN/m^2) or less over an existing single layer of roof covering.

[BS] 503.11 Substantial structural alteration. Where the *work area* exceeds 50 percent of the building area and where work involves a *substantial structural alteration*, the lateral load-resisting system of the altered building shall satisfy the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code. Where the building is assigned to Seismic Design Category D or F, supports and attachments for nonstructural components required to serve any portion of the building with a use included in *Risk Category* IV shall comply with Section 1613 of the *International Building Code* or shall comply with ASCE 41 using an objective of Position Retention nonstructural performance with the BSE-1E earthquake hazard level.

Exceptions:

1. Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code*. ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes that are altered based on the conventional light-frame construction methods of the *International Building Code* or in compliance with the provisions of the *International Residential Code*.~~
2. Where the intended *alteration* involves structural components of the lowest story of a building, only the lateral load-resisting system above that story need not comply with this section.

[BS] 706.2 Addition or replacement of roofing or replacement of equipment. Any existing gravity load-carrying structural element for which an *alteration* causes an increase in design dead, live or snow load, including snow drift effects, of more than 5 percent shall be replaced or altered as needed to carry the gravity loads required by the *International Building Code* for new structures.

Exceptions:

1. Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code*. ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the altered building complies with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.~~
2. Buildings in which the increased dead load is due entirely to the addition of a second layer of roof covering weighing 3 pounds per square foot (0.1437 kN/m^2) or less over an existing single layer of roof covering.

[BS] 805.2 Existing structural elements carrying gravity loads. Any existing gravity load-carrying structural element for which an *alteration* causes an increase in design dead, live or snow load, including snow drift effects, of more than 5 percent shall be replaced or altered as needed to carry the gravity loads required by the *International Building Code* for new structures. Any existing gravity load-carrying structural element whose gravity load-carrying capacity is decreased as part of the *alteration* shall be shown to have the capacity to resist the applicable design dead, live and snow loads, including snow drift effects, required by the *International Building Code* for new structures.

Exceptions:

1. Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code*. ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the altered building complies with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.~~

2. Buildings in which the increased dead load is attributable to the addition of a second layer of roof covering weighing 3 pounds per square foot (0.1437 kN/m^2) or less over an existing single layer of roof covering.

[BS] 906.2 Existing structural elements resisting lateral loads. Where work involves a *substantial structural alteration,*the lateral load-resisting system of the altered building shall be shown to satisfy the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code. Where the building is assigned to Seismic Design Category D or F, supports and attachments for nonstructural components required to serve any portion of the building with a use included in *Risk Category* IV shall comply with Section 1613 of the *International Building Code* or shall comply with ASCE 41 using an objective of Position Retention nonstructural performance with the BSE-1E earthquake hazard level.

Exceptions:

1. <u>Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code.*</u> ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes that are altered based on the conventional light-frame construction methods of the *International Building Code* or in compliance with the provisions of the *International Residential Code*.~~
2. Where the intended alteration involves only the lowest story of a building, structural components of the lateral load resisting system above that story need not comply with this section.

[BS] 1103.1 Additional gravity loads. Any existing gravity load-carrying structural element for which an *addition* and its related *alterations* cause an increase in design dead, live or snow load, including snow drift effects, of more than 5 percent shall be replaced or altered as needed to carry the gravity loads required by the *International Building Code* for new structures. Any existing gravity load-carrying structural element whose gravity load-carrying capacity is decreased as part of the *addition* and its related *alterations* shall be considered to be an altered element subject to the requirements of Section 805.2. Any existing element that will form part of the lateral load path for any part of the *addition* shall be considered to be an existing lateral load-carrying structural element subject to the requirements of Section 1103.2.

Exception: <u>Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code.*</u> ~~Buildings of Group R occupancy with not more than five dwelling units or sleeping units used solely for residential purposes where the *existing building* and the *addition* together comply with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.~~

[BS] 1103.2 Lateral force-resisting system. Where the *addition* is structurally independent of the *existing structure*, existing lateral load-carrying structural elements shall be permitted to remain unaltered. Where the *addition* is not structurally independent of the *existing structure*, the lateral force-resisting system of the *existing structure* and its *addition* acting together as a single structure shall comply with Section 1609 of the *International Building Code* and Section 304.3.1 of this code.

Exceptions:

1. <u>Buildings within the scope of *International Residential Code* Section R101.2 shall comply with this code or the *International Residential Code.*</u> ~~Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the *existing building* and the *addition* comply with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.~~
2. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *addition* considered is not more than 10 percent greater than its demand-capacity ratio with the *addition* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Section 1609of the *International Building Code* and Section 304.3.1 of this code*. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of additions and alterations since original construction.*

When calculating demand-capacity ratios for wind, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, alteration or *repair* in compliance with Section 1609 of the *International Building Code* or the code wind forces in effect at the time. When calculating demand-capacity ratios for earthquake, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* in compliance with Section 304.3.1 or the full seismic forces in effect at the time.

Reason: This proposal clarifies duplicative but not entirely identical language from the IEBC, that allows certain existing buildings to use the IRC instead of the IEBC. This simplifies its use and coordinates the IEBC exceptions that have been present since the 2018 edition. Chapter 4 contains similar exceptions which were more narrowly focused and applicable to seismic provisions not available in the IRC, so were intentionally left untouched by this proposal.

This coordination also removes the need to check two different codes to find the most suitable approach. This proposal acknowledges that, in general, if you're doing an existing building project in a small residential building – even an old or non-conforming one – you should just use the IRC. (This rationale will become even more compelling as the IRC develops its own existing building provisions in Appendix BO, formerly Appendix J.)

What about buildings that might qualify for these IEBC exceptions and are not eligible to use the IRC? Doesn't this proposal make compliance harder (or more expensive) for them? No, because these exceptions already require the building to be in compliance with applicable structural provisions of a code for new construction (the IRC or IBC), so the exception already requires as much or more work as the requirement it's meant to waive. Further, understanding that the IEBC exceptions were meant for typical wood-frame houses, any building not eligible for the IRC because of its size (a four-story dwelling?) or use (A, B, E, I, or other non-R occupancy) was not meant to be exempt in the first case. And what about buildings that are within the scope of the IRC but get bumped to the IBC for structural provisions because they're in high wind or high seismic areas? These buildings also lose no advantage, since they would not be triggered to use those IRC structural provisions anyway, owing to the IRC's general allowance for existing building projects that leave the building "no less compliant."

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As noted in the reason statement, the revisions are clarifications and preserve the general allowance in Section 101.2 exception to use the IRC.

Staff Analysis: ADM1-25 Part I contains a related proposed revision to IEBC Section 101.2 that will be heard by the ADMIN committee. Similar exceptions to IEBC Section 101.2 are included in IBC Section 101.2, IFC Section 1001.1, IPC Section 101.2, IMC Section 101.2, and IFGC Section 101.2.

THIS CODE CHANGE WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Existing Building Code

Revise as follows:

[BS] 502.4 Existing structural elements carrying lateral load. Where the *addition* is structurally independent of the *existing structure*, existing lateral load-carrying structural elements shall be permitted to remain unaltered. Where the *addition* is not structurally independent of the *existing structure*, the lateral force-resisting system of the *existing structure* and its *addition* acting together as a single structure shall comply with Section 1609 of the *International Building Code* and with Section 304.3.1 of this code.

Exceptions:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *addition* considered is not more than 10 percent greater than its demand-capacity ratio with the *addition* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Sections 1609 and 1613 of the *International Building Code*. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of *additions* and *alterations* since original construction. When calculating demand-capacity ratios for wind, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* that brought the structure into ~~in~~ compliance with Section 1609 of the *International Building Code* or the code wind forces in effect at the time. When calculating demand-capacity ratios for earthquake, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* that brought the structure into ~~in~~ compliance with Section 304.3.1 or the full seismic forces in effect at the time.
2. Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the *existing building* and the *addition* together comply with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.

[BS] 503.4 Existing structural elements carrying lateral load. Except as permitted by Section 503.13, where the *alteration* increases design lateral loads, results in a prohibited structural irregularity as defined in ASCE 7, or decreases the capacity of any existing lateral load-carrying structural element, the lateral force-resisting system of the altered building or structure shall meet the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code.

Exceptions:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the alteration considered is not more than 10 percent greater than its demand-capacity ratio with the *alteration* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Section 1609 of the *International Building Code* and Section 304.3.1 or 304.3.2 of this code. The same methodology shall be used for the altered and unaltered structures. For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of additions and alterations since original construction. When calculating demand-capacity ratios for wind, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* that brought the structure into ~~in~~ compliance with Section 1609 of the *International Building Code* or the code wind forces in effect at the time. When calculating demand-capacity ratios for earthquake, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* that brought the structure into ~~in~~ compliance with Section 304.3.1 or Section 304.3.2, Item 1 or 3, or the full or reduced seismic forces in effect at the time.

2. Buildings in which the increase in the demand-capacity ratio is due entirely to the addition of rooftop-supported mechanical equipment individually having an operating weight less than 400 pounds (181.4 kg) and where the total additional weight of all rooftop equipment placed after initial construction of the building is less than 10 percent of the roof dead load. For purposes of this exception, “roof” shall mean the roof level above a particular story.
3. Increases in the demand-capacity ratio due to lateral loads from seismic forces need not be evaluated for the installation of rooftop *photovoltaic panel systems* where the additional roof dead load due to the system, including ballast where applicable, does not exceed 5 pounds per square foot (psf) (0.2394 kN/m^2) and does not exceed 10 percent of the dead load of the existing roof.

[BS] 805.3 Existing structural elements resisting lateral loads. Except as permitted by Section 805.4, where the *alteration* increases design lateral loads, or where the alteration results in prohibited structural irregularity as defined in ASCE 7, or where the *alteration* decreases the capacity of any existing lateral load-carrying structural element, the lateral force-resisting system of the altered building or structure shall meet the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code.

Exceptions:

1. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *alteration* considered is not more than 10 percent greater than its demand-capacity ratio with the *alteration* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Section 1609of the *International Building Code* and Section 304.3.1 or 304.3.2 of this code . The same methodology shall be used for the altered and unaltered structures.For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of *additions* and *alterations* since original construction. When calculating demand-capacity ratios for wind, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* that brought the structure into ~~in~~ compliance with Section 1609 of the *International Building Code* or the code wind forces in effect at the time. When calculating demand-capacity ratios for earthquake, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* that brought the structure into ~~in~~ compliance with Section 304.3.1 or 304.3.2 Item 1 or 3 or the full or reduced seismic forces in effect at the time.
2. Buildings in which the increase in the demand-capacity ratio is due entirely to the addition of rooftop-supported mechanical equipment individually having an operating weight less than 400 pounds (181.4 kg) and where the total additional weight of all rooftop equipment placed after initial construction of the building is less than 10 percent of the roof dead load. For purposes of this exception, “roof” shall mean the roof level above a particular story.
3. Increases in the demand-capacity ratio due to lateral loads from seismic forces need not be evaluated for the installation of rooftop *photovoltaic panel systems* where the additional roof dead load due to the system, including ballast where applicable, does not exceed 5 pounds per square foot (psf) (0.2394 kN/m^2) and does not exceed 10 percent of the dead load of the existing roof.

[BS] 1103.2 Lateral force-resisting system. Where the *addition* is structurally independent of the *existing structure*, existing lateral load-carrying structural elements shall be permitted to remain unaltered. Where the *addition* is not structurally independent of the *existing structure*, the lateral force-resisting system of the *existing structure* and its *addition* acting together as a single structure shall comply with Section 1609 of the *International Building Code* and Section 304.3.1 of this code.

Exceptions:

1. Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes where the *existing building* and the *addition* comply with the conventional light-frame construction methods of the *International Building Code* or the provisions of the *International Residential Code*.

2. Any existing lateral load-carrying structural element whose demand-capacity ratio with the *addition* considered is not more than 10 percent greater than its demand-capacity ratio with the *addition* ignored shall be permitted to remain unaltered. For purposes of calculating demand-capacity ratios, the demand shall consider applicable load combinations with design lateral loads or forces in accordance with Section 1609of the *International Building Code* and Section 304.3.1 of this code. *For purposes of this exception, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacities shall account for the cumulative effects of additions and alterations since original construction.*

When calculating demand-capacity ratios for wind, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, alteration or *repair*<u>that brought the structure into</u> ~~in~~ compliance with Section 1609 of the *International Building Code* or the code wind forces in effect at the time. When calculating demand-capacity ratios for earthquake, the date of original construction shall be permitted to be taken as the date of completion of a prior *addition*, *alteration* or *repair* <u>that brought the structure into</u> ~~in~~ compliance with Section 304.3.1 or the full seismic forces in effect at the time.

Reason: Although the overall intent is to allow the clock to be "reset" with respect to cumulative changes if a prior addition, alteration, or repair complied with the wind or seismic provisions at the time (or current code); however, the wording of portions of these four provisions is not entirely clear. There appears to be a minor loophole in which one could have implemented a very small addition, alteration, or repair that was in compliance with the seismic requirements of the then-current code, but most of the structure was not improved, and that might arguably "reset the clock". It is doubtful this is the intent. Instead, it seems likely that the intent was to have only an addition, alteration, or repair that brought the whole structure into compliance with the wind or seismic provisions reset the clock.

Bibliography: "Evaluation of the Effects of Oakland's Earthquake Damage Repair Ordinance" by G.R. Searer, T.F. Paret, S.A. Freeman, and U.M., Gilmartin, pubished in the Proceedings of the 8th US Conference on Earthquake Engineering in San Francisco, California in April 2006.

Cost Impact: Increase

Estimated Immediate Cost Impact:

There is a small (likely very small) chance that someone might have taken advantage of these small loopholes. This change would head off that permissive interpretation and cause them to have to strengthen more members due to their proposed addition or alteration. So either the cost stays the same because the design professonal was always going to interpret the provisions according to the intent, or the cost increases due to the fact that the accidental loophole was closed. If the design professional was going to do something sneaky like add a small addition that complies with Section 1609 and then design a big repair, addition, or alteration that doesn't have to consider all of the other repairs, additions, or alterations that have occurred in the past, that tactic would be prohibited by this change. Although there have not been many studies that quantify the costs of upgrades of existing buildings, the proponent conducted a study of the Oakland Earthquake Damage Repair Ordinance that was implemented after the 1989 Loma Prieta Earthquake and found that repair+upgrade cost anywhere from 53 percent more to 3370 percent more, with several projects costing about 400 percent more, than if repair-only had been permitted. So for a project that would only address the damaged elements and cost, say $100,000, the repair+upgrade might cost $500,000. These are potentially substantial cost increases; however, the cost increases *associated with these loopholes* would be very rare due to a confluence of unlikely events or due to precluding a sneaky approach to avoid the intent of the trigger.

Estimated Immediate Cost Impact Justification (methodology and variables):

The study that quantified the cost differential of repair+upgrade compared to repair-only is this paper: "Evaluation of the Effects of the Oakland's Earthquake Damage Repair Ordinance" by G.R. Searer, T.F. Paret, S.A. Freeman, and U.M., Gilmartin, pubished in the Proceedings of the 8th US Conference on Earthquake Engineering in San Francisco, California in April 2006.

EB54-25

EB55-25

IEBC: 502.6, 1101.6

Proponents: Jeff Grove, Chair, representing BCAC (bcac@iccsafe.org)

2024 International Existing Building Code

Revise as follows:

502.6 Enhanced classroom acoustics. In additions to Group E occupancies, enhanced classroom acoustics shall be provided in all classrooms ~~in the *addition*~~ with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.

1101.6 Enhanced classroom acoustics. In additions to Group E occupancies, enhanced classroom acoustics shall be provided in all classrooms ~~in the *addition*~~ with a volume of 20,000 cubic feet (565 m^3) or less. Enhanced classroom acoustics shall comply with the reverberation time in Section 808 of ICC A117.1.

Reason: There is a technical glitch for if the volume is applied to the addition, or to the classrooms. The provisions for acoustics in IBC Section 1207, IRBC 503.18, 506.4, 903.4, and 1011.4 all are applicable for classroom with a volume of 20,000 cubic feet. The size of addition is not relevant if it does not include classrooms.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification for where acoustic improvements are needed in an addition, not an increase in requirements.

2024 International Existing Building Code

SECTION 503
ALTERATIONS

Delete without substitution:

~~SECTION 505~~
~~WINDOWS AND EMERGENCY ESCAPE OPENINGS~~

Add new text as follows:

<u>503.21</u> <u>Windows and emergency escape and rescue openings</u>. <u>Windows and emergency escape and rescue opening shall comply with this section.</u>

Revise as follows:

~~505.1~~ <u>503.21.1</u> **Replacement windows.** The installation or replacement of windows shall be as required for new installations.

~~505.2~~ <u>503.21.2</u> **Window fall prevention on replacement windows.** In Group R-2 or R-3 buildings containing dwelling units, and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices or other window fall prevention devices complying with ASTM F2090 shall be installed where an existing window is replaced and where all of the following apply to the replacement window:

1. The window is operable.
2. One of the following applies:
   2.1. The window replacement includes replacement of the sash and frame.
   2.2. The window replacement includes the sash only where the existing frame remains.
3. One of the following applies:
   3.1. In Group R-2 or R-3 buildings containing dwelling units, the bottom of the clear opening of the window opening is at a height less than 36 inches (915 mm) above the finished floor.
   3.2. In one- and two-family dwellings and townhouses regulated by the *International Residential Code*, the bottom of the clear opening of the window opening is at a height less than 24 inches (610 mm) above the finished floor.
4. The window will permit openings that will allow passage of a 4-inch-diameter (102 mm) sphere when the window is in its largest opened position.
5. The vertical distance from the bottom of the clear opening of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

Exception: Operable windows where the bottom of the clear opening of the window opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F2006.

~~505.3~~ 505.21.3 **Replacement window emergency escape and rescue openings.** Where windows are required to provide *emergency escape and rescue openings* in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code,* replacement windows shall be exempt from the requirements of Section 1031.3 of the *International Building Code* and Section 319.2 of the *International Residential Code,* provided that the replacement window meets the following conditions:

1. The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.
2. Where the replacement of the window is part of a *change of occupancy,* it shall comply with Section 1011.5.6.

~~505.3.1~~ 503.21.3.1 **Control devices.** Window opening control devices or fall prevention devices complying with ASTM F2090 shall be permitted for use on windows required to provide *emergency escape and rescue openings*. After operation to release the control device allowing the window to fully open, the control device shall not reduce the net clear opening area of the window unit. *Emergency escape and rescue openings* shall be operational from the inside of the room without the use of keys or tools.

~~505.4~~ 503.21.4 **Bars, grilles, covers or screens.** Bars, grilles, covers, screens or similar devices are permitted to be placed over *emergency escape and rescue openings*, bulkhead enclosure or window wells that serve such openings, provided all of the following conditions are met:

1. The minimum net clear opening size complies with the code that was in effect at the time of construction.
2. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening.
3. Where such devices are installed, they shall not reduce the net clear opening of the *emergency escape and rescue openings*.
4. Smoke alarms shall be installed in accordance with Section 907.2.11 of the *International Building Code*.

SECTION ~~506~~ 504
CHANGE OF OCCUPANCY

Delete without substitution:

~~SECTION 504~~
~~FIRE ESCAPES~~

Add new text as follows:

504.7 Fire escapes. Fire escapes shall comply with this section.

Revise as follows:

[BE] ~~504.1~~ 504.7.1 Where permitted. Fire escapes shall be permitted only as provided for in Sections ~~504.1.1~~504.7.1.1 through ~~504.1.4~~ 504.7.1.4 .

[BE] ~~504.1.1~~ 504.7.1.1 New buildings. Fire escapes shall not constitute any part of the required means of egress in new buildings.

[BE] ~~504.1.2~~ 504.7.1.2 Existing fire escapes. Existing fire escapes shall continue to be accepted as a component in the means of egress in *existing buildings* only.

[BE] ~~504.1.3~~ 504.7.1.3 New fire escapes. New fire escapes for *existing buildings* shall be permitted only where exterior stairways cannot be utilized because of lot lines limiting stairway size or because of sidewalks, alleys or roads at grade level. New fire escapes shall not incorporate ladders or access by windows.

[BE] ~~504.1.4~~ 504.7.1.4 Limitations. Fire escapes shall comply with this section and shall not constitute more than 50 percent of the required number of exits nor more than 50 percent of the required exit capacity.

[BE] ~~504.2~~ 504.7.2 Location. Where located on the front of the building and where projecting beyond the building line, the lowest landing shall be not less than 7 feet (2134 mm) or more than 12 feet (3658 mm) above grade, and shall be equipped with a counterbalanced stairway to the street. In alleyways and thoroughfares less than 30 feet (9144 mm) wide, the clearance under the lowest landing shall be not less than 12 feet (3658 mm).

[BE] ~~504.3~~ 504.7.3 Construction. The fire escape shall be designed to support a live load of 100 pounds per square foot (4788 Pa) and shall be constructed of steel or other *approved noncombustible materials*. Fire escapes constructed of wood not less than nominal 2 inches (51 mm) thick are permitted on buildings of Type V construction. Walkways and railings located over or supported by combustible roofs in buildings of Type III and IV construction are permitted to be of wood not less than nominal 2 inches (51 mm) thick.

[BE] ~~504.4~~ 504.7.4 Dimensions. Stairways shall be not less than 22 inches (559 mm) wide with risers not more than, and treads not less than, 8 inches (203 mm) and landings at the foot of stairways not less than 40 inches (1016 mm) wide by 36 inches (914 mm) long, located not more than 8 inches (203 mm) below the door.

[BE] ~~504.5~~ 504.7.5 Opening protectives. Doors and windows within 10 feet (3048 mm) of fire escape stairways shall be protected with $^3/_4$-hour opening protectives.

Exception: Opening protection shall not be required in buildings equipped throughout with an *approved* automatic sprinkler system.

Reason: The intent of this proposal is similar to the more extensive reordering proposed for Chapter 3 and 10. This follows the order of the IBC with the idea that this order is familiar and it will be easier for people to find requirements and use the IEBC.
Chapter 5 is basically divided into additions, alterations, changes of occupancy. Windows and EERO's should not be a separate section; 506.4 addressed EERO under COO. Fire escapes are typically required where the occupant load increases in a COO. Fire escapes should not be in a separate section, but under COO. There are other proposals to relocated these sections and matching sections in the work area method into Chapter 3. That is preferred. However, they should at least not be separate sections in Chapter 5.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and 2024 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a reorganization of sections. There are no changes to requirements.

EB57-25

IEBC: 503.1.1 (New)

Proponents: Julie C. Furr, representing NCSEA Existing Building Committee (jcfurr@ssr-inc.com); Erik Madsen, representing NCSEA (emadsen@dci-engineers.com); Emily Guglielmo, representing NCSEA (eguglielmo@martinmartin.com)

2024 International Existing Building Code

Add new text as follows:

503.1.1 Photovoltaic panel systems. Roof structures that provide support for *photovoltaic panel systems* shall be shown to comply with or be altered to comply with Section 1607.14.3 of the *International Building Code*.

Reason: This proposal provides a pointer in the IEBC to current provisions in the IBC that give direction on how and when live load offsets are appropriate to use when installing photovoltaic systems. Unlike new construction that can be designed for all planned loads, the structural capacity of existing buildings is a fixed value. When new systems not considered in the original building design are installed, it is critical that the additional new load be properly accounted for to avoid adverse performance (deflection, ponding, etc) or localized failures of the structure.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This language points to an existing IBC section that already addresses live load offsets and does not impose new technical requirements.

2024 International Existing Building Code

Revise as follows:

[BS] 503.11 Substantial structural alteration. Where the *work area* exceeds 50 percent of the building area and where work involves a *substantial structural alteration*, the lateral load-resisting system of the altered building shall satisfy the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code. Where the building is assigned to Seismic Design Category D or F, supports and attachments for nonstructural components required to serve any portion of the building with a use included in *Risk Category* IV shall comply with Section 1613 of the *International Building Code* or shall comply with ASCE 41 using an objective of Position Retention nonstructural performance with the BSE-1E earthquake hazard level.

Exceptions:

1. Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes that are altered based on the conventional light-frame construction methods of the *International Building Code* or in compliance with the provisions of the *International Residential Code*.
2. Where the intended *alteration* involves only ~~structural components of~~ the lowest story of a building assigned to *Risk Category* I, II, or III, ~~only~~ structural components of the lateral load-resisting system above that story need not comply with this section. This exception shall not be used to reduce or exempt any of the work required by Sections 503.6 through 503.10 or any of the work required by Section 503.12.

[BS] 906.2 Existing structural elements resisting lateral loads. Where work involves a *substantial structural alteration,*the lateral load-resisting system of the altered building shall be shown to satisfy the requirements of Section 1609 of the *International Building Code* and Section 304.3.2 of this code. Where the building is assigned to Seismic Design Category D or F, supports and attachments for nonstructural components required to serve any portion of the building with a use included in *Risk Category* IV shall comply with Section 1613 of the *International Building Code* or shall comply with ASCE 41 using an objective of Position Retention nonstructural performance with the BSE-1E earthquake hazard level.

Exceptions:

1. Buildings of Group R occupancy with not more than five dwelling or sleeping units used solely for residential purposes that are altered based on the conventional light-frame construction methods of the *International Building Code* or in compliance with the provisions of the *International Residential Code*.
2. Where the intended alteration involves only the lowest story of a building assigned to *Risk Category* I, II, or III, structural components of the lateral load resisting system above that story need not comply with this section. This exception shall not be used to reduce or exempt any of the work required by Section 706.3.1, Section 706.3.2 or Sections 906.4 through 906.7.

Reason: This proposal clarifies the application of an exception that applies where a substantial structural alteration (SSA) involves only the lowest story of a building. It confirms that the intent of the exception is to waive the full-building upgrade triggered by the SSA itself, but not to waive other proactive risk reduction measures that might apply to the same project. The proposal has matching parts for the Prescriptive and Work Area methods.

The limitation of Exception 2 to Risk Category I – III serves two purposes. First, it clarifies the intended scope of Exception 2, which is not meant to override Section 503.5, which already triggers a full building retrofit for SDC F (i.e. RC IV with high seismicity) with a major alteration. Second, it clarifies the intended scope of Exception 2, which is not meant to override the part of the provision dealing with nonstructural components in RC IV.

The limitation where Exception 2 conflicts with other triggers clarifies several issues:

It clarifies the intended scope of Exception 2, which is not meant to override triggered roof-level improvements. Without this clarification, there would be a fair question as to whether triggered roof-level work is actually required. This clarification is necessary for two cases (though both are admittedly limited): First, a major (or Level 3) alteration with substantial structural alteration within the first story. This level of work should trigger the following improvements above:a) rigid wall-flexible diaphragm wall anchorage triggered by major alteration in SDC C-F (Sec 503.7 or 906.4); b) URM wall anchors at floor and roof triggered by major alteration in SDC C-F (Sec 503.8 or 906.5); c) URM parapets triggered by major alteration in SDC C-F (Sec 503.9 or 906.6); and d) URM partition bracing triggered by major alteration in SDC C-F (Sec 503.10 or 906.7). Second, a major (or Level 3) alteration with substantial structural alteration within the first story, together with significant reroofing on the same permit. This level of work should trigger the following improvements above: a) URM parapets in SDC D-F (Sec 503.6 or 706.3.1); b) Roof strengthening for wind where the basic wind speed > 130 mph (Sec 503.12 or 706.3.2).

Notes for reference:

- Exception 2 is already limited in its application. Since 503.11 already presumes a work area greater than 50%, then if the intended work involves only the first story, Exception 2 would already only waive work in the upper story of a 2-story building.
- Per the IBC, a “story” goes from the upper surface of a given floor to the upper surface of the floor above. Thus, a floor diaphragm & floor framing are part of the story below. So, Exception 2 does not exempt the diaphragm above the lowest story.

As background, we note that these sections and exceptions were revised for the 2024 IEBC by proposals EB15-22, which made editorial improvements, and EB66-22, which added the sentence about SDC D & F. SCSC was the proponent for both.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Will not increase costs, assuming code users have been applying Exception 2 as intended relative to the other related IEBC sections (eg 503.5 etc).

2024 International Existing Building Code

Revise as follows:

[BS] 503.12 ~~Roof diaphragms~~ Roofs resisting wind uplift loads in high-wind regions. Where the intended *alteration* requires a permit for *reroofing* and involves removal of roofing materials from more than 50 percent of the ~~roof diaphragm of a building or section~~ total area of the roof or from more than 50 percent of a structurally independent section of the roof of a building located where the basic wind speed, *V*, is greater than 130 mph (58 m/s) in accordance with Figure 1609.3(2) of the *International Building Code*, ~~roof diaphragms,~~ the connections of the roof ~~diaphragm to roof framing members, and roof-to-wall connections~~ deck to its supports within the reroofing area shall be evaluated for the wind uplift loads specified in Section 1609 of the *International Building Code*~~, including wind uplift~~. If the ~~diaphragms and~~ connections located within the reroofing area in their current condition are not capable of resisting 75 percent of those wind loads, they shall be replaced or strengthened in accordance with the loads specified in Section 1609 of the *International Building Code*.

Exception: Buildings that have been demonstrated to comply with the wind load provisions in ASCE 7—88 or later editions.

[BS] 706.3.2 ~~Roof diaphragms~~ Roofs resisting wind uplift loads in high-wind regions. Where roofing materials are removed from more than 50 percent of the total area of the roof or from more than 50 percent of a structurally independent section of the roof ~~diaphragm or section~~ of a building located where the basic wind speed, *V*, is greater than 130 mph (58 m/s), in accordance with Figure 1609.3(2) of the *International Building Code*, ~~roof diaphragms,~~ connections of the roof deck to its supports located within the reroofing area ~~diaphragm to roof framing members, and roof-to-wall connections~~ shall be evaluated for the wind uplift loads specified in the *International Building Code*~~, including wind uplift~~. If the ~~diaphragms and~~ connections in their current condition are not capable of resisting 75 percent of those wind loads, they shall be replaced or strengthened in accordance with the loads specified in the *International Building Code.*

Exception: Buildings that have been demonstrated to comply with the wind load provisions in ASCE 7—88 or later editions.

Reason: A provision in the first edition of the IEBC, published in 2003, required that when more than 50% of the roofing materials were removed from a roof diaphragm, the integrity of the diaphragm was to be evaluated, and if found to be deficient because of insufficient or deteriorated connections, such connections were to be provided or replaced. This provision appears to have been originally intended to address obviously deficient or deteriorated connections based on a visual observation of the diaphragm's top surface only; deficiencies or deterioration beyond this could not be observed or easily remedied in the relatively short period of time available between removal and replacement of a roofing system. Our inquiries to the International Code Council Technical Services indicated that the committee responsible for drafting this original provision was focused on connections, which they believed were often the cause of failures in high winds; however there were no meeting minutes or other written records that correlated the development of this original provision to any studies or documentation of any structural failures, including roof diaphragm failures.

This original provision changed dramatically in the 2009 IEBC requiring an evaluation that goes far beyond the integrity of only the diaphragm connectors, to include an evaluation of the entire diaphragm. In most cases, the evaluation of an existing roof diaphragm is challenging because most of the structure to be evaluated is concealed. A diaphragm evaluation conforming to this and/or the current provision could involve the following: 1) removal of all existing roofing down to the structural diaphragm for observation and, except where drawings are available and sufficiently detailed, collection of data to support the structural analysis; 2) engineering calculations, which cannot be performed extemporaneously in the field, evaluating the diaphragm and connection strengths to resist the prescribed design wind forces; 3) installation of temporary protection for the roof in anticipation of the possibility of resulting structural retrofit work; 4) both demobilization and subsequent remobilization of the roofing crew; 5) design and permitting of any necessary structural retrofit work; 6) potentially hiring a subcontractor capable of installing the necessary structural retrofits; and 7) resuming installation of the replacement roofing system. (It is significant to note that the code change proposal upon which the revisions to this 2009 IEBC provision were based did not reference any studies, reports, investigations, etc. documenting diaphragm failures. This code change proposal also stated it would not increase the cost of construction, which appears to have been a gross misrepresentation.)

This provision has become onerous to many building owners trying to maintain and protect their buildings from the weather. Even in those cases where the evaluation indicates that the existing diaphragm possesses the strength required to resist the code-prescribed loads, the costs associated with the evaluation and roofing delays alone, without the need for any structural retrofits, can be substantial and can result in significant increases in costs for the routine exercise of reroofing. And where structural upgrades to a roof diaphragm are found to be necessary, the additional costs associated with the evaluation and retrofits may put the total cost for the project beyond the budget of the building owner. Where this occurs, not being able to reroof the building could lead to deterioration related to a breached roofing envelope resulting in the need for additional expenditures, both structural and non-structural. Some jurisdictions in high wind areas have deleted this provision and others have amended it to only consider the effects of wind uplift.
